This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32 SoC.

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32 board.

**Note:** This is documentation for stable version v4.4 of ESP-IDF. Other *ESP-IDF Versions* are also available.

### 1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth
- Dual high performance Xtensa® 32-bit LX6 CPU cores
- Ultra Low Power co-processor
- Multiple peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

**Hardware:**

- An **ESP32** board
- **USB cable** - USB A / micro USB B
- **Computer** running Windows, Linux, or macOS

**Software:**

You have a choice to either download and install the following software manually

- **Toolchain** to compile code for ESP32
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the **Toolchain**
or get through the onboarding process using the following official plugins for integrated development environments (IDE) described in separate documents

- Eclipse Plugin (installation link)
- VS Code Extension (setup)

![Diagram of development process](image)

**Fig. 1:** Development of applications for ESP32

1.3 Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

1.3.1 ESP32-DevKitC V4 Getting Started Guide

This guide shows how to start using the ESP32-DevKitC V4 development board.

**What You Need**

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*. 
Overview

ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - ESP32-WROOM-DA
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROVER-E
  - ESP32-WROVER-IE
- male or female pin headers.

For details please refer to ESP Product Selector.

Functional Description

The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V4 board.

</tr>
</tbody>
</table>

### Note:
The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.

### Note:
The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.

## Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

## Header Block

The two tables below provide the Name and Function of I/O header pins on both sides of the board, as shown in ESP32-DevKitC V4 with ESP32-WROOM-32 module soldered. The numbering and names are the same as in the ESP32-DevKitC V4 schematics (PDF).

### Pin Layout

### Note on C15

The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

In case these issues occur, please remove the component. The figure below shows C15 highlighted in yellow.
Chapter 1. Get Started

1.3.2 ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options.

What You Need
- ESP-WROVER-KIT V4.1 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:
- ESP32-WROVER-E module
- LCD screen
- MicroSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:
- Starting from the first picture’s top right corner and going clockwise
Chapter 1. Get Started

Fig. 7: ESP-WROVER-KIT block diagram

Fig. 8: ESP-WROVER-KIT board layout - front
Fig. 9: ESP-WROVER-KIT board layout - back

- Then moving on to the second picture
### FT2232
The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See [ESP-WROVER-KIT V4.1 schematic](#).

### 32.768 kHz
External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.

### 0R
Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32’s current consumption in different modes.

### ESP32-WROVER-E module
This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.

### Diagnostic LEDs
Four red LEDs connected to the GPIO pins of FT2232. Intended for future use.

### UART
Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.

### SPI
By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the voltage of this interface is 3.3 V.

### CTS/RTS
Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.

### JTAG
JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.

### USB Port
USB interface. Power supply for the board as well as the communication interface between a computer and the board.

### EN Button
Reset button.

### BOOT Button
Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

### Power Switch
Power On/Off Switch. Toggling toward the Boot button powers the board on, toggling away from Boot powers the board off.

### Power Selector
Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.

### 5V Input
5V power supply interface for a standard coaxial power connector, 5.5 x 2.1 mm, center positive. This interface can be more convenient when the board is operating autonomously (not connected to a computer).

### 5V Power On LED
This red LED turns on when power is supplied to the board, either from USB or 5V Input.

### LDO
NCP1117(1A), 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to [ESP-WROVER-KIT V4.1 schematic](#).

### Camera Connector
Camera interface, a standard OV7670 camera module.

### RGB LED
Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).

### I/O Connector
All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, 12C, 12S, SPI, etc.

### MicroSD Card Slot
Useful for developing applications that access MicroSD card for data storage and retrieval.

### LCD
Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure [ESP-WROVER-KIT board layout - back](#).
Chapter 1. Get Started

Setup Options

There are three jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.
<table>
<thead>
<tr>
<th>Header</th>
<th>Jumper Setting</th>
<th>Description of Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>JP7</td>
<td>Power ESP-WROVER-KIT via an external power supply</td>

<tr>
<td>JP2</td>
<td>Enable JTAG functionality</td>
<td></td>
</tr>
<tr>
<td>JP3</td>
<td>Enable UART communication</td>
<td></td>
</tr>
</tbody>
</table>
Allocation of ESP32 Pins

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the Card Detect signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

Main I/O Connector / JP1

The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

<table>
<thead>

- LED - RGB LED
- MicroSD - MicroSD Card / J4
- LCD - LCD / U5
- PSRAM - ESP32-WROVER-E’s PSRAM

Note: Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

32.768 kHz Oscillator

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 GPIO32</td>
</tr>
<tr>
<td>2 GPIO33</td>
</tr>
</tbody>
</table>

Note: Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.

</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP2.

### Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**  Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development**  Please proceed to **Get Started**, where Section **Installation Step by Step** will quickly help you set up the development environment and then flash an example project onto your board.
Chapter 1. Get Started

ESP-WROVER-KIT V3 Getting Started Guide  This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V3 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview  The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description  The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

</tr>
</tbody>
</table>
**Allocation of ESP32 Pins**

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

**Main I/O Connector / JP1**

The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

**32.768 kHz Oscillator**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>GPIO32</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.
Chapter 1. Get Started

**SPI Flash / JP13**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CLK / GPIO6</td>
</tr>
<tr>
<td>2</td>

<td>SD2 / GPIO9</td>
</tr>
<tr>
<td>5</td>
<td>SD3 / GPIO10</td>
</tr>
<tr>
<td>6</td>
<td>CMD / GPIO11</td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP13.

**Start Application Development** Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup** Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development** Please proceed to **Get Started**, where Section **Installation Step by Step** will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V2 Getting Started Guide  This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER series

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview  The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description  The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Fig. 13: ESP-WROVER-KIT block diagram

Fig. 14: ESP-WROVER-KIT board layout - front
Fig. 15: ESP-WROVER-KIT board layout - back
## Key Component | Description
---|---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
ESP32 Module | Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.
CTS/RTS | Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
UART | Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.
JTAG | JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.
FT2232 | The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.
EN | Reset button.
Boot | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
USB | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Select | Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.
Power Key | Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.
5V Input | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
LDO | NCP1117(1A). 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V2 schematic.
Camera | Camera interface, a standard OV7670 camera module.
RGB | Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).
I/O | All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc.
MicroSD Card | MicroSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the MicroSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section Setup Options.
LCD | Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure ESP-WROVER-KIT board layout - back.

**Setup Options**  There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.

### 1.3.3 ESP32-PICO-KIT V4 / V4.1 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V4 / V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check [ESP32 Hardware Reference](#).

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

**What You Need**

- ESP32-PICO-KIT mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section **Start Application Development**.
Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details see module’s datasheet in Related Documents.
2. ESP32-PICO-KIT comes with male headers by default.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.

![ESP32-PICO-KIT block diagram](image)

Fig. 16: ESP32-PICO-KIT block diagram
Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

Fig. 17: ESP32-PICO-KIT board layout

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Key Component | Description
---|---
ESP32-PICO-D4 | Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.
LDO | 5V-to-3.3V Low dropout voltage regulator (LDO).
USB-UART bridge | Single-chip USB-UART bridge: CP2102 in V4 provides up to 1 Mbps transfer rates and CP2102N in V4.1 offers up to 3 Mbps transfer rates.
Micro USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
5V Power On LED | This red LED turns on when power is supplied to the board. For details, see the schematics in Related Documents.
I/O | All the pins on ESP32-PICO-D4 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc. For details, please see Section Pin Descriptions.
BOOT Button | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
EN Button | Reset button.

Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

Pin Descriptions

The two tables below provide the **Name** and **Function** of I/O header pins on both sides of the board, see **ESP32-PICO-KIT board layout**. The pin numbering and header names are the same as in the schematic given in **Related Documents**.

**Header J3**
Chapter 1. Get Started

The following notes give more information about the items in the tables above.

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input b) output
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Start Application Development

Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions

The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”).

Fig. 18: ESP32-PICO-KIT dimensions - back

For the board physical construction details, please refer to its Reference Design listed below.

ESP32-PICO-KIT V3 Getting Started Guide  This guide shows how to get started with the ESP32-PICO-KIT V3 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.
Chapter 1. Get Started

What You Need

- ESP32-PICO-KIT V3 mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-PICO-KIT V3 is an ESP32-based mini development board produced by Espressif. The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module.

The development board features a USB-UART Bridge circuit, which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access.

Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT V3 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Fig. 20: ESP32-PICO-KIT V3 board layout

### 1.3.4 ESP32-Ethernet-Kit V1.2 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- ESP32-Ethernet-Kit V1.2 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.
Fig. 21: ESP32-Ethernet-Kit V1.2 Overview (click to enlarge)
Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The **Ethernet board (A)** contains Bluetooth/Wi-Fi dual-mode ESP32-WROVER-E module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The **PoE board (B)** provides power over Ethernet functionality. The A board can work independently, without the board B installed.

![ESP32-Ethernet-Kit V1.2](image)

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description

The following figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.
Chapter 1. Get Started

Fig. 23: ESP32-Ethernet-Kit block diagram (click to enlarge)

Fig. 24: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)
**Ethernet Board (A)** The table below provides description starting from the picture’s top right corner and going clockwise.
<table>
<thead>

</tr>
<tr>
<td>EN Button</td>
<td>Reset button.</td>
</tr>
<tr>
<td>GPIO Header 1</td>
<td>This header provides six unpopulated through-hole solder pads connected to spare GPIOs of ESP32. For details, see GPIO Header 1.</td>
</tr>
</tbody>
</table>
Note: Automatic firmware download is supported. If following steps and using software described in Section Start Application Development, users don’t need to do any operation with BOOT button or EN button.

**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under Functionality Overview.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![Fig. 25: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)](image)

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board A Connector</td>
<td>Four female (left) and four male (right) header pins for connecting the PoE board (B) to Ethernet board (A). The pins on the left accept power coming from a PoE switch. The pins on the right deliver 5 V power supply to the Ethernet board (A).</td>
</tr>
<tr>
<td>External Power Terminals</td>
<td>Optional power supply (26.6 ~ 54 V) to the PoE board (B).</td>
</tr>
</tbody>
</table>

**Setup Options**

This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch** When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

<table>
<thead>
<tr>
<th>DIP SW</th>

<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**RMII Clock Selection** The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APLL (not recommended).
Note: For additional information on the RMII clock selection, please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2.

RMII Clock Sourced Externally by PHY  By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

![Fig. 26: RMII Clock from IP101GRI PHY](image)

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-up sampling phase).

RMII Clock Sourced Internally from ESP32’s APLL  Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.
Fig. 27: RMI clock from ESP Internal APLL
GPIO Allocation

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface** The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

<table>
<thead>
<tr>
<th>No.</th>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RMII Interface</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>GPIO21</td>

</tr>
<tr>
<td>PHY Reset</td>
<td></td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>GPIO5</td>
<td>Reset_N</td>
</tr>
</tbody>
</table>

**Note:** The allocation of all pins under the ESP32’s RMII Interface is fixed and cannot be changed either through IO MUX or GPIO Matrix. REF_CLK can only be selected from GPIO0, GPIO16 or GPIO17 and it cannot be changed through GPIO Matrix.

**GPIO Header 1** This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>

</table>
Chapter 1. Get Started

Note:

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the Function Switch.

---

Note:

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also *RMII Clock Sourced Externally by PHY*. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see *ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic*.
2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-E module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

1. Set the Function Switch on the Ethernet board (A) to its default position by turning all the switches to ON.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The PoE board (B) can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the Power Switch from GND to 5V0 position, the 5V Power On LED should light up.

Now to Development Proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example After setting up the development environment and testing the board, you can configure and flash the ethernet/basic example. This example has been created for testing Ethernet functionality. It supports different PHY, including IP101GRI installed on ESP32-Ethernet-Kit V1.2.

Summary of Changes from ESP32-Ethernet-Kit V1.1

- Correct the placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch.
- Values of C1, C2, C42, and C43 are updated to 20 pF. For more information, please check ESP32-Ethernet-Kit V1.2 Ethernet board (A) schematic.
- Replace ESP32-WROVER-B with ESP32-WROVER-E.

ESP32-Ethernet-Kit V1.0 Getting Started Guide This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The ESP32-Ethernet-Kit is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).
What You Need

- ESP32-Ethernet-Kit V1.0 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description

The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.
Fig. 29: ESP32-Ethernet-Kit block diagram (click to enlarge)

Fig. 30: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)
Ethernet Board (A)  The table below provides description starting from the picture’s top right corner and going clockwise.
# Chapter 1. Get Started

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>

<td>Download button. Holding down BOOT and then pressing CH_PU initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>CH_PU Button</td>
<td>Reset button.</td>
</tr>
</tbody>
</table>
**PoE Board (B)**  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under **Functionality Overview**.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![ESP32-Ethernet-Kit-PoEboard(B) layout](click to enlarge)

**Setup Options**  This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch**  The functions for specific GPIO pins can be selected with the Function Switch.

<table>
<thead>

<tr>
<td>4</td>
<td>GPIO35</td>
</tr>
<tr>
<td>5</td>
<td>GPIO36</td>
</tr>
<tr>
<td>6</td>
<td>GPIO39</td>
</tr>
</tbody>
</table>

**GPIO Header 2**  This header contains the GPIOs with specific MII functionality (except GPIO2), as opposed to Reduced Media-Independent Interface (RMII) functionality implemented on ESP32-Ethernet-Kit board by default, see IP101GRI (PHY) Interface. Depending on the situation, if MMI is used, specific Ethernet applications might require this functionality.

<table>
<thead>
<tr>

</tr>
<tr>
<td>5</td>
<td>GPIO5</td>
<td>EMAC_RX_CLK</td>
<td>See note 2</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the Function Switch.
**GPIO Header 3**  The functionality of GPIOs connected to this header depends on the settings of the *Function Switch*.

**Note:**

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

**Start Application Development**  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.
**Initial Setup**

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from **GND** to **5V0** position, the **5V Power On LED** should light up.

**Now to Development** Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example** After setting up the development environment and testing the board, you can configure and flash the *ethernet/basic* example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.0 board*.

**ESP32-Ethernet-Kit V1.1 Getting Started Guide** This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- ESP32-Ethernet-Kit V1.1 board
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

**Overview** ESP32-Ethernet-Kit is an ESP32-based development board produced by *Espressif*.

It consists of two development boards, the Ethernet board A and the PoE board B. The *Ethernet board (A)* contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The *PoE board (B)* provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring, the Ethernet board (A) also features FTDI FT2232H chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

**Functionality Overview** The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.
Fig. 32: ESP32-Ethernet-Kit V1.1

</tbody>
</table>
**PoE Board (B)**  This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview*.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![PoE Board (B) layout](image)

**Table 2: Table PoE board (B)**

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board A Connector</td>
<td>Four female (left) and four male (right) header pins for connecting the PoE board (B) to Ethernet board (A). The pins on the left accept power coming from a PoE switch. The pins on the right deliver 5 V power supply to the Ethernet board (A).</td>
</tr>
<tr>
<td>External Power Terminals</td>
<td>Optional power supply (26.6 ~ 54 V) to the PoE board (B).</td>
</tr>
</tbody>
</table>

**Setup Options**  This section describes options to configure the ESP32-Ethernet-Kit hardware.

**Function Switch**  When in On position, this DIP switch is routing listed GPIOs to FT2232H to provide JTAG functionality. When in Off position, the GPIOs may be used for other purposes.

<table>
<thead>
<tr>
<th>DIP SW</th>
<th>GPIO Pin</th>
</tr>
</thead>
<tbody>
<tr>

<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**Note:**  Placement of GPIO pin number marking on the board’s silkscreen besides the DIP switch is incorrect. Please use instead the pin order as in the table above.

**RMII Clock Selection**  The ethernet MAC and PHY under RMII working mode need a common 50 MHz reference clock (i.e. RMII clock) that can be provided either externally, or generated from internal ESP32 APPL.

**Note:**  For additional information on the RMII clock selection, please refer to [ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic](image), sheet 2, location D2.
RMII Clock Sourced Externally by PHY  By default, the ESP32-Ethernet-Kit is configured to provide RMII clock for the IP101GRI PHY’s 50M_CLKO output. The clock signal is generated by the frequency multiplication of 25 MHz crystal connected to the PHY. For details, please see the figure below.

![Fig. 36: RMII Clock from IP101GRI PHY](image)

Please note that the PHY is reset on power up by pulling the RESET_N signal down with a resistor. ESP32 should assert RESET_N high with GPIO5 to enable PHY. Only this can ensure the power-up of system. Otherwise ESP32 may enter download mode (when the clock signal of REF_CLK_50M is at a high logic level during the GPIO0 power-upsampling phase).

RMII Clock Sourced Internally from ESP32’s APLL  Another option is to source the RMII Clock from internal ESP32 APLL, see figure below. The clock signal coming from GPIO0 is first inverted, to account for transmission line delay, and then supplied to the PHY.

To implement this option, users need to remove or add some RC components on the board. For details please refer to ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic, sheet 2, location D2. Please note that if the APLL is already used for other purposes (e.g. I2S peripheral), then you have no choice but use an external RMII clock.

GPIO Allocation  This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.
Fig. 37: RMII Clock from ESP Internal APLL
IP101GRI (PHY) Interface  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below. Implementation of ESP32-Ethernet-Kit defaults to Reduced Media-Independent Interface (RMII).

</table>

**Note:**
1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROOM-32D module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the Function Switch.

**Note:**

1. To prevent the power-on state of the GPIO0 from being affected by the clock output on the PHY side, the RESET_N signal to PHY defaults to low, turning the clock output off. After power-on you can control RESET_N with GPIO5 to turn the clock output on. See also **RMII Clock Sourced Externally by PHY**. For PHYs that cannot turn off the clock output through RESET_N, it is recommended to use a crystal module that can be disabled/enabled externally. Similarly like when using RESET_N, the oscillator module should be disabled by default and turned on by ESP32 after power-up. For a reference design please see **ESP32-Ethernet-Kit V1.1 Ethernet board (A) schematic**.

2. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without PSRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.

---

**Start Application Development**  Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**

1. Set the **Function Switch** on the Ethernet board (A) to its default position by turning all the switches to ON.
2. To simplify flashing and testing of the application, do not input extra signals to the board headers.
3. The **PoE board (B)** can now be plugged in, but do not connect external power to it.
4. Connect the Ethernet board (A) to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

**Now to Development** Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board. Move on to the next section only if you have successfully completed all the above steps.

**Configure and Load the Ethernet Example** After setting up the development environment and testing the board, you can configure and flash the *ethernet/basic* example. This example has been created for testing Ethernet functionality. It supports different PHY, including **IP101GRI** installed on *ESP32-Ethernet-Kit V1.1*.

**Summary of Changes from ESP32-Ethernet-Kit V1.0**

- The original inverted clock provided to the PHY by ESP32 using GPIO0 has been replaced by a clock generated on PHY side. The PHY’s clock is connected to the ESP32 with same GPIO0. The GPIO2 which was originally used to control the active crystal oscillator on the PHY side, can now be used for other purposes.
- On power up, the ESP32 boot strapping pin GPIO0 may be affected by clock generated on the PHY side. To resolve this issue the PHY’s Reset-N signal is pulled low using resistor R17 and effectively turning off the PHY’s clock output. The Reset-N signal can be then pulled high by ESP32 using GPIO5.
- Removed FT232H chip’s external SPI Flash U6.
- Removed flow control jumper header J4.
- Removed nTRST JTAG signal. The corresponding GPIO4 can now be used for other purposes.
- Pull-up resistor R68 on the GPIO15 line is moved to the MTDO side of JTAG.
- To make the A and B board connections more foolproof (reduce chances of plugging in the B board in reverse orientation), the original two 4-pin male rows on board A were changed to one 4-pin female row and one 4-pin male row. Corresponding male and female 4-pins rows were installed on board B.

**1.3.5 ESP32-DevKitS(-R)**

This user guide provides information on ESP32-DevKitS(-R), an ESP32-based flashing board produced by Espressif. ESP32-DevKitS(-R) is a combination of two board names: ESP32-DevKitS and ESP32-DevKitS-R. S stands for springs, and R stands for WROVER.
Chapter 1. Get Started

The document consists of the following major sections:

- **Getting Started**: Provides an overview of ESP32-DevKitS(-R) and hardware/software setup instructions to get started.
- **Hardware Reference**: Provides more detailed information about ESP32-DevKitS(-R)’s hardware.
- **Related Documents**: Gives links to related documentation.

### Getting Started

This section describes how to get started with ESP32-DevKitS(-R). It begins with a few introductory sections about ESP32-DevKitS(-R), then Section *How to Flash a Board* provides instructions on how to mount a module onto ESP32-DevKitS(-R), get it ready, and flash firmware onto it.

### Overview

ESP32-DevKitS(-R) is Espressif’s flashing board designed specifically for ESP32. It can be used to flash an ESP32 module without soldering the module to the power supply and signal lines. With a module mounted, ESP32-DevKitS(-R) can also be used as a mini development board like ESP32-DevKitC.

ESP32-DevKitS and ESP32-DevKitS-R boards vary only in layout of spring pins to fit the following ESP32 modules.

- **ESP32-DevKitS**:
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE

- **ESP32-DevKitS-R**:
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E
  - ESP32-WROVER-IE

For information about above modules, please refer to ESP32 Series Modules.

### How to Flash a Board

Before powering up your ESP32-DevKitS(-R), please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- An ESP32 module of your choice
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

### Hardware Setup

Please mount a module of your choice onto your ESP32-DevKitS(-R) according to the following steps:

- Gently put your module on the ESP32-DevKitS(-R) board. Make sure that castellated holes on your module are aligned with spring pins on the board.
- Press your module down into the board until it clicks.
- Check whether all spring pins are inserted into castellated holes. If there are some misaligned spring pins, place them into castellated holes with tweezers.

### Software Setup

#### Preferred Method

The ESP-IDF development framework provides a preferred way of flashing binaries onto ESP32-DevKitS(-R). Please proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitS(-R).

#### Alternative Method

As an alternative, Windows users can flash binaries using the Flash Download Tool. Just download it, unzip it, and follow the instructions inside the doc folder.

### Note:

1. To flash binary files, ESP32 should be set to Firmware Download mode. This can be done either by the flash tool automatically, or by holding down the Boot button and tapping the EN button.
2. After flashing binary files, the Flash Download Tool restarts your ESP32 module and boots the flashed application by default.

### Board Dimensions

### Contents and Packaging
Fig. 40: ESP32-DevKitS board dimensions - back

Fig. 41: ESP32-DevKitS-R board dimensions - back
**Retail orders** If you order a few samples, each ESP32-DevKitS(-R) comes in an individual package in either antistatic bag or any packaging depending on a retailer.

For retail orders, please go to https://www.espressif.com/en/company/contact/buy-a-sample.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

**Hardware Reference**

**Block Diagram** A block diagram below shows the components of ESP32-DevKitS(-R) and their interconnections.

![Block Diagram](image)

**Power Supply Options** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

It is advised to use the first option: micro USB port.

### 1.3.6 ESP32-PICO-KIT-1

**Overview**

ESP32-PICO-KIT-1 is an ESP32-based development board produced by Espressif.

The core of this board is **ESP32-PICO-V3** - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-V3 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
Chapter 1. Get Started

• 4 MB flash
• Filter capacitors
• RF matching network

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-V3 are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.

**Note:** ESP32-PICO-KIT-1 comes with male headers by default.

ESP32-PICO-KIT-1 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

- **Getting Started:** Provides an overview of the ESP32-PICO-KIT-1 and software setup instructions to get started.
- **Contents and Packaging:** Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference:** Provides more detailed information about the ESP32-PICO-KIT-1’s hardware.
- **Hardware Revision Details:** Covers revision history, known issues, and links to user guides for previous versions of the ESP32-PICO-KIT-1.
- **Related Documents:** Gives links to related documentation.

**Getting Started**

This section describes how to get started with the ESP32-PICO-KIT-1. It begins with a few introductory sections about the ESP32-PICO-KIT-1, then Section *Start Application Development* provides instructions on how to flash firmware onto the ESP32-PICO-KIT-1.

**Description of Components**  The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT-1 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Fig. 43: ESP32-PICO-KIT-1 Overview (click to enlarge)
Chapter 1. Get Started

Start Application Development  Before powering up your ESP32-PICO-KIT-1, please make sure that the board is in good condition with no obvious signs of damage.

Required Hardware

- 1 x ESP32-PICO-KIT-1
- 1 x USB 2.0 A to Micro B cable
• 1 x Computer running Windows, Linux, or macOS

**Software Setup**  Please proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment.

**Contents and Packaging**

**Retail Orders**  If you order one or several samples of the board, each ESP32-PICO-KIT-1 development board comes in an individual package.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Hardware Reference**

**Block Diagram**  The block diagram below shows the main components of ESP32-PICO-KIT-1 and their interconnections.

![ESP32-PICO-KIT-1 Block Diagram](https://www.espressif.com/en/company/contact/buy-a-sample)

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

**Warning:**  The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

**Pin Descriptions**  The two tables below provide the Name and Function of I/O header pins on both sides of the board, see *Description of Components*. The pin numbering and header names are the same as in the schematic given in *Related Documents*.

The following notes give more information about the items in the tables above.
1. This pin is connected to the pin of the USB bridge chip on the board.
2. 32.768 kHz crystal oscillator: a) input b) output
3. The operating voltage of ESP32-PICO-KIT-1’s embedded SPI flash is 3.3 V. Therefore, the strapping pin MTDI should be pulled down during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

1.3.7 ESP32-PICO-DevKitM-2

Overview

ESP32-PICO-DevKitM-2 is an ESP32-based development board produced by Espressif.

The core of this board is ESP32-PICO-MINI-02(02U) module with complete Wi-Fi and Bluetooth functionalities. The development board features a USB-to-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-MINI-02(02U) are led out to two rows of 18 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, all header pads are populated with two rows of male pin headers.
Note: ESP32-PICO-DevKitM-2 comes with male headers by default.

ESP32-PICO-DevKitM-2 provides the users with hardware for development of applications based on the ESP32, making it easier for users to explore ESP32 functionalities.

This guide covers:

- **Getting Started**: Provides an overview of the ESP32-PICO-DevKitM-2 and software setup instructions to get started.
- **Contents and Packaging**: Provides information about packaging and contents for retail and wholesale orders.
- **Hardware Reference**: Provides more detailed information about the ESP32-PICO-DevKitM-2’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions (if any) of the ESP32-PICO-DevKitM-2.
- **Related Documents**: Gives links to related documentation.

### Getting Started

This section describes how to get started with the ESP32-PICO-DevKitM-2. It begins with a few introductory sections about the ESP32-PICO-DevKitM-2, then Section *Start Application Development* provides instructions on how to flash firmware onto the ESP32-PICO-DevKitM-2.

### Description of Components

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-DevKitM-2 board. We take the board with a ESP32-PICO-MINI-02 module as an example in the following sections.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Chapter 1. Get Started

Fig. 48: ESP32-PICO-DevKitM-2 board layout - front (click to enlarge)

<tr>
<td>USB-to-UART bridge</td>
<td>CP2102N, single-chip USB-UART bridge that offers up to 3 Mbps transfers rates.</td>
</tr>
<tr>
<td>Micro-B USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the board.</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>This red LED turns on when power is supplied to the board. For details, see the schematic in Related Documents.</td>
</tr>
<tr>
<td>I/O Connector</td>
<td>All the pins on ESP32-PICO-MINI-02 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc. For details, please see Section Pin Descriptions.</td>
</tr>
<tr>
<td>BOOT Button</td>
<td>Download button. Holding down Boot and then pressing En initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>EN Button</td>
<td>Reset button.</td>
</tr>
</tbody>
</table>

**Start Application Development**  
Before powering up your ESP32-PICO-DevKitM-2, please make sure that the board is in good condition with no obvious signs of damage.

**Required Hardware**
- 1 x ESP32-PICO-DevKitM-2
- 1 x USB 2.0 A to Micro B cable
- 1 x Computer running Windows, Linux, or macOS
Software Setup  Please proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment.

Contents and Packaging

Retail Orders  If you order one or several samples of the board, each ESP32-PICO-DevKitM-2 development board comes in an individual package.

For retail orders, please go to https://www.espressif.com/en/company/contact/buy-a-sample.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram  The block diagram below shows the main components of ESP32-PICO-DevKitM-2 and their interconnections.

![ESP32-PICO-DevKitM-2 Block Diagram](Fig.49: ESP32-PICO-DevKitM-2 Block Diagram (click to enlarge))

Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V/GND header pins
- 3V3/GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

Pin Descriptions  The two tables below provide the Name and Function of I/O header pins on both sides of the board, see Description of Components. The pin numbering and header names are the same as in the schematic given in Related Documents.

1.3.8 ESP32-DevKitM-1

This user guide will help you get started with ESP32-DevKitM-1 and will also provide more in-depth information. ESP32-DevKitM-1 is an ESP32-MINI-I(1U)-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Users can either connect peripherals with jumper wires or mount ESP32-DevKitM-1 on a breadboard.
The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-DevKitM-1’s hardware.
- **Related Documents**: Gives links to related documentation.

## Getting Started

This section describes how to get started with ESP32-DevKitM-1. It begins with a few introductory sections about the ESP32-DevKitM-1, then Section *Start Application Development* provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-DevKitM-1.

### Overview

This is a small and convenient development board that features:

- ESP32-MINI-1, or ESP32-MINI-1U module
- USB-to-serial programming interface that also provides power supply for the board
- pin headers
- pushbuttons for reset and activation of Firmware Download mode
- a few other components

### Contents and Packaging

**Retail orders**  If you order a few samples, each ESP32-DevKitM-1 comes in an individual package in either anti-static bag or any packaging depending on your retailer.

**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes.

**Description of Components**  The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitM-1 board. We take the board with a ESP32-MINI-1 module as an example in the following sections.
# Chapter 1. Get Started

![Fig. 51: ESP32-DevKitM-1 - front](image)

</tr>
</tbody>
</table>

**Start Application Development**  Before powering up your ESP32-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**  
- ESP32-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Software Setup**  Please proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an application example onto your ESP32-DevKitM-1.
**Attention:** ESP32-DevKitM-1 is a board with a single core module, please enable single core mode (`CONFIG_FREERTOS_UNICORE`) in `menuconfig` before flashing your applications.

**Hardware Reference**

**Block Diagram** A block diagram below shows the components of ESP32-DevKitM-1 and their interconnections.

![Block Diagram](image)

Fig. 52: ESP32-DevKitM-1

**Power Source Select** There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V and GND header pins
- 3V3 and GND header pins

**Warning:**

- The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.
- Power supply by micro USB port is recommended.

**Pin Descriptions** The table below provides the Name and Function of pins on both sides of the board. For peripheral pin configurations, please refer to ESP32 Datasheet.

1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

1.4.1 Setting up Development Environment

- Step 1. Install prerequisites for Windows, Linux, or macOS
- Step 2. Get ESP-IDF
- Step 3. Set up the tools
- Step 4. Set up the environment variables

1.4.2 Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build the Project
- Step 9. Flash onto the Device
- Step 10. Monitor

1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

1.5.1 Standard Setup of Toolchain for Windows

**Note:** Currently only 64-bit versions of Windows are supported. 32-bit Windows can use the Legacy GNU Make Build System.

**Introduction**

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

**Note:** Previous versions of ESP-IDF used the Legacy GNU Make Build System and MSYS2 Unix compatibility environment. This is no longer required, ESP-IDF can be used from the Windows Command Prompt.

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.
Chapter 1. Get Started

ESP-IDF Tools Installer

The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers from this URL: https://dl.espressif.com/dl/esp-idf/?idf=4.4

What is the usecase for Online and Offline Installer

Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory %userprofile%\.espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation

The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is %userprofile%\Desktop\esp-idf where %userprofile% is your home directory.

Launching ESP-IDF Environment

At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (cmd.exe):  

Using the Command Prompt

For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs export.bat script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run cmd.exe, then change to the ESP-IDF directory you wish to use, and run export.bat. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to Step 5. Start a Project.

Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:
  idf.py build
  C:\Users\test\esp\esp-idf>
Chapter 1. Get Started

Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using a script**  From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF tools to PATH using an export script**  ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
%userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

### 1.5.2 Standard Setup of Toolchain for Linux

**Install Prerequisites**

To compile with ESP-IDF you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- **Ubuntu and Debian:**

  ```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb
```

- **CentOS 7 & 8:**

  ```
sudo yum -y update & sudo yum install git wget flex bison gperf python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusb
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- **Arch:**

  ```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja...
```

Espressif Systems 99 Release v4.4  Submit Document Feedback
Chapter 1. Get Started

Note:

- CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

Additional Tips

Permission issues /dev/ttyUSB0  With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

Python compatibility

ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

1.5.3 Standard Setup of Toolchain for Mac OS

Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

- install pip:
  
sudo easy_install pip

- install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    
brew install cmake ninja dfu-util
  - If you have MacPorts, you can run:
    
sudo port install cmake ninja dfu-util
  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note: If an error like this is shown during any step:

```
```

Then you will need to install the XCode command line tools to continue. You can install these by running xcode-select --install.
Chapter 1. Get Started

**Installing Python 3**  Basing on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```
python3 --version
```

If above command returns an error, it means Python 3 is not installed.

Below is an overview of steps to install Python 3.

- Installing with HomeBrew can be done as follows:

```
brew install python3
```

- If you have MacPorts, you can run:

```
sudo port install python38
```

**Next Steps**

To carry on with development environment setup, proceed to **Step 2. Get ESP-IDF**.

<table>
<thead>
<tr>
<th>Windows</th>
<th>Linux</th>
<th>Mac OS</th>
</tr>
</thead>
</table>

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

### 1.6 Step 2. Get ESP-IDF

To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

#### 1.6.1 Linux and macOS

Open Terminal, and run the following commands:
Chapter 1. Get Started

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.4 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into ~/esp/esp-idf.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

### 1.6.2 Windows

In addition to installing the tools, *ESP-IDF Tools Installer* for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these *instructions*.

### 1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

#### 1.7.1 Windows

*ESP-IDF Tools Installer* for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```
cd %userprofile%\esp\esp-idf
install.bat esp32
```

or with Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32
```

#### 1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh esp32
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32
```

**Note:** To install tools for multiple targets you can specify those targets at once. For example: `./install.sh esp32,esp32c3,esp32s3`. To install tools for all supported targets, run the script without specifying targets `./install.sh` or use `./install.sh all`. 

Submit Document Feedback
1.7.3 Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

**Windows**

To prefer the Espressif download server when running the ESP-IDF Tools Installer, mark the Use Espressif download mirror instead of GitHub in the screen Select Components section Optimization.

**Linux and macOS**

To prefer the Espressif download server when installing tools, use the following sequence of commands when running install.sh:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

1.7.4 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: $HOME/.espressif on Linux and macOS, %USERPROFILE%\.espressif on Windows. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

1.8.1 Windows

**ESP-IDF Tools Installer** for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell:

```
.\%HOME%/esp/esp-idf/export.ps1
```
1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```
$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

   ```
   alias get_idf=' . $HOME/esp/esp-idf/export.sh'
   ```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from `examples` directory in IDF.

Copy the project `get-started/hello_world` to `~/esp` directory:

1.9.1 Linux and macOS

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world ./
```

1.9.2 Windows

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

1.10 Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:
Chapter 1. Get Started

- **Windows**: names like COM1
- **Linux**: starting with `/dev/tty`
- **macOS**: starting with `/dev/cu`

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32* for full details.

**Note**: Keep the port name handy as you will need it in the next steps.

### 1.11 Step 7. Configure

Navigate to your `hello_world` directory from *Step 5. Start a Project*, set ESP32 chip as the target and run the project configuration utility `menuconfig`.

#### 1.11.1 Linux and macOS

```bash
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

#### 1.11.2 Windows

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32` should be done once, after opening a new project. If the project contains some existing builds and configuration, they will be cleared and initialized. The target may be saved in environment variable to skip this step at all. See *Selecting the Target* for additional information.

If the previous steps have been done correctly, the following menu appears:

![Fig. 57: Project configuration - Home window](image)

Espressif Systems Release v4.4
You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for "hello_world". This example will run with default configuration.

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, or ESP32-DevKitM-1 board with the ESP32-MIN1-1(1U) module, enable single core mode (`CONFIG_FREERTOS_UNICORE`) in menuconfig before flashing examples.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

### 1.12 Step 8. Build the Project

Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
  ../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_FREQ 40m 0x10000 build/hello_world.bin
  -v build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

### 1.13 Step 9. Flash onto the Device

Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32 board’s serial port name from **Step 6. Connect Your Device**.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.
Chapter 1. Get Started

For more information on idf.py arguments, see idf.py.

Note: The option flash automatically builds and flashes the project, so running idf.py build is not necessary.

1.13.1 Encountered Issues While Flashing?

If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an esp-idf development board, hold down the Boot button (GPIO0) and press the EN button (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.

1.13.2 Normal Operation

When flashing, you will see the output log similar to the following:

```
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
                   --after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB--
                   0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin--
                   0x10000 hello_world.bin
esptool.py v3.0-dev

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application. If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out the *Eclipse guide*, *VS Code guide*.

### 1.14 Step 10. Monitor

To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application:

```bash
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_ 
→world/build/hello_world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
... 
Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2MB...
→external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.
Chapter 1. Get Started

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change `CONFIG_ESP32_XTAL_FREQ_SEL` to 26 MHz.
4. After that, `build and flash` the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:
- *IDF Monitor* for handy shortcuts and more details on using IDF monitor.
- *idf.py* for a full reference of `idf.py` commands and options.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32 because required hardware is not included in ESP32 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32 target, or the table does not exist at all, the example will work on ESP32.

#### 1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in Step 2. *Get ESP-IDF.*

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. *Set up the tools.*

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. *Set up the environment variables.*

#### 1.16 Related Documents

#### 1.16.1 Establish Serial Connection with ESP32

This section provides guidance how to establish serial connection between ESP32 and PC.
Chapter 1. Get Started

Connect ESP32 to PC

Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

Check port on Windows

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

![Device Manager](image)

**Fig. 58:** USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Check port on Linux and macOS

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:
Fig. 59: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

Note: macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux

The currently logged user should have read and write access to the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after reseting ESP32.

Windows and Linux

In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32, see Example Output.

Note: Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

macOS

To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in Check port on Linux and macOS, run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART7
```

Espressif Systems 112 Release v4.4
Fig. 60: Setting Serial Communication in PuTTY on Windows
Fig. 61: Setting Serial Communication in PuTTY on Linux
The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`. What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32, see Example Output. To exit the `screen` session type Ctrl-A + \.

**Note:** Do not forget to exit the `screen` session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output** An example log by ESP32 is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00, q_drv:0x00, d_drv:0x00, cs0_drv:0x00, hd_drv:0x00, wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008, len:8
load:0x3fff0010, len:3464
load:0x40078000, len:7828
load:0x40080000, len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esp_tool documentation for more details.

If you got here from *Step 6. Connect Your Device* when installing s/w for ESP32 development, then you can continue with *Step 7. Configure*.

### 1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to [Espressif IDF Eclipse Plugins](https://github.com/espressif/esptool) IDF for further instructions.

**Note:** In [Espressif IDF Eclipse Plugins](https://github.com/espressif/esptool), though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

If you require Eclipse IDE support for legacy ESP_IDF Make build system, you can follow the [legacy GNU Make build system Getting Started guide](https://github.com/espressif/esptool) which has steps for *Building and Flashing with Eclipse IDE*.
1.16.3 Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.

Quick Install Guide

Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from VS Code Marketplace or following Quick Installation Guide.

Supported Features

- **Setup**, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
- **Build**, with one click build and multi target build, you can easily build and deploy your applications.
- **Flash**, with both UART and JTAG flash out of the box.
- **Monitoring** comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- **Debugging** <https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>, with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- **GUI Menu Config**, provides with simplified UI for configuring your chip.
- **App & Heap Tracing**, provides support for collecting traces from your application and simplified UI for analyzing them.
- **System View Tracing Viewer**, aims to read and display the .svdat files into trace UI, we also support multiple core tracing views.
- **IDF Size Analysis Overview** presents an UI for binary size analysis.
- **Rainmaker Cloud**, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- **Code Coverage**, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

Bugs & Feature Requests

If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the forum, or open a github issue for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, raise your feature request on github.

1.16.4 IDF Monitor

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running idf.py monitor.

For the legacy GNU Make system, run make monitor.

Keyboard Shortcuts

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
## Keyboard Shortcut

<table>
<thead>
<tr>
<th>Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+]</td>
<td>Exit the program</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl+I (or I)</td>
<td>Stop/resume printing timestamps</td>
<td>IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.</td>
</tr>
<tr>
<td>• Ctrl+H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+C</td>
<td>Interrupt running application</td>
<td>Pauses IDF monitor and run GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.</td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-} and Ctrl-T, will be sent through the serial port.

### IDF-specific features

#### Automatic Address Decoding
Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4________, IDF Monitor uses addr2line to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was... unhandled. 
Register dump:
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.

Register dump:

PC : 0x400f360d  PS : 0x00060330  A0 : 0x800dbf56  A1 : 0x3ffb7e00

EXCVADDR: 0x00000000  LBEG : 0x4000c46c  LEND : 0x4000c477  LCOUNT : 0x00000000

To decode each address, IDF Monitor runs the following command in the background:

```
xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line option: `idf_monitor.py --disable-address-decoding` to disable address decoding.
Chapter 1. Get Started

Launching GDB with GDBStub  By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Furthermore, the application can be configured to run GDBStub in the background and handle the Ctrl+C event from the monitor.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub on panic, open the project configuration menu (idf.py menuconfig) and set CONFIG_ESP_SYSTEM_PANIC to GDBStub on panic or set CONFIG_ESP_SYSTEM_PANIC to GDBStub on runtime.

In this case, if the panic handler or Ctrl+C command is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
xattrs-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex...
```

Output Filtering  IDF monitor can be invoked as idf.py monitor --print-filter="xyz", where --print-filter is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of <tag>:<log_level> items where <tag> is the tag string and <log_level> is a character from the set {N, E, W, I, D, V, *} referring to a level for logging.

For example, PRINT_FILTER="tag1:W" matches and prints only the outputs written with ESP_LOGW("tag1", ...) or at lower verbosity level, i.e. ESP_LOGE("tag1", ...). Not specifying a <log_level> or using * defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

**Examples Of Filtering Rules:**

- * can be used to match any tags. However, the string PRINT_FILTER="*:I tag1:E" with regards to tag1 prints errors only, because the rule for tag1 has a higher priority over the rule for *.
- The default (empty) rule is equivalent to *:V because matching every tag at the Verbose level or lower means matching everything.
- "*:N" suppresses not only the outputs from logging functions, but also the prints made by printf, etc. To avoid this, use *:E or a higher verbosity level.
- Rules "tag1:V", "tag1:v", "tag1:*, "tag1:*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1:I tag2:W" only prints tag1 at the Info verbosity level or lower and tag2 at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because tag3:N specifies that tag3 should not be printed.
• tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example

The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID...
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options PRINT_FILTER="wifi esp_image:E light_driver:I" is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

• Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
• Occasionally, when “idf.py” or “make” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
• When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

1.16.5 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see Step 3. Set up the tools) you may build the toolchain yourself.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

• if you want to customize toolchain build configuration
• if you want to use a different GCC version (such as 4.8.5)
• if you want to hack gcc or newlib or libstdc++
• if you are curious and/or have time to spare
• if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.
Chapter 1. Get Started

Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the ESP-IDF Tools Installer for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section Standard Setup of Toolchain for Windows.

Note: The GNU Make based build system requires the MSYS2 Unix compatibility environment on Windows. The CMake-based build system does not require this environment.

Get ESP-IDF

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `%userprofile%\esp\esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Note: The `git clone` option `-b v4.4` tells git to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

Note: As a fallback, it is also possible to download a zip file of this stable release from the Releases page. Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

Note: Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

Tools

CMake Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `%userprofile%\esp\esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Note: The `git clone` option `-b v4.4` tells git to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

Note: As a fallback, it is also possible to download a zip file of this stable release from the Releases page. Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

Note: Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

Tools

CMake Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `%userprofile%\esp\esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Note: The `git clone` option `-b v4.4` tells git to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

Note: As a fallback, it is also possible to download a zip file of this stable release from the Releases page. Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

Note: Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```

Tools

CMake Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b v4.4 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `%userprofile%\esp\esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Note: The `git clone` option `-b v4.4` tells git to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.

Note: As a fallback, it is also possible to download a zip file of this stable release from the Releases page. Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

Note: Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```
cd esp-idf
git submodule update --init
```
Ninja build

Note: Ninja currently only provides binaries for 64-bit Windows. It is possible to use CMake and `idf.py` with other build tools, such as mingw-make, on 32-bit windows. However this is currently undocumented.

Download the Ninja latest stable Windows release from the (download page).

The Ninja for Windows download is a .zip file containing a single `ninja.exe` file which needs to be unzipped to a directory which is then added to your Path (or you can choose a directory which is already on your Path).

Python

Download the latest Python for Windows installer, and run it.

The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path” . Change this option to select “Will be installed”.

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:

```
pip install --user pyserial
```

Toolchain Setup

Download the precompiled Windows toolchain:

Unzip the zip file to `C:\Program Files` (or some other location). The zip file contains a single directory `xtensa-esp32-elf`.

Next, the `bin` subdirectory of this directory must be added to your Path. For example, the directory to add may be `C:\Program Files\xtensa-esp32-elf\bin`.

Note: If you already have the MSYS2 environment (for use with the “GNU Make” build system) installed, you can skip the separate download and add the directory `C:\msys32\opt\xtensa-esp32-elf\bin` to the Path instead, as the toolchain is included in the MSYS2 environment.

Adding Directory to Path

To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append `;<new value>`.

Next Steps

To carry on with development environment setup, proceed to Step 3. Set up the tools.

Setup Linux Toolchain from Scratch

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section Standard Setup of Toolchain for Linux.

Note: The reason you might need to build your own toolchain is to solve the Y2K38 problem (time_t expand to 64 bits instead of 32 bits).
Chapter 1. Get Started

Install Prerequisites  To compile with ESP-IDF you need to get the following packages:

- **CentOS 7:**
  
  ```
  sudo yum -y update && sudo yum install git ncpurses-devel flex bison gperf
  --python3 python3-pip cmake ninja-build ccache dfu-util libusbx
  ```

  CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- **Ubuntu and Debian:**
  
  ```
  sudo apt-get install git libncurses-dev flex bison gperf python3 python3-
  --pip python3-setuptools python3-serial python3-cryptography python3-future_
  --python3-pyparsing python3-pyelftools cmake ninja-build ccache libssl-dev_
  ```

- **Arch:**
  
  ```
  sudo pacman -Sy --needed gcc git make ncpurses flex bison gperf python-pyserial_
  --python-cryptography python-future python-pyparsing python-pyelftools cmake_
  ```

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.

Compile the Toolchain from Source

- **Install dependencies:**
  
  - **CentOS 7:**
    
    ```
    sudo yum install gawk gperf grep gettext ncpurses-devel python3 python3-
    --dev automake bison flex texinfo help2man libtool make
    ```

  - **Ubuntu pre-16.04:**
    
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
    --dev automake bison flex texinfo help2man libtool make
    ```

  - **Ubuntu 16.04 or newer:**
    
    ```
    sudo apt-get install gawk gperf grep gettext python python-
    --dev automake bison flex texinfo help2man librdb tool libtool-bin make
    ```

  - **Debian 9:**
    
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
    --dev automake bison flex texinfo help2man librdb tool libtool-bin make
    ```

  - **Arch:**
    
    ```
    sudo pacman -Sy --needed python-pip
    ```

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
```

(continues on next page)
Chapter 1. Get Started

```bash
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

**Note:** To create a toolchain with support for 64-bit time_t, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file in 33 and 43 lines.

Build the toolchain:

```bash
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/xtensa-esp32-elf`.

**Add Toolchain to PATH**  The custom toolchain needs to be copied to a binary directory and added to the PATH. Choose a directory, for example `~/esp/xtensa-esp32-elf/`, and copy the build output to this directory.

To use it, you will need to update your PATH environment variable in `~/.profile` file. To make `xtensa-esp32-elf` available for all terminal sessions, add the following line to your `~/.profile` file:

```bash
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

**Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead. In CentOS, alias should set in `.bashrc`.

Log off and log in back to make the `.profile` changes effective. Run the following command to verify if PATH is correctly set:

```bash
printenv PATH
```

You are looking for similar result containing toolchain’s path at the beginning of displayed string:

```bash
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/
~local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/usr/
~games:/usr/local/games:/snap/bin
```

Instead of `/home/user-name` there should be a home path specific to your installation.

**Next Steps**  To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

**Setup Toolchain for Mac OS from Scratch**

**Package Manager**  To set up the toolchain from scratch, rather than downloading a pre-compiled toolchain, you will need to install either the MacPorts or Homebrew package manager.

MacPorts needs a full XCode installation, while Homebrew only needs XCode command line tools.

See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.
Chapter 1. Get Started

Install Prerequisites

- install pip:
  
  ```
  sudo easy_install pip
  ```

- install pyserial:
  
  ```
  pip install --user pyserial
  ```

- install CMake & Ninja build:
  
  - If you have Homebrew, you can run:
    
    ```
    brew install cmake ninja dfu-util
    ```
  
  - If you have MacPorts, you can run:
    
    ```
    sudo port install cmake ninja dfu-util
    ```

Compile the Toolchain from Source

Install dependencies:

- with MacPorts:
  
  ```
  sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf
  ```

- with Homebrew:
  
  ```
  brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool
  ```

Create a case-sensitive filesystem image:

```
hdutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive..., HFS+
```

Mount it:

```
hdutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```
Chapter 1. Get Started

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. To use it, you need to add ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin to PATH environment variable.

Next Steps  To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

1.16.6  Get Started (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This document is intended to help you set up the software development environment for the hardware based on Espressif ESP32.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32 board.

**Note:** This is documentation for stable version v4.4 of ESP-IDF. Other ESP-IDF Versions are also available.

Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

What You Need

Hardware:

- An ESP32 board
- USB cable - USB A / micro USB B
- Computer running Windows, Linux, or macOS

Software:

- Toolchain to build the Application for ESP32
- ESP-IDF that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain
- Text editor to write programs (Projects) in C, e.g., Eclipse

Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.
Chapter 1. Get Started

Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment

- Step 1. Set up the Toolchain for Windows, Linux or macOS
- Step 2. Get ESP-IDF
- Step 3. Set Environment Variables
- Step 4. Install the Required Python Packages

Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build and Flash
- Step 9. Monitor

Step 1. Set up the Toolchain

The toolchain is a set of programs for compiling code and building applications.

The quickest way to start development with ESP32 is by installing a prebuilt toolchain. Pick up your OS below and follow the provided instructions.

Standard Setup of Toolchain for Windows (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Introduction

Windows doesn’t have a built-in “make” environment, so as well as installing the toolchain you will need a GNU-compatible environment. We use the MSYS2 environment to provide this. You don’t need to use this environment all the time (you can use Eclipse or some other front-end), but it runs behind the scenes.

Toolchain Setup

The quick setup is to download the Windows all-in-one toolchain & MSYS2 zip file from dl.espressif.com:

Unzip the zip file to C:\ (or some other location, but this guide assumes C:\) and it will create an msys32 directory with a pre-prepared environment.

Important: If another toolchain location is used (different than the default C:\msys32), please ensure that the path where the all-in-one toolchain gets unzipped is a plain ASCII, contains no spaces, symlinks or accents.

Check it Out

Open a MSYS2 MINGW32 terminal window by running C:\msys32\mingw32.exe. The environment in this window is a bash shell. Create a directory named esp that is a default location to develop ESP32 applications. To do so, run the following shell command:

```
mkdir -p ~/esp
```
By typing `cd ~/esp` you can then move to the newly created directory. If there are no error messages you are done with this step.

Use this window in the following steps setting up development environment for ESP32.

**Next Steps**  To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

**Updating The Environment**  When IDF is updated, sometimes new toolchains are required or new requirements are added to the Windows MSYS2 environment. To move any data from an old version of the precompiled environment to a new one:

- Take the old MSYS2 environment (ie C:\msys32) and move/rename it to a different directory (ie C:\msys32_old).
- Download the new precompiled environment using the steps above.
- Unzip the new MSYS2 environment to C:\msys32 (or another location).
- Find the old C:\msys32_old\home directory and move this into C:\msys32.
- You can now delete the C:\msys32_old directory if you no longer need it.

You can have independent different MSYS2 environments on your system, as long as they are in different directories. There are also steps to update the existing environment without downloading a new one, although this is more complex.

**Related Documents**

**Setup Windows Toolchain from Scratch (Legacy GNU Make)**

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Setting up the environment gives you some more control over the process, and also provides the information for advanced users to customize the install. The pre-built environment, addressed to less experienced users, has been prepared by following these steps.

To quickly setup the toolchain in standard way, using a prebuilt environment, proceed to section *Standard Setup of Toolchain for Windows (Legacy GNU Make)*.

**Configure Toolchain & Environment from Scratch**  This process involves installing MSYS2, then installing the MSYS2 and Python packages which ESP-IDF uses, and finally downloading and installing the Xtensa toolchain.

- Navigate to the MSYS2 installer page and download the *msys2-1686-xxxxxxx.exe* installer executable (we only support a 32-bit MSYS environment, it works on both 32-bit and 64-bit Windows.) At time of writing, the latest installer is *msys2-1686-20161025.exe*.
- Run through the installer steps. Uncheck the “Run MSYS2 32-bit now” checkbox at the end.
• Once the installer exits, open Start Menu and find “MSYS2 MinGW 32-bit” to run the terminal.

(Why launch this different terminal? MSYS2 has the concept of different kinds of environments. The default “MSYS” environment is Cygwin-like and uses a translation layer for all Windows API calls. We need the “MinGW” environment in order to have a native Python which supports COM ports.)

• The ESP-IDF repository on github contains a script in the tools directory titled windows_install_prerequisites.sh. If you haven’t got a local copy of the ESP-IDF yet, that’s OK - you can just download that one file in Raw format from here: tools/windows/windows_install_prerequisites.sh. Save it somewhere on your computer.

• Type the path to the shell script into the MSYS2 terminal window. You can type it as a normal Windows path, but use forward-slashes instead of back-slashes. ie: C:/Users/myuser/Downloads/windows_install_prerequisites.sh. You can read the script beforehand to check what it does.

• The windows_install_prerequisites.sh script will download and install packages for ESP-IDF support, and the ESP32 toolchain.

Troubleshooting
• While the install script runs, MSYS may update itself into a state where it can no longer operate. You may see errors like the following:

```
*** fatal error - cygheap base mismatch detected - 0x612E5408/0x612E4408. This-
--problem is probably due to using incompatible versions of the cygwin DLL.
```

If you see errors like this, close the terminal window entirely (terminating the processes running there) and then re-open a new terminal. Re-run windows_install_prerequisites.sh (tip: use the up arrow key to see the last run command). The update process will resume after this step.

• MSYS2 is a “rolling” distribution so running the installer script may install newer packages than what is used in the prebuilt environments. If you see any errors that appear to be related to installing MSYS2 packages, please check the MSYS2-packages issues list for known issues. If you don’t see any relevant issues, please raise an IDF issue.

MSYS2 Mirrors in China
There are some (unofficial) MSYS2 mirrors inside China, which substantially improves download speeds inside China.

To add these mirrors, edit the following two MSYS2 mirrorlist files before running the setup script. The mirrorlist files can be found in the /etc/pacman.d directory (i.e. c:\msys2\etc\pacman.d).

Add these lines at the top of mirrorlist.mingw32:

```
Server = https://mirrors.ustc.edu.cn/msys2/mingw/i686/
Server = http://mirror.bit.edu.cn/msys2/REPOS/MINGW/i686
```

Add these lines at the top of mirrorlist.msys:

```
Server = http://mirrors.ustc.edu.cn/msys2/msys/$arch
Server = http://mirror.bit.edu.cn/msys2/REPOS/MSYS2/$arch
```

HTTP Proxy
You can enable an HTTP proxy for MSYS and PIP downloads by setting the http_proxy variable in the terminal before running the setup script:

```
export http_proxy='http://http.proxy.server:PORT'
```

Or with credentials:

```
export http_proxy='http://user:password@http.proxy.server:PORT'
```

Add this line to /etc/profile in the MSYS directory in order to permanently enable the proxy when using MSYS.
**Alternative Setup: Just download a toolchain**  If you already have an MSYS2 install or want to do things differently, you can download just the toolchain here:

**Note:** If you followed instructions Configure Toolchain & Environment from Scratch, you already have the toolchain and you won’t need this download.

**Important:** Just having this toolchain is *not enough* to use ESP-IDF on Windows. You will need GNU make, bash, and sed at minimum. The above environments provide all this, plus a host compiler (required for menuconfig support).

**Next Steps**  To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

**Updating The Environment**  When IDF is updated, sometimes new toolchains are required or new system requirements are added to the Windows MSYS2 environment.

Rather than setting up a new environment, you can update an existing Windows environment & toolchain:

- Update IDF to the new version you want to use.
- Run the `tools/windows/windows_install_prerequisites.sh` script inside IDF. This will install any new software packages that weren’t previously installed, and download and replace the toolchain with the latest version.

The script to update MSYS2 may also fail with the same errors mentioned under *Troubleshooting*.

If you need to support multiple IDF versions concurrently, you can have different independent MSYS2 environments in different directories. Alternatively you can download multiple toolchains and unzip these to different directories, then use the PATH environment variable to set which one is the default.

**Standard Setup of Toolchain for Linux (Legacy GNU Make)**

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

**Install Prerequisites**  To compile with ESP-IDF you need to get the following packages:

- **CentOS 7:**
  ```bash
  sudo yum install gcc git wget make flex bison gperf python python2-cryptography
  ```

- **Ubuntu and Debian:**
  ```bash
  sudo apt-get install gcc git wget make flex bison gperf python python-pip--python-setuptools python-serial python-cryptography python-future python-pyparsing python-pyelftools libffi-dev libssl-dev
  ```

- **Arch:**
  ```bash
  sudo pacman -S --needed gcc git make flex bison gperf python-pyserial python-cryptography python-future python-pyparsing python-pyelftools
  ```

**Note:** Some older Linux distributions may be missing some of the Python packages listed above (or may use pyserial version 2.x which is not supported by ESP-IDF). It is possible to install these packages via pip instead - as described in section *Step 4. Install the Required Python Packages.*
Toolchain Setup  
ESP32 toolchain for Linux is available for download from Espressif website:

- for 64-bit Linux:  
  https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-linux-amd64.tar.gz

- for 32-bit Linux:  

1. Download this file, then extract it in `~/esp` directory:

   • for 64-bit Linux:
     ```
     mkdir -p ~/esp
     cd ~/esp
     tar xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-linux-amd64.tar.gz
     ```

   • for 32-bit Linux:
     ```
     mkdir -p ~/esp
     cd ~/esp
     tar xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-linux-i686.tar.gz
     ```

2. The toolchain will be extracted into `~/esp/xtensa-esp32-elf/` directory. To use it, you will need to update your `PATH` environment variable in `~/.profile` file. To make `xtensa-esp32-elf` available for all terminal sessions, add the following line to your `~/.profile` file:

   ```
   export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
   ```

   Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your `~/.profile` file:

   ```
   alias get_esp32='export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"'
   ```

   Then when you need the toolchain you can type `get_esp32` on the command line and the toolchain will be added to your `PATH`.  

   **Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead. In CentOS, alias should set in `.bashrc`.  

3. Log off and log in back to make the `.profile` changes effective. Run the following command to verify if `PATH` is correctly set:

   ```
   printenv PATH
   ```

   You are looking for similar result containing toolchain’ s path at the beginning of displayed string:

   ```
   $ printenv PATH
   /home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.
   ...
   ```

   Instead of `/home/user-name` there should be a home path specific to your installation.

**Permission issues /dev/ttyUSB0**  
With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

**Next Steps**  
To carry on with development environment setup, proceed to section **Step 2. Get ESP-IDF**.

**Related Documents**
Chapter 1. Get Started

Setup Linux Toolchain from Scratch (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Note: Standard process for installing the toolchain is described here. See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- Ubuntu and Debian:
  
  ```
  sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python-
  --python-pip python-setuptools python-serial python-cryptography python-future-
  --python-pyparsing python-pyelftools libffi-dev libssl-dev
  ```

- Arch:
  
  ```
  sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial-
  --python-cryptography python-future python-pyparsing python-pyelftools
  ```

Note: Some older (pre-2014) Linux distributions may use pyserial version 2.x which is not supported by ESP-IDF. In this case please install a supported version via pip as it is described in section Step 4. Install the Required Python Packages.

Compile the Toolchain from Source

- Install dependencies:
  - CentOS 7:
    
    ```
    sudo yum install gawk gperf grep gettext ncurses-devel python python-devel-
    --automake bison flex texinfo help2man libtool
    ```
  
  - Ubuntu pre-16.04:
    
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
    --dev automake bison flex texinfo help2man libtool
    ```
  
  - Ubuntu 16.04 or newer:
    
    ```
    sudo apt-get install gawk gperf grep gettext python python-dev automake-
    --bison flex texinfo help2man libtool libtool-bin
    ```
  
  - Debian 9:
    
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
    --dev automake bison flex texinfo help2man libtool libtool-bin
    ```
  
  - Arch:
    
    TODO

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:
Chapter 1. Get Started

```bash
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in ~/esp/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

Next Steps  To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Standard Setup of Toolchain for Mac OS (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Install Prerequisites

- install pip:
  ```
sudo easy_install pip
  ```

Note: pip will be used later for installing the required Python packages.

Toolchain Setup  ESP32 toolchain for macOS is available for download from Espressif website:

Download this file, then extract it in ~/esp directory:

```
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2021r2-macos.tar.gz
```

The toolchain will be extracted into ~/esp/xtensa-esp32-elf/ directory.

To use it, you will need to update your PATH environment variable in ~/.profile file. To make xtensa-esp32-elf available for all terminal sessions, add the following line to your ~/.profile file:

```
export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your ~/.profile file:

```
alias get_esp32="export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Then when you need the toolchain you can type get_esp32 on the command line and the toolchain will be added to your PATH.

Next Steps  To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.
Chapter 1. Get Started

Setup Toolchain for Mac OS from Scratch (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

**Note:** Standard process for installing the toolchain is described [here](#). See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

- **install pip:**
  
  ```
  sudo easy_install pip
  ```

  **Note:** pip will be used later for installing the required Python packages.

Compile the Toolchain from Source

- **Install dependencies:**
  - Install either MacPorts or homebrew package manager. MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.
  - with MacPorts:
    ```
    sudo port install gsed gawk binutils gperf grep gettext wget libtool
    ```
  - with homebrew:
    ```
    brew install gnu-sed gawk binutils gperftools gettext wget help2man
    ```

Create a case-sensitive filesystem image:

```
hdutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_\n-HFS+"
```

Mount it:

```
hdutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
```
Chapter 1. Get Started

(continued from previous page)

```
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

**Next Steps** To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

### Windows | Linux | macOS

**Note:** This guide uses the directory ~/esp on Linux and macOS or %userprofile%\esp on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

Depending on your experience and preferences, you may want to customize your environment instead of using a prebuilt toolchain. To set up the system your own way go to Section **Customized Setup of Toolchain (Legacy GNU Make)**.

**Step 2. Get ESP-IDF**

Besides the toolchain, you also need ESP32-specific API (software libraries and source code). They are provided by Espressif in ESP-IDF repository.

To get a local copy of ESP-IDF, navigate to your installation directory and clone the repository with `git clone`.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v4.4 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into ~/esp/esp-idf.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

**Note:** The `git clone` option `-b v4.4` tells git to clone the tag in the ESP-IDF repository `git clone` corresponding to this version of the documentation.
Chapter 1. Get Started

**Note:** As a fallback, it is also possible to download a zip file of this stable release from the Releases page. Do not download the “Source code” zip file(s) generated automatically by GitHub, they do not work with ESP-IDF.

**Note:** Do not miss the --recursive option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```bash
cd esp-idf
git submodule update --init
```

### Step 3. Set Environment Variables

The toolchain uses the environment variable IDF_PATH to access the ESP-IDF directory. This variable should be set up on your computer, otherwise projects will not build.

These variables can be set temporarily (per session) or permanently. Please follow the instructions specific to Windows, Linux and macOS in Section Add IDF_PATH to User Profile (Legacy GNU Make).

### Step 4. Install the Required Python Packages

The python packages required by ESP-IDF are located in IDF_PATH/requirements.txt. You can install them by running:

```bash
python -m pip install --user -r $IDF_PATH/requirements.txt
```

**Note:** Please check the version of the Python interpreter that you will be using with ESP-IDF. For this, run the command python --version and depending on the result, you might want to use python3, python3.7 or similar instead of just python, e.g.:

```bash
python3 -m pip install --user -r $IDF_PATH/requirements.txt
```

### Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in IDF.

Copy get-started/hello_world to the ~/esp directory:

**Linux and macOS**

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Windows**

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.
**Important:** The esp-idf build system does not support spaces in the paths to either esp-idf or to projects.

**Step 6. Connect Your Device**

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32 (Legacy GNU Make)* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

**Step 7. Configure**

Navigate to your `hello_world` directory from **Step 5. Start a Project** and run the project configuration utility `menuconfig`.

**Linux and macOS**

```bash
cd ~/esp/hello_world
make menuconfig
```

**Windows**

```bash
cd %userprofile%\esp\hello_world
make menuconfig
```

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

Fig. 63: Project configuration - Home window
Chapter 1. Get Started

In the menu, navigate to Serial flasher config > Default serial port to configure the serial port, where project will be loaded to. Confirm selection by pressing enter, save configuration by selecting < Save > and then exit menuconfig by selecting < Exit >.

To navigate and use menuconfig, press the following keys:

- Arrow keys for navigation
- Enter to go into a submenu
- Esc to go up one level or exit
- ? to see a help screen. Enter key exits the help screen
- Space, or Y and N keys to enable (Yes) and disable (No) configuration items with checkboxes “[*]”
- ? while highlighting a configuration item to display help about that item
- / to find configuration items

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing examples.

**Step 8. Build and Flash**

Build and flash the project by running:

```
make flash
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries. After that, these binaries will be flashed onto your ESP32 board.

**Encountered Issues While Flashing?** If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

esptool.py resets ESP32 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32 (Legacy GNU Make)). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP PU (EN) pins of ESP32, thus changes in the voltage levels of DTR and RTS will boot ESP32 into Firmware Download mode. As an example, check the schematic for ESP32-DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an esp-idf development board, hold down the Boot button (GPIO0) and press the EN button (CHIP PU).
- For other types of hardware, try pulling GPIO0 down.

**Normal Operation** If there are no issues by the end of the flash process, you will see the output log similar to the one given below. Then the board will reboot and start up the “hello_world” application.
Chapter 1. Get Started

```
esptool.py v3.0-dev
Flashing binaries to serial port /dev/ttyUSB0 (app at offset 0x10000)...
esptool.py v3.0-dev

```

If you’d like to use the Eclipse IDE instead of running `make`, check out the Eclipse guide.

**Step 9. Monitor**

To check if “hello_world” is indeed running, type `make monitor`.

This command launches the **IDF Monitor** application:

```
$ make monitor
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+| | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...
Hello world!
This is esp32 chip with 2 CPU cores, WiFi/BT/BLE, silicon revision 1, 4MB external...
---flash
Restarting in 10 seconds...
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+|`.
Chapter 1. Get Started

If IDF monitor fails shortly after the upload, or if instead of the messages above you see a random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change `CONFIG_ESP32_XTAL_FREQ_SEL` to 26MHz.
4. After that, build and flash the application again.

Note: You can combine building, flashing and monitoring into one step by running:

```
make flash monitor
```

See also IDF Monitor for handy shortcuts and more details on using IDF monitor.

That’s all that you need to get started with ESP32!

Now you are ready to try some other examples, or go straight to developing your own applications.

Environment Variables

Some environment variables can be specified whilst calling `make` allowing users to override arguments without the need to reconfigure them using `make menuconfig`.

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description &amp; Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP-PORT</td>
<td>Overrides the serial port used in flash and monitor. Examples: <code>make flash ESPPORT=/dev/ttyUSB1, make monitor ESPPORT=COM1</code></td>
</tr>
<tr>
<td>ESP-BAUD</td>
<td>Overrides the serial baud rate when flashing the ESP32. Example: <code>make flash ESPBAUD=9600</code></td>
</tr>
<tr>
<td>MONITOR-BAUD</td>
<td>Overrides the serial baud rate used when monitoring. Example: <code>make monitor MONITORBAUD=9600</code></td>
</tr>
</tbody>
</table>

Note: You can export environment variables (e.g. `export ESPPORT=/dev/ttyUSB1`). All subsequent calls of `make` within the same terminal session will use the exported value given that the variable is not simultaneously overridden.

Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

If downloading to a new path, remember to `Add IDF_PATH to User Profile (Legacy GNU Make)` so that the toolchain scripts can find ESP-IDF in its release specific location.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.
Chapter 1. Get Started

Related Documents

Add IDF_PATH to User Profile (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

To preserve setting of IDF_PATH environment variable between system restarts, add it to the user profile, following instructions below.

Windows

The user profile scripts are contained in C:/msys32/etc/profile.d/ directory. They are executed every time you open an MSYS2 window.

1. Create a new script file in C:/msys32/etc/profile.d/ directory. Name it export_idf_path.sh.
2. Identify the path to ESP-IDF directory. It is specific to your system configuration and may look something like C:\msys32\home\user-name\esp\esp-idf
3. Add the export command to the script file, e.g.:

   ```bash
   export IDF_PATH=C:/msys32/home/user-name/esp/esp-idf
   ```

   Remember to replace backslashes with forward slashes in the original Windows path.
4. Save the script file.
5. Close MSYS2 window and open it again. Check if IDF_PATH is set, by typing:

   ```bash
   printenv IDF_PATH
   ```

   The path previously entered in the script file should be printed out.

   If you do not like to have IDF_PATH set up permanently in user profile, you should enter it manually on opening of an MSYS2 window:

   ```bash
   export IDF_PATH=C:/msys32/home/user-name/esp/esp-idf
   ```

   If you got here from section Step 3. Set Environment Variables, while installing s/w for ESP32 development, then go back to section Step 5. Start a Project.

Linux and MacOS

Set up IDF_PATH by adding the following line to ~/.profile file:

```bash
export IDF_PATH=/~/.profile
```

Log off and log back in to make this change effective.

Note: If you have /bin/bash set as login shell, and both .bash_profile and .profile exist, then update .bash_profile instead.

Run the following command to check if IDF_PATH is set:

```bash
printenv IDF_PATH
```

The path previously entered in ~/.profile file (or set manually) should be printed out.

If you do not like to have IDF_PATH set up permanently, you should enter it manually in terminal window on each restart or logout:

```bash
export IDF_PATH=/~/.profile
```

If you got here from section Step 3. Set Environment Variables, while installing s/w for ESP32 development, then go back to section Step 5. Start a Project.
Establish Serial Connection with ESP32 (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This section provides guidance how to establish serial connection between ESP32 and PC.

Connect ESP32 to PC  Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below are the links to drivers for ESP32 and other boards produced by Espressif:

<table>
<thead>
<tr>
<th>Development Board</th>
<th>USB Driver</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-DevKitC</td>
<td>CP210x</td>
<td></td>
</tr>
<tr>
<td>ESP32-LyraT</td>

<td></td>
</tr>
</tbody>
</table>

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with and operating system and automatically installed upon connecting one of the listed boards to the PC.

Check port on Windows  Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

Check port on Linux and MacOS  To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*  
```

MacOS

```
ls /dev/cu.*  
```

Adding user to dialout on Linux  The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```
sudo usermod -a -G dialout $USER  
```

on Arch Linux this is done by adding the user to uucp group with the following command:

```
sudo usermod -a -G uucp $USER  
```

Make sure you re-login to enable read and write permissions for the serial port.
Fig. 64: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 65: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Verify serial connection  Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![PuTTY Configuration](image)

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```
ets Jun  8 2016 00:22:57

I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```
Fig. 67: Setting Serial Communication in PuTTY on Linux
If you see some legible log, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO00 pins. See the esptool documentation for more details.

**Note:** Close serial terminal after verification that communication is working. In next step we are going to use another application to upload ESP32. This application will not be able to access serial port while it is open in terminal.

If you got here from section *Step 6. Connect Your Device* when installing s/w for ESP32 development, then go back to section *Step 7. Configure*.

**Build and Flash with Make (Legacy GNU Make)**

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

**Finding a project** As well as the esp-idf-template project, ESP-IDF comes with some example projects on github in the examples directory.

Once you’ve found the project you want to work with, change to its directory and you can configure and build it.

**Configuring your project**

```
make menuconfig
```

**Compiling your project**

```
make all
```

…will compile app, bootloader and generate a partition table based on the config.

**Flashing your project** When `make all` finishes, it will print a command line to use esptool.py to flash the chip. However you can also do this from make by running:

```
make flash
```

This will flash the entire project (app, bootloader and partition table) to a new chip. Also if partition table has ota_data then this command will flash a initial ota_data. It allows to run the newly loaded app from a factory partition (or the first OTA partition, if factory partition is not present). The settings for serial port flashing can be configured with `make menuconfig`.

You don’t need to run `make all` before running `make flash`, `make flash` will automatically rebuild anything which needs it.

**Compiling & Flashing Just the App** After the initial flash, you may just want to build and flash just your app, not the bootloader and partition table:

- `make app - build just the app.`
- `make app-flash - flash just the app.`

`make app-flash` will automatically rebuild the app if it needs it.

There’s no downside to refrashing the bootloader and partition table each time, if they haven’t changed.
Chapter 1. Get Started

**The Partition Table** Once you’ve compiled your project, the “build” directory will contain a binary file with a name like “my_app.bin”. This is an ESP32 image binary that can be loaded by the bootloader.

A single ESP32’s flash can contain multiple apps, as well as many kinds of data (calibration data, filesystems, parameter storage, etc). For this reason, a partition table is flashed to offset 0x8000 in the flash.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to *make menuconfig* and choose one of the simple predefined partition tables:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you *make partition_table* then it will print a summary of the partition table.

For more details about partition tables and how to create custom variations, view the documentation.

**Build and Flash with Eclipse IDE (Legacy GNU Make)**

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

**Installing Eclipse IDE** The Eclipse IDE gives you a graphical integrated development environment for writing, compiling and debugging ESP-IDF projects.

- Start by installing the esp-idf for your platform (see files in this directory with steps for Windows, OS X, Linux).
- We suggest building a project from the command line first, to get a feel for how that process works. You also need to use the command line to configure your esp-idf project (via *make menuconfig*), this is not currently supported inside Eclipse.
- Download the Eclipse Installer for your platform from [eclipse.org](http://eclipse.org).
- When running the Eclipse Installer, choose “Eclipse for C/C++ Development” (in other places you’ll see this referred to as CDT.)

**Setting up Eclipse** Once your new Eclipse installation launches, follow these steps:

**Import New Project**

- Eclipse makes use of the Makefile support in ESP-IDF. This means you need to start by creating an ESP-IDF project. You can use the idf-template project from github, or open one of the examples in the esp-idf examples subdirectory.
- Once Eclipse is running, choose File -> Import...
- In the dialog that pops up, choose “C/C++” -> “Existing Code as Makefile Project” and click Next.
- On the next page, enter “Existing Code Location” to be the directory of your IDF project. Don’t specify the path to the ESP-IDF directory itself (that comes later). The directory you specify should contain a file named “Makefile” (the project Makefile).
- On the same page, under “Toolchain for Indexer Settings” choose “Cross GCC”. Then click Finish.

**Project Properties**

- The new project will appear under Project Explorer. Right-click the project and choose Properties from the context menu.
- Click on the “Environment” properties page under “C/C++ Build”. Click “Add…” and enter name `BATCH_BUILD` and value 1.
- Click “Add…” again, and enter name `IDF_PATH`. The value should be the full path where ESP-IDF is installed. Windows users can copy the `IDF_PATH` from windows explorer.
• Edit the PATH environment variable. Keep the current value, and append the path to the Xtensa toolchain installed as part of IDF setup, if this is not already listed on the PATH. A typical path to the toolchain looks like `/home/user-name/esp/xtensa-esp32-elf/bin`. Note that you need to add a colon (: before the appended path. Windows users will need to prepend `C:\msys32\mingw32\bin;C:\msys32\opt\xtensa-esp32-elf\bin;C:\msys32\usr\bin` to PATH environment variable (If you installed msys32 to a different directory then you’ll need to change these paths to match).

• On macOS, add a PYTHONPATH environment variable and set it to `/Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages`. This is so that the system Python, which has pyserial installed as part of the setup steps, overrides any built-in Eclipse Python.

ADDITIONAL NOTE: If either the IDF_PATH directory or the project directory is located outside `C:\msys32\home` directory, you will have to give custom build command in C/C++ Build properties as: `python ${IDF_PATH}/tools/windows/eclipse_make.py` (Please note that the build time may get significantly increased by this method.)

Navigate to “C/C++ General” -> “Preprocessor Include Paths” property page:

• Click the “Providers” tab
• In the list of providers, click “CDT Cross GCC Built-in Compiler Settings”. Change “Command to get compiler specs” to `xtensa-esp32-elf-gcc ${FLAGS} -std=c++11 -E -P -v -dD "$\{INPUTS\}"`.
• In the list of providers, click “CDT GCC Build Output Parser” and change the “Compiler command pattern” to `xtensa-esp32-elf-\{gcc\|g++\|c++\|cc\|cpp\|clang\}

Navigate to “C/C++ General” -> “Indexer” property page:

• Check “Enable project specific settings” to enable the rest of the settings on this page.
• Uncheck “Allow heuristic resolution of includes”. When this option is enabled Eclipse sometimes fails to find correct header directories.

Navigate to “C/C++ Build” -> “Behavior” property page:

• Check “Enable parallel build” to enable multiple build jobs in parallel.

Building in Eclipse  Before your project is first built, Eclipse may show a lot of errors and warnings about undefined values. This is because some source files are automatically generated as part of the esp-idf build process. These errors and warnings will go away after you build the project.

• Click OK to close the Properties dialog in Eclipse.
• Outside Eclipse, open a command line prompt. Navigate to your project directory, and run `make menu-config` to configure your project’s esp-idf settings. This step currently has to be run outside Eclipse.

If you try to build without running a configuration step first, esp-idf will prompt for configuration on the command line - but Eclipse is not able to deal with this, so the build will hang or fail.

• Back in Eclipse, choose Project -> Build to build your project.

TIP: If your project had already been built outside Eclipse, you may need to do a Project -> Clean before choosing Project -> Build. This is so Eclipse can see the compiler arguments for all source files. It uses these to determine the header include paths.

Flash from Eclipse  You can integrate the “make flash” target into your Eclipse project to flash using esptool.py from the Eclipse UI:

• Right-click your project in Project Explorer (important to make sure you select the project, not a directory in the project, or Eclipse may find the wrong Makefile.)
• Select Build Targets -> Create -> from the context menu.
• Type “flash” as the target name. Leave the other options as their defaults.
• Now you can use Project -> Build Target -> Build (Shift+F9) to build the custom flash target, which will compile and flash the project.

Note that you will need to use “make menuconfig” to set the serial port and other config options for flashing. “make menuconfig” still requires a command line terminal (see the instructions for your platform.)
Follow the same steps to add bootloader and partition_table targets, if necessary.

**Customized Setup of Toolchain (Legacy GNU Make)** Instead of downloading binary toolchain from Espressif website (see *Step 1. Set up the Toolchain*) you may build the toolchain yourself.

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.
Chapter 2

API Reference

2.1 Bluetooth API

2.1.1 Controller & VHCI

Overview

Instructions

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

• This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/hci/controller_vhci_ble_adv.

API Reference

Header File

• components/bt/include/esp32/include/esp_bt.h

Functions

`esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)`

Set BLE TX power Connection Tx power should only be set after connection created.

Return ESP_OK - success, other - failed

Parameters

• power_type: The type of which tx power, could set Advertising/Connection/Default and etc
• power_level: Power level(index) corresponding to absolute value(dbm)

`esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)`

Get BLE TX power Connection Tx power should only be get after connection created.

Return >= 0 - Power level, < 0 - Invalid

Parameters

• power_type: The type of which tx power, could set Advertising/Connection/Default and etc

`esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)`

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.
Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

Return ESP_OK - success, other - failed

Parameters

• min_power_level: The minimum power level
• max_power_level: The maximum power level

```c
esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)
```

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

Return ESP_OK - success, other - failed

Parameters

• min_power_level: The minimum power level
• max_power_level: The maximum power level

```c
esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)
```

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

Return ESP_OK - success, other - failed

Parameters

• data_path: SCO data path

```c
esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)
```

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Return ESP_OK - success, other - failed

Parameters

• cfg: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

```c
esp_err_t esp_bt_controller_deinit (void)
```

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

Return ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_enable (esp bt_mode_t mode)
```

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

Return ESP_OK - success, other - failed

Parameters

• mode: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp bt_controller_init().

```c
esp_err_t esp_bt_controller_disable (void)
```

Disable BT controller.

Return ESP_OK - success, other - failed

```c
esp_bt_controller_get_status (void)
```

Get BT controller is initialised/de-initialised/enabled/disabled.

Return status value

```c
bool esp_vhci_host_check_send_available (void)
```

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.
**Return** true for ready to send, false means cannot send packet

```c
void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
```

`esp_vhci_host_send_packet` host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**
- data: the packet point
- len: the packet length

```c
esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)
```

`esp_vhci_host_register_callback` register the vhci reference callback struct defined by vhci_host_callback structure.

**Return** ESP_OK - success, ESP_FAIL - failed

**Parameters**
- callback: `esp_vhci_host_callback` type variable

```c
esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)
```

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

`esp_bt_controller_mem_release(mode)` should be called only before `esp_bt_controller_init()` or after `esp_bt_controller_deinit()`.

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls `esp_bt_controller_enable(ESP_BT_MODE_BLE)` to use BLE only then it is safe to call `esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT)` at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API `esp_bt_mem_release(ESP_BT_MODE_BTDM)` instead, which internally calls `esp_bt_controller_mem_release(ESP_BT_MODE_BTDM)` and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of `esp_bt_mem_release()` function.

**Return** ESP_OK - success, other - failed

**Parameters**
- mode: the mode want to release memory

```c
esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)
```

This function first releases controller memory by internally calling `esp_bt_controller_mem_release()`. Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`. 
For example, if a user only uses Bluetooth for setting the WiFi configuration, and does not use Bluetooth in the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit Bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- `mode`: the mode whose memory is to be released

```c
esp_err_t esp_bt_sleep_enable(void)
```

enable Bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for Bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, Bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Return**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

disable Bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, Bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, Bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Return**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush(void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**
- ESP_OK: success
- other: failed

```c
void esp_wifi_bt_power_domain_on(void)
```

bt Wi-Fi power domain power on

```c
void esp_wifi_bt_power_domain_off(void)
```

bt Wi-Fi power domain power off
Structures

```c
struct esp_bt_controller_config_t
```

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

### Public Members

- `uint16_t controller_task_stack_size`
  - Bluetooth controller task stack size
- `uint8_t controller_task_prio`
  - Bluetooth controller task priority
- `uint8_t hci_uart_no`
  - If use UART1/2 as HCI IO interface, indicate UART number
- `uint32_t hci_uart_baudrate`
  - If use UART1/2 as HCI IO interface, indicate UART baudrate
- `uint8_t scan_duplicate_mode`
  - Scan duplicate mode
- `uint8_t scan_duplicate_type`
  - Scan duplicate type
- `uint16_t normal_adv_size`
  - Normal adv size for scan duplicate
- `uint16_t mesh_adv_size`
  - Mesh adv size for scan duplicate
- `uint16_t send_adv_reserved_size`
  - Controller minimum memory value
- `uint32_t controller_debug_flag`
  - Controller debug log flag
- `uint8_t mode`
  - Controller mode: BR/EDR, BLE or Dual Mode
- `uint8_t ble_max_conn`
  - BLE maximum connection numbers
- `uint8_t bt_max_acl_conn`
  - BR/EDR maximum ACL connection numbers
- `uint8_t bt_sco_datapath`
  - SCO data path, i.e. HCI or PCM module
- `bool auto_latency`
  - BLE auto latency, used to enhance classic BT performance
- `bool bt_legacy_auth_vs_evt`
  - BR/EDR Legacy auth complete event required to protect from BIAS attack
- `uint8_t bt_max_sync_conn`
  - BR/EDR maximum ACL connection numbers. Effective in menuconfig
- `uint8_t ble_sca`
  - BLE low power crystal accuracy index
- `uint8_t pcm_role`
  - PCM role (master & slave)
- `uint8_t pcm_polar`
  - PCM polar trig (falling clk edge & rising clk edge)
bool hli
    Using high level interrupt or not

uint32_t magic
    Magic number

struct esp_vhci_host_callback
    "esp_vhci_host_callback" used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available)(void)
    callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
    callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
    "esp_vhci_host_callback" used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
    Bluetooth mode for controller enable/disable.
    Values:
    ESP_BT_MODE_IDLE = 0x00
        Bluetooth is not running
    ESP_BT_MODE_BLE = 0x01
        Run BLE mode
    ESP_BT_MODE_CLASSIC_BT = 0x02
        Run Classic BT mode
    ESP_BT_MODE_BTDM = 0x03
        Run dual mode

enum [anonymous]
    BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only
    ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.
    Values:
    ESP_BLE_SCA_500PPM = 0
        BLE SCA at 500ppm
    ESP_BLE_SCA_250PPM
        BLE SCA at 250ppm
    ESP_BLE_SCA_150PPM
        BLE SCA at 150ppm
    ESP_BLE_SCA_100PPM
        BLE SCA at 100ppm
    ESP_BLE_SCA_75PPM
        BLE SCA at 75ppm
ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

enum esp_bt_controller_status_t
Bluetooth controller enable/disable/initialised/de-initialised status.
Values:
ESP_BT_CONTROLLER_STATUS_IDLE = 0
ESP_BT_CONTROLLER_STATUS_INITED
ESP_BT_CONTROLLER_STATUS_ENABLED
ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. When disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV: for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN: for scan.
ESP_BLE_PWR_TYPE_DEFAULT: if each connection’s TX power is not set, it will use this default value. If neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.
Values:
ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
For connection handle 0
ESP_BLE_PWR_TYPE_CONN_HDL1 = 1
For connection handle 1
ESP_BLE_PWR_TYPE_CONN_HDL2 = 2
For connection handle 2
ESP_BLE_PWR_TYPE_CONN_HDL3 = 3
For connection handle 3
ESP_BLE_PWR_TYPE_CONN_HDL4 = 4
For connection handle 4
ESP_BLE_PWR_TYPE_CONN_HDL5 = 5
For connection handle 5
ESP_BLE_PWR_TYPE_CONN_HDL6 = 6
For connection handle 6
ESP_BLE_PWR_TYPE_CONN_HDL7 = 7
For connection handle 7
ESP_BLE_PWR_TYPE_CONN_HDL8 = 8
For connection handle 8
ESP_BLE_PWR_TYPE_ADV = 9
For advertising
ESP_BLE_PWR_TYPE_SCAN = 10
For scan
ESP_BLE_PWR_TYPE_DEFAULT = 11
For default, if not set other, it will use default value
ESP_BLE_PWR_TYPE_NUM = 12
TYPE numbers
enum esp_power_level_t
    Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

ESP_PWR_LVL_N12 = 0
    Corresponding to -12dbm

ESP_PWR_LVL_N9 = 1
    Corresponding to -9dbm

ESP_PWR_LVL_N6 = 2
    Corresponding to -6dbm

ESP_PWR_LVL_N3 = 3
    Corresponding to -3dbm

ESP_PWR_LVL_N0 = 4
    Corresponding to 0dbm

ESP_PWR_LVL_P3 = 5
    Corresponding to +3dbm

ESP_PWR_LVL_P6 = 6
    Corresponding to +6dbm

ESP_PWR_LVL_P9 = 7
    Corresponding to +9dbm

ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
    Backward compatibility! Setting to -14dbm will actually result to -12dbm

ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
    Backward compatibility! Setting to -11dbm will actually result to -9dbm

ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
    Backward compatibility! Setting to -8dbm will actually result to -6dbm

ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
    Backward compatibility! Setting to -5dbm will actually result to -3dbm

ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
    Backward compatibility! Setting to -2dbm will actually result to 0dbm

ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
    Backward compatibility! Setting to +1dbm will actually result to +3dbm

ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
    Backward compatibility! Setting to +4dbm will actually result to +6dbm

ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
    Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t
    Bluetooth audio data transport path.

Values:

ESP_SCO_DATA_PATH_HCI = 0
    data over HCI transport

ESP_SCO_DATA_PATH_PCM = 1
    data over PCM interface

2.1.2 BT COMMON

BT GENERIC DEFINES
API Reference

Header File

- components/bluetooth/bluedroid/api/include/api/esp_bt_defs.h

Structures

```c
struct esp_bt_uuid_t

UUID type.
```

Public Members

```c
uint16_t len
    UUID length, 16bit, 32bit or 128bit

uint16_t uuid16
    16bit UUID

uint32_t uuid32
    32bit UUID

uint8_t uuid128[ESP_UUID_LEN_128]
    128bit UUID

union esp_bt_uuid_t::[anonymous] uuid
    UUID
```

Macros

```c
ESP_BLUEDROID_STATUS_CHECK(status)
ESP_BT_OCTET16_LEN
ESP_BT_OCTET8_LEN
ESP_DEFAULT_GATT_IF
    Default GATT interface id.
ESP_BLE_CONN_INT_MIN
    relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h
ESP_BLE_CONN_INT_MAX
    relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h
ESP_BLE_CONN_LATENCY_MIN
    relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h
ESP_BLE_CONN_SUP_TOUT_MIN

ESP_BLE_CONN_PARAM_UNDEF
ESP_BLE_SCAN_PARAM_UNDEF
ESP_BLE_IS_VALID_PARAM(x, min, max)
    Check the param is valid or not.
```
Chapter 2. API Reference

ESP_UUID_LEN_16
ESP_UUID_LEN_32
ESP_UUID_LEN_128
ESP_BD_ADDR_LEN
   Bluetooth address length.
ESP_BLE_ENC_KEY_MASK
   Used to exchange the encryption key in the init key & response key.
ESP_BLE_ID_KEY_MASK
   Used to exchange the IRK key in the init key & response key.
ESP_BLE_CSR_KEY_MASK
   Used to exchange the CSRK key in the init key & response key.
ESP_BLE_LINK_KEY_MASK
   Used to exchange the link key (this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.
ESP_APP_ID_MIN
   Minimum of the application id.
ESP_APP_ID_MAX
   Maximum of the application id.
ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

Type Definitions
typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]

    BLE_WL_ADDR_TYPE_RANDOM = 0x01
```

**BT MAIN API**

**Overview**

**Application Example**

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h
Chapter 2. API Reference

Functions

`esp_bluedroid_status_t esp_bluedroid_get_status(void)`
Get bluetooth stack status.

**Return**
Bluetooth stack status

`esp_err_t esp_bluedroid_enable(void)`
Enable bluetooth, must after esp_bluedroid_init().

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_disable(void)`
Disable bluetooth, must prior to esp_bluedroid_deinit().

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_init(void)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_deinit(void)`
Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

Enumerations

`enum esp_bluedroid_status_t` Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

**Values**:
- **ESP_BLUEDROID_STATUS_UNINITIALIZED** = 0
  Bluetooth not initialized
- **ESP_BLUEDROID_STATUS_INITIALIZED**
  Bluetooth initialized but not enabled
- **ESP_BLUEDROID_STATUS_ENABLED**
  Bluetooth initialized and enabled

BT DEVICE APIs

**Overview**
Bluetooth device reference APIs.

**Instructions**

**Application Example**
Instructions

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_bt_device.h
**Functions**

**const uint8_t** esp_bt_dev_get_address**(void)**
Get bluetooth device address. Must use after “esp_bluedroid_enable.”

**Return**
- bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

**esp_err_t esp_bt_dev_set_device_name**(const char *name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL : others

**Parameters**
- [in] name: device name to be set

### 2.1.3 BT LE

**GAP API**

**Overview**

**Instructions**

**Application Example** Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

**Functions**

**esp_err_t esp_ble_gap_register_callback**(esp_gap_ble_cb_t callback)
This function is called to occur gap event, such as scan result.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] callback: callback function

**esp_err_t esp_ble_gap_config_adv_data**(esp_ble_adv_data_t *adv_data)
This function is called to override the BTA default ADV parameters.

**Return**
- ESP_OK : success
- other : failed
Parameters

- **[in] adv_data**: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

```c
esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)
```

This function is called to set scan parameters.

Return

- ESP_OK : success
- other : failed

Parameters

- **[in] scan_params**: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

```c
esp_err_t esp_ble_gap_start_scanning(uint32_t duration)
```

This procedure keep the device scanning the peer device which advertising on the air.

Return

- ESP_OK : success
- other : failed

Parameters

- **[in] duration**: Keeping the scanning time, the unit is second.

```c
esp_err_t esp_ble_gap_stop_scanning(void)
```

This function call to stop the device scanning the peer device which advertising on the air.

Return

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_start_advertising(esp_ble_adv_params_t *adv_params)
```

This function is called to start advertising.

Return

- ESP_OK : success
- other : failed

Parameters

- **[in] adv_params**: pointer to User defined adv_params data structure.

```c
esp_err_t esp_ble_gap_stop_advertising(void)
```

This function is called to stop advertising.

Return

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_update_conn_params(esp_ble_conn_update_params_t *params)
```

Update connection parameters, can only be used when connection is up.

Return

- ESP_OK : success
- other : failed

Parameters

- **[in] params**: - connection update parameters

```c
esp_err_t esp_ble_gap_set_pkt_data_len(esp_bd_addr_t remote_device, uint16_t tx_data_length)
```

This function is to set maximum LE data packet size.

Return

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)
```

This function sets the static Random Address and Non-Resolvable Private Address for the application.
Chapter 2. API Reference

Return

- ESP_OK: success
- other: failed

Parameters

- [in] rand_addr: the random address which should be setting

\texttt{esp_err_t esp\_ble\_gap\_clear\_rand\_addr(void)}

This function clears the random address for the application.

Return

- ESP_OK: success
- other: failed

\texttt{esp_err_t esp\_ble\_gap\_config\_local\_privacy(bool privacy\_enable)}

Enable/disable privacy on the local device.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] privacy_enable: enable/disable privacy on remote device.

\texttt{esp_err_t esp\_ble\_gap\_config\_local\_icon(uint16_t icon)}

set local gap appearance icon

Return

- ESP_OK: success
- other: failed

Parameters

- [in] icon: External appearance value, these values are defined by the Bluetooth SIG, please refer to \url{https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml}

\texttt{esp_err_t esp\_ble\_gap\_update\_whitelist(bool add\_remove, esp\_bd\_addr\_t remote\_bda, esp\_ble\_wl\_addr\_type\_t wl\_addr\_type)}

Add or remove device from white list.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] add\_remove: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] remote\_bda: the remote device address add/remove from the white list.
- [in] wl\_addr\_type: whitelist address type

\texttt{esp_err_t esp\_ble\_gap\_clear\_whitelist(void)}

Clear all white list.

Return

- ESP_OK: success
- other: failed

\texttt{esp_err_t esp\_ble\_gap\_get\_whitelist\_size(uint16_t* length)}

Get the whitelist size in the controller.

Return

- ESP_OK: success
- other: failed

Parameters

- [out] length: the white list length.
**esp_err_t esp_ble_gap_set_prefer_conn_params**

```c
esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)
```

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
- [in] supervision_tout: preferred supervision timeout

---

**esp_err_t esp_ble_gap_set_device_name**

```c
esp_err_t esp_ble_gap_set_device_name(const char *name)
```

Set device name to the local device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] name: device name.

---

**esp_err_t esp_ble_gap_get_local_used_addr**

```c
esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)
```

This function is called to get local used address and address type.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] local_used_addr: current local used ble address (six bytes)
- [in] addr_type: ble address type

---

**uint8_t *esp_ble_resolve_adv_data**

```c
uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)
```

This function is called to get ADV data for a specific type.

**Return**
- pointer of ADV data

**Parameters**
- [in] adv_data: pointer of ADV data which to be resolved
- [in] type: finding ADV data type
- [out] length: return the length of ADV data not including type

---

**esp_err_t esp_ble_gap_config_adv_data_raw**

```c
esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
```

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] raw_data: raw advertising data
- [in] raw_data_len: raw advertising data length, less than 31 bytes

---

**esp_err_t esp_ble_gap_config_scan_rsp_data_raw**

```c
esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
```

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
• [in] raw_data:: raw scan response data
• [in] raw_data_len:: raw scan response data length, less than 31 bytes

esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t *remote_addr)
This function is called to read the RSSI of remote device. The address of link policy results are returned in the
gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] remote_addr:: The remote connection device address.

esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
esp_duplicate_info_t device_info)
This function is called to add a device info into the duplicate scan exceptional list.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when
type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV ,
device_info is invalid.
• [in] device_info: the device information.

esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
.esp_duplicate_info_t device_info)
This function is called to remove a device info from the duplicate scan exceptional list.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when
type is MESH_BEACON>Type, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV ,
device_info is invalid.
• [in] device_info: the device information.

esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list(esp_duplicate_scan_exceptional_list_type_t list_type)
This function is called to clean the duplicate scan exceptional list. This API will delete all device information
in the duplicate scan exceptional list.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] list_type: duplicate scan exceptional list type, the value can be one or more of
esp_duplicate_scan_exceptional_list_type_t.

esp_err_t esp_ble_gap_set_security_param(esp_ble_sm_param_t param_type, void *value,
uint8_t len)
Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin
Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only secure connection mode, it is necessary do as following:
1. Set bit ESP_LE_AUTH_REQ_SC_ONLY (param_type is ESP_BLE_SM_AUTHEN_REQ_MODE), bit ESP_LE_AUTH_BOND and bit ESP_LE_AUTH_REQ_MITM is optional as required.
2. Set to ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE (param_type is ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH).

Return - ESP_OK : success
  • other : failed

Parameters
  • [in] param_type : the type of the param which to be set
  • [in] value : the param value
  • [in] len : the length of the param value

`esp_err_t esp_ble_gap_security_rsp (esp_bd_addr_t bd_addr, bool accept)`

Grant security request access.

Return - ESP_OK : success
  • other : failed

Parameters
  • [in] bd_addr : BD address of the peer
  • [in] accept : accept the security request or not

`esp_err_t esp_ble_set_encryption (esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)`

Set a gap parameter value. Use this function to change the default GAP parameter values.

Return - ESP_OK : success
  • other : failed

Parameters
  • [in] bd_addr : the address of the peer device need to encryption
  • [in] sec_act : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

`esp_err_t esp_ble_passkey_reply (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)`

Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK : success
  • other : failed

Parameters
  • [in] bd_addr : BD address of the peer
  • [in] accept : passkey entry successful or declined.
  • [in] passkey : passkey value, must be a 6 digit number, can be lead by 0.

`esp_err_t esp_ble_confirm_reply (esp_bd_addr_t bd_addr, bool accept)`

Reply the confirm value to the peer device in the secure connection stage.

Return - ESP_OK : success
  • other : failed

Parameters
  • [in] bd_addr : BD address of the peer device
  • [in] accept : numbers to compare are the same or different.

`esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)`

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - ESP_OK : success
  • other : failed

Parameters
  • [in] bd_addr : BD address of the peer device

`int esp_ble_get_bond_device_num (void)`

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number.
  • ESP_FAIL : failed
**esp_err_t esp_ble_get_bond_device_list (int *dev_num, esp_ble_bond_dev_t *dev_list)**

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
  - [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
  - [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)**

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
  - [in] bd_addr: BD address of the peer device.
  - [in] TK: TK value, the TK value shall be a 128-bit random number.
  - [in] len: length of tk, should always be 128-bit

**esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)**

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
  - [in] remote_device: BD address of the peer device

**esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)**

This function is called to read the connection parameters information of the device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
  - [in] bd_addr: BD address of the peer device.
  - [out] conn_params: the connection parameters information

**esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)**

BLE set channels.

**Return**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

**Parameters**
  - [in] channels: : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**esp_err_t esp_gap_ble_set_authorization (esp_bd_addr_t bd_addr, bool authorize)**

This function is called to authorized a link after Authentication(MITM protection)

**Return**
- ESP_OK : success
- other : failed

**Parameters**
  - [in] bd_addr: BD address of the peer device.
  - [out] authorize: Authorized the link or not.
`esp_err_t esp_ble_gap_read_phy(esp_bd_addr_t bd_addr)`
This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- `[in]` `bd_addr`: BD address of the peer device

`esp_err_t esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask)`
This function is used to allow the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- `[in]` `tx_phy_mask`: indicates the transmitter PHYs that the Host prefers the Controller to use
- `[in]` `rx_phy_mask`: indicates the receiver PHYs that the Host prefers the Controller to use

`esp_err_t esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)`
This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- `[in]` `bd_addr`: remote address
- `[in]` `all_phys_mask`: a bit field that allows the Host to specify
- `[in]` `tx_phy_mask`: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- `[in]` `rx_phy_mask`: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- `[in]` `phy_options`: a bit field that allows the Host to specify options for PHYs

`esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)`
This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- `[in]` `instance`: Used to identify an advertising set
- `[in]` `rand_addr`: Random Device Address

`esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)`
This function is used by the Host to set the advertising parameters.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- `[in]` `instance`: Identifies the advertising set whose parameters are being configured.
- `[in]` `params`: advertising parameters

`esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)`
This function is used to set the data used in advertising PDUs that have a data field.

**Return**
- ESP_OK: success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose data are being configured
- [in] length: data length
- [in] data: data information

```c
esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw(uint8_t instance, uint16_t length, const uint8_t * scan_rsp_data)
```

This function is used to provide scan response data used in scanning response PDUs.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose response data are being configured.
- [in] length: responsedatalength
- [in] scan_rsp_data: responsedatainformation

```c
esp_err_t esp_ble_gap_ext_adv_start(uint8_t num_adv, const esp_ble_gap_ext_adv_t * ext_adv)
```

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] num_adv: Number of advertising sets to enable or disable
- [in] ext_adv: adv parameters

```c
esp_err_t esp_ble_gap_ext_adv_stop(uint8_t num_adv, const uint8_t * ext_adv_inst)
```

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] num_adv: Number of advertising sets to enable or disable
- [in] ext_adv_inst: ext adv instance

```c
esp_err_t esp_ble_gap_ext_adv_set_remove(uint8_t instance)
```

This function is used to remove an advertising set from the Controller.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: Used to identify an advertising set

```c
esp_err_t esp_ble_gap_ext_adv_set_clear(void)
```

This function is used to remove all existing advertising sets from the Controller.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_set_params(uint8_t instance, const esp_ble_gap_periodic_adv_params_t * params)
```

This function is used by the Host to set the parameters for periodic advertising.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
- [in] params: periodic adv parameters
### esp_err_t esp_ble_gap_config_periodic_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

- **Return**: ESP_OK : success
- **other**: failed

- **Parameters**
  - [in] instance::identifies the advertising set whose periodic advertising parameters are being configured.
  - [in] length:: the length of periodic data
  - [in] data:: periodic data information

### esp_err_t esp_ble_gap_periodic_adv_start(uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

- **Return**: ESP_OK : success
- **other**: failed

- **Parameters**
  - [in] instance:: Used to identify an advertising set

### esp_err_t esp_ble_gap_periodic_adv_stop(uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

- **Return**: ESP_OK : success
- **other**: failed

- **Parameters**
  - [in] instance:: Used to identify an advertising set

### esp_err_t esp_ble_gap_set_ext_scan_params(const esp_ble_ext_scan_params_t *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

- **Return**: ESP_OK : success
- **other**: failed

- **Parameters**
  - [in] params:: scan parameters

### esp_err_t esp_ble_gap_start_ext_scan(uint32_t duration, uint16_t period)

This function is used to enable scanning.

- **Return**: ESP_OK : success
- **other**: failed

- **Parameters**
  - [in] duration:: Scan duration
  - [in] period:: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

### esp_err_t esp_ble_gap_stop_ext_scan(void)

This function is used to disable scanning.

- **Return**: ESP_OK : success
- **other**: failed

### esp_err_t esp_ble_gap_periodic_adv_create_sync(const esp_ble_gap_periodic_adv_sync_params_t *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

- **Return**: ESP_OK : success
- **other**: failed

- **Parameters**
  - [in] params:: sync parameters

### esp_err_t esp_ble_gap_periodic_adv_sync_cancel(void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

- **Return**: ESP_OK : success
Chapter 2. API Reference

- other : failed

**esp_err_t esp_ble_gap_periodic_adv_syncTerminate** (uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

Return - ESP_OK : success
- other : failed

Parameters
- [in] sync_handle: : identify the periodic advertiser

**esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list** (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

Return - ESP_OK : success
- other : failed

Parameters
- [in] addr_type: : address type
- [in] addr: : Device Address
- [in] sid: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list** (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

Return - ESP_OK : success
- other : failed

Parameters
- [in] addr_type: : address type
- [in] addr: : Device Address
- [in] sid: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t esp_ble_gap_periodic_adv_clear_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

Return - ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_prefer_ext_connect_params_set** (esp_bd_addr_t addr, esp_ble_gap_phy_mask_t phy_mask, const esp_ble_gap_conn_params_t *phy_1m_conn_params, const esp_ble_gap_conn_params_t *phy_2m_conn_params, const esp_ble_gap_conn_params_t *phy_coded_conn_params)

This function is used to set aux connection parameters.

Return - ESP_OK : success
- other : failed

Parameters
- [in] addr: : device address
- [in] phy_mask: : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- [in] phy_1m_conn_params: : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- [in] phy_2m_conn_params: : Connection parameters for the LE 2M PHY are provided.
- [in] phy_coded_conn_params: : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

The length of device info

```c
esp_duplicate_info_t device_info
```
device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

**struct ble_update_whitelist_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
```
Indicate update duplicate scan exceptional list operation success status

```c
uint8_t subcode
```
Define update duplicate scan exceptional list operation success status

```c
uint16_t length
```
The length of device_info
Public Members

`esp_bt_status_t status`
Indicate the add or remove whitelist operation success status

`esp_ble_wl_operation_t wl_operation`
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

`struct esp_ble_adv_params_t`
Advertising parameters.

Public Members

uint16_t `adv_int_min`
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t `adv_int_max`
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

`esp_ble_adv_type_t adv_type`
Advertising type

`esp_ble_addr_type_t own_addr_type`
Owner bluetooth device address type

`esp_bd_addr_t peer_addr`
Peer device bluetooth device address

`esp_ble_addr_type_t peer_addr_type`
Peer device bluetooth device address type, only support public address type and random address type

`esp_ble_adv_channel_t channel_map`
Advertising channel map

`esp_ble_adv_filter_t adv_filter_policy`
Advertising filter policy

`struct esp_ble_adv_data_t`
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

bool `set_scan_rsp`
Set this advertising data as scan response or not

bool `include_name`
Advertising data include device name or not

bool `include_txpower`
Advertising data include TX power

int `min_interval`
Advertise data show slave preferred connection min interval. The connection interval in the following manner: connIntervalmin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.
int max_interval
Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalmax = Conn_Interval_Max * 1.25 ms Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
External appearance of device

uint16_t manufacturer_len
Manufacturer data length

uint8_t *p_manufacturer_data
Manufacturer data point

uint16_t service_data_len
Service data length

uint8_t *p_service_data
Service data point

uint16_t service_uuid_len
Service uuid length

uint8_t *p_service_uuid
Service uuid array point

uint8_t flag
Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
Ble scan parameters.

Public Members

esp_ble_scan_type_t scan_type
Scan type

esp_ble_addr_type_t own_addr_type
Owner address type

esp_ble_scan_filter_t scan_filter_policy
Scan filter policy

uint16_t scan_interval
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t scan_duplicate
The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
connection parameters information
Public Members

uint16_t interval
collection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_conn_update_params_t
Connection update parameters.

Public Members

esp_bd_addr_t bda
Bluetooth device address

uint16_t min_int
Min connection interval

uint16_t max_int
Max connection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
BLE pktdate length keys.

Public Members

uint16_t rx_len
pkt rx data length value

uint16_t tx_len
pkt tx data length value

struct esp_ble_penc_keys_t
BLE encryption keys.

Public Members

esp bt octet16 tltk
The long term key

esp bt octet8 t rand
The random number

uint16_t ediv
The ediv value

uint8_t sec_level
The security level of the security link

uint8_t key_size
The key size(7~16) of the security link
struct esp_ble_pcsrk_keys_t
BLE CSRK keys.

Public Members

uint32_t counter
The counter

esp_bt_octet16_t csrk
The csrk key

uint8_t sec_level
The security level

struct esp_ble_pid_keys_t
BLE pid keys.

Public Members

esp_bt_octet16_t irk
The irk value

esp_ble_addr_type_t addr_type
The address type

esp_bd_addr_t static_addr
The static address

struct esp_ble_lenc_keys_t
BLE Encryption reproduction keys.

Public Members

esp_bt_octet16_t ltk
The long term key

uint16_t div
The div value

uint8_t key_size
The key size of the security link

uint8_t sec_level
The security level of the security link

struct esp_ble_lcsrk_keys
BLE SRK keys.

Public Members

uint32_t counter
The counter value

uint16_t div
The div value

uint8_t sec_level
The security level of the security link

esp_bt_octet16_t csrk
The csrk key value
struct esp_ble_sec_key_notif_t
Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t bd_addr
peer address

uint32_t passkey
the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
Structure of the security request.

Public Members

esp_bd_addr_t bd_addr
peer address

struct esp_ble_bond_key_info_t
struct type of the bond key information value

Public Members

esp_ble_key_mask_t key_mask
the key mask to indicate which key is present

esp_ble_penc_keys_t penc_key
received peer encryption key

esp_ble_pcsrk_keys_t pcsrk_key
received peer device SRK

esp_ble_pid_keys_t pid_key
peer device ID key

struct esp_ble_bond_dev_t
struct type of the bond device value

Public Members

esp_bd_addr_t bd_addr
peer address

esp_ble_bond_key_info_t bond_key
the bond key information

struct esp_ble_key_t
union type of the security key value

Public Members

esp_bd_addr_t bd_addr
peer address

esp_ble_key_type_t key_type
key type of the security link

esp_ble_key_value_t p_key_value
the pointer to the key value
**struct esp_ble_local_id_keys_t**
structure type of ble_local_id_keys value

**Public Members**

`esp_bt_octet16_t ir`
the 16 bits of the ir value

`esp_bt_octet16_t irk`
the 16 bits of the ir key value

`esp_bt_octet16_t dhk`
the 16 bits of the dh key value

**struct esp_ble_auth_cmpl_t**
Structure associated with ESP_AUTH_CMPL_EVT.

**Public Members**

`esp_bd_addr_t bd_addr`
BD address peer device.

`bool key_present`
Valid link key value in key element

`esp_link_key key`
Link key associated with peer device.

`uint8_t key_type`
The type of Link Key

`bool success`
TRUE of authentication succeeded, FALSE if failed.

`uint8_t fail_reason`
The HCI reason/error code for when success=FALSE

`esp_ble_addr_type_t addr_type`
Peer device address type

`esp_bt_dev_type_t dev_type`
Device type

`esp_ble_auth_req_t auth_mode`
authentication mode

**struct esp_ble_gap_ext_adv_params_t**
ext adv parameters

**Public Members**

`esp_ble_ext_adv_type_mask_t type`
ext adv type

`uint32_t interval_min`
ext adv minimum interval

`uint32_t interval_max`
ext adv maximum interval

`esp_ble_adv_channel_t channel_map`
ext adv channel map

\end{verbatim}
**struct esp_ble_gap_conn_params_t**
create extend connection parameters

**Public Members**

- `uint16_t scan_interval`
  - init scan interval
- `uint16_t scan_window`
  - init scan window
- `uint16_t interval_min`
  - minimum interval
- `uint16_t interval_max`
  - maximum interval
- `uint16_t latency`
  - ext scan type
- `uint16_t supervision_timeout`
  - connection supervision timeout
- `uint16_t min_ce_len`
  - minimum ce length
- `uint16_t max_ce_len`
  - maximum ce length

**struct esp_ble_gap_ext_adv_t**
extend adv enable parameters

**Public Members**

- `uint8_t instance`
  - advertising handle
- `int duration`
  - advertising duration
- `int max_events`
  - maximum number of extended advertising events

**struct esp_ble_gap_periodic_adv_params_t**
periodic adv parameters

**Public Members**

- `uint16_t interval_min`
  - periodic advertising minimum interval
- `uint16_t interval_max`
  - periodic advertising maximum interval
- `uint8_t properties`
  - periodic advertising properties

**struct esp_ble_gap_periodic_adv_sync_params_t**
periodic adv sync parameters
Public Members

`esp_ble_gap_sync_t filter_policy`
periodic advertising sync filter policy

`uint8_t sid`
periodic advertising sid

`esp_ble_gap_adv_type_t addr_type`
periodic advertising address type

`esp_bd_addr_t addr`
periodic advertising address

`uint16_t skip`
the maximum number of periodic advertising events that can be skipped

`uint16_t sync_timeout`
synchronization timeout

`struct esp_ble_gap_ext_adv_reprot_t`
extend adv report parameters

Public Members

`esp_ble_gap_adv_type_t event_type`
extend advertising type

`uint8_t addr_type`
extend advertising address type

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_gap_ble_cb_param_t *param)

GAP callback function type.
Parameters

- `event::` Event type
- `param::` Point to callback parameter, currently is union type

Enumerations

```c
enum esp_gap_ble_cb_event_t
{
    GAP BLE callback event type.

    Values:
    ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0,
    ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT,

    ESP_GAP_BLE_LOCAL_ER_EVT
    ESP_GAP_BLE_NC_REQ_EVT
    ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
    When stop adv complete, the event comes.
    ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
    When stop scan complete, the event comes.
    ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT = 19
    When set the static rand address complete, the event comes.
    ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
    When update connection parameters complete, the event comes.
    ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
    When set pkt length complete, the event comes.
    ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
    When Enable/disable privacy on the local device complete, the event comes.
```
ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
   When remove the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
   When clear the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
   When get the bond device list complete, the event comes

ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
   When read the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
   When add or remove whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
   When update duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT = 29
   When setting BLE channels complete, the event comes

ESP_BLE_AD_MANUFACTURER_SPECIFIC_TYPE = 0xFF

enum esp_ble_adv_type_t
  Advertising mode.
  Values:
  ADV_TYPE_IND = 0x00
  ADV_TYPE_DIRECT_IND_HIGH = 0x01
  ADV_TYPE_SCAN_IND = 0x02
  ADV_TYPE_NONCONN_IND = 0x03
  ADV_TYPE_DIRECT_IND_LOW = 0x04

enum esp_ble_adv_channel_t
  Advertising channel mask.
  Values:
  ADV_CHNL_37 = 0x01
  ADV_CHNL_38 = 0x02
  ADV_CHNL_39 = 0x04
  ADV_CHNL_ALL = 0x07

enum esp_ble_adv_filter_t
  Values:
  ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY = 0x00
     Allow both scan and connection requests from anyone.
  ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
     Allow both scan req from White List devices only and connection req from anyone.
  ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
     Allow both scan req from anyone and connection req from White List devices only.
  ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
     Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
  Values:
  ESP_BLE_SEC_ENCRYPT
  ESP_BLE_SEC_ENCRYPT_NO_MITM
  ESP_BLE_SEC_ENCRYPT_MITM

enum esp_ble_sm_param_t
  Values:
  ESP_BLE_SM_PASSKEY
  ESP_BLE_SM_AUTHEN_REQ_MODE
  ESP_BLE_SM_IOCAP_MODE
ESP_BLE_SM_SET_INIT_KEY
ESP_BLE_SM_SET_RSP_KEY
ESP_BLE_SM_MAX_KEY_SIZE
ESP_BLE_SM_MIN_KEY_SIZE
ESP_BLE_SM_SET_STATIC_PASSKEY
ESP_BLE_SM_CLEAR_STATIC_PASSKEY
ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH
ESP_BLE_SM_OOB_SUPPORT
ESP_BLE_APP_ENC_KEY_SIZE
ESP_BLE_SM_MAX_PARAM

enum esp_ble_scan_type_t
Ble scan type.
Values:
BLE_SCAN_TYPE_PASSIVE = 0x0
Passive scan
BLE_SCAN_TYPE_ACTIVE = 0x1
Active scan

enum esp_ble_scan_filter_t
Ble scan filter type.
Values:
BLE_SCAN_FILTER_ALLOW_ALL = 0x0
Accept all:
1. advertisement packets except directed advertising packets not addressed to this device (default).
BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1
Accept only:
1. advertisement packets from devices where the advertiser’s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.
BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2
Accept all:
1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.
BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR = 0x3
Accept all:
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

enum esp_ble_scan_duplicate_t
Ble scan duplicate type.
Values:
BLE_SCAN_DUPLICATE_DISABLE = 0x0
the Link Layer should generate advertising reports to the host for each packet received
BLE_SCAN_DUPLICATE_ENABLE = 0x1
the Link Layer should filter out duplicate advertising reports to the Host
`BLE_SCAN_DUPLICATE_MAX = 0x2
0x02 ~ 0xFF, Reserved for future use`

`enum esp_gap_search_evt_t`
`Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.`
`Values:`

- `ESP_GAP_SEARCH_INQ_RES_EVT = 0`
  Inquiry result for a peer device.

- `ESP_GAP_SEARCH_INQ_CMPL_EVT = 1`
  Inquiry complete.

- `ESP_GAP_SEARCH_DISC_RES_EVT = 2`
  Discovery result for a peer device.

- `ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3`
  Discovery result for BLE GATT based service on a peer device.

- `ESP_GAP_SEARCH_DISC_CMPL_EVT = 4`
  Discovery complete.

- `ESP_GAP_SEARCH_DI_DISC_CMPL_EVT = 5`
  Discovery complete.

- `ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6`
  Search cancelled

- `ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7`
  The number of pkt discarded by flow control

`enum esp_ble_evt_type_t`
`Ble scan result event type, to indicate the result is scan response or advertising data or other.`
`Values:`

- `ESP_BLE_EVT_CONN_ADV = 0x00`
  Connectable undirected advertising (ADV_IND)

- `ESP_BLE_EVT_CONN_DIR_ADV = 0x01`
  Connectable directed advertising (ADV_DIRECT_IND)

- `ESP_BLE_EVT_DISC_ADV = 0x02`
  Scannable undirected advertising (ADV_SCAN_IND)

- `ESP_BLE_EVT_NON_CONN_ADV = 0x03`
  Non connectable undirected advertising (ADV_NONCONN_IND)

- `ESP_BLE_EVT_SCAN_RSP = 0x04`
  Scan Response (SCAN_RSP)

`enum esp_ble wl_opration_t`
`Values:`

- `ESP_BLE_WHITELIST_REMOVE = 0x00`
  remove mac from whitelist

- `ESP_BLE_WHITELIST_ADD = 0x01`
  add address to whitelist

`enum esp_bt_duplicate_exceptional_subcode_type_t`
`Values:`

- `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0`
  Add device info into duplicate scan exceptional list

- `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE`
  Remove device info from duplicate scan exceptional list
**Chapter 2. API Reference**

**ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
Clean duplicate scan exceptional list

**enum esp_ble_duplicate_exceptional_info_type_t**
Values:

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0**
  BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
  BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**
  BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRVADV**
  BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ...

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRVADV**
  BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ...

**enum esp_duplicate_scan_exceptional_list_type_t**
Values:

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)**
  duplicate scan exceptional addr list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)**
  duplicate scan exceptional mesh link ID list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)**
  duplicate scan exceptional mesh beacon type list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRVADV_LIST = BLE_BIT(3)**
  duplicate scan exceptional mesh adv with provisioning service uuid

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRVADV_LIST = BLE_BIT(4)**
  duplicate scan exceptional mesh adv with proxy service uuid

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF**
  duplicate scan exceptional all list

**GATT DEFINES**

**Overview**

**Instructions**

**Application Example**

**Instructions**

**API Reference**

**Header File**

- components/bluetooth/host/bluedroid/api/include/api/esp_gatt_defs.h

**Unions**

**union esp_gatt_rsp_t**

```
#include <esp_gatt_defs.h> GATT remote read request response type.
```
Public Members

```c
struct esp_gatt_value_t
{
    attr_value
    Gatt attribute structure
    uint16_t handle
    Gatt attribute handle
}
```

Structures

```c
struct esp_gatt_id_t
{
    Gatt id, include uuid and instance id.
}
```

Public Members

```c
struct esp_gatt_id_t
{
    uuid
    UUID
    uint8_t inst_id
    Instance id
}
```

Public Members

```c
struct esp_gatt_srvc_id_t
{
    Gatt service id, include id (uuid and instance id) and primary flag.
}
```

Public Members

```c
struct esp_gatt_id_t
{
    Gatt id, include uuid and instance
    bool is_primary
    This service is primary or not
}
```

Public Members

```c
struct esp_attr_desc_t
{
    Attribute description (used to create database)
    uint16_t uuid_length
    UUID length
    uint8_t *uuid_p
    UUID value
    uint16_t perm
    Attribute permission
    uint16_t max_length
    Maximum length of the element
    uint16_t length
    Current length of the element
    uint8_t *value
    Element value array
    struct esp_attr_control_t
    attribute auto response flag
}
```
Public Members

uint8_t auto_rsp
    if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
    attribute type added to the gatt server database

Public Members

esp_attr_control_t attr_control
    The attribute control type

esp_attr_desc_t att_desc
    The attribute type

struct esp_attr_value_t
    set the attribute value type

Public Members

uint16_t attr_max_len
    attribute max value length

uint16_t attr_len
    attribute current value length

uint8_t* attr_value
    the pointer to attribute value

struct esp_gatts_incl_svc_desc_t
    Gatt include service entry element.

Public Members

uint16_t start_hdl
    Gatt start handle value of included service

uint16_t end_hdl
    Gatt end handle value of included service

uint16_t uuid
    Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t
    Gatt include 128 bit service entry element.

Public Members

uint16_t start_hdl
    Gatt start handle value of included 128 bit service

uint16_t end_hdl
    Gatt end handle value of included 128 bit service

struct esp_gatt_value_t
    Gatt attribute value.
Public Members

uint8_t value[ESP_GATT_MAX_ATTR_LEN]
    Gatt attribute value

uint16_t handle
    Gatt attribute handle

uint16_t offset
    Gatt attribute value offset

uint16_t len
    Gatt attribute value length

uint8_t auth_req
    Gatt authentication request

struct esp_gatt_conn_params_t
    Connection parameters information.

Public Members

uint16_t interval
    connection interval

uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
    read multiple attribute

Public Members

uint8_t num_attr
    The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
    The handles list

struct esp_gattc_db_elem_t
    data base attribute element

Public Members

esp_gatt_db_attr_type_t type
    The attribute type

uint16_t attribute_handle
    The attribute handle, it’s valid for all of the type

uint16_t start_handle
    The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
    ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
    The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
    ESP_GATT_DB_SECONDARY_SERVICE
**esp_gatt_char_prop_t**

properties

The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

**esp_bt_uuid_t**

uuid

The attribute uuid, it’s valid for all of the type

### struct esp_gattc_service_elem_t

service element

**Public Members**

bool **is_primary**

The service flag, true if the service is primary service, else is secondary service

uint16_t **start_handle**

The start handle of the service

uint16_t **end_handle**

The end handle of the service

**esp_bt_uuid_t**

uuid

The uuid of the service

### struct esp_gattc_char_elem_t

characteristic element

**Public Members**

uint16_t **char_handle**

The characteristic handle

**esp_gatt_char_prop_t**

properties

The characteristic properties

**esp_bt_uuid_t**

uuid

The characteristic uuid

### struct esp_gattc_descr_elem_t

descriptor element

**Public Members**

uint16_t **handle**

The characteristic descriptor handle

**esp_bt_uuid_t**

uuid

The characteristic descriptor uuid

### struct esp_gattc_incl_svc_elem_t

include service element

**Public Members**

uint16_t **handle**

The include service current attribute handle

uint16_t **incl_srvc_s_handle**

The start handle of the service which has been included

uint16_t **incl_srvc_e_handle**

The end handle of the service which has been included
**esp_BT_UUID */uuid

The include service uuid

ESP_GATT_MAX_ATTR_LEN
    GATT maximum attribute length.
ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
    If callback report gatc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t
    Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
    Attribute write data type from the client.
    Values:
    ESP_GATT_PREP_WRITE_CANCEL = 0x00
        Prepare write cancel
    ESP_GATT_PREP_WRITE_EXEC = 0x01
        Prepare write execute
enum esp_gatt_status_t
    GATT success code and error codes.
    Values:
    ESP_GATT_OK = 0x0
    ESP_GATT_INVALID_HANDLE = 0x01
    ESP_GATT_READ_NOT_PERMIT = 0x02
    ESP_GATT_WRITE_NOT_PERMIT = 0x03
    ESP_GATT_INVALID_PDU = 0x04
    ESP_GATT_INSUF_AUTHENTICATION = 0x05

enum esp_gatt_conn_reason_t

    Gatt Connection reason enum.

    Values:

    ESP_GATT_CONN_UNKNOWN = 0
        Gatt connection unknown
    ESP_GATT_CONN_L2C_FAILURE = 1
        General L2cap failure
Chapter 2. API Reference

```
ESP_GATT_CONN_TIMEOUT = 0x08
Connection timeout

ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
Connection terminate by peer user

ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
Connection terminated by local host

ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
Connection fail to establish

ESP_GATT_CONN_LMP_TIMEOUT = 0x22
Connection fail for LMP response tout

ESP_GATT_CONN_CONN_CANCEL = 0x0100
L2CAP connection cancelled

ESP_GATT_CONN_NONE = 0x0101
No connection to cancel

define esp_gatt_auth_req_t
Gatt authentication request type.

Values:

ESP_GATT_AUTH_REQ_NONE = 0
ESP_GATT_AUTH_REQ_NO_MITM = 1
ESP_GATT_AUTH_REQ_MITM = 2
ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
ESP_GATT_AUTH_REQ_SIGNED_MITM = 4

define esp_service_source_t
Values:

ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
ESP_GATT_SERVICE_FROM_NVS_FLASH = 1
ESP_GATT_SERVICE_FROM_UNKNOWN = 2

define esp_gatt_write_type_t
Gatt write type.

Values:

ESP_GATT_WRITE_TYPE_NO_RSP = 1
Gatt write attribute need no response

ESP_GATT_WRITE_TYPE_RSP
Gatt write attribute need remote response

define esp_gatt_db_attr_type_t
the type of attribute element

Values:

ESP_GATT_DB_PRIMARY_SERVICE
Gatt primary service attribute type in the cache

ESP_GATT_DB_SECONDARY_SERVICE
Gatt secondary service attribute type in the cache

ESP_GATT_DB_CHARACTERISTIC
Gatt characteristic attribute type in the cache

ESP_GATT_DB_DESCRIPTOR
Gatt characteristic descriptor attribute type in the cache
```
Chapter 2. API Reference

**ESP_GATT_DB_INCLUDEDSERVICE**
Gatc include service attribute type in the cache

**ESP_GATT_DB_ALL**
Gatc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

**GATT SERVER API**

**Overview**

**Application Example**
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

**Functions**

- **esp_err_t esp_ble_gatts_register_callback(esp_gatts_cb_t callback)**
  This function is called to register application callbacks with BTA GATTS module.

  **Return**
  - ESP_OK: success
  - other: failed

- **esp_err_t esp_ble_gatts_app_register(uint16_t app_id)**
  This function is called to register application identifier.

  **Return**
  - ESP_OK: success
  - other: failed

- **esp_err_t esp_ble_gatts_app_unregister(esp_gatt_if_t gatts_if)**
  unregister with GATT Server.

  **Return**
  - ESP_OK: success
  - other: failed

  **Parameters**
  - [in] gatts_if: GATT server access interface

- **esp_err_t esp_ble_gatts_create_service(esp_gatt_if_t gatts_if, esp_gatt_svc_id_t *service_id, uint16_t num_handle)**
  Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to
report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] service_id: service ID.
- [in] num_handle: number of handle requested for this service.

```
esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t* gatts_attr_db,
                                        esp_gatt_if_t gatts_if,
                                        uint8_t max_nb_attr,
                                        uint8_t servc_inst_id)
```

Create a service attribute tab.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_attr_db: the pointer to the service attr tab
- [in] gatts_if: GATT server access interface
- [in] max_nb_attr: the number of attribute to be added to the service database.
- [in] servc_inst_id: the instance id of the service

```
esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle,
                                            uint16_t included_service_handle)
```

This function is called to add an included service. This function have to be called between `esp_ble_gatts_create_service` and `esp_ble_gatts_add_char`. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service handle to which this included service is to be added.
- [in] included_service_handle: the service ID to be included.

```
esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t* char_uuid,
                                 esp_gatt_perm_t perm, esp_gatt_char_prop_t property,
                                 esp_attr_value_t* char_val, esp_attr_control_t* control)
```

This function is called to add a characteristic into a service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service handle to which this included service is to be added.
- [in] char_uuid: Characteristic UUID.
- [in] perm: Characteristic value declaration attribute permission.
- [in] property: Characteristic Properties
- [in] char_val: Characteristic value
- [in] control: attribute response control byte

```
esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t* descr_uuid,
                                       esp_gatt_perm_t perm, esp_attr_value_t* char_descr_val, esp_attr_control_t* control)
```

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Return
- ESP_OK: success
- other: failed
Chapter 2. API Reference

Parameters
• [in] service_handle: service handle to which this characteristic descriptor is to be added.
• [in] perm: descriptor access permission.
• [in] descr_uuid: descriptor UUID.
• [in] char_descr_val: Characteristic descriptor value
• [in] control: attribute response control byte

**esp_err_t esp_ble_gatts_delete_service (uint16_t service_handle)**

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] service_handle: service_handle to be deleted.

**esp_err_t esp_ble_gatts_start_service (uint16_t service_handle)**

This function is called to start a service.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] service_handle: the service handle to be started.

**esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)**

This function is called to stop a service.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] service_handle: - service to be topped.

**esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)**

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] gatts_if: GATT server access interface
• [in] conn_id: - connection id to indicate.
• [in] attr_handle: - attribute handle to indicate.
• [in] value_len: - indicate value length.
• [in] value: value to indicate.
• [in] need_confirm: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

**esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)**

This function is called to send a response to a request.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] gatts_if: GATT server access interface
Chapter 2. API Reference

- [in] trans_id: - transfer id
- [in] status: - response status

\texttt{esp_err_t esp_ble_gatts_set_attr_value} (uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] attr_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

\texttt{esp_gatt_status_t esp_ble_gatts_get_attr_value} (uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

**Return**
- ESP_GATT_OK: success
- other: failed

**Parameters**
- [in] attr_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

\texttt{esp_err_t esp_ble_gatts_open} (esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address.
- [in] is_direct: direct connection or background auto connection

\texttt{esp_err_t esp_ble_gatts_close} (esp_gatt_if_t gatts_if, uint16_t conn_id)

Close a connection a remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.

\texttt{esp_err_t esp_ble_gatts_send_service_change_indication} (esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)

Send service change indication.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Unions
union esp_ble_gatts_cb_param_t
#include <esp_gatts_api.h> Gatt server callback parameters union.

**Public Members**

- `struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg`  
  Gatt server callback param of ESP_GATTS_REG_EVT

    #include <esp_gatts_api.h> ESP_GATTS_RESPONSE_EVT.

Public Members

    esp_gatt_status_t status
        Operation status
    uint16_t handle
        Attribute handle which send response

struct gatts_send_service_change_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_SEND_SERVICE_CHANGE_EVT.

Public Members

    esp_gatt_status_t status
        Operation status

struct gatts_set_attr_val_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_SET_ATTR_VAL_EVT.

Public Members

    uint16_t srvc_handle
        The service handle
    uint16_t attr_handle
        The attribute handle
    esp_gatt_status_t status
        Operation status

struct gatts_start_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_START_EVT.

Public Members

    esp_gatt_status_t status
        Operation status
    uint16_t service_handle
        Service attribute handle

struct gatts_stop_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_STOP_EVT.
Public Members

*esp_gatt_status_t* status
  
  Operation status

uint16_t service_handle
  
  Service attribute handle

struct gatts_write_evt_param
  
  #include <esp_gatts_api.h> ESP_GATTS_WRITE_EVT.

Public Members

uint16_t conn_id
  
  Connection id

uint32_t trans_id
  
  Transfer id

*esp_bd_addr_t* bda
  
  The bluetooth device address which been written

uint16_t handle
  
  The attribute handle

uint16_t offset
  
  Offset of the value, if the value is too long

bool need_rsp
  
  The write operation need to do response

bool is_prep
  
  This write operation is prepare write

uint16_t len
  
  The write attribute value length

uint8_t *value
  
  The write attribute value

Macros

#define ESP_GATT_PREP_WRITE_CANCEL
Prepare write flag to indicate cancel prepare write

#define ESP_GATT_PREP_WRITE_EXEC
Prepare write flag to indicate execute prepare write

Type Definitions

typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, 
                                esp_ble_gatts_cb_param_t *param)
  
  GATT Server callback function type.

Parameters

- event:: Event type
- gatts_if:: GATT server access interface, normally different gatts_if correspond to different profile
- param:: Point to callback parameter, currently is union type

Enumerations
## GATT Server callback function events.

### Values:

<table>
<thead>
<tr>
<th>Event Type</th>

<tr>
<td>ESP_GATTS_CLOSE_EVT</td>
<td>18</td>
<td>GATT server close event, when a GATT server closes</td>
</tr>
<tr>
<td>ESP_GATTS_LISTEN_EVT</td>
<td>19</td>
<td>GATT listen to be connected event, when listen to be connected happens</td>
</tr>
<tr>
<td>ESP_GATTS_CONGEST_EVT</td>
<td>20</td>
<td>Congestion event, when congestion happens</td>
</tr>
<tr>
<td>ESP_GATTS_RESPONSE_EVT</td>
<td>21</td>
<td>GATT send response complete event, when a response comes</td>
</tr>
</tbody>
</table>
ESP_GATTS_CREAT_ATTR_TAB_EVT = 22
   When gatt create table complete, the event comes
ESP_GATTS_SET_ATTR_VAL_EVT = 23
   When gatt set attr value complete, the event comes
ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24
   When gatt send service change indication complete, the event comes

GATT CLIENT API

Overview  Instructions

Application Example  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:
   • This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
     – bluetooth/bluedroid/ble/gatt_client
     – GATT Client Example Walkthrough
   • This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
     – bluetooth/bluedroid/ble/gatcc_multi_connect
     – GATT Client Multi-connection Example Walkthrough
   • This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
     – bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File
   • components/bluetooth/bluedroid/api/include/api/esp_gatte_api.h

Functions

esp_err_t esp_ble_gattc_register_callback(esp_gatcb_t callback)
   This function is called to register application callbacks with GATTC module.

   Return
   • ESP_OK: success
   • other: failed

   Parameters
   • [in] callback:: pointer to the application callback function.

esp_err_t esp_ble_gattc_app_register(uint16_t app_id)
   This function is called to register application callbacks with GATTC module.

   Return
   • ESP_OK: success
   • other: failed

   Parameters
   • [in] app_id:: Application Identify (UUID), for different application

esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)
   This function is called to unregister an application from GATTC module.

   Return
   • ESP_OK: success
   • other: failed
Chapter 2. API Reference

Parameters
• [in] gattc_if: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda,
                             esp_ble_addr_type_t remote_addr_type, bool is_direct)
```
Open a direct connection or add a background auto connection.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] remote_bda: remote device bluetooth device address.
• [in] remote_addr_type: remote device bluetooth device the address type.
• [in] is_direct: direct connection or background auto connection(by now, background auto connection is not supported).

```c
esp_err_t esp_ble_gattc_aux_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda,
                                 esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

```c
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
```
Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID to be closed.

```c
esp_err_t esp_ble_gattc_search_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)
```
This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] filter_uuid: a UUID of the service application is interested in. If Null, discover for all services.

```c
esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                          esp_bt_uuid_t *svc_uuid, esp_gatt_service_elem_t *result, uint16_t *count)
```
Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’ t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.
Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] svc_uuid: the pointer to the service uuid.
• [out] result: The pointer to the service which has been found in the gattc cache.
• [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• [in] offset: Offset of the service position to get.

findall the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle.
• [in] end_handle: the attribute end handle
• [out] result: The pointer to the characteristic in the service.
• [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
• [in] offset: Offset of the characteristic position to get.

findall the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] char_handle: the given characteristic handle
• [out] result: The pointer to the descriptor in the characteristic.
• [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
• [in] offset: Offset of the descriptor position to get.

findthe characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle
• [in] end_handle: the attribute end handle
• [in] char_uuid: the characteristic uuid
• [out] result: The pointer to the characteristic in the service.
• [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattccache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattccache Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle
• [in] end_handle: the attribute end handle
• [in] char_uuid: the characteristic uuid.
• [in] descr_uuid: the descriptor uuid.
• [out] result: The pointer to the descriptor in the given characteristic.
• [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattccache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattccache Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] char_handle: the characteristic handle.
• [in] descr_uuid: the descriptor uuid.
• [out] result: The pointer to the descriptor in the given characteristic.
• [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattccache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattccache Note: It just get include service from local cache, won’t get from remote devices.

**Return**

- ESP_OK: success
Chapter 2. API Reference

- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `incl_uuid`: the include service uuid
- [out] `result`: The pointer to the include service in the given service.
- [inout] `count`: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t incl_uuid, uint16_t* count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `type`: the attribute type.
- [in] `start_handle`: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] `end_handle`: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] `char_handle`: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- [out] `count`: output the number of attribute has been found in the gattc cache with the given attribute type.

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t* db, uint16_t* count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `conn_id`: connection ID which identify the server.
- [in] `db`: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] `count`: number of elements in database.

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
• [in] handle: characteristic handle to read.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] start_handle: the attribute start handle.
- [in] end_handle: the attribute end handle
- [in] uuid: The UUID of attribute which will be read.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] read_multi: pointer to the read multiple parameter.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: descriptor handle to read.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to write.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] write_type: the type of attribute write operation.
- [in] auth_req: authentication request.
### esp_err_t esp_ble_gattc_write_char_descr

This function is called to write characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: descriptor handle to write.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] write_type: the type of attribute write operation.
- [in] auth_req: authentication request.

### esp_err_t esp_ble_gattc_prepare_write

This function is called to prepare write a characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

### esp_err_t esp_ble_gattc_prepare_write_char_descr

This function is called to prepare write a characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic descriptor handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

### esp_err_t esp_ble_gattc_execute_write

This function is called to execute write a prepare write sequence.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
• [in] is_execute: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

**Return**
- ESP_OK: registration succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

**Return**
- ESP_OK: unregister succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_bda: remote device BD address.

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] src_addr: the source address which provide the attribute table.
- [in] assoc_addr: the associated device address which went to share the attribute table with the source address.
- [in] is_assoc: true add the associated device address, false remove the associated device address.

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTCC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**
- ESP_OK: success
- other: failed
### Parameters
- [in] `gattc_if`: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```

Clean the service cache of this device in the gattc stack.

### Return
- ESP_OK: success
- other: failed

### Parameters
- [in] `remote_bda`: remote device BD address.

### Unions

```c
union esp_ble_gattc_cb_param_t
```

#include `<esp_gattc_api.h>` Gatt client callback parameters union.

### Public Members

```c
struct esp_ble_gattc_cb_param_t::gattc_reg_evt_param reg
```
Gatt client callback param of ESP_GATTC_REG_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_open_evt_param open
```
Gatt client callback param of ESP_GATTC_OPEN_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_close_evt_param close
```
Gatt client callback param of ESP_GATTC_CLOSE_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_cfg_mtu_evt_param cfg_mtu
```
Gatt client callback param of ESP_GATTC_CFG_MTU_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_search_cmpl_evt_param search_cmpl
```
Gatt client callback param of ESP_GATTC_SEARCH_CMPL_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_search_res_evt_param search_res
```
Gatt client callback param of ESP_GATTC_SEARCH_RES_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_read_char_evt_param read
```
Gatt client callback param of ESP_GATTC_READ_CHAR_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_write_evt_param write
```
Gatt client callback param of ESP_GATTC_WRITE_DESCR_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_exec_cmpl_evt_param exec_cmpl
```
Gatt client callback param of ESP_GATTC_EXEC_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_notify_evt_param notify
```
Gatt client callback param of ESP_GATTC_NOTIFY_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_srvc_chg_evt_param srvc_chg
```
Gatt client callback param of ESP_GATTC_SRVC_CHG_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_congest_evt_param congest
```
Gatt client callback param of ESP_GATTC_CONGEST_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_reg_for_notify_evt_param reg_for_notify
```
Gatt client callback param of ESP_GATTC_REG_FOR_NOTIFY_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_unreg_for_notify_evt_param unreg_for_notify
```
Gatt client callback param of ESP_GATTC_UNREG_FOR_NOTIFY_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_connect_evt_param connect
```
Gatt client callback param of ESP_GATTC_CONNECT_EVT

```c
struct esp_ble_gattc_cb_param_t::gattc_disconnect_evt_param disconnect
```
Gatt client callback param of ESP_GATTC_DISCONNECT_EVT

Operation status
```

```c
uint16_t conn_id
Connection id
```

```c
uint16_t handle
The Characteristic or descriptor handle
```
uint16_t **offset**
The prepare write offset, this value is valid only when prepare write

**Type Definitions**

```c
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,
                              esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

**Parameters**

- `event`: Event type
- `gattc_if`: GATT client access interface, normally different gattc_if correspond to different profile
- `param`: Point to callback parameter, currently is union type

**Enumerations**

```c
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

**Values:**

- **ESP_GATTC_REG_EVT** = 0
  - When GATT client is registered, the event comes
- **ESP_GATTC_UNREG_EVT** = 1
  - When GATT client is unregistered, the event comes
- **ESP_GATTC_OPEN_EVT** = 2
  - When GATT virtual connection is set up, the event comes
- **ESP_GATTC_READ_CHAR_EVT** = 3
  - When GATT characteristic is read, the event comes
- **ESP_GATTC_WRITE_CHAR_EVT** = 4
  - When GATT characteristic write operation completes, the event comes
- **ESP_GATTC_CLOSE_EVT** = 5
  - When GATT virtual connection is closed, the event comes
- **ESP_GATTC_SEARCH_CMPL_EVT** = 6
  - When GATT service discovery is completed, the event comes
- **ESP_GATTC_SEARCH_RES_EVT** = 7
  - When GATT service discovery result is got, the event comes
- **ESP_GATTC_READ_DESCR_EVT** = 8
  - When GATT characteristic descriptor read completes, the event comes
- **ESP_GATTC_WRITE_DESCR_EVT** = 9
  - When GATT characteristic descriptor write completes, the event comes
- **ESP_GATTC_NOTIFY_EVT** = 10
  - When GATT notification or indication arrives, the event comes
- **ESP_GATTC_PREP_WRITE_EVT** = 11
  - When GATT prepare-write operation completes, the event comes
- **ESP_GATTC_EXEC_EVT** = 12
  - When write execution completes, the event comes
- **ESP_GATTC_ACL_EVT** = 13
  - When ACL connection is up, the event comes
- **ESP_GATTC_CANCEL_OPEN_EVT** = 14
  - When GATT client ongoing connection is cancelled, the event comes
Chapter 2. API Reference

ESP_GATTC_SRVC_CHG_EVT = 15
   When "service changed" occurs, the event comes

ESP_GATTC_ENC_CMPL_CB_EVT = 17
   When encryption procedure completes, the event comes

ESP_GATTC_CFG_MTU_EVT = 18
   When configuration of MTU completes, the event comes

ESP_GATTC_ADV_DATA_EVT = 19
   When advertising of data, the event comes

ESP_GATTC_MULT_ADV_ENB_EVT = 20
   When multi-advertising is enabled, the event comes

ESP_GATTC_MULT_ADV_UPD_EVT = 21
   When multi-advertising parameters are updated, the event comes

ESP_GATTC_MULT_ADV_DATA_EVT = 22
   When multi-advertising data arrives, the event comes

ESP_GATTC_MULT_ADV_DIS_EVT = 23
   When multi-advertising is disabled, the event comes

ESP_GATTC_CONGEST_EVT = 24
   When GATT connection congestion comes, the event comes

ESP_GATTC_BTH_SCAN_ENB_EVT = 25
   When batch scan is enabled, the event comes

ESP_GATTC_BTH_SCAN_CFG_EVT = 26
   When batch scan storage is configured, the event comes

ESP_GATTC_BTH_SCAN_RD_EVT = 27
   When Batch scan read event is reported, the event comes

ESP_GATTC_BTH_SCAN_THR_EVT = 28
   When Batch scan threshold is set, the event comes

ESP_GATTC_BTH_SCAN_PARAM_EVT = 29
   When Batch scan parameters are set, the event comes

ESP_GATTC_BTH_SCAN_DIS_EVT = 30
   When Batch scan is disabled, the event comes

ESP_GATTC_SCANFLT_CFG_EVT = 31
   When Scan filter configuration completes, the event comes

ESP_GATTC_SCANFLT_PARAM_EVT = 32
   When Scan filter parameters are set, the event comes

ESP_GATTC_SCANFLT_STATUS_EVT = 33
   When Scan filter status is reported, the event comes

ESP_GATTC_ADV_VSC_EVT = 34
   When advertising vendor spec content event is reported, the event comes

ESP_GATTC_REG_FOR_NOTIFY_EVT = 38
   When register for notification of a service completes, the event comes

ESP_GATTC_UNREG_FOR_NOTIFY_EVT = 39
   When unregister for notification of a service completes, the event comes

ESP_GATTC_CONNECT_EVT = 40
   When the ble physical connection is set up, the event comes

ESP_GATTC_DISCONNECT_EVT = 41
   When the ble physical connection disconnected, the event comes
Chapter 2. API Reference

**ESP_GATTC_READ_MULTIPLE_EVT = 42**
When the ble characteristic or descriptor multiple complete, the event comes

**ESP_GATTC_QUEUE_FULL_EVT = 43**
When the gattc command queue full, the event comes

**ESP_GATTC_SET_ASSOC_EVT = 44**
When the ble gattc set the associated address complete, the event comes

**ESP_GATTC_GET_ADDR_LIST_EVT = 45**
When the ble get gattc address list in cache finish, the event comes

**ESP_GATTC_DIS_SRVC_CMPL_EVT = 46**
When the ble discover service complete, the event comes

**BLUFI API**

**Overview**
BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example**
Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

**API Reference**

**Header File**

- components/bt/common/api/include/api/esp_blufi_api.h

**Functions**

`esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)`
This function is called to receive blufi callback event.

**Return**
ESP_OK - success, other - failed

**Parameters**

`[in] callbacks: callback functions`

`esp_err_t esp_blufi_profile_init (void)`
This function is called to initialize blufi_profile.

**Return**
ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit (void)`
This function is called to de-initialize blufi_profile.

**Return**
ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`
This function is called to send wifi connection report.

**Return**
ESP_OK - success, other - failed

**Parameters**

- `opmode`: wifi opmode
- `sta_conn_state`: station is already in connection or not
• **softap_conn_num**: softap connection number
• **extra_info**: extra information, such as sta_ssid, softap_ssid and etc.

```c
esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)
```
This function is called to send wifi list.

**Return**
- ESP_OK - success
- other - failed

**Parameters**
- **apCount**: wifi list count
- **list**: wifi list

```c
uint16_t esp_blufi_get_version (void)
```
Get BLUFI profile version.

**Return**
- Most 8bit significant is Great version,
- Least 8bit is Sub version

```c
esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)
```
This function is called to send blufi error information.

**Return**
- ESP_OK - success
- other - failed

**Parameters**
- **state**: error state

```c
esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)
```
This function is called to custom data.

**Return**
- ESP_OK - success
- other - failed

**Parameters**
- **data**: custom data value
- **data_len**: the length of custom data

### Unions

```c
union esp_blufi_cb_param_t
```
BLUFI callback parameters union.

#### Public Members

```c

    #include <esp_blufi_api.h> ESP_BLUFI_EVENT_RECV_USERNAME.

Public Members

uint8_t *name
    Username point
Chapter 2. API Reference

```c
int name_len
   Username length

struct blufi_set_wifi_mode_evt_param
   #include <esp_blufi_api.h> ESP_BLUFI_EVENT_SET_WIFI_MODE.

Public Members

wifi_mode_t op_mode
   Wifi operation mode

Structures

struct esp_blufi_extra_info_t
   BLUFI extra information structure.

Public Members

uint8_t sta_bssid[6]
   BSSID of station interface

bool sta_bssid_set
   is BSSID of station interface set

uint8_t *sta_ssid
   SSID of station interface

int sta_ssid_len
   length of SSID of station interface

uint8_t *sta_passwd
   password of station interface

int sta_passwd_len
   length of password of station interface

uint8_t *softap_ssid
   SSID of softap interface

int softap_ssid_len
   length of SSID of softap interface

uint8_t *softap_passwd
   password of station interface

int softap_passwd_len
   length of password of station interface

uint8_t softap_authmode
   authentication mode of softap interface

bool softap_authmode_set
   is authentication mode of softap interface set

uint8_t softap_max_conn_num
   max connection number of softap interface

bool softap_max_conn_num_set
   is max connection number of softap interface set

uint8_t softap_channel
   channel of softap interface

bool softap_channel_set
   is channel of softap interface set
```
struct esp_blufi_ap_record_t
   Description of an WiFi AP.

   **Public Members**

   int8_t ssid[33]
      SSID of AP

   int8_t rssi
      signal strength of AP

struct esp_blufi_callbacks_t
   BLUFI callback functions type.

   **Public Members**

   esp_blufi_event_cb_t event_cb
      BLUFI event callback

   esp_blufi_negotiate_data_handler_t negotiate_data_handler
      BLUFI negotiate data function for negotiate share key

   esp_blufi_encrypt_func_t encrypt_func
      BLUFI encrypt data function with share key generated by negotiate_data_handler

   esp_blufi_decrypt_func_t decrypt_func
      BLUFI decrypt data function with share key generated by negotiate_data_handler

   esp_blufi_checksum_func_t checksum_func
      BLUFI check sum function (FCS)

**Macros**

ESP_BD_ADDR_LEN
   Bluetooth address length.

**Type Definitions**

typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
   Bluetooth device address.

typedef void (*esp_blufi_event_cb_t)(esp_blufi_event_cb_t event, esp_blufi_cb_param_t *param)
   BLUFI event callback function type.

   **Parameters**

   • event:: Event type
   • param:: Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)
   BLUFI negotiate data handler.

   **Parameters**

   • data:: data from phone
   • len:: length of data from phone
   • output_data:: data want to send to phone
   • output_len:: length of data want to send to phone
   • need_free:: output reporting if memory needs to be freed or not*

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
   BLUFI encrypt the data after negotiate a share key.
Return  Nonnegative number is encrypted length, if error, return negative number;

Parameters
- iv8: initial vector(8bit), normally, blufi core will input packet sequence number
- crypt_data: plain text and encrypted data, the encrypt function must support autochthonous encrypt
- crypt_len: length of plain text

```c
typedef int(*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI decrypt the data after negotiate a share key.

Return  Nonnegative number is decrypted length, if error, return negative number;

Parameters
- iv8: initial vector(8bit), normally, blufi core will input packet sequence number
- crypt_data: encrypted data and plain text, the encrypt function must support autochthonous decrypt
- crypt_len: length of encrypted text

```c
typedef uint16_t(*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

BLUFI checksum.

Parameters
- iv8: initial vector(8bit), normally, blufi core will input packet sequence number
- data: data need to checksum
- len: length of data

Enumerations

```c
enum esp_blufi_cb_event_t
```

Values:

- `ESP_BLUFI_EVENT_INIT_FINISH` = 0
- `ESP_BLUFI_EVENT_DEINIT_FINISH`
- `ESP_BLUFI_EVENT_SET_WIFI_OPMODE`
- `ESP_BLUFI_EVENT_BLE_CONNECT`
- `ESP_BLUFI_EVENT_BLE_DISCONNECT`
- `ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP`
- `ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP`
- `ESP_BLUFI_EVENT_GET_WIFI_STATUS`
- `ESP_BLUFI_EVENT_DEAUTHENTICATE_STA`
- `ESP_BLUFI_EVENT_RECV_STA_BSSID`
- `ESP_BLUFI_EVENT_RECV_STA_SSID`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_SSID`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL`
- `ESP_BLUFI_EVENT_RECV_USERNAME`
- `ESP_BLUFI_EVENT_RECV_CA_CERT`
- `ESP_BLUFI_EVENT_RECV_CLIENT_CERT`
- `ESP_BLUFI_EVENT_RECV_SERVER_CERT`
Chapter 2. API Reference

```c
ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY
ESP_BLUFI_EVENT_RECV_SLAVE_DISCONNECT_BLE
ESP_BLUFI_EVENT_GET_WIFI_LIST
ESP_BLUFI_EVENT_REPORT_ERROR
ESP_BLUFI_EVENT_RECV_CUSTOM_DATA
```

```c
enum esp_blufi_sta_conn_state_t
BLUFI config status.
Values:
ESP_BLUFI_STA_CONN_SUCCESS = 0x00
ESP_BLUFI_STA_CONN_FAIL = 0x01
```

```c
enum esp_blufi_init_state_t
BLUFI init status.
Values:
ESP_BLUFI_INIT_OK = 0
ESP_BLUFI_INIT_FAILED
```

```c
enum esp_blufi_deinit_state_t
BLUFI deinit status.
Values:
ESP_BLUFI_DEINIT_OK = 0
ESP_BLUFI_DEINIT_FAILED
```

```c
enum esp_blufi_error_state_t
Values:
ESP_BLUFI_SEQUENCE_ERROR = 0
ESP_BLUFI_CHECKSUM_ERROR
ESP_BLUFI_DECRYPT_ERROR
ESP_BLUFI_ENCRYPT_ERROR
ESP_BLUFI_INIT_SECURITY_ERROR
ESP_BLUFI_DH_MALLOC_ERROR
ESP_BLUFI_DH_PARAM_ERROR
ESP_BLUFI_READ_PARAM_ERROR
ESP_BLUFI_MAKE_PUBLIC_ERROR
ESP_BLUFI_DATA_FORMAT_ERROR
```

### 2.1.4 CLASSIC BT

**CLASSIC BLUETOOTH GAP API**

**Overview**  Instructions

**Application Example**  Instructions
API Reference

Header File
- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

```c
static uint32_t esp_bt_gap_get_cod_svc(uint32_t cod)
get major service field of COD

return major service bits
parameters
• [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_major_dev(uint32_t cod)
get major device field of COD

return major device bits
parameters
• [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_minor_dev(uint32_t cod)
get minor service field of COD

return minor service bits
parameters
• [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_format_type(uint32_t cod)
get format type of COD

return format type
parameters
• [in] cod: Class of Device

static bool esp_bt_gap_is_valid_cod(uint32_t cod)
decline the integrity of COD

return
• true if code is valid
• false otherwise
parameters
• [in] cod: Class of Device
```

```c
esp_err_t esp_bt_gap_register_callback(esp_bt_gap_cb_t callback)
register callback function. This function should be called after esp_bluedroid_enable() completes successfully

return
• ESP_OK: Succeed
• ESP_FAIL: others

esp_err_t esp_bt_gap_set_scan_mode(esp_bt_connection_mode_t c_mode,
esp_bt_discovery_mode_t d_mode)
Set discoverability and connectability mode for legacy Bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

return
• ESP_OK: Succeed
• ESP_ERR_INVALID_ARG: if argument invalid
• ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others
parameters
• [in] c_mode: one of the enums of esp_bt_connection_mode_t
• [in] d_mode: one of the enums of esp_bt_discovery_mode_t
```
**esp_err_t esp_bt_gap_start_discovery**

This function starts Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. `esp bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` when Inquiry is started or Name Discovery is completed. `esp bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_RES_EVT` each time the two types of discovery results are got.

**Return**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

**Parameters**

- [in] `mode`: - Inquiry mode
- [in] `inq_len`: - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process,
  - when this time expires, Inquiry will be halted.
- [in] `num_rsps`: - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

**esp_err_t esp_bt_gap_cancel_discovery**

Cancel Inquiry and Name Discovery. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp bt_gap_cb_t` will be called with `ESP_BT_GAP_DISC_STATE_CHANGED_EVT` if Inquiry or Name Discovery is cancelled by calling this function.

**Return**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_bt_gap_get_remote_services**

Start SDP to get remote services. This function should be called after `esp_bluedroid_enable()` completes successfully. `esp bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVCS_EVT` after service discovery ends.

**Return**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_bt_gap_get_remote_service_record**

Start SDP to look up the service matching `uuid` on the remote device. This function should be called after `esp_bluedroid_enable()` completes successfully.

`esp bt_gap_cb_t` will be called with `ESP_BT_GAP_RMT_SRVC_REC_EVT` after service discovery ends.

**Return**

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**uint8_t* esp bt_gap_resolve_eir_data**

This function is called to get EIR data for a specific type.

**Return**

pointer of starting position of `eir` data excluding `eir` data type, NULL if not found

**Parameters**

- [in] `eir`: - pointer of raw eir data to be resolved
- [in] `type`: - specific EIR data type
- [out] `length`: - return the length of EIR data excluding fields of length and data type
**esp_err_t esp_bt_gap_config_eir_data (esp_bt_eir_data_t *eir_data)**

This function is called to config EIR data.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

**Parameters**
- [in] eir_data: - pointer of EIR data content

**esp_err_t esp_bt_gap_set_cod (esp_bt_cod_t cod, esp_bt_cod_mode_t mode)**

This function is called to set class of device. The structure esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

**Parameters**
- [in] cod: - class of device
- [in] mode: - setting mode

**esp_err_t esp_bt_gap_get_cod (esp.bt_cod_t *cod)**

This function is called to get class of device.

**Return**
- ESP_OK : Succeed
- ESP_FAIL: others

**Parameters**
- [out] cod: - class of device

**esp_err_t esp_bt_gap_read_rssi_delta (esp_bd_addr_t remote_addr)**

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

**Return**
- ESP_OK : Succeed
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: - remote device address, corresponding to a certain connection handle

**esp_err_t esp_bt_gap_remove_bond_device (esp_bd_addr_t bd_addr)**

Removes a device from the security database list of peer device.

**Return**
- ESP_OK : success
- ESP_FAIL : failed

**Parameters**
- [in] bd_addr: : BD address of the peer device

**int esp_bt_gap_get_bond_device_num (void)**

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return**
- >= 0 : bonded devices number
- ESP_FAIL : failed

**esp_err_t esp_bt_gap_get_bond_device_list (int *dev_num, esp_bd_addr_t *dev_list)**

Get the device from the security database list of peer device. It will return the device bonded information immediately.
## Chapter 2. API Reference

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[inout]** `dev_num`: Indicate the `dev_list` array(buffer) size as input. If `dev_num` is large enough, it means the actual number as output. Suggest that `dev_num` value equal to `esp_ble_get_bond_device_num()`.
- **[out]** `dev_list`: an array(buffer) of `esp_bd_addr_t` type. Use for storing the bonded devices address. The `dev_list` should be allocated by who call this API.

```c
esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
```

Set pin type and default pin code for legacy pairing.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- **[in]** `pin_type`: Use variable or fixed pin. If `pin_type` is ESP_BT_PIN_TYPE_VARIABLE, `pin_code` and `pin_code_len` will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- **[in]** `pin_code_len`: Length of `pin_code`
- **[in]** `pin_code`: Pin_code

```c
esp_err_t esp_bt_gap_set_security_param(esp_bt_sp_param_t param_type, void *value, uint8_t len)
```

Set a GAP security parameter value. Overrides the default value.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- **[in]** `param_type`: the type of the param which is to be set
- **[in]** `value`: the param value
- **[in]** `len`: the length of the param value

```c
esp_err_t esp_bt_gap_ssp_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
```

Reply the key value to the peer device in the legacy connection stage.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- **[in]** `bd_addr`: BD address of the peer
- **[in]** `accept`: passkey entry successful or declined.
- **[in]** `passkey`: passkey value, must be a 6 digit number, can be lead by 0.

```c
esp_err_t esp_bt_gap_ssp_confirm_reply(esp_bd_addr_t bd_addr, bool accept)
```
Chapter 2. API Reference

Reply the confirm value to the peer device in the legacy connection stage.

Return - ESP_OK : success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other : failed

Parameters
  - [in] bd_addr: BD address of the peer device
  - [in] accept: numbers to compare are the same or different

esp_err_t esp_bt_gap_set_afh_channels (esp_bt_gap_afh_channels channels)
Set the AFH channels.

Return - ESP_OK : success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other : failed

Parameters
  - [in] channels: The n th such field (in the range 0 to 78) contains the value for channel n :
    0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and
    shall be set to 0. At least 20 channels shall be marked as unknown.

esp_err_t esp_bt_gap_read_remote_name (esp_bd_addr_t remote_bda)
Read the remote device name.

Return - ESP_OK : success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other : failed

Parameters
  - [in] remote_bda: The remote device’s address

esp_err_t esp_bt_gap_set_qos (esp_bd_addr_t remote_bda, uint32_t t_poll)
Config Quality of service.

Return - ESP_OK : success
  - ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
  - other : failed

Parameters
  - [in] remote_bda: The remote device’s address
  - [in] t_poll: Poll interval, the maximum time between transmissions which from the master to
    a particular slave on the ACL logical transport. unit is 0.625ms

Unions

union esp_bt_gap_cb_param_t
#include <esp_gap_bt_api.h> A2DP state callback parameters.

Public Members

 Chapter 2. API Reference

```c
struct esp_bt_gap_dev_prop_t
    Bluetooth Device Property Descriptor.

Public Members

    esp_bt_gap_dev_prop_type_t type
        Device property type
    int len
        Device property value length
    void *val
        Device property value

struct esp_bt_eir_data_t
    EIR data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

    bool fec_required
        FEC is required or not, true by default
    bool include_txpower
        EIR data include TX power, false by default
    bool include_uuid
        EIR data include UUID, false by default
    uint8_t flag
        EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default
    uint16_t manufacturer_len
        Manufacturer data length, 0 by default
    uint8_t *p_manufacturer_data
        Manufacturer data point
    uint16_t url_len
        URL length, 0 by default
    uint8_t *p_url
        URL point

Macros

    ESP_BT_GAP_RSSI_HIGH_THRLD
        RSSI threshold.
        High RSSI threshold
    ESP_BT_GAP_RSSI_LOW_THRLD
        Low RSSI threshold
    ESP_BT_GAP_AFH_CHANNELS_LEN
```

Espressif Systems 265 Release v4.4

Submit Document Feedback
### ESP_BT_GAP_MAX_BDNAME_LEN
- Maximum bytes of Bluetooth device name.

### ESP_BT_GAP_EIR_DATA_LEN
- Maximum size of EIR Significant part.

### ESP_BT_EIR_TYPE_FLAGS
- Extended Inquiry Response data type.
  - Flag with information such as BR/EDR and LE support

### ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID
- Incomplete list of 16-bit service UUIDs

### ESP_BT_EIR_TYPE_CMPL_16BITS_UUID
- Complete list of 16-bit service UUIDs

### ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID
- Incomplete list of 32-bit service UUIDs

### ESP_BT_EIR_TYPE_CMPL_32BITS_UUID
- Complete list of 32-bit service UUIDs

### ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID
- Incomplete list of 128-bit service UUIDs

### ESP_BT_EIR_TYPE_CMPL_128BITS_UUID
- Complete list of 128-bit service UUIDs

### ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME
- Shortened Local Name

### ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME
- Complete Local Name

### ESP_BT_EIR_TYPE_TX_POWER_LEVEL
- Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

### ESP_BT_EIR_TYPE_URL
- Uniform resource identifier

### ESP_BT_EIR_TYPE_MANU_SPECIFIC
- Manufacturer specific data

### ESP_BT_EIR_TYPE_MAX_NUM
- MAX number of EIR type

### ESP_BT_EIR_FLAG_LIMIT_DISC

### ESP_BT_EIR_FLAG_GEN_DISC

### ESP_BT_EIR_FLAG_BREDR_NOT_SPT

### ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT

### ESP_BT_EIR_FLAG_DMT_HOST_SPT

### ESP_BT_EIR_MAX_LEN

### ESP_BT_PIN_CODE_LEN
- Max pin code length

### ESP_BT_IO_CAP_OUT

### ESP_BT_IO_CAP_IO

### ESP_BT_IO_CAP_IN

### ESP_BT_IO_CAP_NONE

### ESP_BT_PM_MD_ACTIVE
- Active mode
Chapter 2. API Reference

ESP_BT_PM_MD_HOLD
Hold mode

ESP_BT_PM_MD_SNIFF
Sniff mode

ESP_BT_PM_MD_PARK
Park state

ESP_BT_COD_SRVC_BIT_MASK
Bits of major service class field.

ESP_BT_COD_SRVC_BIT_OFFSET
Major service bit offset

ESP_BT_COD_MAJOR_DEV_BIT_MASK
Bits of major device class field.

ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK
Bits of minor device class field.

ESP_BT_COD_MINOR_DEV_BIT_OFFSET
Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK
Bits of format type.

ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
Format type bit offset

ESP_BT_COD_FORMAT_TYPE_1
Class of device format type 1.

ESP_BT_GAP_MIN_INQ_LEN
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

ESP_BT_GAP_MAX_INQ_LEN
Maximum inquiry duration, unit is 1.28s

Type Definitions
typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_eir_type_t

typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
    Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
    Combination of the IO Capability

typedef void(*esp.bt_gapCb_t)(esp.bt_gapCb_event_t event, esp.bt_gapCb_param_t *param)
    bluetooth GAP callback function type

Parameters
    • event:: Event type
    • param:: Pointer to callback parameter
Enumerations

```c
enum esp_bt_cod_mode_t
    class of device settings

Values:

ESP_BT_SET_COD_MAJOR_MINOR = 0x01
    overwrite major, minor class
ESP_BT_SET_COD_SERVICE_CLASS = 0x02
    set the bits in the input, the current bit will remain
ESP_BT_CLR_COD_SERVICE_CLASS = 0x04
    clear the bits in the input, others will remain
ESP_BT_SET_COD_ALL = 0x08
    overwrite major, minor, set the bits in service class
ESP_BT_INIT_COD = 0x0a
    overwrite major, minor, and service class
```

```c
enum esp_bt_connection_mode_t
    Discoverability and Connectability mode.

Values:

ESP_BT_NON_CONNECTABLE
    Non-connectable
ESP_BT_CONNECTABLE
    Connectable
```

```c
enum esp_bt_discovery_mode_t
    Values:

ESP_BT_NON_DISCOVERABLE
    Non-discoverable
ESP_BT_LIMITED_DISCOVERABLE
    Limited Discoverable
ESP_BT_GENERAL_DISCOVERABLE
    General Discoverable
```

```c
enum esp_bt_gap_dev_prop_type_t
    Bluetooth Device Property type.

Values:

ESP_BT_GAP_DEV_PROP_BDNAME = 1
    Bluetooth device name, value type is int8_t[]
ESP_BT_GAP_DEV_PROP_COD
    Class of Device, value type is uint32_t
ESP_BT_GAP_DEV_PROP_RSSI
    Received Signal strength Indication, value type is int8_t, ranging from -128 to 127
ESP_BT_GAP_DEV_PROP_EIR
    Extended Inquiry Response, value type is uint8_t[]
```

```c
enum esp_bt_cod_srvc_t
    Major service class field of Class of Device, multiple bits can be set.

Values:

ESP_BT_COD_SRVC_NONE = 0
    None indicates an invalid value
ESP_BT_COD_SRVC_LMTD_DISCOVER = 0x1
    Limited Discoverable Mode
```
Chapter 2. API Reference

ESP_BT_COD_SRVC_POSITIONING = 0x8
   Positioning (Location identification)

ESP_BT_COD_SRVC_NETWORKING = 0x10
   Networking, e.g. LAN, Ad hoc

ESP_BT_COD_SRVC_RENDERING = 0x20
   Rendering, e.g. Printing, Speakers

ESP_BT_COD_SRVC_CAPTURING = 0x40
   Capturing, e.g. Scanner, Microphone

ESP_BT_COD_SRVC_OBJ_TRANSFER = 0x80
   Object Transfer, e.g. v-Inbox, v-Folder

ESP_BT_COD_SRVC_AUDIO = 0x100
   Audio, e.g. Speaker, Microphone, Headset service

ESP_BT_COD_SRVC_TELEPHONY = 0x200
   Telephony, e.g. Cordless telephony, Modem, Headset service

ESP_BT_COD_SRVC_INFORMATION = 0x400
   Information, e.g., WEB-server, WAP-server

enum esp_bt_pin_type_t
Values:

ESP_BT_PIN_TYPE_VARIABLE = 0
   Refer to BTM_PIN_TYPE_VARIABLE

ESP_BT_PIN_TYPE_FIXED = 1
   Refer to BTM_PIN_TYPE_FIXED

enum esp_bt_sp_param_t
Values:

ESP_BT_SP_IOCAP_MODE = 0
   Set IO mode

enum esp_bt_cod_major_dev_t
Major device class field of Class of Device.
Values:

ESP_BT_COD_MAJOR_DEV_MISC = 0
   Miscellaneous

ESP_BT_COD_MAJOR_DEV_COMPUTER = 1
   Computer

ESP_BT_COD_MAJOR_DEV_PHONE = 2
   Phone(cellular, cordless, pay phone, modem

ESP_BT_COD_MAJOR_DEV_LAN_NAP = 3
   LAN, Network Access Point

ESP_BT_COD_MAJOR_DEV_AV = 4

Health
ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED = 31
Uncategorized: device not specified

enum esp_bt_gap_discovery_state_t
Bluetooth Device Discovery state

    Values:
    ESP_BT_GAP_DISCOVERY_STOPPED
    Device discovery stopped
    ESP_BT_GAP_DISCOVERY_STARTED
    Device discovery started

enum esp_bt_gap_cb_event_t
BT GAP callback events.

    Values:
    ESP_BT_GAP_DISC_RES_EVT = 0
    Device discovery result event
    ESP_BT_GAP_DISC_STATE_CHANGED_EVT
    Discovery state changed event
    ESP_BT_GAP_RMT_SRVCS_EVT
    Get remote services event
    ESP_BT_GAP_RMT_SRVC_REC_EVT
    Get remote service record event
    ESP_BT_GAP_AUTH_CMPL_EVT
    Authentication complete event
    ESP_BT_GAP_PIN_REQ_EVT
    Legacy Pairing Pin code request
    ESP_BT_GAP_CFM_REQ_EVT
    Security Simple Pairing User Confirmation request.
    ESP_BT_GAP_KEY_NOTIF_EVT
    Security Simple Pairing Passkey Notification
    ESP_BT_GAP_KEY_REQ_EVT
    Security Simple Pairing Passkey request
    ESP_BT_GAP_READ_RSSI_DELTA_EVT
    Read rssi event
    ESP_BT_GAP_CONFIG_EIR_DATA_EVT
    Config EIR data event
    ESP_BT_GAP_SET_AFH_CHANNELS_EVT
    Set AFH channels event
    ESP_BT_GAP_READ_REMOTE_NAME_EVT
    Read Remote Name event
    ESP_BT_GAP_MODE_CHG_EVT
    ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT
    remove bond device complete event
    ESP_BT_GAP_QOS_CMPL_EVT
    QOS complete event
    ESP_BT_GAP_EVT_MAX
enum esp_bt_inq_mode_t
Inquiry Mode

Values:

ESP_BT_INQ_MODE_GENERAL_INQUIRY
General inquiry mode

ESP_BT_INQ_MODE_LIMITED_INQUIRY
Limited inquiry mode

Bluetooth A2DP API

Overview

Instructions

Application Example
Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h

Functions

esp_err_t esp_a2d_register_callback(esp_a2d_cb_t callback)
Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] callback: A2DP event callback function

esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)
Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] callback: A2DP sink data callback function

esp_err_t esp_a2d_sink_init (void)
Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: if the initialization request is sent successfully
Chapter 2. API Reference

- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_deinit (void)`
De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

Return
- ESP_OK: if the deinitialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)`
Connect to remote bluetooth A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

Return
- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

`esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)`
Disconnect from the remote A2DP source device. This API must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

Return
- ESP_OK: disconnect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

`esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)`
Media control commands. This API can be used for both A2DP sink and source and must be called after esp_a2d_sink_init() and before esp_a2d_sink_deinit().

Return
- ESP_OK: control command is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] ctrl: control commands for A2DP data channel

`esp_err_t esp_a2d_source_init (void)`
Initialize the bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

Return
- ESP_OK: if the initialization request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_deinit (void)`
De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

Return
• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_a2d_source_register_data_callback(esp_a2d_source_data_cb_t callback)
```

Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] callback: A2DP source data callback function

```c
esp_err_t esp_a2d_source_connect(esp_bd_addr_t remote_bda)
```

Connect to remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

Return
- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

```c
esp_err_t esp_a2d_source_disconnect(esp_bd_addr_t remote_bda)
```

Disconnect from the remote A2DP sink device. This API must be called after esp_a2d_source_init() and before esp_a2d_source_deinit().

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote bluetooth device address

Unions

```c
union esp_a2d_cb_param_t
```

Include `<esp_a2dp_api.h>` A2DP state callback parameters.

Public Members

```c
struct esp_a2d_cb_param_t.a2d_conn_stat_param conn_stat
```

A2DP connection status

```c
struct esp_a2d_cb_param_t.a2d_audio_stat_param audio_stat
```

audio stream playing state

```c
struct esp_a2d_cb_param_t.a2d_audio_cfg_param audio_cfg
```

media codec configuration information

```c
struct esp_a2d_cb_param_t.media_ctrl_stat_param media_ctrl_stat
```

status in acknowledgement to media control commands

```c
struct esp_a2d_cb_param_t.a2d_prof_stat_param a2d_prof_stat
```

status to indicate a2d prof init or deinit

```c
struct a2d_audio_cfg_param
```

Include `<esp_a2dp_api.h>` ESP_A2D_AUDIO_CFG_EVT.
Chapter 2. API Reference

Public Members

```c
esp_bd_addr_t remote_bda
remote bluetooth device address
```

```c
esp_a2d_mcc_t mcc
A2DP media codec capability information

Type Definitions

\texttt{typedef uint8\_t esp\_a2d\_mct\_t}
A2DP profile callback function type.

\texttt{typedef void (*esp\_a2d\_cb\_t)(esp\_a2d\_cb\_event\_t event, esp\_a2d\_cb\_param\_t *param)}

typedef
A2DP profile callback function type.

Parameters

- \texttt{event::} Event type
- \texttt{param::} Pointer to callback parameter

\texttt{typedef void (*esp\_a2d\_sink\_data\_cb\_t)(const uint8\_t*buf, uint32\_t len)}
A2DP sink data callback function.

Parameters

- \texttt{buf::} pointer to the data received from A2DP source device and is PCM format decoded from SBC decoder; buf references to a static memory block and can be overwritten by upcoming data
- \texttt{len::} size(in bytes) in buf

\texttt{typedef int32\_t (*esp\_a2d\_source\_data\_cb\_t)(uint8\_t *buf, int32\_t len)}
A2DP source data read callback function.

Return
size of bytes read successfully, if the argument \texttt{len} is -1, this value is ignored.
### Parameters

- **[in]** `buf`:: buffer to be filled with PCM data stream from higher layer
- **[in]** `len`:: size(in bytes) of data block to be copied to `buf`. -1 is an indication to user that data buffer shall be flushed

### Enumerations

#### enum esp_a2d_connection_state_t

Bluetooth A2DP connection states.

**Values:**

- **ESP_A2D_CONNECTION_STATE_DISCONNECTED** = 0
  - connection released
- **ESP_A2D_CONNECTION_STATE_CONNECTING**
  - connecting remote device
- **ESP_A2D_CONNECTION_STATE_CONNECTED**
  - connection established
- **ESP_A2D_CONNECTION_STATE_DISCONNECTING**
  - disconnecting remote device

#### enum esp_a2d_disc_rsn_t

Bluetooth A2DP disconnection reason.

**Values:**

- **ESP_A2D_DISC_RSN_NORMAL** = 0
  - Finished disconnection that is initiated by local or remote device
- **ESP_A2D_DISC_RSN_ABNORMAL**
  - Abnormal disconnection caused by signal loss

#### enum esp_a2d_audio_state_t

Bluetooth A2DP datapath states.

**Values:**

- **ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND** = 0
  - audio stream datapath suspended by remote device
- **ESP_A2D_AUDIO_STATE_STOPPED**
  - audio stream datapath stopped
- **ESP_A2D_AUDIO_STATE_STARTED**
  - audio stream datapath started

#### enum esp_a2d_media_ctrl_ack_t

A2DP media control command acknowledgement code.

**Values:**

- **ESP_A2D_MEDIA_CTRL_ACK_SUCCESS** = 0
  - media control command is acknowledged with success
- **ESP_A2D_MEDIA_CTRL_ACK_FAILURE**
  - media control command is acknowledged with failure
- **ESP_A2D_MEDIA_CTRL_ACK_BUSY**
  - media control command is rejected, as previous command is not yet acknowledged

#### enum esp_a2d_media_ctrl_t

A2DP media control commands.

**Values:**

- **ESP_A2D_MEDIA_CTRL_NONE** = 0
  - Not for application use, use inside stack only.
Chapter 2. API Reference

ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_init_state_t
Bluetooth A2DP Initiation states.

Values:

ESP_A2D_DEINIT_SUCCESS = 0
A2DP profile deinit successful event

ESP_A2D_INIT_SUCCESS
A2DP profile init successful event

enum esp_a2d_cb_event_t
A2DP callback events.

Values:

ESP_A2D_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_A2D_AUDIO_STATE_EVT
audio stream transmission state changed event

ESP_A2D_AUDIO_CFG_EVT
audio codec is configured, only used for A2DP SINK

ESP_A2D_MEDIA_CTRL_ACK_EVT
acknowledge event in response to media control commands

ESP_A2D_PROF_STATE_EVT
indicate a2dp init&deinit complete

BT AVRCP APIs

Overview Bluetooth AVRCP reference APIs.

Instructions

Application Example Instructions

API Reference

Functions

esp_err_t esp_avrc_ct_register_callback (esp_avrc_ct_cb_t callback)
Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
Chapter 2. API Reference

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] callback: AVRCP controller callback function

```c
esp_err_t esp_avrc_ct_init (void)
```

Initialize the bluetooth AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_ct_deinit (void)
```

De-initialize AVRCP controller module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_ct_send_set_player_value_cmd (uint8_t tl, uint8_t attr_id, uint8_t value_id)
```

Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRC connection is established.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] tl: transaction label, 0 to 15, consecutive commands should use different values
- [in] attr_id: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
- [in] value_id: attribute value defined for the specific player application setting attribute

```c
esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd (uint8_t tl)
```

Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRC connection is established.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] tl: transaction label, 0 to 15, consecutive commands should use different values

```c
esp_err_t esp_avrc_ct_send_register_notification_cmd (uint8_t tl, uint8_t event_id, uint32_t event_parameter)
```

Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRC connection is established.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

**Parameters**
- [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
• [in] event_id: id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
• [in] event_parameter: playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

`esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd (uint8_t tl, uint8_t volume)`
Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

Parameters
• [in] tl: transaction label, 0 to 15, consecutive commands should use different values
• [in] volume: volume, 0 to 0x7f, means 0% to 100%

`esp_err_t esp_avrc_ct_send_metadata_cmd (uint8_t tl, uint8_t attr_mask)`
Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
• [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
• [in] attr_mask: mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

`esp_err_t esp_avrc_ct_send_passthrough_cmd (uint8_t tl, uint8_t key_code, uint8_t key_state)`
Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
• [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
• [in] key_code: passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
• [in] key_state: passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

`esp_err_t esp_avrc_tg_register_callback (esp_avrc_tg_cb_t callback)`
Register application callbacks to AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
• [in] callback: AVRCP target callback function

`esp_err_t esp_avrc_tg_init (void)`
Initialize the bluetooth AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.
Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_avrc_tg_deinit (void)
De-initialize AVRCP target module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRCP cannot work independently, AVRCP should be used along with A2DP and AVRC should be deinitialized before A2DP.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_avrc_tg_get_psth_cmd_filter (esp_avrc_psth_filter_t filter, esp_avrc_psth_bit_mask_t *cmd_set)
Get the current filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter().

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
• ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
• ESP_FAIL: otherwise

esp_err_t esp_avrc_tg_set_psth_cmd_filter (esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)
Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set “1” as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
• ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
• ESP_ERR_NOT_SUPPORTED: if filter type is ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes unallowed commands

bool esp_avrc_psth_bit_mask_operation (esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)
Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PASSTHROUGH command.

Return For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

Parameters

• [in] op: operation requested on the bit mask field
• [in] psth: pointer to passthrough command bit mask structure
• [in] cmd: passthrough command code
### esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in `evt_set`. This function should be called after esp_avrc_tg_init().

For capability type `ESP_AVRC_RN_CAP_ALLOWED_EVT`, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type `ESP_AVRC_RN_CAP_SUPPORTED_EVT`, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using esp_avrc_tg_set_rn_evt_cap().

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if `cap` is invalid or `evt_set` is NULL
- ESP_FAIL: otherwise

### esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in `evt_set` and must be a subset of allowed event IDs with current implementation. This function should be called after esp_avrc_tg_init().

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if `evt_set` is NULL

### bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *events, esp_avrc_rn_event_ids_t event_id)

Operate on the type `esp_avrc_rn_evt_cap_mask_t` with regard to a specific event.

For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

**Return**
For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise return false.

**Parameters**
- [in] `op`: operation requested on the bit mask field
- [in] `events`: pointer to event notification capability bit mask structure
- [in] `event_id`: notification event code

### esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp, esp_avrc_rn_param_t *param)

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using esp_avrc_tg_set_rn_evt_cap(), in a bit mask representation in `evt_set`. This function should be called after esp_avrc_tg_init().

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if `evt_set` is NULL

**Parameters**
- [in] `event_id`: notification event ID that remote AVRCP CT registers
- [in] `rsp`: notification response code
- [in] `param`: parameters included in the specific notification

### Unions

```c
union esp_avrc_rn_param_t

#include <esp_avrc_api.h> AVRCP notification parameters.
```
Public Members

`uint8_t volume`  
response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127

`esp_avrc_playback_stat_t playback`  
response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE

`uint8_t elm_id[8]`  
response data for ESP_AVRC_RN_TRACK_CHANGE

`uint32_t play_pos`  
response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond

`esp_avrc_batt_stat_t batt`  
response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE

union `esp_avrc_ct_cb_param_t`  
#include <esp_avrc_api.h> AVRC controller callback parameters.

Public Members

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat
AVRC connection status
```

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp
passsthrough command response
```

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp
metadata attributes response
```

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf
notifications
```

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats
AVRC features discovered from remote SDP server
```

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_get_rn_caps_rsp_param get_rn_caps_rsp
get supported event capabilities response from AVRCP target
```

```c
struct esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp
set absolute volume response event
```

```c
struct avrc_ct_change_notify_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CHANGE_NOTIFY_EVT.
```

Public Members

```c
uint8_t event_id
id of AVRC event notification
```

```c
esp_avrc_rn_param_t event_parameter
event notification parameter
```

```c
struct avrc_ct_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.
```

Public Members

```c
bool connected
whether AVRC connection is set up
```
```
estd::string remote_bda
remote bluetooth device address
```

**struct avrc_ct_get_rn_caps_rsp_param**

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CABILITIES_RSP_EVT.
```

**Public Members**

- `uint8_t cap_count`
  number of items provided in event or company_id according to cap_id used

- `esp_avrc_rn_evt_cap_mask_t evt_set`
  supported event_ids represented in bit-mask

**struct avrc_ct_meta_rsp_param**

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.
```

**Public Members**

- `uint8_t attr_id`
  id of metadata attribute

- `uint8_t *attr_text`
  attribute itself

- `int attr_length`
  attribute character length

**struct avrc_ct_psth_rsp_param**

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
```

**Public Members**

- `uint8_t tl`
  transaction label, 0 to 15

- `uint8_t key_code`
  passthrough command code

- `uint8_t key_state`
  0 for PRESSED, 1 for RELEASED

**struct avrc_ct_rmt_feats_param**

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_REMOTE_FEATURES_EVT.
```

**Public Members**

- `uint32_t feat_mask`
  AVRC feature mask of remote device

- `uint16_t tg_feat_flag`
  feature flag of remote device as TG

- `esp_bd_addr_t remote_bda`
  remote bluetooth device address

**struct avrc_ct_set_volume_rsp_param**

```c
#include <esp_avrc_api.h> ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT.
```
Public Members

```c
uint8_t volume
    the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%
union esp_avrc_tg_cb_param_t
#include <esp_avrc_api.h> AVRC target callback parameters.
```

Public Members

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_conn_stat_param conn_stat
    AVRC connection status
struct esp_avrc_tg_cb_param_t::avrc_tg_rmt_feats_param rmt_feats
    AVRC features discovered through SDP
struct esp_avrc_tg_cb_param_t::avrc_tg_psth_cmd_param psth_cmd
    passthrough command
struct esp_avrc_tg_cb_param_t::avrc_tg_set_abs_vol_param set_abs_vol
    set absolute volume command targeted on audio sink
struct esp_avrc_tg_cb_param_t::avrc_tg_reg_ntf_param reg_ntf
    register notification
struct esp_avrc_tg_cb_param_t::avrc_tg_set_app_value_param set_app_value
    set player application value
struct avrc_tg_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_TG_CONNECTION_STATE_EVT.
```

Public Members

```c
bool connected
    whether AVRC connection is set up
esp_bd_addr_t remote_bda
    remote bluetooth device address
struct avrc_tg_psth_cmd_param
#include <esp_avrc_api.h> ESP_AVRC_TG_PASSTHROUGH_CMD_EVT.
```

Public Members

```c
uint8_t keyCode
    passthrough command code
uint8_t key_state
    0 for PRESSED, 1 for RELEASED
struct avrc_tg_reg_ntf_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT.
```

Public Members

```c
uint8_t eventId
    event id of AVRC RegisterNotification
uint32_t eventParameter
    event notification parameter
```
struct avrc_tg_rmt_feats_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REMOTE_FEATURES_EVT.

Public Members

uint32_t feat_mask
AVRC feature mask of remote device

uint16_t ct_feat_flag
feature flag of remote device as CT

esp_bd_addr_t remote_bda
remote bluetooth device address

struct avrc_tg_set_abs_vol_param
#include <esp_avrc_api.h> ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT.

Public Members

uint8_t volume
volume ranges from 0 to 127

struct avrc_tg_setAppState_value_param
#include <esp_avrc_api.h> ESP_AVRC_TG_SETPLAYER_APP_VALUE_EVT.

Public Members

uint8_t num_val
attribute num

esp_avrc_setAppState_value_param_t *p_vals
point to the id and value of player application attribute

Structures

struct esp_avrc_psth_bit_mask_t
AVRC passthrough command bit mask.

Public Members

uint16_t bits[8]
bit mask representation of PASSTHROUGH commands

struct esp_avrc_rn_evt_cap_mask_t
AVRC target notification event capability bit mask.

Public Members

uint16_t bits
bit mask representation of PASSTHROUGH commands

struct esp_avrc_setAppState_value_param_t
AVRCP set app value parameters.
Public Members

```c
uint8_t attr_id
player application attribute id
```

```c
uint8_t attr_val
player application attribute value
```

Macros

```c
ESP_AVRC_TRANS_LABEL_MAX
max transaction label
```

Type Definitions

```c
typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)
    AVRCP controller callback function type.
```

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter union

```c
typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)
    AVRCP target callback function type.
```

Parameters

- `event`: Event type
- `param`: Pointer to callback parameter union

Enumerations

```c
enum esp_avrc_features_t
    AVRC feature bit mask.
```

Values:

```c
ESP_AVRC_FEAT_RCTG = 0x0001
remote control target
```

```c
ESP_AVRC_FEAT_RCCT = 0x0002
remote control controller
```

```c
ESP_AVRC_FEAT_VENDOR = 0x0008
remote control vendor dependent commands
```

```c
ESP_AVRC_FEAT_BROWSE = 0x0010
use browsing channel
```

```c
ESP_AVRC_FEAT_META_DATA = 0x0040
remote control metadata transfer command/response
```

```c
ESP_AVRC_FEAT_ADV_CTRL = 0x0200
remote control advanced control command/response
```

```c
enum esp_avrc_feature_flag_t
    AVRC supported features flag retrieved in SDP record.
```

Values:

```c
ESP_AVRC_FEAT_FLAG_CAT1 = 0x0001
category 1
```

```c
ESP_AVRC_FEAT_FLAG_CAT2 = 0x0002
category 2
```
ESP_AVRC_FEAT_FLAG_CAT3 = 0x0004
    category 3
ESP_AVRC_FEAT_FLAG_CAT4 = 0x0008
    category 4
ESP_AVRC_FEAT_FLAG_BROWSING = 0x0040
    browsing
ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE_PROP = 0x0080
    Cover Art GetImageProperties
ESP_AVRC_FEAT_FLAG_COVER_ART_GET_IMAGE = 0x0100
    Cover Art GetImage
ESP_AVRC_FEAT_FLAG_COVER_ART_GET_LINKED_THUMBNAIL = 0x0200
    Cover Art GetLinkedThumbnail

enum esp_avrc_pt_cmd_t
    AVRC passthrough command code.
    Values:
    ESP_AVRC_PT_CMD_SELECT = 0x00
        select
    ESP_AVRC_PT_CMD_UP = 0x01
        up

F5

ESP_AVRC_PT_CMD_VENDOR = 0x7E
vendor unique

gen esp_avrc_psth_filter_t
AVRC passthrough command filter.

Values:

ESP_AVRC_PSTH_FILTER_ALLOWED_CMD = 0
all of the PASSTHROUGH commands that can possibly be used, immutable

ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD = 1
PASSTHROUGH commands selectively supported according to the current configuration

enum esp_avrc_bit_mask_op_t
Values:
Chapter 2. API Reference

ESP_AVRC_BIT_MASK_OP_TEST = 0
operation code to test a specific bit

ESP_AVRC_BIT_MASK_OP_SET = 1
operation code to set a specific bit

ESP_AVRC_BIT_MASK_OP_CLEAR = 2
operation code to clear a specific bit

**enum esp_avrc_pt_cmd_state_t**  
AVRC passthrough command state.

**Values:**

ESP_AVRC_PT_CMD_STATE_PRESSED = 0  
key pressed

ESP_AVRC_PT_CMD_STATE_RELEASED = 1  
key released

**enum esp_avrc_ct_cb_event_t**  
AVRC Controller callback events.

**Values:**

ESP_AVRC_CT_CONNECTION_STATE_EVT = 0  
connection state changed event

ESP_AVRC_CT_PASSTHROUGH_RSP_EVT = 1  
passthrough response event

ESP_AVRC_CT_METADATA_RSP_EVT = 2  
metadata response event

ESP_AVRC_CT_PLAY_STATUS_RSP_EVT = 3  
play status response event

ESP_AVRC_CT_CHANGE_NOTIFY_EVT = 4  
notification event

ESP_AVRC_CT_REMOTE_FEATURES_EVT = 5  
feature of remote device indication event

ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT = 6  
supported notification events capability of peer device

ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT = 7  
set absolute volume response event

**enum esp_avrc_tg_cb_event_t**  
AVRC Target callback events.

**Values:**

ESP_AVRC_TG_CONNECTION_STATE_EVT = 0  
connection state changed event

ESP_AVRC_TG_REMOTE_FEATURES_EVT = 1  
feature of remote device indication event

ESP_AVRC_TG_PASSTHROUGH_CMD_EVT = 2  
passthrough command event

ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT = 3  
set absolute volume command from remote device

ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT = 4  
register notification event
ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT = 5
set application attribute value, attribute refer to esp_avrc_ps_attr_ids_t

enum esp_avrc_md_attr_mask_t
AVRC metadata attribute mask.
Values:

ESP_AVRC_MD_ATTR_TITLE = 0x1
title of the playing track
ESP_AVRC_MD_ATTR_ARTIST = 0x2
track artist
ESP_AVRC_MD_ATTR_ALBUM = 0x4
album name
ESP_AVRC_MD_ATTR_TRACK_NUM = 0x8
track position on the album
ESP_AVRC_MD_ATTR_NUM_TRACKS = 0x10
number of tracks on the album
ESP_AVRC_MD_ATTR_GENRE = 0x20
track genre
ESP_AVRC_MD_ATTR_PLAYING_TIME = 0x40
total album playing time in miliseconds

enum esp_avrc_rn_event_ids_t
AVRC event notification ids.
Values:

ESP_AVRC_RN_PLAY_STATUS_CHANGE = 0x01
track status change, eg. from playing to paused
ESP_AVRC_RN_TRACK_CHANGE = 0x02
new track is loaded
ESP_AVRC_RN_TRACK_REACHED_END = 0x03
current track reached end
ESP_AVRC_RN_TRACK_REACHED_START = 0x04
current track reached start position
ESP_AVRC_RN_PLAY_POS_CHANGED = 0x05
track playing position changed
ESP_AVRC_RN_BATTERY_STATUS_CHANGE = 0x06
battery status changed
ESP_AVRC_RN_SYSTEM_STATUS_CHANGE = 0x07
system status changed
ESP_AVRC_RN_APP_SETTING_CHANGE = 0x08
application settings changed
ESP_AVRC_RN_NOW_PLAYING_CHANGE = 0x09
now playing content changed
ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE = 0x0a
available players changed
ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE = 0x0b
the addressed player changed
ESP_AVRC_RN_UIDS_CHANGE = 0x0c
UIDs changed
ESP_AVRC_RN_VOLUME_CHANGE = 0x0d
volume changed locally on TG

ESP_AVRC_RN_MAX_EVT

enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.
Values:
ESP_AVRC_RN_CAP_ALLOWED_EVT = 0
all of the notification events that can possibly be supported, immutable

ESP_AVRC_RN_CAP_SUPPORTED_EVT = 1
notification events selectively supported according to the current configuration

ESP_AVRC_RN_CAP_MAX

enum esp_avrc_rn_rsp_t
AVRC notification response type.
Values:
ESP_AVRC_RN_RSP_INTERIM = 13
initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

ESP_AVRC_RN_RSP_CHANGED = 15
final response to RegisterNotification command

enum esp_avrc_ps_attr_ids_t
AVRC player setting ids.
Values:
ESP_AVRC_PS_EQUALIZER = 0x01
equalizer, on or off

ESP_AVRC_PS_REPEAT_MODE = 0x02
repeat mode

ESP_AVRC_PS_SHUFFLE_MODE = 0x03
shuffle mode

ESP_AVRC_PS_SCAN_MODE = 0x04
scan mode on or off

ESP_AVRC_PS_MAX_ATTR

enum esp_avrc_ps_eq_value_ids_t
AVRC equalizer modes.
Values:
ESP_AVRC_PS_EQUALIZER_OFF = 0x1
equalizer OFF

ESP_AVRC_PS_EQUALIZER_ON = 0x2
equalizer ON

enum esp_avrc_ps_rpt_value_ids_t
AVRC repeat modes.
Values:
ESP_AVRC_PS_REPEAT_OFF = 0x1
repeat mode off

ESP_AVRC_PS_REPEAT_SINGLE = 0x2
single track repeat
ESP_AVRC_PS_REPEAT_GROUP = 0x3
  group repeat

enum esp_avrc_ps_shf_value_ids_t
  AVRC shuffle modes.
  Values:
  ESP_AVRC_PS_SHUFFLE_OFF = 0x1
  ESP_AVRC_PS_SHUFFLE_ALL = 0x2
  ESP_AVRC_PS_SHUFFLE_GROUP = 0x3

enum esp_avrc_ps_scn_value_ids_t
  AVRC scan modes.
  Values:
  ESP_AVRC_PS_SCAN_OFF = 0x1
    scan off
  ESP_AVRC_PS_SCAN_ALL = 0x2
    all tracks scan
  ESP_AVRC_PS_SCAN_GROUP = 0x3
    group scan

enum esp_avrc_rsp_t
  AVCTP response codes.
  Values:
  ESP_AVRC_RSP_NOT_IMPL = 8
    not implemented
  ESP_AVRC_RSP_ACCEPT = 9
    accept
  ESP_AVRC_RSP_REJECT = 10
    reject
  ESP_AVRC_RSP_IN_TRANS = 11
    in transition
  ESP_AVRC_RSP_IMPL_STBL = 12
    implemented/stable
  ESP_AVRC_RSP_CHANGED = 13
    changed
  ESP_AVRC_RSP_INTERIM = 15
    interim

enum esp_avrc_batt_stat_t
  AVRCP battery status.
  Values:
  ESP_AVRC_BATT_NORMAL = 0
    normal state
  ESP_AVRC_BATT_WARNING = 1
    unable to operate soon
  ESP_AVRC_BATT_CRITICAL = 2
    cannot operate any more
  ESP_AVRC_BATT_EXTERNAL = 3
    plugged to external power supply
ESP_AVRC_BATT_FULL_CHARGE = 4
when completely charged from external power supply

**enum esp_avrc_playback_stat_t**
AVRCP current status of playback.

*Values:*

ESP_AVRC_PLAYBACK_STOPPED = 0
stopped
ESP_AVRC_PLAYBACK_PLAYING = 1
playing
ESP_AVRC_PLAYBACK_PAUSED = 2
paused
ESP_AVRC_PLAYBACK_FWD_SEEK = 3
forward seek
ESP_AVRC_PLAYBACK_REV_SEEK = 4
reverse seek
ESP_AVRC_PLAYBACK_ERROR = 0xFF
error

**SPP API**

**Overview**  Instructions

**Application Example**  Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

**API Reference**

**Header File**

- components/bluetooth/bluedroid/api/include/api/esp_spp_api.h

**Functions**

**esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)**
This function is called to init callbacks with SPP module.

*Return*

- ESP_OK: success
- other: failed

*Parameters*

- [in] callback: pointer to the init callback function.

**esp_err_t esp_spp_init (esp_spp_mode_t mode)**
This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

*Return*

- ESP_OK: success
- other: failed

*Parameters*
[in] mode: Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

**esp_err_t esp_spp_deinit (void)**

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init() completes successfully.

Return
- ESP_OK: success
- other: failed

**esp_err_t esp_spp_start_discovery (esp_bd_addr_t bd_addr)**

This function is called to performs service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

Parameters
- [in] bd_addr: Remote device bluetooth device address.

**esp_err_t esp_spp_connect (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)**

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

Parameters
- [in] role: Master or slave.
- [in] remote_scn: Remote device bluetooth device SCN.
- [in] peer_bd_addr: Remote device bluetooth device address.

**esp_err_t esp_spp_disconnect (uint32_t handle)**

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

Parameters
- [in] handle: The connection handle.

**esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)**

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

Parameters
Chapter 2. API Reference

- **[in] sec_mask:** Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **[in] role:** Master or slave.
- **[in] local_scn:** The specific channel you want to get. If channel is 0, means get any channel.
- **[in] name:** Server’s name.

```c
esp_err_t esp_spp_stop_srv(void)
```
This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

```c
esp_err_t esp_spp_stop_srv_scn(uint8_t scn)
```
This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Return
- ESP_OK: success
- other: failed

Parameters
- **[in] scn:** Server channel number.

```c
esp_err_t esp_spp_write(uint32_t handle, int len, uint8_t *p_data)
```
This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter ‘cong’ is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter ‘cong’ is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter ‘cong’ equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

Return
- ESP_OK: success
- other: failed

Parameters
- **[in] handle:** The connection handle.
- **[in] len:** The length of the data written.
- **[in] p_data:** The data written.

```c
esp_err_t esp_spp_vfs_register(void)
```
This function is used to register VFS. For now, SPP only supports write, read and close.

Return
- ESP_OK: success
- other: failed

Unions

```c
union esp_spp_cb_param_t
#include <esp_spp_api.h> SPP callback parameters union.
```

Public Members

```c
struct esp_spp_cb_param_t::spp_init_evt_param init
SPP callback param of SPP_INIT_EVT
```

**struct esp_spp_cb_param_t::spp_uninit_evt_param uninit**
SPP callback param of SPP_UNINIT_EVT

**struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp**
SPP callback param of SPP_DISCOVERY_COMP_EVT

**struct esp_spp_cb_param_t::spp_open_evt_param open**
SPP callback param of ESP_SPP_OPEN_EVT

**struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open**
SPP callback param of ESP_SPP_SRV_OPEN_EVT

**struct esp_spp_cb_param_t::spp_close_evt_param close**
SPP callback param of ESP_SPP_CLOSE_EVT

**struct esp_spp_cb_param_t::spp_start_evt_param start**
SPP callback param of ESP_SPP_START_EVT

**struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop**
SPP callback param of ESP_SPP_SRV_STOP_EVT

**struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init**
SPP callback param of ESP_SPP_CL_INIT_EVT

**struct esp_spp_cb_param_t::spp_write_evt_param write**
SPP callback param of ESP_SPP_WRITE_EVT

**struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind**
SPP callback param of ESP_SPP_DATA_IND_EVT

**struct esp_spp_cb_param_t::spp_cong_evt_param cong**
SPP callback param of ESP_SPP_CONG_EVT

**struct spp_cl_init_evt_param**
#include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

**Public Members**

**esp_spp_status_t status**
status

**uint32_t handle**
The connection handle

**uint8_t sec_id**
security ID used by this server

        congestion status

Macros

ESP_SPP_SEC_NONE  
    No security. relate to BTA_SEC_NONE in bta/bta_api.h

ESP_SPP_SEC_AUTHORIZE  
    Authorization required (only needed for out going connection ) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

ESP_SPP_SEC_AUTHENTICATE  
    Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

ESP_SPP_SEC_ENCRYPT  
    Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

ESP_SPP_SEC_MODE4_LEVEL4  
    Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

ESP_SPP_SEC_MITM  
    Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

ESP_SPP_SEC_IN_16_DIGITS  
    Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

ESP_SPP_MAX_MTU  
    SPP max MTU

ESP_SPP_MAX_SCN  
    SPP max SCN
Chapter 2. API Reference

**Type Definitions**

```c
typedef uint16_t esp_spp_sec_t
typedef void (esp_spp_cb_t)(esp_spp_cb_event_t event, esp_spp_cb_param_t *param)
```

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

**Parameters**

- `event`: Event type
- `param`: Point to callback parameter, currently is union type

**Enumerations**

```c
enum esp_spp_status_t

Values:

- ESP_SPP_SUCCESS = 0
  - Successful operation.
- ESP_SPP_FAILURE
  - Generic failure.
- ESP_SPP_BUSY
  - Temporarily can not handle this request.
- ESP_SPP_NO_DATA
  - No data
- ESP_SPP_NO_RESOURCE
  - No more resource
- ESP_SPP_NEED_INIT
  - SPP module shall init first
- ESP_SPP_NEED_DEINIT
  - SPP module shall deinit first
- ESP_SPP_NO_CONNECTION
  - Connection may have been closed
- ESP_SPP_NO_SERVER
  - No SPP server

enum esp_spp_role_t

Values:

- ESP_SPP_ROLE_MASTER = 0
  - Role: master
- ESP_SPP_ROLE_SLAVE = 1
  - Role: slave

enum esp_spp_mode_t

Values:

- ESP_SPP_MODE_CB = 0
  - When data is coming, a callback will come with data
- ESP_SPP_MODE_VFS = 1
  - Use VFS to write/read data

enum esp_spp_cb_event_t

SPP callback function events.

Values:

- ESP_SPP_INIT_EVT = 0
  - When SPP is init, the event comes
ESP_SPP_UNINIT_EVT = 1
When SPP is uninit, the event comes

ESP_SPP_DISCOVERY_COMP_EVT = 8
When SDP discovery complete, the event comes

ESP_SPP_OPEN_EVT = 26
When SPP Client connection open, the event comes

ESP_SPP_CLOSE_EVT = 27
When SPP connection closed, the event comes

ESP_SPP_START_EVT = 28
When SPP server started, the event comes

ESP_SPP_CL_INIT_EVT = 29
When SPP client initiated a connection, the event comes

ESP_SPP_DATA_IND_EVT = 30
When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_CONG_EVT = 31
When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_WRITE_EVT = 33
When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_SRV_OPEN_EVT = 34
When SPP Server connection open, the event comes

ESP_SPP_SRV_STOP_EVT = 35
When SPP server stopped, the event comes

Type Definitions

typedef void (*esp_hf_connection_state_callback)(esp_hf_connection_state_t state, esp_bd_addr_t *bd_addr)

Callback for connection state change. state will have one of the values from BtHfConnectionState

typedef void (*esp_hf_audio_state_callback)(esp_hf_audio_state_t state, esp_bd_addr_t *bd_addr)

Callback for audio connection state change. state will have one of the values from BtHfAudioState

typedef void (*esp_hf_vr_cmd_callback)(esp_hf_vr_state_t state, esp_bd_addr_t *bd_addr)

Callback for VR connection state change. state will have one of the values from BtHfVRState

typedef void (*esp_hf_answer_call_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for answer incoming call (ATA)

typedef void (*esp_hf_hangup_call_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for disconnect call (AT+CHUP)

typedef void (*esp_hf_volume_cmd_callback)(esp_hf_volume_control_target_t type, int volume, esp_bd_addr_t *bd_addr)

Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHfVolumeControl).

typedef void (*esp_hf_dial_call_cmd_callback)(char *number, esp_bd_addr_t *bd_addr)

Callback for dialing an outgoing call If number is NULL, redial

typedef void (*esp_hf_dtmf_cmd_callback)(char tone, esp_bd_addr_t *bd_addr)

Callback for sending DTMF tones tone contains the dtmf character to be sent

typedef void (*esp_hf_nrec_cmd_callback)(esp_hf_nrec_t nrec, esp_bd_addr_t *bd_addr)

Callback for enabling/disabling noise reduction/echo cancellation value will be 1 to enable, 0 to disable

typedef void (*esp_hf_wbs_callback)(esp_hf_wbs_config_t wbs, esp_bd_addr_t *bd_addr)

Callback for AT+BCS and event from BAC WBS enable, WBS disable

typedef void (*esp_hf_chld_cmd_callback)(esp_hf_chld_type_t chld, esp_bd_addr_t *bd_addr)

Callback for call hold handling (AT+CHLD) value will contain the call hold command (0, 1, 2, 3)

typedef void (*esp_hf_cnum_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for CNUM (subscriber number)

typedef void (*esp_hf_cind_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for indicators (CIND)

typedef void (*esp_hf_cops_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for operator selection (COPS)

typedef void (*esp_hf_clcc_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for call list (AT+CLCC)

typedef void (*esp_hf_unknown_at_cmd_callback)(char *at_string, esp_bd_addr_t *bd_addr)

Callback for unknown AT command recd from AG at_string will contain the unparsed AT string

typedef void (*esp_hf_key_pressed_cmd_callback)(esp_bd_addr_t *bd_addr)

Callback for keypressed (HSP) event.

Enumerations

enum esp_hf_in_band_ring_state_t

in-band ring tone state

Values:

ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED = 0
ESPF_HF_IN_BAND_RINGTONE_PROVIDED
enum esp_hf_vr_state_t
  voice recognition state

Values:

ESP_HF_VR_STATE_DISABLED = 0
  voice recognition disabled

ESP_HF_VR_STATE_ENABLED
  voice recognition enabled

enum esp_hf_volume_control_target_t
  Bluetooth HFP audio volume control target.

Values:

ESP_HF_VOLUME_CONTROL_TARGET_SPK = 0
  speaker

ESP_HF_VOLUME_CONTROL_TARGET_MIC
  microphone

enum esp_hf_audio_state_t
  Bluetooth HFP audio connection status.

Values:

ESP_HF_AUDIO_STATE_DISCONNECTED = 0
  audio connection released

ESP_HF_AUDIO_STATE_CONNECTING
  audio connection has been initiated

ESP_HF_AUDIO_STATE_CONNECTED
  audio connection is established

ESP_HF_AUDIO_STATE_CONNECTED_MSBC
  mSBC audio connection is established

enum esp_hf_volume_type_t
  Values:

ESP_HF_VOLUME_TYPE_SPK = 0

ESP_HF_VOLUME_TYPE_MIC

enum esp_hf_network_state_t
  +CIND network service availability status

Values:

ESP_HF_NETWORK_STATE_NOT_AVAILABLE = 0

ESP_HF_NETWORK_STATE_AVAILABLE

enum esp_hf_service_type_t
  +CIEV Service type

Values:

ESP_HF_SERVICE_TYPE_HOME = 0

ESP_HF_SERVICE_TYPE_ROAMING

enum esp_hf_call_status_t
  +CIND call status indicator values

Values:

ESP_HF_CALL_STATUS_NO_CALLS = 0
  no call in progress
ESP_HF_CALL_STATUS_CALL_IN_PROGRESS = 1
call is present (active or held)

enum esp_hf_call_setup_status_t
+CIND call setup status indicator values

Values:
ESP_HF_CALL_SETUP_STATUS_IDLE = 0
no call setup in progress
ESP_HF_CALL_SETUP_STATUS_INCOMING = 1
incoming call setup in progress
ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING = 2
outgoing call setup in dialing state
ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING = 3
outgoing call setup in alerting state

enum esp_hf_roaming_status_t
+CIND roaming status indicator values

Values:
ESP_HF_ROAMING_STATUS_INACTIVE = 0
roaming is not active
ESP_HF_ROAMING_STATUS_ACTIVE
a roaming is active

enum esp_hf_call_held_status_t
+CIND call held indicator values

Values:
ESP_HF_CALL_HELD_STATUS_NONE = 0
no calls held
ESP_HF_CALL_HELD_STATUS_HELD_AND_ACTIVE = 1
both active and held call
ESP_HF_CALL_HELD_STATUS_HELD = 2
call on hold, no active call

enum esp_hf_current_call_status_t
+CCLC status of the call

Values:
ESP_HF_CURRENT_CALL_STATUS_ACTIVE = 0
active
ESP_HF_CURRENT_CALL_STATUS_HELD = 1
held
ESP_HF_CURRENT_CALL_STATUS_DIALING = 2
dialing (outgoing calls only)
ESP_HF_CURRENT_CALL_STATUS_ALERTING = 3
alerting (outgoing calls only)
ESP_HF_CURRENT_CALL_STATUS_INCOMING = 4
incoming (incoming calls only)
ESP_HF_CURRENT_CALL_STATUS_WAITING = 5
waiting (incoming calls only)
ESP_HF_CURRENT_CALL_STATUS_HELD_BY_RESP_HOLD = 6
call held by response and hold
enum esp_hf_current_call_direction_t
+CLCC direction of the call

Values:

ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING = 0
    outgoing
ESP_HF_CURRENT_CALL_DIRECTION_INCOMING = 1
    incoming

enum esp_hf_current_call_mpty_type_t
+CLCC multi-party call flag

Values:

ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE = 0
    not a member of a multi-party call
ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI = 1
    member of a multi-party call

enum esp_hf_current_call_mode_t
+CLCC call mode

Values:

ESP_HF_CURRENT_CALL_MODE_VOICE = 0
ESP_HF_CURRENT_CALL_MODE_DATA = 1
ESP_HF_CURRENT_CALL_MODE_FAX = 2

enum esp_hf_call_addr_type_t
+CLCC address type

Values:

ESP_HF_CALL_ADDR_TYPE_UNKNOWN = 0x81
    unknown address type
ESP_HF_CALL_ADDR_TYPEINTERNATIONAL = 0x91
    international address

enum esp_hf_subscriber_service_type_t
+CNUM service type of the phone number

Values:

ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN = 0
    unknown
ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE
    voice service
ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
    fax service

enum esp_hf_btrh_status_t
+BTRH response and hold result code

Values:

ESP_HF_BTRH_STATUS_HELD = 0
    incoming call is put on held in AG
ESP_HF_BTRH_STATUS_ACCEPTED
    held incoming call is accepted in AG
ESP_HF_BTRH_STATUS_REJECTED
    held incoming call is rejected in AG
enum esp_hf_btrh_cmd_t
AT+BTRH response and hold action code.

Values:
ESP_HF_BTRH_CMD_HOLD = 0
put the incoming call on hold
ESP_HF_BTRH_CMD_ACCEPT = 1
accept a held incoming call
ESP_HF_BTRH_CMD_REJECT = 2
reject a held incoming call

enum esp_hf_nrec_t
Values:
ESP_HF_NREC_STOP = 0
ESP_HF_NREC_START

enum esp_hf_call_waiting_status_t
+CCWA response status

Values:
ESP_HF_CALL_WAITING_INACTIVE
ESP_HF_CALL_WAITING_ACTIVE

enum esp_hf_wbs_config_t
Values:
ESP_HF_WBS_NONE
ESP_HF_WBS_NO
ESP_HF_WBS_YES

enum esp_hf_connection_state_t
Bluetooth HFP RFCOMM connection and service level connection status.

Values:
ESP_HF_CONNECTION_STATE_DISCONNECTED = 0
RFCOMM data link channel released
ESP_HF_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link
ESP_HF_CONNECTION_STATE_CONNECTED
RFCOMM connection established
ESP_HF_CONNECTION_STATE_SLC_CONNECTED
service level connection established
ESP_HF_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM data link

enum esp_hf_chld_type_t
AT+CHLD command values.

Values:
ESP_HF_CHLD_TYPE_REL = 0
<0>, Terminate all held or set UDUB( “busy” ) to a waiting call
ESP_HF_CHLD_TYPE_REL_ACC
<1>, Terminate all active calls and accepts a waiting/held call
ESP_HF_CHLD_TYPE_HOLD_ACC
<2>, Hold all active calls and accepts a waiting/held call
ESP_HF_CHLD_TYPE_MERGE
<3>, Add all held calls to a conference

ESP_HF_CHLD_TYPE_MERGE_DETACH
<4>, connect the two calls and disconnects the subscriber from both calls

ESP_HF_CHLD_TYPE_REL_X
<1x>, releases specified calls only

ESP_HF_CHLD_TYPE_PRIV_X
<2x>, request private consultation mode with specified call

```c
enum esp_hf_at_response_code_t
{
    ESP_HF_AT_RESPONSE_CODE_OK = 0,
    ESP_HF_AT_RESPONSE_CODE_ERR,
    ESP_HF_AT_RESPONSE_CODE_NO_CARRIER,
    ESP_HF_AT_RESPONSE_CODE_BUSY,
    ESP_HF_AT_RESPONSE_CODE_NO_ANSWER,
    ESP_HF_AT_RESPONSE_CODE_DELAYED,
    ESP_HF_AT_RESPONSE_CODE_BLACKLISTED,
    ESP_HF_AT_RESPONSE_CODE_CME,
};
```

Values:

ESP_HF_AT_RESPONSE_CODE_OK = 0
acknowledges execution of a command line

ESP_HF_AT_RESPONSE_CODE_ERR
command not accepted

ESP_HF_AT_RESPONSE_CODE_NO_CARRIER
connection terminated

ESP_HF_AT_RESPONSE_CODE_BUSY
busy signal detected

ESP_HF_AT_RESPONSE_CODE_NO_ANSWER
connection completion timeout

ESP_HF_AT_RESPONSE_CODE_DELAYED
delayed

ESP_HF_AT_RESPONSE_CODE_BLACKLISTED
blacklisted

ESP_HF_AT_RESPONSE_CODE_CME
CME error

```c
enum esp_hf_at_response_t
{
    ESP_HF_AT_RESPONSE_ERROR = 0,
    ESP_HF_AT_RESPONSE_OK,
};
```

```c
enum esp_hf_cme_err_t
{
    ESP_HF_CME_AG_FAILURE = 0,
    ESP_HF_CME_NO_CONNECTION_TO_PHONE = 1,
    ESP_HF_CME_OPERATION_NOT_ALLOWED = 3,
    ESP_HF_CME_OPERATION_NOT_SUPPORTED = 4,
    ESP_HF_CME_PH_SIM_PIN_REQUIRED = 5,
    ESP_HF_CME_SIM_NOT_INSERTED = 10,
};
```

Extended Audio Gateway Error Result Code Response.

Values:

ESP_HF_CME_AG_FAILURE = 0
ag failure

ESP_HF_CME_NO_CONNECTION_TO_PHONE = 1
no connection to phone

ESP_HF_CME_OPERATION_NOT_ALLOWED = 3
operation not allowed

ESP_HF_CME_OPERATION_NOT_SUPPORTED = 4
operation not supported

ESP_HF_CME_PH_SIM_PIN_REQUIRED = 5
PH-SIM PIN Required

ESP_HF_CME_SIM_NOT_INSERTED = 10
SIM not inserted
### HFP CLIENT API

**Overview**  Instructions

**API Reference**

**Header File**

- components/bluetooth/bluedroid/include/api/esp_hf_client_api.h
Functions

esp_err_t esp_hf_client_register_callback(esp_hf_client_cb_t callback)

Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] callback: HFP client event callback function

esp_err_t esp_hf_client_init(void)

Initialize the Bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_deinit(void)

De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_connect(esp_bd_addr_t remote_bda)

Establish a Service Level Connection to remote Bluetooth HFP audio gateway (AG) device. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Return
- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote Bluetooth device address

esp_err_t esp_hf_client_disconnect(esp_bd_addr_t remote_bda)

Disconnect from the remote HFP audio gateway. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote Bluetooth device address

esp_err_t esp_hf_client_connect_audio(esp_bd_addr_t remote_bda)

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote Bluetooth device address

esp_err_t esp_hf_client_disconnect_audio(esp_bd_addr_t remote_bda)

Release the established audio connection with remote HFP AG. As a precondition to use this API, Service
Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_hf_client_start_voice_recognition(void)`
Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_stop_voice_recognition(void)`
Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_volume_update(esp_hf_volume_control_target_t type, int volume)`
Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker or microphone, range 0 to 15

`esp_err_t esp_hf_client_dial(const char* number)`
Place a call with a specified number. If number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] number: number string of the call. If NULL, the last number is called (aka re-dial)

`esp_err_t esp_hf_client_dial_memory(int location)`
Place a call with number specified by location (speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] location: location of the number in the memory

`esp_err_t esp_hf_client_send_chld_cmd(esp_hf_child_type_t child, int idx)`
Send call hold and multiparty commands, or enhanced call control commands (Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.
Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] chld: AT+CHLD call hold and multiparty handling AT command.
• [in] idx: used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

```c
esp_err_t esp_hf_client_send_btrh_cmd (esp_hf_btrh_cmd_t btrh)
```

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] btrh: response and hold action to send

```c
esp_err_t esp_hf_client_answer_call (void)
```

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_reject_call (void)
```

Reject an incoming call(send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_query_current_calls (void)
```

Query list of current calls in AG(send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_query_current_operator_name (void)
```

Query the name of currently selected network operator in AG(use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

```c
esp_err_t esp_hf_client_retrieve_subscriber_info (void)
```

Get subscriber information number from AG(send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
```c
esp_err_t esp_hf_client_send_dtmf(char code)
Transmit DTMF codes during an ongoing call (use AT+VTS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] code: DTMF code, single ascii character in the set 0-9, #, *, A-D
```

```c
esp_err_t esp_hf_client_request_last_voice_tag_number (void)
Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others
```

```c
esp_err_t esp_hf_client_send_nrec (void)
Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others
```

```c
esp_err_t esp_hf_client_register_data_callback (esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)
Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] recv: HFP client incoming data callback function
- [in] send: HFP client outgoing data callback function
```

```c
void esp_hf_client_outgoing_data_ready (void)
Trigger the lower-layer to fetch and send audio data. This function is only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.
```

```c
void esp_hf_client_pcm_resample_init (uint32_t src_sps, uint32_t bits, uint32_t channels)
Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

Parameters
- [in] src_sps: original samples per second (source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- [in] bits: number of bits per PCM sample (16)
- [in] channels: number of channels (i.e. mono(1), stereo(2) …)
```

```c
void esp_hf_client_pcm_resample_deinit (void)
Deinitialize the down sampling converter.
```

```c
int32_t esp_hf_client_pcm_resample (void *src, uint32_t in_bytes, void *dst)
Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.
```
Return

number of samples converted

Parameters

- [in] src: pointer to the buffer where the original sampling PCM are stored
- [in] in_bytes: length of the input PCM sample buffer in byte
- [in] dst: pointer to the buffer which is to be used to store the converted PCM samples

Unions

### Type Definitions

**typedef** `void (*esp_hf_client_incoming_data_cb_t)(const uint8_t*buf, uint32_t len)`

HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

**Parameters**

- `[in] buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- `[in] len`: size (in bytes) in `buf`

**typedef** `uint32_t (*esp_hf_client_outgoing_data_cb_t)(uint8_t*buf, uint32_t len)`

HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

**Return** length of data successfully read

**Parameters**

- `[in] buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
- `[in] len`: size (in bytes) in `buf`

**typedef** `void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)`

HFP client callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

### Enumerations

**enum esp_hf_client_connection_state_t**

Bluetooth HFP RFCOMM connection and service level connection status.

**Values**:

- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED = 0`
  - RFCOMM data link channel released
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING`
  - connecting remote device on the RFCOMM data link
- `ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED`
  - RFCOMM connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED`
  - service level connection established
- `ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING`
  - disconnecting with remote device on the RFCOMM dat link

**enum esp_hf_client_audio_state_t**

Bluetooth HFP audio connection status.

**Values**:

- `ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED = 0`
  - audio connection released
- `ESP_HF_CLIENT_AUDIO_STATE_CONNECTING`
  - audio connection has been initiated
ESP_HF_CLIENT_AUDIO_STATE_CONNECTED
    audio connection is established

ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC
    mSBC audio connection is established

enum esp_hf_client_in_band_ring_state_t
    in-band ring tone state

Values:

ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0
 ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_client_cb_event_t
    HF CLIENT callback events.

Values:

ESP_HF_CLIENT_CONNECTION_STATE_EVT = 0
    connection state changed event

ESP_HF_CLIENT_AUDIO_STATE_EVT
    audio connection state change event

ESP_HF_CLIENT_BVRA_EVT
    voice recognition state change event

ESP_HF_CLIENT_CIND_CALL_EVT
    call indication

ESP_HF_CLIENT_CIND_CALL_SETUP_EVT
    call setup indication

ESP_HF_CLIENT_CIND_CALL_HELD_EVT
    call held indication

ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT
    network service availability indication

ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT
    signal strength indication

ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
    roaming status indication

ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
    battery level indication

ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
    current operator information

ESP_HF_CLIENT_BTRH_EVT
    call response and hold event

ESP_HF_CLIENT_CLIP_EVT
    Calling Line Identification notification

ESP_HF_CLIENT_CCWA_EVT
    call waiting notification

ESP_HF_CLIENT_CLCC_EVT
    list of current calls notification

ESP_HF_CLIENT_VOLUME_CONTROL_EVT
    audio volume control command from AG, provided by +VGM or +VGS message

ESP_HF_CLIENT_AT_RESPONSE_EVT
    AT command response event
ESP_HF_CLIENT_CNUM_EVT
subscriber information response from AG

ESP_HF_CLIENT_BSIR_EVT
setting of in-band ring tone

ESP_HF_CLIENT_BINP_EVT
requested number of last voice tag from AG

ESP_HF_CLIENT_RING_IND_EVT
ring indication event

HFP AG API

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_hf_ag_api.h

Functions

$\text{esp_err_t esp_bt_hf_register_callback (esp_hf_cb_t callback)}$
Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: if callback is a NULL function pointer

Parameters

• [in] callback: HFP AG event callback function

$\text{esp_err_t esp_bt_hf_init (esp_bd_addr_t remote_addr)}$
Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

• ESP_OK: if the initialization request is sent successfully
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• [in] remote_addr: remote bluetooth device address

$\text{esp_err_t esp_bt_hf_deinit (esp_bd_addr_t remote_addr)}$
De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

• ESP_OK: success
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters

• [in] remote_addr: remote bluetooth device address

$\text{esp_err_t esp_bt_hf_connect (esp_bd_addr_t remote_bda)}$
To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

Return

• ESP_OK: connect request is sent to lower layer
• ESP_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others
Parameters

- [in] remote_bda: remote bluetooth HFP client device address

esp_err_t esp_bt_hf_disconnect (esp_bd_addr_t remote_bda)
Disconnect from the remote HFP client. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address

esp_err_t esp_bt_hf_connect_audio (esp_bd_addr_t remote_bda)
Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address

esp_err_t esp_bt_hf_disconnect_audio (esp_bd_addr_t remote_bda)
Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address

esp_err_t esp_bt_hf_vra (esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)
Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: the device address of voice recognition initiator
- [in] value: 0 - voice recognition disabled, 1- voice recognition enabled

esp_err_t esp_bt_hf_volume_control (esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)
Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

esp_err_t esp_hf_unat_response (esp_bd_addr_t remote_addr, char *unat)
Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection
shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_addr: remote bluetooth device address
- [in] unat: User AT command response to HF Client. It will respond “ERROR” by default if unat is NULL.

```c
esp_err_t esp_bt_hf_cmee_response(esp_bd_addr_t remote_bda,
                                  esp_hf_at_response_code_t response_code,
                                  esp_hf_cme_err_t error_code)
```

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address
- [in] response_code: AT command response code
- [in] error_code: CME error code

```c
esp_err_t esp_bt_hf_indchange_notification(esp_bd_addr_t remote_addr,
                                          esp_hf_call_status_t call_state,
                                          esp_hf_call_setup_status_t call_setup_state,
                                          esp_hf_network_state_t ntk_state,
                                          int signal)
```

Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_addr: remote bluetooth device address
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] ntk_state: network service state
- [in] signal: signal strength from 0 to 5

```c
esp_err_t esp_bt_hf_cind_response(esp_bd_addr_t remote_addr,
                                  esp_hf_call_status_t call_state,
                                  esp_hf_call_setup_status_t call_setup_state,
                                  esp_hf_network_state_t ntk_state,
                                  esp_hf_roaming_status_t roam,
                                  esp_hf_held_status_t call_held_state)
```

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_addr: remote bluetooth device address
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] ntk_state: network service state
- [in] signal: signal strength from 0 to 5
- [in] roam: roam state
Chapter 2. API Reference

• [in] batt_lev: battery level from 0 to 5
• [in] call_held_status: call held status

\texttt{esp_err_t esp_bt_hf_cops_response(esp_bd_addr_t remote_addr, char *name)}

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] remote_addr: remote Bluetooth device address

\texttt{esp_err_t esp_bt_hf_clcc_response(esp_bd_addr_t remote_addr, int index, esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state, esp_hf_current_call_mode_t mode, esp_hf_current_call_mpty_type_t mpty, char *number, esp_hf_call_addr_type_t type)}

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] remote_addr: remote Bluetooth device address
• [in] index: the index of current call
• [in] dir: call direction (incoming/outgoing)
• [in] current_call_state: current call state
• [in] mode: current call mode (voice/data/fax)
• [in] mpty: single or multi type
• [in] number: current call number
• [in] type: international type or unknown

\texttt{esp_err_t esp_bt_hf_cnum_response(esp_bd_addr_t remote_addr, char *number, esp_hf_subscriber_service_type_t type)}

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] remote_addr: remote Bluetooth device address
• [in] number: registration number
• [in] type: service type (unknown/voice/fax)

\texttt{esp_err_t esp_bt_hf_bsir(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)}

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
• ESP_OK: disconnect request is sent to lower layer
• ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] remote_addr: remote Bluetooth device address
Chapter 2. API Reference

- [in] state: in-band ring tone state

```c
esp_err_t esp_bt_hf_answer_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
        esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number,
        esp_hf_call_addr_type_t call_addr_type)
```

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

```c
esp_err_t esp_bt_hf_reject_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
        esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number,
        esp_hf_call_addr_type_t call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

```c
esp_err_t esp_bt_hf_out_call(esp_bd_addr_t remote_addr, int num_active, int num_held,
        esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number,
        esp_hf_call_addr_type_t call_addr_type)
```

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the outgoing call
- [in] call_addr_type: call address type
### esp_err_t esp_bt_hf_end_call

*esp_bd_addr_t remote_addr*, *int num_active*, *int num_held*,
*esp_hf_call_status_t call_state*, *esp_hf_call_setup_status_t call_setup_state*, *char *number*, *esp_hf_call_addr_type_t call_addr_type*

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: remote bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the call
- [in] call_addr_type: call address type

### esp_err_t esp_bt_hf_register_data_callback

*esp_hf_incoming_data_cb_t recv*, *esp_hf_outgoing_data_cb_t send*

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
- [in] recv: HFP client incoming data callback function
- [in] send: HFP client outgoing data callback function

### void esp_hf_outgoing_data_ready

Trigger the lower-layer to fetch and send audio data.

This function is only used in the case that Voice Over HCI is enabled. As a precondition to use this API, Service Level Connection shall exist with HFP client. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data

### Unions

```c

Type Definitions

\texttt{typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)}
AG incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters
• \( [\text{in}] \text{ buf} \): pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• \( [\text{in}] \text{ len} \): size(in bytes) in buf

typedef uint32_t(*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len)
AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Return length of data successfully read

Parameters
• \( [\text{in}] \text{ buf} \): pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• \( [\text{in}] \text{ len} \): size(in bytes) in buf

typedef void(*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param)
HF AG callback function type.

Parameters
• event:: Event type
• param:: Pointer to callback parameter

Enumerations

enum esp_hf_cb_event_t
HF callback events.

Values:
ESP_HF_CONNECTION_STATE_EVT = 0
Connection state change event

ESP_HF_AUDIO_STATE_EVT
Audio connection state change event

ESP_HF_BVRA_RESPONSE_EVT
Voice recognition state change event

ESP_HF_VOLUME_CONTROL_EVT
Audio volume control command from HF Client, provided by +VGM or +VGS message

ESP_HF_UNAT_RESPONSE_EVT
Unknown AT cmd Response

ESP_HF_IND_UPDATE_EVT
Indicator Update Event

ESP_HF_CIND_RESPONSE_EVT
Call And Device Indicator Response

ESP_HF_COPS_RESPONSE_EVT
Current operator information

ESP_HF_CLCC_RESPONSE_EVT
List of current calls notification

ESP_HF_CNUM_RESPONSE_EVT
Subscriber information response from HF Client

ESP_HF_VTS_RESPONSE_EVT
Enable or not DTMF

ESP_HF_NREC_RESPONSE_EVT
Enable or not NREC

ESP_HF_ATA_RESPONSE_EVT
Answer an Incoming Call
2.1.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![ESP NimBLE Stack](image)

Fig. 1: ESP NimBLE Stack

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:
Chapter 2. API Reference

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

Functions

`esp_err_t esp_nimble_hci_init(void)`

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Return

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_and_controller_init(void)`

Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    //This function will return only when nimble_port-->stop() is executed.
    nimble_port_run();
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

`nimble_port_freertos_init()` is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.
Return
- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_deinit (void)
```
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note This function should be called after the NimBLE host is deinitialized.

Return
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_and_controller_deinit (void)
```
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

Note This function should not be executed in the context of Bluetooth host task.

Note This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();
    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with...
        *error: $d", ret);
    }
}
```

If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

Return
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

Macros
- BLE_HCI_UART_H4_NONE
- BLE_HCI_UART_H4_CMD
- BLE_HCI_UART_H4_ACL
- BLE_HCI_UART_H4_SCO
- BLE_HCI_UART_H4_EVT

2.1.6 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.
Chapter 2. API Reference

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Public Members

int err_code
Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr
Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side

Values:

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
Receive Friend Request from existing Low Power Node

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
Receive Friend Clear from other friend node

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
Friend feature disabled or corresponding NetKey is deleted
Public Members

\texttt{uint16_t lpn_addr}

Low Power Node unicast address

\texttt{esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_friend\_friendship\_terminate\_param::[anonymous]\_reason}

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

Indicate the result of setting action of fast provisioning

struct ble_mesh_set_fast_prov_info_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.

Public Members

uint8_t status_unicast
Indicate the result of setting unicast address range of fast provisioning

uint8_t status_net_idx
Indicate the result of setting NetKey Index of fast provisioning

uint8_t status_match
Indicate the result of setting matching Device UUID of fast provisioning

struct ble_mesh_set_oob_pub_key_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.

Public Members

int err_code
Indicate the result of setting OOB Public Key

struct ble_mesh_set_unprov_dev_name_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.

Public Members

int err_code
Indicate the result of setting BLE Mesh device name

union esp_ble_mesh_server_state_value_t
#include <esp_ble_mesh_defs.h> Server model state value union.

Public Members

uint8_t onoff
The value of the Generic OnOff state

The value of the Light LC Light OnOff state

struct esp_ble_mesh_server_state_value_t::{anonymous} gen_onoff
The Generic OnOff state

int16_t level
The value of the Generic Level state

struct esp_ble_mesh_server_state_value_t::{anonymous} gen_level
The Generic Level state

uint8_t onpowerup
The value of the Generic OnPowerUp state
struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onpowerup
    The Generic OnPowerUp state

uint16_t power
    The value of the Generic Power Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_power_actual
    The Generic Power Actual state

uint16_t lightness
    The value of the Light Lightness Actual state
    The value of the Light Lightness Linear state
    The value of the Light CTL Lightness state
    The value of the Light HSL Lightness state
    The value of the Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_actual
    The Light Lightness Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_linear
    The Light Lightness Linear state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_lightness
    The Light CTL Lightness state

uint16_t temperature
    The value of the Light CTL Temperature state

int16_t delta_uv
    The value of the Light CTL Delta UV state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
    The Light CTL Temperature & Delta UV states

uint16_t hue
    The value of the Light HSL Hue state

uint16_t saturation
    The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl
    The Light HSL composite state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
    The Light HSL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
    The Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
    The Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
    The Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
    The Light LC Light OnOff state

union esp_ble_mesh_model_cb_param_t
    #include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.
Public Members

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT
```

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param model_send_comp
Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT
```

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param model_publish_comp
Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
```

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_recv_publish_msg_param client_recv_publish_msg
Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
```

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param client_send_timeout
Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
```

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param model_publish_update
Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
```

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param server_model_update_state
Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
```

```c
struct ble_mesh_model_send_timeout_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.
```

Public Members

```c
uint32_t opcode
Opcode of the previously sent message
```

```c
esp_ble_mesh_model_t *model
Pointer to the model which sends the previous message
```

```c
esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the previous message
```

```c
struct ble_mesh_mod_recv_publish_msg_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.
```

Public Members

```c
uint32_t opcode
Opcode of the unsolicited received message
```

```c
esp_ble_mesh_model_t *model
Pointer to the model which receives the message
```

```c
esp_ble_mesh_msg_ctx_t *ctx
Pointer to the context of the message
```

```c
uint16_t length
Length of the received message
```

```c
uint8_t *msg
Value of the received message
```

```c
struct ble_mesh_model_operation_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.
```
Chapter 2. API Reference

Public Members

uint32_t opcode
  Opcode of the received message

esp_ble_mesh_model_t *model
  Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
  Pointer to the context of the received message

uint16_t length
  Length of the received message

uint8_t *msg
  Value of the received message

struct ble_mesh_model_publish_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
  Indicate the result of publishing a message

esp_ble_mesh_model_t *model
  Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
  Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
  Indicate the result of sending a message

uint32_t opcode
  Opcode of the message

esp_ble_mesh_model_t *model
  Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t *ctx
  Context of the message

struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.
Chapter 2. API Reference

Public Members

int err_code
Indicate the result of updating server model state

esp_ble_mesh_model_t *model
Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t type
Type of the updated server state

Structures

struct esp_ble_mesh_deinit_param_t
BLE Mesh deinit parameters

Public Members

bool erase_flash
Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_elem_t
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

uint16_t element_addr
Element Address, assigned during provisioning.

const uint16_t location
Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t sig_model_count
SIG Model count

const uint8_t vnd_model_count
Vendor Model count

esp_ble_mesh_model_t *sig_models
SIG Models

esp_ble_mesh_model_t *vnd_models
Vendor Models

struct esp_ble_mesh_model_pub_t
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

esp_ble_mesh_model_t *model
Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t publish_addr
Publish Address.

uint16_t app_idx: 12
Publish AppKey Index.

uint16_t cred: 1
Friendship Credentials Flag.
uint16_t \texttt{send\_rel} : 1
Force reliable sending (segment acks)

uint8_t \texttt{ttl}
Publish Time to Live.

uint8_t \texttt{retransmit}
Retransmit Count & Interval Steps.

uint8_t \texttt{period}
Publish Period.

uint8_t \texttt{period\_div} : 4
Divisor for the Period.

uint8_t \texttt{fast\_period} : 1
Use FastPeriodDivider

uint8_t \texttt{count} : 3
Retransmissions left.

uint32_t \texttt{period\_start}
Start of the current period.

\textbf{struct net_buf_simple *} \texttt{msg}
Publication buffer, containing the publication message.
This will get correctly created when the publication context has been defined using the
\texttt{ESP\_BLE\_MESH\_MODEL\_PUB\_DEFINE} macro.

\texttt{ESP\_BLE\_MESH\_MODEL\_PUB\_DEFINE} (name, size);

\textbf{esp\_ble\_mesh\_cb\_t} \texttt{update}
Callback used to update publish message. Initialized by the stack.

\textbf{struct k\_delayed\_work} \texttt{timer}
Publish Period Timer. Initialized by the stack.

uint8_t \texttt{dev\_role}
Role of the device that is going to publish messages

\textbf{struct esp\_ble\_mesh\_model\_op\_t}
Abstraction that describes a model operation context. This structure is associated with struct
\texttt{bt\_mesh\_model\_op} in \texttt{mesh\_access.h}

\textbf{Public Members}

\textbf{const} uint32_t \texttt{opcode}
Message opcode

\textbf{const} size_t \texttt{min\_len}
Message minimum length

\textbf{esp\_ble\_mesh\_cb\_t} \texttt{param\_cb}
Callback used to handle message. Initialized by the stack.

\textbf{struct esp\_ble\_mesh\_model\_cbs\_t}
Abstraction that describes a model callback structure. This structure is associated with struct
\texttt{bt\_mesh\_model\_cb} in \texttt{mesh\_access.h}

\textbf{Public Members}

\textbf{esp\_ble\_mesh\_cb\_t} \texttt{init\_cb}
Callback used during model initialization. Initialized by the stack.
struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]:[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
NetKey Index of the subnet through which to send the message.

uint16_t app_idx
AppKey Index for message encryption.

uint16_t addr
Remote address.
```c
uint16_t recv_dst
    Destination address of a received message. Not used for sending.

int8_t recv_rssi
    RSSI of received packet. Not used for sending.

uint8_t recv_ttl : 7
    Received TTL value. Not used for sending.

uint8_t send_rel : 1
    Force sending reliably by using segment acknowledgement

uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
    Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message
```

```c
struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h
```

### Public Members

```c
uint16_t cid
    16-bit SIG-assigned company identifier

uint16_t pid
    16-bit vendor-assigned product identifier

uint16_t vid
    16-bit vendor-assigned product version identifier

size_t element_count
    Element count

esp_ble_mesh_elem_t *elements
    A sequence of elements
```

```c
struct esp_ble_mesh_unprov_dev_add_t
    Information of the device which is going to be added for provisioning.
```

### Public Members

```c
esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled
```
esp_ble_mesh_prov_bearer_t \texttt{bearer}  
Provisioning Bearer

\textbf{struct esp_ble_mesh_device_delete_t}  
Information of the device which is going to be deleted.

\textbf{Public Members}

\texttt{esp_ble_mesh_bd_addr_t addr}  
Device address

\texttt{esp_ble_mesh_addr_type_t addr_type}  
Device address type

uint8_t \texttt{uuid[16]}  
Device UUID

uint8_t \texttt{flag}  
BIT0: device address; BIT1: device UUID

\textbf{struct esp_ble_mesh_prov_data_info_t}  
Information of the provisioner which is going to be updated.

\textbf{Public Members}

uint16_t \texttt{net_idx}  
NetKey Index

uint8_t \texttt{flags}  
Flags

uint32_t \texttt{iv_index}  
IV Index

uint8_t \texttt{flag}  
BIT0: net_idx; BIT1: flags; BIT2: iv_index

\textbf{struct esp_ble_mesh_node_t}  
Information of the provisioned node

\textbf{Public Members}

\texttt{esp_ble_mesh_bd_addr_t addr}  
Node device address

\texttt{esp_ble_mesh_addr_type_t addr_type}  
Node device address type

uint8_t \texttt{dev_uuid[16]}  
Device UUID

uint16_t \texttt{oob_info}  
Node OOB information

uint16_t \texttt{unicast_addr}  
Node unicast address

uint8_t \texttt{element_num}  
Node element number

uint16_t \texttt{net_idx}  
Node NetKey Index
uint8_t flags
    Node key refresh flag and iv update flag

uint32_t iv_index
    Node IV Index

uint8_t dev_key[16]
    Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

uint16_t comp_length
    Length of Composition Data

uint8_t* comp_data
    Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.

**Public Members**

uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey index used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning

uint8_t offset
    Offset of the UUID to be compared

uint8_t match_length
    Length of the UUID to be compared

uint8_t match_val[16]
    Value of UUID to be compared

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set

**Public Members**

uint16_t hb_src
    Heartbeat source address (unicast address)

uint16_t hb_dst
    Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
    BLE Mesh client models related definitions.

    Client model Get/Set message opcode and corresponding Status message opcode
Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

esp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.

int op_pair_size
Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
Pointer to the internal data of client model

uint8_t msg_role
Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
Common parameters of the messages sent by Client Model.

Public Members

esp_ble_mesh_opcode_t opcode
Message opcode

esp_ble_mesh_model_t *model
Pointer to the client model structure

esp_ble_mesh_msg_ctx_t ctx
The context used to send message

int32_t msg_timeout
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role
Role of the device - Node/Provisioner

struct esp_ble_mesh_state_transition_t
Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
Flag used to indicate if the transition timer has been started internally.

If the model which contains esp_ble_mesh_state_transition_t sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.
And users can use this flag to indicate whether the timer is started or not.

**Public Members**

bool `just_started`
Indicate if the state transition has just started

`uint8_t trans_time`
State transition time

`uint8_t remain_time`
Remaining time of state transition

`uint8_t delay`
Delay before starting state transition

`uint32_t quo_tt`
Duration of each divided transition step

`uint32_t counter`
Number of steps which the transition duration is divided

`uint32_t total_duration`
State transition total duration

`int64_t start_timestamp`
Time when the state transition is started

*struct* `k_delayed_work timer`
Timer used for state transition

*struct esp_ble_mesh_last_msg_info_t*
Parameters of the server model received last same set message.

**Public Members**

`uint8_t tid`
Transaction number of the last message

`uint16_t src`
Source address of the last message

`uint16_t dst`
Destination address of the last message

`int64_t timestamp`
Time when the last message is received

*struct esp_ble_mesh_server_rsp_ctrl_t*
Parameters of the Server Model response control

**Public Members**

`uint8_t get_auto_rsp`
BLE Mesh Server Response Option.

1. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
2. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
3. If `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
4. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
5. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
6. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models.

```c
uint8_t set_auto_rsp : 1
    Response control for Client Set messages

uint8_t status_auto_rsp : 1
    Response control for Server Status messages
```

**Macros**

- `ESP_BLE_MESH_SDU_MAX_LEN`
  - The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.
- `ESP_BLE_MESH_MIC_SHORT`
  - Length of a long Mesh MIC.
- `ESP_BLE_MESH_MIC_LONG`
  - The maximum length of a BLE Mesh provisioned node name
- `ESP_BLE_MESH_NODE_NAME_MAX_LEN`
  - The maximum length of a BLE Mesh unprovisioned device name
- `ESP_BLE_MESH_DEVICE_NAME_MAX_LEN`
  - The maximum length of settings user id
- `ESP_BLE_MESH_SETTINGS_UID_SIZE`
  - Invalid settings index
- `ESP_BLE_MESH_INVALID_SETTINGS_IDX`
  - Define the BLE Mesh octet 16 bytes size
- `ESP_BLE_MESH_OCTET16_LEN`
- `ESP_BLE_MESH_OCTET8_LEN`
- `ESP_BLE_MESH_CID_NVAL`
  - Special TTL value to request using configured default TTL
- `ESP_BLE_MESH_TTL_DEFAULT`
  - Maximum allowed TTL value
- `ESP_BLE_MESH_TTL_MAX`
- `ESP_BLE_MESH_ADDR_UNASSIGNED`
- `ESP_BLE_MESH_ADDR_ALL_NODES`
- `ESP_BLE_MESH_ADDR_PROXIES`
- `ESP_BLE_MESH_ADDR_FRIENDS`
- `ESP_BLE_MESH_ADDR_RELAYS`
- `ESP_BLE_MESH_KEY_UNUSED`
- `ESP_BLE_MESH_KEY_DEV`
- `ESP_BLE_MESH_KEY_PRIMARY`
- `ESP_BLE_MESH_KEY_ANY`
  - Primary Network Key index
- `ESP_BLE_MESH_NET_PRIMARY`
  - Relay state value
ESP_BLE_MESH_RELAY_DISABLED
ESP_BLE_MESH_RELAY_ENABLED
ESP_BLE_MESH_RELAY_NOT_SUPPORTED
  Beacon state value
ESP_BLE_MESH_BEACON_DISABLED
ESP_BLE_MESH_BEACON_ENABLED
  GATT Proxy state value
ESP_BLE_MESH_GATT_PROXY_DISABLED
ESP_BLE_MESH_GATT_PROXY_ENABLED
ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED
  Friend state value
ESP_BLE_MESH_FRIEND_DISABLED
ESP_BLE_MESH_FRIEND_ENABLED
ESP_BLE_MESH_FRIEND_NOT_SUPPORTED
  Node identity state value
ESP_BLE_MESH_NODE_IDENTITY_STOPPED
ESP_BLE_MESH_NODE_IDENTITY_RUNNING
ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED
  Supported features
ESP_BLE_MESH_FEATURE_RELAY
ESP_BLE_MESH_FEATURE_PROXY
ESP_BLE_MESH_FEATURE_FRIEND
ESP_BLE_MESH_FEATURE_LOW_POWER
ESP_BLE_MESH_FEATURE_ALL_SUPPORTED
ESP_BLE_MESH_ADDR_IS_UNICAST(addr)
ESP_BLE_MESH_ADDR_IS_GROUP(addr)
ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)
ESP_BLE_MESH_ADDR_IS_RFU(addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT(count, int_ms)
  Encode transmission count & interval steps.
  Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about
  90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random de-
  lay).
  Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
  Parameters
  • count: Number of retransmissions (first transmission is excluded).
  • int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.
ESP_BLE_MESH_GET_TRANSMIT_COUNT(transmit)
  Decode transmit count from a transmit value.
  Return Transmission count (actual transmissions equal to N + 1).
  Parameters
  • transmit: Encoded transmit count & interval value.
**ESP_BLE_MESH_GET_TRANSMIT_INTERVAL** (transmit)
Decide the transmit interval from a transmit value.

**Return** Transmission interval in milliseconds.

**Parameters**
- transmit: Encoded transmit count & interval value.

**ESP_BLE_MESH_PUBLISH_TRANSMIT** (count, int_ms)
Encode Publish Retransmit count & interval steps.

**Return** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**
- count: Number of retransmissions (first transmission is excluded).
- int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)
Decode Publish Retransmit count from a given value.

**Return** Retransmission count (actual transmissions equal to N + 1).

**Parameters**
- transmit: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)
Decode Publish Retransmit interval from a given value.

**Return** Transmission interval in milliseconds.

**Parameters**
- transmit: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**
Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)
**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)
**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

**Note** This macro is associated with BLE_MESH_ELEM in mesh_access.h

**Parameters**
- _loc: Location Descriptor.
- _mods: Array of SIG models.
- _vnd_mods: Array of vendor models.

**ESP_BLE_MESH_PROV** (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

**BT_OCTET32_LEN**

**BD_ADDR_LEN**

ESP_BLE_MESH_ADDR_TYPERPA_PUBLIC
ESP_BLE_MESH_ADDR_TYPERPARANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE(_name, _msg_len, _role)
Define a model publication context.

Parameters
- _name: Variable name given to the context.
- _msg_len: Length of the publication message.
- _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP(_opcode, _min_len)
Define a model operation context.

Parameters
- _opcode: Message opcode.
- _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

Response will be sent internally

Type Definitions
typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]
Define the BLE Mesh octet 8 bytes size
typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]
Invalid Company ID
typedef uint32_t esp_ble_mesh_cb_t
typedef uint8_t UINT8
typedef uint16_t UINT16
typedef uint32_t UINT32
typedef uint64_t UINT64
typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]
typedef uint8_t BD_ADDR[BD_ADDR_LEN]
typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]
typedef uint8_t esp_ble_mesh_addr_type_t
BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t

esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t

esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t

esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t

esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t

esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t

esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.
Enumerations

enum esp_ble_mesh_cb_type_t

Values:
PROXY_FILTER_WHITELIST
PROXY_FILTER_BLACKLIST

enum esp_ble_meshProv_cbEvent_t
Values:
ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
   Initialize BLE Mesh provisioning capabilities and internal data information completion event
ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
   Set the unprovisioned device name completion event
ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
   Enable node provisioning functionality completion event
ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
   Disable node provisioning functionality completion event
ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
   Establish a BLE Mesh link event
ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
   Close a BLE Mesh link event
ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
   Generate Node input OOB public key event
ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
   Generate Node Output Number event
Chapter 2. API Reference

ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generate Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
Node add NetKey locally completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
Node add AppKey locally completion event

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
Node bind AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_RECV_UNPROV_ADV_PKT_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
Provisioner start to provision an unprovisioned device completion event

ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
Provisioner delete a device from the list, close provisioning link with the device completion event

ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
Provisioner set net_idx/flags/iv_index used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
Provisioner set static oob value used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
Provisioner set unicast address of primary element completion event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
Provisioner read unprovisioned device OOB public key completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
Provisioner input number completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
Provisioner input string completion event

ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
Provisioner set node name completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
Provisioner add local app key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
Provisioner update local app key completion event

ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
Provisioner update local network key completion event

ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT
Provisioner store node composition data completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
Provisioner delete node with uuid completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
Provisioner delete node with unicast address completion event

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
Provisioner start to receive heartbeat message completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Provisioner set the heartbeat filter type completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT
Provisioner set the heartbeat filter information completion event

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT
Provisioner receive heartbeat message event

ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT
Provisioner directly erase settings completion event
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event
Chapter 2. API Reference

ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation
Values:

ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states
Values:

ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_Actual_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_Actual_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t
Values:

ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event
Chapter 2. API Reference

ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:
- ESP-BLE-MESH Stack Initialization
- Reading of Local Data Information
- Low Power Operation (Updating)
- Send/Publish Messages, add Local AppKey, etc.
- ESP-BLE-MESH Node/Provisioner Provisioning
- ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

esp_err_t esp_ble_mesh_init(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

Note: After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

Return: ESP_OK on success or error code otherwise.

Parameters:
- [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

esp_err_t esp_ble_mesh_deinit(esp_ble_mesh_deinit_param_t *param)
De-initialize BLE Mesh module.

Note: This function shall be invoked after esp_ble_mesh_client_model_deinit().

Return: ESP_OK on success or error code otherwise.

Parameters:

Reading of Local Data Information
Header File

- components.bt.esp_ble_mesh.api.core.include.esp_ble_mesh_local_data_operation_api.h

Functions

```c
int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)
```

Get the model publish period, the unit is ms.

**Return** Publish period value on success, 0 or (negative) error code from errno.h on failure.

**Parameters**

```c
uint16_t esp_ble_mesh_get_primary_element_address(void)
```

Get the address of the primary element.

**Return** Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

```c
uint16_t* esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)
```

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**

- [in] model: Pointer to the model.
- [in] group_addr: Group address.

```c
esp_ble_mesh_elem_t* esp_ble_mesh_find_element(uint16_t element_addr)
```

Find the BLE Mesh element pointer via the element address.

**Return** Pointer to the element on success, or NULL on failure.

**Parameters**

- [in] element_addr: Element address.

```c
uint8_t esp_ble_mesh_get_element_count(void)
```

Get the number of elements that have been registered.

**Return** Number of elements.

```c
esp_ble_mesh_model_t* esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)
```

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**

- [in] element: Element to which the model belongs.
- [in] company_id: A 16-bit company identifier assigned by the Bluetooth SIG.

```c
esp_ble_mesh_model_t* esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id)
```

Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**

- [in] element: Element to which the model belongs.
const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)
Get the Composition data which has been registered.

Return Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
A local model of node or Provisioner subscribes a group address.

Note This function shall not be invoked before node is provisioned or Provisioner is enabled.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] element_addr: Unicast address of the element to which the model belongs.
• [in] group_addr: The group address to be subscribed.

esp_err_t esp_ble_mesh_model_unsubscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
A local model of node or Provisioner unsubscribes a group address.

Note This function shall not be invoked before node is provisioned or Provisioner is enabled.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] element_addr: Unicast address of the element to which the model belongs.
• [in] group_addr: The subscribed group address.

const uint8_t *esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)
This function is called by Node to get the local NetKey.

Return NetKey on success, or NULL on failure.
Parameters
• [in] net_idx: NetKey index.

const uint8_t *esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)
This function is called by Node to get the local AppKey.

Return AppKey on success, or NULL on failure.
Parameters
• [in] app_idx: AppKey index.

esp_err_t esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)
This function is called by Node to add a local NetKey.

Note This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] net_key: NetKey to be added.
• [in] net_idx: NetKey Index.

esp_err_t esp_ble_mesh_node_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
This function is called by Node to add a local AppKey.

Note The net_idx must be an existing one. This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] app_key: AppKey to be added.
• [in] net_idx: NetKey Index.
Chapter 2. API Reference

- [in] app_idx: AppKey Index.

```c
esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)
```

This function is called by Node to bind AppKey to model locally.

**Note** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] element_addr: Node local element address
- [in] company_id: Node local company id
- [in] model_id: Node local model id
- [in] app_idx: Node local appkey index

### Low Power Operation (Updating)

**Header File**
```
components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h
```

**Functions**

```c
esp_err_t esp_ble_mesh_lpn_enable(void)
```

Enable BLE Mesh device LPN functionality.

**Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lpn_disable(bool force)
```

Disable BLE Mesh device LPN functionality.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] force: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

```c
esp_err_t esp_ble_mesh_lpn_poll(void)
```

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP_OK on success or error code otherwise.

### Send/Publish Messages, add Local AppKey, etc.

```

**Functions**
Chapter 2. API Reference

\[ \text{esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)} \]

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** callback: Pointer to the callback function.

\[ \text{esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)} \]

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** data: Pointer to the message data.
- **[in]** opcode: The message opcode.

\[ \text{esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)} \]

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: BLE Mesh Client model to which the message belongs.

\[ \text{esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)} \]

De-initialize the user-defined client model.

**Note** This function shall be invoked before esp_ble_mesh_deinit() is called.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: Pointer of the Client model.

\[ \text{esp_err_t esp_ble_mesh_server_model_send_msg (esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data)} \]

Send server model messages (such as server model status messages).

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: BLE Mesh Server Model to which the message belongs.
- **[in]** ctx: Message context, includes keys, TTL, etc.
- **[in]** opcode: Message opcode.
- **[in]** length: Message length (exclude the message opcode).
- **[in]** data: Parameters of Access Payload (exclude the message opcode) to be sent.
```c
esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
                                         esp_ble_mesh_msg_ctx_t *ctx,
                                         uint32_t opcode, 
                                         uint16_t length, 
                                         uint8_t *data, 
                                         int32_t msg_timeout, 
                                         bool need_rsp,
                                         esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `model`: BLE Mesh Client Model to which the message belongs.
- [in] `ctx`: Message context, includes keys, TTL, etc.
- [in] `length`: Message length (exclude the message opcode).
- [in] `data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] `msg_timeout`: Time to get response to the message (in milliseconds).
- [in] `need_rsp`: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- [in] `device_role`: Role of the device (Node/Provisioner) that sends the message.

```c
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model,
                                         uint32_t opcode, 
                                         uint16_t length, 
                                         uint8_t *data, 
                                         esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message (`esp_ble_mesh_model_pub_t::msg`) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `length`: Message length (exclude the message opcode).
- [in] `data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] `device_role`: Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

```c
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model,
                                                  esp_ble_mesh_server_state_type_t type,
                                                  esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `model`: Server model which is going to update the state.
- [in] `value`: Server model state value.

```c
esp_err_t esp_ble_mesh_node_local_reset(void)
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be re-provisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name(uint16_t index, const char *name)
```

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
Chapter 2. API Reference

• [in] index: Index of the node in the node queue.
• [in] name: Name (end by ‘\0’) to be set for the node.

**const char* esp_ble_mesh_provisioner_get_node_name (uint16_t index)**

This function is called to get the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** Node name on success, or NULL on failure.

**Parameters**
• [in] index: Index of the node in the node queue.

**uint16_t esp_ble_mesh_provisioner_get_node_index (const char* name)**

This function is called to get the node (provisioned device) index.

**Return** Node index on success, or an invalid value (0xFFFF) on failure.

**Parameters**
• [in] name: Name of the node (end by ‘\0’).

**esp_err_t esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t *data, uint16_t length)**

This function is called to store the Composition Data of the node.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• [in] unicast_addr: Element address of the node
• [in] data: Pointer of Composition Data
• [in] length: Length of Composition Data

**esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])**

This function is called to get the provisioned node information with the node device uuid.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**
• [in] uuid: Device UUID of the node

**esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)**

This function is called to get the provisioned node information with the node unicast address.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**
• [in] unicast_addr: Unicast address of the node

**esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name (const char *name)**

This function is called to get the provisioned node information with the node name.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**
• [in] name: Name of the node (end by ‘\0’).

**uint16_t esp_ble_mesh_provisioner_get_prov_node_count (void)**

This function is called by Provisioner to get provisioned node count.

**Return** Number of the provisioned nodes.

**const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry (void)**

This function is called by Provisioner to get the entry of the node table.

**Note** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e., if the *esp_ble_mesh_node_t **node) is NULL. For example: ``` const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i <
CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i];
    if (node) { …… } }"

Return Pointer to the start of the node table.

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])
```

This function is called to delete the provisioned node information with the node device uuid.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uuid: Device UUID of the node

```c
esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr(uint16_t unicast_addr)
```

This function is called to delete the provisioned node information with the node unicast address.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] unicast_addr: Unicast address of the node

```c
esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16],
                                                     uint16_t net_idx, uint16_t app_idx)
```

This function is called to add a local AppKey for Provisioner.

Note app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] app_key: The app key to be set for the local BLE Mesh stack.
- [in] app_idx: The app key index.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_app_key(const uint8_t app_key[16],
                                                       uint16_t net_idx, uint16_t app_idx)
```

This function is used to update a local AppKey for Provisioner.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] app_key: Value of the AppKey.
- [in] net_idx: Corresponding NetKey Index.
- [in] app_idx: The AppKey Index

```c
const uint8_t* esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
```

This function is called by Provisioner to get the local app key value.

Return App key on success, or NULL on failure.

Parameters

- [in] app_idx: Application key index.

```c
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr,
                                                                uint16_t app_idx,
                                                                uint16_t model_id, uint16_t company_id)
```

This function is called by Provisioner to bind own model with proper app key.

Note company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] element_addr: Provisioner local element address
• [in] app_idx: Provisioner local appkey index
• [in] model_id: Provisioner local model id
• [in] company_id: Provisioner local company id

```c
esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16],
                                                uint16_t net_idx)
```

This function is called by Provisioner to add local network key.

**Note** net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16],
                                                       uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] net_key: Value of the NetKey.

```c
const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

**Parameters**

```c
esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)
```

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] enable: Enable or disable receiving heartbeat messages.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)
```

This function is called by Provisioner to set the heartbeat filter type.

**Note** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] type: Heartbeat filter type (acceptlist or rejectlist).

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)
```

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   - The filter entry with the same SRC or DST will be removed.

**Note** 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
• If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
• If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
• If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] op: Add or REMOVE
• [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)
This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)
This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] index: Settings index.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)
This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] uid: Settings user id.

esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)
This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.
1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides being cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …...

Return ESP_OK on success or error code otherwise.

Parameters
• [in] index: Settings index.
• [in] erase: Indicate if erasing mesh information.

esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid (const char *uid, bool erase)
This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.
1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey,
nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters
- [in] uid: Settings userid.
- [in] erase: Indicate if erasing mesh information.

`esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index(uint8_t index)`

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] index: Settings index.

`esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid(const char* uid)`

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] uid: Settings user id.

`const char* esp_ble_mesh_provisioner_get_settings_uid(uint8_t index)`

This function is called by Provisioner to get settings user id.

Return Setting userid on success or NULL on failure.

Parameters
- [in] index: Settings index.

`uint8_t esp_ble_mesh_provisioner_get_settings_index(const char* uid)`

This function is called by Provisioner to get settings index.

Return Settings index.

Parameters
- [in] uid: Settings user id.

`uint8_t esp_ble_mesh_provisioner_get_free_settings_count(void)`

This function is called by Provisioner to get the number of free settings user id.

Return Number of free settings user id.

`const uint8_t* esp_ble_mesh_get_fast_prov_app_key(uint16_t net_idx, uint16_t app_idx)`

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters
- [in] app_idx: Application key index.

Type Definitions

`typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)`

ESPS-MESH Node/Provisioner Provisioning
Chapter 2. API Reference

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions

**esp_err_t esp_ble_mesh_register_prov_callback(esp_ble_mesh_prov_cb_t callback)**
- Register BLE Mesh provisioning callback.
  - **Return** ESP_OK on success or error code otherwise.
  - **Parameters**
    - [in] callback: Pointer to the callback function.

**bool esp_ble_mesh_node_is_provisioned (void)**
- Check if a device has been provisioned.
  - **Return** TRUE if the device is provisioned, FALSE if the device is un provisioned.

**esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**
- Enable specific provisioning bearers to get the device ready for provisioning.
  - **Note** PB-ADV: send un provisioned device beacon. PB-GATT: send connectable advertising packets.
  - **Return** ESP_OK on success or error code otherwise.
  - **Parameters**
    - bearers: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**
- Disable specific provisioning bearers to make a device inaccessible for provisioning.
  - **Return** ESP_OK on success or error code otherwise.
  - **Parameters**
    - bearers: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**
- Un provisioned device set own oob public key & private key pair.
  - **Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an un provisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.
  - **Return** ESP_OK on success or error code otherwise.
  - **Parameters**
    - [in] pub_key_x: Un provisioned device’s Public Key X
    - [in] pub_key_y: Un provisioned device’s Public Key Y
    - [in] private_key: Un provisioned device’s Private Key

**esp_err_t esp_ble_mesh_node_input_number (uint32_t number)**
- Provide provisioning input OOB number.
  - **Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.
  - **Return** ESP_OK on success or error code otherwise.
  - **Parameters**
    - [in] number: Number input by device.

**esp_err_t esp_ble_mesh_node_input_string (const char *string)**
- Provide provisioning input OOB string.
  - **Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.
  - **Return** ESP_OK on success or error code otherwise.
  - **Parameters**
    - [in] string: String input by device.
esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] name: Unprovisioned device name

---

esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device’s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] link_idx: The provisioning link index
- [in] pub_key_x: Unprovisioned device’s Public Key X
- [in] pub_key_y: Unprovisioned device’s Public Key Y

---

esp_err_t esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)

Provide provisioning input OOB string.

This is intended to be called after the esp_ble_mesh_prov_t prov_input_num callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] string: String input by Provisioner.
- [in] link_idx: The provisioning link index.

---

esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

This is intended to be called after the esp_ble_mesh_prov_t prov_input_num callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] number: Number input by Provisioner.
- [in] link_idx: The provisioning link index.

---

esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

---

esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

---

esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)

Add unprovisioned device info to the unprov_dev queue.
Return ESP_OK on success or error code otherwise.

Note: 1. Currently address type only supports public address and static random address.

1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.

2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
   • In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters
• [in] add_dev: Pointer to a struct containing the device information
• [in] flags: Flags indicate several operations on the device information
   – Remove device information from queue after device has been provisioned (BIT0)
   – Start provisioning immediately after device is added to queue (BIT1)
   – Device can be removed if device queue is full (BIT2)

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
            esp_ble_mesh_bd_addr_t addr,
            esp_ble_mesh_addr_type_t addr_type,
            esp_ble_mesh_prov_bearer_t bearer,
            uint16_t oob_info,
            uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Return Zero on success or (negative) error code otherwise.

Note: 1. Currently address type only supports public address and static random address.

1. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.

2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

3. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.
Chapter 2. API Reference

Parameters

• [in] uuid: Device UUID of the unprovisioned device
• [in] addr: Address of the unprovisioned device
• [in] addr_type: Device address type of the unprovisioned device
• [in] bearer: Provisioning bearer going to be used by Provisioner
• [in] oob_info: OOB info of the unprovisioned device
• [in] unicast_addr: Unicast address going to be allocated for the unprovisioned device

```
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

Note If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisionning procedure. Either one of the device address or device UUID can be used as input.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] del_dev: Pointer to a struct containing the device information.

```
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] match_val: Value to be compared with the part of the device UUID.
• [in] match_len: Length of the compared match value.
• [in] offset: Offset of the device UUID to be compared (based on zero).
• [in] prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

```
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

```
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value, uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Return ESP_OK on success or error code otherwise.

Parameters

• [in] value: Pointer to the static oob value.
• [in] length: Length of the static oob value.

```
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)
```

This function is called by Provisioner to set own Primary element address.

Note This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct esp_ble_mesh_prov_t will be ignored, and Provisioner will use this address as its own
primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] addr: Unicast address of the Primary element of Provisioner.

`esp_err_t esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)`

This function is called to set provisioning data information before starting fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

`esp_err_t esp_ble_mesh_set_fast_prov_action(esp_ble_mesh_fast_prov_action_t action)`

This function is called to start/suspend/exit fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] action: fast provisioning action (i.e. enter, suspend, exit).

Type Definitions

```c
typedef void(*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event, esp_ble_mesh_prov_cb_param_t *param);
```

: event, event code of provisioning events; param, parameters of provisioning events

```c
typedef void(*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info, esp_ble_mesh_prov_bearer_t bearer);
```

: Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Parameters

- [in] addr: Pointer to the unprovisioned device address.
- [in] addr_type: Unprovisioned device address type.
- [in] adv_type: Adv packet type(ADV_IND or ADV_NONCONN_IND).
- [in] oob_info: OOB information of the unprovisioned device.
- [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions

```c
esp_err_t esp_ble_mesh_proxy_identity_enable(void)
```

Enable advertising with Node Identity.

Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_enable(void)
```

Enable BLE Mesh GATT Proxy Service.
Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_disable (void)
```
Disconnected the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_connect (esp_mesh_bd_addr_t addr,
                                          esp_mesh_addr_type_t addr_type, uint16_t net_idx)
```
Proxy Client creates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] addr: Device address of the Proxy Server.
- [in] addr_type: Device address type (public or static random).

```c
esp_err_t esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)
```
Proxy Client terminates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.

```c
esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle,
                                                   uint16_t net_idx,
                                                   esp_ble_mesh_proxy_filter_type_t filter_type)
```
Proxy Client sets the filter type of the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] filter_type: whitelister or blacklist.

```c
esp_err_t esp_ble_mesh_proxy_client_add_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)
```
Proxy Client adds address to the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr_num: Number of the filter address.

```c
esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)
```
Proxy Client removes address from the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr_num: Number of the filter address.
Chapter 2. API Reference

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

**Note:** Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_meshDefs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_meshDefs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Unions

union esp_ble_mesh_cfg_client_get_state_t

The model app status value

\texttt{esp\_ble\_mesh\_cfg\_friend\_status\_cb\_t \texttt{friend\_status}}
The friend status value

\texttt{esp\_ble\_mesh\_cfg\_hb\_pub\_status\_cb\_t \texttt{heartbeat\_pub\_status}}
The heartbeat publication status value

\texttt{esp\_ble\_mesh\_cfg\_hb\_sub\_status\_cb\_t \texttt{heartbeat\_sub\_status}}
The heartbeat subscription status value

\texttt{esp\_ble\_mesh\_cfg\_net\_trans\_status\_cb\_t \texttt{net\_transmit\_status}}
The network transmit status value

\texttt{esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t \texttt{model\_sub\_list}}
The model subscription list value

\texttt{esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t \texttt{netkey\_list}}
The network key index list value

\texttt{esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t \texttt{appkey\_list}}
The application key index list value

\texttt{esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t \texttt{node\_identity\_status}}
The node identity status value
The model application key index list value.

The key refresh phase status value.

The low power node poll timeout status value.

```
union esp_ble_mesh_cfg_server_state_change_t
```

Configuration Server model state change value union.

uint8_t relay_retransmit
Relay Retransmit state
```

```c
uint8_t beacon
Secure Network Beacon state
```

```c
uint8_t gatt_proxy
GATT Proxy state
```

```c
uint8_t friend_state
Friend state
```

```c
uint8_t default_ttl
Default TTL
```

```c
struct k_delayed_work timer
Heartbeat Publication timer
```

```c
uint16_t dst
Destination address for Heartbeat messages
```

```c
uint16_t count
Number of Heartbeat messages to be sent
Number of Heartbeat messages received
```

```c
uint8_t period
Period for sending Heartbeat messages
```

```c
uint8_t ttl
TTL to be used when sending Heartbeat messages
```

```c
uint16_t feature
Bit field indicating features that trigger Heartbeat messages when changed
```

```c
uint16_t net_idx
NetKey Index used by Heartbeat Publication
```

```c
struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub
Heartbeat Publication
```

esp_ble_mesh_cb_t heartbeat_recv_cb
Optional heartbeat subscription tracking function
```

```c
struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub
Heartbeat Subscription
```
struct esp_ble_mesh_cfg_composition_data_get_t
Parameters of Config Composition Data Get.

Public Members

uint8_t page
Page number of the Composition Data.

struct esp_ble_mesh_cfg_model_pub_get_t
Parameters of Config Model Publication Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_sig_model_sub_get_t
Parameters of Config SIG Model Subscription Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

struct esp_ble_mesh_cfg_vnd_model_sub_get_t
Parameters of Config Vendor Model Subscription Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_app_key_get_t
Parameters of Config AppKey Get.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_node_identity_get_t
Parameters of Config Node Identity Get.
**Public Members**

`uint16_t net_idx`
- The network key index

`struct esp_ble_mesh_cfg_sig_model_app_get_t`
- Parameters of Config SIG Model App Get.

**Public Members**

`uint16_t element_addr`
- The element address

`uint16_t model_id`
- The model id

`struct esp_ble_mesh_cfg_vnd_model_app_get_t`
- Parameters of Config Vendor Model App Get.

**Public Members**

`uint16_t element_addr`
- The element address

`uint16_t model_id`
- The model id

`uint16_t company_id`
- The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_kr_phase_get_t`
- Parameters of Config Key Refresh Phase Get.

**Public Members**

`uint16_t net_idx`
- The network key index

`struct esp_ble_mesh_cfg_lpn_polltimeout_get_t`
- Parameters of Config Low Power Node PollTimeout Get.

**Public Members**

`uint16_t lpn_addr`
- The unicast address of the Low Power node

`struct esp_ble_mesh_cfg_beacon_set_t`
- Parameters of Config Beacon Set.

**Public Members**

`uint8_t beacon`
- New Secure Network Beacon state

`struct esp_ble_mesh_cfg_default_ttl_set_t`
- Parameters of Config Default TTL Set.
Public Members

uint8_t \_ttl
The default TTL state value

\textbf{struct esp\_ble\_mesh\_cfg\_friend\_set\_t}
Parameters of Config Friend Set.

Public Members

uint8_t \_friend\_state
The friend state value

\textbf{struct esp\_ble\_mesh\_cfg\_gatt\_proxy\_set\_t}
Parameters of Config GATT Proxy Set.

Public Members

uint8_t \_gatt\_proxy
The GATT Proxy state value

\textbf{struct esp\_ble\_mesh\_cfg\_relay\_set\_t}
Parameters of Config Relay Set.

Public Members

uint8_t \_relay
The relay value
uint8_t \_relay\_retransmit
The relay retransmit value

\textbf{struct esp\_ble\_mesh\_cfg\_net\_key\_add\_t}
Parameters of Config NetKey Add.

Public Members

uint16_t \_net\_idx
The network key index
uint8_t \_net\_key[16]
The network key value

\textbf{struct esp\_ble\_mesh\_cfg\_app\_key\_add\_t}
Parameters of Config AppKey Add.

Public Members

uint16_t \_net\_idx
The network key index
uint16_t \_app\_idx
The app key index
uint8_t \_app\_key[16]
The app key value

\textbf{struct esp\_ble\_mesh\_cfg\_model\_app\_bind\_t}
Parameters of Config Model App Bind.
Public Members

uint16_t element_addr
   The element address

uint16_t model_app_idx
   Index of the app key to bind with the model

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t
Parameters of Config Model Publication Set.

Public Members

uint16_t element_addr
   The element address

uint16_t publish_addr
   Value of the publish address

uint16_t publish_app_idx
   Index of the application key

bool cred_flag
   Value of the Friendship Credential Flag

uint8_t publish_ttl
   Default TTL value for the publishing messages

uint8_t publish_period
   Period for periodic status publishing

uint8_t publish_retransmit
   Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_add_t
Parameters of Config Model Subscription Add.

Public Members

uint16_t element_addr
   The element address

uint16_t sub_addr
   The address to be added to the Subscription List

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete.
Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t sub_addr
    The address to be removed from the Subscription List
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_sub_overwrite_t
    Parameters of Config Model Subscription Overwrite.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t sub_addr
    The address to be added to the Subscription List
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_sub_va_add_t
    Parameters of Config Model Subscription Virtual Address Add.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint8_t label_uuid[16]
    The Label UUID of the virtual address to be added to the Subscription List
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_sub_va_delete_t
    Parameters of Config Model Subscription Virtual Address Delete.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint8_t label_uuid[16]
    The Label UUID of the virtual address to be removed from the Subscription List
```

```c
uint16_t model_id
    The model id
```
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_overwrite_t
Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t element_addr
The element address

uint8_t label_uuid[16]
Value of the Label UUID publish address

uint16_t publish_app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t publish_ttl
Default TTL value for the publishing messages

uint8_t publish_period
Period for periodic status publishing

uint8_t publish_retransmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
Parameters of Config Model Subscription Delete All.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
    Parameters of Config NetKey Update.

    Public Members

    uint16_t net_idx
        The network key index
    uint8_t net_key[16]
        The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
    Parameters of Config NetKey Delete.

    Public Members

    uint16_t net_idx
        The network key index

struct esp_ble_mesh_cfg_app_key_update_t
    Parameters of Config AppKey Update.

    Public Members

    uint16_t net_idx
        The network key index
    uint16_t app_idx
        The app key index
    uint8_t app_key[16]
        The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
    Parameters of Config AppKey Delete.

    Public Members

    uint16_t net_idx
        The network key index
    uint16_t app_idx
        The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
    Parameters of Config Node Identity Set.

    Public Members

    uint16_t net_idx
        The network key index
    uint8_t identity
        New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
    Parameters of Config Model App Unbind.
Public Members

```c
uint16_t element_addr
The element address
```

```c
uint16_t model_app_idx
Index of the app key to bind with the model
```

```c
uint16_t model_id
The model id
```

```c
uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set.
```

Public Members

```c
uint16_t net_idx
The network key index
```

```c
uint8_t transition
New Key Refresh Phase Transition
```

```c
struct esp_ble_mesh_cfg_net_transmit_set_t
Parameters of Config Network Transmit Set.
```

Public Members

```c
uint8_t net_transmit
Network Transmit State
```

```c
struct esp_ble_mesh_cfg_heartbeat_pub_set_t
Parameters of Config Model Heartbeat Publication Set.
```

Public Members

```c
uint16_t dst
Destination address for Heartbeat messages
```

```c
uint8_t count
Number of Heartbeat messages to be sent
```

```c
uint8_t period
Period for sending Heartbeat messages
```

```c
uint8_t ttl
TTL to be used when sending Heartbeat messages
```

```c
uint16_t feature
Bit field indicating features that trigger Heartbeat messages when changed
```

```c
uint16_t net_idx
NetKey Index
```

```c
struct esp_BLE_mesh_cfg_heartbeat_sub_set_t
Parameters of Config Model Heartbeat Subscription Set.
```
### Public Members

**uint16_t src**
Source address for Heartbeat messages

**uint16_t dst**
Destination address for Heartbeat messages

**uint8_t period**
Period for receiving Heartbeat messages

**struct esp_ble_mesh_cfg_beacon_status_cb_t**
Parameter of Config Beacon Status

### Public Members

**uint8_t beacon**
Secure Network Beacon state value

**struct esp_ble_mesh_cfg_comp_data_status_cb_t**
Parameters of Config Composition Data Status

### Public Members

**uint8_t page**
Page number of the Composition Data

**struct net_buf_simple *composition_data**
Pointer to Composition Data for the identified page

**struct esp_ble_mesh_cfg_default_ttl_status_cb_t**
Parameter of Config Default TTL Status

### Public Members

**uint8_t default_ttl**
Default TTL state value

**struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t**
Parameter of Config GATT Proxy Status

### Public Members

**uint8_t gatt_proxy**
GATT Proxy state value

**struct esp_ble_mesh_cfg_relay_status_cb_t**
Parameters of Config Relay Status

### Public Members

**uint8_t relay**
Relay state value

**uint8_t retransmit**
Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)
struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message
\textbf{Chapter 2. API Reference}

\begin{verbatim}
uint16_t \texttt{net_idx}
\hspace{1em} Index of the NetKey

\textbf{struct esp_ble_mesh_cfg_app_key_status_cb_t}
\hspace{1em} Parameters of Config AppKey Status

\textbf{Public Members}

uint8_t \texttt{status}
\hspace{1em} Status Code for the request message

uint16_t \texttt{net_idx}
\hspace{1em} Index of the NetKey

uint16_t \texttt{app_idx}
\hspace{1em} Index of the application key

\textbf{struct esp_ble_mesh_cfg_mod_app_status_cb_t}
\hspace{1em} Parameters of Config Model App Status

\textbf{Public Members}

uint8_t \texttt{status}
\hspace{1em} Status Code for the request message

uint16_t \texttt{element_addr}
\hspace{1em} Address of the element

\hspace{1em} Friend state value

\textbf{struct esp_ble_mesh_cfg_hb_pub_status_cb_t}
\hspace{1em} Parameters of Config Heartbeat Publication Status

\textbf{Public Members}

uint8_t \texttt{status}
\hspace{1em} Status Code for the request message

uint16_t \texttt{dst}
\hspace{1em} Destination address for Heartbeat messages

uint8_t \texttt{count}
\hspace{1em} Number of Heartbeat messages remaining to be sent

uint8_t \texttt{period}
\hspace{1em} Period for sending Heartbeat messages
\end{verbatim}
uint8_t \texttt{ttl} \\
TTL to be used when sending Heartbeat messages

uint16_t \texttt{features} \\
Features that trigger Heartbeat messages when changed

uint16_t \texttt{net_idx} \\
Index of the NetKey

\textbf{struct esp_ble_mesh_cfg_hb_sub_status_cb_t} \\
Parameters of Config Heartbeat Subscription Status

\textbf{Public Members}

uint8_t \texttt{status} \\
Status Code for the request message

uint16_t \texttt{src} \\
Source address for Heartbeat messages

uint16_t \texttt{dst} \\
Destination address for Heartbeat messages

uint8_t \texttt{period} \\
Remaining Period for processing Heartbeat messages

uint8_t \texttt{count} \\
Number of Heartbeat messages received

uint8_t \texttt{min_hops} \\
Minimum hops when receiving Heartbeat messages

uint8_t \texttt{max_hops} \\
Maximum hops when receiving Heartbeat messages

\textbf{struct esp_ble_mesh_cfg_net_trans_status_cb_t} \\
Parameters of Config Network Transmit Status

\textbf{Public Members}

uint8_t \texttt{net_trans_count} : 3 \\
Number of transmissions for each Network PDU originating from the node

uint8_t \texttt{net_trans_step} : 5 \\
Maximum hops when receiving Heartbeat messages

\textbf{struct esp_ble_mesh_cfg_model_sub_list_cb_t} \\
Parameters of Config SIG/Vendor Subscription List

\textbf{Public Members}

uint8_t \texttt{status} \\
Status Code for the request message

uint16_t \texttt{element_addr} \\
Address of the element

uint16_t \texttt{company_id} \\
Company ID

uint16_t \texttt{model_id} \\
Model ID
struct net_buf_simple *sub_addr
    A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
    Parameter of Config NetKey List

**Public Members**

struct net_buf_simple *net_idx
    A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
    Parameters of Config AppKey List

**Public Members**

uint8_t status
    Status Code for the request message

uint16_t net_idx
    NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx
    A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct esp_ble_mesh_cfg_node_id_status_cb_t
    Parameters of Config Node Identity Status

**Public Members**

uint8_t status
    Status Code for the request message

uint16_t net_idx
    Index of the NetKey

uint8_t identity
    Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
    Parameters of Config SIG/Vendor Model App List

**Public Members**

uint8_t status
    Status Code for the request message

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct net_buf_simple *app_idx
    All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
    Parameters of Config Key Refresh Phase Status
Public Members

   AppKey Index

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
   Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
   NetKey Index

uint8_t kr_phase
   New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
   Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t *model
   Pointer to the server model structure

esp_ble_mesh_msg_ctx_t ctx
   Context of the received message

esp_ble_mesh_cfg_server_cb_value_t value
   Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)
   Define a new Config Server Model.
   
   Note The Config Server Model can only be included by a Primary Element.
   Return New Config Server Model instance.
   Parameters
       • srv_data: Pointer to a unique Config Server Model user_data.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)
   Define a new Config Client Model.
   
   Note The Config Client Model can only be included by a Primary Element.
   Return New Config Client Model instance.
   Parameters
       • cli_data: Pointer to a unique struct esp_ble_mesh_client_t.
```
**Type Definitions**

typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
Configuration Server Model context

typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
                                             esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,
                                            esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_cfg_client_cb_event_t
This enum value is the event of Configuration Client Model

Values:

ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

enum esp_ble_mesh_cfg_server_cb_event_t
This enum value is the event of Configuration Server model

Values:

ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
ESP_BLE_MESH_CFG_SERVER_EVT_MAX

**Health Client/Server Models**

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

**Functions**

esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)

Register BLE Mesh Health Server Model callback.
Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
```

This function is called to get the Health Server states using the Health Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)
```

This function is called to set the Health Server states using the Health Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_server_fault_update(esp_ble_mesh_elem_t *element)
```

This function is called by the Health Server Model to update the context of its Health Current status.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] element: The element to which the Health Server Model belongs.

Unions
```
union esp_ble_mesh_health_client_get_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.
```

Public Members
```
esp_ble_mesh_health_fault_get_t fault_get
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.
```

```
union esp_ble_mesh_health_client_set_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
esp_ble_mesh_health_client_set_state function should not be set to NULL.
```

Public Members
```
esp_ble_mesh_health_attention_set_t attention_set
For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.
```
Chapter 2. API Reference

```c
esp_ble_mesh_health_period_set_t period_set
For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

esp_ble_mesh_health_fault_test_t fault_test
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

esp_ble_mesh_health_fault_clear_t fault_clear
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.
```

```c
union esp_ble_mesh_health_client_common_cb_param_t
#include <esp_ble_mesh_health_model_api.h>
HealthClientModelreceivedmessageunion.

Public Members

```c
esp_ble_mesh_health_current_status_cb_t current_status
The health current status value

esp_ble_mesh_health_fault_status_cb_t fault_status
The health fault status value

esp_ble_mesh_health_period_status_cb_t period_status
The health period status value

esp_ble_mesh_health_attention_status_cb_t attention_status
The health attention status value
```

```c
union esp_ble_mesh_health_server_cb_param_t
#include <esp_ble_mesh_health_model_api.h>
HealthServerModelcallbackparametersunion.

Public Members

```c
esp_ble_mesh_health_fault_update_comp_cb_t fault_update_comp
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT

esp_ble_mesh_health_fault_clear_cb_t fault_clear
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT

esp_ble_mesh_health_fault_test_cb_t fault_test
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT

esp_ble_mesh_health_attention_on_cb_t attention_on
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

esp_ble_mesh_health_attention_off_cb_t attention_off
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
```

Structures

```c
struct esp_ble_mesh_health_srv_cb_t
ESP BLE Mesh Health Server callback

Public Members

```c
esp_ble_mesh_cb_t fault_clear
Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t fault_test
Run a specific health test. Initialized by the stack.
```
**esp_ble_mesh_cb_t attention_on**  
Health attention on callback. Initialized by the stack.

**esp_ble_mesh_cb_t attention_off**  
Health attention off callback. Initialized by the stack.

**struct esp_ble_mesh_health_test_t**  
ESP BLE Mesh Health Server test Context

**Public Members**

- `uint8_t id_count`  
  Number of Health self-test ID

- `const uint8_t *test_ids`  
  Array of Health self-test IDs

- `uint16_t company_id`  
  Company ID used to identify the Health Fault state

- `uint8_t prev_test_id`  
  Current test ID of the health fault test

- `uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`  
  Array of current faults

- `uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`  
  Array of registered faults

**struct esp_ble_mesh_health_srv_t**  
ESP BLE Mesh Health Server Model Context

**Public Members**

- `esp_ble_mesh_model_t *model`  
  Pointer to Health Server Model

- `esp_ble_mesh_health_srv_cb_t health_cb`  
  Health callback struct

- `struct k_delayed_work attention_timer`  
  Attention Timer state

- `bool attention_timer_start`  
  Attention Timer start flag

- `esp_ble_mesh_health_test_t health_test`  
  Health Server fault test

**struct esp_ble_mesh_health_fault_get_t**  
Parameter of Health Fault Get

**Public Members**

- `uint16_t company_id`  
  Bluetooth assigned 16-bit Company ID

**struct esp_ble_mesh_health_attention_set_t**  
Parameter of Health Attention Set
Public Members

`uint8_t attention`
Value of the Attention Timer state

`struct esp_ble_mesh_health_period_set_t`
Parameter of Health Period Set

Public Members

`uint8_t fast_period_divisor`
Divider for the Publish Period

`struct esp_ble_mesh_health_fault_test_t`
Parameter of Health Fault Test

Public Members

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`uint8_t test_id`
ID of a specific test to be performed

`struct esp_ble_mesh_health_fault_clear_t`
Parameter of Health Fault Clear

Public Members

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct esp_ble_mesh_health_current_status_cb_t`
Parameters of Health Current Status

Public Members

`uint8_t test_id`
ID of a most recently performed test

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct net_buf_simple *fault_array`
FaultArray field contains a sequence of 1-octet fault values

`struct esp_ble_mesh_health_fault_status_cb_t`
Parameters of Health Fault Status

Public Members

`uint8_t test_id`
ID of a most recently performed test

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct net_buf_simple *fault_array`
FaultArray field contains a sequence of 1-octet fault values
struct esp_ble_mesh_health_period_status_cb_t
  Parameter of Health Period Status

Public Members

  uint8_t fast_period_divisor
  Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
  Parameter of Health Attention Status

Public Members

  uint8_t attention
  Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
  Health Client Model callback parameters

Public Members

  int error_code
  Appropriate error code
  
  esp_ble_mesh_client_common_param_t *params
  The client common parameters.
  
  esp_ble_mesh_health_client_common_cb_param_t status_cb
  The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
  Parameter of publishing Health Current Status completion event

Public Members

  int error_code
  The result of publishing Health Current Status
  
  esp_ble_elem_t *element
  Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
  Parameters of Health Fault Clear event

Public Members

  esp_ble_mesh_model_t *model
  Pointer to the Health Server Model
  
  uint16_t company_id
  Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
  Parameters of Health Fault Test event
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model

`uint8_t test_id`
ID of a specific test to be performed

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct esp_ble_mesh_health_attention_on_cb_t`
Parameter of Health Attention On event

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model

`uint8_t time`
Duration of attention timer on (in seconds)

`struct esp_ble_mesh_health_attention_off_cb_t`
Parameter of Health Attention Off event

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model

Macros

`ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)`
Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

**Parameters**
- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

`ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)`
Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

**Parameters**
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)`
A helper to define a health publication context

**Parameters**
- `_name`: Name given to the publication context variable.
- `_max`: Maximum number of faults the element can have.
- `_role`: Role of the device which contains the model.

`ESP_BLE_MESH_HEALTH_STANDARD_TEST`
SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.
ESP_BLE_MESH_NO_FAULT
Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions
typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.
Health Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter
typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations
genue esp_ble_mesh_health_client_cb_event_t
This enum value is the event of Health Client Model

Values:
ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX
genue esp_ble_mesh_health_server_cb_event_t
This enum value is the event of Health Server Model

Values:
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
Chapter 2. API Reference

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)
```

Register BLE Mesh Generic Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params, 
    esp_ble_mesh_generic_client_get_state_t *get_state)
```

Get the value of Generic Server Model states using the Generic Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] get_state: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params, 
    esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] set_state: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_generic_client_get_state_t
    #include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.
```
Public Members

```
Public Members

bool op_en
   Indicate if optional parameters are included

uint8_t onoff
   Target value of Generic OnOff state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_level_set_t
   Parameters of Generic Level Set.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t level
   Target value of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_delta_set_t
   Parameters of Generic Delta Set.

Public Members

bool op_en
   Indicate if optional parameters are included

int32_t level
   Delta change of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
   Parameters of Generic Move Set.

Public Members

bool op_en
   Indicate if optional parameters are included
int16_t delta_level
    Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_def_trans_time_set_t
    Parameter of Generic Default Transition Time Set.

Public Members

uint8_t trans_time
    The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_set_t
    Parameter of Generic OnPowerUp Set.

Public Members

uint8_t onpowerup
    The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_set_t
    Parameters of Generic Power Level Set.

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t power
    Target value of Generic Power Actual state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_power_default_set_t
    Parameter of Generic Power Default Set.

Public Members

uint16_t power
    The value of the Generic Power Default state

struct esp_ble_mesh_gen_power_range_set_t
    Parameters of Generic Power Range Set.
Public Members

`uint16_t range_min`
Value of Range Min field of Generic Power Range state

`uint16_t range_max`
Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_gen_loc_global_set_t`
Parameters of Generic Location Global Set.

Public Members

`int32_t global_latitude`
Global Coordinates (Latitude)

`int32_t global_longitude`
Global Coordinates (Longitude)

`int16_t global_altitude`
Global Altitude

`struct esp_ble_mesh_gen_loc_local_set_t`
Parameters of Generic Location Local Set.

Public Members

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

`struct esp_ble_mesh_gen_user_property_get_t`
Parameter of Generic User Property Get.

Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

`struct esp_ble_mesh_gen_user_property_set_t`
Parameters of Generic User Property Set.

Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

`struct net_buf_simple *property_value`
Raw value for the User Property
struct esp_ble_mesh_gen_admin_property_get_t
Parameter of Generic Admin Property Get.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic Admin Property

struct esp_ble_mesh_gen_admin_property_set_t
Parameters of Generic Admin Property Set.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic Admin Property
- `uint8_t user_access`
  Enumeration indicating user access
- `struct net_buf_simple *property_value`
  Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
Parameter of Generic Manufacturer Property Get.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic Manufacturer Property
- `uint8_t user_access`
  Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

**Public Members**

- `uint16_t property_id`
  A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.
Public Members

bool op_en
   Indicate if optional parameters are included

uint8_t present_onoff
   Current value of Generic OnOff state

uint8_t target_onoff
   Target value of Generic OnOff state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
   Parameters of Generic Level Status.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t present_level
   Current value of Generic Level state

int16_t target_level
   Target value of the Generic Level state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
   Parameter of Generic Default Transition Time Status.

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

Public Members

uint8_t onpowerup
   The value of the Generic OnPowerUp state

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_power
   Current value of Generic Power Actual state

uint16_t target_power
   Target value of Generic Power Actual state (optional)
uint8_t **remain_time**
Time to complete state transition (C.1)

**struct esp_ble_mesh_gen_power_last_status_cb_t**
Parameter of Generic Power Last Status.

**Public Members**

uint16_t **power**
The value of the Generic Power Last state

**struct esp_ble_mesh_gen_power_default_status_cb_t**
Parameter of Generic Power Default Status.

**Public Members**

uint16_t **power**
The value of the Generic Default Last state

**struct esp_ble_mesh_gen_power_range_status_cb_t**
Parameters of Generic Power Range Status.

**Public Members**

uint8_t **status_code**
Status Code for the request message

uint16_t **range_min**
Value of Range Min field of Generic Power Range state

uint16_t **range_max**
Value of Range Max field of Generic Power Range state

**struct esp_ble_mesh_gen_battery_status_cb_t**
Parameters of Generic Battery Status.

**Public Members**

uint32_t **battery_level**: 8
Value of Generic Battery Level state

uint32_t **time_to_discharge**: 24
Value of Generic Battery Time to Discharge state

uint32_t **time_to_charge**: 24
Value of Generic Battery Time to Charge state

uint32_t **flags**: 8
Value of Generic Battery Flags state

**struct esp_ble_mesh_gen_loc_global_status_cb_t**
Parameters of Generic Location Global Status.

**Public Members**

int32_t **global_latitude**
Global Coordinates (Latitude)

int32_t **global_longitude**
Global Coordinates (Longitude)
Chapter 2. API Reference

int16_t global_altitude
   Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
   Parameters of Generic Location Local Status.

Public Members

int16_t local_north
   Local Coordinates (North)

int16_t local_east
   Local Coordinates (East)

int16_t local_altitude
   Local Altitude

uint8_t floor_number
   Floor Number

uint16_t uncertainty
   Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
   Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
   Parameters of Generic User Property Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic User Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
   Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
   Parameters of Generic Admin Property Status.
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic Admin Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
   Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
   Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
   Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
   Generic Client Model callback parameters

Public Members

int error_code
   Appropriate error code

esp_ble_mesh_client_common_param_t *params
   The client common parameters.

esp_ble_mesh_gen_client_status_cb_t status_cb
   The generic status message callback values
**struct esp_ble_mesh_gen_onoff_state_t**

Parameters of Generic OnOff state

**Public Members**

```
uint8_t onoff
  The present value of the Generic OnOff state

uint8_t target_onoff
  The target value of the Generic OnOff state
```

**struct esp_ble_mesh_gen_onoff_srv_t**

User data of Generic OnOff Server Model

**Public Members**

```
 esp_ble_mesh_model_t *model
  Pointer to the Generic OnOff Server Model. Initialized internally.

 esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

 esp_ble_mesh_gen_onoff_state_t state
  Parameters of the Generic OnOff state

 esp_ble_mesh_last_msg_info_t last
  Parameters of the last received set message

 esp_ble_mesh_state_transition_t transition
  Parameters of state transition
```

**struct esp_ble_mesh_gen_level_state_t**

Parameters of Generic Level state

**Public Members**

```
int16_t level
  The present value of the Generic Level state

int16_t target_level
  The target value of the Generic Level state

int16_t last_level
  When a new transaction starts, level should be set to last_level, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
  The last delta change of the Generic Level state

bool move_start
  Indicate if the transition of the Generic Level state has been started

bool positive
  Indicate if the transition is positive or negative
```

**struct esp_ble_mesh_gen_level_srv_t**

User data of Generic Level Server Model
Public Members

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{model}

Pointer to the Generic Level Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *} \texttt{rsp\_ctrl}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_gen\_level\_state\_t *} \texttt{state}

Parameters of the Generic Level state

\texttt{esp\_ble\_mesh\_last\_msg\_info\_t} \texttt{last}

Parameters of the last received set message

\texttt{esp\_ble\_mesh\_state\_transition\_t} \texttt{transition}

Parameters of state transition

\texttt{int32\_t} \texttt{tt\_delta\_level}

Delta change value of level state transition

\texttt{struct esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t}

Parameter of Generic Default Transition Time state

Public Members

\texttt{uint8\_t} \texttt{trans\_time}

The value of the Generic Default Transition Time state

\texttt{struct esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t}

User data of Generic Default Transition Time Server Model

Public Members

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{model}

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t} \texttt{rsp\_ctrl}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t} \texttt{state}

Parameters of the Generic Default Transition Time state

\texttt{struct esp\_ble\_mesh\_gen\_onpowerup\_state\_t}

Parameter of Generic OnPowerUp state

Public Members

\texttt{uint8\_t} \texttt{onpowerup}

The value of the Generic OnPowerUp state

\texttt{struct esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t}

User data of Generic Power OnOff Server Model

Public Members

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{model}

Pointer to the Generic Power OnOff Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t} \texttt{rsp\_ctrl}

Response control of the server model received messages
Chapter 2. API Reference

`esp_ble_mesh_gen_onpowerup_state_t *state`
Parameters of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_onoff_setup_srv_t`
User data of Generic Power OnOff Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_onpowerup_state_t *state`
Parameters of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_level_state_t`
Parameters of Generic Power Level state

**Public Members**

`uint16_t power_actual`
The present value of the Generic Power Actual state

`uint16_t target_power_actual`
The target value of the Generic Power Actual state

`uint16_t power_last`
The value of the Generic Power Last state

`uint16_t power_default`
The value of the Generic Power Default state

`uint8_t status_code`
The status code of setting Generic Power Range state

`uint16_t power_range_min`
The minimum value of the Generic Power Range state

`uint16_t power_range_max`
The maximum value of the Generic Power Range state

`struct esp_ble_mesh_gen_power_level_srv_t`
User data of Generic Power Level Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the Generic Power Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_gen_power_level_state_t *state`
Parameters of the Generic Power Level state

`esp_ble_mesh_last_msg_info_t *last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition
int32_t tt_delta_level
    Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
    User data of Generic Power Level Setup Server Model

Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Generic Power Level Setup Server Model. Initialized internally.
    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages
    esp_ble_mesh_gen_power_level_state_t *state
        Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_state_t
    Parameters of Generic Battery state

Public Members

    uint32_t battery_level : 8
        The value of the Generic Battery Level state
    uint32_t time_to_discharge : 24
        The value of the Generic Battery Time to Discharge state
    uint32_t time_to_charge : 24
        The value of the Generic Battery Time to Charge state
    uint32_t battery_flags : 8
        The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
    User data of Generic Battery Server Model

Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Generic Battery Server Model. Initialized internally.
    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages
    esp_ble_mesh_gen_battery_state_t *state
        Parameters of the Generic Battery state

struct esp_ble_mesh_gen_location_state_t
    Parameters of Generic Location state

Public Members

    int32_t global_latitude
        The value of the Global Latitude field
    int32_t global_longitude
        The value of the Global Longitude field
    int16_t global_altitude
        The value of the Global Altitude field
**Chapter 2. API Reference**

```c
int16_t local_north
    The value of the Local North field

int16_t local_east
    The value of the Local East field

int16_t local_altitude
    The value of the Local Altitude field

uint8_t floor_number
    The value of the Floor Number field

uint16_t uncertainty
    The value of the Uncertainty field
```

**struct esp_ble_mesh_gen_location_srv_t**
User data of Generic Location Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
    Parameters of the Generic Location state
```

**struct esp_ble_mesh_gen_location_setup_srv_t**
User data of Generic Location Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
    Parameters of the Generic Location state
```

**struct esp_ble_mesh_generic_property_t**
Parameters of Generic Property states

**Public Members**

```c
uint16_t id
    The value of User/Admin/Manufacturer Property ID

uint8_t user_access
    The value of User Access field

uint8_t admin_access
    The value of Admin Access field

uint8_t manu_access
    The value of Manufacturer Access field

struct net_buf_simple *val
    The value of User/Admin/Manufacturer Property
```
struct esp_ble_mesh_gen_user_prop_srv_t
User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
   Response control of the server model received messages

uint8_t property_count
   Generic User Property count

struct esp_ble_mesh_gen_user_prop_srv_t
User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
   Response control of the server model received messages

uint8_t property_count
   Generic Admin Property count

struct esp_ble_mesh_gen_admin_prop_srv_t
User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp ctrl
   Response control of the server model received messages

uint8_t property_count
   Generic Manufacturer Property count

struct esp_ble_mesh_gen_manu_prop_srv_t
User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp ctrl
   Response control of the server model received messages

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model

Public Members
Chapter 2. API Reference

uint8_t id_count
   Generic Client Property ID count

uint16_t *property_ids
   Parameters of the Generic Client Property state

struct esp_ble_mesh_state_change_gen_onoff_set_t
   Parameter of Generic OnOff Set state change event

Public Members

uint8_t onoff
   The value of Generic OnOff state

struct esp_ble_mesh_state_change_gen_level_set_t
   Parameter of Generic Level Set state change event

Public Members

int16_t level
   The value of Generic Level state

struct esp_ble_mesh_state_change_gen_delta_set_t
   Parameter of Generic Delta Set state change event

Public Members

int16_t level
   The value of Generic Level state

struct esp_ble_mesh_state_change_gen_move_set_t
   Parameter of Generic Move Set state change event

Public Members

int16_t level
   The value of Generic Level state

struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
   Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t trans_time
   The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
   Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t onpowerup
   The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
   Parameter of Generic Power Level Set state change event
Public Members

uint16_t power
The value of Generic Power Actual state

struct esp_ble_mesh_state_change_gen_power_default_set_t
Parameter of Generic Power Default Set state change event

Public Members

uint16_t power
The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
The minimum value of Generic Power Range state
uint16_t range_max
The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
The Global Latitude value of Generic Location state
int32_t longitude
The Global Longitude value of Generic Location state
int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state
int16_t east
The Local East value of Generic Location state
int16_t altitude
The Local Altitude value of Generic Location state
uint8_t floor_number
The Floor Number value of Generic Location state
uint16_t uncertainty
The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event
Public Members

uint16_t id
The property id of Generic User Property state

struct net_buf_simple *value
The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
The property id of Generic Admin Property state

uint8_t access
The property access of Generic Admin Property state

struct net_buf_simple *value
The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
The property id of Generic Manufacturer Property state

uint8_t access
The property value of Generic Manufacturer Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Client Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message
Public Members

`uint16_t property_id`
A starting Client Property ID present within an element

```
struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message
```

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint8_t onoff`
Target value of Generic OnOff state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

```
struct esp_ble_mesh_server_recv_gen_level_set_t
Context of the received Generic Level Set message
```

Public Members

`bool op_en`
Indicate if optional parameters are included

`int16_t level`
Target value of Generic Level state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

```
struct esp_ble_mesh_server_recv_gen_delta_set_t
Context of the received Generic Delta Set message
```

Public Members

`bool op_en`
Indicate if optional parameters are included

`int32_t delta_level`
Delta change of Generic Level state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)
Chapter 2. API Reference

```
uint8_t delay
  Indicate message execution delay (C.1)
```

```
struct esp_ble_mesh_server_recv_gen_move_set_t
  Context of the received Generic Move Set message
```

**Public Members**

```
bool op_en
  Indicate if optional parameters are included
```

```
int16_t delta_level
  Delta Level step to calculate Move speed for Generic Level state
```

```
uint8_t tid
  Transaction ID
```

```
uint8_t trans_time
  Time to complete state transition (optional)
```

```
uint8_t delay
  Indicate message execution delay (C.1)
```

```
struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
  Context of the received Generic Default Transition Time Set message
```

**Public Members**

```
uint8_t trans_time
  The value of the Generic Default Transition Time state
```

```
struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
  Context of the received Generic OnPowerUp Set message
```

**Public Members**

```
uint8_t onpowerup
  The value of the Generic OnPowerUp state
```

```
struct esp_ble_mesh_server_recv_gen_power_level_set_t
  Context of the received Generic Power Level Set message
```

**Public Members**

```
bool op_en
  Indicate if optional parameters are included
```

```
uint16_t power
  Target value of Generic Power Actual state
```

```
uint8_t tid
  Transaction ID
```

```
uint8_t trans_time
  Time to complete state transition (optional)
```

```
uint8_t delay
  Indicate message execution delay (C.1)
```

```
struct esp_ble_mesh_server_recv_gen_power_default_set_t
  Context of the received Generic Power Default Set message
```

Espressif Systems

Submit Document Feedback

Release v4.4
Chapter 2. API Reference

Public Members

```c
uint16_t power
```
The value of the Generic Power Default state

```
struct esp_ble_mesh_server_recv_gen_power_range_set_t
```
Context of the received Generic Power Range Set message

Public Members

```c
uint16_t range_min
```
Value of Range Min field of Generic Power Range state

```c
uint16_t range_max
```
Value of Range Max field of Generic Power Range state

```
struct esp_ble_mesh_server_recv_gen_loc_global_set_t
```
Context of the received Generic Location Global Set message

Public Members

```c
int32_t global_latitude
```
Global Coordinates (Latitude)

```c
int32_t global_longitude
```
Global Coordinates (Longitude)

```c
int16_t global_altitude
```
Global Altitude

```
struct esp_ble_mesh_server_recv_gen_loc_local_set_t
```
Context of the received Generic Location Local Set message

Public Members

```c
int16_t local_north
```
Local Coordinates (North)

```c
int16_t local_east
```
Local Coordinates (East)

```c
int16_t local_altitude
```
Local Altitude

```c
uint8_t floor_number
```
Floor Number

```c
uint16_t uncertainty
```
Uncertainty

```
struct esp_ble_mesh_server_recv_gen_user_property_set_t
```
Context of the received Generic User Property Set message

Public Members

```c
uint16_t property_id
```
Property ID identifying a Generic User Property

```
struct net_buf_simple *property_value
```
Raw value for the User Property
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_generic_server_cb_param_t
Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_generic_server_cb_value_t value
Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)
Define a new Generic OnOff Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

Return New Generic OnOff Client Model instance.

Parameters

• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)
Define a new Generic Level Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

Return New Generic Level Client Model instance.

Parameters

• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
Chapter 2. API Reference

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)**
Define a new Generic Default Transition Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Return** New Generic Default Transition Time Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)**
Define a new Generic Power OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Return** New Generic Power OnOff Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI (cli_pub, cli_data)**
Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI (cli_pub, cli_data)**
Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI (cli_pub, cli_data)**
Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI (cli_pub, cli_data)**
Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV (srv_pub, srv_data)**
Define a new Generic OnOff Server Model.

Generic Server Models related context.
Chapter 2. API Reference

Note 1. The Generic OnOff Server Model is a root model.
1. This model shall support model publication and model subscription.
Return New Generic OnOff Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_onoff_srv_t.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Level Server Model.

Note 1. The Generic Level Server Model is a root model.
1. This model shall support model publication and model subscription.
Return New Generic Level Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_level_srv_t.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

Note 1. The Generic Default Transition Time Server Model is a root model.
1. This model shall support model publication and model subscription.
Return New Generic Default Transition Time Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_def_trans_time_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
2. This model shall support model publication and model subscription.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

1. This model shall support model subscription.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
Return New Generic Power Level Server Model instance.
Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_srv_t.
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

2. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
2. This model shall support model publication and model subscription.
3. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_battery_srv_t.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)
Define a new Generic Location Server Model.

Note 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be used to represent an element that knows its location (global or local).

Return New Generic Location Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_location_srv_t.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

Note 1. The Generic Location Setup Server model extends the Generic Location Server model.
2. This model shall support model subscription.

Return New Generic Location Setup Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_location_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note 1. The Generic User Property Server model is a root model.
2. This model shall support model publication and model subscription.

Return New Generic User Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_user_prop_srv_t.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

Note 1. The Generic Admin Property Server model extends the Generic User Property Server model.
2. This model shall support model publication and model subscription.

Return New Generic Admin Property Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_admin_prop_srv_t.
**ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV** (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

**Note**
1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Manufacturer Property Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV** (srv_pub, srv_data)
Define a new Generic User Property Server Model.

**Note**
1. The Generic Client Property Server model is a root model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Client Property Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

**Type Definitions**

typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event, esp_ble_mesh_generic_client_cb_param_t *param)

Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event, esp_ble_mesh_generic_server_cb_param_t *param)

Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_generic_client_cb_event_t
This enum value is the event of Generic Client Model

**Values**:
- ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX

enum esp_ble_mesh_gen_user_prop_access_t
This enum value is the access value of Generic User Property

**Values**:
- ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
Chapter 2. API Reference

ESP_BLE_MESH_GEN_USER_ACCESS_READ
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_admin_prop_access_t
This enum value is the access value of Generic Admin Property

Values:
ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_manu_prop_access_t
This enum value is the access value of Generic Manufacturer Property

Values:
ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ

enum esp_ble_mesh_generic_server_cb_event_t
This enum value is the event of Generic Server Model

Values:
ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Sensor Client/Server Models

Header File
• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions
esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t callback)

Register BLE Mesh Sensor Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

\textbf{esp_err_t \textit{esp\_ble\_mesh\_sensor\_client\_get\_state\_t}(esp\_ble\_mesh\_client\_common\_param\_t
  *params, esp\_ble\_mesh\_sensor\_client\_get\_state\_t
  *get\_state)}

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

\textbf{Note} If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_sensor\_message\_opcode\_t in esp\_ble\_mesh\_defs.h

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

- \textbf{[in]} params: Pointer to BLE Mesh common client parameters.
- \textbf{[in]} get\_state: Pointer to sensor get message value. Shall not be set to NULL.

\textbf{esp_err_t \textit{esp\_ble\_mesh\_sensor\_client\_set\_state\_t}(esp\_ble\_mesh\_client\_common\_param\_t
  *params, esp\_ble\_mesh\_sensor\_client\_set\_state\_t
  *set\_state)}

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

\textbf{Note} If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_sensor\_message\_opcode\_t in esp\_ble\_mesh\_defs.h

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

- \textbf{[in]} params: Pointer to BLE Mesh common client parameters.
- \textbf{[in]} set\_state: Pointer to sensor set message value. Shall not be set to NULL.

\textbf{esp_err_t \textit{esp\_ble\_mesh\_register\_sensor\_server\_callback\_t}(esp\_ble\_mesh\_sensor\_server\_cb\_t
  callback)}

Register BLE Mesh Sensor Server Model callback.

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

- \textbf{[in]} callback: Pointer to the callback function.

\textbf{Unions}

\textbf{union esp\_ble\_mesh\_sensor\_client\_get\_state\_t}

#include <esp\_ble\_mesh\_sensor\_model\_api\_h> Sensor Client Model get message union.

Parameters of Sensor Cadence Set
Public Members

```c
uint16_t property_id
    Property ID for the sensor
```

```c
uint8_t fast_cadence_period_divisor : 7
    Divisor for the publish period
```

```c
uint8_t status_trigger_type : 1
    The unit and format of the Status Trigger Delta fields
```

```c
struct net_buf_simple *status_trigger_delta_down
    Delta down value that triggers a status message
```

```c
struct net_buf_simple *status_trigger_delta_up
    Delta up value that triggers a status message
```

```c
uint8_t status_min_interval
    Minimum interval between two consecutive Status messages
```

```c
struct net_buf_simple *fast_cadence_low
    Low value for the fast cadence range
```

```c
struct net_buf_simple *fast_cadence_high
    Fast value for the fast cadence range
```

```c
struct esp_ble_mesh_sensor_settings_get_t
    Parameter of Sensor Settings Get
```

uint16_t property_id
   Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
   Parameters of Sensor Column Get

Public Members

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x
   Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
   Parameters of Sensor Series Get

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x1
   Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
   Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
   Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
   Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
   Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
   Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
   Property for the sensor

struct net_buf_simple *sensor_cadence_value
   Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
   Parameters of Sensor Settings Status
Chapter 2. API Reference

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
A sequence of N sensor setting property IDs (optional)

Public Members

bool op_en
Indicate id optional parameters are included

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

uint8_t sensor_setting_access
Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

Public Members

struct net_buf_simple *marshalled_sensor_data
Value of sensor data state (optional)

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
Left values of sensor column status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
Left values of sensor series status

Public Members

struct esp_ble_mesh_sensor_client_cb_param_t
Sensor Client Model callback parameters
Public Members

```c
int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.
```

```c
esp_ble_mesh_client_common_param_t *params
The client common parameters.
```

```c
esp_ble_mesh_sensor_client_status_cb_t status_cb
The sensor status message callback values
```

```c
struct esp_ble_mesh_sensor_descriptor_t
Parameters of Sensor Descriptor state
```

Public Members

```c
uint32_t positive_tolerance : 12
The value of Sensor Positive Tolerance field
```

```c
uint32_t negative_tolerance : 12
The value of Sensor Negative Tolerance field
```

```c
uint32_t sampling_function : 8
The value of Sensor Sampling Function field
```

```c
uint8_t measure_period
The value of Sensor Measurement Period field
```

```c
uint8_t update_interval
The value of Sensor Update Interval field
```

```c
struct esp_ble_mesh_sensor_setting_t
Parameters of Sensor Setting state
```

Public Members

```c
uint16_t property_id
The value of Sensor Setting Property ID field
```

```c
uint8_t access
The value of Sensor Setting Access field
```

```c
struct net_buf_simple *raw
The value of Sensor Setting Raw field
```

```c
struct esp_ble_mesh_sensor_cadence_t
Parameters of Sensor Cadence state
```

Public Members

```c
uint8_t period_divisor : 7
The value of Fast Cadence Period Divisor field
```

```c
uint8_t trigger_type : 1
The value of Status Trigger Type field
```

```c
struct net_buf_simple *trigger_delta_down
Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field
```
struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up field

uint8_t min_interval
The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t format : 1
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t length : 7
The value of the Sensor Data length

struct net_buf_simple *raw_value
The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state

Public Members

struct net_buf_simple *raw_value_x
The value of Sensor Raw Value X field

struct net_buf_simple *column_width
The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states

Public Members

uint16_t sensor_property_id
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
Parameters of the Sensor Descriptor state

const uint8_t setting_count
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
Parameters of the Sensor Setting state
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

Parameters of the Sensor Data state

Parameters of the Sensor Series Column state

User data of Sensor Server Model

Pointer to the Sensor Server Model. Initialized internally.

Response control of the server model received messages

Sensor state count

Parameters of the Sensor states

User data of Sensor Setup Server Model

Pointer to the Sensor Setup Server Model. Initialized internally.

Response control of the server model received messages

Sensor state count

Parameters of the Sensor states

Parameters of Sensor Cadence Set state change event

The value of Sensor Property ID state

The value of Fast Cadence Period Divisor state

The value of Status Trigger Type state

The value of Status Trigger Delta Down state
### Chapter 2. API Reference

```c
struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up state

uint8_t min_interval
    The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
    The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
    The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
    Parameters of Sensor Setting Set state change event
```

**Public Members**

- uint16_t `property_id`
  The value of Sensor Property ID state

- uint16_t `setting_property_id`
  The value of Sensor Setting Property ID state

- struct net_buf_simple *`setting_value`
  The value of Sensor Property Value state

```c
struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
    Context of the received Sensor Descriptor Get message
```

**Public Members**

- bool `op_en`
  Indicate if optional parameters are included

- uint16_t `property_id`
  Property ID of a sensor (optional)

```c
struct esp_ble_mesh_server_recv_sensor_cadence_get_t
    Context of the received Sensor Cadence Get message
```

**Public Members**

- uint16_t `property_id`
  Property ID of a sensor

```c
struct esp_ble_mesh_server_recv_sensor_settings_get_t
    Context of the received Sensor Settings Get message
```

**Public Members**

- uint16_t `property_id`
  Property ID of a sensor

```c
struct esp_ble_mesh_server_recv_sensor_setting_get_t
    Context of the received Sensor Setting Get message
```
Chapter 2. API Reference

Public Members

```c
uint16_t property_id
   Property ID of a sensor
```

```c
uint16_t setting_property_id
   Setting ID identifying a setting within a sensor
```

```c
struct esp_ble_mesh_server_recv_sensor_get_t
   Context of the received Sensor Get message
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t property_id
   Property ID for the sensor (optional)
```

```c
struct esp_ble_mesh_server_recv_sensor_column_get_t
   Context of the received Sensor Column Get message
```

Public Members

```c
uint16_t property_id
   Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x
   Raw value identifying a column
```

```c
struct esp_ble_mesh_server_recv_sensor_series_get_t
   Context of the received Sensor Series Get message
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t property_id
   Property identifying a sensor
```

```c
struct net_buf_simple *raw_value
   Raw value containing X1 and X2 (optional)
```

```c
struct esp_ble_mesh_server_recv_sensor_cadence_set_t
   Context of the received Sensor Cadence Set message
```

Public Members

```c
uint16_t property_id
   Property ID for the sensor
```

```c
struct net_buf_simple *cadence
   Value of Sensor Cadence state
```

```c
struct esp_ble_mesh_server_recv_sensor_setting_set_t
   Context of the received Sensor Setting Set message
```
Chapter 2. API Reference

Public Members

```c
uint16_t property_id
    Property ID identifying a sensor
```

```c
uint16_t setting_property_id
    Setting ID identifying a setting within a sensor
```

```c
struct net_buf_simple *setting_raw
    Raw value for the setting
```

```c
struct esp_ble_mesh_sensor_server_cb_param_t
    Sensor Server Model callback parameters
```

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Sensor Server Models
```

```c
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
```

```c
esp_ble_mesh_sensor_server_cb_value_t value
    Value of the received Sensor Messages
```

Macros

**ESP_BLE_MESH_MODEL_SENSOR_CLI** (cli_pub, cli_data)
Define a new Sensor Client Model.

Note This API needs to be called for each element on which the application needs to have a Sensor Client Model.

**Return** New Sensor Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_SENSOR_SRV** (srv_pub, srv_data)
Define a new Sensor Server Model.

Note 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

**Return** New Sensor Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

**ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV** (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

Note 1. The Sensor Setup Server model extends the Sensor Server model.
1. This model shall support model publication and model subscription.

**Return** New Sensor Setup Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

**ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID**
Invalid Sensor Property ID

**ESP_BLE_MESH_SENSORPROPERTY_ID_LEN**
Length of Sensor Property ID
**ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN**
Length of Sensor Descriptor state

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE**
Unspecified Sensor Positive Tolerance

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE**
Unspecified Sensor Negative Tolerance

**ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD**
Not applicable Sensor Measurement Period

**ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL**
Not applicable Sensor Update Interval

**ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID**
Invalid Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN**
Length of Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN**
Length of Sensor Setting Access

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ**
Sensor Setting Access - Read

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE**
Sensor Setting Access - Read & Write

**ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN**
Length of Sensor Divisor Trigger Type

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN**
Length of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE**
Maximum value of Sensor Period Divisor

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX**
Maximum value of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR**
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16**
Sensor Status Trigger Type - Format Type “uint16”

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A**
Sensor Data Format A

**ESP_BLE_MESHSENSOR_DATA_FORMAT_B**
Sensor Data Format B

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN**
MPID length of Sensor Data Format A

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN**
MPID length of Sensor Data Format B

**ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN**
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

**ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT(_data)**
Get format of the sensor data.
Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters

- _data: Pointer to the start of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)

Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters

- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)

Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Return Sensor Property ID of the sensor data.

Parameters

- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)

Generate a MPID value for sensor data with Format A.

Note
1. The Format field is 0b0 and indicates that Format A is used.
2. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
3. The Property ID is an 11-bit bit field representing 11 LSB of a Property ID.
4. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

Return 2-octet MPID value for sensor data with Format A.

Parameters

- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)

Generate a MPID value for sensor data with Format B.

Note
1. The Format field is 0b1 and indicates Format B is used.
2. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
3. The Property ID is a 16-bit bit field representing a Property ID.
4. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
5. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Return 3-octet MPID value for sensor data with Format B.

Parameters

- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

Type Definitions

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Parameters
Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)
```

**Enumerations**

**enum esp_ble_mesh_sensor_client_cb_event_t**

This enum value is the event of Sensor Client Model

**Values**:

- ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

**enum esp_ble_mesh_sensor_sample_func**

This enum value is value of Sensor Sampling Function

**Values**:

- ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
- ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
- ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
- ESP_BLE_MESH_SAMPLE_FUNC_RMS
- ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
- ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
- ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
- ESP_BLE_MESH_SAMPLE_FUNC_COUNT

**enum esp_ble_mesh_sensor_server_cb_event_t**

This enum value is the event of Sensor Server Model

**Values**:

- ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
  1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
  2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.
- ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.
- ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.
- ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX
Chapter 2. API Reference

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

**esp_err_t esp_ble_mesh_time_scene_client_set_state**

Register BLE Mesh Time Scene Client Model callback.

- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - **[in]** callback: Pointer to the callback function.

**esp_err_t esp_ble_mesh_time_scene_client_get_state**

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

- **Note**: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h
- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - **[in]** params: Pointer to BLE Mesh common client parameters.
  - **[in]** get_state: Pointer to time scene get message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_time_scene_server_get_state**

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

- **Note**: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h
- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - **[in]** params: Pointer to BLE Mesh common client parameters.
  - **[in]** set_state: Pointer to time scene set message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_register_time_scene_server_callback**

Register BLE Mesh Time and Scenes Server Model callback.

- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - **[in]** callback: Pointer to the callback function.

Unions

**union esp_ble_mesh_time_scene_client_get_state_t**

Structures

```c
struct esp_ble_mesh_time_set_t
```
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

```c
uint8_t tai_seconds[5]
```
The current TAI time in seconds

```c
uint8_t sub_second
```
The sub-second time in units of 1/256 second

```c
uint8_t uncertainty
```
The estimated uncertainty in 10-millisecond steps

```c
uint16_t time_authority : 1
```
0 = No Time Authority, 1 = Time Authority

```c
uint16_t tai_utc_delta : 15
```
The current difference between TAI and UTC in seconds

```c
uint8_t time_zone_offset
```
The local time zone offset in 15-minute increments

```c
struct esp_ble_mesh_time_zone_set_t
```
Parameters of Time Zone Set

Public Members

```c
uint8_t time_zone_offset_new
```
Upcoming local time zone offset

```c
uint8_t tai_zone_change[5]
```
TAI Seconds time of the upcoming Time Zone Offset change

```c
struct esp_ble_mesh_tai_utc_delta_set_t
```
Parameters of TAI-UTC Delta Set

```c
```

Public Members

uint16_t tai_utc_delta_new: 15
Upcoming difference between TAI and UTC in seconds

uint16_t padding: 1
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
Parameter of Time Role Set

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_store_t
Parameter of Scene Store

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
Parameters of Scene Recall

bool op_en
Indicate if optional parameters are included

uint16_t scene_number
The number of scenes to be recalled

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get
Public Members

uint8_t \texttt{index}
Index of the Schedule Register entry to get

\texttt{struct esp\_ble\_mesh\_scheduler\_act\_set\_t}
Parameters of Scheduler Action Set

Public Members

uint64_t \texttt{index}: 4
Index of the Schedule Register entry to set

uint64_t \texttt{year}: 7
Scheduled year for the action

uint64_t \texttt{month}: 12
Scheduled month for the action

uint64_t \texttt{day}: 5
Scheduled day of the month for the action

uint64_t \texttt{hour}: 5
Scheduled hour for the action

uint64_t \texttt{minute}: 6
Scheduled minute for the action

uint64_t \texttt{second}: 6
Scheduled second for the action

uint64_t \texttt{day\_of\_week}: 7
Schedule days of the week for the action

uint64_t \texttt{action}: 4
Action to be performed at the scheduled time

uint64_t \texttt{trans\_time}: 8
Transition time for this action

uint16_t \texttt{scene\_number}
Transition time for this action

\texttt{struct esp\_ble\_mesh\_time\_status\_cb\_t}
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t \texttt{tai\_seconds}[5]
The current TAI time in seconds

uint8_t \texttt{sub\_second}
The sub-second time in units of 1/256 second

uint8_t \texttt{uncertainty}
The estimated uncertainty in 10-millisecond steps

uint16_t \texttt{time\_authority}
0 = No Time Authority, 1 = Time Authority

uint16_t \texttt{tai\_utc\_delta}
Current difference between TAI and UTC in seconds
### Chapter 2. API Reference

**uint8_t time_zone_offset**  
The local time zone offset in 15-minute increments

**struct esp_ble_mesh_time_zone_status_cb_t**  
Parameters of Time Zone Status

#### Public Members

- **uint8_t time_zone_offset_curr**  
  Current local time zone offset
- **uint8_t time_zone_offset_new**  
  Upcoming local time zone offset
- **uint8_t tai_zone_change[5]**  
  TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_tai_utc_delta_status_cb_t**  
Parameters of TAI-UTC Delta Status

#### Public Members

- **uint16_t tai_utc_delta_curr : 15**  
  Current difference between TAI and UTC in seconds
- **uint16_t padding_1 : 1**  
  Always 0b0. Other values are Prohibited.
- **uint16_t tai_utc_delta_new : 15**  
  Upcoming difference between TAI and UTC in seconds
- **uint16_t padding_2 : 1**  
  Always 0b0. Other values are Prohibited.
- **uint8_t tai_delta_change[5]**  
  TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_time_role_status_cb_t**  
Parameter of Time Role Status

#### Public Members

- **uint8_t time_role**  
  The Time Role for the element

**struct esp_ble_mesh_scene_status_cb_t**  
Parameters of Scene Status

#### Public Members

- **bool op_en**  
  Indicate if optional parameters are included
- **uint8_t status_code**  
  Status code of the last operation
- **uint16_t current_scene**  
  Scene Number of the current scene
- **uint16_t target_scene**  
  Scene Number of the target scene (optional)
uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
   Parameters of Scene Register Status

Public Members

uint8_t status_code
   Status code for the previous operation

uint16_t current_scene
   Scene Number of the current scene

struct net_buf_simple *scenes
   A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
   Parameter of Scheduler Status

Public Members

uint16_t schedules
   Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
   Parameters of Scheduler Action Status

Public Members

uint64_t index : 4
   Enumerates (selects) a Schedule Register entry

uint64_t year : 7
   Scheduled year for the action

uint64_t month : 12
   Scheduled month for the action

uint64_t day : 5
   Scheduled day of the month for the action

uint64_t hour : 5
   Scheduled hour for the action

uint64_t minute : 6
   Scheduled minute for the action

uint64_t second : 6
   Scheduled second for the action

uint64_t day_of_week : 7
   Schedule days of the week for the action

uint64_t action : 4
   Action to be performed at the scheduled time

uint64_t trans_time : 8
   Transition time for this action

uint16_t scene_number
   Transition time for this action
struct esp_ble_mesh_time_scene_client_cb_param_t
    Time Scene Client Model callback parameters

Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t status_cb
    The scene status message callback values

struct esp_ble_mesh_time_state_t
    Parameters of Time state

Public Members

uint8_t tai_seconds[5]
    The value of the TAI Seconds state

uint8_t subsecond
    The value of the Subsecond field

uint8_t uncertainty
    The value of the Uncertainty field

uint8_t time_zone_offset_curr
    The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
    The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
    The value of the TAI of Zone Change field

uint16_t time_authority : 1
    The value of the Time Authority bit

uint16_t tai_utc_delta_curr : 15
    The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new : 15
    The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
    The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::*[anonymous] time
    Parameters of the Time state

uint8_t time_role
    The value of the Time Role state

struct esp_ble_mesh_time_srv_t
    User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Time Server Model. Initialized internally.
Chapter 2. API Reference

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_time_state_t *state
Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_time_state_t *state
Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model

Public Members

uint16_t scene_number
The value of the Scene Number

uint8_t scene_type
The value of the Scene Type

struct net_buf_simple *scene_value
Scene value may use a union to represent later, the union contains structures of all the model states which
can be stored in a scene. The value of the Scene Value

struct esp_ble_mesh_scenes_state_t
Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states
of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a
maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container
associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model
handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation.
The scene transition is in progress when at least one transition from the group of individual model transitions
is in progress.
```
Public Members

```c
const uint16_t scene_count
The Scenes state’s scene count
```

```c
exp_ble_mesh_scene_register_t *scenes
Parameters of the Scenes state
```

```c
uint16_t current_scene
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.
```

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

```c
uint16_t target_scene
The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.
```

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

```c
uint8_t status_code
The status code of the last scene operation
```

```c
bool in_progress
Indicate if the scene transition is in progress
```

```c
struct esp_ble_mesh_scene_srv_t
User data of Scene Server Model
```

Public Members

```c
exp_ble_mesh_model_t *model
Pointer to the Scene Server Model. Initialized internally.
```

```c
exp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```

```c
exp_ble_mesh_scenes_state_t *state
Parameters of the Scenes state
```

```c
exp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
```

```c
exp_ble_mesh_state_transition_t transition
Parameters of state transition
```

```c
struct esp_ble_mesh_scene_setup_srv_t
User data of Scene Setup Server Model
```
Chapter 2. API Reference

Public Members

*esp_ble_mesh_model_t* model
  Pointer to the Scene Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
  Response control of the server model received messages

*esp_ble_mesh_scenes_state_t* state
  Parameters of the Scenes state

```c
struct esp_ble_mesh_schedule_register_t
  Parameters of Scheduler Register state
```

Public Members

```c
bool in_use
  Indicate if the registered schedule is in use

uint64_t year : 7
  The value of Scheduled year for the action

uint64_t month : 12
  The value of Scheduled month for the action

uint64_t day : 5
  The value of Scheduled day of the month for the action

uint64_t hour : 5
  The value of Scheduled hour for the action

uint64_t minute : 6
  The value of Scheduled minute for the action

uint64_t second : 6
  The value of Scheduled second for the action

uint64_t day_of_week : 7
  The value of Schedule days of the week for the action

uint64_t action : 4
  The value of Action to be performed at the scheduled time

uint64_t trans_time : 8
  The value of Transition time for this action

uint16_t scene_number
  The value of Scene Number to be used for some actions
```

```c
struct esp_ble_mesh_scheduler_state_t
  Parameters of Scheduler state
```

Public Members

```c
const uint8_t schedule_count
  Scheduler count

*esp_ble_mesh_schedule_register_t* schedules
  Up to 16 scheduled entries
```

```c
struct esp_ble_mesh_scheduler_srv_t
  User data of Scheduler Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Scheduler Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`
Parameters of the Scheduler state

`struct esp_ble_mesh_scheduler_setup_srv_t`
User data of Scheduler Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Scheduler Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`
Parameters of the Scheduler state

`struct esp_ble_mesh_state_change_time_set_t`
Parameters of Time Set state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

`struct esp_ble_mesh_state_change_time_status_t`
Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps
#include "esp_ble_mesh_api.h"

uint16_t time_authority = 1;
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr = 15;
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr;
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t time_zone_offset_new;
Upcoming local time zone offset

uint8_t tai_zone_change[5];
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t tai_utc_delta_new = 15;
Upcoming difference between TAI and UTC in seconds

uint8_t tai_delta_change[5];
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
Parameter of Time Role Set state change event

Public Members

uint8_t time_role;
The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
Parameter of Scene Store state change event

Public Members

uint16_t scene_number;
The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
Parameter of Scene Recall state change event

Public Members

uint16_t scene_number;
The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
Parameter of Scene Delete state change event
Public Members

```c
uint16_t scene_number
```

The number of scenes to be deleted

```c
struct esp_ble_mesh_state_change_scheduler_act_set_t
```

Parameter of Scheduler Action Set state change event

Public Members

```c
uint64_t index
```

Index of the Schedule Register entry to set

```c
uint64_t year
```

Scheduled year for the action

```c
uint64_t month
```

Scheduled month for the action

```c
uint64_t day
```

Scheduled day of the month for the action

```c
uint64_t hour
```

Scheduled hour for the action

```c
uint64_t minute
```

Scheduled minute for the action

```c
uint64_t second
```

Scheduled second for the action

```c
uint64_t day_of_week
```

Scheduled day of the week for the action

```c
uint64_t action
```

Action to be performed at the scheduled time

```c
uint64_t trans_time
```

Transition time for this action

```c
uint16_t scene_number
```

Scene number to be used for some actions

```c
struct esp_ble_mesh_server_recv_scheduler_act_get_t
```

Context of the received Scheduler Action Get message

Public Members

```c
uint8_t index
```

Index of the Schedule Register entry to get

```c
struct esp_ble_mesh_server_recv_time_set_t
```

Context of the received Time Set message

Public Members

```c
uint8_t tai_seconds[5]
```

The current TAI time in seconds

```c
uint8_t subsecond
```

The sub-second time in units of 1/256 second
**uint8_t** `uncertainty`
   The estimated uncertainty in 10-millisecond steps

**uint16_t** `time_authority`
   0 = No Time Authority, 1 = Time Authority

**uint16_t** `tai_utc_delta`
   Current difference between TAI and UTC in seconds

**uint8_t** `time_zone_offset`
   The local time zone offset in 15-minute increments

**struct esp_ble_mesh_server_recv_time_zone_set_t**
   Context of the received Time Zone Set message

### Public Members

**uint8_t** `time_zone_offset_new`
   Upcoming local time zone offset

**uint8_t** `tai_zone_change[5]`
   TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_server_recv_tai_utc_delta_set_t**
   Context of the received TAI UTC Delta Set message

### Public Members

**uint16_t** `tai_utc_delta_new` : 15
   Upcoming difference between TAI and UTC in seconds

**uint16_t** `padding` : 1
   Always 0b0. Other values are Prohibited.

**uint8_t** `tai_delta_change[5]`
   TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_server_recv_time_role_set_t**
   Context of the received Time Role Set message

### Public Members

**uint8_t** `time_role`
   The Time Role for the element

**struct esp_ble_mesh_server_recv_scene_store_t**
   Context of the received Scene Store message

### Public Members

**uint16_t** `scene_number`
   The number of scenes to be stored

**struct esp_ble_mesh_server_recv_scene_recall_t**
   Context of the received Scene Recall message
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t scene_number
   The number of scenes to be recalled

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
   Context of the received Scene Delete message

Public Members

uint16_t scene_number
   The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
   Context of the received Scheduler Action Set message

Public Members

uint64_t index : 4
   Index of the Schedule Register entry to set

uint64_t year : 7
   Scheduled year for the action

uint64_t month : 12
   Scheduled month for the action

uint64_t day : 5
   Scheduled day of the month for the action

uint64_t hour : 5
   Scheduled hour for the action

uint64_t minute : 6
   Scheduled minute for the action

uint64_t second : 6
   Scheduled second for the action

uint64_t day_of_week : 7
   Schedule days of the week for the action

uint64_t action : 4
   Action to be performed at the scheduled time

uint64_t trans_time : 8
   Transition time for this action

uint16_t scene_number
   Scene number to be used for some actions

struct esp_ble_mesh_server_recv_time_status_t
   Context of the received Time Status message
Chapter 2. API Reference

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local timezone offset in 15-minute increments

struct esp_ble_mesh_time_scene_server_cb_param_t
Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t value
Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)
Define a new Time Client Model.

Note This API needs to be called for each element on which the application needs to have a Time Client Model.

Return New Time Client Model instance.

Parameters
• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)
Define a new Scene Client Model.

Note This API needs to be called for each element on which the application needs to have a Scene Client Model.

Return New Scene Client Model instance.

Parameters
• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)
Define a new Scheduler Client Model.

Note This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Return New Scheduler Client Model instance.

Parameters
• cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)
Define a new Time Server Model.

Note 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
Return New Time Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_time_srv_t.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)
Define a new Time Setup Server Model.

Note 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
   1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
   2. This model does not support subscribing nor publishing.
Parameters
   • srv_data: Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)
Define a new Scene Server Model.

Note 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be present only on the Primary element of a node.
Return New Scene Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_scene_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)
Define a new Scene Setup Server Model.

Note 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
   1. This model shall support model subscription.
   2. The model may be present only on the Primary element of a node.
Return New Scene Setup Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_scene_setup_srv_t.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

Note 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be present only on the Primary element of a node.
   3. The model requires the Time Server model shall be present on the element.
Return New Scheduler Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_scheduler_srv_t.
Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

**Parameters**

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

---

**ESP_BLE_MESH_UNKNOWN_TAI_SECONDS**

Unknown TAI Seconds

**ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE**

Unknown TAI of Zone Change

**ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE**

Unknown TAI of Delta Change

**ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE**

Maximum TAI-UTC Delta value

**ESP_BLE_MESH_TAI_SECONDS_LEN**

Length of TAI Seconds

**ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN**

Length of TAI of Zone Change

**ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN**

Length of TAI of Delta Change

**ESP_BLE_MESH_INVALID_SCENE_NUMBER**

Invalid Scene Number

**ESP_BLE_MESH_SCENE_NUMBER_LEN**

Length of the Scene Number

**ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR**

Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY**

Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR**

Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY**

Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR**

Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN**

Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN**

Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR**

Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN**

Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC**

Every 15 seconds of the Scheduled minute
ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET
Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

**Type Definitions**

typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event,
esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.
Time Scene Client Model callback function type

Parameters

- **event**: Event type
- **param**: Pointer to callback parameter

typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event,
esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.
Time Scene Server Model callback function type

Parameters

- **event**: Event type
Enumerations

enum esp_ble_mesh_time_scene_client_cb_event_t
This enum value is the event of Time Scene Client Model

Values:

ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

enum esp_ble_mesh_time_scene_server_cb_event_t
This enum value is the event of Time Scene Server Model

Values:

ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Time Scene Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Time Scene Set/Unack messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Time Scene Get messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Time Scene Set/Unack messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Time Status message is received.

ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)
Register BLE Mesh Light Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: pointer to the callback function.

esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_light_client_common_param_t *params,
                                           esp_ble_mesh_light_client_get_state_t *get_state)
Get the value of Light Server Model states using the Light Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.

Parameters
- [in] get_state: Pointer of light get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_light_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_light_client_set_state_t *set_state)
```

Set the value of Light Server Model states using the Light Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_tinesp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] set_state: Pointer of light set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_lighting_server_callback(esp_ble_mesh_lighting_server_cb_t callback)
```

Register BLE Mesh Lighting Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

uint8_t trans_time
    Time to complete state transition (optional)
```
**uint8_t delay**

Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_lightness_default_set_t**

Parameter of Light Lightness Default Set

**Public Members**

**uint16_t lightness**

The value of the Light Lightness Default state

**struct esp_ble_mesh_light_lightness_range_set_t**

Parameters of Light Lightness Range Set

**Public Members**

**uint16_t range_min**

Value of range min field of light lightness range state

**uint16_t range_max**

Value of range max field of light lightness range state

**struct esp_ble_mesh_light_ctl_set_t**

Parameters of Light CTL Set

**Public Members**

**bool op_en**

Indicate if optional parameters are included

**uint16_t ctl_lightness**

Target value of light ctl lightness state

**uint16_t ctl_temperature**

Target value of light ctl temperature state

**int16_t ctl_delta_uv**

Target value of light ctl delta UV state

**uint8_t tid**

Transaction ID

**uint8_t trans_time**

Time to complete state transition (optional)

**uint8_t delay**

Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature Set

**Public Members**

**bool op_en**

Indicate if optional parameters are included

**uint16_t ctl_temperature**

Target value of light ctl temperature state

**int16_t ctl_delta_uv**

Target value of light ctl delta UV state
Chapter 2. API Reference

```c
uint8_t tid
Transaction ID
```

```c
uint8_t trans_time
Time to complete state transition (optional)
```

```c
uint8_t delay
Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range Set
```

### Public Members

```c
uint16_t range_min
Value of temperature range min field of light ctl temperature range state
```

```c
uint16_t range_max
Value of temperature range max field of light ctl temperature range state
```

```c
struct esp_ble_mesh_light_ctl_default_set_t
Parameters of Light CTL Default Set
```

uint8_t delay
Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_light_hsl_hue_set_t
Parameters of Light HSL Hue Set
```
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t hue
   Target value of light hsl hue state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
   Parameters of Light HSL Saturation Set

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t saturation
   Target value of light hsl hue state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_default_set_t
   Parameters of Light HSL Default Set

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state

uint16_t saturation
   Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_set_t
   Parameters of Light HSL Range Set

Public Members

uint16_t hue_range_min
   Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
   Value of hue range max field of light hsl hue range state
uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The target value of the Light xyL Lightness state

uint16_t xyl_x
The target value of the Light xyL x state

uint16_t xyl_y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state
struct esp_ble_mesh_light_lc_mode_set_t
    Parameter of Light LC Mode Set

    Public Members

    uint8_t mode
        The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
    Parameter of Light LC OM Set

    Public Members

    uint8_t mode
        The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
    Parameters of Light LC Light OnOff Set

    Public Members

    bool op_en
        Indicate whether optional parameters included

    uint8_t light_onoff
        The target value of the Light LC Light OnOff state

    uint8_t tid
        Transaction Identifier

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
    Parameter of Light LC Property Get

    Public Members

    uint16_t property_id
        Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
    Parameters of Light LC Property Set

    Public Members

    uint16_t property_id
        Property ID identifying a Light LC Property

    struct net_buf_simple *property_value
        Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
    Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

    Parameters of Light Lightness Status
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_lightness
   Current value of light lightness actual state

uint16_t target_lightness
   Target value of light lightness actual state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
   Parameters of Light Lightness Linear Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_lightness
   Current value of light lightness linear state

uint16_t target_lightness
   Target value of light lightness linear state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
   Parameter of Light Lightness Last Status

Public Members

uint16_t lightness
   The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
   Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
   The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
   Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
   Status Code for the request message

uint16_t range_min
   Value of range min field of light lightness range state

uint16_t range_max
   Value of range max field of light lightness range state
struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_lightness
Current value of light ctl lightness state

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t target_ctl_lightness
Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
Target value of light ctl temperature state (optional)

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
Parameters of Light CTL Temperature Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t present_ctl_delta_uv
Current value of light ctl delta UV state

uint16_t target_ctl_temperature
Target value of light ctl temperature state (optional)

uint16_t target_ctl_delta_uv
Target value of light ctl delta UV state (optional)

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
Parameters of Light CTL Temperature Range Status

Public Members

uint8_t status_code
Status code for the request message

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
Parameters of Light CTL Default Status

Parameters of Light xyl Status
Chapter 2. API Reference

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The present value of the Light xyL Lightness state

uint16_t xyl_x
The present value of the Light xyL x state

uint16_t xyl_y
The present value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light xyL Target Status

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t target_xyl_lightness
The target value of the Light xyL Lightness state

uint16_t target_xyl_x
The target value of the Light xyL x state

uint16_t target_xyl_y
The target value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xyL Default Status

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xyL Range Status

Public Members

uint8_t status_code
Status Code for the requesting message

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state
uint16_t `xyl_x_range_max`
   The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t `xyl_y_range_min`
   The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t `xyl_y_range_max`
   The value of the xyL y Range Max field of the Light xyL y Range state

`struct esp_ble_mesh_light_lc_mode_status_cb_t`
Parameter of Light LC Mode Status

**Public Members**

`uint8_t mode`
The present value of the Light LC Mode state

`struct esp_ble_mesh_light_lc_om_status_cb_t`
Parameter of Light LC OM Status

**Public Members**

`uint8_t mode`
The present value of the Light LC Occupancy Mode state

`struct esp_ble_mesh_light_lc_light_onoff_status_cb_t`
Parameters of Light LC Light OnOff Status

**Public Members**

`bool op_en`
Indicate whether optional parameters included

`uint8_t present_light_onoff`
The present value of the Light LC Light OnOff state

`uint8_t target_light_onoff`
The target value of the Light LC Light OnOff state (Optional)

`uint8_t remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_lc_property_status_cb_t`
Parameters of Light LC Property Status

**Public Members**

`uint16_t property_id`
Property ID identifying a Light LC Property

`struct net_buf_simple *property_value`
Raw value for the Light LC Property

`struct esp_ble_mesh_light_client_cb_param_t`
Lighting Client Model callback parameters
Public Members

```c
int error_code
   Appropriate error code
```

```c
esp_ble_mesh_client_common_param_t *params
   The client common parameters.
```

The maximum value of \textit{Light CTL Temperature Range state}

\texttt{uint16_t lightness\_default} \\
The value of \textit{Light Lightness Default state}

\texttt{uint16_t temperature\_default} \\
The value of \textit{Light CTL Temperature Default state}

\texttt{int16_t delta\_uv\_default} \\
The value of \textit{Light CTL Delta UV Default state}

\textbf{struct esp\_ble\_mesh\_light\_ctl\_srv\_t} \\
User data of \textit{Light CTL Server Model}
Public Members

*esp_ble_mesh_model_t *model*
Point to the Lighting CTL Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl*
Response control of the server model received messages.

*esp_ble_mesh_light_ctl_state_t *state*
Parameters of the Light CTL state.

*esp_ble_mesh_last_msg_info_t *last*
Parameters of the last received set message.

*esp_ble_mesh_state_transition_t *transition*
Parameters of state transition.

int32_t *tt_delta_lightness*
Delta change value of lightness state transition.

int32_t *tt_delta_temperature*
Delta change value of temperature state transition.

int32_t *tt_delta_delta_uv*
Delta change value of delta uv state transition.

*struct esp_ble_mesh_light_ctl_setup_srv_t*
User data of Light CTL Setup Server Model.

Public Members

*esp_ble_mesh_model_t *model*
Point to the Lighting CTL Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl*
Response control of the server model received messages.

*esp_ble_mesh_light_ctl_state_t *state*
Parameters of the Light CTL state.

*struct esp_ble_mesh_light_ctl_temp_srv_t*
User data of Light CTL Temperature Server Model.

Public Members

*esp_ble_mesh_model_t *model*
Point to the Lighting CTL Temperature Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl*
Response control of the server model received messages.

*esp_ble_mesh_light_ctl_state_t *state*
Parameters of the Light CTL state.

*esp_ble_mesh_last_msg_info_t *last*
Parameters of the last received set message.

*esp_ble_mesh_state_transition_t *transition*
Parameters of state transition.

int32_t *tt_delta_temperature*
Delta change value of temperature state transition.

int32_t *tt_delta_delta_uv*
Delta change value of delta uv state transition.
The present value of Light HSL Lightness state
uint16_t target_lightness
The target value of Light HSL Lightness state
uint16_t hue
The present value of Light HSL Hue state
uint16_t target_hue
The target value of Light HSL Hue state
uint16_t saturation
The present value of Light HSL Saturation state
uint16_t target_saturation
The target value of Light HSL Saturation state
uint16_t lightness_default
The value of Light Lightness Default state
uint16_t hue_default
The value of Light HSL Hue Default state
uint16_t saturation_default
The value of Light HSL Saturation Default state
uint8_t status_code
The status code of setting Light HSL Hue & Saturation Range state
uint16_t hue_range_min
The minimum value of Light HSL Hue Range state
uint16_t hue_range_max
The maximum value of Light HSL Hue Range state
uint16_t saturation_range_min
The minimum value of Light HSL Saturation state
uint16_t saturation_range_max
The maximum value of Light HSL Saturation state

User data of Light HSL Server Model

Public Members

struct esp_ble_mesh_light_hsl_srv_t

Pointer to the Lighting HSL Server Model. Initialized internally.
resp_ctrl
Response control of the server model received messages
state
Parameters of the Light HSL state
last
Parameters of the last received set message
transition
Parameters of state transition
**Chapter 2. API Reference**

```c
int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_hue
    Delta change value of hue state transition

int32_t tt_delta_saturation
    Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
    User data of Light HSL Setup Server Model
```

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting HSL Setup Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_light_hsl_state_t *state`
  Parameters of the Light HSL state

```c
struct esp_ble_mesh_light_hsl_hue_srv_t
    User data of Light HSL Hue Server Model
```

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting HSL Hue Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_light_hsl_state_t *state`
  Parameters of the Light HSL state

- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message

- `esp_ble_mesh_state_transition_t transition`
  Parameters of state transition

- `int32_t tt_delta_hue`
  Delta change value of hue state transition

```c
struct esp_ble_mesh_light_hsl_sat_srv_t
    User data of Light HSL Saturation Server Model
```

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_light_hsl_state_t *state`
  Parameters of the Light HSL state

- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message
**esp_ble_mesh_state_transition_t**

Parameters of state transition

**int32_t tt_delta_saturation**

Delta change value of saturation state transition

**struct esp_ble_mesh_light_xyl_state_t**

Parameters of Light xyl state

**Public Members**

**uint16_t lightness**

The present value of Light xyl Lightness state

**uint16_t target_lightness**

The target value of Light xyl Lightness state

**uint16_t x**

The present value of Light xyl x state

**uint16_t target_x**

The target value of Light xyl x state

**uint16_t y**

The present value of Light xyl y state

**uint16_t target_y**

The target value of Light xyl y state

**uint16_t lightness_default**

The value of Light Lightness Default state

**uint16_t x_default**

The value of Light xyl x Default state

**uint16_t y_default**

The value of Light xyl y Default state

**uint8_t status_code**

The status code of setting Light xyl x & y Range state

**uint16_t x_range_min**

The minimum value of Light xyl x Range state

**uint16_t x_range_max**

The maximum value of Light xyl x Range state

**uint16_t y_range_min**

The minimum value of Light xyl y Range state

**uint16_t y_range_max**

The maximum value of Light xyl y Range state

**struct esp_ble_mesh_light_xyl_srv_t**

User data of Light xyl Server Model

**Public Members**

**esp_ble_mesh_model_t **model

Pointer to the Lighting xyl Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl

Response control of the server model received messages

**esp_ble_mesh_light_xyl_state_t **state

Parameters of the Light xyl state
**esp_ble_mesh_last_msg_info_t**
- Parameters of the last received set message

**esp_ble_mesh_state_transition_t**
- Parameters of state transition

**int32_t tt_delta_lightness**
- Delta change value of lightness state transition

**int32_t tt_delta_x**
- Delta change value of x state transition

**int32_t tt_delta_y**
- Delta change value of y state transition

**struct esp_ble_mesh_light_xyl_setup_srv_t**
- User data of Light xyl Setup Server Model

### Public Members

**esp_ble_mesh_model_t *model**
- Pointer to the Lighting xyl Setup Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**
- Response control of the server model received messages

**esp_ble_mesh_light_xyl_state_t *state**
- Parameters of the Light xyl state

**struct esp_ble_mesh_light_lc_state_t**
- Parameters of Light LC states

### Public Members

**uint32_t mode : 1**
- 0b0 The controller is turned off.
- 0b1 The controller is turned on.

**uint32_t occupancy_mode : 1**
- The value of Light LC Occupancy Mode state

**uint32_t light_onoff : 1**
- The present value of Light LC Light OnOff state

**uint32_t target_light_onoff : 1**
- The target value of Light LC Light OnOff state

**uint32_t occupancy : 1**
- The value of Light LC Occupancy state

**uint32_t ambient_luxlevel : 24**
- The value of Light LC Ambient LuxLevel state

**uint16_t linear_output**
1. Light LC Linear Output = max(((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state
struct esp_ble_mesh_light_lc_property_state_t
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state
float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade

uint8_t fade_standby_auto
The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual
The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t state
The value of Light LC state machine state

struct k_delayed_work timer
Timer of Light LC state machine
**struct esp_ble_mesh_light_control_t**

Parameters of Light Lightness controller

**Public Members**

- `esp_ble_mesh_light_lc_state_t state`
  Parameters of Light LC state

- `esp_ble_mesh_light_lc_property_state_t prop_state`
  Parameters of Light LC Property state

- `esp_ble_mesh_light_lc_state_machine_t state_machine`
  Parameters of Light LC state machine

**struct esp_ble_mesh_light_lc_srv_t**

User data of Light LC Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting LC Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_light_control_t *lc`
  Parameters of the Light controller

- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message

- `esp_ble_mesh_state_transition_t *transition`
  Parameters of state transition

**struct esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting LC Setup Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_light_control_t *lc`
  Parameters of the Light controller

**struct esp_ble_mesh_state_change_light_lightness_set_t**

Parameter of Light Lightness Actual state change event

**Public Members**

- `uint16_t lightness`
  The value of Light Lightness Actual state

**struct esp_ble_mesh_state_change_light_lightness_linear_set_t**

Parameter of Light Lightness Linear state change event
Public Members

uint16_t lightness
   The value of Light Lightness Linear state

struct esp_ble_mesh_state_change_light_lightness_default_set_t
   Parameter of Light Lightness Default state change event

Public Members

uint16_t lightness
   The value of Light Lightness Default state

struct esp_ble_mesh_state_change_light_lightness_range_set_t
   Parameters of Light Lightness Range state change event

Public Members

uint16_t range_min
   The minimum value of Light Lightness Range state
uint16_t range_max
   The maximum value of Light Lightness Range state

struct esp_ble_mesh_state_change_light_ctl_set_t
   Parameters of Light CTL state change event

Public Members

uint16_t lightness
   The value of Light CTL Lightness state
uint16_t temperature
   The value of Light CTL Temperature state
int16_t delta_uv
   The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
   Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
   The value of Light CTL Temperature state
int16_t delta_uv
   The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
   Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
   The minimum value of Light CTL Temperature Range state
uint16_t range_max
   The maximum value of Light CTL Temperature Range state
struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
  The value of Light Lightness Default state
uint16_t temperature
  The value of Light CTL Temperature Default state
int16_t delta_uv
  The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
  The value of Light HSL Lightness state
uint16_t hue
  The value of Light HSL Hue state
uint16_t saturation
  The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
  The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

Public Members

uint16_t saturation
  The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event

Public Members

uint16_t lightness
  The value of Light HSL Lightness Default state
uint16_t hue
  The value of Light HSL Hue Default state
uint16_t saturation
  The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event
Public Members

```
uint16_t hue_range_min
  The minimum hue value of Light HSL Range state
uint16_t hue_range_max
  The maximum hue value of Light HSL Range state
uint16_t saturation_range_min
  The minimum saturation value of Light HSL Range state
uint16_t saturation_range_max
  The maximum saturation value of Light HSL Range state
```

`struct esp_ble_mesh_state_change_light_xyl_set_t`
Parameters of Light xyL state change event

Public Members

```
uint16_t lightness
  The value of Light xyL Lightness state
uint16_t x
  The value of Light xyL x state
uint16_t y
  The value of Light xyL y state
```

`struct esp_ble_mesh_state_change_light_xyl_default_set_t`
Parameters of Light xyL Default state change event

Public Members

```
uint16_t lightness
  The value of Light xyL Lightness Default state
uint16_t x
  The value of Light xyL x Default state
uint16_t y
  The value of Light xyL y Default state
```

`struct esp_ble_mesh_state_change_light_xyl_range_set_t`
Parameters of Light xyL Range state change event

Public Members

```
uint16_t x_range_min
  The minimum value of Light xyL x Range state
uint16_t x_range_max
  The maximum value of Light xyL x Range state
uint16_t y_range_min
  The minimum value of Light xyL y Range state
uint16_t y_range_max
  The maximum value of Light xyL y Range state
```

`struct esp_ble_mesh_state_change_light_lc_mode_set_t`
Parameter of Light LC Mode state change event
Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_onoff_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event

Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message
Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
Context of the received Light Lightness Linear Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness linear state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
Context of the received Light Lightness Range Set message

Public Members

uint16_t range_min
Value of range min field of light lightness range state
uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_server_recv_light_ctl_set_t
Context of the received Light CTL Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light ctl lightness state

uint16_t temperature
   Target value of light ctl temperature state

int16_t delta_uv
   Target value of light ctl delta UV state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
Context of the received Light CTL Temperature Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t temperature
   Target value of light ctl temperature state

int16_t delta_uv
   Target value of light ctl delta UV state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
Context of the received Light CTL Temperature Range Set message

Public Members

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state
**struct esp_ble_mesh_server_recv_light_ctl_default_set_t**
Context of the received Light CTL Default Set message

**Public Members**

- `uint16_t lightness`
  Value of light lightness default state
- `uint16_t temperature`
  Value of light temperature default state
- `int16_t delta_uv`
  Value of light delta UV default state

**struct esp_ble_mesh_server_recv_light_hsl_set_t**
Context of the received Light HSL Set message

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `uint16_t lightness`
  Target value of light hsl lightness state
- `uint16_t hue`
  Target value of light hsl hue state
- `uint16_t saturation`
  Target value of light hsl saturation state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_hsl_hue_set_t**
Context of the received Light HSL Hue Set message

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `uint16_t hue`
  Target value of light hsl hue state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t**
Context of the received Light HSL Saturation Set message

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
- `uint16_t hue`
  Target value of light hsl hue state
- `uint8_t tid`
  Transaction ID
- `uint8_t trans_time`
  Time to complete state transition (optional)
- `uint8_t delay`
  Indicate message execution delay (C.1)
### Public Members

- **bool op_en**
  - Indicate if optional parameters are included

- **uint16_t saturation**
  - Target value of light hsl hue state

- **uint8_t tid**
  - Transaction ID

- **uint8_t trans_time**
  - Time to complete state transition (optional)

- **uint8_t delay**
  - Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_light_hsl_default_set_t
```
- Context of the received Light HSL Default Set message

### Public Members

- **uint16_t lightness**
  - Value of light lightness default state

- **uint16_t hue**
  - Value of light hue default state

- **uint16_t saturation**
  - Value of light saturation default state

```c
struct esp_ble_mesh_server_recv_light_hsl_range_set_t
```
- Context of the received Light HSL Range Set message

### Public Members

- **uint16_t hue_range_min**
  - Value of hue range min field of light hsl hue range state

- **uint16_t hue_range_max**
  - Value of hue range max field of light hsl hue range state

- **uint16_t saturation_range_min**
  - Value of saturation range min field of light hsl saturation range state

- **uint16_t saturation_range_max**
  - Value of saturation range max field of light hsl saturation range state

```c
struct esp_ble_mesh_server_recv_light_xyl_set_t
```
- Context of the received Light xyL Set message

### Public Members

- **bool op_en**
  - Indicate whether optional parameters included

- **uint16_t lightness**
  - The target value of the Light xyL Lightness state

- **uint16_t x**
  - The target value of the Light xyL x state
```
struct esp_ble_mesh_server_recv_light_xyl_default_set_t
Context of the received Light xyL Default Set message

Public Members

uint16_t lightness
  The value of the Light Lightness Default state
uint16_t x
  The value of the Light xyL x Default state
uint16_t y
  The value of the Light xyL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
Context of the received Light xyl Range Set message

Public Members

uint16_t x_range_min
  The value of the xyL x Range Min field of the Light xyL x Range state
uint16_t x_range_max
  The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t y_range_min
  The value of the xyL y Range Min field of the Light xyL y Range state
uint16_t y_range_max
  The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_recv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

Public Members

uint8_t mode
  The target value of the Light LC Modestate

struct esp_ble_mesh_server_recv_light_lc_om_set_t
Context of the received Light OM Set message

Public Members

uint8_t mode
  The target value of the Light LC Occupancy Modestate

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message
```

Public Members

```c
bool op_en
    Indicate whether optional parameters included
```

```c
uint8_t light_onoff
    The target value of the Light LC Light OnOff state
```

```c
uint8_t tid
    Transaction Identifier
```

```c
uint8_t trans_time
    Time to complete state transition (optional)
```

```c
uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_lc_property_set_t
    Context of the received Light LC Property Set message
```

Public Members

```c
uint16_t property_id
    Property ID identifying a Light LC Property
```

```c
struct net_buf_simple *property_value
    Raw value for the Light LC Property
```

```c
struct esp_ble_mesh_server_recv_sensor_status_t
    Context of the received Sensor Status message
```

Public Members

```c
struct net_buf_simple *data
    Value of sensor data state (optional)
```

```c
struct esp_ble_mesh_lighting_server_cb_param_t
    Lighting Server Model callback parameters
```

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Lighting Server Models
```

```c
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
```

```c
esp_ble_mesh_lighting_server_cb_value_t value
    Value of the received Lighting Messages
```

Macros

```c
ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)
    Define a new Light Lightness Client Model.
```

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

**Parameters**

- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.
**ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI** (cli_pub, cli_data)
Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

**Parameters**
- *cli_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *cli_data*: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)
Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

**Parameters**
- *cli_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *cli_data*: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)
Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

**Parameters**
- *cli_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *cli_data*: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_CLI** (cli_pub, cli_data)
Define a new Light LC Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

**Parameters**
- *cli_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *cli_data*: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)
Lighting Server Models related context.

Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

**Return** New Light Lightness Server Model instance.

**Parameters**
- *srv_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *srv_data*: Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (srv_pub, srv_data)
Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**
- *srv_pub*: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- *srv_data*: Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`. 
ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)
Define a new Light CTL Server Model.

Note 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

Return New Light CTL Server Model instance.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)
Define a new Light CTL Setup Server Model.

Note 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
    1. This model shall support model subscription.

Return New Light CTL Setup Server Model instance.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_setup_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)
Define a new Light CTL Temperature Server Model.

Note 1. The Light CTL Temperature Server model extends the Generic Level Server model.
    1. This model shall support model publication and model subscription.

Return New Light CTL Temperature Server Model instance.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_light_ctl_temp_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)
Define a new Light HSL Server Model.

Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.
    1. This model shall support model publication and model subscription.
    2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.
    1. This model shall support model subscription.
Return New Light HSL Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
1. This model shall support model publication and model subscription.

Return New Light HSL Hue Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
1. This model shall support model publication and model subscription.

Return New Light HSL Saturation Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)

Define a new Light xYL Server Model.

Note 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Light xYL Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)

Define a new Light xYL Setup Server Model.

Note 1. The Light xYL Setup Server model extends the Light xYL Server and the Light Lightness Setup Server.
1. This model shall support model subscription.

Return New Light xYL Setup Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)

Define a new Light LC Server Model.

Note 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

Return New Light LC Server Model instance.

Parameters

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)

Define a new Light LC Setup Server Model.
Note 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
   1. This model shall support model publication and model subscription.
   2. This model may be used to configure setup parameters for the Light LC Server model.

Return New Light LC Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_lc_setup_srv_t.

Type Definitions

typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event, esp_ble_mesh_light_client_cb_param_t *param)

Bluetooth Mesh Light Client Model function.
Lighting Client Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event, esp_ble_mesh_lighting_server_cb_param_t *param)

Bluetooth Mesh Lighting Server Model function.
Lighting Server Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_light_client_cb_event_t
This enum value is the event of Lighting Client Model

Values:
ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states

Values:
ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL
enum esp_ble_mesh_lighting_server_cb_event_t
This enum value is the event of Lighting Server Model

Values:

ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Lighting Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Lighting Get messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Sensor Status message is received.

ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well
as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For use cases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only use cases, using NimBLE is recommended. It is less demanding in terms of code footprint and
  runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- ESP32 Bluetooth Architecture (PDF) [English]
- ESP32 Bluetooth Architecture (PDF) [中文]

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

2.2 Networking APIs

2.2.1 Wi-Fi

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32 Wi-Fi networking
functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Combined AP-STA mode (ESP32 is concurrently an access point and a station connected to another access
  point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
• Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples  The wifi directory of ESP-IDF examples contains the following applications:

Code examples for Wi-Fi are provided in the wifi directory of ESP-IDF examples.

In addition, there is a simple esp-idf-template application to demonstrate a minimal IDF project structure.

API Reference

Header File

• components/esp_wifi/include/esp_wifi.h

Functions

`esp_err_t esp_wifi_init(const wifi_init_config_t *config)`

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called

Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Return

• ESP_OK: succeed
• ESP_ERR_NO_MEM: out of memory
• others: refer to error code esp_err.h

Parameters

• config: pointer to WiFi initialized configuration structure; can point to a temporary variable.

`esp_err_t esp_wifi_deinit(void)`

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_set_mode(wifi_mode_t mode)`

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error code in esp_err.h

Parameters

• mode: WiFi operating mode

`esp_err_t esp_wifi_get_mode(wifi_mode_t *mode)`

Get current operating mode of WiFi.

Return

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
Chapter 2. API Reference

• [out] mode: store current WiFi mode

```
void esp_wifi_start(void)
```

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_FAIL: other WiFi internal errors

```
void esp_wifi_stop(void)
```

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```
void esp_wifi_restore(void)
```

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

• esp_wifi_set_bandwidth,
• esp_wifi_set_protocol,
• esp_wifi_set_config related
• esp_wifi_set_mode

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```
void esp_wifi_connect(void)
```

Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

```
void esp_wifi_disconnect(void)
```

Disconnect the ESP32 WiFi station from the AP.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
• ESP_ERR_WIFI NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_FAIL: other WiFi internal errors
Chapter 2. API Reference

**esp_err_t esp_wifi_clear_fast_connect (void)**
Currently this API is just an stub API.

Return
- ESP_OK: succeed
- others: fail

**esp_err_t esp_wifi_deauth_sta (uint16_t aid)**
deauthenticate all stations or associated id equals to aid

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters
- `aid`: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)**
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the
will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause
the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500
milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

Parameters
- `config`: configuration of scanning
- `block`: if block is true, this API will block the caller until the scan is done, otherwise it will return
immediately

**esp_err_t esp_wifi_scan_stop (void)**
Stop the scan in process.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)**
Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

Parameters
- `number`: store number of APIs found in last scan

**esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)**
Get AP list found in last scan.

**esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)**
Get AP list found in last scan.
Chapter 2. API Reference

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

**Parameters**

- [inout] number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- ap_records: wifi_ap_record_t array to hold the found APs

**esp_err_t** esp_wifi_sta_get_ap_info (**wifi_ap_record_t** *ap_info)

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

**Parameters**

- ap_info: the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

**esp_err_t** esp_wifi_set_ps (**wifi_ps_type_t** type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**

- [out] type: power save type

**esp_err_t** esp_wifi_get_ps (**wifi_ps_type_t** *type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**

- [out] type: store current power save type

**esp_err_t** esp_wifi_set_protocol (**wifi_interface_t** ifx, uint8_t protocol_bitmap)

Set protocol type of specified interface. The default protocol is WiFi_MIN_PROTOCOL. WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**

- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

**esp_err_t** esp_wifi_get_protocol (**wifi_interface_t** ifx, uint8_t *protocol_bitmap)

Get the current protocol bitmap of the specified interface.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
Chapter 2. API Reference

- ifx: interface
- [out] protocol_bitmap: store current WiFi protocol bitmap of interface ifx

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface to be configured
- bw: bandwidth

```c
esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)
```
Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx

```c
esp_err_t esp_wifi_set_channel(uint8_t primary, wifi_second_chan_t second)
```
Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp_wifi_start()
2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: for HT20, primary is the channel number, for HT40, primary is the primary channel
- second: for HT20, second is ignored, for HT40, second is the second channel

```c
esp_err_t esp_wifi_get_channel(uint8_t *primary, wifi_second_chan_t *second)
```
Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- primary: store current primary channel
- [out] second: store current second channel
**esp_err_t esp_wifi_set_country (const wifi_country_t *country)**

configure country info

**Attention 1.** It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

**Attention 2.** The default country is CHINA `{.cc=“CN”, .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}`

**Attention 3.** When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is `{.cc=“USA”, .schan=1, .nchan=11}` and the country info of the AP to which the station is connected is `{.cc=“JP”, .schan=1, .nchan=14}` then the country info that will be used is `{.cc=“JP”, .schan=1, .nchan=14}`. If the station disconnected from the AP the country info is set back to the country info of the station automatically, `{.cc=“US”, .schan=1, .nchan=11}` in the example.

**Attention 4.** When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention 5.** When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention 6.** The country configuration is stored into flash.

**Attention 7.** When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- country: the configured country info

**esp_err_t esp_wifi_get_country (wifi_country_t *country)**

get the current country info

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- country: country info

**esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])**

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention 1.** This API can only be called when the interface is disabled

**Attention 2.** ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention 3.** The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX” , but can not be “15:XX:XX:XX:XX:XX” .

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface
- mac: the MAC address

**esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])**

Get MAC of specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters
- ifx: interface
- [out] mac: store mac of the interface ifx

`esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)`
Register the RX callback function in the promiscuous mode.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- cb: callback

`esp_err_t esp_wifi_set_promiscuous (bool en)`
Enable the promiscuous mode.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- en: false - disable, true - enable

`esp_err_t esp_wifi_get_promiscuous (bool *en)`
Get the promiscuous mode.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- [out] en: store the current status of promiscuous mode

`esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)`
Enable the promiscuous mode packet type filter.

Note The default filter is to filter all packets except WIFI_PKT_MISC

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- filter: the packet type filtered in promiscuous mode.

`esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter) `
Get the promiscuous filter.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- [out] filter: store the current status of promiscuous filter

`esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter) `
Enable subtype filter of the control packet in promiscuous mode.

Note The default filter is to filter none control packet.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- filter: the subtype of the control packet filtered in promiscuous mode.
**esp_err_t esp_wifi_get_promiscuous_ctrl_filter** *(wifi_promiscuous_filter_t *filter)*  
Get the subtype filter of the control packet in promiscuous mode.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init  
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**  
- **[out]** filter: store the current status of subtype filter of the control packet in promiscuous mode

**esp_err_t esp_wifi_set_config** *(wifi_interface_t interface, wifi_config_t *conf)*  
Set the configuration of the ESP32 STA or AP.

**Attention**  
1. This API can be called only when specified interface is enabled, otherwise, API fail  
2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.  
3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init  
- ESP_ERR_INVALID_ARG: invalid argument  
- ESP_ERR_WIFI_IF: invalid interface  
- ESP_ERR_WIFI_MODE: invalid mode  
- ESP_ERR_WIFI_PASSWORD: invalid password  
- ESP_ERR_WIFI_NV: WiFi internal NVS error  
- others: refer to the error code in esp_err.h

**Parameters**  
- interface: interface  
- conf: station or soft-AP configuration

**esp_err_t esp_wifi_get_config** *(wifi_interface_t interface, wifi_config_t *conf)*  
Get configuration of specified interface.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init  
- ESP_ERR_INVALID_ARG: invalid argument  
- ESP_ERR_WIFI_IF: invalid interface

**Parameters**  
- interface: interface  
- **[out]** conf: station or soft-AP configuration

**esp_err_t esp_wifi_ap_get_sta_list** *(wifi_sta_list_t *sta)*  
Get STAs associated with soft-AP.

**Attention**  
SSC only API

**Return**  
- ESP_OK: succeed  
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init  
- ESP_ERR_INVALID_ARG: invalid argument  
- ESP_ERR_WIFI_MODE: WiFi mode is wrong  
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**  
- **[out]** sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**esp_err_t esp_wifi_ap_get_sta_aid** *(const uint8_t mac[6], uint16_t *aid)*  
Get AID of STA connected with soft-AP.

**Return**  
- ESP_OK: succeed  
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init  
- ESP_ERR_INVALID_ARG: invalid argument  
- ESP_ERR_WIFI_MODE: WiFi mode is wrong  
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid  
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**  
- **[out]** sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode
### ESP_OK: succeed
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

#### Parameters
- **mac**: STA’s mac address
- **[out]** aid: Store the AID corresponding to STA mac

**esp_err_t esp_wifi_set_storage (wifi_storage_t storage)**

Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI_STORAGE_FLASH

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- **storage**: :storage type

**esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)**

Set 802.11 Vendor-Specific Information Element.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

**Parameters**
- **enable**: If true, specified IE is enabled. If false, specified IE is removed.
- **type**: Information Element type. Determines the frame type to associate with the IE.
- **idx**: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- **vnd_ie**: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**esp_err_t esp_wifi_set_vendor_ie_cb (esp_vendor_ie_cb_t cb, void *ctx)**

Register Vendor-Specific Information Element monitoring callback.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **cb**: Callback function
- **ctx**: Context argument, passed to callback function.

**esp_err_t esp_wifi_set_max_tx_power (int8_t power)**

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the max_tx_power of the structure wifi_country_t variable.

**Attention** 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],[20]}, {[28, 33],[28]}, {[34, 43],[34]}, {[44, 51],[44]}, {[52, 55],[52]}, {[56, 59],[56]}, {[60, 65],[60]}, {[66, 71],[66]}, {[72, 79],[72]}, {[80, 84],[80]}}.

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

Parameters
• power: Maximum WiFi transmitting power.

`esp_err_t esp_wifi_get_max_tx_power(int8_t *power)`

Get maximum transmitting power after WiFi start.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_ARG: invalid argument

Parameters
• power: Maximum WiFi transmitting power, unit is 0.25dBm.

`esp_err_t esp_wifi_set_event_mask(uint32_t mask)`

Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
Attention 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
Attention 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• mask: WiFi event mask.

`esp_err_t esp_wifi_get_event_mask(uint32_t *mask)`

Get mask of WiFi events.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument

Parameters
• mask: WiFi event mask.

`esp_err_t esp_wifi_80211_tx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`

Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Return
• ESP_OK: success
• ESP_ERR_WIFI_IF: Invalid interface
• ESP_ERR_INVALID_ARG: Invalid parameter
• ESP_ERR_WIFI_NO_MEM: out of memory

Parameters
• ifx: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
• buffer: raw ieee80211 buffer
• len: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
• en_sys_seq: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211Tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after
the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- cb: callback
- ctx: context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```

Set CSI data configuration.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- config: configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```

Enable or disable CSI.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- en: true - enable, false - disable

```c
esp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
```

Set antenna GPIO configuration.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

**Parameters**
- config: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)
```

Get current antenna GPIO configuration.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**Parameters**
- config: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_set_ant (const wifi_ant_config_t *config)
```

Set antenna configuration.

**Return**
Chapter 2. API Reference

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters
- config: Antenna configuration.

esp_err_t esp_wifi_get_ant(wifi_ant_config_t *config)
Get current antenna configuration.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
- config: Antenna configuration.

int64_t esp_wifi_get_tsf_time(wifi_interface_t interface)
Get the TSF time. In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

Attention 1. Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Return 0 or the TSF time

Parameters
- interface: The interface whose tsf_time is to be retrieved.

esp_err_t esp_wifi_set_inactive_time(wifi_interface_t ifx, uint16_t sec)
Set the inactive time of the ESP32 STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
Attention 2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
Attention 3. The inactive time configuration is not stored into flash

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters
- ifx: interface to be configured.
- sec: Inactive time. Unit seconds.

esp_err_t esp_wifi_get_inactive_time(wifi_interface_t ifx, uint16_t *sec)
Get inactive time of specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

esp_err_t esp_wifi_statis_dump(uint32_t modules)
Dump WiFi statistics.

Return
- ESP_OK: succeed
- others: failed

Parameters
- modules: statistic modules to be dumped
**esp_err_t esp_wifi_set_rssi_threshold** (int32_t rssi)

Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**
- rssi: threshold value in dbm between -100 to 0

**esp_err_t esp_wifi_ftm_initiate_session** (wifi_ftm_initiator_cfg_t *cfg)

Start an FTM Initiator session by sending FTM request. If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** Use this API only in Station mode

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- cfg: FTM Initiator session configuration

**esp_err_t esp_wifi_ftm_end_session** (void)

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Return**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_ftm_resp_set_offset** (int16_t offset_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- offset_cm: T1 Offset to be added in centimeters

**esp_err_t esp_wifi_config_11b_rate** (wifi_interface_t ifx, bool disable)

Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().
2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- ifx: Interface to be configured.
- disable: true means disable 11b rate while false means enable 11b rate.

**esp_err_t esp_wifi_config_espnnow_rate** (wifi_interface_t ifx, wifi_phy_rate_t rate)

Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- ifx: Interface to be configured.
- rate: Phy rate to be configured.
**esp_err_t esp_wifi_set_connectionless_wake_interval (uint16_t interval)**
Set interval for station to wake up periodically at disconnected.

**Attention 1.** Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work.

**Attention 2.** This configuration only works for station mode and disconnected status.

**Attention 3.** This configuration would influence nothing until some module configure wake_window.

**Attention 4.** A sensible interval which is not too small is recommended (e.g. 100ms)

**Parameters**
- **interval:** how much microsecond would the chip wake up, from 1 to 65535.

**esp_err_t esp_wifi_set_country_code (const char *country, bool ieee80211d_enabled)**
configure country

**Attention 1.** When ieee80211d_enabled, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention 2.** When ieee80211d_enabled is disabled, then the configured country info is used always.

**Attention 3.** When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention 4.** The country configuration is stored into flash.

**Attention 5.** When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention 7.** When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.

**Attention 8.** The default country is “CN” and ieee80211d_enabled is TRUE.

**Return**
- **ESP_OK:** succeed
- **ESP_ERR_WIFI_NOT_INIT:** WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG:** invalid argument

**Parameters**
- **country:** the configured country ISO code
- **ieee80211d_enabled:** 802.11d is enabled or not

**esp_err_t esp_wifi_get_country_code (char *country)**
get the current country code

**Return**
- **ESP_OK:** succeed
- **ESP_ERR_WIFI_NOT_INIT:** WiFi is not initialized by esp_wifi_init
- **ESP_ERR_INVALID_ARG:** invalid argument

**Parameters**
- **country:** country code

**esp_err_t esp_wifi_config_80211_tx_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)**
Config 80211 tx rate of specified interface.

**Attention 1.** This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**
- **ESP_OK:** succeed
- **others:** failed

**Parameters**
- **ifx:** Interface to be configured.
- **rate:** Phy rate to be configured.
**struct wifi_init_config_t**

WiFi stack configuration parameters passed to esp_wifi_init call.

**Public Members**

- `system_event_handler_t event_handler`
  WiFi event handler

- `wifi_osi_funcs_t *osi_funcs`
  WiFi OS functions

- `wpa_crypto_funcs_t wpa_crypto_funcs`
  WiFi station crypto functions when connect

- `int static_rx_buf_num`
  WiFi static RX buffer number

- `int dynamic_rx_buf_num`
  WiFi dynamic RX buffer number

- `int tx_buf_type`
  WiFi TX buffer type

- `int static_tx_buf_num`
  WiFi static TX buffer number

- `int dynamic_tx_buf_num`
  WiFi dynamic TX buffer number

- `int cache_tx_buf_num`
  WiFi TX cache buffer number

- `int csi_enable`
  WiFi channel state information enable flag

- `int ampdu_rx_enable`
  WiFi AMPDU RX feature enable flag

- `int ampdu_tx_enable`
  WiFi AMPDU TX feature enable flag

- `int amsdu_tx_enable`
  WiFi AMSDU TX feature enable flag

- `int nvs_enable`
  WiFi NVS flash enable flag

- `int nano_enable`
  Nano option for printf/scan family enable flag

- `int rx_ba_win`
  WiFi Block Ack RX window size

- `int wifi_task_core_id`
  WiFi Task Core ID

- `int beacon_max_len`
  WiFi softAP maximum length of the beacon

- `int mgmt_sbuf_num`
  WiFi management short buffer number, the minimum value is 6, the maximum value is 32

- `uint64_t feature_caps`
  Enables additional WiFi features and capabilities

- `bool sta_disconnected_pm`
  WiFi Power Management for station at disconnected status
int magic
   WiFi init magic number, it should be the last field

Macros

ESP_ERR_WIFI_NOT_INIT
   WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED
   WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED
   WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
   WiFi interface error

ESP_ERR_WIFI_MODE
   WiFi mode error

ESP_ERR_WIFI_STATE
   WiFi internal state error

ESP_ERR_WIFI_CONN
   WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
   WiFi internal NVS module error

ESP_ERR_WIFI_MAC
   MAC address is invalid

ESP_ERR_WIFI_SSID
   SSID is invalid

ESP_ERR_WIFI_PASSWORD
   Password is invalid

ESP_ERR_WIFI_TIMEOUT
   Timeout error

ESP_ERR_WIFI_WAKE_FAIL
   WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK
   The caller would block

ESP_ERR_WIFI_NOT_CONNECT
   Station still in disconnect status

ESP_ERR_WIFI_POST
   Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
   Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
   Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
   The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
   The WiFi TX is disallowed

Type Definitions

typedef void (*wifi_promiscuous_cb_t) (void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters
- buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
- type: promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t) (void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6],
const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Parameters
- ctx: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
- type: Information element type, based on frame type received.
- sa: Source 802.11 address.
- vnd_ie: Pointer to the vendor specific element data received.
- rssi: Received signal strength indication.

typedef void (*wifi_csi_cb_t) (void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters
- ctx: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
- data: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File
- components/esp_wifi/include/esp_wifi_types.h
Unions

union wifi_config_t
#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config() 

Public Members

wifi_ap_config_t ap
    configuration of AP

wifi_sta_config_t sta
    configuration of STA

Structures

struct wifi_country_t
    Structure describing WiFi country-based regional restrictions.

Public Members

char cc[3]
    country code string

uint8_t schan
    start channel

uint8_t nchan
    total channel number

int8_t max_tx_power
    This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t policy
    country policy

struct wifi_active_scan_time_t
    Range of active scan times per channel.

Public Members

uint32_t min
    minimum active scan time per channel, units: millisecond

uint32_t max
    maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t
    Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t active
    active scan time per channel, units: millisecond.

uint32_t passive
    passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.
struct wifi_scan_config_t
Parameters for an SSID scan.

Public Members

uint8_t * ssid
SSID of AP

uint8_t * bssid
MAC address of AP

uint8_t channel
channel, scan the specific channel

bool show_hidden
enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
scan type, active or passive

wifi_scan_time_t scan_time
scan time per channel

struct wifi_ap_record_t
Description of a WiFi AP.

Public Members

uint8_t bssid[6]
MAC address of AP

uint8_t ssid[33]
SSID of AP

uint8_t primary
channel of AP

wifi_second_chan_t second
secondary channel of AP

int8_t rssi
signal strength of AP

wifi_auth_mode_t authmode
authmode of AP

wifi_cipher_type_t pairwise_cipher
pairwise cipher of AP

wifi_cipher_type_t group_cipher
group cipher of AP

wifi_ant_t ant
antenna used to receive beacon from AP

uint32_t phy_11b : 1
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
bit: 3 flag to identify if low rate is enabled or not
Chapter 2. API Reference

uint32_t wps : 1
    bit: 4 flag to identify if WPS is supported or not

uint32_t ftm_responder : 1
    bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator : 1
    bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t reserved : 25
    bit: 7..31 reserved

wifi_country_t country
    country information of AP

struct wifi_scan_threshold_t
    Structure describing parameters for a WiFi fast scan.

    Public Members

    int8_t rssi
        The minimum rssi to accept in the fast scan mode

    wifi_auth_mode_t authmode
        The weakest authmode to accept in the fast scan mode

struct wifi_pmf_config_t
    Configuration structure for Protected Management Frame

    Public Members

    bool capable
        Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if other device also advertizes PMF capability.

    bool required
        Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct wifi_ap_config_t
    Soft-AP configuration settings for the ESP32.

    Public Members

    uint8_t ssid[32]
        SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

    uint8_t password[64]
        Password of ESP32 soft-AP.

    uint8_t ssid_len
        Optional length of SSID field.

    uint8_t channel
        Channel of ESP32 soft-AP

    wifi_auth_mode_t authmode
        Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

    uint8_t ssid_hidden
        Broadcast SSID or not, default 0, broadcast the SSID
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>max_connection</code></td>
<td>Max number of stations allowed to connect in, default 4, max 10</td>
</tr>
<tr>
<td><code>beacon_interval</code></td>
<td>Beacon interval which should be multiples of 100. Unit: TU (time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100</td>
</tr>
<tr>
<td><code>pairwise_cipher</code></td>
<td>Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP. Enum values before that will be considered as invalid and default cipher suites (TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.</td>
</tr>
<tr>
<td><code>ftm_responder</code></td>
<td>Enable FTM Responder mode</td>
</tr>
</tbody>
</table>

**struct wifi_sta_config_t**

STA configuration settings for the ESP32.

**Public Members**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

</tbody>
</table>

```c
uint32_t reserved : 29
   Reserved for future feature set
```

**struct wifi_sta_info_t**
Description of STA associated with AP.

**Public Members**

```
uint8_t mac[6]
   mac address
int8_t rssi
   current average rssi of sta connected
uint32_t phy_11b : 1
   bit: 0 flag to identify if 11b mode is enabled or not
uint32_t phy_11g : 1
   bit: 1 flag to identify if 11g mode is enabled or not
uint32_t phy_11n : 1
   bit: 2 flag to identify if 11n mode is enabled or not
uint32_t phy_lr : 1
   bit: 3 flag to identify if low rate is enabled or not
uint32_t is_mesh_child : 1
   bit: 4 flag to identify mesh child
uint32_t reserved : 27
   bit: 5..31 reserved
```

**struct wifi_sta_list_t**
List of stations associated with the ESP32 Soft-AP.

**Public Members**

```
wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
   station list
int num
   number of stations in the list (other entries are invalid)
```

**struct vendor_ie_data_t**
Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

**Public Members**

```
uint8_t element_id
   Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)
uint8_t length
   Length of all bytes in the element data following this field. Minimum 4.
uint8_t vendor_oui[3]
   Vendor identifier (OUI).
uint8_t vendor_oui_type
   Vendor-specific OUI type.
uint8_t payload[0]
   Payload. Length is equal to value in ‘length’ field, minus 4.
```
Chapter 2. API Reference

**struct wifi_pkt_rx_ctrl_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

**Public Members**

- **signed rssi : 8**  
  Received Signal Strength Indicator (RSSI) of packet. unit: dBm

- **unsigned rate : 5**  
  PHY rate encoding of the packet. Only valid for non HT(11bg) packet

- **unsigned __pad0__ : 1**  
  reserved

- **unsigned sig_mode : 2**  
  0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

- **unsigned __pad1__ : 16**  
  reserved

- **unsigned mcs : 7**  
  Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MCS0 ~ MCS76)

- **unsigned cwb : 1**  
  Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

- **unsigned __pad2__ : 16**  
  reserved

- **unsigned smoothing : 1**  
  reserved

- **unsigned not_sounding : 1**  
  reserved

- **unsigned __pad3__ : 1**  
  reserved

- **unsigned aggregation : 1**  
  Aggregation. 0: MPDU packet; 1: AMPDU packet

- **unsigned stbc : 2**  
  Space Time Block Code (STBC). 0: non STBC packet; 1: STBC packet

- **unsigned fec_coding : 1**  
  Flag is set for 11n packets which are LDPC

- **unsigned sgi : 1**  
  Short Guide Interval (SGI). 0: Long GI; 1: Short GI

- **signed noise_floor : 8**  
  noise floor of Radio Frequency Module (RF). unit: 0.25dBm

- **unsigned ampdu_cnt : 8**  
  ampdu cnt

- **unsigned channel : 4**  
  primary channel on which this packet is received

- **unsigned secondary_channel : 4**  
  secondary channel on which this packet is received. 0: none; 1: above; 2: below

- **unsigned __pad4__ : 8**  
  reserved
unsigned *timestamp* : 32
   timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep
   is not enabled. unit: microsecond

unsigned __pad5__ : 32
   reserved

unsigned __pad6__ : 31
   reserved

unsigned *ant* : 1
   antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned *sig_len* : 12
   length of packet including Frame Check Sequence(FCS)

unsigned __pad7__ : 12
   reserved

unsigned *rx_state* : 8
   state of the packet. 0: no error; others: error numbers which are not public

**struct wifi_promiscuous_pkt_t**
   Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

**Public Members**

**wifi_pkt_rx_ctrl_t** *rx_ctrl*
   metadata header

uint8_t *payload[0]*
   Data or management payload. Length of payload is described by *rx_ctrl.sig_len*. Type of content deter-
   mined by packet type argument of callback.

**struct wifi_promiscuous_filter_t**
   Mask for filtering different packet types in promiscuous mode.

**Public Members**

uint32_t *filter_mask*
   OR of one or more filter values WIFI_PROMIS_FILTER_*

**struct wifi_csi_config_t**
   Channel state information(CSI) configuration type.

**Public Members**

bool *lltf_en*
   enable to receive legacy long training field,lltf) data. Default enabled

bool *htlltf_en*
   enable to receive HT long training field(htlltf) data. Default enabled

bool *stbc_htlltf2_en*
   enable to receive space time block code HT long training field(stbc-hlltf2) data. Default enabled

bool *ltf_merge_en*
   enable to generate ltf data by averaging ltf and ht_ltf data when receiving HT packet. Otherwise, use
   ht_ltf data directly. Default enabled

bool *channel_filter_en*
   enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent
   sub-carrier. Default enabled
bool manu_scale
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the
shift bits. false: automatically. true: manually. Default false

uint8_t shift
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
CSI data type.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
received packet radio metadata header of the CSI data

uint8_t mac[6]
source MAC address of the CSI data

bool first_word_invalid
first four bytes of the CSI data is invalid or not

int8_t *buf
buffer of CSI data

uint16_t len
length of CSI data

struct wifi_ant_gpio_t
WiFi GPIO configuration for antenna selection.

Public Members

uint8_t gpio_select : 1
Whether this GPIO is connected to external antenna switch

uint8_t gpio_num : 7
The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t gpio_cfg[4]
The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
WiFi antenna configuration.

Public Members

wifi_ant_mode_t rx_ant_mode
WiFi antenna mode for receiving

wifi_ant_t rx_ant_default
Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t tx_ant_mode
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode
is set to WIFI_ANT_MODE_AUTO
```c
uint8_t enabled_ant0 : 4
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1 : 4
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
   Action Frame Tx Request.

Public Members

wifi_interface_t ifx
   WiFi interface to send request to

uint8_t dest_mac[6]
   Destination MAC address

bool no_ack
   Indicates no ack required

wifi_action_rx_cb_t rx_cb
   Rx Callback to receive any response

uint32_t data_len
   Length of the appended Data

uint8_t data[0]
   Appended Data payload

struct wifi_ftm_initiator_cfg_t
   FTM Initiator configuration.

Public Members

uint8_t resp_mac[6]
   MAC address of the FTM Responder

uint8_t channel
   Primary channel of the FTM Responder

uint8_t frm_count
   No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t burst_period
   Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

struct wifi_event_sta_scan_done_t
   Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

uint32_t status
   status of scanning APs: 0 — success, 1 - failure

uint8_t number
   number of scan results

uint8_t scan_id
   scan sequence number, used for block scan

struct wifi_event_sta_connected_t
   Argument structure for WIFI_EVENT_STA_CONNECTED event
```
Public Members

uint8_t ssid[32]
SSID of connected AP

uint8_t ssid_len
SSID length of connected AP

uint8_t bssid[6]
BSSID of connected AP

uint8_t channel
channel of connected AP

wifi_auth_mode_t authmode
authentication mode used by AP

struct wifi_event_sta_disconnected_t
Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
SSID of disconnected AP

uint8_t ssid_len
SSID length of disconnected AP

uint8_t bssid[6]
BSSID of disconnected AP

uint8_t reason
reason of disconnection

struct wifi_event_sta_authmode_change_t
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t old_mode
the old auth mode of AP

wifi_auth_mode_t new_mode
the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t pin_code[8]
PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t ap_cred_cnt
Number of AP credentials received
uchar_t ssid[MAXSSID_LEN]
    SSID of AP
uchar_t passphrase[MAX_PASSPHRASE_LEN]
    Passphrase for the AP

struct wifi_event_sta_wps_er_success_t:
    [anonymous] ap_cred[MAXWPS_AP_CRED]
    All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
    Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uchar_t mac[6]
    MAC address of the station connected to ESP32 soft-AP
uchar_t aid
    the aid that ESP32 soft-AP gives to the station connected to

bool is_mesh_child
    flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
    Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uchar_t mac[6]
    MAC address of the station disconnects to ESP32 soft-AP
uchar_t aid
    the aid that ESP32 soft-AP gave to the station disconnects to

bool is_mesh_child
    flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
    Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
    Received probe request signal strength
uchar_t mac[6]
    MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
    Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
    RSSI value of bss

struct wifi_ftm_report_entry_t
    Argument structure for
Public Members

- `uint8_t dlog_token`  
  Dialog Token of the FTM frame

- `int8_t rssi`  
  RSSI of the FTM frame received

- `uint32_t rtt`  
  Round Trip Time in pSec with a peer

- `uint64_t t1`  
  Time of departure of FTM frame from FTM Responder in pSec

- `uint64_t t2`  
  Time of arrival of FTM frame at FTM Initiator in pSec

- `uint64_t t3`  
  Time of departure of ACK from FTM Initiator in pSec

- `uint64_t t4`  
  Time of arrival of ACK at FTM Responder in pSec

**struct wifi_event_ftm_report_t**  
Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

- `uint8_t peer_mac[6]`  
  MAC address of the FTM Peer

- `wifi_ftm_status_t status`  
  Status of the FTM operation

- `uint32_t rtt_raw`  
  Raw average Round-Trip-Time with peer in Nano-Seconds

- `uint32_t rtt_est`  
  Estimated Round-Trip-Time with peer in Nano-Seconds

- `uint32_t dist_est`  
  Estimated one-way distance in Centi-Meters

- `wifi_ftm_report_entry_t *ftm_report_data`  
  Pointer to FTM Report with multiple entries, should be freed after use

- `uint8_t ftm_report_num_entries`  
  Number of entries in the FTM Report data

**struct wifi_event_action_tx_status_t**  
Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

- `wifi_interface_t ifx`  
  WiFi interface to send request to

- `uint32_t context`  
  Context to identify the request

- `uint8_t da[6]`  
  Destination MAC address

- `uint8_t status`  
  Status of the operation
struct wifi_event_roc_done_t
    Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

uint32_t context
    Context to identify the request

Macros

WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
    max number of stations which can connect to ESP32 soft-AP
WIFI_VENDOR_IE_ELEMENT_ID
WIFI_PROMIS_FILTER_MASK_ALL
    filter all packets
WIFI_PROMIS_FILTER_MASK_MGMT
    filter the packets with type of WIFI_PKT_MGMT
WIFI_PROMIS_FILTER_MASK_CTRL
    filter the packets with type of WIFI_PKT_CTRL
WIFI_PROMIS_FILTER_MASK_DATA
    filter the packets with type of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_MISC
    filter the packets with type of WIFI_PKT_MISC
WIFI_PROMIS_FILTER_MASK_DATA_MPDU
    filter the MPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
    filter the AMPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_FCSFAIL
    filter the FCS failed packets, do not open it in general
WIFI_PROMIS_CTRL_FILTER_MASK_ALL
    filter all control packets
WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
    filter the control packets with subtype of Control Wrapper
WIFI_PROMIS_CTRL_FILTER_MASK_BAR
    filter the control packets with subtype of Block Ack Request
WIFI_PROMIS_CTRL_FILTER_MASK_BA
    filter the control packets with subtype of Block Ack
WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
    filter the control packets with subtype of PS-Poll
WIFI_PROMIS_CTRL_FILTER_MASK_RTS
  filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
  filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
  filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
  filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
  filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
  mask all WiFi events

WIFI_EVENT_MASK_NONE
  mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
  mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN
MAX_PASSPHRASE_LEN
MAX_WPS_AP_CRED
WIFI_STATIS_BUFFER
WIFI_STATIS_RXTX
WIFI_STATIS_HW
WIFI_STATIS_DIAG
WIFI_STATIS_PS
WIFI_STATIS_ALL

Type Definitions
typedef int (*wifi_action_rx_cb_t) (uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
The Rx callback function of Action Tx operations.

Parameters
  • hdr: pointer to the IEEE 802.11 Header structure
  • payload: pointer to the Payload following 802.11 Header
  • len: length of the Payload
  • channel: channel number the frame is received on

Enumerations
enum wifi_mode_t
  Values:
  
WIFI_MODE_NULL = 0
  null mode

WIFI_MODE_STA
  WiFi station mode

WIFI_MODE_AP
  WiFi soft-AP mode

WIFI_MODE_APSTA
  WiFi station + soft-AP mode
Chapter 2. API Reference

WIFI_MODE_MAX

enum wifi_interface_t
{
  Values:
  WIFI_IF_STA = ESP_IF_WIFI_STA
  WIFI_IF_AP = ESP_IF_WIFI_AP
}

enum wifi_country_policy_t
{
  WIFI_COUNTRY_POLICY_AUTO
  Country policy is auto, use the country info of AP to which the station is connected
  WIFI_COUNTRY_POLICY_MANUAL
  Country policy is manual, always use the configured country info
}

enum wifi_second_chan_t

Values:

WIFI_SECOND_CHAN_NONE = 0
    the channel width is HT20

WIFI_SECOND_CHAN_ABOVE
    the channel width is HT40 and the secondary channel is above the primary channel

WIFI_SECOND_CHAN BELOW
    the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t

Values:

WIFI_SCAN_TYPE_ACTIVE = 0
    active scan

WIFI_SCAN_TYPE_PASSIVE
    passive scan

enum wifi_cipher_type_t

Values:

WIFI_CIPHER_TYPE_NONE = 0
    the cipher type is none
WIFI_CIPHER_TYPE_WEP40
the cipher type is WEP40

WIFI_CIPHER_TYPE_WEP104
the cipher type is WEP104

WIFI_CIPHER_TYPE_TKIP
the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP
the cipher type is CCMP

WIFI_CIPHER_TYPE_TKIP_CCMP
the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES_CMAC128
the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_SMS4
the cipher type is SMS4

WIFI_CIPHER_TYPE_GCMP
the cipher type is GCMP

WIFI_CIPHER_TYPE_GCMP256
the cipher type is GCMP-256

WIFI_CIPHER_TYPE_AES_GMAC128
the cipher type is AES-GMAC-128

WIFI_CIPHER_TYPE_AES_GMAC256
the cipher type is AES-GMAC-256

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
WiFi antenna.
Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

enum wifi_scan_method_t
Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t
Values:
Chapter 2. API Reference

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t
Values:
WIFI_BW_HT20 = 1
WIFI_BW_HT40

enum wifi_storage_t
Values:
WIFI_STORAGE_FLASH
all configuration will store in both memory and flash
WIFI_STORAGE_RAM
all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.
Values:
WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
Values:
WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
Values:
WIFI_PKT_MGMT
Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_CTRL
Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_DATA
Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_MISC
Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.
enum wifi_ant_mode_t
WiFi antenna mode.

Values:

WIFI_ANT_MODE_ANT0
Enable WiFi antenna 0 only

WIFI_ANT_MODE_ANT1
Enable WiFi antenna 1 only

WIFI_ANT_MODE_AUTO
Enable WiFi antenna 0 and 1, automatically select an antenna

WIFI_ANT_MODE_MAX
Invalid WiFi enabled antenna

enum wifi_phy_rate_t
WiFi PHY rate encodings.

Values:

WIFI_PHY_RATE_1M_L = 0x00
1 Mbps with long preamble

WIFI_PHY_RATE_2M_L = 0x01
2 Mbps with long preamble

WIFI_PHY_RATE_5M_L = 0x02
5.5 Mbps with long preamble

WIFI_PHY_RATE_11M_L = 0x03
11 Mbps with long preamble

WIFI_PHY_RATE_2M_S = 0x05
2 Mbps with short preamble

WIFI_PHY_RATE_5M_S = 0x06
5.5 Mbps with short preamble

WIFI_PHY_RATE_11M_S = 0x07
11 Mbps with short preamble

WIFI_PHY_RATE_48M = 0x08
48 Mbps

WIFI_PHY_RATE_24M = 0x09
24 Mbps

WIFI_PHY_RATE_12M = 0x0A
12 Mbps

WIFI_PHY_RATE_6M = 0x0B
6 Mbps

WIFI_PHY_RATE_54M = 0x0C
54 Mbps

WIFI_PHY_RATE_36M = 0x0D
36 Mbps

WIFI_PHY_RATE_18M = 0x0E
18 Mbps

WIFI_PHY_RATE_9M = 0x0F
9 Mbps

WIFI_PHY_RATE_MCS0_LGI = 0x10
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_LGI = 0x15
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_LGI = 0x16
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_LGI = 0x17
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS0_SGI = 0x18
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

WIFI_PHY_RATE_MCS1_SGI = 0x19
MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_SGI = 0x1A
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_SGI = 0x1B
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_SGI = 0x1C
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_SGI = 0x1D
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_SGI = 0x1E
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_SGI = 0x1F
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

WIFI_PHY_RATE_LORA_250K = 0x29
250 Kbps

WIFI_PHY_RATE_LORA_500K = 0x2A
500 Kbps

WIFI_PHY_RATE_MAX

enum wifi_event_t
WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
ESP32 WiFi ready

WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

WIFI_EVENT_STA_START
ESP32 station start

WIFI_EVENT_STA_STOP
ESP32 station stop
WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

WIFI_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

WIFI_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
ESP32 soft-AP start

WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

WIFI_EVENT_FTM_REPORT
Receive report of FTM procedure

WIFI_EVENT_STA_BSS_RSSI_LOW
AP’s RSSI crossed configured threshold

WIFI_EVENT_ACTION_TX_STATUS
Status indication of Action Tx operation

WIFI_EVENT_ROC_DONE
Remain-on-Channel operation complete

WIFI_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

WIFI_EVENT_MAX
Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

WPS_FAIL_REASON_NORMAL = 0
ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX
Chapter 2. API Reference

```c
enum wifi_ftm_status_t
    FTM operation status types.
    Values:
    FTM_STATUS_SUCCESS = 0
        FTM exchange is successful
    FTM_STATUS_UNSUPPORTED
        Peer does not support FTM
    FTM_STATUS_CONF_REJECTED
        Peer rejected FTM configuration in FTM Request
    FTM_STATUS_NO_RESPONSE
        Peer did not respond to FTM Requests
    FTM_STATUS_FAIL
        Unknown error during FTM exchange
```

**SmartConfig**

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check *Provisioning API*.

**Application Example**  Connect ESP32 to target AP using SmartConfig: wifi/smart_config.

**API Reference**

**Header File**

- components/esp_wifi/include/esp_smartconfig.h

**Functions**

```c
const char *esp_smartconfig_get_version (void)
    Get the version of SmartConfig.

Return
    - SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
    Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Return
    - ESP_OK: succeed
    - others: fail

Parameters
    - config: pointer to smartconfig start configure structure
```

```c
esp_err_t esp_smartconfig_stop (void)
    Stop SmartConfig, free the buffer taken by esp_smartconfig_start.
```
Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smart-config_start.

Return
- ESP_OK: succeed
- others: fail

`esp_err_t esp_esptouch_set_timeout (uint8_t time_s)`
Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return
- ESP_OK: succeed
- others: fail

Parameters
- `time_s`: range 15s~255s, offset: 45s.

`esp_err_t esp_smartconfig_set_type (smartconfig_type_t type)`
Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

Return
- ESP_OK: succeed
- others: fail

Parameters
- `type`: Choose from the smartconfig_type_t.

`esp_err_t esp_smartconfig_fast_mode (bool enable)`
Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

Return
- ESP_OK: succeed
- others: fail

Parameters
- `enable`: false-disable(default); true-enable;

`esp_err_t esp_smartconfig_get_rvd_data (uint8_t *rvd_data, uint8_t len)`
Get reserved data of ESPTouch v2.

Return
- ESP_OK: succeed
- others: fail

Parameters
- `rvd_data`: reserved data
- `len`: length of reserved data

Structures

`struct smartconfig_event_got_ssid_pswd_t`
Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

`uint8_t ssid[32]`
SSID of the AP. Null terminated string.

`uint8_t password[64]`
Password of the AP. Null terminated string.

`bool bssid_set`
whether set MAC address of target AP or not.
Chapter 2. API Reference

```
uint8_t bssid[6]
    MAC address of target AP.

smartconfig_type_t type
    Type of smartconfig (ESPTouch or AirKiss).

uint8_t token
    Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
    IP address of cellphone.

struct smartconfig_start_config_t
    Configure structure for esp_smartconfig_start

Public Members

bool enable_log
    Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
    Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
    ESPTouch v2 crypt key, len should be 16.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT()

Enumerations

enum smartconfig_type_t
    Values:
    SC_TYPE_ESPTOUCH = 0
        protocol: ESPTouch
    SC_TYPE_AIRKISS
        protocol: AirKiss
    SC_TYPE_ESPTOUCH_AIRKISS
        protocol: ESPTouch and AirKiss
    SC_TYPE_ESPTOUCH_V2
        protocol: ESPTouch v2

enum smartconfig_event_t
    Smartconfig event declarations
    Values:
    SC_EVENT_SCAN_DONE
        ESP32 station smartconfig has finished to scan for APs
    SC_EVENT_FOUND_CHANNEL
        ESP32 station smartconfig has found the channel of the target AP
    SC_EVENT_GOT_SSID_PSWD
        ESP32 station smartconfig got the SSID and password
    SC_EVENT_SEND_ACK_DONE
        ESP32 station smartconfig has sent ACK to cellphone
```
ESP-NOW

Overview  ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format  ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>7~</td>
<td></td>
</tr>
<tr>
<td>255 bytes</td>
<td>4 bytes</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value filed is used to prevents relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security  ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call esp_now_set_pmk() to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization  Call esp_now_init() to initialize ESP-NOW and esp_now_deinit() to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When esp_now_deinit() is called, all of the information of paired devices will be deleted.
Add Paired Device  Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data  Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data  Call `esp_now_register_recv_cb` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

API Reference

Header File
- components/esp_wifi/include/esp_now.h

Functions

```c
esp_err_t esp_now_init (void)
Initialize ESPNOW function.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error
```

```c
esp_err_t esp_now_deinit (void)
De-initialize ESPNOW function.

Return
- ESP_OK : succeed
```

```c
esp_err_t esp_now_get_version (uint32_t *version)
Get the version of ESPNOW.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
- version: ESPNOW version
```

```c
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)
Register callback function of receiving ESPNOW data.
```
Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL : internal error

Parameters
• cb: callback function of receiving ESPNOW data

`esp_err_t esp_now_unregister_recv_cb (void)`
Unregister callback function of receiving ESPNOW data.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

`esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)`
Register callback function of sending ESPNOW data.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL : internal error

Parameters
• cb: callback function of sending ESPNOW data

`esp_err_t esp_now_unregister_send_cb (void)`
Unregister callback function of sending ESPNOW data.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

`esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)`
Send ESPNOW data.

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_INTERNAL : internal error
• ESP_ERR_ESPNOW_NO_MEM : out of memory
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
• ESP_ERR_ESPNOW_IF : current WiFi interface doesn’t match that of peer

Parameters
• peer_addr: peer MAC address
• data: data to send
• len: length of data

`esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)`
Add a peer to peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_FULL : peer list is full
• ESP_ERR_ESPNOW_NO_MEM : out of memory
• ESP_ERR_ESPNOW_EXIST : peer has existed

Parameters
• peer: peer information
# Chapter 2. API Reference

**esp_err_t esp_now_del_peer** *(const uint8_t *peer_addr)*

Delete a peer from peer list.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**Parameters**
- peer_addr: peer MAC address

**esp_err_t esp_now_mod_peer** *(const esp_now_peer_info_t *peer)*

Modify a peer.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full

**Parameters**
- peer: peer information

**esp_err_t esp_now_get_peer** *(const uint8_t *peer_addr, esp_now_peer_info_t *peer)*

Get a peer whose MAC address matches peer_addr from peer list.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**Parameters**
- peer_addr: peer MAC address
- peer: peer information

**esp_err_t esp_now_fetch_peer** *(bool from_head, esp_now_peer_info_t *peer)*

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**Parameters**
- from_head: fetch from head of list or not
- peer: peer information

**bool esp_now_is_peer_exist** *(const uint8_t *peer_addr)*

Peer exists or not.

**Return**
- true: peer exists
- false: peer not exists

**Parameters**
- peer_addr: peer MAC address

**esp_err_t esp_now_get_peer_num** *(esp_now_peer_num_t *num)*

Get the number of peers.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

**Parameters**
- num: peer number
Chapter 2. API Reference

- num: number of peers

```c
esp_err_t esp_now_set_pmk(const uint8_t *pmk)
```
Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

**Parameters**
- pmk: primary master key

```c
esp_err_t esp_now_set_wake_window(uint16_t window)
```
Set esp_now wake window for sta_disconnected power management.

**Attention** 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
2. This configuration only work for station mode and disconnected status
3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked
4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time
5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

**Parameters**
- window: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

**Structures**

```c
struct esp_nowpeer_info
```
ESPNOW peer information parameters.

**Public Members**

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
```
ESPNOW peer MAC address that is also the MAC address of station or softap

```c
uint8_t lmk[ESP_NOW_KEY_LEN]
```
ESPNOW peer local master key that is used to encrypt data

```c
uint8_t channel
```
Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

```c
wifi_interface_t ifidx
```
Wi-Fi interface that peer uses to send/receive ESPNOW data

```c
bool encrypt
```
ESPNOW data that this peer sends/receives is encrypted or not

```c
void *priv
```
ESPNOW peer private data

```c
struct esp_nowpeer_num
```
Number of ESPNOW peers which exist currently.
Public Members

```c
int total_num
Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM
```

```c
int encrypt_num
Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
```

Macros

```c
ESP_ERR_ESPNOW_BASE
ESPNOW error number base.
```

```c
ESP_ERR_ESPNOW_NOT_INIT
ESPNOW is not initialized.
```

```c
ESP_ERR_ESPNOW_ARG
Invalid argument
```

```c
ESP_ERR_ESPNOW_NO_MEM
Out of memory
```

```c
ESP_ERR_ESPNOW_FULL
ESPNOW peer list is full
```

```c
ESP_ERR_ESPNOW_NOT_FOUND
ESPNOW peer is not found
```

```c
ESP_ERR_ESPNOW_INTERNAL
Internal error
```

```c
ESP_ERR_ESPNOW_EXIST
ESPNOW peer has existed
```

```c
ESP_ERR_ESPNOW_IF
Interface error
```

```c
ESP_NOW_ETH_ALEN
Length of ESPNOW peer MAC address
```

```c
ESP_NOW_KEY_LEN
Length of ESPNOW peer local master key
```

```c
ESP_NOW_MAX_TOTAL_PEER_NUM
Maximum number of ESPNOW total peers
```

```c
ESP_NOW_MAX_ENCRYPT_PEER_NUM
Maximum number of ESPNOW encrypted peers
```

```c
ESP_NOW_MAX_DATA_LEN
Maximum length of ESPNOW data which is sent very time
```

Type Definitions

```c
typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.
```

```c
typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.
```

```c
typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
Callback function of receiving ESPNOW data.
```

Parameters

- `mac_addr`: peer MAC address
- `data`: received data
- `data_len`: length of received data
typedef void(*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)

Callback function of sending ESPNOW data.

Parameters

- `mac_addr`: peer MAC address
- `status`: status of sending ESPNOW data (succeed or fail)

Enumerations

```c
define esp_now_send_status_t

enum esp_now_send_status_t

Status of sending ESPNOW data .

Values:

ESP_NOW_SEND_SUCCESS = 0

Send ESPNOW data successfully

ESP_NOW_SEND_FAIL

Send ESPNOW data fail
```

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. **ESP-WIFI-MESH Programming Model**
2. **Writing an ESP-WIFI-MESH Application**
3. **Self Organized Networking**
4. **Application Examples**
5. **API Reference**

For documentation regarding the ESP-WIFI-MESH protocol, please see the *ESP-WIFI-MESH API Guide*. For more information about ESP-WIFI-MESH Development Framework, please see *ESP-WIFI-MESH Development Framework*.

ESP-WIFI-MESH Programming Model

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

![ESP-WIFI-MESH Software Stack Diagram](image)

Fig. 2: ESP-WIFI-MESH Software Stack
**System Events** An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

![Fig. 3: ESP-WIFI-MESH System Events Delivery](image)

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as **MESH_EVENT_PARENT_CONNECTED** and **MESH_EVENT_CHILD_CONNECTED** to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, **IP_EVENT_STA_GOT_IP** and **IP_EVENT_STA_LOST_IP** can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, user’s should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node is required to initialize LwIP by calling** `tcpip_adapter_init()` . In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-WIFI-MESH applications.

```c
/* tcpip initialization */
tcip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```
Note: ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-WIFI-MESH Application The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT,
                                         IP_EVENT_STA_GOT_IP,
                                         &ip_event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

Initialize Mesh The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_event_handler, NULL));
```

Configuring an ESP-WIFI-MESH Network ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

Submit Document Feedback
The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *)&cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router’s channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *)&cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *)&cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self Organized Networking  Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self Organized Networking  Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking  The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.
• If the node was previously connected to other nodes, it will remain connected.
• If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
• If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self Organized Networking**  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
• Nodes previously scanning for a parent node will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             |               | • A root node already connected to router will stay connected.  
• A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |               | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```
Calling Wi-Fi API  There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-WIFI-MESH.

```c
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

The **Internal Communication Example** demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The **Manual Networking Example** demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

```c
esp_err_t esp_mesh_init (void)
```

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention**  This API shall be called after Wi-Fi is started.
**Return**

- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_deinit` (void)

Mesh de-initialization.

- Release resources and stop the mesh

**Return**

- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_start` (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention**

This API shall be called after mesh initialization and configuration.

**Return**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

`esp_err_t esp_mesh_stop` (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Return**

- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)`

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention**

This API is not reentrant.

**Return**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- **ESP_ERR_MESH_NO_ROUTE_FOUND**
- **ESP_ERR_MESH_DISCARD**

**Parameters**

- **[in]** `to` : the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **[in]** `data` : pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **[in]** `flag` : bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root ( “to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use `esp_mesh_send_block_time()` to specify a blocking time.
    - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- **[in]** `opt` : options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **[in]** `opt_count` : option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

```c
esp_err_t esp_mesh_send_block_time (uint32_t time_ms)
```  
Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

**Return**  
- ESP_OK

**Parameters**

- **[in]** `time_ms` : blocking time of esp_mesh_send(), unit:ms

```c
esp_err_t esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```  
Receive a packet targeted to self over the mesh network.

**flag** could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD

Parameters

• [out] from: the address of the original source of the packet
• [out] data: pointer to the received mesh packet
  – Field proto is the data protocol in use. Should follow it to parse the received data.
  – Field tos is the transmission tos (type of service) in use.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-
  MAX_DELAY: wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_FROMDS represents data from external IP network
  – MESH_DATA_TODS represents data directed upward within the mesh network

Parameters

• [out] opt: options desired to receive
  – MESH_OPT_RECV_DS_ADDR attaches the DS address
• [in] opt_count: option count desired to receive
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

\[ \text{esp_err_t } \text{esp_mesh_recv_toDS}(\text{mesh_addr_t } \ast \text{from}, \text{mesh_addr_t } \ast \text{to}, \text{mesh_data_t } \ast \text{data}, \text{int timeout_ms}, \text{int } \ast \text{flag}, \text{mesh_opt_t } \text{opt}[\], \text{int opt_count}) \]

Receive a packet targeted to external IP network.

• Root uses this API to receive packets destined to external IP network
• Root forwards the received packets to the final destination via socket.
• If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default: 32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Return

• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD
• ESP_ERR_MESH_RECV_RELEASE

Parameters

• [out] from: the address of the original source of the packet
• [out] to: the address contains remote IP address and port (IPv4:PORT)
• [out] data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-
  MAX_DELAY: wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters

• [out] opt: options desired to receive
  • [in] opt_count: option count desired to receive

\[ \text{esp_err_t } \text{esp_mesh_set_config}(\text{const mesh_cfg_t } \ast \text{config}) \]

Set mesh stack configuration.
• Use `MESH_INIT_CONFIG_DEFAULT()` to initialize the default values, mesh IE is encrypted by default.
• Mesh network is established on a fixed channel (1-14).
• Mesh event callback is mandatory.
• Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
• Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. `max_connection` of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- `[in] config`: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `[out] config`: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```
Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `[in] router`: pointer to router configuration

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```
Get router configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `[out] router`: pointer to router configuration

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Parameters**
- `[in] id`: pointer to mesh network ID
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
Get mesh network ID.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] id: pointer to mesh network ID

esp_err_t esp_mesh_set_type(mesh_type_t type)
Designate device type over the mesh network.

• MESH_IDLE: designates a device as a self-organized node for a mesh network
• MESH_ROOT: designates the root node for a mesh network
• MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
• MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Return
• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] type: device type

mesh_type_t esp_mesh_get_type(void)
Get device type over mesh network.

Attention This API shall be called after having received the event
MESH_EVENT_PARENT_CONNECTED.

Return mesh type

esp_err_t esp_mesh_set_max_layer(int max_layer)
Set network max layer value.

• for tree topology, the max is 25.
• for chain topology, the max is 1000.
• Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] max_layer: max layer value

int esp_mesh_get_max_layer(void)
Get max layer value.

Return max layer value

esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)
Set mesh softAP password.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] pwd: pointer to the password
• [in] len: password length

esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)
Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.
Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- [in] authmode: authentication mode

`wifi_auth_mode_t esp_mesh_get_ap_authmode(void)`
Get mesh softAP authentication mode.

Return authentication mode

`esp_err_t esp_mesh_set_ap_connections(int connections)`
Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] connections: the number of max connections

`int esp_mesh_get_ap_connections(void)`
Get mesh max connection configuration.

Return the number of mesh max connections

`int esp_mesh_get_non_mesh_connections(void)`
Get non-mesh max connection configuration.

Return the number of non-mesh max connections

`int esp_mesh_get_layer(void)`
Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return layer value

`esp_err_t esp_mesh_get_parent_bssid(mesh_addr_t *bssid)`
Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return

- ESP_OK
- ESP_FAIL

Parameters

- [out] bssid: pointer to parent BSSID

`bool esp_mesh_is_root(void)`
Return whether the device is the root node of the network.

Return true/false

`esp_err_t esp_mesh_set_self_organized(bool enable, bool select_parent)`
Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

Attention This API is used to dynamically modify whether to enable the self organizing.

Return
**Chapter 2. API Reference**

**ESP_OK**
**ESP_FAIL**

**Parameters**
- `[in] enable`: enable or disable self-organized networking
- `[in] select_parent`: Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new
    parent like other non-root devices.

bool `esp_mesh_get_self_organized` (void)
Return whether enable self-organized networking or not.

**Return**
true/false

`esp_err_t esp_mesh_waive_root` (const `mesh_vote_t` *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to
  ask current root to initiate a new round of voting. During the voting, a better root candidate would be
  expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better
  root candidate is found, keep the current one. If a better candidate is found, the new better one will send
  a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect
  with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention**
This API is only called by the root.

**Return**
- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

**Parameters**
- `[in] vote`: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is rc specified shall be false.
  - Field attempts shall be at least 15 times.
- `[in] reason`: only accept `MESH_VOTE_REASON_ROOT_INITIATED` for now

`esp_err_t esp_mesh_set_vote_percentage` (float percentage)
Set vote percentage threshold for approval of being a root (default: 0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention**
This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- `[in] percentage`: vote percentage threshold

float `esp_mesh_get_vote_percentage` (void)
Get vote percentage threshold for approval of being a root.

**Return**
percentage threshold

`esp_err_t esp_mesh_set_ap_assoc_expire` (int seconds)
Set mesh softAP associate expired time (default: 10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will
  take this child inactive and disassociate it.
If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] seconds: the expired time

```c
int esp_mesh_get_ap_assoc_expire (void)
```
Get mesh softAP associate expired time.

**Return** seconds

```c
int esp_mesh_get_total_node_num (void)
```
Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Return** total number of devices (including the root)

```c
int esp_mesh_get_routing_table_size (void)
```
Get the number of devices in this device’s sub-network (including self)

**Return** the number of devices over this device’s sub-network (including self)

```c
esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
```
Get routing table of this device’s sub-network (including itself)

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [out] mac: pointer to routing table
- [in] len: routing table size(in bytes)
- [out] size: pointer to the number of devices in routing table (including itself)

```c
esp_err_t esp_mesh_post_toDS_state (bool reachable)
```
Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] reachable: this state represents whether the root is able to access external IP network

```c
esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
```
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [out] pending: pointer to the TX pending

```c
esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
```
Return the number of packets available in the queue waiting to be received by applications.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [out] pending: pointer to the RX pending

```c
int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
```
Return the number of packets could be accepted from the specified address.

**Return** the number of upQ for a certain address
Chapter 2. API Reference

Parameters

• [in] addr: self address or an associate children address
• [out] xseqno_in: sequence number of the last received packet from the specified address

```c
esp_err_t esp_mesh_set_xon_qsize(int qsize)
```

Set the number of queue.

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_FAIL

Parameters

• [in] qsize: default:32 (min:16)

```c
int esp_mesh_get_xon_qsize(void)
```

Get queue size.

Return the number of queue

```c
esp_err_t esp_mesh_allow_root_conflicts(bool allowed)
```

Set whether allow more than one root existing in one network.

Return

• ESP_OK
• ESP_WIFI_ERR_NOT_INIT
• ESP_WIFI_ERR_NOT_START

Parameters

• [in] allowed: allow or not

```c
bool esp_mesh_is_root_conflicts_allowed(void)
```

Check whether allow more than one root to exist in one network.

Return true/false

```c
esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)
```

Set group ID addresses.

Return

• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters

• [in] addr: pointer to new group ID addresses
• [in] num: the number of group ID addresses

```c
esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)
```

Delete group ID addresses.

Return

• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters

• [in] addr: pointer to deleted group ID address
• [in] num: the number of group ID addresses

```c
int esp_mesh_get_group_num(void)
```

Get the number of group ID addresses.

Return the number of group ID addresses

```c
esp_err_t esp_mesh_get_group_list(mesh_addr_t *addr, int num)
```

Get group ID addresses.

Return

• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
bool esp_mesh_is_my_group(const mesh_addr_t *addr)
Check whether the specified group address is my group.
Return  true/false

esp_err_t esp_mesh_set_capacity_num(int num)
Set mesh network capacity (max:1000, default:300)
Attention This API shall be called before mesh is started.
Return
• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED
• ESP_MESH_ERR_ARGUMENT
Parameters
• [in] num: mesh network capacity

int esp_mesh_get_capacity_num(void)
Get mesh network capacity.
Return  mesh network capacity

esp_err_t esp_mesh_set_ie_crypto_funcs(const mesh_crypto_funcs_t *crypto_funcs)
Set mesh IE crypto functions.
Attention This API can be called at any time after mesh is initialized.
Return
• ESP_OK
Parameters
• [in] crypto_funcs: crypto functions for mesh IE
  – If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

esp_err_t esp_mesh_set_ie_crypto_key(const char *key, int len)
Set mesh IE crypto key.
Attention This API can be called at any time after mesh is initialized.
Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT
Parameters
• [in] key: ASCII crypto key
• [in] len: length in bytes, range:8~64

esp_err_t esp_mesh_get_ie_crypto_key(char *key, int len)
Get mesh IE crypto key.
Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT
Parameters
• [out] key: ASCII crypto key
• [in] len: length in bytes, range:8~64

esp_err_t esp_mesh_set_root_healing_delay(int delay_ms)
Set delay time before starting root healing.
Return
• ESP_OK
Parameters
• [in] delay_ms: delay time in milliseconds

int esp_mesh_get_root_healing_delay(void)
Get delay time before network starts root healing.
Return delay time in milliseconds

\texttt{esp_err_t esp_mesh_fix_root} (bool \texttt{enable})

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

Return
- ESP_OK

Parameters
- \[\text{in}\] \texttt{enable}: enable or not

\texttt{bool esp_mesh_is_root_fixed} (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disablenetworkFixedRootSettingbyAPI \texttt{esp_mesh_fix_root}().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Return true/false

\texttt{esp_err_t esp_mesh_set_parent} (const \texttt{wifi_config_t* parent}, const \texttt{mesh_addr_t* parent_mesh_id}, \texttt{mesh_type_t my_type}, int \texttt{my_layer})

Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Return
- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

Parameters
- \[\text{in}\] \texttt{parent}: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- \[\text{in}\] \texttt{parent_mesh_id}: parent mesh ID.
  - If this value is not set, the original mesh ID is used.
- \[\text{in}\] \texttt{my_type}: mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then \texttt{my_type} shall set MESH_ROOT and \texttt{my_layer} shall set MESH_ROOT_LAYER.
- \[\text{in}\] \texttt{my_layer}: mesh layer
  - \texttt{my_layer} of the device may change after joining the network.
  - If \texttt{my_type} is set MESH_NODE, \texttt{my_layer} shall be greater than MESH_ROOT_LAYER.
  - If \texttt{my_type} is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

\texttt{esp_err_t esp_mesh_scan_get_ap_ie_len} (int* \texttt{len})

Get mesh networking IE length of one AP.

Return
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters
- \[\text{out}\] \texttt{len}: mesh networking IE length

\texttt{esp_err_t esp_mesh_scan_get_ap_record} (wif\_ap\_record\_t \texttt{*ap_record}, void* \texttt{buffer})

Get AP record.

Attention Different from \texttt{esp_wifi_scan_get_ap_records()}, this API only gets one of APs scanned each time. See “manual_networking” example.

Return
ESP_OK
ESP_ERR_WIFI_NOT_INIT
ESP_ERR_WIFI_ARG
ESP_ERR_WIFI_FAIL

**Parameters**
- **[out] ap_record**: pointer to one AP record
- **[out] buffer**: pointer to the mesh networking IE of this AP

```c
esp_err_t esp_mesh_flush_upstream_packets (void)
```
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_get_subnet_nodes_num (const mesh_addr_t *child_mac, int *nodes_num)
```
Get the number of nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- **[in] child_mac**: an associated child address of this device
- **[out] nodes_num**: pointer to the number of nodes in the subnet of a specific child

```c
esp_err_t esp_mesh_get_subnet_nodes_list (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)
```
Get nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- **[in] child_mac**: an associated child address of this device
- **[out] nodes**: pointer to nodes in the subnet of a specific child
- **[in] nodes_num**: the number of nodes in the subnet of a specific child

```c
esp_err_t esp_mesh_disconnect (void)
```
Disconnect from current parent.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_connect (void)
```
Connect to current parent.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_flush_scan_result (void)
```
Flush scan result.

**Return**
- ESP_OK

```c
esp_err_t esp_mesh_switch_channel (const uint8_t *new_bssid, int csa_newchan, int csa_count)
```
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**
- ESP_OK
Parameters

- **[in] new_bssid**: the new router BSSID if the router changes
- **[in] csa_newchan**: the new channel number to which the whole network is moving
- **[in] csa_count**: channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

```c
esp_err_t esp_mesh_get_router_bssid(uint8_t *router_bssid)
```

Get the router BSSID.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

Parameters

- **[out] router_bssid**: pointer to the router BSSID

```c
int64_t esp_mesh_get_tsf_time(void)
```

Get the TSF time.

Return the TSF time

```c
esp_err_t esp_mesh_set_topology(esp_mesh_topology_t topo)
```

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

Parameters

- **[in] topo**: MESH_TOPO_TREE or MESH_TOPO_CHAIN

```c
esp_mesh_topology_t esp_mesh_get_topology(void)
```

Get mesh topology.

Return MESH_TOPO_TREE or MESH_TOPO_CHAIN

```c
esp_err_t esp_mesh_enable_ps(void)
```

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_disable_ps(void)
```

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

```c
bool esp_mesh_is_ps_enabled(void)
```

Check whether the mesh Power Save function is enabled.

Return true/false

```c
bool esp_mesh_is_device_active(void)
```

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.
**Return**  true/false

*esp_err_t esp_mesh_set_active_duty_cycle*(int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

**Attention**  This API can be called at any time after mesh is started.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**

- [in] dev_duty: device duty cycle
- [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

*esp_err_t esp_mesh_get_active_duty_cycle*(int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

**Return**
- ESP_OK

**Parameters**

- [out] dev_duty: device duty cycle
- [out] dev_duty_type: device PS duty cycle type

*esp_err_t esp_mesh_set_network_duty_cycle*(int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

**Attention**  This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
Chapter 2. API Reference

- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] nwk_duty: network duty cycle
- [in] duration_mins: duration (unit: minutes)
- [in] applied_rule: only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

Return
- ESP_OK

Parameters
- [out] nwk_duty: current network duty cycle
- [out] duration_mins: the duration of current nwk_duty
- [out] dev_duty_type: if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- [out] applied_rule: MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
int esp_mesh_get_running_active_duty_cycle(void)
```

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Return the running active duty cycle

```c
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)
```

Duty signaling.

Return
- ESP_OK

Parameters
- [in] fwd_times: the times of forwarding duty signaling packets

Unions
```
union mesh_addr_t
#include <esp_mesh.h> Mesh address.
```

Public Members
```
uint8_t addr[6]
mac address

mip_t mip
mip address

union mesh_event_info_t
#include <esp_mesh.h> Mesh event information.
```
Public Members

\texttt{mesh\_event\_channel\_switch\_t} \texttt{channel\_switch}
channel switch

\texttt{mesh\_event\_child\_connected\_t} \texttt{child\_connected}
child connected

\texttt{mesh\_event\_child\_disconnected\_t} \texttt{child\_disconnected}
child disconnected

\texttt{mesh\_event\_routing\_table\_change\_t} \texttt{routing\_table}
routing table change

\texttt{mesh\_event\_connected\_t} \texttt{connected}
parent connected

\texttt{mesh\_event\_disconnected\_t} \texttt{disconnected}
parent disconnected

\texttt{mesh\_event\_no\_parent\_found\_t} \texttt{no\_parent}
no parent found

\texttt{mesh\_event\_layer\_change\_t} \texttt{layer\_change}
layer change

\texttt{mesh\_event\_toDS\_state\_t} \texttt{toDS\_state}
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

\texttt{mesh\_event\_vote\_started\_t} \texttt{vote\_started}
vote started

\texttt{mesh\_event\_root\_address\_t} \texttt{root\_addr}
root address

\texttt{mesh\_event\_root\_switch\_req\_t} \texttt{switch\_req}
root switch request

\texttt{mesh\_event\_root\_conflict\_t} \texttt{root\_conflict}
other powerful root

\texttt{mesh\_event\_root\_fixed\_t} \texttt{root\_fixed}
fixed root

\texttt{mesh\_event\_scan\_done\_t} \texttt{scan\_done}
scan done

\texttt{mesh\_event\_network\_state\_t} \texttt{network\_state}
network state, such as whether current mesh network has a root.

\texttt{mesh\_event\_find\_network\_t} \texttt{find\_network}
network found that can join

\texttt{mesh\_event\_router\_switch\_t} \texttt{router\_switch}
network information

\texttt{mesh\_event\_ps\_duty\_t} \texttt{ps\_duty}
PS duty information

\texttt{union mesh\_rc\_config\_t}

\texttt{#include <esp\_mesh\_h>} Vote address configuration.
Chapter 2. API Reference

Public Members

int attempts
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
a new root address specified by users for API esp_mesh_waive_root()

Structures

struct mip_t
IP address and port.

Public Members

ip4_addr_t ip4
IP address

uint16_t port
port

struct mesh_event_channel_switch_t
Channel switch information.

Public Members

uint8_t channel
new channel

struct mesh_event_connected_t
Parent connected information.

Public Members

wifi_event_sta_connected_t connected
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t self_layer
layer

uint8_t duty
parent duty

struct mesh_event_no_parent_found_t
No parent found information.

Public Members

int scan_times
scan times being through

struct mesh_event_layer_change_t
Layer change information.

Public Members

uint16_t new_layer
new layer
struct mesh_event_vote_started_t
vote started information

Public Members

int reason
vote reason, vote could be initiated by children or by the root itself

int attempts
max vote attempts before stopped

mesh_addr_t rc_addr
root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t
find a mesh network that this device can join

Public Members

uint8_t channel
channel number of the new found network

uint8_t router_bssid[6]
router BSSID

struct mesh_event_root_switch_req_t
Root switch request information.

Public Members

int reason
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

mesh_addr_t rc_addr
the address of root switch requester

struct mesh_event_root_conflict_t
Other powerful root address.

Public Members

int8_t rssi
rssi with router

uint16_t capacity
the number of devices in current network

uint8_t addr[6]
other powerful root address

struct mesh_event_routing_table_change_t
Routing table change.

Public Members

uint16_t rt_size_new
the new value

uint16_t rt_size_change
the changed value
struct mesh_event_root_fixed_t
    Root fixed.

    Public Members

    bool is_fixed
        status

struct mesh_event_scan_done_t
    Scan done event information.

    Public Members

    uint8_t number
        the number of APs scanned

struct mesh_event_network_state_t
    Network state information.

    Public Members

    bool is_rootless
        whether current mesh network has a root

struct mesh_event_ps_duty_t
    PS duty information.

    Public Members

    uint8_t duty
        parent or child duty

    mesh_event_child_connected_t child_connected
        child info

struct mesh_opt_t
    Mesh option.

    Public Members

    uint8_t type
        option type

    uint16_t len
        option length

    uint8_t* val
        option value

struct mesh_data_t
    Mesh data for esp_mesh_send() and esp_mesh_recv()

    Public Members

    uint8_t* data
        data
Chapter 2. API Reference

uint16_t size
data size

mesh_proto_t proto
data protocol

mesh_tos_t tos
data type of service

struct mesh_router_t
Router configuration.

Public Members

uint8_t ssid[32]
SSID

uint8_t ssid_len
length of SSID

uint8_t bssid[6]
BSSID, if this value is specified, users should also specify “allow_router_switch”.

uint8_t password[64]
password

bool allow_router_switch
if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct mesh_ap_cfg_t
Mesh softAP configuration.

Public Members

uint8_t password[64]
mesh softAP password

uint8_t max_connection
max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection

uint8_t nonmesh_max_connection
max non-mesh connections

struct mesh_cfg_t
Mesh initialization configuration.

Public Members

uint8_t channel
channel, the mesh network on

bool allow_channel_switch
if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t mesh_id
mesh network identification
Chapter 2. API Reference

mesh_router_t router
router configuration

mesh_ap_cfg_t mesh_ap
mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
crypto functions

struct mesh_vote_t
Vote.

Public Members

float percentage
vote percentage threshold for approval of being a root

bool is_rc_specified
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
network start root election.

mesh_rc_config_t config
vote address configuration

struct mesh_tx_pending_t
The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
to parent queue

int to_parent_p2p
to parent (P2P) queue

int to_child
to child queue

int to_child_p2p
to child (P2P) queue

int mgmt
management queue

int broadcast
broadcast and multicast queue

struct mesh_rx_pending_t
The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
to external DS

int toSelf
to self
Macros

**MESH_ROOT_LAYER**
root layer value

**MESH_MTU**
max transmit unit (in bytes)

**MESH_MPS**
max payload size (in bytes)

**ESP_ERR_MESH_WIFI_NOT_START**
Mesh error code definition.
Wi-Fi isn’t started

**ESP_ERR_MESH_NOT_INIT**
mesh isn’t initialized

**ESP_ERR_MESH_NOT_CONFIG**
mesh isn’t configured

**ESP_ERR_MESH_NOT_START**
mesh isn’t started

**ESP_ERR_MESH_NOT_SUPPORT**
ot supported yet

**ESP_ERR_MESH_NOT_ALLOWED**
operation is not allowed

**ESP_ERR_MESH_NO_MEMORY**
out of memory

**ESP_ERR_MESH_ARGUMENT**
illegal argument

**ESP_ERR_MESH_EXCEED_MTU**
packet size exceeds MTU

**ESP_ERR_MESH_TIMEOUT**
timeout

**ESP_ERR_MESH_DISCONNECTED**
disconnected with parent on station interface

**ESP_ERR_MESH_QUEUE_FAIL**
queue fail

**ESP_ERR_MESH_QUEUE_FULL**
queue full

**ESP_ERR_MESH_NO_PARENT_FOUND**
no parent found to join the mesh network

**ESP_ERR_MESH_NO_ROUTE_FOUND**
no route found to forward the packet

**ESP_ERR_MESH_OPTION_NULL**
no option found

**ESP_ERR_MESH_OPTION_UNKNOWN**
unknown option

**ESP_ERR_MESH_XON_NO_WINDOW**
no window for software flow control on upstream

**ESP_ERR_MESH_INTERFACE**
low-level Wi-Fi interface error
ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

ESP_ERR_MESH_XMIT
XMIT

ESP_ERR_MESH_QUEUE_READ
error in reading queue

ESP_ERR_MESH_PS
mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
release esp_mesh_recv_toDS

MESH_DATA_ENC
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

MESH_DATA_P2P
point-to-point delivery over the mesh network

MESH_DATA_FROMDS
receive from external IP network

MESH_DATA_TODS
identify this packet is target to external IP network

MESH_DATA_NONBLOCK
esp_mesh_send() non-block

MESH_DATA_DROP
in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
identify this packet is target to a group address

MESH_OPT_SEND_GROUP
Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
Flag of mesh networking IE.
vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
fixed root

MESH_PS_DEVICE_DUTY_REQUEST
Mesh PS (Power Save) duty cycle type.
requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**
requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**
indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**
Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

**MESH_INIT_CONFIG_DEFAULT**

---

**Type Definitions**

```c
typedef mesh_addr_t mesh_event_root_address_t
  Root address.
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
  Parent disconnected information.
typedef wifi_event_ap_sta_connected_t mesh_event_child_connected_t
  Child connected information.
typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
  Child disconnected information.
typedef wifi_event_sta_connected_t mesh_event_router_switch_t
  New router information.
```

**Enumerations**

```c
enum mesh_event_id_t
  Enumerated list of mesh event id.
  Values:
  MESH_EVENT_STARTED
    mesh is started
  MESH_EVENT_STOPPED
    mesh is stopped
  MESH_EVENT_CHANNEL_SWITCH
    channel switch
  MESH_EVENT_CHILD_CONNECTED
    a child is connected on softAP interface
  MESH_EVENT_CHILD_DISCONNECTED
    a child is disconnected on softAP interface
  MESH_EVENT_ROUTING_TABLE_ADD
    routing table is changed by adding newly joined children
  MESH_EVENT_ROUTING_TABLE_REMOVE
    routing table is changed by removing leave children
  MESH_EVENT_PARENT_CONNECTED
    parent is connected on station interface
  MESH_EVENT_PARENT_DISCONNECTED
    parent is disconnected on station interface
  MESH_EVENT_NO_PARENT_FOUND
    no parent found
```
**MESH_EVENT_LAYER_CHANGE**
layer changes over the mesh network

**MESH_EVENT_TODS_STATE**
state represents whether the root is able to access external IP network

**MESH_EVENT_VOTE_STARTED**
the process of voting a new root is started either by children or by the root

**MESH_EVENT_VOTE_STOPPED**
the process of voting a new root is stopped

**MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

**MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

**MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

**MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH_EVENT_ROOT_FIXED**
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH_EVENT_SCAN_DONE**
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

**MESH_EVENT_NETWORK_STATE**
network state, such as whether current mesh network has a root.

**MESH_EVENT_STOP_RECONNECTION**
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH_EVENT_FIND_NETWORK**
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH_EVENT_ROUTER_SWITCH**
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH_EVENT_PS_PARENT_DUTY**
parent duty

**MESH_EVENT_PS_CHILD_DUTY**
child duty

**MESH_EVENT_PS_DEVICE_DUTY**
device duty

**MESH_EVENT_MAX**

```
enum mesh_type_t
{ Device type.

Values:

MESH_IDLE
    hasn’t joined the mesh network yet
```
**MESH_ROOT**
the only sink of the mesh network. Has the ability to access external IP network

**MESH_NODE**
intermediate device. Has the ability to forward packets over the mesh network

**MESH_LEAF**
has no forwarding ability

**MESH_STA**
connect to router with a standalone Wi-Fi station mode, no network expansion capability

```c
enum mesh_proto_t
Protocol of transmitted application data.
Values:

MESH_PROTO_BIN
binary

MESH_PROTO_HTTP
HTTP protocol

MESH_PROTO_JSON
JSON format

MESH_PROTO_MQTT
MQTT protocol

MESH_PROTO_AP
IP network mesh communication of node’s AP interface

MESH_PROTO_STA
IP network mesh communication of node’s STA interface
```

```c
enum mesh_tos_t
For reliable transmission, mesh stack provides three type of services.
Values:

MESH_TOS_P2P
provide P2P (point-to-point) retransmission on mesh stack by default

MESH_TOS_E2E
provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

MESH_TOS_DEF
no retransmission on mesh stack
```

```c
enum mesh_vote_reason_t
Vote reason.
Values:

MESH_VOTE_REASON_ROOT_INITIATED = 1
vote is initiated by the root

MESH_VOTE_REASON_CHILD_INITIATED
vote is initiated by children
```

```c
enum mesh_disconnect_reason_t
Mesh disconnect reason code.
Values:

MESH_REASON_CYCLIC = 100
cyclic is detected

MESH_REASON_PARENT_IDLE
parent is idle
MESH_REASON_LEAF
the connected device is changed to a leaf

MESH_REASON_DIFF_ID
in different mesh ID

MESH_REASON_ROOTS
root conflict is detected

MESH_REASON_PARENT_STOPPED
parent has stopped the mesh

MESH_REASON_SCAN_FAIL
scan fail

MESH_REASON_IE_UNKNOWN
unknown IE

MESH_REASON_WAIVE_ROOT
waive root

MESH_REASON_PARENT_WORSE
parent with very poor RSSI

MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent

MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

enum esp_mesh_topology_t
Mesh topology.
Values:

MESH_TOPO_TREE
tree topology

MESH_TOPO_CHAIN
chain topology

enum mesh_event_toDS_state_t
The reachability of the root to a DS (distribute system)
Values:

MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network

MESH_TODS_REACHABLE
the root is able to access external IP network

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboardig devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

• Simple and intuitive to use; no lengthy instructions to follow for new device setup
• No need to remember and enter passwords into the device being provisioned
• Works with electronic or printed QR codes, or human-readable strings
• Supports both WPA2 and WPA3 networks
Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

### API Reference

#### Header File

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

#### Functions

**esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)**

- Initialize DPP Supplicant.
- Starts DPP Supplicant and initializes related Data Structures.
- return
  - ESP_OK: Success
  - ESP_FAIL: Failure

**Parameters**

- evt_cb: Callback function to receive DPP related events

**void esp_supp_dpp_deinit (void)**

- De-initialize DPP Supplicant.
- Frees memory from DPP Supplicant Data Structures.

**esp_err_t esp_supp_dpp_bootstrap_gen (const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)**

- Generates Bootstrap Information as an Enrollee.
- Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Return**

- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**

- chan_list: List of channels device will be available on for listening
- type: Bootstrap method type, only QR Code method is supported for now.
- key: (Optional) Private Key used to generate a Bootstrapping Public Key
- info: (Optional) Ancillary Device Information like Serial Number

**esp_err_t esp_supp_dpp_start_listen (void)**

- Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.
- Listens on every Channel from Channel List for a pre-defined wait time.

**Return**

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request
void esp_supp_dpp_stop_listen (void)
    Stop listening on Channels.
    Stops listening on Channels and cancels ongoing listen operation.

Macros
ESP_ERR_DPP_FAILURE
    Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE
    DPP Frame Tx failed OR not Aced
ESP_ERR_DPP_INVALID_ATTR
    Encountered invalid DPP Attribute

Type Definitions
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
    Types of Bootstrap Methods for DPP.
typedef void (*esp_supp_dpp_event_cb_t) (esp_supp_dpp_event_t evt, void *data)
    Callback function for receiving DPP Events from Supplicant.
    Callback function will be called with DPP related information.
    Parameters
    • evt: DPP event ID
    • data: Event data payload

Enumerations
enum dpp_bootstrap_type
    Types of Bootstrap Methods for DPP.
    Values:
    DPP_BOOTSTRAP_QR_CODE
        QR Code Method
    DPP_BOOTSTRAP_PKEX
        Proof of Knowledge Method
    DPP_BOOTSTRAP_NFC_URI
        NFC URI record Method
enum esp_supp_dpp_event_t
    Types of Callback Events received from DPP Supplicant.
    Values:
    ESP_SUPP_DPP_URI_READY
        URI is ready through Bootstrapping
    ESP_SUPP_DPP_CFG_RECVD
        Config received via DPP Authentication
    ESP_SUPP_DPP_FAIL
        DPP Authentication failure

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.
Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.

2.2.2 Ethernet

Ethernet
Overview    ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc control of Ethernet driver

Basic Ethernet Concepts    Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless rage expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown blow:

![Ethernet Data Frame Format](image)

**Fig. 4: Ethernet Data Frame Format**

Preamble and Start-of-Frame Delimiter    The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.
**Destination Address**  The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address**  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length**  The type/length field is a 2-byte field, if the value in this field is <= 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is >= 1536, it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload**  The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS**  The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:**  Besides the basic data frame described above, there’re two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.
Configure MAC and PHY

Ethernet driver is composed of two parts: MAC and PHY.

The communication between MAC and PHY can have diverse choices: MII (Media Independent Interface), RMII (Reduced Media Independent Interface) and etc.

One of the obvious difference between MII and RMII is the signal consumption. For MII, it usually costs up to 18 signals. Instead, RMII interface can reduce the consumption to 9.

In RMII mode, both the receiver and transmitter signals are referenced to the REF_CLK. REF_CLK must be stable during any access to PHY and MAC. Generally there’re three ways to generate the REF_CLK depending on the PHY device in your design:

- Some PHY chip can derive the REF_CLK from its external connected 25MHz crystal oscillator (as seen the option a in the picture). In this case, you should select CONFIG_ETH_RMII_CLK_INPUT in CONFIG_ETH_RMII_CLK_MODE.
- Some PHY chip uses an external connected 50MHz crystal oscillator or other clock source, which can also be used as the REF_CLK for MAC side (as seen the option b in the picture). In this case, you still need to select CONFIG_ETH_RMII_CLK_INPUT in CONFIG_ETH_RMII_CLK_MODE.
- Some EMAC controller can generate the REF_CLK using its internal high precision PLL (as seen the option c in the picture). In this case, you should select CONFIG_ETH_RMII_CLK_OUTPUT in CONFIG_ETH_RMII_CLK_MODE.

Note: REF_CLK is configured via Project Configuration as described above by default. However, it can be overwritten from user application code by appropriately setting interface and clock_config members of eth_mac_config_t structure. See emac_rmii_clock_mode_t and emac_rmii_clock_gpio_t for more details.

Warning: If the RMII clock mode is selected to CONFIG_ETH_RMII_CLK_OUTPUT, then GPIO0 can be used to output the REF_CLK signal. See CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 for more information. What’s more, if you’re not using PSRAM in your design, GPIO16 and GPIO17 are also available to output the reference clock. See CONFIG_ETH_RMII_CLK_OUT_GPIO for more information.

If the RMII clock mode is selected to CONFIG_ETH_RMII_CLK_INPUT, then GPIO0 is the only choice to input the REF_CLK signal. Please note that, GPIO0 is also an important strapping GPIO on ESP32. If GPIO0 samples a low level during power up, ESP32 will go into download mode. The system will get halted until a manually reset. The workaround of this issue is disabling the REF_CLK in hardware by default, so that the strapping pin won’t be interfered by other signals in boot stage. Then re-enable the REF_CLK in Ethernet driver installation stage. The ways to disable the REF_CLK signal can be:

- Disable or power down the crystal oscillator (as the case b in the picture).
- Force the PHY device in reset status (as the case a in the picture). This could fail for some PHY device (i.e. it still outputs signal to GPIO0 even in reset state).

No matter which RMII clock mode you select, you really need to take care of the signal integrity of REF_CLK in your hardware design! Keep the trace as short as possible. Keep it away from RF devices. Keep it away from inductor elements.

Note: ESP-IDF only supports the RMII interface (i.e. always select CONFIG_ETH_PHY_INTERFACE_RMII in Kconfig option CONFIG_ETH_PHY_INTERFACE).

Signals used in data plane are fixed to specific GPIOs via MUX, they can’t be modified to other GPIOs. Signals used in control plane can be routed to any free GPIOs via Matrix. Please refer to ESP32-Ethernet-Kit for hardware design example.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in eth_mac_config_t, including:
Fig. 5: Ethernet RMII Interface
Chapter 2. API Reference

- **sw_reset_timeout_ms**: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- **rx_task_stack_size** and **rx_task_prio**: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- **flags**: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.
- **smi_mdc_gpio_num** and **smi_mdio_gpio_num**: the GPIO number used to connect the SMI signals.
- **interface**: configuration of MAC Data interface to PHY (MII/RMII).
- **clock_config**: configuration of EMAC Interface clock (REF_CLK mode and GPIO number in case of RMII).

Configuration for PHY is described in `eth_phy_config_t`, including:

- **phy_addr**: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- **reset_timeout_ms**: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- **autonego_timeout_ms**: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- **reset_gpio_num**: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

Create MAC and PHY Instance    Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

**Internal EMAC + External PHY**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
mac_config.smi_mdc_gpio_num = CONFIG_EXAMPLE_ETH_MDC_GPIO; // alter the GPIO used for MDC signal
mac_config.smi_mdio_gpio_num = CONFIG_EXAMPLE_ETH_MDIO_GPIO; // alter the GPIO used for MDIO signal
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance

eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
esp_eth_phy_t *phy = esp_eth_phy_new_ip101(&phy_config); // create PHY instance
esp_eth_phy_t *phy = esp_eth_phy_new_rtl8201(&phy_config); // ESP-IDF officially supports several different Ethernet PHY chip driver
esp_eth_phy_t *phy = esp_eth_phy_new_lan8720(&phy_config);
```

**Optional Runtime MAC Clock Configuration**    EMAC REF_CLK can be optionally configured from user application code.
```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration

// ...
mac_config.interface = EMAC_DATA_INTERFACE_RMII; // alter EMAC Data Interface
mac_config.clock_config.rmi1.clock_mode = EMAC_CLK_OUT; // select EMAC REF_CLK mode
mac_config.clock_config.rmi1.clock_gpio = EMAC_CLK_OUT_GPIO; // select GPIO number used to input/output EMAC REF_CLK
esp_eth_mac_t *mac = esp_eth_mac_new_esp32(&mac_config); // create MAC instance

SPI-Ethernet Module
```

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Allocate SPI device from the bus
spi_device_interface_config_t devcfg = {
    .command_bits = 1,
    .address_bits = 7,
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
ESP_ERROR_CHECK(spi_bus_add_device(CONFIG_EXAMPLE_ETH_SPI_HOST, &devcfg, &spi_handle));
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(spi_handle);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don’t have other choices but the integrated PHY.
- We have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instructions on creating SPI device handle, please refer to [SPI Master](#).
- The SPI device configuration (i.e. `spi_device_interface_config_t`) can be different for other Ethernet modules. Please check out your module’s spec and the examples in esp-idf.
**Install Driver**  
To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- **mac**: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- **phy**: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- **check_link_period_ms**: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- **stack_input**: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- **on_lowlevel_init_done** and **on_lowlevel_deinit_done**: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to **ESP Event**.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data) {
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x", mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}
esp_event_loop_create_default(); // create a default event loop that running in background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
```

---

**Chapter 2. API Reference**

**Install Driver**  
To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- **mac**: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- **phy**: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- **check_link_period_ms**: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- **stack_input**: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- **on_lowlevel_init_done** and **on_lowlevel_deinit_done**: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to **ESP Event**.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data) {
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x", mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}
esp_event_loop_create_default(); // create a default event loop that running in background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL); // register Ethernet event handler (to deal with user specific stuffs when event like link up/down happened)
**Start Ethernet Driver**  After driver installation, we can start Ethernet immediately.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack**  Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to LwIP.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to **Network Interface**.

```c
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
  ip_event_got_ip_t *event = (ip_event_got_ip_t *)event_data;
  const esp_netif_ip_info_t *ip_info = &event->ip_info;

  ESP_LOGI(TAG, "Ethernet Got IP Address");
  ESP_LOGI(TAG, "~~~~~~~~~~~");
  ESP_LOGI(TAG, "ETHIP: " IPSTR(ip_info->ip));
  ESP_LOGI(TAG, "ETHMASK: " IPSTR(ip_info->netmask));
  ESP_LOGI(TAG, "ETHGW: " IPSTR(ip_info->gw));
  ESP_LOGI(TAG, "~~~~~~~~~~~");
}
```

```c
esp_netif_init(); // Initialize TCP/IP network interface (should be called only once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for Ethernet driver
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:**  It is recommended to fully initialize the Ethernet driver and network interface prior registering user’s Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user’s handlers.

**Misc control of Ethernet driver**  The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`
*/ get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

;/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

Flow control Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by invoking `esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, true);`. One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

Application Example

- Ethernet basic example: ethernet/basic.
- Ethernet iperf example: ethernet/iperf.
- Ethernet to Wi-Fi AP “router” : ethernet/eth2ap.
- Most of protocol examples should also work for Ethernet: protocols.

API Reference

Header File

- components/esp_eth/include/esp_eth.h

Functions

`esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)`
Install Ethernet driver.

Return

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

Parameters

- [in] config: configuration of the Ethernet driver
- [out] out_hdl: handle of Ethernet driver

`esp_err_t esp_eth_driver_uninstall(esp_eth_handle_t hdl)`
Uninstall Ethernet driver.
Chapter 2. API Reference

Note It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

Return

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver

*esp_err_t* esp_eth_start *(esp_eth_handle_t hdl)*

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

Note This API will start driver state machine and internal software timer (for checking link status).

Return

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver

*esp_err_t* esp_eth_stop *(esp_eth_handle_t hdl)*

Stop Ethernet driver.

Note This function does the opposite operation of espeth_start.

Return

- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver

*esp_err_t* esp_eth_update_input_path *(esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)*

Update Ethernet data input path (i.e. specify where to pass the input buffer)

Note After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

Return

- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver
- [in] stack_input: function pointer, which does the actual process on incoming packets
- [in] priv: private resource, which gets passed to stack_input callback without any modification

*esp_err_t* esp_eth_transmit *(esp_eth_handle_t hdl, void *buf, size_t length)*

General Transmit.

Return

- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

Parameters

- [in] hdl: handle of Ethernet driver
• [in] buf: buffer of the packet to transfer
• [in] length: length of the buffer to transfer

`esp_err_t esp_eth_receive(esp_eth_handle_t hdl, uint8_t* buf, uint32_t* length)`

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

**Note** Before this function got invoked, the value of “length” should be set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Note** This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn’t support polling mode. Instead, users should register input callback with `esp_eth_update_input_path`.

**Return**
• ESP_OK: receive frame buffer successfully
• ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
• ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
• ESP_FAIL: receive frame buffer failed because some other error occurred

**Parameters**
• [in] hdl: handle of Ethernet driver
• [out] buf: buffer to preserve the received packet
• [out] length: length of the received packet

`esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void* data)`

Misc IO function of Ethernet driver.

The following IO control commands are supported:

• ETH_CMD_S_MAC_ADDR sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
• ETH_CMD_G_MAC_ADDR gets Ethernet interface MAC address. data argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
• ETH_CMD_S_PHY_ADDR sets PHY address in range of <0-31>. data argument is pointer to memory of uint32_t datatype from where the configuration option is read.
• ETH_CMD_G_PHY_ADDR gets PHY address. data argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
• ETH_CMD_G_SPEED gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
• ETH_CMD_S_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
• ETH_CMD_S_FLOW_CTRL sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
• ETH_CMD_G_DUPLEX_MODE gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
• ETH_CMD_S_PHY_LOOPBACK sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

**Return**
• ESP_OK: process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred

**Parameters**
• [in] hdl: handle of Ethernet driver
• [in] cmd: IO control command
• [inout] data: address of data for set command or address where to store the data when used with get command

`esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)`

Increase Ethernet driver reference.

**Note** Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care
should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be
uninstalled during your using time.

Return
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters
• [in] hdl: handle of Ethernet driver

_{esp_err_t esp_eth_decrease_reference (esp_eth_handle_t hdl)}_
Decrease Ethernet driver reference.

Return
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters
• [in] hdl: handle of Ethernet driver

Structures

_{struct esp_eth_config_t}_
Configuration of Ethernet driver.

Public Members

_{esp_eth_mac_t *mac}_
Ethernet MAC object.

_{esp_eth_phy_t *phy}_
Ethernet PHY object.

_{uint32_t check_link_period_ms}_
Period time of checking Ethernet link status.

_{esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)}_
Input frame buffer to user’s stack.

Return
• ESP_OK: input frame buffer to upper stack successfully
• ESP_FAIL: error occurred when inputting buffer to upper stack

Parameters
• [in] eth_handle: handle of Ethernet driver
• [in] buffer: frame buffer that will get input to upper stack
• [in] length: length of the frame buffer

_{esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)}_
Callback function invoked when lowlevel initialization is finished.

Return
• ESP_OK: process extra lowlevel initialization successfully
• ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters
• [in] eth_handle: handle of Ethernet driver

_{esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)}_
Callback function invoked when lowlevel deinitialization is finished.

Return
• ESP_OK: process extra lowlevel deinitialization successfully
• ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters
• [in] eth_handle: handle of Ethernet driver
**esp_err_t** (*read_phy_reg*) *(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)*

Read PHY register.

**Note** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Return**
- **ESP_OK**: read PHY register successfully
- **ESP_ERR_INVALID_ARG**: read PHY register failed because of invalid argument
- **ESP_ERR_TIMEOUT**: read PHY register failed because of timeout
- **ESP_FAIL**: read PHY register failed because some other error occurred

**Parameters**
- **[in]** eth_handle: handle of Ethernet driver
- **[in]** phy_addr: PHY chip address (0-31)
- **[in]** phy_reg: PHY register index code
- **[out]** reg_value: PHY register value

**esp_err_t** (*write_phy_reg*) *(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)*

Write PHY register.

**Note** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Return**
- **ESP_OK**: write PHY register successfully
- **ESP_ERR_INVALID_ARG**: write PHY register failed because of invalid argument
- **ESP_ERR_TIMEOUT**: write PHY register failed because of timeout
- **ESP_FAIL**: write PHY register failed because some other error occurred

**Parameters**
- **[in]** eth_handle: handle of Ethernet driver
- **[in]** phy_addr: PHY chip address (0-31)
- **[in]** phy_reg: PHY register index code
- **[in]** reg_value: PHY register value

**Macros**

**ETH_DEFAULT_CONFIG** *(emac, emphy)*

Default configuration for Ethernet driver.

**Type Definitions**

**typedef** void *esp_eth_handle_t

Handle of Ethernet driver.

**Header File**

- `components/esp_eth/include/esp_eth_com.h`

**Functions**

**esp_err_t** **esp_eth_detect_phy_addr** *(esp_eth_mediator_t *eth, int *detected_addr)*

Detect PHY address.

**Return**
- **ESP_OK**: detect phy address successfully
- **ESP_ERR_INVALID_ARG**: invalid parameter
- **ESP_ERR_NOT_FOUND**: cannot detect any PHY device
- **ESP_FAIL**: detect phy address failed because some other error occurred

**Parameters**
• [in] eth: mediator of Ethernet driver
• [out] detected_addr: a valid address after detection

Structures

```
struct esp_eth_mediator_s
    Ethernet mediator.
```

Public Members

```
esp_err_t (*phy_reg_read) (esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

**Return**

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```
esp_err_t (*phy_reg_write) (esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

**Return**

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

```
esp_err_t (*stack_input) (esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)
```

Deliver packet to upper stack.

**Return**

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] buffer: packet buffer
- [in] length: length of the packet

```
esp_err_t (*on_state_changed) (esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```

Callback on Ethernet state changed.

**Return**

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] state: new state
- [in] args: optional argument for the new state

Macros

**ETH_MAX_PAYLOAD_LEN**

Maximum Ethernet payload size.
ETH_MIN_PAYLOAD_LEN
Minimum Ethernet payload size.

ETH_HEADER_LEN
Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)

ETH_VLAN_TAG_LEN
Optional 802.1q VLAN Tag length.

ETH_JUMBO_FRAME_PAYLOAD_LEN
Jumbo frame payload size.

ETH_MAX_PACKET_SIZE
Maximum frame size (1522 Bytes)

ETH_MIN_PACKET_SIZE
Minimum frame size (64 Bytes)

Type Definitions
typedef struct esp_eth_mediator_s esp_eth_mediator_t
Ethernet mediator.

Enumerations
enum esp_eth_state_t
Ethernet driver state.

Values:
ETH_STATE_LLINIT
Low level init done
ETH_STATE_DEINIT
Deinit done
ETH_STATE_LINK
Link status changed
ETH_STATE_SPEED
Speed updated
ETH_STATE_DUPLEX
Duplex updated
ETH_STATE_PAUSE
Pause ability updated

enum esp_eth_io_cmd_t
Command list for ioctl API.

Values:
ETH_CMD_G_MAC_ADDR
Get MAC address
ETH_CMD_S_MAC_ADDR
Set MAC address
ETH_CMD_G_PHY_ADDR
Get PHY address
ETH_CMD_S_PHY_ADDR
Set PHY address
ETH_CMD_G_SPEED
Get Speed
ETH_CMD_S_PROMISCUOUS
Set promiscuous mode

ETH_CMD_S_FLOW_CTRL
Set flow control

ETH_CMD_G_DUPLEX_MODE
Get Duplex mode

ETH_CMD_S_PHY_LOOPBACK
Set PHY loopback

enum eth_event_t
Ethernet event declarations.

Values:

ETHERNET_EVENT_START
Ethernet driver start

ETHERNET_EVENT_STOP
Ethernet driver stop

ETHERNET_EVENT_CONNECTED
Ethernet got a valid link

ETHERNET_EVENT_DISCONNECTED
Ethernet lost a valid link

Header File

- components/esp_eth/include/esp_eth_mac.h

Functions

esp_eth_mac_t *esp_eth_mac_new_esp32 (const eth_mac_config_t *config)
Create ESP32 Ethernet MAC instance.

Return

- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

Parameters

- config: Ethernet MAC configuration

Unions

union eth_mac_clock_config_t
#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.

Public Members

struct eth_mac_clock_config_t::{anonymous} mii
EMAC MII Clock Configuration

emac_rmii_clock_mode_t clock_mode
RMII Clock Mode Configuration

emac_rmii_clock_gpio_t clock_gpio
RMII Clock GPIO Configuration

struct eth_mac_clock_config_t::{anonymous} rmii
EMAC RMII Clock Configuration
Structures

struct esp_eth_mac_s
    Ethernet MAC.

Public Members

*esp_err_t (set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
    Set mediator for Ethernet MAC.

Return
    • ESP_OK: set mediator for Ethernet MAC successfully
    • ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

Parameters
    • [in] mac: Ethernet MAC instance
    • [in] eth: Ethernet mediator

*esp_err_t (init)(esp_eth_mac_t *mac)
    Initialize Ethernet MAC.

Return
    • ESP_OK: initialize Ethernet MAC successfully
    • ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
    • ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

Parameters
    • [in] mac: Ethernet MAC instance

*esp_err_t (deinit)(esp_eth_mac_t *mac)
    Deinitialize Ethernet MAC.

Return
    • ESP_OK: deinitialize Ethernet MAC successfully
    • ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

Parameters
    • [in] mac: Ethernet MAC instance

*esp_err_t (start)(esp_eth_mac_t *mac)
    Start Ethernet MAC.

Return
    • ESP_OK: start Ethernet MAC successfully
    • ESP_FAIL: start Ethernet MAC failed because some other error occurred

Parameters
    • [in] mac: Ethernet MAC instance

*esp_err_t (stop)(esp_eth_mac_t *mac)
    Stop Ethernet MAC.

Return
    • ESP_OK: stop Ethernet MAC successfully
    • ESP_FAIL: stop Ethernet MAC failed because some error occurred

Parameters
    • [in] mac: Ethernet MAC instance

*esp_err_t (transmit)(esp_eth_mac_t *mac, uint8_t*buf, uint32_t length)
    Transmit packet from Ethernet MAC.

Return
    • ESP_OK: transmit packet successfully
    • ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
    • ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
    • ESP_FAIL: transmit packet failed because some other error occurred

Parameters
    • [in] mac: Ethernet MAC instance
**Chapter 2. API Reference**

- [in] `mac`: Ethernet MAC instance
- [in] `buf`: packet buffer to transmit
- [in] `length`: length of packet

```c
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
```

Receive packet from Ethernet MAC.

**Note** Memory of `buf` is allocated in the Layer2, make sure it get free after process.

**Note** Before this function got invoked, the value of "length" should set by user, equals the size of `buffer`. After the function returned, the value of "length" means the real length of received data.

**Return**

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. In this case, value of returned "length" indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [out] `buf`: packet buffer which will preserve the received frame
- [out] `length`: length of the received packet

```c
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

**Return**

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `phy_addr`: PHY chip address (0~31)
- [in] `phy_reg`: PHY register index code
- [out] `reg_value`: PHY register value

```c
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Write PHY register.

**Return**

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `phy_addr`: PHY chip address (0~31)
- [in] `phy_reg`: PHY register index code
- [in] `reg_value`: PHY register value

```c
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

**Return**

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

**Parameters**

- [in] `mac`: Ethernet MAC instance
- [in] `addr`: MAC address
**esp_err_t** (*get_addr*) (*esp_eth_mac_t* *mac*, uint8_t *addr*)

Get MAC address.

**Return**
- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

**esp_err_t** (*set_speed*) (*esp_eth_mac_t* *mac*, eth_speed_t speed)

Set speed of MAC.

**Return**
- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

**esp_err_t** (*set_duplex*) (*esp_eth_mac_t* *mac*, eth_duplex_t duplex)

Set duplex mode of MAC.

**Return**
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

**esp_err_t** (*set_link*) (*esp_eth_mac_t* *mac*, eth_link_t link)

Set link status of MAC.

**Return**
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] link: Link status

**esp_err_t** (*set_promiscuous*) (*esp_eth_mac_t* *mac*, bool enable)

Set promiscuous of MAC.

**Return**
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

**esp_err_t** (*enable_flow_ctrl*) (*esp_eth_mac_t* *mac*, bool enable)

Enable flow control on MAC layer or not.

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable flow control; set false to disable flow control
**esp_err_t** (*set_peer_pause_ability*) *(esp_eth_mac_t *mac, uint32_t ability)*

Set the PAUSE ability of peer node.

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

**Parameters**
- [in] *mac*: Ethernet MAC instance
- [in] *ability*: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**esp_err_t** (*del*) *(esp_eth_mac_t *mac)*

Free memory of Ethernet MAC.

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

**Parameters**
- [in] *mac*: Ethernet MAC instance

**struct eth_mac_config_t**

Configuration of Ethernet MAC object.

### Public Members

- uint32_t *sw_reset_timeout_ms*
  - Software reset timeout value (Unit: ms)
- uint32_t *rx_task_stack_size*
  - Stack size of the receive task
- uint32_t *rx_task_prio*
  - Priority of the receive task
- int *smi_mdc_gpio_num*
  - SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration
- int *smi_mdio_gpio_num*
  - SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration
- uint32_t *flags*
  - Flags that specify extra capability for mac driver
- eth_data_interface_t *interface*
  - EMAC Data interface to PHY (MII/RMII)
- *eth_mac_clock_config_t* *clock_config*
  - EMAC Interface clock configuration

### Macros

**ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE**
- MAC driver can work when cache is disabled

**ETH_MAC_FLAG_PIN_TO_CORE**
- Pin MAC task to the CPU core where driver installation happened

**ETH_MAC_DEFAULT_CONFIG()**
- Default configuration for Ethernet MAC object.

### Type Definitions

**typedef struct esp_eth_mac_s esp_eth_mac_t**
- Ethernet MAC.
Enumerations

enum emac_rmii_clock_mode_t
    RMII Clock Mode Options.
    
Values:

EMAC_CLK_DEFAULT
    Default values configured using Kconfig are going to be used when “Default” selected.

EMAC_CLK_EXT_IN
    Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.
    
Note MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

EMAC_CLK_OUT
    Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum emac_rmii_clock_gpio_t
    RMII Clock GPIO number Options.
    
Values:

EMAC_CLK_IN_GPIO = 0
    MAC will get RMII clock from outside at this GPIO.
    
Note ESP32 only supports GPIO0 to input the RMII clock.

EMAC_APPL_CLK_OUT_GPIO = 0
    Output RMII Clock from internal APLL Clock available at GPIO0.
    
Note GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

EMAC_CLK_OUT_GPIO = 16
    Output RMII Clock from internal APLL Clock available at GPIO16.

EMAC_CLK_OUT_180_GPIO = 17
    Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

Header File

- components/esp_eth/include/esp_eth_phy.h

Functions

esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)
    Create a PHY instance of IP101.
    
Return
    - instance: create PHY instance successfully
    - NULL: create PHY instance failed because some error occurred

Parameters
    - [in] config: configuration of PHY

esp_eth_phy_t *esp_eth_phy_new_rtl8201(const eth_phy_config_t *config)
    Create a PHY instance of RTL8201.
    
Return
    - instance: create PHY instance successfully
    - NULL: create PHY instance failed because some error occurred
Parameters

- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_lan87xx(const eth_phy_config_t *config)
```
Create a PHY instance of LAN87xx.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

```c
static esp_eth_phy_t *esp_eth_phy_new_lan8720(const eth_phy_config_t *config)
```
Create a PHY instance of LAN8720.

**Note** For ESP-IDF backwards compatibility reasons. In all other cases, use `esp_eth_phy_new_lan87xx` instead.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_dp83848(const eth_phy_config_t *config)
```
Create a PHY instance of DP83848.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_ksz8041(const eth_phy_config_t *config)
```
Create a PHY instance of KSZ8041.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_ksz8081(const eth_phy_config_t *config)
```
Create a PHY instance of KSZ8081.

**Return**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

**Structures**

```c
struct esp_eth_phy_s
```
Ethernet PHY.

**Public Members**

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

**Return**

- ESP_OK: set mediator for Ethernet PHY instance successfully
• ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some
invalid arguments

Parameters
• [in] phy: Ethernet PHY instance
• [in] mediator: mediator of Ethernet driver

esp_err_t(*reset)(esp_eth_phy_t *phy)
Software Reset Ethernet PHY.

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t(*reset_hw)(esp_eth_phy_t *phy)
Hardware Reset Ethernet PHY.

Note Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t(*init)(esp_eth_phy_t *phy)
Initialize Ethernet PHY.

Return
• ESP_OK: initialize Ethernet PHY successfully
• ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t(*deinit)(esp_eth_phy_t *phy)
Deinitialize Ethernet PHY.

Return
• ESP_OK: deinitialize Ethernet PHY successfully
• ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters
• [in] phyL: Ethernet PHY instance

esp_err_t(*negotiate)(esp_eth_phy_t *phy)
Start auto negotiation.

Return
• ESP_OK: restart auto negotiation successfully
• ESP_FAIL: restart auto negotiation failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t(*get_link)(esp_eth_phy_t *phy)
Get Ethernet PHY link status.

Return
• ESP_OK: get Ethernet PHY link status successfully
• ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t(*pwrctl)(esp_eth_phy_t *phy, bool enable)
Power control of Ethernet PHY.

Return
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

`esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)`
Set PHY chip address.

**Return**
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

`esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)`
Get PHY chip address.

**Return**
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

**Parameters**
- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

`esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)`
Advertise pause function supported by MAC layer.

**Return**
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

**Parameters**
- [in] phy: Ethernet PHY instance
- [out] addr: Pause ability

`esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)`
Configure PHY instance loopback function successfully

**Return**
- ESP_OK: PHY instance loopback configuration successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] enable: enables or disables PHY loopback

`esp_err_t (*del)(esp_eth_phy_t *phy)`
Free memory of Ethernet PHY instance.

**Return**
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance

**Public Members**

`struct eth_phy_config_t` Ethernet PHY configuration.

`int32_t phy_addr`
PHY address, set -1 to enable PHY address detection at initialization stage

`uint32_t reset_timeout_ms`
Reset timeout value (Unit: ms)
uint32_t autonego_timeout_ms
    Auto-negotiation timeout value (Unit: ms)

int reset_gpio_num
    Reset GPIO number, -1 means no hardware reset

Macros
ESP_ETH_PHY_ADDR_AUTO
ETH_PHY_DEFAULT_CONFIG
    Default configuration for Ethernet PHY object.

Type Definitions
typedef struct esp_eth Phy_s esp_eth_phy_t
    Ethernet PHY.

Header File
    • components/esp_eth/include/esp_eth_netif_glue.h

Functions
esp_eth_netif glue_handle_t esp_eth_new_netif glue (esp_eth handle_t eth_hdl)
    Create a netif glue for Ethernet driver.
    Note: netif glue is used to attach io driver to TCP/IP netif
    Return: glue object, which inherits esp_netif driver_base_t
    Parameters
        • eth_hdl: Ethernet driver handle

esp_err_t esp_eth_del_netif glue (esp_eth_netif glue_handle_t eth_netif glue)
    Delete netif glue of Ethernet driver.
    Return: -ESP_OK: delete netif glue successfully
    Parameters
        • eth_netif glue: netif glue

esp_err_t esp_eth_set_default_handlers (void *esp_netif)
    Register default IP layer handlers for Ethernet.
    Note: Ethernet handle might not yet properly initialized when setting up these default handlers
    Warning: This function is deprecated and is kept here only for compatibility reasons. Registration of default
    IP layer handlers for Ethernet is now handled automatically. Do not call this function if you want to use
    multiple Ethernet instances at a time.
    Return
        • ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
        • ESP_OK: set default IP layer handlers successfully
        • others: other failure occurred during register esp_event handler
    Parameters
        • [in] esp_netif: esp network interface handle created for Ethernet driver

esp_err_t esp_eth_clear_default_handlers (void *esp_netif)
    Unregister default IP layer handlers for Ethernet.
    Warning: This function is deprecated and is kept here only for compatibility reasons. Unregistration
    of default IP layer handlers for Ethernet is now handled automatically if not registered by calling
    esp_eth_set_default_handlers.
    Return
        • ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
        • ESP_OK: clear default IP layer handlers successfully
        • others: other failure occurred during unregister esp_event handler
    Parameters

Submit Document Feedback
Chapter 2. API Reference

- [in] esp_netif: esp network interface handle created for Ethernet driver

**Type Definitions**

```c
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver. Code examples for the Ethernet API are provided in the ethernet directory of ESP-IDF examples.

### 2.2.3 Thread

**Thread**

**Introduction**

Thread is a IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

**Application Examples**

The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell openthread/ot_cli.
- The Thread border router openthread/ot_br.
- The Thread radio co-processor openthread/ot_rcc.

**API Reference**

For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

**Header File**

- components/openthread/include/esp_openthread.h

**Functions**

```c
esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)
```

Initializes the full OpenThread stack.

**Note**

The OpenThread instance will also be initialized in this function.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**Parameters**

- [in] init_config: The initialization configuration.

```c
esp_err_t esp_openthread_launch_mainloop(void)
```

Launches the OpenThread main loop.

**Note**

This function will not return unless error happens when running the OpenThread stack.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

```c
esp_err_t esp_openthread_deinit(void)
```

This function performs OpenThread stack and platform driver deinitialization.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
otInstance *`esp_openthread_get_instance` (void)
This function acquires the underlying OpenThread instance.

**Note** This function can be called on other tasks without lock.

**Return** The OpenThread instance pointer

### Header File
- components/openthread/include/esp_openthread_types.h

### Structures

#### `struct esp_openthread_mainloop_context_t`
This structure represents a context for a select() based mainloop.

- **Public Members**
  - `fd_set read_fds`
    - The read file descriptors
  - `fd_set write_fds`
    - The write file descriptors
  - `fd_set error_fds`
    - The error file descriptors
  - `int max_fd`
    - The max file descriptor
  - `struct timeval timeout`
    - The timeout

**struct esp_openthread_uart_config_t**
The uart port config for OpenThread.

- **Public Members**
  - `uart_port_t port`
    - UART port number
  - `uart_config_t uart_config`
    - UART configuration, see `uart_config_t` docs
  - `int rx_pin`
    - UART RX pin
  - `int tx_pin`
    - UART TX pin

**struct esp_openthread_radio_config_t**
The OpenThread radio configuration.

- **Public Members**
  - `esp_openthread_radio_mode_t radio_mode`
    - The radio mode
  - `esp_openthread_uart_config_t radio_uart_config`
    - The uart configuration to RCP

**struct esp_openthread_host_connection_config_t**
The OpenThread host connection configuration.
Chapter 2. API Reference

Public Members

*esp_openthread_host_connection_mode_t* `host_connection_mode`
   The host connection mode

*esp_openthread_uart_config_t* `host_uart_config`
   The uart configuration to host

*struct esp_openthread_port_config_t*
   The OpenThread port specific configuration.

Public Members

*const char* `storage_partition_name`
   The partition for storing OpenThread dataset

*uint8_t* `netif_queue_size`
   The packet queue size for the network interface

*uint8_t* `task_queue_size`
   The task queue size

*struct esp_openthread_platform_config_t*
   The OpenThread platform configuration.

Public Members

*esp_openthread_radio_config_t* `radio_config`
   The radio configuration

*esp_openthread_host_connection_config_t* `host_config`
   The host connection configuration

*esp_openthread_port_config_t* `port_config`
   The port configuration

Enumerations

*enum esp_openthread_event_t* `event_t`
   OpenThread event declarations.

*Values:*

*OPENTHREAD_EVENT_START*  
OpenThread stack start

*OPENTHREAD_EVENT_STOP*  
OpenThread stack stop

*OPENTHREAD_EVENT_IF_UP*  
OpenThread network interface up

*OPENTHREAD_EVENT_IF_DOWN*  
OpenThread network interface down

*OPENTHREAD_EVENT_GOT_IP6*  
OpenThread stack added IPv6 address

*OPENTHREAD_EVENT_LOST_IP6*  
OpenThread stack removed IPv6 address

*OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN*  
OpenThread stack joined IPv6 multicast group
**OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**

OpenThread stack left IPv6 multicast group

**enum esp_openthread_radio_mode_t**

The radio mode of OpenThread.

**Values:**

- **RADIO_MODE_NATIVE** = 0x0
  
  Use the native 15.4 radio

- **RADIO_MODE_UART_RCP** = 0x1
  
  UART connection to a 15.4 capable radio co-processor (RCP)

- **RADIO_MODE_SPI_RCP** = 0x2
  
  SPI connection to a 15.4 capable radio co-processor (RCP)

**enum esp_openthread_host_connection_mode_t**

How OpenThread connects to the host.

**Values:**

- **HOST_CONNECTION_MODE_NONE** = 0x0
  
  Disable host connection

- **HOST_CONNECTION_MODE_CLI_UART** = 0x1
  
  CLI UART connection to the host

- **HOST_CONNECTION_MODE_RCP_UART** = 0x2
  
  RCP UART connection to the host

**Header File**

- components/openthread/include/esp_openthread_lock.h

**Functions**

**esp_err_t** **esp_openthread_lock_init**(void)

This function initializes the OpenThread API lock.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

**void** **esp_openthread_lock_deinit**(void)

This function deinitializes the OpenThread API lock.

**bool** **esp_openthread_lock_acquire**(TickType_t **block_ticks**)

This function acquires the OpenThread API lock.

**Note** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

**Return**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**Parameters**

- [in] **block_ticks**: The maximum number of RTOS ticks to wait for the lock.

**void** **esp_openthread_lock_release**(void)

This function releases the OpenThread API lock.

**Header File**

- components/openthread/include/esp_openthread_netif_glue.h
Chapter 2. API Reference

Functions

void *esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)
This function initializes the OpenThread network interface glue.

   Return
   • glue pointer on success
   • NULL on failure

Parameters
   • [in] config: The platform configuration.

void esp_openthread_netif_glue_deinit (void)
This function deinitializes the OpenThread network interface glue.

esp_netif_t *esp_openthread_get_netif (void)
This function acquires the OpenThread netif.

   Return  The OpenThread netif or NULL if not initialized.

Header File

• components/openthread/include/esp_openthread_border_router.h

Functions

esp_err_t esp_openthread_border_router_init (esp_netif_t *backbone_netif)
Initializes the border router features of OpenThread.

   Note  Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

   Return
   • ESP_OK on success
   • ESP_ERR_NOT_SUPPORTED if feature not supported
   • ESP_ERR_INVALID_STATE if already initialized
   • ESP_FIAL on other failures

Parameters
   • [in] backbone_netif: The backbone network interface (WiFi or ethernet)

esp_err_t esp_openthread_border_router_deinit (void)
Deinitializes the border router features of OpenThread.

   Return
   • ESP_OK on success
   • ESP_ERR_INVALID_STATE if not initialized
   • ESP_FIAL on other failures

esp_netif_t *esp_openthread_get_backbone_netif (void)
Gets the backbone interface of OpenThread border router.

   Return  The backbone interface or NULL if border router not initialized.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.

2.2.4  IP Network Layer

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

• It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
• The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.
ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the TCP/IP Adapter Migration Guide section in case existing applications to be ported to use the esp-netif API instead.

### ESP-NETIF architecture

```
+-----------------------+                         +-----------------------+
|_init                 |                         |_esp_netif_transmit_    |
|settings             |                         |esp_netif_receive       |
|events               |                         |esp_netif_free_rx_buffer|
|init                 |                         |                       |
|*                    |                         |*                       |

|get/set              |                         |*                       |
|*                    |                         |*                       |
|init                 |                         |*                       |
|**                   |                         |*                       |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|                   |                         |**                     |
|                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
|**                   |                         |**                     |
```

Data and event flow in the diagram

- . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<--- Data packets going from communication media to TCP/IP stack and back
- * * * * * * Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

### ESP-NETIF interaction

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

1. **Initialization code**
   1. Initializes IO driver
   2. Creates a new instance of ESP-NETIF and configure with
      - ESP-NETIF specific options (flags, behaviour, name)
• Network stack options (netif init and input functions, not publicly available)
• IO driver specific options (transmit, free rx buffer functions, IO driver handle)

3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   • use default handlers for common interfaces defined in IO drivers; or define a specific handlers for
     customised behaviour/new interfaces
   • register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API
• Getting and setting TCP/IP related parameters (DHCP, IP, etc)
• Receiving IP events (connect/disconnect)
• Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver  Communication driver plays these two important roles in
relation with ESP-NETIF:
1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up ->
turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   • Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are
     passed to the IO driver
   • Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter  ESP-NETIF is an intermediary between an IO driver and a network stack,
connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-
NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided
to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface
could be divided into these 6 groups:
1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
6) Driver conversion utilities

D) Network stack  Network stack has no public interaction with application code with regard to public interfaces
and shall be fully abstracted by ESP-NETIF API.

ESP-NETIF programmer’s manual  Please refer to the example section for basic initialization of default inter-
faces:
• WiFi Station: wifi/getting_started/station/main/station_example_main.c
• WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c
• Ethernet: ethernet/basic/main/ethernet_example_main.c
For more specific cases please consult this guide: ESP-NETIF Custom I/O Driver.
### WiFi default initialization

The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_ap()`
- `esp_netif_create_default_wifi_sta()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using WiFi in AP+STA mode, both these interfaces has to be created.

### API Reference

#### Header File

- `components/esp_netif/include/esp_netif.h`

#### Functions

**esp_err_t esp_netif_init (void)**

Initialize the underlying TCP/IP stack.

**Return**

- ESP_OK on success
- ESP_FAIL if initializing failed

**Note**
This function should be called exactly once from application code, when the application starts up.

**esp_err_t esp_netif_deinit (void)**

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note**: Deinitialization is not supported yet

**Return**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

**esp_netif_t* esp_netif_new (const esp_netif_config_t* esp_netif_config)**

Creates an instance of new esp-netif object based on provided config.

**Return**

- pointer to esp-netif object on success
- NULL otherwise

**Parameters**

- [in] `esp_netif_config`: pointer esp-netif configuration

**void esp_netif_destroy (esp_netif_t* esp_netif)**

Destroys the esp_netif object.

**Parameters**

- [in] `esp_netif`: pointer to the object to be deleted

**esp_err_t esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)**

Configures driver related options of esp_netif object.

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**Parameters**

- [inout] `esp_netif`: pointer to the object to be configured
- [in] `driver_config`: pointer esp-netif io driver related configuration
### esp_err_t esp_netif_attach(esp_netif_t* esp_netif, esp_netif_iodriver_handle driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**
- [inout] esp_netif: pointer to esp_netif object to be attached
- [in] driver_handle: pointer to the driver handle

### esp_err_t esp_netifReceive(esp_netif_t* esp_netif, void* buffer, size_t len, void* eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Received data
- [in] len: Length of the data frame
- [in] eb: Pointer to internal buffer (used in Wi-Fi driver)

### void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event.

Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

### void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

### void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

### void esp_netif_action_disconnected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler
Chapter 2. API Reference

Parameters
- [in] esp_netif: Handle to esp-netif instance
  - base:
  - event_id:
  - data:

void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
  - base:
  - event_id:
  - data:

void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
  - base:
  - event_id:
  - data:

void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
  - base:
  - event_id:
  - data:

void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
  - base:
  - event_id:
  - data:

void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
  - base:
  - event_id:
  - data:

esp_err_t esp_netif_set_mac (esp_netif_t *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

Return
Chapter 2. API Reference

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] mac: Desired mac address for the related network interface

\textit{esp_err_t esp_netif_get_mac}(esp_netif_t *esp_netif, uint8_t mac[])

Get the mac address for the interface instance.

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] mac: Resultant mac address for the related network interface

\textit{esp_err_t esp_netif_set_hostname}(esp_netif_t *esp_netif, const char *hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters
- [in] esp_netif: Handle to esp-netif instance

\textit{esp_err_t esp_netif_get_hostname}(esp_netif_t *esp_netif, const char **hostname)

Get interface hostname.

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] hostname: Returns a pointer to the hostname. Maybe NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

\textit{bool esp_netif_is_netif_up}(esp_netif_t *esp_netif)

Test if supplied interface is up or down.

Return
- true - Interface is up
- false - Interface is down

Parameters
- [in] esp_netif: Handle to esp-netif instance

\textit{esp_err_t esp_netif_get_ip_info}(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
Chapter 2. API Reference

- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

```
esp_err_t esp_netif_get_old_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
```

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

```
esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: IP information to set on the specified interface

```
esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
```

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: Store the old IP information for the specified interface

```
int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
```

Get net interface index from network stack implementation.

**Note** This index could be used in setsockopt() to bind socket with multicast interface

Return implementation specific index of interface represented with supplied esp_netif

Parameters

• [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_get_netif_impl_name** (esp_netif_t *esp_netif, char *name)

Get net interface name from network stack implementation.

**Note** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [out] name: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**esp_err_t esp_netif_dhcps_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

**esp_err_t esp_netif_dhcpc_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

**esp_err_t esp_netif_dhcpc_start** (esp_netif_t *esp_netif)

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPPC_START_FAILED

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
**esp_err_t esp_netif_dhcpc_stop (esp_netif_t *esp_netif)**

Stop DHCP client (only if enabled in interface object)

**Note** Calling action_netif_stop() will also stop the DHCP Client if it is running.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_dhcpc_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP client status.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] status: If successful, the status of DHCP client will be returned in this argument.

**esp_err_t esp_netif_dhcps_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP Server status.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] status: If successful, the status of the DHCP server will be returned in this argument.

**esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)**

Start DHCP server (only if enabled in interface object)

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)**

Stop DHCP server (only if enabled in interface object)

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)**

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
This function can override it by setting server type ESP_NETIF_DNS_MAIN.
Other DNS Server types are not supported for the Wi-Fi AP interface.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [in] dns: DNS Server address to set

```
esp_err_t esp_netif_get_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type,
                                esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.
This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled,
the Main or Backup DNS Server may be set by the current DHCP lease.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [out] dns: DNS Server result is written here on success

```
esp_err_t esp_netif_create_ip6_linklocal(esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.
This function also registers a callback for the specified interface, so that if the link-local address becomes
verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

```
esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return
a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6
  address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```
esp_err_t esp_netif_get_ip6_global(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
Chapter 2. API Reference

- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
int esp_netif_get_all_ip6(esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])  
```
Get all IPv6 addresses of the specified interface.

**Return** number of returned IPv6 addresses

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: Array of IPv6 addresses will be copied to the argument

```c
void esp_netif_set_ip4_addr(esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)  
```
Sets IPv4 address to the specified octets.

**Parameters**
- [out] addr: IP address to be set
- a: the first octet (127 for IP 127.0.0.1)
- b:
- c:
- d:

```c
char *esp_ip4addr_ntoa(const esp_ip4_addr_t *addr, char *buf, int buflen)  
```
Converts numeric IP address into decimal dotted ASCII representation.

**Return** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

**Parameters**
- addr: ip address in network order to convert
- buf: target buffer where the string is stored
- buflen: length of buf

```c
uint32_t esp_ip4addr_aton(const char *addr)  
```
Asci internet address interpretation routine The value returned is in network order.

**Return** ip address in network order

**Parameters**
- addr: IP address in ascii representation (e.g. “127.0.0.1”)

```c
esp_err_t esp_netif_str_to_ip4(const char *src, esp_ip4_addr_t *dst)  
```
Converts ASCII internet IPv4 address into esp_ip4_addr_t.

**Return**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

**Parameters**
- [in] src: IPv4 address in ascii representation (e.g. “127.0.0.1”)
- [out] dst: Address of the target esp_ip4_addr_t structure to receive converted address

```c
esp_err_t esp_netif_str_to_ip6(const char *src, esp_ip6_addr_t *dst)  
```
Converts ASCII internet IPv6 address into esp_ip6_addr_t Zeros in the IP address can be stripped or completely ommited: “2001:0db8:85a3:0:0:0:0:2:1” or “2001:db8::2:1”

**Return**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

**Parameters**
- [in] src: IPv6 address in ascii representation (e.g. 2001:0db8:85a3:0:0:0:0:0:2:1)
- [out] dst: Address of the target esp_ip6_addr_t structure to receive converted address
**esp_netif_iodriver_handle** `esp_netif_get_io_driver (esp_netif_t *esp_netif)`

Gets media driver handle for this esp-netif instance.

**Return** opaque pointer of related IO driver

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)`

Searches over a list of created objects to find an instance with supplied if key.

**Return** Handle to esp-netif instance

**Parameters**

- if_key: Textual description of network interface

`esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)`

Returns configured flags for this interface.

**Return** Configuration flags

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)`

Returns configured interface key for this esp-netif instance.

**Return** Textual description of related interface

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`const char *esp_netif_get_desc (esp_netif_t *esp_netif)`

Returns configured interface type for this esp-netif instance.

**Return** Enumerated type of this interface, such as station, AP, ethernet

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`int esp_netif_get_route_prio (esp_netif_t *esp_netif)`

Returns configured routing priority number.

**Return** Integer representing the instance’s route-prio, or -1 if invalid paramters

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)`

Returns configured event for this esp-netif instance and supplied event type.

**Return** specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

**Parameters**

- [in] esp_netif: Handle to esp-netif instance
- event_type: (either get or lost IP)

`esp_netif_t *esp_netif_next (esp_netif_t *esp_netif)`

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Return** First netif from the list if supplied parameter is NULL, next one otherwise

**Parameters**

- [in] esp_netif: Handle to esp-netif instance

`size_t esp_netif_get_nr_of_ifs (void)`

Returns number of registered esp_netif objects.

**Return** Number of esp_netifs

`void esp_netif_netstack_buf_ref (void *netstack_buf)`

Increase the reference counter of net stack buffer

**Parameters**

- [in] netstack_buf: the net stack buffer
void esp_netif_netstack_buf_free (void *netstack_buf)
free the netstack buffer

Parameters
  • [in] netstack_buf: the net stack buffer

Macros
ESP_NETIF_SUPPRESS_LEGACY_WARNING

WiFi default API reference

Header File
  • components/esp_wifi/include/esp_wifi_default.h

Functions
esp_err_t esp_netif_attach_wifi_station (esp_netif_t *esp_netif)
Attaches wifi station interface to supplied netif.
  
Return
  • ESP_OK on success
  • ESP_FAIL if attach failed

Parameters
  • esp_netif: instance to attach the wifi station to

esp_err_t esp_netif_attach_wifi_ap (esp_netif_t *esp_netif)
Attaches wifi soft AP interface to supplied netif.
  
Return
  • ESP_OK on success
  • ESP_FAIL if attach failed

Parameters
  • esp_netif: instance to attach the wifi AP to

esp_err_t esp_wifi_set_default_wifi_sta_handlers (void)
Sets default wifi event handlers for STA interface.
  
Return
  • ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t esp_wifi_set_default_wifi_ap_handlers (void)
Sets default wifi event handlers for AP interface.
  
Return
  • ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers (void *esp_netif)
Clears default wifi event handlers for supplied network interface.
  
Return
  • ESP_OK on success, error returned from esp_event_handler_register if failed

Parameters
  • esp_netif: instance of corresponding if object

esp_netif_t *esp_netif_create_default_wifi_ap (void)
Creates default WIFI AP. In case of any init error this API aborts.
  
Note The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

Return pointer to esp-netif instance

esp_netif_t *esp_netif_create_default_wifi_sta (void)
Creates default WIFI STA. In case of any init error this API aborts.
**Note**  The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

**Return**  pointer to esp-netif instance

```c
void esp_netif_destroy_default_wifi (void *esp_netif)
```

Destructs default WIFI netif created with esp_netif_create_default_wifi_…() API.

**Note**  This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

**Parameters**

- `[in]` esp_netif: object to detach from WiFi and destroy

```c
esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)
```

Creates esp_netif WiFi object based on the custom configuration.

**Attention**  This API DOES NOT register default handlers!

**Return**  pointer to esp-netif instance

**Parameters**

- `[in]` wifi_if: type of wifi interface
- `[in]` esp_netif_config: inherent esp-netif configuration pointer

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled.

Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Return**  ESP_OK on success

**Parameters**

- `[out]` p_netif_sta: pointer where the resultant STA interface is saved (if non NULL)
- `[out]` p_netif_ap: pointer where the resultant AP interface is saved (if non NULL)

---

**TCP/IP Adapter Migration Guide**

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor **ESP-NETIF**.

**Updating network connection code**

**Network stack initialization**  Simply replace tcpip_adapter_init() with esp_netif_init(). Please note that the **ESP-NETIF** initialization API returns standard error code and the esp_netif_deinit() for un-initialization is available.

Also replace `#include "tcpip_adapter.h"` with `#include "esp_netif.h"`.

**Network interface creation**  TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the **ESP-NETIF** to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call `esp_netif_create_default_wifi_sta();` or `esp_netif_create_default_wifi_ap();` after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:
Replacing other tcpip_adapter API  All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:

- Setters/Getters
- DHCP
- DNS
- IP address

Default event handlers  Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```c
ESP_LOGI(TAG, "got ip: %s\n", IPSTR(&event->ip_info.ip));
```

Instead of

```c
ESP_LOGI(TAG, "got ip: %s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since ip4addr_ntoa() is a LwIP API, the esp-netif provides esp_ip4addr_ntoa() as a replacement, but the above method is generally preferred.

IP addresses  It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. * esp-netif IP address definitions

Next steps  Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output  As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- esp_netif_transmit()
- esp_netif_free_rx_buffer()
- esp_netif_receive()

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls esp_netif_receive() on a new data received event.
### Post attach callback

A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iiodriver_handle_t driver_handle);
```

It is assumed that the `esp_netif_iiodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to:

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base; /*!< base structure reserved as
    esp-netif driver */
    driver_impl_t *h; /*!< handle of driver implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

### Default handlers

I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV__EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV__EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

### Network stack connection

The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.
Header File

- components/esp_netif/include/esp_netif_net_stack.h

Functions

esp_netif_t* esp_netif_get_handle_from_netif_impl (void *dev)

Returns esp-netif handle.

Parameters
- [in] dev: opaque ptr to network interface of specific TCP/IP stack

Return handle to related esp-netif instance

 esp_netif_get_netif_impl (esp_netif_t *esp_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Parameters
- [in] esp_netif: Handle to esp-netif instance

Return handle to related network stack netif handle

esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame

Return ESP_OK on success, an error passed from the I/O driver otherwise

esp_err_t esp_netif_transmit_wrap (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] data: Data to be transmitted
- [in] len: Length of the data frame
- [in] netstack_buf: net stack buffer

esp_netif_free_rx_buffer (void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the TCP/IP Adapter Migration Guide to update existing IDF applications.

2.2.5 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.
2.3 Peripherals API

2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32 integrates 2 SAR (Successive Approximation Register) ADCs, supporting a total of 18 measurement channels (analog enabled pins).

These channels are supported:

ADC1:
- 8 channels: GPIO32 - GPIO39

ADC2:
- 10 channels: GPIO0, GPIO2, GPIO4, GPIO12 - GPIO15, GPIO25 - GPIO27

ADC Attenuation

Vref is the reference voltage used internally by ESP32 ADCs for measuring the input voltage. The ESP32 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

<table>
<thead>
<tr>
<th>Attenuation</th>
<th>Measurable input voltage range</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC_ATTEN_DB_0</td>
<td>100 mV ~ 950 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_2_5</td>
<td>100 mV ~ 1250 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_6</td>
<td>150 mV ~ 1750 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_11</td>
<td>150 mV ~ 2450 mV</td>
</tr>
</tbody>
</table>

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \tag{1}
\]

where:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vout</td>
<td>Digital output result, standing for the voltage.</td>
</tr>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, see ADC Attenuation.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 4095 under Continuous Read mode.</td>
</tr>
</tbody>
</table>

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See ADC Calibration.
ADC Limitations

Note:

• Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:
  • ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
  • ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.
• Since the ADC2 module is also used by the Wi-Fi, only one of them could get the preemption when using together, which means the `adc2_get_raw()` may get blocked until Wi-Fi stops, and vice versa.

Driver Usage

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

Note: ADC readings from a pin not connected to any signal are random.

ADC Single Read mode  The ADC should be configured before reading is taken.

• For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
• For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

Single Read mode ADC example can be found in `peripherals/adc/single_read` directory of ESP-IDF examples.

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function `hall_sensor_read()`. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

There is another specific function `adc_vref_to_gpio()` used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section ADC Calibration.

Note:  See ADC Limitations for the limitation of using ADC single read mode.

Minimizing Noise

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.
Chapter 2. API Reference

ADC Calibration

The esp_adc_cal/include/esp_adc_cal.h API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of 

\[ y = \text{coeff}_a \times x + \text{coeff}_b \]

and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

Calibration Values

Calibration values are used to generate characteristic curves that account for the variation of ADC reference voltage of a particular ESP32 chip. There are currently 3 source(s) of calibration values on ESP32. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs’ readings at 150 mV and 850 mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, Default Vref will be used.

Individual measurement and burning of the eFuse Vref has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/after than 012018 (see Line 4 on figure below). If you would like to purchase chips or modules with calibration, double check with distributor or Espressif (sales@espressif.com) directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if eFuse Vref is present by running the espfuse.py tool with adc_info parameter.
Fig. 7: Graph illustrating effect of differing reference voltages on the ADC voltage curve.

Fig. 8: ESP32 Chip Surface Marking
Replace /dev/ttyUSB0 with ESP32 board’s port name.

A chip that has specific eFuse Vref value programmed (in this case 1093 mV) will be reported as follows:

```
ADC Vref calibration: 1093 mV
```

In another example below the eFuse Vref is not programmed:

```
ADC Vref calibration: None (1100 mV nominal)
```

For a chip with two point calibration the message will look similar to:

```
ADC Vref calibration: 1149 mV
ADC readings stored in eFuse BLK3:
  ADC1 Low reading (150 mV): 306
  ADC1 High reading (850 mV): 3153
  ADC2 Low reading (150 mV): 389
  ADC2 High reading (850 mV): 3206
```

**Application Extensions**

For a full example see esp-idf: peripherals/adc/single_read

Characterizing an ADC at a particular attenuation:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

// Characterize ADC at particular attenuation
esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_characteristics_t));
esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_BIT_12, DEFAULT_VREF, adc_chars);
// Check type of calibration value used to characterize ADC
if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref");
} else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point");
} else {
    printf("Default");
}
```

Reading an ADC then converting the reading to a voltage:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);
```

Routing ADC reference voltage to GPIO, so it can be manually measured (for Default Vref):

```c
#include "driver/adc.h"
...
```

(continues on next page)
esp_err_t status = adc_vref_to_gpio(ADC_UNIT_1, GPIO_NUM_25);
if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
} else {
    printf("failed to route v_ref\n");
}

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. ADC1_CHANNEL_0_GPIO_NUM is the GPIO number of ADC1 channel 0.
2. ADC1_GPIO0_CHANNEL is the ADC1 channel number of GPIO n.

API Reference

This reference covers three components:

- ADC driver
- ADC Calibration
- GPIO Lookup Macros

ADC driver

Header File

- components/driver/include/driver/adc.h

Functions

- void adc_power_on (void)
  - Enable ADC power.
- void adc_power_off (void)
  - Power off SAR ADC.
- void adc_power_acquire (void)
  - Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call adc_power_release when done using the ADC.
- void adc_power_release (void)
  - Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

esp_err_t adc1_pad_get_io_num (adc1_channel_t channel, gpio_num_t *gpio_num)

Get the GPIO number of a specific ADC1 channel.

Return
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters
- channel: Channel to get the GPIO number
- gpio_num: output buffer to hold the GPIO number

esp_err_t adc1_config_channel_atten (adc1_channel_t channel, adc_atten_t atten)

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.
Due to ADC characteristics, most accurate results are obtained within the suggested range shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>100 ~ 950</td>
</tr>
<tr>
<td></td>
<td>2.5</td>
<td>100 ~ 1250</td>
</tr>
<tr>
<td>ESP32</td>
<td>6</td>
<td>150 ~ 1750</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>150 ~ 2450</td>
</tr>
<tr>
<td>ESP32-S2</td>
<td>0</td>
<td>0 ~ 750</td>
</tr>
<tr>
<td></td>
<td>2.5</td>
<td>0 ~ 1050</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>0 ~ 1300</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>0 ~ 2500</td>
</tr>
</tbody>
</table>

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc1_config_width (adc_bits_width_t width_bit)
```
Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `width_bit`: Bit capture width for ADC1

```c
int adc1_get_raw (adc1_channel_t channel)
```
Take an ADC1 reading from a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ECO_and_Workarounds_for_Bugs_in_ESP32 for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

**Return**
- Parameter error
- Other: ADC1 channel reading.

**Parameters**
- channel: ADC1 channel to read

```c
esp_err_t adc_set_data_inv(adc_unit_t adc_unit, bool inv_en)
```
Set ADC data invert.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- adc_unit: ADC unit index
- inv_en: whether enable data invert

```c
esp_err_t adc_set_clk_div(uint8_t clk_div)
```
Set ADC source clock.

**Return**
- ESP_OK success

**Parameters**
- clk_div: ADC clock divider, ADC clock is divided from APB clock

```c
esp_err_t adc_set_data_width(adc_unit_t adc_unit, adc_bits_width_t width_bit)
```
Configure ADC capture width.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- adc_unit: ADC unit index
- width_bit: Bit capture width for ADC unit.

```c
void adc1_ulp_enable(void)
```
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using `adc1_get_raw()` function.

Note that `adc1_config_channel_atten, adc1_config_width()` functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

```c
esp_err_t adc2_pad_get_io_num(adc2_channel_t channel, gpio_num_t *gpio_num)
```
Get the GPIO number of a specific ADC2 channel.

**Return**
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

**Parameters**
- channel: Channel to get the GPIO number
- gpio_num: output buffer to hold the GPIO number

```c
esp_err_t adc2_config_channel_atten(adc2_channel_t channel, adc_atten_t atten)
```
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation</th>
<th>suggested range</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(dB)</td>
<td>(mV)</td>
</tr>
</tbody>
</table>

(continues on next page)
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

**Note** ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

**Parameters**
- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

```c
esp_err_t adc_vref_to_gpio(adc_unit_t adc_unit, gpio_num_t gpio)
```

Output ADC1 or ADC2’s reference voltage to ADC2’s channel’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.
Note ESP32 only supports output of ADC2’s internal reference voltage.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- [in] adc_unit: ADC unit index
- [in] gpio: GPIO number (Only ADC2’s channels IO are supported)

```c
esp_err_t adc2_vref_to_gpio (gpio_num_t gpio)
```

Output ADC2 reference voltage to adc2_channe_t’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- [in] gpio: GPIO number (ADC2’s channels are supported)

```c
esp_err_t adc_digi_initialize (const adc_digi_init_config_t *init_config)
```

Initialize the Digital ADC.

**Return**
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

**Parameters**
- init_config: Pointer to Digital ADC initialization config. Refer to adc_digi_init_config_t.

```c
esp_err_t adc_digi_read_bytes (uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)
```

Read bytes from Digital ADC through DMA.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

**Parameters**
- [out] buf: Buffer to read from ADC.
- [in] length_max: Expected length of data read from the ADC.
- [out] out_length: Real length of data read from the ADC via this API.
- [in] timeout_ms: Time to wait for data via this API, in millisecond.

```c
esp_err_t adc_digi_start (void)
```

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_digi_stop (void)
```

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

```c
esp_err_t adc_digi_deinititalize (void)
```

Deinitialize the Digital ADC.

**Return**
ESP_ERR_INVALID_STATE Driver state is invalid.
ESP_OK On success

`esp_err_t adc_digi_controller_configure(const adc_digi_configuration_t *config)`

Setting the digital controller.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

**Parameters**
- `config`: Pointer to digital controller paramter. Refer to `adc_digi_config_t`.

```c
int hall_sensor_read(void)
```

Read Hall Sensor.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

**Note** The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

**Note** The ADC1 module must be enabled by calling `adc1_config_width()` before calling `hall_sensor_read()`. ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

**Return** The hall sensor reading.

```c
esp_err_t adc_set_i2s_data_source(adc_i2s_source_t src)
```

Set I2S data source.

**Return**
- ESP_OK success

**Parameters**
- `src`: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

```c
esp_err_t adc_i2s_mode_init(adc_unit_t adc_unit, adc_channel_t channel)
```

Initialize I2S ADC mode.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `adc_unit`: ADC unit index
- `channel`: ADC channel index

**Structures**

```c
struct adc_digi_init_config_s
```

ADC DMA driver configuration.

**Public Members**

```c
uint32_t max_store_buf_size
```
Max length of the converted data that driver can store before they are processed.

```c
uint32_t conv_num_each_intr
```
Bytes of data that can be converted in 1 interrupt.

```c
uint32_t adc1_chan_mask
```
Channel list of ADC1 to be initialized.

```c
uint32_t adc2_chan_mask
```
Channel list of ADC2 to be initialized.
struct adc_digi_configuration_t
ADC digital controller settings.

Public Members

bool conv_limit_en
To limit ADC conversion times. Conversion stops after finishing conv_limit_num times conversion.

uint32_t conv_limit_num
Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32_t pattern_num
Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz Fs = Fd / interval / 2 Fs:
sampling frequency; Fd: digital controller frequency, no larger than 5M for better performance interval:
interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC
measurement period, the largest interval should not be larger than 4095

adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.

Macros

ADC_ATTEN_0db
ADC rtc controller attenuation option.

Note This definitions are only for being back-compatible

ADC_ATTEN_2_5db
ADC_ATTEN_6db
ADC_ATTEN_11db

ADC_WIDTH_BIT_DEFAULT
The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by
SOC_ADC_MAX_BITWIDTH defined in soc_caps.h.

ADC_WIDTH_9Bit
ADC_WIDTH_10Bit
ADC_WIDTH_11Bit
ADC_WIDTH_12Bit
ADC_MAX_DELAY
Digital ADC DMA read max timeout value, it may make the adc_digi_read_bytes block forever if the
OS supports.

Type Definitions
typedef struct adc_digi_init_config_s adc_digi_init_config_t
ADC DMA driver configuration.
Enumerations

```c
enum adc1_channel_t
{
    ADC1_CHANNEL_0 = 0,
    ADC1_CHANNEL_1,
    ADC1_CHANNEL_2,
    ADC1_CHANNEL_3,
    ADC1_CHANNEL_4,
    ADC1_CHANNEL_5,
    ADC1_CHANNEL_6,
    ADC1_CHANNEL_7,
    ADC1_CHANNEL_MAX
};
```

Values:
- ADC1_CHANNEL_0 = 0
  - ADC1 channel 0 is GPIO36
- ADC1_CHANNEL_1
  - ADC1 channel 1 is GPIO37
- ADC1_CHANNEL_2
  - ADC1 channel 2 is GPIO38
- ADC1_CHANNEL_3
  - ADC1 channel 3 is GPIO39
- ADC1_CHANNEL_4
  - ADC1 channel 4 is GPIO32
- ADC1_CHANNEL_5
  - ADC1 channel 5 is GPIO33
- ADC1_CHANNEL_6
  - ADC1 channel 6 is GPIO34
- ADC1_CHANNEL_7
  - ADC1 channel 7 is GPIO35
- ADC1_CHANNEL_MAX

```c
enum adc2_channel_t
{
    ADC2_CHANNEL_0 = 0,
    ADC2_CHANNEL_1,
    ADC2_CHANNEL_2,
    ADC2_CHANNEL_3,
    ADC2_CHANNEL_4,
    ADC2_CHANNEL_5,
    ADC2_CHANNEL_6,
    ADC2_CHANNEL_7,
    ADC2_CHANNEL_8,
    ADC2_CHANNEL_9,
    ADC2_CHANNEL_MAX
};
```

Values:
- ADC2_CHANNEL_0 = 0
  - ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)
- ADC2_CHANNEL_1
  - ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)
- ADC2_CHANNEL_2
  - ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)
- ADC2_CHANNEL_3
  - ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)
- ADC2_CHANNEL_4
  - ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)
- ADC2_CHANNEL_5
  - ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)
- ADC2_CHANNEL_6
  - ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)
- ADC2_CHANNEL_7
  - ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)
- ADC2_CHANNEL_8
  - ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)
- ADC2_CHANNEL_9
  - ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)
- ADC2_CHANNEL_MAX

```c
enum adc_i2s_encode_t
{
    ADC_I2S_ENCODE_A,  \ ADC digital controller encode option.
    ADC_I2S_ENCODE_B,
    ADC_I2S_ENCODE_MAX
};
```

Values:
### ADC_ENCODE_12BIT
ADC to DMA data format, [15:12]-channel [11:0]-12 bits ADC data

### ADC_ENCODE_11BIT
ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data

### ADC_ENCODE_MAX

---

**Header File**

- components/hal/include/hal/adc_types.h

**Structures**

```c
struct adc_digi_pattern_config_t
ADC digital controller pattern configuration.
```

**Public Members**

```c
uint8_t atten
Attenuation of this ADC channel.
```

```c
uint8_t channel
ADC channel.
```

```c
uint8_t unit
ADC unit.
```

```c
uint8_t bit_width
ADC output bit width.
```

```c
struct adc_digi_output_data_t
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.
```

**Note**

ESP32: Only type1 is valid. ADC2 does not support DMA mode.

ESP32-S2: Member `channel` can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

**Public Members**

```c
uint16_t data : 12
ADC real output data info. Resolution: 12 bit.
```

```c
ADC real output data info. Resolution: 11 bit.
```

```c
uint16_t channel : 4
ADC channel index info.
```

ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

```c
uint16_t unit : 1
ADC unit index info. 0: ADC1; 1: ADC2.
```

```c
struct adc_digi_output_data_t::[anonymous]::[anonymous]::[anonymous] type2
When the configured output format is 11bit. ADC_DIGI_FORMAT_11BIT
```

```c
uint16_t val
Raw data value
```
Enumerations

enum adc_unit_t
ADC unit enumeration.

Note For ADC digital controller (DMA mode), ESP32 doesn’t support ADC_UNIT_2, ADC_UNIT_BOTH, ADC_UNIT_ALTER.

Values:

ADC_UNIT_1 = 1
SAR ADC 1.

ADC_UNIT_2 = 2
SAR ADC 2.

ADC_UNIT_BOTH = 3
SAR ADC 1 and 2.

ADC_UNIT_ALTER = 7
SAR ADC 1 and 2 alternative mode.

ADC_UNIT_MAX

enum adc_channel_t
ADC channels handle. See adc1_channel_t, adc2_channel_t.

Note For ESP32 ADC1, don’t use ADC_CHANNEL_8, ADC_CHANNEL_9. See adc1_channel_t.

Values:

ADC_CHANNEL_0 = 0
ADC channel

ADC_CHANNEL_1
ADC channel

ADC_CHANNEL_2
ADC channel

ADC_CHANNEL_3
ADC channel

ADC_CHANNEL_4
ADC channel

ADC_CHANNEL_5
ADC channel

ADC_CHANNEL_6
ADC channel

ADC_CHANNEL_7
ADC channel

ADC_CHANNEL_8
ADC channel

ADC_CHANNEL_9
ADC channel

ADC_CHANNEL_MAX

enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC. See adc1_config_channel_atten.

Values:

ADC_ATTEN_DB_0 = 0
No input attenuation, ADC can measure up to approx. 800 mV.
ADC_ATTEN_DB_2_5 = 1
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

ADC_ATTEN_DB_6 = 2
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

ADC_ATTEN_DB_11 = 3
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

ADC_ATTEN_MAX

enum adc_bits_width_t
ADC resolution setting option.

Note Only used in single read mode

Values:
ADC_WIDTH_BIT_9 = 0
ADC capture width is 9Bit.

ADC_WIDTH_BIT_10 = 1
ADC capture width is 10Bit.

ADC_WIDTH_BIT_11 = 2
ADC capture width is 11Bit.

ADC_WIDTH_BIT_12 = 3
ADC capture width is 12Bit.

ADC_WIDTH_MAX

enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.

Values:
ADC_CONV_SINGLE_UNIT_1 = 1
Only use ADC1 for conversion.

ADC_CONV_SINGLE_UNIT_2 = 2
Only use ADC2 for conversion.

ADC_CONV_BOTH_UNIT = 3
Use Both ADC1 and ADC2 for conversion simultaneously.

ADC_CONV_ALTER_UNIT = 7
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

ADC_CONV_UNIT_MAX

enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.

Values:
ADC_DIGI_FORMAT_12BIT
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (adc_digi_output_data_t). Note: For single convert mode.

ADC_DIGI_FORMAT_11BIT
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (adc_digi_output_data_t). Note: For multi or alter convert mode.

ADC_DIGI_FORMAT_MAX

ADC_DIGI_OUTPUT_FORMAT_TYPE1
See adc_digi_output_data_t.type1
ADC_DIGI_OUTPUT_FORMAT_TYPE2

See adc_digi_output_data_t.type2

enum adc_i2s_source_t

ESP32 ADC DMA source selection.

Values:

ADC_I2S_DATA_SRC_IO_SIG = 0
I2S data from GPIO matrix signal

ADC_I2S_DATA_SRC_ADC = 1
I2S data from ADC

ADC_I2S_DATA_SRC_MAX

ADC Calibration

Header File

components/esp_adc_cal/include/esp_adc_cal.h

Functions

esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

Note in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

Return

• ESP_OK: The calibration mode is supported in eFuse
• ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
• ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

Parameters

• value_type: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten,
adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \[y = \text{coeff}_a \times x + \text{coeff}_b\]. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

Note For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig.
For ESP32S2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

Return

• ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
• ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
• ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

Parameters

• [in] adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
• [in] atten: Attenuation to characterize
• [in] bit_width: Bit width configuration of ADC
• [in] default_vref: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
• [out] chars: Pointer to empty structure used to store ADC characteristics

```c
uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)
```

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

**Note** Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return** Voltage in mV

**Parameters**
• [in] adc_reading: ADC reading
• [in] chars: Pointer to initialized structure containing ADC characteristics

```c
esp_err_t esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)
```

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return**
• ESP_OK: ADC read and converted to mV
• ESP_ERR_INVALID_ARG: Error due to invalid arguments
• ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

**Parameters**
• [in] channel: ADC Channel to read
• [in] chars: Pointer to initialized ADC characteristics structure
• [out] voltage: Pointer to store converted voltage

**Structures**

```c
struct esp_adc_cal_characteristics_t
```

Structure storing characteristics of an ADC.

**Note** Call esp_adc_cal_characterize() to initialize the structure

**Public Members**

```c
adc_unit_t adc_num
```

ADC number

```c
adc_atten_t atten
```

ADC attenuation

```c
adc_bits_width_t bit_width
```

ADC bit width

```c
uint32_t coeff_a
```

Gradient of ADC-Voltage curve

```c
uint32_t coeff_b
```

Offset of ADC-Voltage curve

```c
uint32_t vref
```

Vref used by lookup table

```c
const uint32_t *low_curve
```

Pointer to low Vref curve of lookup table (NULL if unused)
const uint32_t *high_curve
    Pointer to high Vref curve of lookup table (NULL if unused)

uint8_t version
    ADC Calibration

Enumerations
enum esp_adc_cal_value_t
    Type of calibration value used in characterization.

Values:
    ESP_ADC_CAL_VAL_EFUSE_VREF = 0
        Characterization based on reference voltage stored in eFuse
    ESP_ADC_CAL_VAL_EFUSE_TP = 1
        Characterization based on Two Point values stored in eFuse
    ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
        Characterization based on default reference voltage
    ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3
        Characterization based on Two Point values and fitting curve coefficients stored in eFuse

ESP_ADC_CAL_VAL_MAX

ESP_ADC_CAL_VAL_NOT_SUPPORTED = ESP_ADC_CAL_VAL_MAX

Chapter 2. API Reference

2.3.2 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data by the digital controller, via the I2S driver when using the “built-in DAC mode”.

For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

Application Example

Setting DAC channel 1 (GPIO25) voltage to approx 0.78 of VDD_A voltage (VDD * 200/255). For VDD_A 3.3V, this is 2.59V:

```c
#include <driver/dac.h>
...
dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```
API Reference

Header File

- components/driver.esp32/include/driver/dac.h

Functions

```c
esp_err_t dac_i2s_enable (void)

Enable DAC output data from I2S.
```

Return

- ESP_OK success

```c
esp_err_t dac_i2s_disable (void)

Disable DAC output data from I2S.
```

Return

- ESP_OK success

Header File

- components/driver/include/driver/dac_common.h

Functions

```c
esp_err_t dac_pad_get_io_num (dac_channel_t channel, gpio_num_t *gpio_num)

Get the GPIO number of a specific DAC channel.
```

Return

- ESP_OK if success

Parameters

- channel: Channel to get the gpio number
- gpio_num: output buffer to hold the gpio number

```c
esp_err_t dac_output_voltage (dac_channel_t channel, uint8_t dac_value)

Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.
```

Note

Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

Return

- ESP_OK success

Parameters

- channel: DAC channel
- dac_value: DAC output value

```c
esp_err_t dac_output_enable (dac_channel_t channel)

DAC pad output enable.
```

Note

DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

Parameters

- channel: DAC channel

```c
esp_err_t dac_output_disable (dac_channel_t channel)

DAC pad output disable.
```

Note

DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

Return

- ESP_OK success

Parameters

- channel: DAC channel

```c
esp_err_t dac_cw_generator_enable (void)

Enable cosine wave generator output.
```
Return

- ESP_OK success

```c
esp_err_t dac_cw_generator_disable (void)
```

Disable cosine wave generator output.

Return

- ESP_OK success

```c
esp_err_t dac_cw_generator_config (dac_config_t *cw)
```

Config the cosine wave generator function in DAC module.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG The parameter is NULL.

**Parameters**

- cw: Configuration.

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. `DAC_CHANNEL_1_GPIO_NUM` is the GPIO number of channel 1 (GPIO25);
2. `DAC_GPIO26_CHANNEL` is the channel number of GPIO 26 (channel 2).

**Header File**

- `components/soc/esp32/include/soc/dac_channel.h`

**Macros**

- `DAC_GPIO25_CHANNEL`
- `DAC_CHANNEL_1_GPIO_NUM`
- `DAC_GPIO26_CHANNEL`
- `DAC_CHANNEL_2_GPIO_NUM`

**Header File**

- `components/hal/include/hal/dac_types.h`

**Structures**

```c
struct dac_cw_config_t
```

Config the cosine wave generator function in DAC module.

**Public Members**

```c
dac_channel_t en_ch
```

Enable the cosine wave generator of DAC channel.

```c
dac_cw_scale_t scale
```

Set the amplitude of the cosine wave generator output.

```c
dac_cw_phase_t phase
```

Set the phase of the cosine wave generator output.

```c
uint32_t freq
```

Set frequency of cosine wave generator output. Range: 130(130Hz) ~ 55000(100KHz).
int8_t offset
Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

Enumerations
enum dac_channel_t
Values:

\[
\begin{align*}
\text{DAC\_CHANNEL\_1} & = 0 \\
\text{DAC\_CHANNEL\_2} & = 1 \\
\text{DAC\_CHANNEL\_MAX} & = \max
\end{align*}
\]
DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)
DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)

enum dac_cw_scale_t
The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.
Values:

\[
\begin{align*}
\text{DAC\_CW\_SCALE\_1} & = 0x0 \\
\text{DAC\_CW\_SCALE\_2} & = 0x1 \\
\text{DAC\_CW\_SCALE\_4} & = 0x2 \\
\text{DAC\_CW\_SCALE\_8} & = 0x3
\end{align*}
\]
1/1. Default.
1/2.
1/4.
1/8.

enum dac_cw_phase_t
Set the phase of the cosine wave generator output.
Values:

\[
\begin{align*}
\text{DAC\_CW\_PHASE\_0} & = 0x2 \\
\text{DAC\_CW\_PHASE\_180} & = 0x3
\end{align*}
\]
Phase shift +0°
Phase shift +180°

2.3.3 General Purpose Timer

Introduction
The ESP32 chip contains two hardware timer groups. Each group has two general-purpose hardware timer(s). They are all 64-bit generic timers based on 16-bit pre-scalers and 64-bit up / down counters which are capable of being auto-reloaded.

Functional Overview
The following sections of this document cover the typical steps to configure and operate a timer:

- **Timer Initialization** - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.
- **Timer Control** - describes how to read a timer’s value, pause or start a timer, and change how it operates.
- **Alarms** - shows how to set and use alarms.
- **Interrupts** - explains how to use interrupt callbacks.
**Timer Initialization**  The two ESP32 timer groups, with two timer(s) in each, provide the total of four individual timers for use. An ESP32 timer group should be identified using `timer_group_t`. An individual timer in a group should be identified with `timer_idx_t`.

First of all, the timer should be initialized by calling the function `timer_init()` and passing a structure `timer_config_t` to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Divider**: Sets how quickly the timer’s counter is “ticking”. The setting divider is used as a divisor of the clock source that by default is APB_CLK running at 80 MHz. For more information of APB_CLK frequency, please check [ESP32 Technical Reference Manual > Reset and Clock [PDF]](https://doc.espressif.com/espressif/systems/esp32-technical-reference-manual#reset-and-clock-pdf) chapter for more details.
- **Mode**: Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.
- **Counter Enable**: If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.
- **Alarm Enable**: Can be set using `alarm_en`.
- **Auto Reload**: Sets if the counter should auto_reload the initial counter value on the timer’s alarm or continue incrementing or decrementing.

To get the current values of the timer’s settings, use the function `timer_get_config()`.

**Timer Control**  Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to true, or call `timer_start()`. You can specify the timer’s initial counter value by calling `timer_set_counter_value()`. To check the timer’s current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.

To reconfigure the timer, you can call `timer_init()`. This function is described in Section **Timer Initialization**.

You can also reconfigure the timer by using dedicated functions to change individual settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Dedicated Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divider</td>
<td><code>timer_set_divider()</code></td>
<td>Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.</td>
</tr>
<tr>
<td>Mode</td>
<td><code>timer_set_counter_mode()</code></td>
<td>Set if the counter should be incrementing or decrementing</td>
</tr>
<tr>
<td>Auto Reload</td>
<td><code>timer_set_auto_reload()</code></td>
<td>Set if the initial counter value should be reloaded on the timer’s alarm</td>
</tr>
</tbody>
</table>

**Alarms**  To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:

- An interrupt will be triggered if previously configured. See Section **Interrupts** on how to configure interrupts.
- When auto_reload is enabled, the timer’s counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with `timer_set_counter_value()`.

**Note:**

- If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.
- Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.

To check the specified alarm value, call `timer_get_alarm_value()`.
Interrupts  Registration of an interrupt callback for a specific timer can be done by calling `timer_isr_callback_add()` and passing in the group ID, timer ID, callback handler and user data. The callback handler will be invoked in ISR context, so user shouldn’t put any blocking API in the callback function. The benefit of using interrupt callback instead of precessing interrupt from scratch is, you don’t have to deal with interrupt status check and clean stuffs, they are all addressed before the callback got run in driver’s default interrupt handler.

For more information on how to use interrupts, please see the application example below.

Application Example

The 64-bit hardware timer example: `peripherals/timer_group`.

API Reference

Header File

- `components/driver/include/driver/timer.h`

Functions

```c
esp_err_t timer_get_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)
```

Read the counter value of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- `timer_val`: Pointer to accept timer counter value.

```c
esp_err_t timer_get_counter_time_sec(timer_group_t group_num, timer_idx_t timer_num, double *time)
```

Read the counter value of hardware timer, in unit of a given scale.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- `time`: Pointer, type of double*, to accept timer counter value, in seconds.

```c
esp_err_t timer_set_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t load_val)
```

Set counter value to hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- `load_val`: Counter value to write to the hardware timer.

```c
esp_err_t timer_start(timer_group_t group_num, timer_idx_t timer_num)
```

Start the counter of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_pause(timer_group_t group_num, timer_idx_t timer_num)
```

Pause the counter of hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_set_counter_mode(timer_group_t group_num, timer_idx_t timer_num, timer_count_dir_t counter_dir)
```

Set counting mode for hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **counter_dir**: Counting direction of timer, count-up or count-down

```c
esp_err_t timer_set_auto_reload(timer_group_t group_num, timer_idx_t timer_num, timer_autoreload_t reload)
```

Enable or disable counter reload function when alarm event occurs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **reload**: Counter reload mode.

```c
esp_err_t timer_set_divider(timer_group_t group_num, timer_idx_t timer_num, uint32_t divider)
```

Set hardware divider of the source clock to the timer group. By default, the source clock is APB clock running at 80 MHz. For more information, please check Chapter Reset and Clock in Chip Technical Reference Manual.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **divider**: Timer clock divider value. The divider’s range is from from 2 to 65536.

```c
esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)
```

Set timer alarm value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value**: A 64-bit value to set the alarm value.

```c
esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)
```

Get timer alarm value.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_value: Pointer of A 64-bit value to accept the alarm value.

```c
esp_err_t timer_set_alarm(uint8_t group_num, uint8_t timer_num, timer_alarm_t alarm_en)
```
Enable or disable generation of timer alarm events.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_en: To enable or disable timer alarm function.

```c
esp_err_t timer_isr_callback_add(timer_group_t group_num, timer_idx_t timer_num, timer_isr_t isr_handler, void* arg, int intr_alloc_flags)
```
Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

Note This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call timer_isr_register(…) to register ISR.

Parameters
• group_num: Timer group number
• timer_num: Timer index of timer group
• isr_handler: Interrupt handler function, it is a callback function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t timer_isr_callback_remove(timer_group_t group_num, timer_idx_t timer_num)
```
Remove ISR handle callback for the corresponding timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t timer_isr_register(timer_group_t group_num, timer_idx_t timer_num, void (*fn)(void*))
```
Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

Note If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call timer_spinlock_take(…) before your handling, and call timer_spinlock_give(…) after your handling.
Parameters

- group_num: Timer group number
- timer_num: Timer index of timer group
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\[ \text{esp_err_t timer_init}( \text{timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config} ) \]

Initializes and configures the timer.

Parameters

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- config: Pointer to timer initialization parameters.

\[ \text{esp_err_t timer_deinit}( \text{timer_group_t group_num, timer_idx_t timer_num} ) \]

Deinitializes the timer.

Parameters

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

\[ \text{esp_err_t timer_get_config}( \text{timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config} ) \]

Get timer configuration value.

Parameters

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- config: Pointer of struct to accept timer parameters.

\[ \text{esp_err_t timer_group_intr_enable}( \text{timer_group_t group_num, timer_intr_t intr_mask} ) \]

Enable timer group interrupt, by enable mask.

Parameters

- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- intr_mask: Timer interrupt enable mask.
  - TIMER_INTR_T0: t0 interrupt
  - TIMER_INTR_T1: t1 interrupt
  - TIMER_INTR_WDT: watchdog interrupt

\[ \text{esp_err_t timer_group_intr_disable}( \text{timer_group_t group_num, timer_intr_t intr_mask} ) \]

Disable timer group interrupt, by disable mask.

Return

- ESP_OK Success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- intr_mask: Timer interrupt disable mask.
  - TIMER_INTR_T0: t0 interrupt
  - TIMER_INTR_T1: t1 interrupt
  - TIMER_INTR_WDT: watchdog interrupt

`esp_err_t timer_enable_intr(timer_group_t group_num, timer_idx_t timer_num)`
Enable timer interrupt.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index.

`esp_err_t timer_disable_intr(timer_group_t group_num, timer_idx_t timer_num)`
Disable timer interrupt.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index.

`void timer_group_intr_clr_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Clear timer interrupt status, just used in ISR.

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index.

`void timer_group_clr_intr_status_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Clear timer interrupt status, just used in ISR.

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index.

`void timer_group_enable_alarm_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Enable alarm interrupt, just used in ISR.

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index.

`uint64_t timer_group_get_counter_value_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Get the current counter value, just used in ISR.

Return
- Counter value

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index.

`void timer_group_set_alarm_value_in_isr(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_val)`
Set the alarm threshold for the timer, just used in ISR.

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.
• alarm_val: Alarm threshold.

```c
void timer_group_set_counter_enable_in_isr(timer_group_t group_num, timer_idx_t timer_num, timer_start_t counter_en)
```
Enable/disable a counter, just used in ISR.

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.
- `counter_en`: Enable/disable.

```c
timer_intr_t timer_group_intr_get_in_isr(timer_group_t group_num)
```
Get the masked interrupt status, just used in ISR.

**Return**
- Interrupt status

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

```c
uint32_t timer_group_get_intr_status_in_isr(timer_group_t group_num)
```
Get interrupt status, just used in ISR.

**Return**
- Interrupt status

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

```c
void timer_group_clr_intr_sta_in_isr(timer_group_t group_num, timer_intr_t intr_mask)
```
Clear the masked interrupt status, just used in ISR.

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `intr_mask`: Masked interrupt.

```c
bool timer_group_get_auto_reload_in_isr(timer_group_t group_num, timer_idx_t timer_num)
```
Get auto reload enable status, just used in ISR.

**Return**
- True Auto reload enabled
- False Auto reload disabled

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index

```c
esp_err_t timer_spinlock_take(timer_group_t group_num)
```
Take timer spinlock to enter critical protect.

**Note** Deprecated, the recommended way is to use ISR callbacks instead, see timer_group_example_main

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

```c
esp_err_t timer_spinlock_give(timer_group_t group_num)
```
Give timer spinlock to exit critical protect.

**Note** Deprecated, the recommended way is to use ISR callbacks instead, see timer_group_example_main

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
Chapter 2. API Reference

Macros

**TIMER_BASE_CLK**
Frequency of the clock on the input of the timer groups

Type Definitions

typedef bool (*timer_isr_t)(void *)

Interrupt handle callback function. User need to rerun a bool value in callback.

Return
- True Do task yield at the end of ISR
- False Not do task yield at the end of ISR

Note If you called FreeRTOS functions in callback, you need to return true or false based on the return value of argument pxHigherPriorityTaskWoken. For example, xQueueSendFromISR is called in callback, if the return value pxHigherPriorityTaskWoken of any FreeRTOS calls is pdTRUE, return true; otherwise return false.

typedef intr_handle_t timer_isr_handle_t

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

Header File

- components/hal/include/hal/timer_types.h

Structures

struct timer_config_t
Data structure with timer’s configuration settings.

Public Members

timer_alarm_t alarm_en
Timer alarm enable

timer_start_t counter_en
Counter enable

timer_intr_mode_t intr_type
Interrupt mode

timer_count_dir_t counter_dir
Counter direction

timer_autoreload_t auto_reload
Timer auto-reload

uint32_t divider
Counter clock divider. The divider’s range is from 2 to 65536.

Enumerations

enum timer_group_t
Selects a Timer-Group out of 2 available groups.

Values:

- TIMER_GROUP_0 = 0
  Hw timer group 0
- TIMER_GROUP_1 = 1
  Hw timer group 1
- TIMER_GROUP_MAX
enum timer_idx_t
   Select a hardware timer from timer groups.
   Values:
   
   TIMER_0 = 0
      Select timer0 of GROUPx
   TIMER_1 = 1
      Select timer1 of GROUPx
   TIMER_MAX

enum timer_count_dir_t
   Decides the direction of counter.
   Values:
   
   TIMER_COUNT_DOWN = 0
      Descending Count from cnt.high|cnt.low
   TIMER_COUNT_UP = 1
      Ascending Count from Zero
   TIMER_COUNT_MAX

enum timer_start_t
   Decides whether timer is on or paused.
   Values:
   
   TIMER_PAUSE = 0
      Pause timer counter
   TIMER_START = 1
      Start timer counter

enum timer_intr_t
   Interrupt types of the timer.
   Values:
   
   TIMER_INTR_T0 = BIT(0)
      interrupt of timer 0
   TIMER_INTR_T1 = BIT(1)
      interrupt of timer 1
   TIMER_INTR_WDT = BIT(2)
      interrupt of watchdog
   TIMER_INTR_NONE = 0

enum timer_alarm_t
   Decides whether to enable alarm mode.
   Values:
   
   TIMER_ALARM_DIS = 0
      Disable timer alarm
   TIMER_ALARM_EN = 1
      Enable timer alarm
   TIMER_ALARM_MAX

enum timer_intr_mode_t
   Select interrupt type if running in alarm mode.
   Values:
**Chapter 2. API Reference**

**TIMER_INTR_LEVEL = 0**
Interrupt mode: level mode

**TIMER_INTR_MAX**

```c
enum timer_autoreload_t
```
Select if Alarm needs to be loaded by software or automatically reload by hardware.

**Values:**

**TIMER_AUTORELOAD_DIS = 0**
Disable auto-reload: hardware will not load counter value after an alarm event

**TIMER_AUTORELOAD_EN = 1**
Enable auto-reload: hardware will load counter value after an alarm event

**TIMER_AUTORELOAD_MAX**

### 2.3.4 GPIO & RTC GPIO

**Overview**

The ESP32 chip features 34 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF]*.

Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal. The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

Note:

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to ESP32 datasheet.
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you’re using Wi-Fi and you’re having trouble getting the value from an ADC2 GPIO, you may consider using an ADC1 GPIO instead, that should solve your problem. For more details, please refer to ADC limitations.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep
- The Ultra Low Power co-processor is running
- Analog functions such as ADC/DAC/etc are in use.

Application Example

GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

API Reference - Normal GPIO

Header File

- components/driver/include/driver/gpio.h

Functions

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
```

GPIO common configuration.

- Configure GPIO’s Mode, pull-up, pull-down, IntrType

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin (gpio_num_t gpio_num)
```

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.
Return Always return ESP_OK.

Parameters

- **gpio_num**: GPIO number.

`esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)`
GPIO set interrupt trigger type.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **gpio_num**: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **intr_type**: Interrupt type, select from gpio_int_type_t

`esp_err_t gpio_intr_enable(gpio_num_t gpio_num)`
Enable GPIO module interrupt signal.

Note Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **gpio_num**: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_intr_disable(gpio_num_t gpio_num)`
Disable GPIO module interrupt signal.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **gpio_num**: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)`
GPIO set output level.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

Parameters

- **gpio_num**: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **level**: Output level. 0: low; 1: high

`int gpio_get_level(gpio_num_t gpio_num)`
GPIO get input level.

Warning If the pad is not configured for input (or input and output) the returned value is always 0.

Return

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

Parameters

- **gpio_num**: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

`esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)`
GPIO set direction.
Configure GPIO direction, such as output_only, input_only, output_and_input

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO error

Parameters
• gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• mode: GPIO direction

\texttt{esp_err_t gpio_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)}

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG: Parameter error

Parameters
• gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• pull: GPIO pull up/down mode.

\texttt{esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)}

Enable GPIO wake-up function.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number.
• intr_type: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

\texttt{esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)}

Disable GPIO wake-up function.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

\texttt{esp_err_t gpio_isr_register (void (*fn) (void *arg), void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle)}

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the \texttt{interrupt allocation functions}.

Parameters
• fn: Interrupt handler function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO error
• ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
Chapter 2. API Reference

```c
esp_err_t gpio_pullup_en (gpio_num_t gpio_num)
    Enable pull-up on GPIO.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • gpio_num: GPIO number

esp_err_t gpio_pullup_dis (gpio_num_t gpio_num)
    Disable pull-up on GPIO.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • gpio_num: GPIO number

esp_err_t gpio_pulldown_en (gpio_num_t gpio_num)
    Enable pull-down on GPIO.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • gpio_num: GPIO number

esp_err_t gpio_pulldown_dis (gpio_num_t gpio_num)
    Disable pull-down on GPIO.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • gpio_num: GPIO number
```

```c
esp_err_t gpio_install_isr_service (int intr_alloc_flags)
    Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

    This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered
    for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin
    handlers are registered via the gpio_isr_handler_add() function.

    Return
    • ESP_OK Success
    • ESP_ERR_NO_MEM No memory to install this service
    • ESP_ERR_INVALID_STATE ISR service already installed.
    • ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
    • ESP_ERR_INVALID_ARG GPIO error

    Parameters
    • intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred)
      ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

void gpio_uninstall_isr_service (void)
    Uninstall the driver’s GPIO ISR service, freeing related resources.

esp_err_t gpio_isr_handler_add (gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
    Add ISR handler for the corresponding GPIO pin.

    Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

    The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the
    ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().
```
This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number
- isr_handler: ISR handler function for the corresponding GPIO number.
- args: parameter for ISR handler.

```c
esp_err_t gpio_isr_handler_remove (gpio_num_t gpio_num)
```
Remove ISR handler for the corresponding GPIO pin.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number

```c
esp_err_t gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
```
Set GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

```c
esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```
Get GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

```c
esp_err_t gpio_hold_en (gpio_num_t gpio_num)
```
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled in output mode: the output level of the pad will be force locked and cannot be changed. In input mode: the input value read will not change, regardless of the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

Return
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
- gpio_num: GPIO number, only support output-capable GPIOs

```c
esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
```
Disable gpio pad hold function.
When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and gpio_hold_dis is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling gpio_hold_dis.

Return

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
- gpio_num: GPIO number, only support output-capable GPIOs

void gpio_deep_sleep_hold_en (void)
Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call gpio_hold_dis will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void gpio_deep_sleep_hold_dis (void)
Disable all digital gpio pad hold function during Deep-sleep.

void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
Set pad input to a peripheral signal through the IOMUX.

Parameters
- gpio_num: GPIO number of the pad.
- signal_idx: Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
Set peripheral output to an GPIO pad through the IOMUX.

Parameters
- gpio_num: gpio_num GPIO number of the pad.
- func: The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- oen_inv: True if the output enable needs to be inverted, otherwise False.

esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)
Enable SLP_SEL to change GPIO status automatically in lightsleep.

Return

- ESP_OK Success

Parameters
- gpio_num: GPIO number of the pad.

esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)
Disable SLP_SEL to change GPIO status automatically in lightsleep.

Return

- ESP_OK Success

Parameters
- gpio_num: GPIO number of the pad.

esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
GPIO set direction at sleep.

Configure GPIO direction, such as output_only,input_only,output_and_input

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO error

Parameters
• gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• mode: GPIO direction

`espr_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)`
Configure GPIO pull-up/pull-down resistors at sleep.
Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG: Parameter error

Parameters
• gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• pull: GPIO pull up/down mode.

Macros
`GPIO_PIN_COUNT`  
`GPIO_IS_VALID_GPIO (gpio_num)`  
Check whether it is a valid GPIO number.

`GPIO_IS_VALID_OUTPUT_GPIO (gpio_num)`  
Check whether it can be a valid GPIO number of output mode.

Type Definitions
`typedef intr_handle_t gpio_isr_handle_t`

Header File
• components/hal/include/hal/gpio_types.h

Structures
`struct gpio_config_t`  
Configuration parameters of GPIO pad for gpio_config function.

Public Members
`uint64_t pin_bit_mask`  
GPIO pin: set with bit mask, each bit maps to a GPIO

`gpio_mode_t mode`  
GPIO mode: set input/output mode

`gpio_pullup_t pull_up_en`  
GPIO pull-up

`gpio_pulldown_t pull_down_en`  
GPIO pull-down

GPIO_DRIVE_CAP_MAX

API Reference - RTC GPIO

Header File

- components/driver/include/driver/rtc_io.h

Functions

static bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)
Determine if the specified GPIO is a valid RTC GPIO.

Return true if GPIO is valid for RTC GPIO use. false otherwise.

Parameters

- gpio_num: GPIO number

static int rtc_io_number_get (gpio_num_t gpio_num)
Get RTC IO index number by gpio number.

Return >=0: Index of rtcio. -1: The gpio is not rtcio.

Parameters

- gpio_num: GPIO number

esp_err_t rtc_gpio_init (gpio_num_t gpio_num)
Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)
Init a GPIO as digital GPIO.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

- gpio_num: GPIO number (e.g. GPIO_NUM_12)

uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)
Get the RTC IO input level.
Return

• 1 High level
• 0 Low level
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_set_level(gpio_num_t gpio_num, uint32_t level)`
Set the RTC IO output level.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• level: output level

`esp_err_t rtc_gpio_set_direction(gpio_num_t gpio_num, rtc_gpio_mode_t mode)`
RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction

`esp_err_t rtc_gpio_set_direction_in_sleep(gpio_num_t gpio_num, rtc_gpio_mode_t mode)`
RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction

`esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)`
RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters

• gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)`
RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
**• gpio_num**: GPIO number (e.g. GPIO_NUM_12)

### esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)
RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

### esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)
RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

### esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set RTC GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

### esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get RTC GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

### esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)
Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

### esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)
Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

**Return**
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```c
esp_err_t rtc_gpio_isolate (gpio_num_t gpio_num)
```

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12).

```c
esp_err_t rtc_gpio_force_hold_all (void)
```

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

```c
esp_err_t rtc_gpio_force_hold_dis_all (void)
```

Disable force hold signal for all RTC IOs.

```c
esp_err_t rtc_gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

Enable wakeup from sleep mode using specific GPIO.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

Parameters
- gpio_num: GPIO number
- intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

```c
esp_err_t rtc_gpio_wakeup_disable (gpio_num_t gpio_num)
```

Disable wakeup from sleep mode using specific GPIO.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

Parameters
- gpio_num: GPIO number

Macros

```c
RTC_GPIO_IS_VALID_GPIO (gpio_num)
```

Header File

- components/hal/include/hal/rtc_io_types.h

Enumerations

```c
enum rtc_gpio_mode_t
```

RTCCIO output/input mode type.

Values:
2.3.5 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32 has two I2C controllers (also referred to as ports) which are responsible for handling communications on the I2C bus. Each I2C controller can operate as master or slave. As an example, one controller can act as a master and the other as a slave at the same time.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends
Configuration  To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C mode of operation - slave or master from `i2c_mode_t`
- Configure communication pins
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32’s internal pull-ups
- (Master only) Set I2C clock speed
- (Slave only) Configure the following
  - Whether to enable 10 bit address mode
  - Define slave address

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```c
int i2c_master_port = 0;

i2c_config_t conf = {
  .mode = I2C_MODE_MASTER,
  .sda_io_num = I2C_MASTER_SDA_IO, // select GPIO specific to your project
  .sda_pullup_en = GPIO_PULLUP_ENABLE,
  .scl_io_num = I2C_MASTER_SCL_IO, // select GPIO specific to your project
  .scl_pullup_en = GPIO_PULLUP_ENABLE,
  .master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your project
  // .clk_flags = 0, /*!< Optional, you can use I2C_SCLK_SRC_FLAG_* flags to choose i2c source clock here. */
};
```

Configuration example (slave):

```c
int i2c_slave_port = I2C_SLAVE_NUM;

i2c_config_t conf_slave = {
  .sda_io_num = I2C_SLAVE_SDA_IO, // select GPIO specific to your project
  .sda_pullup_en = GPIO_PULLUP_ENABLE,
  .scl_io_num = I2C_SLAVE_SCL_IO, // select GPIO specific to your project
  .scl_pullup_en = GPIO_PULLUP_ENABLE,
  .mode = I2C_MODE_SLAVE,
  .slave.addr_10bit_en = 0,
  .slave.slave_addr = ESP_SLAVE_ADDR, // address of your project
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see Customized Configuration.

Source Clock Configuration  Clock sources allocator is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

Note: A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities are not supported.
(clk_flags) is 0 in the clock’s capabilities.

Table 2: Characteristics of ESP32 clock sources

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock frequency</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>APB clock</td>
<td>80 MHz</td>
<td>4 MHz</td>
<td>/</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock’s baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32, reading technical reference manual before using it.

Note: The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

Install Driver  
After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in `esp_hw_support/include/esp_intr_alloc.h`)

Communication as Master  
After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

ESP32’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

Master Write  
The example below shows how to build a command link for an I2C master to send n bytes to a slave.

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`. Then, populate it with the series of data to be sent to the slave:
   a) Start bit - `i2c_master_start()`
   b) Slave address - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
   c) Data - One or more bytes as an argument of `i2c_master_write()`
   d) Stop bit - `i2c_master_stop()`

   Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.
Master Read  The example below shows how to build a command link for an I2C master to read \( n \) bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

Indicating Write or Read  After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address \((\text{ESP_SLAVE_ADDR} << 1) | \text{I2C_MASTER_WRITE}\) and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);

Communication as Slave  After installing the I2C driver, ESP32 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- **i2c_slave_read_buffer()**
  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

Interrupt Handling  During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to ESP32 Technical Reference Manual > I2C Controller (I2C) > Interrupts [PDF] for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

Customized Configuration  As mentioned at the end of Section Configuration, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of start signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of stop signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix _DEFAULT_.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.
Note: ESP32’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the `I2C specification`.

**Error Handling**  The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see `Interrupt Handling`.

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver**  When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

**Application Example**

I2C master and slave example: `peripherals/i2c`.

**API Reference**

**Header File**

- `components/driver/include/driver/i2c.h`

**Functions**

- `esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

  Install an I2C driver.

  **Note**  In master mode, if the cache is likely to be disabled(such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the `psram`(if `psram` is enabled) in interrupt handle function when cache is disabled.

  **Return**

  - `ESP_OK` Success
  - `ESP_ERR_INVALID_ARG` Parameter error
  - `ESP_FAIL` Driver installation error

  **Parameters**

  - `i2c_num`: I2C port number
  - `mode`: I2C mode (either master or slave)
  - `slv_rx_buf_len`: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
  - `slv_tx_buf_len`: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
  - `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

```
esp_err_t i2c_driver_delete(i2c_port_t i2c_num)
Delete I2C driver.

Note  This function does not guarantee thread safety. Please make sure that no thread will continuously hold
      semaphores before calling the delete function.
Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error
Parameters
  • i2c_num: I2C port to delete
```

```
esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)
Configure an I2C bus with the given configuration.
Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error
Parameters
  • i2c_num: I2C port to configure
  • i2c_conf: Pointer to the I2C configuration
```

```
esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)
reset I2C tx hardware fifo
Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error
Parameters
  • i2c_num: I2C port number
```

```
esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)
reset I2C rx fifo
Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error
Parameters
  • i2c_num: I2C port number
```

```
esp_err_t i2c_isr_register(i2c_port_t i2c_num, void(*) fn, void *arg, int intr_alloc_flags, intr_handle_t *handle)
Register an I2C ISR handler.
Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error
Parameters
  • i2c_num: I2C port number to attach handler to
  • fn: ISR handler function
  • arg: Parameter for the ISR handler
  • intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
  • handle: Handle return from esp_intr_alloc.
```

```
esp_err_t i2c_isr_free(intr_handle_t handle)
Delete and free I2C ISR handle.
Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error
Parameters
  • handle: Handle of isr to delete.
```

```
esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)
```
Configure GPIO pins for I2C SCK and SDA signals.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- sda_io_num: GPIO number for I2C SDA signal
- scl_io_num: GPIO number for I2C SCL signal
- sda_pullup_en: Enable the internal pullup for SDA pin
- scl_pullup_en: Enable the internal pullup for SCL pin
- mode: I2C mode

`esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)`

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

`esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)`

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- read_buffer: Buffer to store the bytes received on the bus
- read_size: Size, in bytes, of the read buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

`esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)`

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters

- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- read_buffer: Buffer to store the bytes received on the bus
- read_size: Size, in bytes, of the read buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

*i2c_cmd_handle_t i2c_cmd_link_create static (uint8_t *buffer, uint32_t size)*

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, …) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete_static().

Note It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro I2C_LINK_RECOMMENDED_SIZE would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

Return Handle to the I2C command link or NULL if the buffer provided is too small, please use I2C_LINK_RECOMMENDED_SIZE macro to get the recommended size for the buffer.

Parameters

- buffer: Buffer to use for commands allocations
- size: Size in bytes of the buffer

*i2c_cmd_handle_t i2c_cmd_link_create (void)*

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete() to release and return the resources. The required bytes will be dynamically allocated.

Return Handle to the I2C command link

void i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list allocated statically with i2c_cmd_link_create_static.

Parameters

- cmd_handle: I2C commands list allocated statically. This handle should be created thanks to i2c_cmd_link_create_static() function

void i2c_cmd_link_delete (i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

Parameters

- cmd_handle: I2C commands list. This handle should be created thanks to i2c_cmd_link_create() function

esp_err_t i2c_master_start (i2c_cmd_handle_t cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all the queued commands.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

Parameters

- cmd_handle: I2C commands list
**esp_err_t i2c_master_write_byte**

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Byte to send on the port
- `ack_en`: Enable ACK signal

**esp_err_t i2c_master_write**

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Byte to send on the port
- `ack_en`: Enable ACK signal

**esp_err_t i2c_master_read_byte**

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Pointer where the received byte will be stored. This buffer shall remain `valid` until the transaction is finished.
- `ack`: ACK signal

**esp_err_t i2c_master_read**

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Pointer where the received bytes will be stored. This buffer shall remain `valid` until the transaction is finished.
• data_len: Size, in bytes, of the data buffer
• ack: ACK signal

`esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)`
Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`
Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number
• cmd_handle: I2C commands list
• ticks_to_wait: Maximum ticks to wait before issuing a timeout.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)`
Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

Note This function shall only be called in I2C slave mode.

Return
• ESP_FAIL (-1) Parameter error
• Other (>=0) The number of data bytes pushed to the I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Bytes to write into internal buffer
• size: Size, in bytes, of data buffer
• ticks_to_wait: Maximum ticks to wait.

`int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)`
Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note This function shall only be called in I2C slave mode.

Return
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes read from I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Buffer to fill with ringbuffer’s bytes
• max_size: Maximum bytes to read
• ticks_to_wait: Maximum waiting ticks
**esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)**
Set I2C master clock period.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- high_period: Clock cycle number during SCL is high level, high_period is a 14 bit value
- low_period: Clock cycle number during SCL is low level, low_period is a 14 bit value

**esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)**
Get I2C master clock period.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)**
Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note Enable filter will slow down the SCL clock.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number to filter
- cyc_num: the APB cycles need to be filtered (0<= cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

**esp_err_t i2c_filter_disable(i2c_port_t i2c_num)**
Disable filter on I2C bus.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number

**esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)**
set I2C master start signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- setup_time: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- hold_time: clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

**esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)**
get I2C master start signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**Parameters**
- **i2c_num**: I2C port number
- **setup_time**: pointer to get setup time
- **hold_time**: pointer to get hold time

```c
esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```

Set I2C master stop signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **setup_time**: clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- **hold_time**: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

```c
esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int* setup_time, int* hold_time)
```

Get I2C master stop signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **setup_time**: pointer to get setup time.
- **hold_time**: pointer to get hold time.

```c
esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)
```

Set I2C data signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **sample_time**: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value.
- **hold_time**: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int* sample_time, int* hold_time)
```

Get I2C data signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **sample_time**: pointer to get sample time
- **hold_time**: pointer to get hold time

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```

Set I2C timeout value

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **timeout**: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int* timeout)
```

Get I2C timeout value
Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode,
                            i2c_trans_mode_t rx_trans_mode)
```

set I2C data transfer mode

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- tx_trans_mode: I2C sending data mode
- rx_trans_mode: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode,
                             i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- tx_trans_mode: pointer to get I2C sending data mode
- rx_trans_mode: pointer to get I2C receiving data mode

Structures

```c
struct i2c_config_t
```

I2C initialization parameters.

Public Members

```c
i2c_mode_t mode
```

I2C mode

```c
int sda_io_num
```

GPIO number for I2C sda signal

```c
int scl_io_num
```

GPIO number for I2C scl signal

```c
bool sda_pullup_en
```

Internal GPIO pull mode for I2C sda signal

```c
bool scl_pullup_en
```

Internal GPIO pull mode for I2C scl signal

```c
uint32_t clk_speed
```

I2C clock frequency for master mode, (no higher than 1MHz for now)

```c
struct i2c_config_t::__anonymous::__anonymous__ master
```

I2C master config

```c
uint8_t addr_10bit_en
```

I2C 10bit address mode enable for slave mode

```c
uint16_t slave_addr
```

I2C address for slave mode
uint32_t **maximum_speed**  
I2C expected clock speed from SCL.

**struct i2c_config_t::[anonymous]::[anonymous] slave**  
I2C slave config

uint32_t **clk_flags**  
Bitwise of **I2C_SCLK_SRC_FLAG_*FOR_DFS** for clk source choice

**Macros**

**I2C_APB_CLK_FREQ**  
I2C source clock is APB clock, 80MHz

**I2C_NUM_MAX**  
I2C port max

**I2C_NUM_0**  
I2C port 0

**I2C_NUM_1**  
I2C port 1

**I2C_SCLK_SRC_FLAG_FOR_NOMAL**  
Any one clock source that is available for the specified frequency may be choosen

**I2C_SCLK_SRC_FLAG_AWARE_DFS**  
For REF tick clock, it won’t change with APB.

**I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**  
For light sleep mode.

**I2C_INTERNAL_STRUCT_SIZE**  
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

**I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)**  
The following macro is used to determine the recommended size of the buffer to pass to i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

**Type Definitions**

typedef void *i2c_cmd_handle_t  
I2C command handle

**Header File**

- components/hal/include/hal/i2c_types.h

**Macros**

**I2C_CLK_FREQ_MAX**  
Use the highest speed that is available for the clock source picked by clk_flags.

**Type Definitions**

typedef int i2c_port_t  
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
Enumerations

enum i2c_mode_t
Values:

I2C_MODE_SLAVE = 0
I2C slave mode

I2C_MODE_MASTER
I2C master mode

I2C_MODE_MAX

enum i2c_rw_t
Values:

I2C_MASTER_WRITE = 0
I2C write data

I2C_MASTER_READ
I2C read data

enum i2c_trans_mode_t
Values:

I2C_DATA_MODE_MSB_FIRST = 0
I2C data msb first

I2C_DATA_MODE_LSB_FIRST = 1
I2C data lsb first

I2C_DATA_MODE_MAX

enum i2c_addr_mode_t
Values:

I2C_ADDR_BIT_7 = 0
I2C 7bit address for slave mode

I2C_ADDR_BIT_10
I2C 10bit address for slave mode

I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
Values:

I2C_MASTER_ACK = 0x0
I2C ack for each byte read

I2C_MASTER_NACK = 0x1
I2C nack for each byte read

I2C_MASTER_LAST_NACK = 0x2
I2C nack for the last byte

I2C_MASTER_ACK_MAX

enum i2c_sclk_t
I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.
Values:

I2C_SCLK_DEFAULT = 0
I2C source clock not selected

I2C_SCLK_APB
I2C source clock from APB, 80M

I2C_SCLK_MAX
enum i2c_opmode_t
Values:

I2C_CMD_RESTART = 0
I2C restart command

I2C_CMD_WRITE
I2C write command

I2C_CMD_READ
I2C read command

I2C_CMD_STOP
I2C stop command

I2C_CMD_END
I2C end command

2.3.6 Inter-IC Sound (I2S)

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter’s (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

- LCD master transmitting mode
- Camera slave receiving mode
- ADC/DAC mode

For more information, see ESP32 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF].

Note: For high accuracy clock applications, use the APPLL_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APPLL_CLK clock source by setting i2s_config_t::use_apll to TRUE.

If i2s_config_t::use_apll = TRUE and i2s_config_t::fixed_mclk > 0, then the master clock output frequency for I2S will be equal to the value of i2s_config_t::fixed_mclk, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.
The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true: 0 < MCLK/LRCK/channels/bits_per_sample < 64.

**Functional Overview**

**Installing the Driver**  Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `i2s_driver_install` returns ESP_OK, it means I2S has started.

Configuration example:

```c
static const int i2s_num = 0; // I2S port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PERSAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

**Setting Communication Pins**  Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

Note: MCK only takes effect in I2S_MODE_MASTER mode.

```c
static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication**  To perform a transmission:
Chapter 2. API Reference

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```c
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)\*SAMPLE_PER_CYCLE\*4, &i2s_bytes_write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```c
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)\*SAMPLE_PER_CYCLE\*4, &i2s_bytes_read, 100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func`i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver** If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

**Application Example**

A code example for the I2S driver can be found in the directory `peripherals/i2s`.

In addition, there are two short configuration examples for the I2S driver.

In addition, there is a short configuration examples for the I2S driver.

**I2S configuration** Example for general usage.

```c
#include "driver/i2s.h"

static const int i2s_num = 0; // I2S port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); // install and start I2S driver
i2s_set_pin(i2s_num, &pin_config);
...

/* You can reset parameters by calling 'i2s_set_clk' (continues on next page)*/
* The low 16 bits are the valid data bits in one chan and the high 16 bits are
* the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
* be set to the same value as low 16 bits.

```c
uint32_t
bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
```

```
i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

### Configuring I2S to use internal DAC for analog output

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16, /* the DAC module will only take the 8 bits from MSB */
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

```

```
...  
i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s...
  
i2s_set_pin(i2s_num, NULL); //for internal DAC, this will enable both of the...
      
      //You can call i2s_set_dac_mode to set built-in DAC output mode.
      //i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

      i2s_set_sample_rates(i2s_num, 22050); //set sample rates
      i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

### API Reference

#### Header File

- components/driver/include/driver/i2s.h

#### Functions

```c
esp_err_t i2s_set_pin (i2s_port_t i2s_num, const i2s_pin_config_t *pin)
```

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.
Parameters

- `i2s_num`: I2S port number
- `pin`: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if `*pin` is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call `i2s_set_dac_mode` instead.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

```c
esp_err_t i2s_set_pdm_rx_down_sample(i2s_port_t i2s_num, i2s_pdm_dsr_t downsample)
```

Set PDM mode down-sample rate. In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be `(fpcm * 64)` or `(fpcm * 128)` accordingly.

**Note** After calling this function, it would call `i2s_set_clk` inside to update the clock frequency. Please call this function after I2S driver has been initialized.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

```c
Parameters

- `i2s_num`: I2S port number
- `downsample`: i2s RX down sample rate for PDM mode.
```

```c
esp_err_t i2s_set_pdm_tx_up_sample(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg)
```

Set TX PDM mode up-sample rate.

**Note** If you have set PDM mode while calling ‘`i2s_driver_install`’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

```c
Parameters

- `i2s_num`: I2S port number
- `upsample_cfg`: Set I2S PDM up-sample rate configuration
```

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
```

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

**Parameters**

- `i2s_num`: I2S port number
- `i2s_config`: I2S configurations - see `i2s_config_t` struct
- `queue_size`: I2S event queue size/depth.
- `i2s_queue`: I2S event queue handle, if set NULL, driver will not use an event queue.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)
```

Uninstall I2S driver.
Chapter 2. API Reference

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE I2S port has been uninstalled by others (e.g. LCD i80)

Parameters
- i2s_num: I2S port number

```c
esp_err_t i2s_write (i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```
Write data to I2S DMA transmit buffer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_write_expand (i2s_port_t i2s_num, const void *src, size_t src_size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```
Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see i2s_config_t).

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
- src_bits: Source audio bit
- aim_bits: Bit wanted, no more than 32, and must be greater than src_bits
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2s_read (i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```
Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call i2s_adc_enable and i2s_adc_disable around the whole reading process, to prevent the data getting corrupted.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- dest: Destination address to read into
- size: Size of data in bytes
• [out] bytes_read: Number of bytes read, if timeout, bytes read will be less than the size passed in.
• ticks_to_wait: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
Esp_err_t i2s_set_sample_rates (i2s_port_t i2s_num, uint32_t rate)
```

Sets sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of channels, bits_per_sample).

\[
\text{bit\_clock} = \text{rate} \times (\text{number of channels}) \times \text{bits\_per\_sample}
\]

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM Out of memory

Parameters

• i2s_num: I2S port number
• rate: I2S sample rate (ex: 8000, 44100…)

```c
Esp_err_t i2s_stop (i2s_port_t i2s_num)
```

Stop I2S driver.

There is no need to call i2s_stop() before calling i2s_driver_uninstall().

Disables I2S TX/RX, until i2s_start() is called.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2s_num: I2S port number

```c
Esp_err_t i2s_start (i2s_port_t i2s_num)
```

Start I2S driver.

It is not necessary to call this function after i2s_driver_install() (it is started automatically), however it is necessary to call it after i2s_stop().

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2s_num: I2S port number

```c
Esp_err_t i2s_zero_dma_buffer (i2s_port_t i2s_num)
```

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2s_num: I2S port number

```c
Esp_err_t i2s_set_clk (i2s_port_t i2s_num, uint32_t rate, uint32_t bits_cfg, i2s_channel_t ch)
```

Set clock & bit width used for I2S RX and TX.

Similar to i2s_set_sample_rates(), but also sets bit width.

1. stop i2s;
2. calculate mclk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S port number
- rate: I2S sample rate (ex: 8000, 44100…)
- bits_cfg: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘i2s_bits_per_sample_t’) the high 16 bits is for total bits in one channel (see ‘i2s_bits_per_chan_t’ ) high 16bits =0 means same as the bits per sample.
- ch: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

float i2s_get_clk (i2s_port_t i2s_num)
get clock set on particular port number.

Return
- actual clock set by i2s driver

Parameters
- i2s_num: I2S port number

esp_err_t i2s_set_adc_mode (adc_unit_t adc_unit, adc1_channel_t adc_channel)
Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

Note In this mode, the ADC maximum sampling rate is 150KHz. Set the sampling rate through i2s_config_t.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: SAR ADC unit index
- adc_channel: ADC channel index

esp_err_t i2s_adc_enable (i2s_port_t i2s_num)
Start to use I2S built-in ADC mode.

Note This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

Parameters
- i2s_num: i2s port index

esp_err_t i2s_adc_disable (i2s_port_t i2s_num)
Stop to use I2S built-in ADC mode.

Note This function would release the lock of ADC so that other tasks can use ADC.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

Parameters
- i2s_num: i2s port index

esp_err_t i2s_set_dac_mode (i2s_dac_mode_t dac_mode)
Set I2S dac mode, I2S built-in DAC is disabled by default.

Note Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one can not be used as RTC DAC function at the same time.

Return
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- dac_mode: DAC mode configurations - see i2s_dac_mode_t

**Structures**

```c
struct i2s_pdm_tx_upsample_cfg_t
```
I2S PDM up-sample rate configuration.

**Note** TX PDM can only be set to the following two upsampling rate configurations: 1: fp = 960, fs = sample_rate / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm
= 128*sample_rate If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be applied.

**Public Members**

```c
int sample_rate
```
I2S PDM sample rate

```c
int fp
```
I2S PDM TX upsampling parameter. Normally it should be set to 960

```c
int fs
```
I2S PDM TX upsampling parameter. When it is set to 480, the pdm clock frequency Fpdm = 128 * sample_rate, when it is set to sample_rate / 100, Fpdm will be fixed to 128*48000

```c
struct i2s_pin_config_t
```
I2S pin number for i2s_set_pin.

**Public Members**

```c
int mck_io_num
```
MCK in out pin

```c
int bck_io_num
```
BCK in out pin

```c
int ws_io_num
```
WS in out pin

```c
int data_out_num
```
DATA out pin

```c
int data_in_num
```
DATA in pin

**Public Members**

```c
i2s_mode_t mode
```
I2S work mode

```c
uint32_t sample_rate
```
I2S sample rate

```c
i2s_bits_per_sample_t bits_per_sample
```
I2S sample bits in one channel

```c
i2s_channel_fmt_t channel_format
```
I2S channel format.
Chapter 2. API Reference

**i2s_comm_format_t**

*communication_format*

I2S communication format

**int intr_alloc_flags**

Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

**int dma_buf_count**

I2S DMA Buffer Count

**int dma_buf_len**

I2S DMA Buffer Length

**bool use_apll**

I2S using APPL as main I2S clock, enable it to get accurate clock

**bool tx_desc_auto_clear**

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

**int fixed_mclk**

I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won’t take effect

**i2s_mclk_multiple_t**

The multiple of I2S master clock(MCLK) to sample rate

**i2s_bits_per_chan_t**

I2S total bits in one channel. only take effect when larger than ‘bits_per_sample’, default ‘0’ means equal to ‘bits_per_sample’

**struct i2s_event_t**

Event structure used in I2S event queue.

### Public Members

**i2s_event_type_t type**

I2S event type

**size_t size**

I2S data size for I2S_DATA event

### Macros

**I2S_PIN_NO_CHANGE**

Use in i2s_pin_config_t for pins which should not be changed

**I2S_PDM_DEFAULT_UPSAMPLE_CONFIG (rate)**

Default I2S PDM Up-Sampling Rate configuration.

### Type Definitions

**typedef i2s_driver_config_t i2s_config_t**

**typedef intr_handle_t i2s_isr_handle_t**

### Enumerations

**enum i2s_port_t**

I2S port number, the max port number is (I2S_NUM_MAX -1).

**Values:**

- **I2S_NUM_0 = 0**

  I2S port 0
Chapter 2. API Reference

```c
I2S_NUM_1 = 1
I2S port 1
I2S_NUM_MAX
I2S port max

enum i2s_event_type_t
I2S event queue types.

Values:

I2S_EVENT_DMA_ERROR
I2S_EVENT_TX_DONE
I2S DMA finish sent 1 buffer

I2S_EVENT_RX_DONE
I2S DMA finish received 1 buffer

I2S_EVENT_TX_Q_OVF
I2S DMA sent queue overflow

I2S_EVENT_RX_Q_OVF
I2S DMA receive queue overflow

I2S_EVENT_MAX
I2S event max index
```

**Header File**

- components/hal/include/hal/i2s_types.h

**Enumerations**

```c
enum i2s_bits_per_sample_t
I2S bit width per sample.

Values:

I2S_BITS_PER_SAMPLE_8BIT = 8
data bit-width: 8

I2S_BITS_PER_SAMPLE_16BIT = 16
data bit-width: 16

I2S_BITS_PER_SAMPLE_24BIT = 24
data bit-width: 24

I2S_BITS_PER_SAMPLE_32BIT = 32
data bit-width: 32
```

```c
enum i2s_bits_per_chan_t
I2S bit width per chan.

Values:

I2S_BITS_PER_CHAN_DEFAULT = (0)
channel bit-width equals to data bit-width

I2S_BITS_PER_CHAN_8BIT = (8)
channel bit-width: 8

I2S_BITS_PER_CHAN_16BIT = (16)
channel bit-width: 16

I2S_BITS_PER_CHAN_24BIT = (24)
channel bit-width: 24

I2S_BITS_PER_CHAN_32BIT = (32)
channel bit-width: 32
```
enum i2s_channel_t
I2S channel.
Values:

I2S_CHANNEL_MONO = (0x01 << 31) | 0x03
I2S channel (mono), two channel enabled. In this mode, you only need to send one channel data but the fifo will copy same data for another channel automatically, then both channels will transmit same data. The highest bit is for differentiating I2S_CHANNEL_STEREO since they both use two channels

I2S_CHANNEL_STEREO = 0x03
I2S channel (stereo), two channel enabled. In this mode, two channels will transmit different data.

enum i2s_comm_format_t
I2S communication standard format.
Values:

I2S_COMM_FORMAT_STAND_I2S = 0X01
I2S communication I2S Philips standard, data launch at second BCK

I2S_COMM_FORMAT_STAND_MSB = 0X02
I2S communication MSB alignment standard, data launch at first BCK

I2S_COMM_FORMAT_STAND_PCM_SHORT = 0x04
PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

I2S_COMM_FORMAT_STAND_PCM_LONG = 0x0C
PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

I2S_COMM_FORMAT_STAND_MAX
standard max

I2S_COMM_FORMAT_I2S = 0x01
I2S communication format I2S, correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_MSB = 0x01
I2S format MSB, (I2S_COMM_FORMAT_I2S |I2S_COMM_FORMAT_I2S_MSB) correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_LSB = 0x02
I2S format LSB, (I2S_COMM_FORMAT_I2S |I2S_COMM_FORMAT_I2S_LSB) correspond to I2S_COMM_FORMAT_STAND_MSB

I2S_COMM_FORMAT_PCM = 0x04
I2S communication format PCM, correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_SHORT = 0x04
PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_LONG = 0x08
PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum i2s_channel_fmt_t
I2S channel format type.
Values:

I2S_CHANNEL_FMT_RIGHT_LEFT
Separated left and right channel

I2S_CHANNEL_FMT_ALL_RIGHT
Load right channel data in both two channels

I2S_CHANNEL_FMT_ALL_LEFT
Load left channel data in both two channels
I2S_CHANNEL_FMT_ONLY_RIGHT
Only load data in right channel (mono mode)

I2S_CHANNEL_FMT_ONLY_LEFT
Only load data in left channel (mono mode)

enum i2s_mode_t
I2S Mode.
Values:
I2S_MODE_MASTER = (0x1 << 0)
Master mode
I2S_MODE_SLAVE = (0x1 << 1)
Slave mode
I2S_MODE_TX = (0x1 << 2)
TX mode
I2S_MODE_RX = (0x1 << 3)
RX mode
I2S_MODE_DAC_BUILT_IN = (0x1 << 4)
Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB
I2S_MODE_ADC_BUILT_IN = (0x1 << 5)
Input I2S data from built-in ADC, each data can be 12-bit width at most
I2S_MODE_PDM = (0x1 << 6)
I2S PDM mode

enum i2s_clock_src_t
I2S source clock.
Values:
I2S_CLK_D2CLK = 0
Clock from PLL_D2_CLK(160M)
I2S_CLK_APLL
Clock from APLL

enum i2s_mclk_multiple_t
The multiple of mclk to sample rate.
Values:
I2S_MCLK_MULTIPLE_DEFAULT = 0
Default value. mclk = sample_rate * 256
I2S_MCLK_MULTIPLE_128 = 128
mclk = sample_rate * 128
I2S_MCLK_MULTIPLE_256 = 256
mclk = sample_rate * 256
I2S_MCLK_MULTIPLE_384 = 384
mclk = sample_rate * 384

enum i2s_dac_mode_t
I2S DAC mode for i2s_set_dac_mode.
Values:
I2S_DAC_CHANNEL_DISABLE = 0
Disable I2S built-in DAC signals

Built-in DAC functions are only supported on I2S0 for current ESP32 chip.
I2S_DAC_CHANNEL_RIGHT_EN = 1
Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

I2S_DAC_CHANNEL_LEFT_EN = 2
Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

I2S_DAC_CHANNEL_BOTH_EN = 0x3
Enable both of the I2S built-in DAC channels.

I2S_DAC_CHANNEL_MAX = 0x4
I2S built-in DAC mode max index

enum i2s_pdm_dsr_t
I2S PDM RX downsample mode.

Values:

I2S_PDM_DSR_8S = 0
downsampling number is 8 for PDM RX mode

I2S_PDM_DSR_16S
downsampling number is 16 for PDM RX mode

I2S_PDM_DSR_MAX

enum i2s_pdm_sig_scale_t
Values:

I2S_PDM_SIG_SCALING_DIV_2 = 0
I2S TX PDM sigmadelta signal scaling: /2

I2S_PDM_SIG_SCALING_MUL_1 = 1
I2S TX PDM sigmadelta signal scaling: x1

I2S_PDM_SIG_SCALING_MUL_2 = 2
I2S TX PDM sigmadelta signal scaling: x2

I2S_PDM_SIG_SCALING_MUL_4 = 3
I2S TX PDM sigmadelta signal scaling: x4

2.3.7 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I2C LCD, RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.
Application Example

LCD examples are located under: peripherals/lcd:

- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- LVGL porting and animation UI - peripherals/lcd/lvgl

API Reference

Header File

- components/hal/include/hal/lcd_types.h

Enumerations

enum lcd_clock_source_t

LCD clock source.

<table>
<thead>
<tr>
<th>LCD clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCD_CLK_SRC_PLL160M</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_APLL</td>
<td>Configurable resolution</td>
<td>ESP_PM_NO_LIGHT_SLEEP lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_XTAL</td>
<td>Medium resolution</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

Values:

- LCD_CLK_SRC_PLL160M: Select PLL160M as the source clock
- LCD_CLK_SRC_APLL: Select APLL as the source clock
- LCD_CLK_SRC_XTAL: Select XTAL as the source clock

Header File

- components/esp_lcd/include/esp_lcd_types.h

Type Definitions

typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
Type of LCD panel handle

Enumerations

enum esp_lcd_color_space_t

LCD color space type definition.

Values:

- ESP_LCD_COLOR_SPACE_RGB: Color space: RGB
- ESP_LCD_COLOR_SPACE_BGR: Color space: BGR
- ESP_LCD_COLOR_SPACE_MONOCHROME: Color space: monochrome
Header File

- components/esp_lcd/include/esp_lcd_panel_io.h

Functions

declare esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- [in] lcd_cmd: The specific LCD command
- [in] param: Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- [in] param_size: Size of param in memory, in bytes, set to zero if no parameter is needed for the command

declare esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

Note: This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback on_color_trans_done().

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- [in] lcd_cmd: The specific LCD command
- [in] color: Buffer that holds the RGB color data
- [in] color_size: Size of color in memory, in bytes

declare esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)

Destory LCD panel IO handle (deinitialize panel and free all corresponding resource)

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()

declare esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)

Create LCD panel IO handle, for SPI interface.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
Chapter 2. API Reference

Parameters
- [in] `bus`: SPI bus handle
- [in] `io_config`: IO configuration, for SPI interface
- [out] `ret_io`: Returned IO handle

```c
esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- [in] `bus`: I2C bus handle
- [in] `io_config`: IO configuration, for I2C interface
- [out] `ret_io`: Returned IO handle

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t *ret_bus)
```

Create Intel 8080 bus handle.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- [in] `bus_config`: Bus configuration
- [out] `ret_bus`: Returned bus handle

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```

Destory Intel 8080 bus handle.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

Parameters
- [in] `bus`: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

```c
esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const esp_lcd_panel_io_i80_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- [in] `bus`: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()
- [in] `io_config`: IO configuration, for i80 interface
- [out] `ret_io`: Returned panel IO handle

**Structures**

```c
struct esp_lcd_panel_io_event_data_t
```

Type of LCD panel IO event data.
**struct esp_lcd_panel_io_spi_config_t**  
Panel IO configuration structure, for SPI interface.

**Public Members**

- int **cs_gpio_num**  
  GPIO used for CS line

- int **dc_gpio_num**  
  GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

- int **spi_mode**  
  Traditional SPI mode (0~3)

- unsigned int **pclk_hz**  
  Frequency of pixel clock

- size_t **trans_queue_depth**  
  Size of internal transaction queue

- *esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done*  
  Callback invoked when color data transfer has finished

- void **user_ctx**  
  User private data, passed directly to on_color_trans_done’ s user_ctx

- int **lcd_cmd_bits**  
  Bit-width of LCD command

- int **lcd_param_bits**  
  Bit-width of LCD parameter

- unsigned int **dc_as_cmd_phase** : 1  
  D/C line value is encoded into SPI transaction command phase

- unsigned int **dc_low_on_data** : 1  
  If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

- unsigned int **octal_mode** : 1  
  Transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

**struct esp_lcd_panel_io_i2c_config_t**

**Public Members**

- uint32_t **dev_addr**  
  I2C device address

- *esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done*  
  Callback invoked when color data transfer has finished

- void **user_ctx**  
  User private data, passed directly to on_color_trans_done’ s user_ctx

- size_t **control_phase_bytes**  
  I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

- unsigned int **dc_bit_offset**  
  Offset of the D/C selection bit in control phase

- int **lcd_cmd_bits**  
  Bit-width of LCD command

- int **lcd_param_bits**  
  Bit-width of LCD parameter
unsigned int dc_low_on_data: 1
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

struct esp_lcd_i80_bus_config_t
LCD Intel 8080 bus configuration structure.

Public Members

int dc_gpio_num
GPIO used for D/C line

int wr_gpio_num
GPIO used for WR line

lcd_clock_source_t clk_src
Clock source for the I80 LCD peripheral

int data_gpio_nums[24]
GPiOs used for data lines

size_t bus_width
Number of data lines, 8 or 16

size_t max_transfer_bytes
Maximum transfer size, this determines the length of internal DMA link

struct esp_lcd_panel_io_i80_config_t
Panel IO configuration structure, for intel 8080 interface.

Public Members

int cs_gpio_num
GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int pclk_hz
Frequency of pixel clock

size_t trans_queue_depth
Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data was transferred done

void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
Bit-width of LCD command

int lcd_param_bits
Bit-width of LCD parameter

unsigned int dc_idle_level: 1
Level of DC line in IDLE phase

unsigned int dc_cmd_level: 1
Level of DC line in CMD phase

unsigned int dc_dummy_level: 1
Level of DC line in DUMMY phase

unsigned int dc_data_level: 1
Level of DC line in DATA phase

struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels
Each i80 device might have its own D/C control logic
unsigned int \texttt{cs\_active\_high} : 1
If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int \texttt{reverse\_color\_bits} : 1
Reverse the data bits, D[N:0] \rightarrow D[0:N]

unsigned int \texttt{swap\_color\_bytes} : 1
Swap adjacent two color bytes

unsigned int \texttt{pclk\_active\_neg} : 1
The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

unsigned int \texttt{pclk\_idle\_low} : 1
The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

\textbf{Type Definitions}
\begin{itemize}
\item \texttt{typedef void* esp\_lcd\_spi\_bus\_handle\_t}
Type of LCD SPI bus handle
\item \texttt{typedef void* esp\_lcd\_i2c\_bus\_handle\_t}
Type of LCD I2C bus handle
\item \texttt{typedef struct esp\_lcd\_i80\_bus\_t *esp\_lcd\_i80\_bus\_handle\_t}
Type of LCD intel 8080 bus handle
\item \texttt{typedef bool (*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t)(esp\_lcd\_panel\_io\_handle\_t panel\_io, esp\_lcd\_panel\_io\_event\_data\_t *edata, void *user\_ctx)}
Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.
\end{itemize}

\textbf{Return} Whether a high priority task has been waken up by this function

\textbf{Parameters}
\begin{itemize}
\item [in] \texttt{panel\_io}: LCD panel IO handle, which is created by factory API like \texttt{esp\_lcd\_new\_panel\_io\_spi()}
\item [in] \texttt{edata}: Panel IO event data, fed by driver
\item [in] \texttt{user\_ctx}: User data, passed from \texttt{esp\_lcd\_panel\_io\_xxx\_config\_t}
\end{itemize}

\textbf{Header File}
\begin{itemize}
\item components/esp\_lcd\_include/esp\_lcd\_panel\_ops.h
\end{itemize}

\textbf{Functions}
\begin{itemize}
\item \texttt{esp\_err\_t esp\_lcd\_panel\_reset (esp\_lcd\_panel\_handle\_t panel)}
Reset LCD panel.
\item [Note] Panel reset must be called before attempting to initialize the panel using \texttt{esp\_lcd\_panel\_init()}.\n\item [Return] \texttt{ESP\_OK} on success
\item [Parameters]
\begin{itemize}
\item [in] \texttt{panel}: LCD panel handle, which is created by other factory API like \texttt{esp\_lcd\_new\_panel\_st7789()}
\end{itemize}
\item \texttt{esp\_err\_t esp\_lcd\_panel\_init (esp\_lcd\_panel\_handle\_t panel)}
Initialize LCD panel.
\item [Note] Before calling this function, make sure the LCD panel has finished the reset stage by \texttt{esp\_lcd\_panel\_reset()}.\n\item [Return] \texttt{ESP\_OK} on success
\item [Parameters]
\begin{itemize}
\item [in] \texttt{panel}: LCD panel handle, which is created by other factory API like \texttt{esp\_lcd\_new\_panel\_st7789()}
\end{itemize}
\end{itemize}
**esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)**

Deinitialize the LCD panel.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

**esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)**

Draw bitmap on LCD panel.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] x_start: Start index on x-axis (x_start included)
- [in] y_start: Start index on y-axis (y_start included)
- [in] x_end: End index on x-axis (x_end not included)
- [in] y_end: End index on y-axis (y_end not included)
- [in] color_data: RGB color data that will be dumped to the specific window range

**esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)**

Mirror the LCD panel on specific axis.

**Note** Combined with esp_lcd_panel_swap_xy(), one can realize screen rotation

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] mirror_x: Whether the panel will be mirrored about the x axis
- [in] mirror_y: Whether the panel will be mirrored about the y axis

**esp_err_t esp_lcd_panel_swap_xy (esp_lcd_panel_handle_t panel, bool swap_axes)**

Swap/Exchange x and y axis.

**Note** Combined with esp_lcd_panel_mirror(), one can realize screen rotation

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] swap_axes: Whether to swap the x and y axis

**esp_err_t esp_lcd_panel_set_gap (esp_lcd_panel_handle_t panel, int x_gap, int y_gap)**

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] x_gap: Extra gap on x axis, in pixels
- [in] y_gap: Extra gap on y axis, in pixels
**esp_err_t esp_lcd_panel_invert_color** *(esp_lcd_panel_handle_t panel, bool invert_color_data)*

Invert the color (bit-wise invert the color data line)

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] invert_color_data: Whether to invert the color data

**esp_err_t esp_lcd_panel_disp_off** *(esp_lcd_panel_handle_t panel, bool off)*

Turn off the display.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] off: Whether to turn off the screen

**Header File**
- components/esp_lcd/include/esp_lcd_panel_rgb.h

**Header File**
- components/esp_lcd/include/esp_lcd_panel_vendor.h

**Functions**

**esp_err_t esp_lcd_new_panel_st7789** *(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)*

Create LCD panel for model ST7789.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

**esp_err_t esp_lcd_new_panel_nt35510** *(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)*

Create LCD panel for model NT35510.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

**esp_err_t esp_lcd_new_panel_ssd1306** *(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)*

Create LCD panel for model SSD1306.
Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

Structures

```c
struct esp_lcd_panel_dev_config_t
Configuration structure for panel device.
```

Public Members

```c
int reset_gpio_num
GPIO used to reset the LCD panel, set to -1 if it’s not used
```

```c
esp_lcd_color_space_t color_space
Set the color space used by the LCD panel
```

```c
unsigned int bits_per_pixel
Color depth, in bpp
```

```c
unsigned int reset_active_high : 1
Setting this if the panel reset is high level active
```

2.3.8 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

LEDC channels are divided into two groups of 8 channels each. One group of LEDC channels operates in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other group of channels operate in low speed mode, the PWM duty cycle must be changed by the driver in software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC in either high or low speed mode is done in three steps:

1. **Timer Configuration** by specifying the PWM signal’s frequency and duty cycle resolution.
2. **Channel Configuration** by associating it with the timer and GPIO to output the PWM signal.
3. **Change PWM Signal** that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.
Timer Configuration  Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode `ledc_mode_t`
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

Channel Configuration  When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal  Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

Change PWM Duty Cycle Using Software  To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Channel Configuration.
The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to \((2 ^ \text{duty_resolution}) - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of \(~0.1\%\).

**Change PWM Duty Cycle using Hardware**  
The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency**  
The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM**  
There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts**  
When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

**LEDC High and Low Speed Mode**  
High speed mode enables a glitch-free changeover of timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, see *ESP32 Technical Reference Manual > LED PWM Controller (LEDC)* [PDF]. Please note that the support for `SLOW_CLOCK` mentioned in this manual is not yet supported in the LEDC driver.

**Supported Range of Frequency and Duty Resolutions**  
The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of \(~0.012\%\) \((2 ^ {13} = 8192\) discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller.
timer which in turn clocks the channel (see timer configuration and the ESP32 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC change duty cycle and fading control example: peripherals/ledc/ledc_fade.

The LEDC basic example: peripherals/ledc/ledc_basic.

**API Reference**

**Header File**

- components/driver/include/driver/ledc.h

**Functions**

- `esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`
  
  LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

  **Return**
  
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**
  
  - ledc_conf: Pointer of LEDC channel configure struct

- `esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

  LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

  **Return**
  
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

  **Parameters**
  
  - timer_conf: Pointer of LEDC timer configure struct
Chapter 2. API Reference

*esp_err_t* **ledc_update_duty** (*ledc_mode_t speed_mode, ledc_channel_t channel*)

LEDC update channel parameters.

**Note** Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

*esp_err_t* **ledc_set_pin** (*int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel*)

Set LEDC output gpio.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *gpio_num*: The LEDC output gpio
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *ledc_channel*: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

*esp_err_t* **ledc_stop** (*ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level*)

LEDC stop. Disable LEDC output, and set idle level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- *idle_level*: Set output idle level after LEDC stops.

*esp_err_t* **ledc_set_freq** (*ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz*)

LEDC set channel frequency (Hz)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *timer_num*: LEDC timer index (0-3), select from ledc_timer_t
- *freq_hz*: Set the LEDC frequency

*uint32_t* **ledc_get_freq** (*ledc_mode_t speed_mode, ledc_timer_t timer_num*)

LEDC get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
Chapter 2. API Reference

- **timer_num**: LEDC timer index (0-3), select from `ledc_timer_t`

**esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)**

LEDC set duty and hpoint value. Only after calling `ledc_update_duty` will the duty update.

**Note**
- `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note**
- If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty**: Set the LEDC duty, the range of duty setting is \([0, (2^{*duty\_resolution}) - 1]\)
- **hpoint**: Set the LEDC hpoint value (max: 0xfffff)

**int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)**

LEDC get hpoint value, the counter value when the output is set high level.

**Return**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

**esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)**

LEDC set duty. This function do not change the hpoint value of this channel. If needed, please call `ledc_set_duty_with_hpoint`. Only after calling `ledc_update_duty` will the duty update.

**Note**
- `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note**
- If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

**uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)**

LEDC get duty.

**Return**
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
**esp_err_t** **ledc_set_fade**

```c
ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,
ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t
duty_cycle_num, uint32_t duty_scale)
```

LED C set gradient. Set LEDC gradient. After the function calls the `ledc_update_duty` function, the function can take effect.

**Note**
If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `duty`: Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- `fade_direction`: Set the direction of the gradient
- `step_num`: Set the number of the gradient
- `duty_cycle_num`: Set how many LEDC tick each time the gradient lasts
- `duty_scale`: Set gradient change amplitude

**esp_err_t** **ledc_isr_register**

```c
void(* fn) (void*) arg)
```

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- `fn`: Interrupt handler function.
- `arg`: User-supplied argument passed to the handler function.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**esp_err_t** **ledc_timer_set**

```c
ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider,
uint32_t duty_resolution, ledc_clk_src_t clk_src)
```

Configure LEDC settings.

**Return**
- (-1) Parameter error
- Other Current LEDC duty

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: Timer index (0-3), there are 4 timers in LEDC module
- `clock_divider`: Timer clock divide value, the timer clock is divided from the selected clock source
- `duty_resolution`: Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]
- `clk_src`: Select LEDC source clock.

**esp_err_t** **ledc_timer_rst**

```c
ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```

Reset LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from `ledc_timer_t`
**esp_err_t** `ledc_timer_pause` *(ledc_mode_t speed_mode, ledc_timer_t timer_sel)*

Pause LEDC timer counter.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *timer_sel*: LEDC timer index (0-3), select from `ledc_timer_t`

**esp_err_t** `ledc_timer_resume` *(ledc_mode_t speed_mode, ledc_timer_t timer_sel)*

Resume LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *timer_sel*: LEDC timer index (0-3), select from `ledc_timer_t`

**esp_err_t** `ledc_bind_channel_timer` *(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)*

Bind LEDC channel with the selected timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- *timer_sel*: LEDC timer index (0-3), select from `ledc_timer_t`

**esp_err_t** `ledc_set_fade_with_step` *(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)*

Set LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step` and `ledc_fade_start`.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- *speed_mode*: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- *channel*: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- *target_duty*: Target duty of fading \([0, (2^\text{duty_resolution}) - 1]\)
- *scale*: Controls the increase or decrease step scale.
- *cycle_num*: increase or decrease the duty every `cycle_num` cycles

**esp_err_t** `ledc_set_fade_with_time` *(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)*

Set LEDC fade function, with a limited time.
Note  Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note  `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

Note  If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [0, `(2**duty_resolution) - 1`]
- `max_fade_time_ms`: The maximum time of the fading (ms).

```c
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```
Install LEDC fade function. This function will occupy interrupt of LEDC module.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

Parameters
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void ledc_fade_func_uninstall(void)
```
Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```
Start LEDC fading.

Note  Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

Note  If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel number
- `fade_mode`: Whether to block until fading done.

```c
esp_err_t ledc_set_duty_and_update(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```
A thread-safe API to set duty for LEDC channel and return when duty updated.

Note  If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Parameters
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `duty`: Set the LEDC duty, the range of duty setting is [0, `(2**duty_resolution) - 1`]
- `hpoint`: Set the LEDC hpoint value(max: 0xfffff)
**esp_err_t** `ledc_set_fade_time_and_start` (*ledc_mode_t* `speed_mode`, *ledc_channel_t* `channel`, uint32_t `target_duty`, uint32_t `max_fade_time_ms`, *ledc_fade_mode_t* `fade_mode`)

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [0, (2**`duty_resolution`) - 1]
- `max_fade_time_ms`: The maximum time of the fading (ms).
- `fade_mode`: choose blocking or non-blocking mode

**esp_err_t** `ledc_set_fade_step_and_start` (*ledc_mode_t* `speed_mode`, *ledc_channel_t* `channel`, uint32_t `target_duty`, uint32_t `scale`, uint32_t `cycle_num`, *ledc_fade_mode_t* `fade_mode`)

A thread-safe API to set and start LEDC fade function.

**Note** Call `ledc_fade_func_install()` once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty`: Target duty of fading [0, (2**`duty_resolution`) - 1]
- `scale`: Controls the increase or decrease step scale.
- `cycle_num`: increase or decrease the duty every `cycle_num` cycles
- `fade_mode`: choose blocking or non-blocking mode

**esp_err_t** `ledc_cb_register` (*ledc_mode_t* `speed_mode`, *ledc_channel_t* `channel`, `ledc_cbs_t *cbs`, void *`user_arg`)

LEDC callback registration function.

**Note** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `cbs`: Group of LEDC callback functions
- `user_arg`: user registered data for the callback function
Structures

**struct ledc_cb_param_t**

LEDC callback parameter.

**Public Members**

*event*  
Event name

*speed_mode*  
Speed mode of the LEDC channel group

*channel*  
LEDC channel (0 - LEDC_CHANNEL_MAX-1)

*duty*  
LEDC current duty of the channel, the range of duty is \([0, (2^{\text{duty_resolution}}) - 1]\)

**struct ledc_cbs_t**

Group of supported LEDC callbacks.

**Note** The callbacks are all running under ISR environment

**Public Members**

*fade_cb*  
LEDC fade_end callback function

**Macros**

LEDC_APB_CLK_HZ

LEDC_REF_CLK_HZ

LEDC_ERR_DUTY

LEDC_ERR_VAL

**Type Definitions**

typedef *intr_handle_t* ledc_isr_handle_t

typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)

Type of LEDC event callback.

**Parameters**

- param: LEDC callback parameter
- user_arg: User registered data

**Enumerations**

enum ledc_cb_event_t

LEDC callback event type.

**Values:**

- LEDC_FADE_END_EVT

LEDC fade end event

**Header File**

- components/hal/include/hal/ledc_types.h
Structures

`struct ledc_channel_config_t`
Configuration parameters of LEDC channel for `lede_channel_config` function.

Public Members

```c
int gpio_num
    the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

lede_mode_t speed_mode
    LEDC speed speed_mode, high-speed mode or low-speed mode

lede_channel_t channel
    LEDC channel (0 - 7)

lede_intr_type_t intr_type
    configure interrupt, Fade interrupt enable or Fade interrupt disable

lede_timer_t timer_sel
    Select the timer source of channel (0 - 3)
```

```c
uint32_t duty
    LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]
```

```c
int hpoint
    LEDC channel hpoint value, the max value is 0xfffff
```

```c
unsigned int output_invert : 1
    Enable (1) or disable (0) gpio output invert
```

```c
struct ledc_channel_config_t::[anonymous] flags
    LEDC flags
```

```c
struct ledc_timer_config_t
    Configuration parameters of LEDC Timer timer for `lede_timer_config` function.
```

Public Members

```c
lede_mode_t speed_mode
    LEDC speed speed_mode, high-speed mode or low-speed mode
```

```c
lede_timer_bit_t duty_resolution
    LEDC channel duty resolution
```

```c
lede_timer_bit_t bit_num
    Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1
```

```c
lede_timer_t timer_num
    The timer source of channel (0 - 3)
```

```c
uint32_t freq_hz
    LEDC timer frequency (Hz)
```

```c
lede_clk_cfg_t clk_cfg
    Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK
```

Enumerations

`enum ledc_mode_t`
Values:
LEDC_HIGH_SPEED_MODE = 0
LEDC high speed speed_mode

LEDC_LOW_SPEED_MODE
LEDC low speed speed_mode

LEDC_SPEED_MODE_MAX
LEDC speed limit

enum ledc_intr_type_t
Values:
LEDC_INTR_DISABLE = 0
Disable LEDC interrupt
LEDC_INTR_FADE_END
Enable LEDC interrupt
LEDC_INTR_MAX

enum ledc_duty_direction_t
Values:
LEDC_DUTY_DIR_DECREASE = 0
LEDC duty decrease direction
LEDC_DUTY_DIR_INCREASE = 1
LEDC duty increase direction
LEDC_DUTY_DIR_MAX

enum ledc_slow_clk_sel_t
Values:
LEDC_SLOW_CLK_RTC8M = 0
LEDC low speed timer clock source is 8MHz RTC clock
LEDC_SLOW_CLK_APB
LEDC low speed timer clock source is 80MHz APB clock

enum ledc_clk_cfg_t
Values:
LEDC_AUTO_CLK = 0
The driver will automatically select the source clock (REF_TICK or APB) based on the giving resolution and duty parameter when init the timer
LEDC_USE_REF_TICK
LEDC timer select REF_TICK clock as source clock
LEDC_USE_APB_CLK
LEDC timer select APB clock as source clock
LEDC_USE_RTC8M_CLK
LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

enum ledc_clk_src_t
Values:
LEDC_REF_TICK = LEDC_USE_REF_TICK
LEDC timer clock divided from reference tick (1Mhz)
LEDC_APB_CLK = LEDC_USE_APB_CLK
LEDC timer clock divided from APB clock (80Mhz)

enum ledc_timer_t
Values:
LED_C_TIMER_0 = 0
  LEDC timer 0

LED_C_TIMER_1
  LEDC timer 1

LED_C_TIMER_2
  LEDC timer 2

LED_C_TIMER_3

LED_C_CHANNEL_MAX

enum ledc_timer_bit_t

Values:

LED_C_TIMER_1_BIT = 1
  LEDC PWM duty resolution of 1 bits

LED_C_TIMER_2_BIT
  LEDC PWM duty resolution of 2 bits

LED_C_TIMER_3_BIT
  LEDC PWM duty resolution of 3 bits

LED_C_TIMER_4_BIT
  LEDC PWM duty resolution of 4 bits

LED_C_TIMER_5_BIT
  LEDC PWM duty resolution of 5 bits

LED_C_TIMER_6_BIT
  LEDC PWM duty resolution of 6 bits

LED_C_TIMER_7_BIT
  LEDC PWM duty resolution of 7 bits

LED_C_TIMER_8_BIT
  LEDC PWM duty resolution of 8 bits
LEDC_TIMER_9_BIT
  LEDC PWM duty resolution of 9 bits

LEDC_TIMER_10_BIT
  LEDC PWM duty resolution of 10 bits

LEDC_TIMER_11_BIT
  LEDC PWM duty resolution of 11 bits

LEDC_TIMER_12_BIT
  LEDC PWM duty resolution of 12 bits

LEDC_TIMER_13_BIT
  LEDC PWM duty resolution of 13 bits

LEDC_TIMER_14_BIT
  LEDC PWM duty resolution of 14 bits

LEDC_TIMER_15_BIT
  LEDC PWM duty resolution of 15 bits

LEDC_TIMER_16_BIT
  LEDC PWM duty resolution of 16 bits

LEDC_TIMER_17_BIT
  LEDC PWM duty resolution of 17 bits

LEDC_TIMER_18_BIT
  LEDC PWM duty resolution of 18 bits

LEDC_TIMER_19_BIT
  LEDC PWM duty resolution of 19 bits

LEDC_TIMER_20_BIT
  LEDC PWM duty resolution of 20 bits

LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t
  Values:
    LEDC_FADE_NO_WAIT = 0
      LEDC fade function will return immediately
    LEDC_FADE_WAIT_DONE
      LEDC fade function will block until fading to the target duty
    LEDC_FADE_MAX

2.3.9 Motor Control Pulse Width Modulator (MCPWM)

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

Further in documentation the outputs of a single unit are labeled PWMxA / PWMxB.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Generator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture and Carrier.
Fig. 12: MCPWM Overview

Fig. 13: MCPWM Block Diagram
Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

![Diagram of Brushed DC Motor Control with MCPWM](image)

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.
Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

Note: Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

Note: Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) [PDF].
Synchronize

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers’ synchronization outputs or GPIO signals via the GPIO matrix. Timer’s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%-99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section Configure.

It’s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section Configure.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in timestamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler’s internal state will change twice. ISR will report on this internal state change, not the input signal.
For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected through `mcpwm_capture_config_t`.

### Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.

2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

![Diagram of Brushless DC Motor Control with MCPWM](image-url)
The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`. Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

**Carrier**

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see [ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule](PDF).

To disable carrier functionality call `mcpwm_carrier_disable()`.

**Interrupts**

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

**Resolution**

The default resolution for MCPWM group and MCPWM timer are configured to 10MHz and 1MHz in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

Note that, these two APIs won’t update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

**Application Example**

MCPWM example are located under: `peripherals/mcpwm`:

- Control of BLDC (brushless DC) motor with hall sensor feedback - `peripherals/mcpwm/mcpwm_bldc_hall_control`
- Brushed DC motor control - `peripherals/mcpwm/mcpwm_brushed_dc_control`
- Servo motor control - `peripherals/mcpwm/mcpwm_servo_control`
- HC-SR04 sensor with capture - `peripherals/mcpwm/mcpwm_capture_hc_sr04`

Enumerations

enum mcpwm_timer_direction_t

Values:

MCPWM_TIMER_DIRECTION_UP
Counting direction: Increase

MCPWM_TIMER_DIRECTION_DOWN
Counting direction: Decrease

enum mcpwm_timer_event_t

Values:

MCPWM_TIMER_EVENT_ZERO
MCPWM timer counts to zero

MCPWM_TIMER_EVENT_PEAK
MCPWM timer counts to peak

enum mcpwm_timer_count_mode_t

Values:

MCPWM_TIMER_COUNT_MODE_PAUSE
MCPWM timer paused

MCPWM_TIMER_COUNT_MODE_UP
MCPWM timer counting up

MCPWM_TIMER_COUNT_MODE_DOWN
MCPWM timer counting down

MCPWM_TIMER_COUNT_MODE_UP_DOWN
MCPWM timer counting up and down

enum mcpwm_timer_execute_cmd_t

Values:

MCPWM_TIMER_STOP_AT_ZERO
MCPWM timer stops when counting to zero

MCPWM_TIMER_STOP_AT_PEAK
MCPWM timer stops when counting to peak

MCPWM_TIMER_START_NO_STOP
MCPWM timer starts counting

MCPWM_TIMER_START_STOP_AT_ZERO
MCPWM timer starts counting and stops when counting to zero

MCPWM_TIMER_START_STOP_AT_PEAK
MCPWM timer starts counting and stops when counting to peak

enum mcpwm_generator_action_t

Values:

MCPWM_GEN_ACTION_KEEP
Generator action: Keep the same level

MCPWM_GEN_ACTION_LOW
Generator action: Force to low level
Chapter 2. API Reference

**MCPWM_GEN_ACTION_HIGH**
Generator action: Force to high level

**MCPWM_GEN_ACTION_TOGGLE**
Generator action: Toggle level

```c
enum mcpwm_trip_type_t
Values:
MCPWM_TRIP_TYPE_CBC
CBC trip type, shut down the operator cycle by cycle
MCPWM_TRIP_TYPE_OST
OST trip type, shut down the operator in one shot
```

**Header File**

- components/driver/include/driver/mcpwm.h

**Functions**

```c
esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
This function initializes each gpio signal for MCPWM.
Note: This function initializes one gpio at a time.
Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters:
- mcpwm_num: set MCPWM unit (0-1)
- io_signal: set MCPWM signals, each MCPWM unit has 6 output (MCPWMXA, MCPWMXB) and 9 input (SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num (0-2)
- gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16
```

```c
esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
Initialize MCPWM gpio structure.
Note: This function initialize a group of MCPWM GPIOs at a time.
Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters:
- mcpwm_num: set MCPWM unit (0-1)
- mcpwm_pin: MCPWM pin structure
```

```c
esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)
Initialize MCPWM parameters.
Note: The default resolution configured for MCPWM group and timer are 160M / 16 = 10M and 10M / 10 = 1M The default resolution can be changed by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution(), before calling this function.
Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters:
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers.
- mcpwm_conf: configure structure mcpwm_config_t
```

```c
esp_err_t mcpwm_group_set_resolution(mcpwm_unit_t mcpwm_num, unsigned long int resolution)
Set resolution of the MCPWM group.
```
Note This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- resolution: set expected frequency resolution

```c
esp_err_t mcpwm_timer_set_resolution(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, unsigned long int resolution)
```
Set resolution of each timer.

Note This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- resolution: set expected frequency resolution

```c
esp_err_t mcpwm_set_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)
```
Set frequency(in Hz) of MCPWM timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

```c
esp_err_t mcpwm_set_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)
```
Set duty cycle of each operator(MCPWMXA/MCPWMXB)

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty: set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

```c
esp_err_t mcpwm_set_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)
```
Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty_in_us: set duty value in microseconds of each operator

```c
esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)
```
Set duty either active high or active low (out of phase/inverted)

**Note** Call this function every time after `mcpwm_set_signal_high` or `mcpwm_set_signal_low` to resume with previously set duty cycle

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- `duty_type`: set active low or active high duty type

```c
uint32_t mcpwm_get_frequency (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Get frequency of timer.

**Return**
- frequency of timer

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
float mcpwm_get_duty (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```
Get duty cycle of each operator.

**Return**
- duty cycle in % of each operator (56.7 means duty is 56.7%)

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

```c
uint32_t mcpwm_get_duty_in_us (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```
Get duty cycle of each operator in us.

**Return**
- duty cycle in us of each operator

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

```c
esp_err_t mcpwm_set_signal_high (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```
Use this function to set MCPWM signal high.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_set_signal_low (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```
Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
Chapter 2. API Reference

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator (MCPWMA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_start(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)
```
Initialize carrier configuration.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf`: configure structure `mcpwm_carrier_config_t`

```c
esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Enable MCPWM carrier submodule, for respective timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Disable MCPWM carrier submodule, for respective timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)
```
Set period of carrier.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• `mcpwm_num`: set MCPWM unit (0-1)
• `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
• `carrier_period`: set the carrier period of each timer, `carrier_period = (carrier_period + 1) * 800ns` (carrier_period <= 15)

```c
esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)
```

Set duty cycle of carrier.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_duty`: set duty cycle of carrier, `carrier_duty = carrier_duty * 12.5%` (chop_duty <= 7)

```c
esp_err_t mcpwm_carrier_oneshot_mode_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)
```

Enable and set width of first pulse in carrier oneshot mode.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `pulse_width`: set pulse width of first pulse in oneshot mode, `width = (carrier_period + 1) * (pulse_width + 1)` (pulse_width <= 15)

```c
esp_err_t mcpwm_carrier_oneshot_mode_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable oneshot mode, width of first pulse = carrier period.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_output_invert(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)
```

Enable or disable carrier output inversion.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_ivt_mode`: enable or disable carrier output inversion

```c
esp_err_t mcpwm_deadtime_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)
```

Enable and initialize deadtime for each MCPWM timer.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
Chapter 2. API Reference

- **dt_mode**: set deadtime mode
- **red**: set rising edge delay = red*100ns
- **fed**: set rising edge delay = fed*100ns

```c
esp_err_t mcpwm_deadtime_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Disable deadtime on MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **mcpwm_num**: set MCPWM unit(0-1)
- **timer_num**: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_fault_init(mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level, mcpwm_fault_signal_t fault_sig)
```
Initialize fault submodule, currently low level triggering is not supported.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **mcpwm_num**: set MCPWM unit(0-1)
- **input_level**: set fault signal level, which will cause fault to occur
- **fault_sig**: set the fault pin, which needs to be enabled

```c
esp_err_t mcpwm_fault_set_oneshot_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```
Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

**Note** currently low level triggering is not supported

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **mcpwm_num**: set MCPWM unit(0-1)
- **timer_num**: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **fault_sig**: set the fault pin, which needs to be enabled for oneshot mode
- **action_on_pwmxa**: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- **action_on_pwmxb**: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```
Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

**Note** currently low level triggering is not supported

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **mcpwm_num**: set MCPWM unit(0-1)
- **timer_num**: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- **fault_sig**: set the fault pin, which needs to be enabled for cyc mode
- **action_on_pwmxa**: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
Chapter 2. API Reference

- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)
```

Disable fault signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `fault_sig`: fault pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig,
                                mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)
```

Initialize capture submodule.

**Note** Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by `mcpwm_isr_register`, and in there, query the capture data.

**Note** The capture timer uses APB_CLK (typically 80MHz) as the count source.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_edge`: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- `cap_sig`: capture pin, which needs to be enabled
- `num_of_pulse`: Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

```c
esp_err_t mcpwm_capture-disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Disable capture signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable_channel(mcpwm_unit_t mcpwm_num,
                                       mcpwm_capture_channel_id_t cap_channel, const mcpwm_capture_config_t *cap_conf)
```

Enable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be enabled
- `cap_conf`: capture channel configuration

```c
esp_err_t mcpwm_capture-disable_channel(mcpwm_unit_t mcpwm_num,
                                       mcpwm_capture_channel_id_t cap_channel)
```

Disable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be disabled
uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)

Get capture value.

Return Captured value

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • cap_sig: capture channel on which value is to be measured

uint32_t mcpwm_capture_signal_get_edge(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)

Get edge of capture signal.

Return Capture signal edge: 1 - positive edge, 2 - negative edge

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • cap_sig: capture channel of whose edge is to be determined

esp_err_t mcpwm_sync_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

Note Count direction is undefined within this API

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
  • sync_sig: set the synchronization input signal
  • phase_val: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

esp_err_t mcpwm_sync_configure(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_sync_config_t *sync_conf)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
  • sync_conf: sync configuration on this timer

esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable sync submodule on given timer.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_set_timer_sync_output(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_timer_sync_trigger_t trigger)

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
**Chapter 2. API Reference**

- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- trigger: set the trigger that will cause the timer to generate a software sync signal. Specifically, MCPWM_SWSYNC_SOURCE_DISABLED will disable the timer from generating sync signal.

```c
esp_err_t mcpwm_timer_trigger_soft_sync(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Trigger a software sync event and sends it to a specific timer.

**Note** This software sync event will have the same effect as hw one, except that:
- On esp32s3 the soft sync event can be routed to its output if MCPWM_SWSYNC_SOURCE_SYNCIN is selected via mcpwm_set_timer_sync_output()
- On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_sync_invert_gpio_synchro(mcpwm_unit_t mcpwm_num, mcpwm_sync_signal_t sync_sig, bool invert)
```

Set external GPIO sync input inverter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- sync_sig: set sync signal of MCPWM, only supports GPIO sync signal
- invert: whether GPIO sync source input is inverted (to get negative edge trigger)

```c
esp_err_t mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void(* fn) void *, void *arg, int intr_alloc_flags, intr_handle_t *handle)
```

Register MCPWM interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- fn: interrupt handler function.
- arg: user-supplied argument passed to the handler function.
- intr_alloc_flags: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. see esp_intr_alloc.h for more info.
- handle: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Structures**

```c
struct mcpwm_pin_config_t
```

pin number for MCPWM

**Public Members**

- int mcpwm0a_out_num
  - MCPWM0A out pin

struct cap_event_data_t
   event data that will be passed into ISR callback

Public Members

mcpwm_capture_on_edge_t cap_edge
   Which signal edge is detected

uint32_t cap_value
   Corresponding timestamp when event occurs. Clock rate = APB (usually 80M)

struct mcpwm_config_t
   MCPWM config structure.

Public Members

uint32_t frequency
   Set frequency of MCPWM in Hz

float cmpr_a
   Set % duty cycle for operator a (MCPWMXA), i.e. for 62.3% duty cycle, duty_a = 62.3

float cmpr_b
   Set % duty cycle for operator b (MCPWMXB), i.e. for 48% duty cycle, duty_b = 48.0

mcpwm_duty_type_t duty_mode
   Set type of duty cycle

mcpwm_counter_type_t counter_mode
   Set type of MCPWM counter
struct mcpwm_carrier_config_t
MCPWM carrier configuration structure.

Public Members

uint8_t carrier_period
Set carrier period = (carrier_period + 1) \* 800ns, carrier_period should be < 16

uint8_t carrier_duty
Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)

uint8_t pulse_width_in_os
Set pulse width of first pulse in one shot mode = (carrier period) \* (pulse_width_in_os + 1), should be less than 16

mcpwm_carrier_os_t carrier_os_mode
Enable or disable carrier oneshot mode

mcpwm_carrier_out_ivt_t carrier_ivt_mode
Invert output of carrier

struct mcpwm_capture_config_t
MCPWM config capture structure.

Public Members

mcpwm_capture_on_edge_t cap_edge
Set capture edge

uint32_t cap_prescale
Prescale of capture signal, ranging from 1 to 256

cap_isr_cb_t capture_cb
User defined capture event callback, running under interrupt context

void *user_data
User defined ISR callback function args

struct mcpwm_sync_config_t
MCPWM config sync structure.

Public Members

mcpwm_sync_signal_t sync_sig
Set sync input signal that will cause timer to sync

uint32_t timer_val
Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak

mcpwm_timer_direction_t count_direction
Counting direction to be set after sync

Macros

MCPWM_OPR_A
MCPWM_OPR_B
MCPWM_OPR_MAX
MCPWM_SELCT_SYNC0
MCPWM_SELCT_SYNC1
MCPWM_SELCT_SYNC2

Type Definitions
typedef mcpwm_generator_t mcpwm_operator_t
typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t
typedef mcpwm_output_action_t mcpwm_action_on_pwmxb_t
typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t

MCPWM capture channel ID alias.
typedef bool (*cap_isr_cb_t) (mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel,
const cap_event_data_t *edata, void *user_data)

Type of capture event callback.

Note Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR(usually has '_ISR' postfix)

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Parameters
• mcpwm: MCPWM unit(0-1)
• cap_channel: capture channel ID
• edata: Capture event data, contains capture edge and capture value, fed by the driver
• user_data: User registered data, passed from mcpwm_capture_config_t

Enumerations
typedef enum mcpwm_io_signals_t

IO signals for the MCPWM.

• 6 MCPWM output pins that generate PWM signals
• 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
• 3 MCPWM sync input pins to synchronize MCPWM outputs signals
• 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A = 0
PWM0A output pin

MCPWM0B
PWM0B output pin

MCPWM1A
PWM1A output pin

MCPWM1B
PWM1B output pin

MCPWM2A
PWM2A output pin

Submit Document Feedback
MCPWM2B
PWM2B output pin

MCPWM_SYNC_0
SYNC0 input pin

MCPWM_SYNC_1
SYNC1 input pin

MCPWM_SYNC_2
SYNC2 input pin

MCPWM_FAULT_0
FAULT0 input pin

MCPWM_FAULT_1
FAULT1 input pin

MCPWM_FAULT_2
FAULT2 input pin

MCPWM_CAP_0 = 84
CAP0 input pin

MCPWM_CAP_1
CAP1 input pin

MCPWM_CAP_2
CAP2 input pin

enum mcpwm_unit_t
Select MCPWM unit.

Values:

MCPWM_UNIT_0
MCPWM unit 0 selected

MCPWM_UNIT_1
MCPWM unit 1 selected

MCPWM_UNIT_MAX
Max number of MCPWM units

enum mcpwm_timer_t
Select MCPWM timer.

Values:

MCPWM_TIMER_0
Select MCPWM timer 0

MCPWM_TIMER_1
Select MCPWM timer 1

MCPWM_TIMER_2
Select MCPWM timer 2

MCPWM_TIMER_MAX
Max number of timers in a unit

enum mcpwm_generator_t
Select MCPWM operator.

Values:

MCPWM_GEN_A
Select MCPWMA, where ‘X’ is operator number

MCPWM_GEN_B
Select MCPWMXB, where ‘X’ is operator number
**MCPWM_GEN_MAX**
Num of generators to each operator of MCPWM

**enum mcpwm_carrier_os_t**
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

*Values:*

- **MCPWM_ONESHOT_MODE_DIS**
  Enable oneshot mode
- **MCPWM_ONESHOT_MODE_EN**
  Disable oneshot mode

**enum mcpwm_carrier_out_ivt_t**
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

*Values:*

- **MCPWM_CARRIER_OUT_IVT_DIS**
  Enable carrier output inversion
- **MCPWM_CARRIER_OUT_IVT_EN**
  Disable carrier output inversion

**enum mcpwm_fault_signal_t**
MCPWM select fault signal input.

*Values:*

- **MCPWM_SELECT_F0**
  Select F0 as input
- **MCPWM_SELECT_F1**
  Select F1 as input
- **MCPWM_SELECT_F2**
  Select F2 as input

**enum mcpwm_sync_signal_t**
MCPWM select sync signal input.

*Values:*

- **MCPWM_SELECT_NO_INPUT**
  No sync input selected
- **MCPWM_SELECT_TIMER0_SYNC**
  Select software sync signal from timer0 as input
- **MCPWM_SELECT_TIMER1_SYNC**
  Select software sync signal from timer1 as input
- **MCPWM_SELECT_TIMER2_SYNC**
  Select software sync signal from timer2 as input
- **MCPWM_SELECT_GPIO_SYNC0**
  Select GPIO SYNC0 as input
- **MCPWM_SELECT_GPIO_SYNC1**
  Select GPIO SYNC1 as input
- **MCPWM_SELECT_GPIO_SYNC2**
  Select GPIO SYNC2 as input

**enum mcpwm_timer_sync_trigger_t**
MCPWM timer sync event trigger.

*Values:*

Chapter 2. API Reference

**MCPWM_SWSYNC_SOURCE_SYNCIN**
the input sync signal will be routed to its sync output path

**MCPWM_SWSYNC_SOURCE_TEZ**
sync signal generated when timer counts to zero

**MCPWM_SWSYNC_SOURCE_TEP**
sync signal generated when timer counts to peak

**MCPWM_SWSYNC_SOURCE_DISABLED**
timer does not generate sync signals

```c
enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.
Values:
MCPWM_LOW_LEVEL_TGR
  Fault condition occurs when fault input signal goes from high to low
MCPWM_HIGH_LEVEL_TGR
  Fault condition occurs when fault input signal goes low to high
```

```c
enum mcpwm_capture_on_edge_t
MCPWM select capture starts from which edge.
Values:
MCPWM_NEG_EDGE = BIT(0)
  Capture the negative edge
MCPWM_POS_EDGE = BIT(1)
  Capture the positive edge
MCPWM_BOTH_EDGE = BIT(1) | BIT(0)
  Capture both edges
```

```c
enum mcpwm_intr_t
Interrupt masks for MCPWM capture.
Values:
MCPWM_LL_INTR_CAP0 = BIT(27)
  Capture 0 happened.
MCPWM_LL_INTR_CAP1 = BIT(28)
  Capture 1 happened.
MCPWM_LL_INTR_CAP2 = BIT(29)
  Capture 2 happened.
```

```c
enum mcpwm_counter_type_t
Select type of MCPWM counter.
Values:
MCPWM_FREEZE_COUNTER
  Counter freeze
MCPWM_UP_COUNTER
  For asymmetric MCPWM
MCPWM_DOWN_COUNTER
  For asymmetric MCPWM
MCPWM_UP_DOWN_COUNTER
  For symmetric MCPWM, frequency is half of MCPWM frequency set
MCPWM_COUNTER_MAX
  Maximum counter mode
```
**enum mcpwm_duty_type_t**

Select type of MCPWM duty cycle mode.

*Values:*

- **MCPWM_DUTY_MODE_0** = 0
  - Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

- **MCPWM_DUTY_MODE_1**
  - Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

- **MCPWM_HAL_GENERATOR_MODE_FORCE_LOW**
- **MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH**

- **MCPWM_DUTY_MODE_MAX**
  - Num of duty cycle modes

**enum mcpwm_deadtime_type_t**

MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

*Values:*

- **MCPWM_DEADTIME_BYPASS** = 0
  - Bypass the deadtime

- **MCPWM_BYPASS_RED**
  - MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

- **MCPWM_BYPASS_FED**
  - MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

- **MCPWM_ACTIVE_HIGH_MODE**
  - MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

- **MCPWM_ACTIVE_LOW_MODE**
  - MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

- **MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE**
  - MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

- **MCPWM_ACTIVE_LOW_COMPLIMENT_MODE**
  - MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

- **MCPWM_ACTIVE_RED_FED_FROM_PWMXA**
  - MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

- **MCPWM_ACTIVE_RED_FED_FROM_PWMXB**
  - MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

- **MCPWM_DEADTIME_TYPE_MAX**
  - Maximum number of supported dead time modes

**enum mcpwm_output_action_t**

MCPWM select action to be taken on the output when event happens.

*Values:*
MCPWM\_ACTION\_NO\_CHANGE = 0
No change in the output

MCPWM\_ACTION\_FORCE\_LOW
Make output low

MCPWM\_ACTION\_FORCE\_HIGH
Make output high

MCPWM\_ACTION\_TOGGLE
Make output toggle

enum mcpwm\_capture\_signal\_t
MCPWM select capture signal input.

Values:

MCPWM\_SELECT\_CAP0
Select CAP0 as input

MCPWM\_SELECT\_CAP1
Select CAP1 as input

MCPWM\_SELECT\_CAP2
Select CAP2 as input

2.3.10 Pulse Counter (PCNT)

Introduction
The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview
Description of functionality of this API has been broken down into four sections:

- **Configuration** - describes counter’s configuration parameters and how to setup the counter.
- **Operating the Counter** - provides information on control functions to pause, measure and clear the counter.
- **Filtering Pulses** - describes options to filtering pulses and the counter control signals.
- **Using Interrupts** - presents how to trigger interrupts on specific states of the counter.

Configuration
The PCNT module has 8 independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt\_unit\_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt\_channel\_t`.

The configuration is provided separately per unit’s channel using `pcnt\_config\_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt\_ctrl\_mode\_t` and `pcnt\_count\_mode\_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.
Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Operating the Counter**

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`.

To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

**Filtering Pulses**

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

**Using Interrupts**

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in Configuration
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

**Application Example**

- Pulse counter with control signal and event interrupt example: `peripherals/pcnt/pulse_count_event`.
- Parse the signal generated from rotary encoder: `peripherals/pcnt/rotary_encoder`.
API Reference

Header File

- components/driver/include/driver/pcnt.h

Functions

**esp_err_t pcnt_unit_config(/** const pcnt_config_t *pcnt_config)
**
Configure Pulse Counter unit.

*Note* This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

*Return*

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

*Parameters*

- pcnt_config: Pointer of Pulse Counter unit configure parameter

**esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)
**
Get pulse counter value.

*Return*

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

*Parameters*

- pcnt_unit: Pulse Counter unit number
- count: Pointer to accept counter value

**esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)
**
Pause PCNT counter of PCNT unit.

*Return*

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

*Parameters*

- pcnt_unit: PCNT unit number

**esp_err_t pcnt_counter_resume(pcnt_unit_t pcnt_unit)
**
Resume counting for PCNT counter.

*Return*

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

*Parameters*

- pcnt_unit: PCNT unit number, select from pcnt_unit_t

**esp_err_t pcnt_counter_clear(pcnt_unit_t pcnt_unit)
**
Clear and reset PCNT counter value to zero.

*Return*

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

*Parameters*

- pcnt_unit: PCNT unit number, select from pcnt_unit_t

**esp_err_t pcnt_intr_enable(pcnt_unit_t pcnt_unit)
**
Enable PCNT interrupt for PCNT unit.
Note Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with `pcnt_event_enable()` and `pcnt_event_disable()`

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `pcnt_unit`: PCNT unit number

`esp_err_t pcnt_intr_disable (pcnt_unit_t pcnt_unit)`
Disable PCNT interrupt for PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `pcnt_unit`: PCNT unit number

`esp_err_t pcnt_event_enable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)`
Enable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

`esp_err_t pcnt_event_disable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)`
Disable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

`esp_err_t pcnt_set_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t value)`
Set PCNT event value of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Counter value for PCNT event

`esp_err_t pcnt_get_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t *value)`
Get PCNT event value of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

Parameters

- **unit**: PCNT unit number
- **evt_type**: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- **value**: Pointer to accept counter value for PCNT event

`esp_err_t pcnt_get_event_status (pcnt_unit_t unit, uint32_t *status)`

Get PCNT event status of PCNT unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **unit**: PCNT unit number
- **status**: Pointer to accept event status word

`esp_err_t pcnt_isr_unregister (pcnt_isr_handle_t handle)`

Unregister PCNT interrupt handler (registered by pcnt_isr_register), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by pcnt_isr_service_install, please call pcnt_isr_service_uninstall instead.

Return

- ESP_OK Success
- ESP_ERR_NOT_FOUND Cannot find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- **handle**: handle to unregister the ISR service.

`esp_err_t pcnt_isr_register (void (*fn) (void]*)` void *

, void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle) Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use pcnt_isr_service_install if this function was called.

Return

- ESP_OK Success
- ESP_ERR_NOT_FOUND Cannot find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters

- **fn**: Interrupt handler function.
- **arg**: Parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling pcnt_isr_unregister to unregister this ISR service if needed, but only if the handle is not NULL.

`esp_err_t pcnt_set_pin (pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)`

Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to PCNT_PIN_NOT_USED if unused.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **unit**: PCNT unit number
- **channel**: PCNT channel number
- **pulse_io**: Pulse signal input GPIO
- **ctrl_io**: Control signal input GPIO

`esp_err_t pcnt_filter_enable (pcnt_unit_t unit)`

Enable PCNT input filter.
Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `unit`: PCNT unit number

`esp_err_t pcnt_filter_disable (pcnt_unit_t unit)`
Disable PCNT input filter.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `unit`: PCNT unit number

`esp_err_t pcnt_set_filter_value (pcnt_unit_t unit, uint16_t filter_val)`
Set PCNT filter value.

**Note** filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `unit`: PCNT unit number
- `filter_val`: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

`esp_err_t pcnt_get_filter_value (pcnt_unit_t unit, uint16_t* filter_val)`
Get PCNT filter value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `unit`: PCNT unit number
- `filter_val`: Pointer to accept PCNT filter value.

`esp_err_t pcnt_set_mode (pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode, pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)`
Set PCNT counter mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `unit`: PCNT unit number
- `channel`: PCNT channel number
- `pos_mode`: Counter mode when detecting positive edge
- `neg_mode`: Counter mode when detecting negative edge
- `hctrl_mode`: Counter mode when control signal is high level
- `lctrl_mode`: Counter mode when control signal is low level

`esp_err_t pcnt_isr_handler_add (pcnt_unit_t unit, void (*isr_handler) (void *, void *) args) void *` Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service.
Chapter 2. API Reference

The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- isr_handler: Interrupt handler function.
- args: Parameter for handler function

```c
esp_err_t pcnt_isr_service_install (int intr_alloc_flags)
```
Install PCNT ISR service.

Note We can manage different interrupt service for each unit. This function will use the default ISR handle service. Calling pcnt_isr_service_uninstall to uninstall the default service if needed. Please do not use pcnt_isr_register if this function was called.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

Parameters
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void pcnt_isr_service_uninstall (void)
```
Uninstall PCNT ISR service, freeing related resources.

```c
esp_err_t pcnt_isr_handler_remove (pcnt_unit_t unit)
```
Delete ISR handler for specified unit.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number

Structures

```c
struct pcnt_config_t
```
Pulse Counter configuration for a single channel.

Public Members

```c
int pulse_gpio_num
```
Pulse input GPIO number, if you want to use GPIO16, enter pulse_gpio_num = 16, a negative value will be ignored

```c
int ctrl_gpio_num
```
Control signal input GPIO number, a negative value will be ignored

```c
pcnt_ctrl_mode_t lctrl_mode
```
PCNT low control mode

```c
pcnt_ctrl_mode_t hctrl_mode
```
PCNT high control mode
### Chapter 2. API Reference

#### `pcnt_count_mode_t` types

- **pos_mode**: PCNT positive edge count mode
- **neg_mode**: PCNT negative edge count mode

#### `int16_t` types

- **counter_h_lim**: Maximum counter value
- **counter_l_lim**: Minimum counter value

#### `pcnt_unit_t` types

- **unit**: PCNT unit number

#### `pcnt_channel_t` types

- **channel**: the PCNT channel

#### Macros

- **PCNT_PIN_NOT_USED**: When selected for a pin, this pin will not be used
- **PCNT_MODE_KEEP**: Control mode: won’t change counter mode
- **PCNT_MODE_REVERSE**: Control mode: invert counter mode (increase -> decrease, decrease -> increase)
- **PCNT_MODE_DISABLE**: Control mode: Inhibit counter (counter value will not change in this condition)
- **PCNT_MODE_MAX**: Counter mode: Inhibit counter (counter value will not change in this condition)
- **PCNT_COUNT_DIS**: Counter mode: Inhibit counter (counter value will not change in this condition)
- **PCNT_CTRL_MODE_MAX**: Counter mode: Increase counter value
- **PCNT_CTRL_MODE_MIN**: Counter mode: Decrease counter value

#### Type Definitions

- **typedef intr_handle_t pcnt_isr_handle_t**
- **typedef pcnt_channel_level_action_t pcnt_ctrl_mode_t**

Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.

**Note**: Configuration covers two actions, one for high, and one for low level on the control input.

- **typedef pcnt_channel_edge_action_t pcnt_cnt_mode_t**

Selection of available modes that determine the counter’s action on the edge of the pulse signal’s input GPIO.

**Note**: Configuration covers two actions, one for positive, and one for negative edge on the pulse input.

#### Enumerations

- **enum pcnt_port_t**

  PCNT port number, the max port number is (PCNT_PORT_MAX - 1).

  **Values**:

  - **PCNT_PORT_0**: PCNT port 0
**Chapter 2. API Reference**

**PCNT_PORT_MAX**
PCNT port max

**enum pcnt_unit_t**
Selection of all available PCNT units.

Values:
- **PCNT_UNIT_0**
  PCNT unit 0
- **PCNT_UNIT_1**
  PCNT unit 1
- **PCNT_UNIT_2**
  PCNT unit 2
- **PCNT_UNIT_3**
  PCNT unit 3
- **PCNT_UNIT_4**
  PCNT unit 4
- **PCNT_UNIT_5**
  PCNT unit 5
- **PCNT_UNIT_6**
  PCNT unit 6
- **PCNT_UNIT_7**
  PCNT unit 7
- **PCNT_UNIT_MAX**

**enum pcnt_channel_t**
Selection of channels available for a single PCNT unit.

Values:
- **PCNT_CHANNEL_0**
  PCNT channel 0
- **PCNT_CHANNEL_1**
  PCNT channel 1
- **PCNT_CHANNEL_MAX**

**enum pcnt_evt_type_t**
Selection of counter’s events that may trigger an interrupt.

Values:
- **PCNT_EVT_THRES_1 = 1 << 2**
  PCNT watch point event: threshold1 value event
- **PCNT_EVT_THRES_0 = 1 << 3**
  PCNT watch point event: threshold0 value event
- **PCNT_EVT_L_LIM = 1 << 4**
  PCNT watch point event: Minimum counter value
- **PCNT_EVT_H_LIM = 1 << 5**
  PCNT watch point event: Maximum counter value
- **PCNT_EVT_ZERO = 1 << 6**
  PCNT watch point event: counter value zero event
- **PCNT_EVT_MAX**
Header File

- components/hal/include/hal/pcnt_types.h

Enumerations

enum pcnt_channel_level_action_t
PCNT channel action on control level.

Values:

  PCNT_CHANNEL_LEVEL_ACTION_KEEP
  Keep current count mode

  PCNT_CHANNEL_LEVEL_ACTION_INVERSE
  Invert current count mode (increase -> decrease, decrease -> increase)

  PCNT_CHANNEL_LEVEL_ACTION_HOLD
  Hold current count value

enum pcnt_channel_edge_action_t
PCNT channel action on signal edge.

Values:

  PCNT_CHANNEL_EDGE_ACTION_HOLD
  Hold current count value

  PCNT_CHANNEL_EDGE_ACTION_INCREASE
  Increase count value

  PCNT_CHANNEL_EDGE_ACTION_DECREASE
  Decrease count value

enum pcnt_unit_count_sign_t
PCNT unit counter value’s sign.

Values:

  PCNT_UNIT_COUNT_SIGN_ZERO_POS
  positive value to zero

  PCNT_UNIT_COUNT_SIGN_ZERO_NEG
  negative value to zero

  PCNT_UNIT_COUNT_SIGN_NEG
  counter value negative

  PCNT_UNIT_COUNT_SIGN_POS
  counter value positive

2.3.11 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to the flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There are only couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
Fig. 16: RMT Transmitter Overview

Fig. 17: RMT Receiver Overview
4. Use Interrupts

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

Common Parameters

- The **channel** to be configured, select one from the `rmt_channel_t` enumerator.
- The **RMT operation mode** - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` member to one of the values from `rmt_mode_t`.
- What is the **pin number** to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many **memory blocks** will be used by the channel, set with `mem_block_num`.
- Extra miscellaneous parameters for the channel can be set in the **flags**.
  - When `RMT_CHANNEL_FLAGS_AWARE_DFS` is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See `power_management` for more information.
  - When `RMT_CHANNEL_FLAGS_INVERT_SIG` is set, the driver will invert the RMT signals sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within [1..255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when `RMT_CHANNEL_FLAGS_AWARE_DFS` is set in `flags`, RMT source clock is changed to REF_TICK or XTAL.

**Note:** The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in **Transmit Mode** or **Receive Mode**:

**Transmit Mode** When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
- Enable the RMT output if idle - `idle_output_en`
- Set the signal level on the RMT output if idle - `idle_level`

**Receive Mode** In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - `filter_en`
- A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.
Finalize Configuration  Once the \textit{rmt\_config\_t} structure is populated with parameters, it should be then invoked with \textit{rmt\_config()} to make the configuration effective.

The last configuration step is installation of the driver in memory by calling \textit{rmt\_driver\_install()}. If \textit{rx\_buf\_size} parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in \textit{Use Interrupts}.

Now, depending on how the channel is configured, we are ready to either \textit{Transmit Data} or \textit{Receive Data}. This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure \textit{rmt\_item32\_t}. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

![Fig. 18: Structure of RMT items (L - signal level)](image)

For a simple example how to define a block of items see \texttt{peripherals/rmt/morse\_code}.

The items are provided to the RMT controller by calling function \textit{rmt\_write\_items()}. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling \textit{rmt\_wait\_tx\_done()}. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling \textit{rmt\_fill\_tx\_items()}. In this case transmission is not started automatically. To control the transmission process use \textit{rmt\_tx\_start()} and \textit{rmt\_tx\_stop()}. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see \textit{rmt\_set\_mem\_block\_num()}.  

Receive Data

\begin{boxedverbatim}
Warning:  RMT RX channel can’t receive packet whose items are larger than its memory block size. If you set the memory block number to 1, then this RX channel can’t receive packet with more than 64 items. This is a hardware limitation.
\end{boxedverbatim}
Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

**Change Operation Parameters**

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

**Parameters Common to Transmit and Receive Mode**

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

**Transmit Mode Parameters**

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

**Receive Mode Parameters**

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

**Use Interrupts**

Registering of an interrupt handler for the RMT controller is done be calling `rmt_isr_register()`.

---

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
Chapter 2. API Reference

- The number of events the transmitter has sent matches a threshold value \texttt{rmt\_set\_tx\_thr\_intr\_en()}
- Ownership to the RMT memory block has been violated \texttt{rmt\_set\_err\_intr\_en()}

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling \texttt{rmt\_set\_intr\_enable\_mask()} or \texttt{rmt\_clr\_intr\_enable\_mask()}.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as \texttt{RMT.int\_clr.val.chN\_event\_name} and defined as a volatile struct in \texttt{soc/esp32/include/soc/rmt\_struct.h}, where \text{N} is the RMT channel number \([0, n]\) and the \text{event\_name} is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function \texttt{rmt\_isr\_deregister()}.

\begin{tabular}{|p{0.9\textwidth}|}
\hline
**Warning:** It’s not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called \texttt{rmt\_driver\_isr\_default}. Instead, if what you want is to get a notification when transaction is done, go ahead with \texttt{rmt\_register\_tx\_end\_callback()}.  
\hline
\end{tabular}

Uninstall Driver

If the RMT driver has been installed with \texttt{rmt\_driver\_install()} for some specific period of time and then not required, the driver may be removed to free allocated resources by calling \texttt{rmt\_driver\_uninstall()}.

Application Examples

- Using RMT to send morse code: \texttt{peripherals/rmt/morse\_code}.
- Using RMT to drive RGB LED strip: \texttt{peripherals/rmt/led\_strip}.
- NEC remote control TX and RX example: \texttt{peripherals/rmt/ir\_protocols}.
- Musical buzzer example: \texttt{peripherals/rmt/musical\_buzzer}.

API Reference

Header File

- \texttt{components/driver/include/driver/rmt.h}

Functions

\begin{verbatim}
\texttt{esp\_err\_t rmt\_set\_clk\_div(rmt\_channel\_t channel, uint8\_t div\_cnt)}
\end{verbatim}

Set RMT clock divider, channel clock is divided from source clock.

Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

Parameters

- channel: RMT channel
- div\_cnt: RMT counter clock divider

\begin{verbatim}
\texttt{esp\_err\_t rmt\_get\_clk\_div(rmt\_channel\_t channel, uint8\_t *div\_cnt)}
\end{verbatim}

Get RMT clock divider, channel clock is divided from source clock.

Return

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

Parameters

- channel: RMT channel
- div\_cnt: pointer to accept RMT counter divider
**esp_err_t rmt_set_rx_idle_thresh** (rmt_channel_t channel, uint16_t thresh)

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: RMT RX idle threshold

**esp_err_t rmt_get_rx_idle_thresh** (rmt_channel_t channel, uint16_t *thresh)

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

**esp_err_t rmt_set_mem_block_num** (rmt_channel_t channel, uint8_t rmt_mem_num)

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * 4 * n, and end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 + RMT_MEM_SIZE_CHn mod 512 * 4

**Note** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: RMTRX memory block number, one block has 64 * 32 bits.

**esp_err_t rmt_get_mem_block_num** (rmt_channel_t channel, uint8_t *rmt_mem_num)

Get RMT memory block number.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: Pointer to accept RMT RX memory block number

**esp_err_t rmt_set_tx_carrier** (rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.
Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• carrier_en: Whether to enable output carrier.
• high_level: High level duration of carrier.
• low_level: Low level duration of carrier.
• carrier_level: Configure the way carrier wave is modulated for channel.
  – 1'b1: transmit on low output level
  – 1'b0: transmit on high output level

`esp_err_t rmt_set_mem_pd (rmt_channel_t channel, bool pd_en)`
Set RMT memory in low power mode.

Reduce power consumed by memory. 1: memory is in low power state.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• pd_en: RMT memory low power enable.

`esp_err_t rmt_get_mem_pd (rmt_channel_t channel, bool *pd_en)`
Get RMT memory low power mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• pd_en: Pointer to accept RMT memory low power mode.

`esp_err_t rmt_tx_start (rmt_channel_t channel, bool tx_idx_rst)`
Set RMT start sending data from memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

`esp_err_t rmt_tx_stop (rmt_channel_t channel)`
Set RMT stop sending.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

`esp_err_t rmt_rx_start (rmt_channel_t channel, bool rx_idx_rst)`
Set RMT start receiving data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.
**esp_err_t rmt_rx_stop (rmt_channel_t channel)**

Set RMT stop receiving data.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel

**esp_err_t rmt_rx_memory_reset (rmt_channel_t channel)**

Reset RMT RX memory.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel

**esp_err_t rmt_rx_memory_reset (rmt_channel_t channel)**

Reset RMT RX memory.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel

**esp_err_t rmt_set_memory_owner (rmt_channel_t channel, rmt_mem_owner_t owner)**

Set RMT memory owner.

**Note** Setting memroy is only valid for RX channel.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- owner: To set when the transmitter or receiver can process the memory of channel.

**esp_err_t rmt_get_memory_owner (rmt_channel_t channel, rmt_mem_owner_t *owner)**

Get RMT memory owner.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- owner: Pointer to get memory owner.

**esp_err_t rmt_set_tx_loop_mode (rmt_channel_t channel, bool loop_en)**

Set RMT tx loop mode.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

**esp_err_t rmt_get_tx_loop_mode (rmt_channel_t channel, bool *loop_en)**

Get RMT tx loop mode.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
Chapter 2. API Reference

Parameters
- **channel**: RMT channel
- **loop_en**: Pointer to accept RMT transmitter loop sending mode.

```c
esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)
```

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- **channel**: RMT channel
- **rx_filter_en**: To enable RMT receiver filter.
- **thresh**: Threshold of pulse width for receiver.

```c
esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)
```

Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- **channel**: RMT channel
- **base_clk**: To choose source clock for RMT module.

```c
esp_err_t rmt_get_source_clk(rmt_channel_t channel, rmt_source_clk_t *src_clk)
```

Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- **channel**: RMT channel
- **src_clk**: Pointer to accept source clock for RMT module.

```c
esp_err_t rmt_set_idle_level(rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)
```

Set RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- **channel**: RMT channel
- **idle_out_en**: To enable idle output.
- **level**: To set the output signal’s level for channel in idle state.

```c
esp_err_t rmt_get_idle_level(rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)
```

Get RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
• channel: RMT channel
• idle_out_en: Pointer to accept value of enable idle
• level: Pointer to accept value of output signal’s level in idle state for specified channel.

**Esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)**
Get RMT status.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• status: Pointer to accept channel status. Please refer to RMT.CHnSTATUS_REG(n=0~7) in rmt_reg.h for more details of each field.

**Esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)**
Set RMT RX interrupt enable.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable RX interrupt.

**Esp_err_t rmt_set_err_intr_en (rmt_channel_t channel, bool en)**
Set RMT RX error interrupt enable.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable RX err interrupt.

**Esp_err_t rmt_set_tx_intr_en (rmt_channel_t channel, bool en)**
Set RMT TX interrupt enable.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable TX interrupt.

**Esp_err_t rmt_set_tx_thr_intr_en (rmt_channel_t channel, bool en, uint16_t evt_thresh)**
Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable TX event interrupt.
• evt_thresh: RMT event interrupt threshold value

**Esp_err_t rmt_set_gpio (rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num, bool invert_signal)**
Configure the GPIO used by RMT channel.

**Return**
• ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
• ESP_OK Configure RMT GPIO successfully
Parameters
- **channel**: RMT channel
- **mode**: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- **gpio_num**: GPIO number, which is connected with certain RMT signal
- **invert_signal**: Invert RMT signal physically by GPIO matrix

```c
esp_err_t rmt_config(const rmt_config_t *rmt_param)
```
Configure RMT parameters.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **rmt_param**: RMT parameter struct

```c
esp_err_t rmt_isr_register(void (*fn)(void *), void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle)
```
Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, cannot register ISR handler for RMT

**Parameters**
- **fn**: Interrupt handler function.
- **arg**: Parameter for the handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: If non-zero, a handle to later cleanup the ISR gets stored here.

```c
esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)
```
Deregister previously registered RMT interrupt handler.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

**Parameters**
- **handle**: Handle obtained from rmt_isr_register

```c
esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)
```
Fill memory data of channel with given RMT items.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **item**: Pointer of items.
- **item_num**: RMT sending items number.
- **mem_offset**: Index offset of memory.

```c
esp_err_t rmt_driver_install(rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)
```
Initialize RMT driver.

**Return**
- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
Chapter 2. API Reference

Parameters
- channel: RMT channel
- rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IAR is used, please do not use the memory allocated from psram when calling rmt_write_items.

`esp_err_t rmt_driver_uninstall(rmt_channel_t channel)`
Uninstall RMT driver.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`esp_err_t rmt_get_channel_status(rmt_channel_status_result_t *channel_status)`
Get the current status of eight channels.

Note
Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

Return
- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

Parameters
- [out] channel_status: store the current status of each channel

`esp_err_t rmt_get_counter_clock(rmt_channel_t channel, uint32_t *clock_hz)`
Get speed of channel’s internal counter clock.

Return
- ESP_ERR_INVALID_ARG Parameter is NULL
- ESP_OK Success

Parameters
- channel: RMT channel
- [out] clock_hz: counter clock speed, in hz

`esp_err_t rmt_write_items(rmt_channel_t channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)`
RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

Note
This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- rmt_item: head point of RMT items array. If ESP_INTR_FLAG_IAR is used, please do not use the memory allocated from psram when calling rmt_write_items.
- item_num: RMT data item number.
- wait_tx_done:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

`esp_err_t rmt_wait_tx_done(rmt_channel_t channel, TickType_t wait_time)`
Wait RMT TX finished.

Return
Chapter 2. API Reference

- ESP_OK RMT Tx done successfully
- ESP_ERR_TIMEOUT Exceeded the ‘wait_time’ given
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**
- channel: RMT channel
- wait_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

**esp_err_t rmt_get_ringbuf_handle (rmt_channel_t channel, RingbufHandle_t *buf_handle)**

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

**esp_err_t rmt_translator_init (rmt_channel_t channel, sample_to_rmt_t fn)**

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

**Return**
- ESP_FAIL Init fail.
- ESP_OK Init success.

**Parameters**
- channel: RMT channel.
- fn: Point to the data conversion function.

**esp_err_t rmt_translator_set_context (rmt_channel_t channel, void* context)**

Set user context for the translator of specific channel.

**Return**
- ESP_FAIL Set context fail
- ESP_OK Set context success

**Parameters**
- channel: RMT channel number
- context: User context

**esp_err_t rmt_translator_get_context (const size_t* item_num, void** context)**

Get the user context set by ‘rmt_translator_set_context’.

**Note** This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

**Return**
- ESP_FAIL Get context fail
- ESP_OK Get context success

**Parameters**
- item_num: Address of the memory which contains the number of translated items (It’s from driver’s internal memory)
- context: Returned User context

**esp_err_t rmt_write_sample (rmt_channel_t channel, const uint8_t* src, size_t src_size, bool wait_tx_done)**

Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

**Return**
- ESP_FAIL Send fail
- ESP_OK Send success

**Parameters**
• channel: RMT channel.
• src: Pointer to the raw data.
• src_size: The size of the raw data.
• wait_tx_done: Set true to wait all data send done.

```c
rmt_tx_end_callback_t rmt_register_tx_end_callback(rmt_tx_end_fn_t function, void *arg)
```
Registers a callback that will be called when transmission ends.

Called by rmt_driver_isr_default in interrupt context.

**Note** Requires rmt_driver_install to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- function: Function to be called from the default interrupt handler or NULL.
- arg: Argument which will be provided to the callback when it is called.

```c
esp_err_t rmt_memory_rw_rst(rmt_channel_t channel)
```
Reset RMT TX/RX memory index.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel

```c
void rmt_set_intr_enable_mask(uint32_t mask)
```
Set mask value to RMT interrupt enable register.

**Parameters**
- mask: Bit mask to set to the register

```c
void rmt_clr_intr_enable_mask(uint32_t mask)
```
Clear mask value to RMT interrupt enable register.

**Parameters**
- mask: Bit mask to clear the register

```c
esp_err_t rmt_set_pin(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)
```
Set RMT pin.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- mode: TX or RX mode for RMT
- gpio_num: GPIO number to transmit or receive the signal.

**Structures**

```c
struct rmt_tx_config_t
```
Data struct of RMT TX configure parameters.

**Public Members**

```c
uint32_t carrier_freq_hz
```
RMT carrier frequency

```c
rmt_carrier_level_t carrier_level
```
Level of the RMT output, when the carrier is applied

```c
rmt_idle_level_t idle_level
```
RMT idle level
uint8_t carrier_duty_percent
    RMT carrier duty (%)
bool carrier_en
    RMT carrier enable
bool loop_en
    Enable sending RMT items in a loop
bool idle_output_en
    RMT idle level output enable

struct rmt_rx_config_t
    Data struct of RMT RX configure parameters.

Public Members

uint16_t idle_threshold
    RMT RX idle threshold
uint8_t filter_ticks_thresh
    RMT filter tick number
bool filter_en
    RMT receiver filter enable

struct rmt_config_t
    Data struct of RMT configure parameters.

Public Members

rmt_mode_t rmt_mode
    RMT mode: transmitter or receiver
rmt_channel_t channel
    RMT channel
gpio_num_t gpio_num
    RMT GPIO number
uint8_t clk_div
    RMT channel counter divider
uint8_t mem_block_num
    RMT memory block number
uint32_t flags
    RMT channel extra configurations, OR’ed with RMT_CHANNEL_FLAGS[\*]

rmt_tx_config_t tx_config
    RMT TX parameter
rmt_rx_config_t rx_config
    RMT RX parameter

struct rmt_tx_end_callback_t
    Structure encapsulating a RMT TX end callback.

Public Members

rmt_tx_end_fn_t function
    Function which is called on RMT TX end
void *arg
Optional argument passed to function

Macros
RMT_CHANNEL_FLAGS_AWARE_DFS
Channel can work during APB clock scaling
RMT_CHANNEL_FLAGS_INVERT_SIG
Invert RMT signal
RMT_MEM_ITEM_NUM
Define memory space of each RMT channel (in words = 4 bytes)
RMT_DEFAULT_CONFIG_TX (gpio, channel_id)
Default configuration for Tx channel.
RMT_DEFAULT_CONFIG_RX (gpio, channel_id)
Default configuration for RX channel.

Type Definitions
typedef intr_handle_t rmt_isr_handle_t
RMT interrupt handle.
typedef void (*rmt_tx_end_fn_t)(rmt_channel_t channel, void *arg)
Type of RMT Tx End callback function.
typedef void (*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)
User callback function to convert uint8_t type data to rmt format(rmt_item32_t).

Note In fact, item_num should be a multiple of translated_size, e.g.: When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be item_num = translated_size*8.

Parameters
• src: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
• [out] dest: Pointer to the buffer storing the rmt format data.
• src_size: The raw data size.
• wanted_num: The number of rmt format data that wanted to get.
• [out] translated_size: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
• [out] item_num: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. It should return 0 if no data was converted.

Header File
• components/hal/include/hal/rmt_types.h

Structures
struct rmt_channel_status_result_t
Data struct of RMT channel status.

Public Members
rmt_channel_status_t status[RMT_CHANNEL_MAX]
Store the current status of each channel
Enumerations

enum rmt_channel_t
RMT channel ID.

Values:

RMT_CHANNEL_0
RMT channel number 0

RMT_CHANNEL_1
RMT channel number 1

RMT_CHANNEL_2
RMT channel number 2

RMT_CHANNEL_3
RMT channel number 3

RMT_CHANNEL_4
RMT channel number 4

RMT_CHANNEL_5
RMT channel number 5

RMT_CHANNEL_6
RMT channel number 6

RMT_CHANNEL_7
RMT channel number 7

RMT_CHANNEL_MAX
Number of RMT channels

enum rmt_mem_owner_t
RMT Internal Memory Owner.

Values:

RMT_MEM_OWNER_TX
RMT RX mode, RMT transmitter owns the memory block

RMT_MEM.Owner_RX
RMT RX mode, RMT receiver owns the memory block

RMT_MEM.Owner_MAX

enum rmt_source_clk_t
Clock Source of RMT Channel.

Values:

RMT_BASECLK_REF = 0
RMT source clock is REF_TICK, 1MHz by default

RMT_BASECLK_APB = 1
RMT source clock is APB CLK, 80Mhz by default

RMT_BASECLK_MAX

enum rmt_data_mode_t
RMT Data Mode.

Note We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

Values:

RMT_DATA_MODE_FIFO

RMT_DATA_MODE_MEM

RMT_DATA_MODE_MAX
### enum `rmt_mode_t`
RMT Channel Working Mode (TX or RX)

**Values:**

- **RMT_MODE_TX**: RMT TX mode
- **RMT_MODE_RX**: RMT RX mode
- **RMT_MODE_MAX**

### enum `rmt_idle_level_t`
RMT Idle Level.

**Values:**

- **RMT_IDLE_LEVEL_LOW**: RMT TX idle level: low Level
- **RMT_IDLE_LEVEL_HIGH**: RMT TX idle level: high Level
- **RMT_IDLE_LEVEL_MAX**

### enum `rmt_carrier_level_t`
RMT Carrier Level.

**Values:**

- **RMT_CARRIER_LEVEL_LOW**: RMT carrier wave is modulated for low Level output
- **RMT_CARRIER_LEVEL_HIGH**: RMT carrier wave is modulated for high Level output
- **RMT_CARRIER_LEVEL_MAX**

### enum `rmt_channel_status_t`
RMT Channel Status.

**Values:**

- **RMT_CHANNEL_UNINIT**: RMT channel uninitialized
- **RMT_CHANNEL_IDLE**: RMT channel status idle
- **RMT_CHANNEL_BUSY**: RMT channel status busy

### 2.3.12 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see *MTDI Strapping Pin* below.

This document has the following structure:
Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2 for models with 3.3 V flash chip
- ESP32-D2WD:
  - No Pull-ups
  - No Pull-up on GPIO12

Systems in Packages (SIP)

- ESP32-PICO-D4:
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Modules

  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - No Pull-ups
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2
  - Download Mode Not Working (minor issue)
- ESP-WROVER-KIT
  - Required pull-ups are provided
  - Pull-up Conflicts on GPIO13 (v4.1, v3, v2, and v1)
  - Conflicts Between Bootstrap and SDIO on DAT2 (v4.1, v2, and v1)
  - Download Mode Not Working (minor issue) (v2, v1)

You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
Chapter 2. API Reference

- ESP32-WROVER-B on v4.1
- ESP32-WROVER on v3
- ESP32-WROOM-32 on v1 and v2

• ESP32-LyraTD-MSC
  - Required pull-ups are provided
  - **Conflicts Between Bootstrap and SDIO on DAT2**

• ESP32-LyraT
  - Required pull-ups are provided
  - **Pull-up Conflicts on GPIO13**

**Non-Espressif Hosts** Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

**Solutions**

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

**Pull-up Conflicts on GPIO13** If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device’s DAT3 to VDD
- Use SPI mode
- **Perform one of the following actions on the GPIO13 pin:**
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

**Conflicts Between Bootstrap and SDIO on DAT2** There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see [MTDI Strapping Pin](#).

To resolve the conflict, you have the following options:

1. **(Recommended) Burn the flash voltage selection eFuses.** This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

   **Warning:** Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on [http://www.espressif.com/](http://www.espressif.com/). If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

   If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

   ```
   components/esptool_py/esptool/espfuse.py set_flash_voltage 3.3V
   ```

   This command will burn the `XPD_SDIO_TIEH`, `XPD_SDIO_FORCE`, and `XPD_SDIO_REG` eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

   ```
   espfuse.py v2.6
   Connecting....

   Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
   The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
   This is an irreversible operation.
   Type 'BURN' (all capitals) to continue.
   ```

   (continues on next page)
BURN
VDD_SDIO setting complete.

To check the status of the eFuses, run:
`components/esptool_py/esptool/espefuse.py summary`

If running from an automated flashing script, espefuse.py has an option `--do-not-confirm`. For more details, see ESP32 Technical Reference Manual [PDF].

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one the following:
   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12**  Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)**  When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:
   - For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
   - For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
     - **LEDs** would not affect operation in most cases.
     - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**

**MTDI Strapping Pin**  MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:
   - For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
   - For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
   - On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see **Overview of Compatibility**.

**Internal Pull-ups and Strapping Requirements**  Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.
With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups/pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:
- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

### 2.3.13 SDMMC Host Driver

**Overview**

ESP32’s SDMMC host peripheral has two slots:
- Slot 0 (SDMMC_HOST_SLOT_0) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (SDMMC_HOST_SLOT_1) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Slot 0</th>
<th>Slot 1</th>
</tr>
</thead>
<tbody>
<tr>

<td>any input via GPIO matrix</td>
<td></td>
</tr>
</tbody>
</table>

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the gpio_cd and gpio_wp members of the sdmmc_slot_config_t structure before calling sdmmc_host_init_slot(). Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning**: Pins used by Slot 0 (HS1_*) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.
Chapter 2. API Reference

Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

See also

See SD/SDIO/MMC Driver for the higher level driver which implements the protocol layer.
See SD SPI Host Driver for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.
See SD Pull-up Requirements for pullup support and compatibilities of modules and development kits.

API Reference

Header File

- `components/driver/include/driver/sdmmc_host.h`
Functions

`esp_err_t sdmmc_host_init (void)`
Initialize SDMMC host peripheral.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdmmc_host_init` was already called
- ESP_ERR_NO_MEM if memory cannot be allocated

`esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)`
Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:
- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using `sdmmc_host_init`

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `slot_config`: additional configuration for the slot

`esp_err_t sdmmc_host_set_bus_width (int slot, size_t width)`
Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `width`: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

`size_t sdmmc_host_getSlotWidth (int slot)`
Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

**Return** configured bus width of the specified slot.

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

`esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)`
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `freq_khz`: card clock frequency, in kHz

`esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)`
Enable or disable DDR mode of SD interface.

**Return**
**ESP_OK** on success
**ESP_ERR_NOT_SUPPORTED** if DDR mode is not supported on this slot

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `ddr_enabled`: enable or disable DDR mode

**esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)**

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

**Attention** Data buffer passed in `cmdinfo->data` must be in DMA capable memory

**Return**
- **ESP_OK** on success
- **ESP_ERR_TIMEOUT** if response or data transfer has timed out
- **ESP_ERR_INVALID_CRC** if response or data transfer CRC check has failed
- **ESP_ERR_INVALID_RESPONSE** if the card has sent an invalid response
- **ESP_ERR_INVALID_SIZE** if the size of data transfer is not valid in SD protocol
- **ESP_ERR_INVALID_ARG** if the data buffer is not in DMA capable memory

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `cmdinfo`: pointer to structure describing command and data to transfer

**esp_err_t sdmmc_host_io_int_enable (int slot)**

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Return** returns ESP_OK, other errors possible in the future

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**esp_err_t sdmmc_host_io_int_wait (int slot, TickType_t timeout_ticks)**

Block until an SDIO interrupt is received, or timeout occurs.

**Return**
- **ESP_OK** on success (interrupt received)
- **ESP_ERR_TIMEOUT** if the interrupt did not occur within `timeout_ticks`

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `timeout_ticks`: number of RTOS ticks to wait for the interrupt

**esp_err_t sdmmc_host_deinit (void)**

Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**
- **ESP_OK** on success
- **ESP_ERR_INVALID_STATE** if `sdmmc_host_init` function has not been called

**esp_err_t sdmmc_host_pullup_en (int slot, int width)**

Enable the pull-ups of sd pins.

This function is deprecated. Please set SDMMC_SLOT_FLAG_INTERNAL_PULLUP flag in `sdmmc_slot_config_t::flags` instead.

**Note** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**
- **ESP_OK**: if success
- **ESP_ERR_INVALID_ARG**: if configured width larger than maximum the slot can support
Chapter 2. API Reference

Parameters

- **slot**: Slot to use, normally set it to 1.
- **width**: Bit width of your configuration, 1 or 4.

Structures

```c
struct sdmmc_slot_config_t

Extra configuration for SDMMC peripheral slot
```

Public Members

- `gpio_num_t gpio_cd`
  
  GPIO number of card detect signal.

- `gpio_num_t cd`
  
  GPIO number of card detect signal; shorter name.

- `gpio_num_t gpio_wp`
  
  GPIO number of write protect signal.

- `gpio_num_t wp`
  
  GPIO number of write protect signal; shorter name.

- `uint8_t width`
  
  Bus width used by the slot (might be less than the max width supported)

- `uint32_t flags`
  
  Features used by this slot.

Macros

- **SDMMC_HOST_SLOT_0**
  
  SDMMC slot 0.

- **SDMMC_HOST_SLOT_1**
  
  SDMMC slot 1.

- **SDMMC_HOST_DEFAULT()**
  
  Default `sdmmc_host_t` structure initializer for SDMMC peripheral.
  
  Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz

- **SDMMC_SLOT_FLAG_INTERNAL_PULLUP**
  
  Enable internal pullup on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

- **SDMMC_SLOT_NO_CD**
  
  indicates that card detect line is not used

- **SDMMC_SLOT_NO_WP**
  
  indicates that write protect line is not used

- **SDMMC_SLOT_WIDTH_DEFAULT**
  
  use the maximum possible width for the slot

- **SDMMC_SLOT_CONFIG_DEFAULT()**
  
  Macro defining default configuration of SDMMC host slot

2.3.14 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t spi_handle` re-
Chapter 2. API Reference

turned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_init`).

This driver’s naming pattern was adopted from the SDMMC Host driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (See SDMMC Host) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.

With the help of SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init`
- `sdspi_host_init_device`
- `sdspi_host_remove_device`
- `sdspi_host_deinit`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

Note: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

API Reference

Header File

- `components/driver/include/driver/sdspi_host.h`

Functions

```c
esp_err_t sdspi_host_init (void)
```

Initialize SD SPI driver.

Note: This function is not thread safe

Return:

- ESP_OK on success
- other error codes may be returned in future versions
### esp_err_t sdspi_host_init_device(const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

**Note** This function is not thread safe. The SDIO overs dspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_host_init_device` has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
- Other errors from the underlying spi_master and gpio drivers

**Parameters**
- `dev_config`: Pointer to device configuration structure
- `out_handle`: Output of the handle to the sdspi device.

### esp_err_t sdspi_host_remove_device(sdspi_dev_handle_t handle)

Remove an SD SPI device.

**Return** Always ESP_OK

**Parameters**
- `handle`: Handle of the SD SPI device

### esp_err_t sdspi_host_do_transaction(sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

**Return**
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

**Parameters**
- `handle`: Handle of the sdspi device
- `cmdinfo`: Pointer to structure describing command and data to transfer

### esp_err_t sdspi_host_set_card_clk(sdspi_dev_handle_t host, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- Other error codes may be returned in the future

**Parameters**
- `host`: Handle of the sdspi device
- `freq_khz`: Card clock frequency, in kHz

### esp_err_t sdspi_host_deinit(void)

Release resources allocated using `sdspi_host_init`.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdspi_host_init` function has not been called
**esp_err_t** \texttt{sdspi_host_io_int_enable}(sdspi_dev_handle_t handle)

Enable SDIO interrupt.

**Return**
- ESP_OK on success

**Parameters**
- handle: Handle of the sdspi device

**esp_err_t** \texttt{sdspi_host_io_int_wait}(sdspi_dev_handle_t handle, TickType_t timeout_ticks)

Wait for SDIO interrupt until timeout.

**Return**
- ESP_OK on success

**Parameters**
- handle: Handle of the sdspi device
- timeout_ticks: Ticks to wait before timeout.

**esp_err_t** \texttt{sdspi_host_init_slot}(int slot, const sdspi_slot_config_t *slot_config)

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call \texttt{gpio_install_isr_service()} before this function.

**Parameters**
- slot: SPI controller to use (SPI2_HOST or SPI3_HOST)
- slot_config: pointer to slot configuration structure

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
- other errors from the underlying spi_master and gpio drivers

**Structures**

**struct sdspi_device_config_t**
Extra configuration for SD SPI device.

**Public Members**

**spi_host_device_t** \texttt{host_id}
SPI host to use, SPIx_HOST (see spi_types.h).

**gpio_num_t** \texttt{gpio_cs}
GPIO number of CS signal.

**gpio_num_t** \texttt{gpio_cd}
GPIO number of card detect signal.

**gpio_num_t** \texttt{gpio_wp}
GPIO number of write protect signal.

**gpio_num_t** \texttt{gpio_int}
GPIO number of interrupt line (input) for SDIO card.

**struct sdspi_slot_config_t**
Extra configuration for SPI host.

**Public Members**

**gpio_num_t** \texttt{gpio_cs}
GPIO number of CS signal.
**Chapter 2. API Reference**

```c
gpio_num_t gpio_cd
    GPIO number of card detect signal.

gpio_num_t gpio_wp
    GPIO number of write protect signal.

gpio_num_t gpio_int
    GPIO number of interrupt line (input) for SDIO card.

gpio_num_t gpio_miso
    GPIO number of MISO signal.

gpio_num_t gpio_mosi
    GPIO number of MOSI signal.

gpio_num_t gpio_sck
    GPIO number of SCK signal.

int dma_channel
    DMA channel to be used by SPI driver (1 or 2).
```

**Macros**

`SDSPI_DEFAULT_HOST`

`SDSPI_HOST_DEFAULT()`

- Default `sdmmc_host_t` structure initializer for SD over SPI driver.
- Uses SPI mode and max frequency set to 20MHz
- ‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

`SDSPI_SLOT_NO_CD`

- Indicates that card detect line is not used

`SDSPI_SLOT_NO_WP`

- Indicates that write protect line is not used

`SDSPI_SLOT_NO_INT`

- Indicates that interrupt line is not used

`SDSPI_DEVICE_CONFIG_DEFAULT()`

- Macro defining default configuration of SD SPI device.

`SDSPI_SLOT_CONFIG_DEFAULT()`

- Macro defining default configuration of SPI host

**Type Definitions**

```c
typedef int sdspi_dev_handle_t
    Handle representing an SD SPI device.
```

**2.3.15 SDIO Card Slave Driver**

**Overview**

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.
## Connections

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>Corresponding pins in SPI mode</th>

<td>#CS</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

**Note:** Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 kΩ resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check *Overview of Compatibility* to see whether your development boards have such pullups.

**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See *Overview of Compatibility* to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- Kits: ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to *SD Pull-up Requirements* for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

### Terminology

The SDIO slave driver uses the following terms:

- **Transfer**: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending**: slave to host transfers.
- **Receiving**: host to slave transfers.

**Note:** Register names in *ESP32 Technical Reference Manual > SDIO Slave Controller* [PDF] are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.
• FIFO: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The
address is related to the length requested to read from/write to the slave in a single transfer: requested length =
0x1F800-address.
• Ownership: When the driver takes ownership of a buffer, it means the driver can randomly read/write the
buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to
the application. If the application reads from a buffer owned by a receiving driver, the data read can be random;
if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
• Requested length: The length requested in one transfer determined by the FIFO address.
• Transfer length: The length requested in one transfer determined by the CMD53 byte/block count field.

Note: Requested length is different from the transfer length. ESP32 slave DMA base on the requested length rather
than the transfer length. The transfer length should be no shorter than the requested length, and the rest part will be
filled with 0 (sending) or discard (receiving).

• Receiving buffer size: The buffer size is pre-defined between the host and the slave before communication
starts. Slave application has to set the buffer size during initialization by the recv_buffer_size member
of sdio_slave_config_t.
• Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below)
and from slave to host (called host interrupts below). See more in Interrupts.
• Registers: specific address in Function 1 access by CMD52 or CMD53.

Communication with ESP SDIO Slave
The host should initialize the ESP32 SDIO slave according to the standard
SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in ESP SDIO
Slave Initialization.

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func
1. Please refer to ESP SDIO Slave Protocol. There is also a component ESP Serial Slave Link for ESP32 master to
communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

Interrupts
There are interrupts from host to slave, and from slave to host to help communicating conveniently.

Slave Interrupts
The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit
of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the
slave_intr_cb member in the sdio_slave_config_t structure.

Note: The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call sdio_slave_wait_int to wait for an interrupt
within a certain time, or call sdio_slave_clear_int to clear interrupts from host. The callback function can
work with the wait functions perfectly.

Host Interrupts
The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When
the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source.
Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the
sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see sdio_slave_hostint_t
for more information.

Shared Registers
There are 52 8-bit R/W shared registers to share information between host and slave. The slave
can write or read the registers at any time by sdio_slave_read_reg and sdio_slave_write_reg. The
host can access (R/W) the register by CMD52 or CMD53.
**Receiving FIFO**  When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling `sdio_slave_recv` or `sdio_slave_recv_packet`. If non-blocking call is needed, set `wait=0`.
   The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers. When `ESP_ERR_NOT_FINISHED` is returned by this API, you should call this API iteratively until the return value is `ESP_OK`. All the continuous buffers returned with `ESP_ERR_NOT_FINISHED`, together with the last buffer returned with `ESP_OK`, belong to one packet from the host. Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.
   If the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.
4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

**Sending FIFO**  Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- **Stream Mode:** when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- **Packet Mode:** the packet length is updated packet by packet, and only when previous packet is sent. This means the host can only get data of one buffer in one transfer.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the wait is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point arg to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t* buffer;
    size_t size;
    int id;
} sdio_transfer_t;

//and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

//and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void**)arg, portMAX_DELAY);
ESP_LOGI("tag", "(#d) successfully send %d bytes of %p", arg->id, arg->size, ...
    arg->buffer);
some_post_callback(arg); //do more things
```

3. Working with the receiving part of this driver, point arg to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

//and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see peripherals/sdio.

**Application Example**

Slave/master communication: peripherals/sdio.

**API Reference**

**Header File**

- components/hal/include/hal/sdio_slave_types.h

**Enumerations**

enum sdio_slave_hostint_t

- Mask of interrupts sending to the host.

**Values:**

- `SDIO_SLAVE_HOSTINT_BIT0 = BIT(0)`
  - General purpose interrupt bit 0.

- `SDIO_SLAVE_HOSTINT_BIT1 = BIT(1)`
Chapter 2. API Reference

```c
SDIO_SLAVE_HOSTINT_BIT2 = BIT(2)
SDIO_SLAVE_HOSTINT_BIT3 = BIT(3)
SDIO_SLAVE_HOSTINT_BIT4 = BIT(4)
SDIO_SLAVE_HOSTINT_BIT5 = BIT(5)
SDIO_SLAVE_HOSTINT_BIT6 = BIT(6)
SDIO_SLAVE_HOSTINT_BIT7 = BIT(7)
SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET = BIT(23)
```

New packet available.

```c
enum sdio_slave_timing_t
Timing of SDIO slave.
Values:
SDIO_SLAVE_TIMING_PSEND_PSAMPLE = 0
   Send at posedge, and sample at posedge. Default value for HS mode. Normally there’s no problem using this to work in DS mode.
SDIO_SLAVE_TIMING_NSEND_PSAMPLE
   Send at negedge, and sample at posedge. Default value for DS mode and below.
SDIO_SLAVE_TIMING_PSEND_NSAMPLE
   Send at posedge, and sample at negedge.
SDIO_SLAVE_TIMING_NSEND_NSAMPLE
   Send at negedge, and sample at negedge.
```

```c
enum sdio_slave_sending_mode_t
   Configuration of SDIO slave mode.
Values:
SDIO_SLAVE_SEND_STREAM = 0
   Stream mode, all packets to send will be combined as one if possible.
SDIO_SLAVE_SEND_PACKET = 1
   Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).
```

Header File
- components/driver/include/driver/sdio_slave.h

Functions

```c
esp_err_t sdio_slave_initialize (sdio_slave_config_t *config)
   Initialize the sdio slave driver
Return
- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success
Parameters
- config: Configuration of the sdio slave driver.
```

```c
void sdio_slave_deinit (void)
   De-initialize the sdio slave driver to release the resources.
```

```c
esp_err_t sdio_slave_start (void)
   Start hardware for sending and receiving, as well as set the IREADY1 to 1.
```

Note: The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See sdio_slave_reset.
Return
• ESP_ERR_INVALID_STATE if already started.
• ESP_OK otherwise.

void sdio_slave_stop (void)
Stop hardware from sending and receiving, also set IOREADY1 to 0.

Note this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting.
Call sdio_slave_reset to do that.

esp_err_t sdio_slave_reset (void)
Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.
Return always return ESP_OK.

sdio_slave_buf_handle_t sdio_slave_recv_register_buf (uint8_t *start)
Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

Note The driver will use and only use the amount of space specified in the recv_buffer_size member set in the sdio_slave_config_t. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

Return The buffer handle if success, otherwise NULL.
Parameters
• start: The start address of the buffer.

esp_err_t sdio_slave_recv_unregister_buf (sdio_slave_buf_handle_t handle)
Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

Return ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.
Parameters
• handle: Handle to the buffer to release.

esp_err_t sdio_slave_recv_load_buf (sdio_slave_buf_handle_t handle)
Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

Return
• ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by sdio_slave_recv can you load it again.
• ESP_OK if success
Parameters
• handle: Handle to the buffer ready to receive data.

esp_err_t sdio_slave_recv_packet (sdio_slave_buf_handle_t *handle_ret, TickType_t wait)
Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler sdio_slave_recv instead, if the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream).

Note Call sdio_slave_load_buf with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from sdio_slave_get_buffer.

Return
• ESP_ERR_INVALID_ARG if handle_ret is NULL
• ESP_ERR_TIMEOUT if timeout before receiving new data
• ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
• ESP_OK if success
Parameters
Chapter 2. API Reference

- **handle_ret**: Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
- **wait**: Time to wait before data received.

```c
esp_err_t sdio_slave_recv(sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)
```

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Return**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

**Parameters**
- **handle_ret**: Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- **[out] out_addr**: Output of the start address, set to NULL if not needed.
- **[out] out_len**: Actual length of the data in the buffer, set to NULL if not needed.
- **wait**: Time to wait before data received.

```c
uint8_t *sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t *len_o)
```

Retrieve the buffer corresponding to a handle.

**Return** buffer address if success, otherwise NULL.

**Parameters**
- **handle**: Handle to get the buffer.
- **len_o**: Output of buffer length

```c
esp_err_t sdio_slave_send_queue(uint8_t *addr, size_t len, void *arg, TickType_t wait)
```

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Return**
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

**Parameters**
- **addr**: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- **len**: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- **arg**: Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- **wait**: Time to wait if the buffer is full.

```c
esp_err_t sdio_slave_send_get_finished(void **out_arg, TickType_t wait)
```

Return the ownership of a finished transaction.

**Return** ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

**Parameters**
- **out_arg**: Argument of the finished transaction. Set to NULL if unused.
- **wait**: Time to wait if there’s no finished sending transaction.

```c
esp_err_t sdio_slave_transmit(uint8_t *addr, size_t len)
```

Start a new sending transfer, and wait for it (blocked) to be finished.

**Return**
- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

**Parameters**
- **addr**: Start address of the buffer to send
Chapter 2. API Reference

- len: Length of buffer to send.

uint8_t sdio_slave_read_reg (int pos)

Read the SPI slave register shared with host.

**Note** register 28 to 31 are reserved for interrupt vector.

**Return** value of the register.

**Parameters**

- **pos**: register address, 0-27 or 32-63.

esp_err_t sdio_slave_write_reg (int pos, uint8_t reg)

Write the SPI slave register shared with host.

**Note** register 29 and 31 are used for interrupt vector.

**Return** ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

**Parameters**

- **pos**: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- **reg**: the value to write.

sdio_slave_hostint_t sdio_slave_get_host_intena (void)

Get the interrupt enable for host.

**Return** the interrupt mask.

void sdio_slave_set_host_intena (sdio_slave_hostint_t mask)

Set the interrupt enable for host.

**Parameters**

- **mask**: Enable mask for host interrupt.

esp_err_t sdio_slave_send_host_int (uint8_t pos)

Interrupt the host by general purpose interrupt.

**Return**

- ESP_ERR_INVALID_ARG if interrupt num error
- ESP_OK otherwise

**Parameters**

- **pos**: Interrupt num, 0-7.

void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)

Clear general purpose interrupt to host.

**Parameters**

- **mask**: Interrupt bits to clear, by bit mask.

esp_err_t sdio_slave_wait_int (int pos, TickType_t wait)

Wait for general purpose interrupt from host.

**Note** this clears the interrupt at the same time.

**Return** ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

**Parameters**

- **pos**: Interrupt source number to wait for. is set.
- **wait**: Time to wait before interrupt triggered.

**Structures**

struct sdio_slave_config_t

Configuration of SDIO slave.

**Public Members**

sdio_slave_timing_t timing

timing of sdio_slave. see sdio_slave_timing_t.
Chapter 2. API Reference

sdio_slaveSending_mode_t sending_mode
mode of sdio_slave. SDIO_SLAVE_MODE_STREAM if the data needs to be sent as much as possible;
SDIO_SLAVE_MODE_PACKET if the data should be sent in packets.

int send_queue_size
max buffers that can be queued before sending.

size_t recv_buffer_size
If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is
too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers
are easily run out. Should be set according to length of data really transferred. All data that do not fully
fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per
buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive
buffer given to the driver should be larger than this.

sdio_event_cb_t event_cb
when the host interrupts slave, this callback will be called with interrupt number (0-7).

uint32_t flags
Features to be enabled for the slave, combinations of SDIO_SLAVE_FLAG_.*.

Macros
SDIO_SLAVE_RECV_MAX_BUFFER
SDIO_SLAVE_FLAG_DAT2_DISABLED
It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or
SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note
that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at
your own risk.

SDIO_SLAVE_FLAG_HOST_INTR_DISABLED
The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this
flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt
registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we
don’t support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_INTERNAL_PULLUP
Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should
be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable
communication, please do connect external pull-ups on the bus. This is only for example and debug use.

Type Definitions
typedef void(*sdio_event_cb_t)(uint8_t event)
typedef void*sdio_slave_buf_handle_t
Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the
handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer
used.

2.3.16 Sigma-delta Modulation

Introduction
ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta
module.

Functionality Overview
There are 8 independent sigma-delta modulation channels identified with sigmadelta_channel_t. Each channel
is capable to output the binary, hardware generated signal with the sigma-delta modulation.
Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the ‘duty’ input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of `sigmadelta_set_duty()`.

**Convert to analog signal (Optional)**

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Fig. 19: Sallen-Key Low Pass Filter](image)

**Application Example**

Sigma-delta Modulation example: `peripherals/sigmadelta`.

**API Reference**

**Header File**

- `components/driver/include/driver/sigmadelta.h`
Chapter 2. API Reference

**Functions**

`esp_err_t sigmadelta_config(const sigmadelta_config_t *config)`
Configure Sigma-delta channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- config: Pointer of Sigma-delta channel configuration struct

`esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)`
Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty. If you add a capacitor between the output pin and ground, the average output voltage will be $V_{dc} = V_{DDIO} / 256 \times \text{duty} + V_{DDIO}/2$, where $V_{DDIO}$ is the power supply voltage.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- channel: Sigma-delta channel number
- duty: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

`esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)`
Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- channel: Sigma-delta channel number
- prescale: The divider of source clock, ranges from 0 to 255

`esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)`
Set Sigma-delta signal output pin.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- channel: Sigma-delta channel number
- gpio_num: GPIO number of output pin.

**Header File**

- components/hal/include/hal/sigmadelta_types.h

**Structures**

`struct sigmadelta_config_t`
Sigma-delta configure struct.
Public Members

`sigmadelta_channel_t channel`
Sigma-delta channel number

`int8_t sigmadelta_duty`
Sigma-delta duty, duty ranges from -128 to 127.

`uint8_t sigmadelta_prescale`
Sigma-delta prescale, prescale ranges from 0 to 255.

`uint8_t sigmadelta_gpio`
Sigma-delta output io number, refer to gpio.h for more details.

Enumerations

`enum sigmadelta_port_t`
SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

`Values:`

- `SIGMADELTA_PORT_0`
  SIGMADELTA port 0

- `SIGMADELTA_PORT_MAX`
  SIGMADELTA port max

`enum sigmadelta_channel_t`
Sigma-delta channel list.

`Values:`

- `SIGMADELTA_CHANNEL_0`
  Sigma-delta channel 0

- `SIGMADELTA_CHANNEL_1`
  Sigma-delta channel 1

- `SIGMADELTA_CHANNEL_2`
  Sigma-delta channel 2

- `SIGMADELTA_CHANNEL_3`
  Sigma-delta channel 3

- `SIGMADELTA_CHANNEL_4`
  Sigma-delta channel 4

- `SIGMADELTA_CHANNEL_5`
  Sigma-delta channel 5

- `SIGMADELTA_CHANNEL_6`
  Sigma-delta channel 6

- `SIGMADELTA_CHANNEL_7`
  Sigma-delta channel 7

- `SIGMADELTA_CHANNEL_MAX`
  Sigma-delta channel max

2.3.17 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.
Overview of ESP32’s SPI peripherals

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MISO, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Protect signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA4</td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA5</td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA6</td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA7</td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>Assert</td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td>De-assert</td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:
• Multi-threaded environments
• Transparent handling of DMA transfers while reading and writing data
• Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI Bus Lock*.

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:
- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

### SPI Features

#### SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it’s meaningless for the task to yield to other tasks when the cache is disabled).

  There are quite a few limitations when using SPI Master driver on the SPI1 bus, see *Notes on Using the SPI Master driver on SPI1 Bus*.

- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

#### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:
• `spi_device_interface_config_t::command_bits`
• `spi_device_interface_config_t::address_bits`
• `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.
**Command and Address Phases** During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::flags` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`. Also see `Transaction Line Mode`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see `Transaction Line Mode`.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If `external PSRAM is enabled`, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in `Transaction Line Mode`.

**Note:** Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see `Known Issues`.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.
**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt**: Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling**: Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

**Transactions with Integers Other Than uint8_t** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to
allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

**Notes on Using the SPI Master driver on SPI1 Bus**

**Note:** Though the **SPI Bus Lock** feature makes it possible to use SPI Master driver on the SPI1 bus, it’s still tricky and needs a lot of special treatment. It’s a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other drivers are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
   - Explicit bus acquiring between `spi_device_acquire_bus()` and `spi_device_release_bus()`.
   - Implicit bus acquiring between `spi_device_polling_start()` and `spi_device_polling_end()` (or inside `spi_device_polling_transmit()`).

During the time above, all other tasks and most ISRs will be disabled (see **IRAM-Safe Interrupt Handlers**). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a **Cache disabled but cached memory region accessed** exception. For differences between IRAM, DRAM, and flash cache, please refer to the [application memory layout](#) documentation.

To place functions into the IRAM, you can either:
   1. Add `IRAM_ATTR` (include `esp_attr.h`) to the function like:
      ```c
      IRAM_ATTR void foo(void) {}  
      ```
      Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.
   2. Use the `noflash` placement in the [linker.lf](#). See more in [Linker Script Generation](#). Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe. Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:
   1. Add `DRAM_ATTR` (include “esp_attr.h”) to the data definition like:
      ```c
      DRAM_ATTR int g_foo = 3;  
      ```
   2. Use the `noflash` placement in the [linker.lf](#). See more in [Linker Script Generation](#).

Please also see the example [peripherals/spi_master/hd_eeprom](#).

**GPIO Matrix and IO_MUX**

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing](#).
The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

SPI Clock Frequency Transferring each byte takes eight times the clock period \( 8/f_{spi} \).

If the clock frequency is too high, the use of some functions might be limited. See Timing Considerations.

Cache Miss The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select \( \text{CONFIG_SPI_MASTER_IN_IRAM} \) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.
For an interrupt transaction, the overall cost is $20+8n/F_{spi}\[\text{MHz}\][\text{us}]$ for $n$ bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/F_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see `IRAM-Safe Interrupt Handlers`.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is < 0, which means the setup timing requirement is violated and the reading might be incorrect.

![Timing diagram](image)

The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33–77% in comparison to the existing `input delay`. To retain a higher frequency, you have to use the IQ_MUX pins or the `dummy bit workaround`. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.
**Dummy bit workaround:** Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td>26.6 No</td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td></td>
</tr>
<tr>
<td>40</td>
<td>Yes</td>
<td>Half-duplex, no DMA allowed</td>
</tr>
</tbody>
</table>

If the Host only writes data, the *dummy bit workaround* and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

`spi_device_interface_config_t::flags`

The SPI master driver still works even if the `input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s `input delay` plus master’s `GPIO matrix delay`. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
\text{Freq limit [MHz]} = \frac{80}{\text{floor}(\text{MISO delay [ns]}/12.5) + 1}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.
Corresponding frequency limits for different Devices with different input delay times are shown in the table below.

<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>
<th>MISO path delay (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>

<td>11.43</td>
</tr>
<tr>
<td></td>
<td>75</td>
<td>100</td>
<td>8.89</td>
</tr>
</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used. If such transactions are required, you have to use one of the alternative solutions:
   1. Use full-duplex transactions instead.
   2. **Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:**
      ```c
      ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
      ```
      This can prohibit you from transmitting and receiving data longer than 64 bytes.
   3. Try using the command and address fields to replace the write phase.

2. Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See [dummy bit speed-up workaround](#).

3. *dummy_bits* in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).

4. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.
Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- `components/hal/include/hal/spi_types.h`

Structures

```c
struct spi_line_mode_t

  Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.
```

Public Members

```c
uint8_t cmd_lines
  The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t addr_lines
  The line width of address phase, e.g. 1-line-addr-phase.

uint8_t data_lines
  The line width of data phase, e.g. 4-line-data-phase.
```

Enumerations

```c
enum spi_host_device_t

  Enum with the three SPI peripherals that are software-accessible in it.

  Values:

  SPI1_HOST = 0
              SPI1.

  SPI2_HOST = 1
              SPI2.

  SPI3_HOST = 2
              SPI3.
```

```c
enum spi_event_t

  SPI Events.

  Values:

  SPI_EV_BUF_TX = BIT(0)
                  The buffer has sent data to master.

  SPI_EV_BUF_RX = BIT(1)
                  The buffer has received data from master.

  SPI_EV_SEND_DMA_READY = BIT(2)
                          Slave has loaded its TX data buffer to the hardware (DMA).

  SPI_EV_SEND = BIT(3)
                Master has received certain number of the data, the number is determined by Master.

  SPI_EV_RECV_DMA_READY = BIT(4)
                          Slave has loaded its RX data buffer to the hardware (DMA).

  SPI_EV_RECV = BIT(5)
                 Slave has received certain number of data from master, the number is determined by Master.
```
Chapter 2. API Reference

SPI_EV_CMD9 = BIT(6)
Received CMD9 from master.

SPI_EV_CMDA = BIT(7)
Received CMDA from master.

SPI_EV_TRANS = BIT(8)
A transaction has done.

Header File

- components/driver/include/driver/spi_common.h

Functions

`esp_err_t spi_bus_initialize( spi_host_device_t host_id, const spi_bus_config_t *bus_config, spi_dma_chan_t dma_chan)`

Initialize a SPI bus.

**Warning** SPI0/1 is not supported

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- host_id: SPI peripheral that controls this bus
- bus_config: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- dma_chan: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

`esp_err_t spi_bus_free( spi_host_device_t host_id)`

Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**

- host_id: SPI peripheral to free

Structures

`struct spi_bus_config_t`

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.
Public Members

```c
int mosi_io_num
    GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int data0_io_num
    GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int miso_io_num
    GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int data1_io_num
    GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int sclk_io_num
    GPIO pin for SPI Clock signal, or -1 if not used.

int quadwp_io_num
    GPIO pin for WP (Write Protect) signal, or -1 if not used.

int data2_io_num
    GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int quadhd_io_num
    GPIO pin for HD (Hold) signal, or -1 if not used.

int data3_io_num
    GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int data4_io_num
    GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int data5_io_num
    GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int data6_io_num
    GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int data7_io_num
    GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int max_transfer_sz
    Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
    Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.
```

```c
int intr_flags
    Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.
```

Macros

```c
SPI_MAX_DMA_LEN
SPI_SWAP_DATA_TX (DATA, LEN)
    Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
```

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

**Parameters**

- **DATA**: Data to be sent, can be uint8_t, uint16_t or uint32_t.
• **LEN**: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI_SWAP_DATA_RX**(DATA, LEN)
Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX((uint32_t*)t->rx_data, 15);
```

**Parameters**
- **DATA**: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN**: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON_BUSFLAG_SLAVE**
Initialize I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**
Initialize I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON_BUSFLAG_SCLK**
Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**
Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**
Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON_BUSFLAG_WP**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_I04_I07**
Check existing of IO4-IO7 pins. Or indicates IO4-IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/WSHD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**Type Definitions**
```c
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**
```c
c enum spi_common_dma_t
    SPI DMA channels.

    Values:
    SPI_DMA_DISABLED = 0
    Do not enable DMA for SPI.
```
SPI_DMA_CH1 = 1
Enable DMA, select DMA Channel 1.

SPI_DMA_CH2 = 2
Enable DMA, select DMA Channel 2.

SPI_DMA_CH_AUTO = 3
Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File
- components/driver/include/driver/spi_master.h

Functions

esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
Allocate a device on a SPI bus.
This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

Note While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- host_id: SPI peripheral to allocate device on
- dev_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

esp_err_t spi_bus_remove_device(spi_device_handle_t handle)
Remove a device from the SPI bus.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

Parameters
- handle: Device handle to free

esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
Queue a SPI transaction for interrupt transaction execution. Get the result by
spi_device_get_trans_result.

Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if
  SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired
  (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

Parameters
- handle: Device handle obtained using spi_host_add_dev
• `trans_desc`: Description of transaction to execute
• `ticks_to_wait`: Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

```c
esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans()`. This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**
- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- `ticks_to_wait`: Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

```c
esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

```c
esp_err_t spi_device_polling_start(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**
- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there’s room in the queue; currently only `portMAX_DELAY` is supported.

```c
esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.
This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `ticks_to_wait`: Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

```c
esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

**Note**
This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note**
The function will wait until all the existing transactions have been sent.

**Return**
- ESP_ERR_INVALID_ARG: `wait` is not set to `portMAX_DELAY`.
- ESP_OK: Success.

**Parameters**
- `device`: The device to occupy the bus.
- `wait`: Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- `dev`: The device to release the bus.

```c
int spi_cal_clock(int fapb, int hz, int duty_cycle, uint32_t *reg_o)
```

Calculate the working frequency that is most close to desired frequency, and also the register value.

**Parameters**
- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz`: Desired working frequency
- `duty_cycle`: Duty cycle of the spi clock
- `reg_o`: Output of value to be set in clock register, or NULL if not needed.

**Return**
Actual working frequency that most fit.

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Return**
Actual working frequency that most fit.

**Parameters**
- `fapb`: The frequency of apb clock, should be `APB_CLK_FREQ`. 
• hz: Desired working frequency
• duty_cycle: Duty cycle of the spi clock

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note** If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
- `gpio_is_used`: True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.
- `eff_clk`: Effective clock frequency (in Hz) from `spi_cal_clock`.
- `dummy_o`: Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o`: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit(bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

**Parameters**
- `gpio_is_used`: True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.

**Structures**

**struct spi_device_interface_config_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

```c
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

```c
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

```c
tuint8_t dummy_bits
```

Amount of dummy bits to insert between address and data phase.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: \((0, 0)\)
- 1: \((0, 1)\)
- 2: \((1, 0)\)
- 3: \((1, 1)\)

```c
uint16_t duty_cycle_pos
```

Duty cycle of positive clock, in 1/256th increments \((128 = 50\%/50\% \text{ duty})\). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

```c
uint16_t cs_ena_pretrans
```

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.
### Section 2. API Reference

- **uint8_t `cs_ena_posttrans`**
  - Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

- **int `clock_speed_hz`**
  - Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

- **int `input_delay_ns`**
  - Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggested to have the right value.

- **int `spics_io_num`**
  - CS GPIO pin for this device, or -1 if not used.

- **uint32_t `flags`**
  - Bitwise OR of SPI_DEVICE_* flags.

- **int `queue_size`**
  - Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

- **`transaction_cb_t pre_cb`**
  - Callback to be called before a transmission is started.

  This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

- **`transaction_cb_t post_cb`**
  - Callback to be called after a transmission has completed.

  This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

- **`struct spi_transaction_t`**
  - This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

#### Public Members

- **uint32_t `flags`**
  - Bitwise OR of SPI_TRANS_* flags.

- **uint16_t `cmd`**
  - Command data, of which the length is set in the `command_bits` of `spi_device_interface_config_t`.

  **NOTE:** this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

  Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

- **uint64_t `addr`**
  - Address data, of which the length is set in the `address_bits` of `spi_device_interface_config_t`.

  **NOTE:** this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

  Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

- **size_t `length`**
  - Total data length, in bits.
size_t rxlength
Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
The command length in this transaction, in bits.

uint8_t address_bits
The address length in this transaction, in bits.

uint8_t dummy_bits
The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).
8MHz

SPI_MASTER_FREQ_9M
8.89MHz

SPI_MASTER_FREQ_10M
10MHz

SPI_MASTER_FREQ_11M
11.43MHz

SPI_MASTER_FREQ_13M
13.33MHz

SPI_MASTER_FREQ_16M
16MHz

SPI_MASTER_FREQ_20M
20MHz

SPI_MASTER_FREQ_26M
26.67MHz

SPI_MASTER_FREQ_40M
40MHz
**Chapter 2. API Reference**

**SPI_MASTER_FREQ_80M**
80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPIDEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALF DupLEX**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_A S_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).
- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**
Use the command_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_ADDR**
Use the address_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_DUMMY**
Use the dummy_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_CS_KEEP_ACTIVE**
Keep CS active after data transfer.
**SPI_TRANS_MULTILINE_CMD**  
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI_TRANS_MODE_OCT**  
Transmit/receive data in 8-bit mode.

**SPI_TRANS_MULTILINE_ADDR**  
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

### Type Definitions

```c
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

#### 2.3.18 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

### Overview of ESP32’s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

- SPI2, sometimes referred to as HSPI
- SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.

### Terminology

The terms used in relation to the SPI slave driver are given in the table below.
**Table 1:**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td><strong>MISO</strong></td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td><strong>MOSI</strong></td>
<td>Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td><strong>SCLK</strong></td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td><strong>CS</strong></td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td><strong>QUADWP</strong></td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td><strong>QUADHD</strong></td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td><strong>Assertion</strong></td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.</td>
</tr>
<tr>
<td><strong>Transaction</strong></td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td><strong>Launch edge</strong></td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td><strong>Latch edge</strong></td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.
Chapter 2. API Reference

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see *Transaction Interval*.

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_init`. Make sure to set the correct I/O pins in the structure `bus_config`. Set the unused signals to -1.

If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO_MUX**

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.
The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see *Timing Considerations*.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

**Speed and Timing Considerations**

**Transaction Interval** The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th></th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

Note: 1. If the frequency is equal to the limitation, it can lead to random errors. 2. The clock uncertainty between Host and Device (12.5ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.
Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied. Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

   ![Timing Diagram]

   If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

Application Example

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

API Reference

Header File

- components/driver/include/driver/spi_slave.h

Functions

```c
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config,
                                const spi_slave_interface_config_t *slave_config,
                                spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

Warning  SPI0/1 is not supported
Warning  If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.
Warning  The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- host: SPI peripheral to use as a SPI slave interface
- bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
- slave_config: Pointer to a spi_slave_interface_config_t struct specifying the details for the slave interface
dma_chan: Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

```c
esp_err_t spi_slave_free(spi_host_device_t host)
```
Free a SPI bus claimed as a SPI slave interface.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**
- host: SPI peripheral to free

```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via spi_slave_initialize.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in trans_desc to the SPI slave driver; the application is not to access this memory until spi_slave_queue_trans is called to hand ownership back to the application.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- host: SPI peripheral that is acting as a slave
- trans_desc: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)
```
Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- host: SPI peripheral to that is acting as a slave
- [out] trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.
Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- host: SPI peripheral to that is acting as a slave
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Structures

struct spi_slave_interface_config_t
This is a configuration for a SPI host acting as a slave device.

Public Members

- int spics_io_num
  CS GPIO pin for this device.
- uint32_t flags
  Bitwise OR of SPI_SLAVE_* flags.
- int queue_size
  Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.
- uint8_t mode
  SPI mode, representing a pair of (CPOL, CPHA) configuration:
  - 0: (0, 0)
  - 1: (0, 1)
  - 2: (1, 0)
  - 3: (1, 1)

slave_transaction_cb_t post_setup_cb
Callback called after the SPI registers are loaded with new data.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t post_trans_cb
Callback called after a transaction is done.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
This structure describes one SPI transaction

Public Members

- size_t length
  Total data length, in bits.
- size_t trans_len
  Transaction data length, in bits.
- const void *tx_buffer
  Pointer to transmit buffer, or NULL for no MOSI phase.
Chapter 2. API Reference

void *rx_buffer
Point to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer % 4 == 0), and has length of a multiple of 4 bytes.

void *user
User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST
Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.3.19 ESP32-WROOM-32SE (Secure Element)

Overview

The ESP32-WROOM-32SE has integrated Microchip’s ATECC608A cryptoauth chip in the module. ATECC608A is secure element which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with use of X.509 based mutual authentication. The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A

Application Example

Secure Element ECDSA Sign/Verify example: peripherals/secure_element/atecc608_ecdsa.

How to configure and provision ESP32-WROOM-32SE for TLS

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit esp_cryptoauth_utility

How to use ATECC608A of ESP32-WROOM-32SE for TLS

ATECC608A can be used for TLS connections using ESP-TLS. To configure ESP-TLS for using secure element please refer ATECC608A with ESP-TLS in ESP-TLS documentation.

2.3.20 Touch Sensor

Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

Touch sensor on ESP32 can support up to 10 capacitive touch pads / GPIOs.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.
For design, operation, and control registers of a touch sensor, see ESP32 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note.

For more information about testing touch sensors in various configurations, please check the Guide for ESP32-Sense-Kit.

**Functionality Overview**

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section *API Reference*. Practical implementation of this API is covered in Section *Application Examples*.

**Initialization** Before using a touch pad, you need to initialize the touch pad driver by calling the function `touch_pad_init()`. This function sets several ..._DEFAULT driver parameters listed in *API Reference* under *Macros*. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling `touch_pad_deinit()`.

**Configuration** Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`.

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

**Touch State Measurements** The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read_raw_data()`
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

**Note:** Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section *Filtering of Measurements*.

For the demonstration of how to read the touch pad data, check the application example *peripherals/touch_sensor/touch_sensor_v1/touch_pad_read*.

**Optimization of Measurements** A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.
Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_meas_time()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Measurement time: `touch_pad_set_meas_time()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Fig. 20: Touch pad - relationship between measurement parameters](image)

The last chart `Output` represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.

You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform...
touch detection in your own application. For sample implementation of both methods of touch detection, see peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt.

**Touch Triggered Interrupts**  Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in Touch State Measurements to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with touch_pad_config() or at the runtime with touch_pad_set_thresh().

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function touch_pad_set_trigger_mode().

Finally, configure and manage interrupt calls using the following functions:

- touch_pad_isr_register()/touch_pad_isr_deregister()
- touch_pad_intr_enable()/touch_pad_intr_disable()

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking touch_pad_get_status() and clear the pad status with touch_pad_clear_status().

**Note:** Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see Filtering of Measurements) does not affect this process.

**Wakeup from Sleep Mode**  If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function touch_pad_set_trigger_source().

Configuration of required bit patterns of pads may be managed for each ‘SET’ with:

- touch_pad_set_group_mask()/touch_pad_get_group_mask()
- touch_pad_clear_group_mask()

**Application Examples**

- Touch sensor read example: peripherals/touch_sensor/touch_sensor_v1/touch_pad_read.
- Touch sensor interrupt example: peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt.

**API Reference**

**Header File**

- components/driver/esp32/include/driver/touch_sensor.h

**Functions**

```c
esp_err_t touch_pad_config(touch_pad_t touch_num, uint16_t threshold)
```

Configure touch pad interrupt threshold.

**Note**  If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized
Parameters
- **touch_num**: touch pad index
- **threshold**: interrupt threshold,

```c
esp_err_t touch_pad_read (touch_pad_t touch_num, uint16_t *touch_value)
```

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

**Note** This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Touch pad parameter error
- **ESP_ERR_INVALID_STATE** This touch pad hardware connection is error, the value of “touch_value” is 0.
- **ESP_FAIL** Touch pad not initialized

Parameters
- **touch_num**: touch pad index
- **touch_value**: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_filtered (touch_pad_t touch_num, uint16_t *touch_value)
```

get filtered touch sensor counter value by IIR filter.

**Note** touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Touch pad parameter error
- **ESP_ERR_INVALID_STATE** This touch pad hardware connection is error, the value of “touch_value” is 0.
- **ESP_FAIL** Touch pad not initialized

Parameters
- **touch_num**: touch pad index
- **touch_value**: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_raw_data (touch_pad_t touch_num, uint16_t *touch_value)
```

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

**Note** touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Touch pad parameter error
- **ESP_ERR_INVALID_STATE** This touch pad hardware connection is error, the value of “touch_value” is 0.
- **ESP_FAIL** Touch pad not initialized

Parameters
- **touch_num**: touch pad index
- **touch_value**: pointer to accept touch sensor value

```c
esp_err_t touch_pad_set_filter_read_cb (filter_cb_t read_cb)
```

Register the callback function that is called after each IIR filter calculation.

**Note** The ‘read_cb’ callback is called in timer task in each filtering cycle.

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** set error

Parameters
- **read_cb**: Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

```c
esp_err_t touch_pad_isr_register (intr_handler_t fn, void *arg)
```
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NO_MEM No memory

**Parameters**
- fn: Pointer to ISR handler
- arg: Parameter for ISR

```c
esp_err_t touch_pad_set_meas_time(uint16_t sleep_cycle, uint16_t meas_cycle)
```

Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note** The greater the duty cycle of the measurement time, the more system power is consumed.

**Return**
- ESP_OK on success

**Parameters**
- sleep_cycle: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. \( t_{sleep} = \frac{\text{sleep cycle}}{\text{RTC_SLOW_CLK frequency}} \). The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
- meas_cycle: The duration of the touch sensor measurement. \( t_{meas} = \frac{\text{meas cycle}}{8\text{M}} \), the maximum measure time is \( 0xffff/8\text{M} = 8.19 \text{ms} \)

```c
touch_pad_get_meas_time(uint16_t* sleep_cycle, uint16_t* meas_cycle)
```

Get touch sensor measurement and sleep time.

**Return**
- ESP_OK on success

**Parameters**
- sleep_cycle: Pointer to accept sleep cycle number
- meas_cycle: Pointer to accept measurement cycle count.

```c
touch_pad_sw_start(void)
```

Trigger a touch sensor measurement, only support in SW mode of FSM.

**Return**
- ESP_OK on success

```c
touch_pad_set_thresh(touch_pad_t touch_num, uint16_t threshold)
```

Set touch sensor interrupt threshold.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- touch_num: touch pad index
- threshold: threshold of touchpad count, refer to touch_pad_set_trigger_mode to see how to set trigger mode.

```c
touch_pad_get_thresh(touch_pad_t touch_num, uint16_t *threshold)
```

Get touch sensor interrupt threshold.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- touch_num: touch pad index
- threshold: pointer to accept threshold

```c
touch_pad_set_trigger_mode(touch_trigger_mode_t mode)
```

Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.
Return
• ESP_OK on success
  • ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• mode: touch sensor interrupt trigger mode

**`esp_err_t touch_pad_get_trigger_mode (touch_trigger_mode_t *mode)`**

Get touch sensor interrupt trigger mode.

Return
• ESP_OK on success

Parameters
• mode: pointer to accept touch sensor interrupt trigger mode

**`esp_err_t touch_pad_set_trigger_source (touch_trigger_src_t src)`**

Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

Return
• ESP_OK on success
  • ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• src: touch sensor interrupt trigger source

**`esp_err_t touch_pad_get_trigger_source (touch_trigger_src_t *src)`**

Get touch sensor interrupt trigger source.

Return
• ESP_OK on success

Parameters
• src: pointer to accept touch sensor interrupt trigger source

**`esp_err_t touch_pad_set_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)`**

Set touch sensor group mask. Touch pad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.

Return
• ESP_OK on success
  • ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• set1_mask: bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask: bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask: bitmask of touch sensor work enable, it’s a 10-bit value

**`esp_err_t touch_pad_get_group_mask (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)`**

Get touch sensor group mask.

Return
• ESP_OK on success

Parameters
• set1_mask: pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask: pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask: pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value

**`esp_err_t touch_pad_clear_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)`**

Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

Return
• ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- set1_mask: bitmask touch sensor signal group1, it’s a 10-bit value
- set2_mask: bitmask touch sensor signal group2, it’s a 10-bit value
- en_mask: bitmask of touch sensor work enable, it’s a 10-bit value

```c
esp_err_t touch_pad_intr_enable (void)
```
To enable touch pad interrupt.

Return
- ESP_OK on success

```c
esp_err_t touch_pad_intr_disable (void)
```
To disable touch pad interrupt.

Return
- ESP_OK on success

```c
esp_err_t touch_pad_intr_clear (void)
```
To clear touch pad interrupt.

Return
- ESP_OK on success

```c
esp_err_t touch_pad_set_filter_period (uint32_t new_period_ms)
```
set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- new_period_ms: filter period, in ms

```c
esp_err_t touch_pad_get_filter_period (uint32_t* p_period_ms)
```
get touch pad filter calibration period, in ms Need to call touch_pad_filter_start before all touch filter APIs

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- p_period_ms: pointer to accept period

```c
esp_err_t touch_pad_filter_start (uint32_t filter_period_ms)
```
start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch_pad_filter_start before all touch filter APIs

Note This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM No memory for driver
- ESP_ERR_INVALID_STATE driver state error

Parameters
- filter_period_ms: filter calibration period, in ms

```c
esp_err_t touch_pad_filter_stop (void)
```
stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
**esp_err_t** `touch_pad_filter_delete` (void)

delete touch pad filter driver and release the memory Need to call `touch_pad_filter_start` before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

**Type Definitions**

```c
typedef void(*filter_cb_t)(uint16_t*raw_value,uint16_t*filtered_value)
```

Callback function that is called after each IIR filter calculation.

**Note**  
This callback is called in timer task in each filtering cycle.

**Note**  
This callback should not be blocked.

**Parameters**
- raw_value: The latest raw data(touch sensor counter value) that points to all channels(raw_value[0..TOUCH_PAD_MAX-1]).
- filtered_value: The latest IIR filtered data(calculated from raw data) that points to all channels(filtered_value[0..TOUCH_PAD_MAX-1]).

**Header File**

- components/driver/include/driver/touch_sensor_common.h

**Functions**

**esp_err_t** `touch_pad_init` (void)

Initialize touch module.

**Note**  
If default parameter don’t match the usage scenario, it can be changed after this function.

**Return**
- ESP_OK Success
- ESP_ERR_NO_MEM Touchpad init error
- ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

**esp_err_t** `touch_pad_deinit` (void)

Un-install touch pad driver.

**Note**  
After this function is called, other touch functions are prohibited from being called.

**Return**
- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

**esp_err_t** `touch_pad_io_init` (touch_pad_t touch_num)

Initialize touch pad GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- touch_num: touch pad index

**esp_err_t** `touch_pad_set_voltage` (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)

Set touch sensor high voltage threshold of chanrge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- refh: the value of DREFH
- refl: the value of DREFL
• **atten**: the attenuation on DREFH

```c
esp_err_t touch_pad_get_voltage(touch_high_volt_t *refh, touch_low_volt_t *refl,
                                 touch_volt_atten_t *atten)
```

Get touch sensor reference voltage.

**Return**
- ESP_OK on success

**Parameters**
- **refh**: pointer to accept DREFH value
- **refl**: pointer to accept DREFL value
- **atten**: pointer to accept the attenuation on DREFH

```c
esp_err_t touch_pad_set_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope,
                                  touch_tie_opt_t *opt)
```

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

**Note** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- **touch_num**: touch pad index
- **slope**: pointer to accept touch pad charge/discharge speed
- **opt**: the initial voltage

```c
esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope,
                                  touch_tie_opt_t *opt)
```

Get touch sensor charge/discharge speed for each pad.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- **touch_num**: touch pad index
- **slope**: pointer to accept touch pad charge/discharge slope
- **opt**: pointer to accept the initial voltage

```c
esp_err_t touch_pad_isr_deregister(void (*fn)(void *, void *arg))
```

Deregister the handler previously registered using `touch_pad_isr_handler_register`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both `fn` and `arg` isn’t registered

**Parameters**
- **fn**: handler function to call (as passed to `touch_pad_isr_handler_register`)
- **arg**: argument of the handler (as passed to `touch_pad_isr_handler_register`)

```c
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)
```

Get the touch pad which caused wake up from deep sleep.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
- **pad_num**: pointer to touch pad which caused wakeup

```c
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Return**
- ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- **mode**: FSM mode

```c
esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

**Return**
- ESP_OK on success

**Parameters**
- **mode**: pointer to accept FSM mode

```c
esp_err_t touch_pad_clear_status(void)
```

To clear the touch sensor channel active status.

**Note** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

**Return**
- ESP_OK on success

```c
uint32_t touch_pad_get_status(void)
```

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Return**
- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

```c
bool touch_pad_meas_is_done(void)
```

Check touch sensor measurement status.

**Return**
- True measurement is underway
- False measurement done

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. TOUCH_PAD_NUM5_GPIO_NUM is the GPIO number of channel 5 (12);
2. TOUCH_PAD_GPIO4_CHANNEL is the channel number of GPIO 4 (channel 0).

**Header File**

- components/soc/esp32/include/soc/touch_sensor_channel.h

**Macros**

- TOUCH_PAD_GPIO4_CHANNEL
- TOUCH_PAD_NUM0_GPIO_NUM
- TOUCH_PAD_GPIO0_CHANNEL
- TOUCH_PAD_NUM1_GPIO_NUM
- TOUCH_PAD_GPIO2_CHANNEL
- TOUCH_PAD_NUM2_GPIO_NUM
- TOUCH_PAD_GPIO15_CHANNEL
- TOUCH_PAD_NUM3_GPIO_NUM
- TOUCH_PAD_GPIO13_CHANNEL
- TOUCH_PAD_NUM4_GPIO_NUM
- TOUCH_PAD_GPIO12_CHANNEL
### Header File

- `components/hal/include/hal/touch_sensor_types.h`

### Macros

- `TOUCH_PAD_BIT_MASK_ALL`
- `TOUCH_PAD_SLOPE_DEFAULT`
- `TOUCH_PAD_TIE_OPT_DEFAULT`
- `TOUCH_PAD_BIT_MASK_MAX`
- `TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD`
- `TOUCH_PAD_LOW_VOLTAGE_THRESHOLD`
- `TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD`
- `TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT`
- `TOUCH_PAD_THRESHOLD_MAX`

  If set touch threshold max value, The touch sensor can’t be in touched status

- `TOUCH_PAD_SLEEP_CYCLE_DEFAULT`

  The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff

- `TOUCH_PAD_MEASURE_CYCLE_DEFAULT`

  The timer frequency is 8Mhz, the max value is 0x7fff

- `TOUCH_FSM_MODE_DEFAULT`

  The touch FSM my be started by the software or timer

- `TOUCH_TRIGGER_MODE_DEFAULT`

  Interrupts can be triggered if sensor value gets below or above threshold

- `TOUCH_TRIGGER_SOURCE_DEFAULT`

  The wakeup trigger source can be SET1 or both SET1 and SET2

### Enumerations

#### `enum touch_pad_t`

- `Touch pad channel`

  **Values:**

  - `TOUCH_PAD_NUM0 = 0`

    Touch pad channel 0 is GPIO4(ESP32)

  - `TOUCH_PAD_NUM1`

    Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)
TOUCH_PAD_NUM2
Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

TOUCH_PAD_NUM3
Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

TOUCH_PAD_NUM4
Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

TOUCH_PAD_NUM5
Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

TOUCH_PAD_NUM6
Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

TOUCH_PAD_NUM7
Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

TOUCH_PAD_NUM8
Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

TOUCH_PAD_NUM9
Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

TOUCH_PAD_MAX

enum touch_high_volt_t
Touch sensor high reference voltage

Values:

TOUCH_HVOLT_KEEP = -1
Touch sensor high reference voltage, no change

TOUCH_HVOLT_2V4 = 0
Touch sensor high reference voltage, 2.4V

TOUCH_HVOLT_2V5
Touch sensor high reference voltage, 2.5V

TOUCH_HVOLT_2V6
Touch sensor high reference voltage, 2.6V

TOUCH_HVOLT_2V7
Touch sensor high reference voltage, 2.7V

TOUCH_HVOLT_MAX

enum touch_low_volt_t
Touch sensor low reference voltage

Values:

TOUCH_LVOLT_KEEP = -1
Touch sensor low reference voltage, no change

TOUCH_LVOLT_0V5 = 0
Touch sensor low reference voltage, 0.5V

TOUCH_LVOLT_0V6
Touch sensor low reference voltage, 0.6V

TOUCH_LVOLT_0V7
Touch sensor low reference voltage, 0.7V

TOUCH_LVOLT_0V8
Touch sensor low reference voltage, 0.8V

TOUCH_LVOLT_MAX
enum touch_volt_atten_t
    Touch sensor high reference voltage attenuation
    
    Values:
    TOUCH_HVOLT_ATTEN_KEEP = -1
        Touch sensor high reference voltage attenuation, no change
    TOUCH_HVOLT_ATTEN_1V5 = 0
        Touch sensor high reference voltage attenuation, 1.5V attenuation
    TOUCH_HVOLT_ATTEN_1V
        Touch sensor high reference voltage attenuation, 1.0V attenuation
    TOUCH_HVOLT_ATTEN_0V5
        Touch sensor high reference voltage attenuation, 0.5V attenuation
    TOUCH_HVOLT_ATTEN_0V
        Touch sensor high reference voltage attenuation, 0V attenuation
    TOUCH_HVOLT_ATTEN_MAX

enum touch_cnt_slope_t
    Touch sensor charge/dischargespeed
    
    Values:
    TOUCH_PAD_SLOPE_0 = 0
        Touch sensor charge / discharge speed, always zero
    TOUCH_PAD_SLOPE_1 = 1
        Touch sensor charge / discharge speed, slowest
    TOUCH_PAD_SLOPE_2 = 2
        Touch sensor charge / discharge speed
    TOUCH_PAD_SLOPE_3 = 3
        Touch sensor charge / discharge speed
    TOUCH_PAD_SLOPE_4 = 4
        Touch sensor charge / discharge speed
    TOUCH_PAD_SLOPE_5 = 5
        Touch sensor charge / discharge speed
    TOUCH_PAD_SLOPE_6 = 6
        Touch sensor charge / discharge speed
    TOUCH_PAD_SLOPE_7 = 7
        Touch sensor charge / discharge speed, fast
    TOUCH_PAD_SLOPE_MAX

enum touch_tie_opt_t
    Touch sensor initial charge level
    
    Values:
    TOUCH_PAD_TIE_OPT_LOW = 0
        Initial level of charging voltage, low level
    TOUCH_PAD_TIE_OPT_HIGH = 1
        Initial level of charging voltage, high level
    TOUCH_PAD_TIE_OPT_MAX

enum touch_fsm_mode_t
    Touch sensor FSM mode
    
    Values:
TOUCH_FSM_MODE_TIMER = 0
To start touch FSM by timer

TOUCH_FSM_MODE_SW
To start touch FSM by software trigger

TOUCH_FSM_MODE_MAX

enum touch_trigger_mode_t
Values:

TOUCH_TRIGGER_BELOW = 0
Touch interrupt will happen if counter value is less than threshold.

TOUCH_TRIGGER_ABOVE = 1
Touch interrupt will happen if counter value is larger than threshold.

TOUCH_TRIGGER_MAX

enum touch_trigger_src_t
Values:

TOUCH_TRIGGER_SOURCE_BOTH = 0
wakeup interrupt is generated if both SET1 and SET2 are “touched”

TOUCH_TRIGGER_SOURCE_SET1 = 1
wakeup interrupt is generated if SET1 is “touched”

TOUCH_TRIGGER_SOURCE_MAX

2.3.21 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. TWAI Protocol Summary
2. Signals Lines and Transceiver
3. Driver Configuration
4. Driver Operation
5. Examples

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).
**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter** (TEC) and the **Receive Error Counter** (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

- **Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

- **Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

- **Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain a integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.

- **TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

- **BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

- **CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock (APB Clock).
Fig. 21: Signal lines of the TWAI controller

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

### Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:
## Chapter 2. API Reference

### Table 5: TWAI Driver Alerts

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABVE_ERR_WARN</td>
<td>One of the error counters has exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

**Note:** The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

### Bit Timing

The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32, the brp can be any even number from 2 to 128.

If the ESP32 is a revision 2 or later chip, the brp will also support any multiple of 4 from 132 to 256, and can be enabled by setting the CONFIG_ESP32_REV_MIN to revision 2 or higher.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.
Chapter 2. API Reference

Fig. 22: Bit timing configuration for 500kbit/s given BRP = 8

**Note:** Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing macro initializers are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- TWAI_TIMING_CONFIG_1MBITS()
- TWAI_TIMING_CONFIG_800KBITS()
- TWAI_TIMING_CONFIG_500KBITS()
- TWAI_TIMING_CONFIG_250KBITS()
- TWAI_TIMING_CONFIG_125KBITS()
- TWAI_TIMING_CONFIG_100KBITS()
- TWAI_TIMING_CONFIG_50KBITS()
- TWAI_TIMING_CONFIG_25KBITS()

Revision 2 or later of the ESP32 also supports the following bit rates:

- TWAI_TIMING_CONFIG_20KBITS()
- TWAI_TIMING_CONFIG_16KBITS()
- TWAI_TIMING_CONFIG_12_5KBITS()

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within twai_filter_config_t known as the acceptance code and the acceptance mask.

The acceptance code specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The acceptance mask is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 23: Bit layout of single filter mode (Right side MSBit)
**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Dual Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 24: Bit layout of dual filter mode (Right side MSBit)](image)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![Fig. 25: State transition diagram of the TWAI driver (see table below)](image)
**Driver States**

Uninstalled: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

Stopped: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

Running: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

Bus-Off: The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags**

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

**Examples**

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }
    ...
}

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.
Chapter 2. API Reference

```c
#include "driver/twai.h"
...

// Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

// Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```c
#include "driver/twai.h"
...

// Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}

// Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```c
#include "driver/twai.h"
...

// Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}
```

(continues on next page)
// Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

Multiple ID Filter Configuration  The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
// Acceptance Mask
MASK = 11'b000 0000 1101
```

Application Examples  Network Example: The TWAI Network example demonstrates communication between two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of data from another node acting as a network slave. The example can be found via `peripherals/twai/twai_network`.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via `peripherals/twai/twai_alert_and_recovery`.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via `peripherals/twai/twai_self_test`.

API Reference

Header File

- `components/hal/include/hal/twai_types.h`

Structures

```
struct twai_message_t
```

Structure to store a TWAI message.

**Note**  The flags member is deprecated

Public Members

```
uint32_t extd : 1
```

Extended Frame Format (29bit ID)

```
uint32_t rtr : 1
```

Message is a Remote Frame
# Chapter 2. API Reference

## `uint32_t ss`
Transmit as a Single Shot Transmission. Unused for received.

## `uint32_t self`
Transmit as a Self Reception Request. Unused for received.

## `uint32_t dlc_non_comp`
Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

## `uint32_t reserved`
Reserved bits

## `uint32_t flags`
Deprecated: Alternate way to set bits using message flags

## `uint32_t identifier`
11 or 29 bit identifier

## `uint8_t data_length_code`
Data length code

## `uint8_t data[TWAI_FRAME_MAX_DLC]`
Data bytes (not relevant in RTR frame)

```
struct twai_timing_config_t
```
Structure for bit timing configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

### Public Members

## `uint32_t brp`
Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

## `uint8_t tseg_1`
Timing segment 1 (Number of time quanta, between 1 to 16)

## `uint8_t tseg_2`
Timing segment 2 (Number of time quanta, 1 to 8)

## `uint8_t sjw`
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

## `bool triple_sampling`
Enables triple sampling when the TWAI controller samples a bit

```
struct twai_filter_config_t
```
Structure for acceptance filter configuration of the TWAI driver (see documentation)

**Note** Macro initializers are available for this structure

### Public Members

## `uint32_t acceptance_code`
32-bit acceptance code

## `uint32_t acceptance_mask`
32-bit acceptance mask

## `bool single_filter`
Use Single Filter Mode (see documentation)
Macros

TWAI_EXTD_ID_MASK
TWAI Constants.
Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK
Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC
Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES
EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES
SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH
Error counter threshold for error passive

Enumerations

enum twai_mode_t
TWAI Controller operating modes.

Values:

TWAI_MODE_NORMAL
Normal operating mode where TWAI controller can send/receive/acknowledge messages

TWAI_MODE_NO_ACK
Transmission does not require acknowledgment. Use this mode for self testing

TWAI_MODE_LISTEN_ONLY
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

• components/driver/include/driver/twai.h

Functions

esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note Macro initializers are available for the configuration structures (see documentation)

Note To reinstall the TWAI driver, call twai_driver_uninstall() first

Return

• ESP_OK: Successfully installed TWAI driver
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_NO_MEM: Insufficient memory
• ESP_ERR_INVALID_STATE: Driver is already installed

Parameters

• [in] g_config: General configuration structure
• [in] t_config: Timing configuration structure
• [in] f_config: Filter configuration structure
**esp_err_t twai_driver_uninstall (void)**

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

**esp_err_t twai_start (void)**

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Return**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

**esp_err_t twai_stop (void)**

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Return**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

**esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)**

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

**Return**
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

**Parameters**
- [in] message: Message to transmit
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

**esp_err_t twai_receive (twai_message_t *message, TickType_t ticks_to_wait)**

Receive a TWAI message.
This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Return**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] message`: Received message
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block on RX queue

```c
esp_err_t twai_read_alerts (uint32_t* alerts, TickType_t ticks_to_wait)
```

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Return**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] alerts`: Bit field of raised alerts (see documentation for alert flags)
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block for alert

```c
esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t* current_alerts)
```

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Return**
- ESP_OK: Alerts reconfigured
- ESP_ERRINVALID STATE: TWAI driver is not installed

**Parameters**
- `[in] alerts_enabled`: Bit field of alerts to enable (see documentation for alert flags)
- `[out] current_alerts`: Bit field of currently raised alerts. Set to NULL if unused

```c
esp_err_t twai_initiate_recovery (void)
```

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Return**
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

```c
esp_err_t twai_get_status_info (twai_status_info_t *status_info)
```

Get current status information of the TWAI driver.

**Return**
- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- [out] status_info: Status information

```c
esp_err_t twai_clear_transmit_queue (void)
```

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```c
esp_err_t twai_clear_receive_queue (void)
```

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when twai_start() is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

```c
struct twai_general_config_t
```
Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

**Public Members**

```c
twai_mode_t mode
```
Mode of TWAI controller

```c
gpio_num_t tx_io
```
Transmit GPIO number

```c
gpio_num_t rx_io
```
Receive GPIO number

```c
gpio_num_t clkout_io
```
CLKOUT GPIO number (optional, set to -1 if unused)

```c
gpio_num_t bus_off_io
```
Bus off indicator GPIO number (optional, set to -1 if unused)

```c
uint32_t tx_queue_len
```
Number of messages TX queue can hold (set to 0 to disable TX Queue)

```c
uint32_t rx_queue_len
```
Number of messages RX queue can hold

```c
uint32_t alerts_enabled
```
Bit field of alerts to enable (see documentation)

```c
uint32_t clkout_divider
```
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

```c
int intr_flags
```
Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

```c
struct twai_status_info_t
```
Structure to store status information of TWAI driver.
Public Members

twai_state_t state
   Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx
   Number of messages queued for transmission or awaiting transmission completion

uint32_t msgs_to_rx
   Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
   Current value of Transmit Error Counter

uint32_t rx_error_counter
   Current value of Receive Error Counter

uint32_t tx_failed_count
   Number of messages that failed transmissions

uint32_t rx_missed_count
   Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
   Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
   Number of instances arbitration was lost

uint32_t bus_error_count
   Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED
   Marks GPIO as unused in TWAI configuration

Enumerations

enum twai_state_t
   TWAI driver states.

Values:

TWAI_STATE_STOPPED
   Stopped state. The TWAI controller will not participate in any TWAI bus activities

TWAI_STATE_RUNNING
   Running state. The TWAI controller can transmit and receive messages

TWAI_STATE_BUS_OFF
   Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

TWAI_STATE_RECOVERING
   Recovering state. The TWAI controller is undergoing bus recovery

2.3.22 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e.,
timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as
RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex
data exchange among different devices.
The ESP32 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

**Functional Overview**

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters**

UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>
Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins**  
After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Driver Installation**  
Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
                                uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication**  
Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting**  
After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```
The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*) &length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts** There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.
The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`.
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`.
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`.

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events.
  - It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`.
  - Disable the interrupt using `uart_disable_pattern_det_intr()`.

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Overview of RS485 specific communication options**

**Note**: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_conf_reg.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485Conf_reg.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485Conf_reg.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the...
user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the -RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options**  This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

**Note:**
- The schematics below do **not** necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

**Circuit A: Collision Detection Circuit**

![Collision Detection Circuit Diagram](image)

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485_TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

![Manual Switching Transmitter/Receiver Diagram](image)
This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

### Circuit C: Auto Switching Transmitter/Receiver

```
VCC1 <---------------+-----------+ +-------------------+----> VCC2
| 10K ____ | | | |
| +---|____|--+ +---x-----------x---+ 10K ____ |
| | | | +---|____|--+
RX <-------------------| UART_RS485CONF_REG.UART_RS485RXBY_TX_EN |
| 10K ____ | | | |
| +------|------| PV ADM2483 | | ____ 120 |
| ____ | | +---|____|---+ RS485_ |
|--bus side
| VCC1 <+---|----|------| DE |
| 10K | | | |
| --+ +--> /RE |
| 10K | | | |
| /-C +---|____|---+ TXD | 10K |
| 1 ---|____|--+_B_ |/ NPN |
| \ | +------|-----x-----
| \-E | | |
| GND1 GND1 GND1 GND2 GND2
```

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

### Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>

### API Reference

**Header File**

- `components/driver/include/driver/uart.h`
Chapter 2. API Reference

**Functions**

```c
esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
```

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **rx_buffer_size**: UART RX ring buffer size.
- **tx_buffer_size**: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size**: UART event queue size/depth.
- **uart_queue**: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

```c
esp_err_t uart_driver_delete(uart_port_t uart_num)
```

Uninstall UART driver.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
bool uart_is_driver_installed(uart_port_t uart_num)
```

Checks whether the driver is installed or not.

**Return**
- true driver is installed
- false driver is not installed

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)
```

Set UART data bits.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **data_bit**: UART data bits

```c
esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)
```

Get the UART data bit configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **data_bit**: Pointer to accept value of UART data bits.

```c
esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)
```

Set UART stop bits.
Return

- ESP_OK Success
- ESP_FAIL Fail

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: UART stop bits

```c
esp_err_t uart_get_stop_bits (uart_port_t uart_num, uart_stop_bits_t *stop_bits)
```

Get the UART stop bit configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bits)

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: Pointer to accept value of UART stop bits.

```c
esp_err_t uart_set_parity (uart_port_t uart_num, uart_parity_t parity_mode)
```

Set UART parity mode.

Return

- ESP_FAIL Parameter error
- ESP_OK Success

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: the enum of uart parity configuration

```c
esp_err_t uart_get_parity (uart_port_t uart_num, uart_parity_t *parity_mode)
```

Get the UART parity mode configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: Pointer to accept value of UART parity mode.

```c
esp_err_t uart_set_baudrate (uart_port_t uart_num, uint32_t baudrate)
```

Set UART baud rate.

Return

- ESP_FAIL Parameter error
- ESP_OK Success

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: UART baud rate.

```c
esp_err_t uart_get_baudrate (uart_port_t uart_num, uint32_t *baudrate)
```

Get the UART baud rate configuration.

Return

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

Parameters

- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: Pointer to accept value of UART baud rate

```c
esp_err_t uart_set_line_inverse (uart_port_t uart_num, uint32_t inverse_mask)
```

Set UART line inverse mode.

Return

- ESP_OK Success
- ESP_FAIL Parameter error

Parameters

- inverse_mask: the enum of UART line inverse configuration
• `uart_num`: UART port number, the max port number is `(UART_NUM_MAX - 1)`.
• `inverse_mask`: Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

```
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```

Set hardware flow control.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is `(UART_NUM_MAX - 1)`
- `flow_ctrl`: Hardware flow control mode
- `rx_thresh`: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

```
esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```

Set software flow control.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `enable`: switch on or off
- `rx_thresh_xon`: low water mark
- `rx_thresh_xoff`: high water mark

```
esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
```

Get the UART hardware flow control configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

**Parameters**
- `uart_num`: UART port number, the max port number is `(UART_NUM_MAX - 1)`
- `flow_ctrl`: Option for different flow control mode.

```
esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)
```

Clear UART interrupt status.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is `(UART_NUM_MAX - 1)`.
- `clr_mask`: Bit mask of the interrupt status to be cleared.

```
esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)
```

Set UART interrupt enable.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is `(UART_NUM_MAX - 1)`.
- `enable_mask`: Bit mask of the enable bits.

```
esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)
```

Clear UART interrupt enable bits.

**Return**
### Chapter 2. API Reference

- **ESP_OK Success**
- **ESP_FAIL Parameter error**

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask**: Bit mask of the disable bits.

#### esp_err_t uart_enable_rx_intr(uart_port_t uart_num)
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Return**
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).

#### esp_err_t uart_disable_rx_intr(uart_port_t uart_num)
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Return**
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).

#### esp_err_t uart_disable_tx_intr(uart_port_t uart_num)
Disable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

**Return**
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

**Parameters**
- **uart_num**: UART port number

#### esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
Enable UART TX interrupt (TXFIFO_EMPTY INTERRUPT)

**Return**
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **enable**: 1: enable; 0: disable
- **thresh**: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

#### esp_err_t uart_isr_register(uart_port_t uart_num, void (*fn)(void *), void *arg, int intr_alloc_flags, uart_isr_handle_t *handle)
Register UART interrupt handler (ISR).

**Note**
UART ISR handler will be attached to the same CPU core that this function is running on.

**Return**
- **ESP_OK Success**
- **ESP_FAIL Parameter error**

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **fn**: Interrupt handler function.
- **arg**: parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### esp_err_t uart_isr_free(uart_port_t uart_num)
Free UART interrupt handler registered by uart_isr_register. Must be called on the same core as uart_isr_register was called.

**Return**
Chapter 2. API Reference

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```

Assign signals of a UART peripheral to GPIO pins.

**Note** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- tx_io_num: UART TX pin GPIO number.
- rx_io_num: UART RX pin GPIO number.
- rts_io_num: UART RTS pin GPIO number.
- cts_io_num: UART CTS pin GPIO number.

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```

Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- level: 1: RTS output low (active); 0: RTS output high (block)

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```

Manually set the UART DTR pin level.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- level: 1: DTR output low; 0: DTR output high

```c
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```

Set UART idle interval after tx FIFO is empty.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- idle_num: idle interval after tx FIFO is empty (unit: the time it takes to send one bit under current baudrate)

```c
esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
```

Set UART configuration parameters.

**Return**
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• uart_config: UART parameter settings

```
esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
```
Configure UART interrupts.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• intr_conf: UART interrupt settings

```
esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)
```
Wait until UART TX FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• ticks_to_wait: Timeout, count in RTOS ticks

```
int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)
```
Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note** This function should only be used when UART TX buffer is not enabled.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• buffer: data buffer address
• len: data length to send

```
int uart_write_bytes(uart_port_t uart_num, const void *src, size_t size)
```
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• src: data buffer address
• size: data length to send

```
int uart_write_bytes_with_break(uart_port_t uart_num, const void *src, size_t size, int brk_len)
```
Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.
Otherwise, if the `tx_buffer_size` > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Return**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `src`: data buffer address
- `size`: data length to send
- `brk_len`: break signal duration(unit: the time it takes to send one bit at current baudrate)

```c
int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Return**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `buf`: pointer to the buffer.
- `length`: data length
- `ticks_to_wait`: sTimeout, count in RTOS ticks

```c
esp_err_t uart_flush (uart_port_t uart_num)
```

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_flush_input (uart_port_t uart_num)
```

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)
```

UART get RX ring buffer cached data length.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `size`: Pointer of size_t to accept cached data length

```c
esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)
```

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_enable_pattern_det_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Note** This function only works for esp32. And this function is deprecated, please use `uart_enable_pattern_det_baud_intr` instead.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as at_cmd char.
- `post_idle`: idle time after the last pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- `pre_idle`: idle time before the first pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- `post_idle`: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- `pre_idle`: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
int uart_pattern_pop_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.
### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

### int uart_pattern_get_pos (uart_port_t uart_num)
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

### Return
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

### esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)
Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

### Return
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

### Parameters
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **queue_length**: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

### esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)
UART set communication mode.

**Note** This function must be executed after uart_driver_install(), when the driver object is initialized.

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters
- **uart_num**: Uart number to configure, the max port number is (UART_NUM_MAX - 1).
- **mode**: UART MODE to set

### esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)
Set uart threshold value for RX fifo full.

**Note** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

### Parameters
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold**: Threshold value above which RX fifo full interrupt is generated

### esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)
Set uart threshold values for TX fifo empty.

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- threshold: Threshold value below which TX fifo empty interrupt is generated

```c
esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)
```

UART set threshold timeout for TOUT feature.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- tout_thresh: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

```c
esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)
```

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- uart_num: Uart number to configure the max port number is (UART_NUM_MAX -1).
- collision_flag: Pointer to variable of type bool to return collision flag.

```c
esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)
```

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in uart_config_t to true.

**Note** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

**Parameters**
- uart_num: UART number, the max port number is (UART_NUM_MAX -1).
- wakeup_threshold: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

```c
esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.
Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

Parameters
• uart_num: UART number, the max port number is (UART_NUM_MAX - 1).
• [out] out_wakeup_threshold: output, set to the current value of wakeup threshold for the given UART.

\[ \text{esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)} \]
Wait until UART tx memory empty and the last char send ok (polling mode).

• Return
  – ESP_OK on success
  – ESP_ERR_INVALID_ARG Parameter error
  – ESP_FAIL Driver not installed

Parameters
• uart_num: UART number

\[ \text{esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)} \]
Configure TX signal loop back to RX module, just for the test usage.

• Return
  – ESP_OK on success
  – ESP_ERR_INVALID_ARG Parameter error
  – ESP_FAIL Driver not installed

Parameters
• uart_num: UART number
  • loop_back_en: Set true to enable the loop back function, else set it false.

\[ \text{void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)} \]
Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters
• uart_num: UART number
  • always_rx_timeout_en: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures
\[ \text{struct uart_intr_config_t} \]
UART interrupt configuration parameters for uart_intr_config function.

Public Members

\[ \text{uint32_t intr_enable_mask} \]
UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

\[ \text{uint8_t rx_timeout_thresh} \]
UART timeout interrupt threshold (unit: time of sending one byte)

\[ \text{uint8_t txfifo_empty_intr_thresh} \]
UART TX empty interrupt threshold.

\[ \text{uint8_t txfifo_full_thresh} \]
UART RX full interrupt threshold.

\[ \text{struct uart_event_t} \]
Event structure used in UART event queue.
Chapter 2. API Reference

**Public Members**

```c
uart_event_type_t type
    UART event type

size_t size
    UART data size for UART_DATA event

bool timeout_flag
    UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.
```

**Macros**

```c
#define UART_NUM_0   UART_port_0
#define UART_NUM_1   UART_port_1
#define UART_NUM_2   UART_port_2
#define UART_NUM_MAX UART_port_max
#define UART_PIN_NO_CHANGE
#define UART_FIFO_LEN
    Length of the UART HW FIFO.
#define UART_BITRATE_MAX
    Maximum configurable bitrate.
```

**Type Definitions**

```c
typedef intr_handler_t uart_isr_handler_t
```

**Enumerations**

```c
enum uart_event_type_t
    UART event types used in the ring buffer.

Values:

UART_DATA
    UART data event

UART_BREAK
    UART break event

UART_BUFFER_FULL
    UART RX buffer full event

UART_FIFO_OVF
    UART FIFO overflow event

UART_FRAME_ERR
    UART RX frame error event

UART_PARITY_ERR
    UART RX parity event

UART_DATA_BREAK
    UART TX data and break event
```
UART_PATTERN_DET
UART pattern detected

UART_EVENT_MAX
UART event max index

Header File
- components/hal/include/hal/uart_types.h

 Structures

struct uart_at_cmd_t
UART AT cmd char configuration parameters. Note that this function may differ on different chip. Please refer to the TRM at configuration.

Public Members
- uint8_t cmd_char
  UART AT cmd char
- uint8_t char_num
  AT cmd char repeat number
- uint32_t gap_tout
  gap time (in baud-rate) between AT cmd char
- uint32_t pre_idle
  the idle time (in baud-rate) between the non AT char and first AT char
- uint32_t post_idle
  the idle time (in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t
UART software flow control configuration parameters.

Public Members
- uint8_t xon_char
  Xon flow control char
- uint8_t xoff_char
  Xoff flow control char
- uint8_t xon_thrd
  If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent
- uint8_t xoff_thrd
  If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct uart_config_t
UART configuration parameters for uart_param_config function.

Public Members
- int baud_rate
  UART baud rate
- uart_word_length_t data_bits
  UART byte size
uart_parity_t
  UART parity mode

uart_stop_bits_t
  UART stop bits

uart_hw_flowcontrol_t
  UART HW flow control mode (cts/rts)

uint8_t
  UART HW RTS threshold

uart_sclk_t
  UART source clock selection

bool
  Deprecated method to select ref tick clock source, set source_clk field instead

Type Definitions

typedef int uart_port_t
  UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

Enumerations

class uart_mode_t
  UART mode selection.

Values:

UART_MODE_UART = 0x00
  mode: regular UART mode

UART_MODE_RS485_HALF_DUPLEX = 0x01
  mode: half duplex RS485 UART mode control by RTS pin

UART_MODE_IRDA = 0x02
  mode: IRDA UART mode

UART_MODE_RS485_COLLISION_DETECT = 0x03
  mode: RS485 collision detection UART mode (used for test purposes)

UART_MODE_RS485_APP_CTRL = 0x04
  mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
  UART word length constants.

Values:

UART_DATA_5_BITS = 0x0
  word length: 5bits

UART_DATA_6_BITS = 0x1
  word length: 6bits

UART_DATA_7_BITS = 0x2
  word length: 7bits

UART_DATA_8_BITS = 0x3
  word length: 8bits

UART_DATA_BITS_MAX = 0x4

enum uart_stop_bits_t
  UART stop bits number.

Values:
UART_STOP_BITS_1 = 0x1
stop bit: 1bit

UART_STOP_BITS_1_5 = 0x2
stop bit: 1.5bits

UART_STOP_BITS_2 = 0x3
stop bit: 2bits

UART_STOP_BITS_MAX = 0x4

enum uart_parity_t
UART parity constants.
Values:

UART_PARITY_DISABLE = 0x0
Disable UART parity

UART_PARITY_EVEN = 0x2
Enable UART even parity

UART_PARITY_ODD = 0x3
Enable UART odd parity

enum uart_hw_flowcontrol_t
UART hardware flow control modes.
Values:

UART_HW_FLOWCTRL_DISABLE = 0x0
disable hardware flow control

UART_HW_FLOWCTRL_RTS = 0x1
enable RX hardware flow control (rts)

UART_HW_FLOWCTRL_CTS = 0x2
enable TX hardware flow control (cts)

UART_HW_FLOWCTRL_CTS_RTS = 0x3
enable hardware flow control

UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
UART signal bit map.
Values:

UART_SIGNAL_INV_DISABLE = 0
Disable UART signal inverse

UART_SIGNAL_IRDA_TX_INV = (0x1 << 0)
inverse the UART irda_tx signal

UART_SIGNAL_IRDA_RX_INV = (0x1 << 1)
inverse the UART irda_rx signal

UART_SIGNAL_RXD_INV = (0x1 << 2)
inverse the UART rxd signal

UART_SIGNAL_CTS_INV = (0x1 << 3)
inverse the UART cts signal

UART_SIGNAL_DSR_INV = (0x1 << 4)
inverse the UART dsr signal

UART_SIGNAL_TXD_INV = (0x1 << 5)
inverse the UART txd signal
UART_SIGNAL_RTS_INV = (0x1 << 6)
    inverse the UART rts signal
UART_SIGNAL_DTR_INV = (0x1 << 7)
    inverse the UART dtr signal

enum uart_sclk_t
    UART source clock.

Values:

UART_SCLK_APB = 0x0
    UART source clock from APB
UART_SCLK_REF_TICK = 0x3
    UART source clock from REF_TICK

GPIO Lookup Macros   The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

Note: These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File

- components/soc/esp32/include/soc/uart_channel.h

Macros

UART_GPIO1_DIRECT_CHANNEL
UART_NUM_0_TXD_DIRECT_GPIO_NUM
UART_GPIO3_DIRECT_CHANNEL
UART_NUM_0_RXD_DIRECT_GPIO_NUM
UART_GPIO19_DIRECT_CHANNEL
UART_NUM_0_CTS_DIRECT_GPIO_NUM
UART_GPIO22_DIRECT_CHANNEL
UART_NUM_0_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO1_DIRECT_CHANNEL
UART_RXD_GPIO3_DIRECT_CHANNEL
UART_CTS_GPIO19_DIRECT_CHANNEL
UART_RTS_GPIO22_DIRECT_CHANNEL
UART_GPIO10_DIRECT_CHANNEL
UART_NUM_1_TXD_DIRECT_GPIO_NUM
UART_GPIO9_DIRECT_CHANNEL
UART_NUM_1_RXD_DIRECT_GPIO_NUM
UART_GPIO6_DIRECT_CHANNEL
UART_NUM_1_CTS_DIRECT_GPIO_NUM
UART_GPIO11_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UART_CTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_GPIO17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM
UART_GPIO16_DIRECT_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7_DIRECT_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO8_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.4 Application Protocols

2.4.1 ASIO port

Overview

Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.
Chapter 2. API Reference

Supported features  ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio protocols/asio:

- protocols/asio/udp_echo_server
- protocols/asio/tcp_echo_server
- protocols/asio/asio_chat
- protocols/asio/ssl_client_server

Please refer to the specific example README.md for details

2.4.2 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedTLS, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tcp, default port 8883
- protocols/mqtt/ssl_psk: MQTT over tcp using pre-shared keys for authentication, default port 8883
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

URI

- Currently support mqtt, mqtts, ws, wss schemes
- MQTT over TCP samples:
MQTT over TCP, port 1884, with username and password

• MQTT over SSL samples:
  - mqtts://mqtt.eclipseprojects.io:8883
  - mqtts://username:password@mqtt.eclipseprojects.io:8883

• MQTT over Websocket samples:
  - ws://mqtt.eclipseprojects.io:80/mqtt

• MQTT over Websocket Secure samples:
  - wss://mqtt.eclipseprojects.io:443/mqtt

• Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .uri = "mqtt://mqtt.eclipseprojects.io",
  .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
  &client);
esp_mqtt_client_start(client);
```

• Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

• Get certificate from server, example:
  ```
  openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 2>/dev/null
  | openssl x509 -outform PEM >mqtt_eclipse_org.pem
  ```

• Check the sample application: examples/mqtt_ssl

• Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .uri = "mqtts://mqtt.eclipseprojects.io:8883",
  .event_handler = mqtt_event_handler,
  .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then cert_len should also be set. Other SSL related configuration parameters are:

- use_global_ca_store: use the global certificate store to verify server certificate, see esp-tls.h for more information
- client_cert_pem: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client_cert_len: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.
- client_key_pem: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- client_key_len: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.
- psk_hint_key: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- alpn_protos: NULL-terminated list of protocols to be used for ALPN.

Last Will and Testament  MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the esp_mqtt_client_config_t struct.

- lwt_topic: pointer to the LWT message topic
- lwt_msg: pointer to the LWT message
Chapter 2. API Reference

- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

**Other Configuration Parameters**

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects
- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
- `refresh_connection_after_ms`: refresh connection after this value (in milliseconds)
- `event_handle`: handle for MQTT events as a callback in legacy mode
- `event_loop_handle`: handle for MQTT event loop library

For more options on `esp_mqtt_client_config_t`, please refer to API reference below

**Change settings in Project Configuration Menu**  The settings for MQTT can be found using `idf.py menu-config`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
• **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple **MQTT_EVENT_DATA** will be posted and **current_data_offset** and **total_data_len** from event data updated to keep track of the fragmented message.

• **MQTT_EVENT_ERROR**: The client has encountered an error. **esp_mqtt_error_type_t** from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.

### API Reference

**Header File**

- components/mqtt/esp-mqtt/include/mqtt_client.h

**Functions**

**esp_mqtt_client_handle_t esp_mqtt_client_init (const esp_mqtt_client_config_t *config)**

Creates mqtt client handle based on the configuration.

*Return* mqtt_client_handle if successfully created, NULL on error

*Parameters*

  • `config`: mqtt configuration structure

**esp_err_t esp_mqtt_client_set_uri (esp_mqtt_client_handle_t client, const char *uri)**

Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

*Return* ESP_FAIL if URI parse error, ESP_OK on success

*Parameters*

  • `client`: mqtt client handle
  • `uri`: char *

**esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)**

Starts mqtt client with already created client handle.

*Return* ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

*Parameters*

  • `client`: mqtt client handle

**esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)**

This api is typically used to force reconnection upon a specific event.

*Return* ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

*Parameters*

  • `client`: mqtt client handle

**esp_err_t esp_mqtt_client_disconnect (esp_mqtt_client_handle_t client)**

This api is typically used to force disconnection from the broker.

*Return* ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

*Parameters*

  • `client`: mqtt client handle

**esp_err_t esp_mqtt_client_stop (esp_mqtt_client_handle_t client)**

Stops mqtt client tasks.

*Notes:*
- Cannot be called from the mqtt event handler

*Return* ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

*Parameters*

  • `client`: mqtt client handle
int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Return message_id of the subscribe message on success -1 on failure

Parameters
- client: mqtt client handle
- topic: topic
- qos: qos

int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)

Unsubscribe the client from defined topic.

Notes:
- Client must be connected to send unsubscribe message
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the subscribe message on success -1 on failure

Parameters
- client: mqtt client handle
- topic: topic

int esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure

Parameters
- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag

int esp_mqtt_client_enqueue(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Return message_id if queued successfully, -1 otherwise

Parameters
- client: mqtt client handle
- topic: topic string
Chapter 2. API Reference

- **data**: payload string (set to NULL, sending empty payload message)
- **len**: data length, if set to 0, length is calculated from payload string
- **qos**: qos of publish message
- **retain**: retain flag
- **store**: if true, all messages are enqueued; otherwise only qos 1 and qos 2 are enqueued

```c
esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)
```

Destroys the client handle.

**Notes:**
- Cannot be called from the mqtt event handler

**Return**
- ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

**Parameters**
- client: mqtt client handle

```c
esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)
```

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

**Return**
- ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration.
- ESP_OK on success

**Parameters**
- client: mqtt client handle
- config: mqtt configuration structure

```c
esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
```

Registers mqtt event.

**Return**
- ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization
- ESP_OK on success

**Parameters**
- client: mqtt client handle
- event: event type
- event_handler: handler callback
- event_handler_arg: handlers context

```c
int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)
```

Get outbox size.

**Return**
- outbox size 0 on wrong initialization

**Parameters**
- client: mqtt client handle

---

**Structures**

**struct esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

- error_type
- related member variables
- note
- MQTT_ERROR_TYPE_TCP_TRANSPORT
- esp_tls_last.esp.err, esp_tls_stack.err, esp_tls_cert_verify_flags, sock_errno
- Error reported from tcp_transport/esp-tls
- MQTT_ERROR_TYPE_CONNECTION_REFUSED
- connect_return_code
- Internal error reported from MQTT broker on connection
Chapter 2. API Reference

Public Members

`esp_err_t esp_tls_last_esp_err`
last esp_err code reported from esp-tls component

`int esp_tls_stack_err`
tls specific error code reported from underlying tls stack

`int esp_tls_cert_verify_flags`
tls flags reported from underlying tls stack during certificate verification

`esp_mqtt_error_type_t error_type`
error type referring to the source of the error

`esp_mqtt_connect_return_code_t connect_return_code`
connection refused error code reported from MQTT broker on connection

`int esp_transport_sock_errno`
errno from the underlying socket

```c
struct esp_mqtt_event_t
MQTT event configuration structure
```

Public Members

```c
struct esp_mqtt_event_id_t
MQTT event type
```

```c
struct esp_mqtt_client_handle_t client
MQTT client handle for this event
```

```c
void *user_context
User context passed from MQTT client config
```

```c
char *data
Data associated with this event
```

`int data_len`
Length of the data for this event

`int total_data_len`
Total length of the data (longer data are supplied with multiple events)

`int current_data_offset`
Actual offset for the data associated with this event

```c
char *topic
Topic associated with this event
```

`int topic_len`
Length of the topic for this event associated with this event

`int msg_id`
MQTT message id of message

```c
struct esp_mqtt_client_config_t
MQTT client configuration structure
```

`bool retain`
Retained flag of the message associated with this event

```c
struct esp_mqtt_error_codes_t *error_handle
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors
```
Public Members

```c
mqtt_event_callback_t event_handle
    handle for MQTT events as a callback in legacy mode

exp_event_loop_handle_t event_loop_handle
    handle for MQTT event loop library

const char *host
    MQTT server domain (ipv4 as string)

const char *uri
    Complete MQTT broker URI

uint32_t port
    MQTT server port

const char *client_id
    default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
    MQTT username

const char *password
    MQTT password

const char *lwt_topic
    LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
    LWT message (NULL by default)

int lwt_qos
    LWT message qos

int lwt_retain
    LWT retained message flag

int lwt_msg_len
    LWT message length

int disable_clean_session
    mqtt clean session, default clean_session is true

int keepalive
    mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
    this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
    pass user context to this option, then can receive that context in event->user_context

int task_prio
    MQTT task priority, default is 5, can be changed in make menuconfig

int task_stack
    MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int buffer_size
    size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)

const char *cert_pem
    Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.
```
size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len.

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t transport
overrides URI transport

int refresh_connection_after_ms
Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

esp_err_t (*crt_bundle_attach)(void *conf)
Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int reconnect_timeout_ms
Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

const char **alpn_protos
NULL-terminated list of supported application protocols to be used for ALPN

const char *clientkey_password
Client key decryption password string

int clientkey_password_len
String length of the password pointed to by clientkey_password

esp_mqtt_protocol_ver_t protocol_ver
MQTT protocol version used for connection, defaults to value from menuconfig

int out_buffer_size
size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

bool skip_cert_common_name_check
Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
enable secure element for enabling SSL connection

void *ds_data
carrier of handle for digital signature parameters

int network_timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)
bool disable_keepalive
Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

const char *path
Path in the URI

int message_retransmit_timeout
timeout for retransmit of failed packet

Macros
MQTT_ERROR_TYPE_ESP_TLS
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_espr_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
typedef esp_err_t (*mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

Enumerations
enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

• user_context - user data from esp_mqtt_client_config_t
• client - mqtt client handle
• various other data depending on event type

Values:

MQTT_EVENT_ANY = -1
MQTT_EVENT_ERROR = 0
on error event, additional context: connection return code, error handle from esp_tls (if supported)

MQTT_EVENT_CONNECTED
connected event, additional context: session_present flag

MQTT_EVENT_DISCONNECTED
disconnected event

MQTT_EVENT_SUBSCRIBED
subscribed event, additional context: msg_id
MQTT_EVENT_UNSUBSCRIBED
unsubscribed event

MQTT_EVENT_PUBLISHED
published event, additional context: msg_id

MQTT_EVENT_DATA
data event, additional context:
- msg_id message id
- topic pointer to the received topic
- topic_len length of the topic
- data pointer to the received data
- data_len length of the data for this event
- current_data_offset offset of the current data for this event
- total_data_len total length of the data received
- retain retain flag of the message
  Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT
The event occurs before connecting

MQTT_EVENT_DELETED
Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
- This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
- Additional context: msg_id (id of the deleted message).

enum esp_mqtt_connect_return_code_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_CONNECTION_ACCEPTED = 0
Connection accepted

MQTT_CONNECTION_REFUSE_PROTOCOL
MQTT connection refused reason: Wrong protocol

MQTT_CONNECTION_REFUSE_ID_REJECTED
MQTT connection refused reason: ID rejected

MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
MQTT connection refused reason: Server unavailable

MQTT_CONNECTION_REFUSE_BAD_USERNAME
MQTT connection refused reason: Wrong user

MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED
MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_ERROR_TYPE_NONE = 0

MQTT_ERROR_TYPE_TCP_TRANSPORT

MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t
Values:

MQTT_TRANSPORT_UNKNOWN = 0x0
**Chapter 2. API Reference**

**MQTT_TRANSPORT_OVER_TCP**  
MQTT over TCP, using scheme: mqtt

**MQTT_TRANSPORT_OVER_SSL**  
MQTT over SSL, using scheme: mqtts

**MQTT_TRANSPORT_OVER_WS**  
MQTT over Websocket, using scheme: ws

**MQTT_TRANSPORT_OVER_WSS**  
MQTT over Websocket Secure, using scheme: wss

```c
enum esp_mqtt_protocol_ver_t
MQTT protocol version used for connection
Values:
MQTT_PROTOCOL_UNDEFINED = 0
MQTT_PROTOCOL_V_3_1
MQTT_PROTOCOL_V_3_1_1
```

### 2.4.3 ESP-TLS

**Overview**

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()` for opening a new TLS connection.
- `esp_tls_conn_read()` for reading from the connection.
- `esp_tls_conn_write()` for writing into the connection.
- `esp_tls_conn_delete()` for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](https://example.com).

**Tree structure for ESP-TLS component**

```
 ├── esp_tls.c
 │   ├── esp_tls.h
 │   └── esp_tls_mbedtls.c
 │       └── esp_tls_wolfssl.c
 └── private_include
     ├── esp_tls_mbedtls.h
     └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file esp-tls/esp_tls.h which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in esp-tls/private_include/esp_tls_mbedtls.h and API specific to wolfssl are present in esp-tls/private_include/esp_tls_wolfssl.h.
TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the esp_tls_cfg_t structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf and cacert_bytes**: The CA certificate can be provided in a buffer to the esp_tls_cfg_t structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in esp_tls_cfg_t structure must be set.
  - cacert_buf - pointer to the buffer which contains the CA cert.
  - cacert_bytes - size of the CA certificate in bytes.
- **use_global_ca_store**: The global_ca_store can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set use_global_ca_store = true in their respective esp_tls_cfg_t structure. See API Reference section below on information regarding different API used for initializing and setting up the global_ca_store.
- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](https://github.com/espressif/esp-wolfssl).
- **psk_hint_key**: To use pre-shared keys for server verification, CONFIG_ESP_TLS_PSK_VERIFICATION should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the esp_tls_cfg_t structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling CONFIG_ESP_TLS_INSECURE and CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the esp_tls_cfg_t structure. WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtl or wolfssl as their underlying SSL/TLS library. By default only mbedtl is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

Note: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands:

   ```bash
   (First change directory (cd) to your project directory)
   mkdir components
   cd components
   git clone https://github.com/espressif/esp-wolfssl.git
   ```

2) Add wolfssl as an extra component in your project.
   - Download wolfssl with:
     ```bash
     git clone https://github.com/espressif/esp-wolfssl.git
     ```
• Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt/Makefile of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```python
idf.py/make menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

## Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

**Note:** These values are subject to change with change in configuration options and version of respective libraries.

## ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedtls as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.

**Note:** ATECC608A chip on ESP32-WROOM-32SE must be already configured and provisioned, for details refer esp_cryptoauth_utility

To enable the secure element support, and use it in your project for TLS connection, you will have to follow below steps

1) Add esp-cryptoauthlib in your project, for details please refer esp-cryptoauthlib with ESP_IDF

2) Enable following menuconfig option:

```python
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-TLS
```

3) Select type of ATECC608A chip with following option:

```python
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to your ESP module please visit ATECC608A chip type

4) Enable use of ATECC608A in ESP-TLS by providing following config option in esp_tls_cfg_t

```c
esp_tls_cfg_t cfg = {
  /* other configurations options */
  .use_secure_element = true,
};
```
API Reference

Header File

- components/esp-tls/esp_tls.h

Functions

```c
esp_tls_t *esp_tls_init (void)
```
Create TLS connection.

Return: tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

```c
esp_tls_t *esp_tls_conn_new (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)
```
Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_new_sync` (and its asynchronous version `esp_tls_conn_new_async`)

Return: pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

```c
int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```
Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Return:

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

Parameters

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- [in] tls: Pointer to esp-tls as esp-tls handle.

```c
esp_tls_t *esp_tls_conn_http_new (const char *url, const esp_tls_cfg_t *cfg)
```
Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new()` API. However this API accepts host’s url.

Return: pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’ . At a minimum, this structure should be zero-initialized.

```c
int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```
Create a new non-blocking TLS/SSL connection.
This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Return**

-1 If connection establishment fails.
0 If connection establishment is in progress.
1 If connection establishment is successful.

**Parameters**

- [in] `hostname`: Hostname of the host.
- [in] `port`: Port number of the host.
- [in] `cfg`: TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to true.
- [in] `tls`: pointer to esp-tls as esp-tls handle.

```c
int esp_tls_conn_http_new_async (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

**Return**

-1 If connection establishment fails.
0 If connection establishment is in progress.
1 If connection establishment is successful.

**Parameters**

- [in] `url`: url of host.
- [in] `cfg`: TLS configuration as `esp_tls_cfg_t`.
- [in] `tls`: pointer to esp-tls as esp-tls handle.

```c
static ssize_t esp_tls_conn_write (esp_tls_t *tls, const void *data, size_t datalen)
```

Write from buffer ‘data’ into specified tls connection.

**Return**

- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer from which data will be written.
- [in] `datalen`: Length of data buffer.

```c
static ssize_t esp_tls_conn_read (esp_tls_t *tls, void *data, size_t datalen)
```

Read from specified tls connection into the buffer ‘data’.

**Return**

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

**Parameters**

- [in] `tls`: pointer to esp-tls as esp-tls handle.
- [in] `data`: Buffer to hold read data.
- [in] `datalen`: Length of data buffer.

```c
void esp_tls_conn_delete (esp_tls_t *tls)
```

Compatible version of `esp_tls_conn_destroy()` to close the TLS/SSL connection.

**Note** This API will be removed in IDFv5.0
Parameters
  • [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_destroy(esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.
This function should be called to close each tls connection opened with esp_tls_conn_new() or
esp_tls_conn_http_new() APIs.
Return
  • -0 on success
  • -1 if socket error or an invalid argument

Parameters
  • [in] tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
Return the number of application data bytes remaining to be read from the current record.
This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.
Return
  • -1 in case of invalid arg
  • bytes available in the application data record read buffer

Parameters
  • [in] tls: pointer to esp-tls as esp-tls handle.

esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)
Returns the connection socket file descriptor from esp_tls session.
Return
  • ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
  • ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

Parameters
  • [in] tls: handle to esp_tls context
  • [out] sockfd: int pointer to sockfd value.

esp_err_t esp_tls_init_global_ca_store(void)
Create a global CA store, initially empty.
This function should be called if the application wants to use the same CA store for multiple connections. This
function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be
effective, this function must be called before any call to esp_tls_set_global_ca_store().
Return
  • ESP_OK if creating global CA store was successful.
  • ESP_ERR_NO_MEM if an error occurred when allocating the mbedtls TLS resources.

esp_err_t esp_tls_set_global_ca_store(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
Set the global CA store with the buffer provided in pem format.
This function should be called if the application wants to set the global CA store for multiple connections i.e. to
add the certificates in the provided buffer to the certificate chain. This function implicitly calls
esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before
calling esp_tls_conn_new().
Return
  • ESP_OK if adding certificates was successful.
  • Other if an error occurred or an action must be taken by the calling process.
Parameters
  • [in] cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for
    creating a global CA store, which can be used by other tls connections.

void esp_tls_free_global_ca_store(void)
Free the global CA store currently being used.
The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

`esp_err_t esp_tls_get_and_clear_last_error(esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)`

Returns last error in `esp_tls` with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- Specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

Parameters
- [in] h: esp-tls error handle.
- [out] esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- [out] esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

`esp_err_t esp_tls_get_and_clear_error_type(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)`

Returns the last error captured in `esp_tls` of a specific type. The error information is cleared internally upon return.

Return
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

Parameters
- [in] h: esp-tls error handle.
- [in] err_type: specific error type
- [out] error_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

`mbedtls_x509_crt* esp_tls_get_global_ca_store(void)`

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

Note: Modifying the pointer might cause a failure in verifying the certificates.

Return
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

`esp_err_t esp_tls_plain_tcp_connect(const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)`

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Return
- ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Parameters
- [in] host: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: ESP-TLS configuration as esp_tls_cfg_t.
- [out] error_handle: ESP-TLS error handle holding potential errors occurred during connection
- [out] sockfd: Socket descriptor if successfully connected on TCP layer

Structures

`struct psk_key_hint`  
ESP-TLS preshared key and hint structure.
Public Members

const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the key

const char *hint
hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
esp-tls client session ticket ctx
Keep alive parameters structure

Public Members

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time (second)

int keep_alive_interval
Keep-alive interval time (second)

int keep_alive_count
Keep-alive packet retry send count

struct esp_tls_cfg
ESP-TLS configuration parameters.

Note
Note about format of certificates:
• This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
• Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { “h2”, NULL };
• where ‘h2’ is the protocol name

const unsigned char *cacert_buf
Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
CA certificate buffer legacy name

unsigned int cacert_bytes
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)
Chapter 2. API Reference

unsigned int **cacert_pem_bytes**
Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
Client certificate legacy name

unsigned int **clientcert_bytes**
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**
Size of client certificate legacy name

const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientkey_pem_buf
Client key legacy name

unsigned int **clientkey_bytes**
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**
Size of client key legacy name

const unsigned char *clientkey_password
Client key decryption password string

unsigned int **clientkey_password_len**
String length of the password pointed to by clientkey_password

bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool use_secure_element
Enable this option to use secure element or atec608a chip (Integrated with ESP32-WROOM-32SE)

int timeout_ms
Network timeout in milliseconds

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool skip_common_name
Skip any validation of server certificate CN field

**tls_keep_alive_cfg** *keep_alive_cfg*
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

**esp_err_t**(*crt_bundle_attach*)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig
Chapter 2. API Reference

```c
void *ds_data
    Pointer for digital signature peripheral context

bool is_plain_tcp
    Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq *if_name
    The name of interface for data to go through. Use the default interface without setting

struct esp_tls
    ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context ssl
    TLS/SSL context

mbedtls_entropy_context entropy
    mbedTLS entropy context structure

mbedtls_ctr_drbg_context ctr_drbg
    mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config conf
    TLS/SSL configuration to be shared between mbedtls_ssl_context structures

mbedtls_net_context server_fd
    mbedTLS wrapper type for sockets

mbedtls_x509_crt cacert
    Container for the X.509 CA certificate

mbedtls_x509_crt *cacert_ptr
    Pointer to the cacert being used.

mbedtls_x509_crt clientcert
    Container for the X.509 client certificate

mbedtls_pk_context clientkey
    Container for the private key of the client certificate

int sockfd
    Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
    Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
    Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t conn_state
    ESP-TLS Connection state

fd_set rset
    read file descriptors

fd_set wset
    write file descriptors

bool is_tls
    indicates connection type (TLS or NON-TLS)

esp_tls_role_t role
    esp-tls role
```
Chapter 2. API Reference

- ESP_TLS_CLIENT
- ESP_TLS_SERVER

```c
esp_tls_error_handle_t error_handle
handle to error descriptor
```

### Type Definitions

**typedef enum esp_tls_conn_state esp_tls_conn_state_t**

ESP-TLS Connection State.

**typedef enum esp_tls_role esp_tls_role_t**

**typedef struct psk_key_hint psk_hint_key_t**

ESP-TLS preshared key and hint structure.

**typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t**

esp-tls client session ticket ctx

Keep alive parameters structure

**typedef struct esp_tls_cfg esp_tls_cfg_t**

ESP-TLS configuration parameters.

**Note**

Note about format of certificates:
- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

**typedef struct esp_tls esp_tls_t**

ESP-TLS Connection Handle.

### Enumerations

**enum esp_tls_conn_state**

ESP-TLS Connection State.

**Values:**

- ESP_TLS_INIT = 0
- ESP_TLS_CONNECTING
- ESP_TLS_HANDSHAKE
- ESP_TLS_FAIL
- ESP_TLS_DONE

**enum esp_tls_role**

**Values:**

- ESP_TLS_CLIENT = 0
- ESP_TLS_SERVER

### 2.4.4 OpenSSL-APIs

**Note:** The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.
The code of this API (located in openssl directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedTLS to do the actual work, so anyone compiling openssl code needs the mbedTLS library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

**Chapter Introduction**

- Chapter 1. SSL Context Method Create
- Chapter 2. SSL Context Function
- Chapter 3. SSL Function
- Chapter 4. SSL X509 Certification and Private Key Function

**Chapter 1. SSL Context Method Create**

1.1 `const SSL_METHOD* SSLv3_client_method(void)`

Arguments:

| none |

Return:

| SSLV3.0 version SSL context client method point |

Description:

| create the target SSL context method |

Example:

```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

1.2 `const SSL_METHOD* TLSv1_client_method(void)`

Arguments:

| none |

Return:

| TLSV1.0 version SSL context client method point |

Description:

| create the target SSL context method |

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();
    ...
}
```
1.3 const SSL_METHOD* TLSv1_1_client_method (void)

Arguments:

none

Return:

TLSV1.1 version SSL context client method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_client_method();
    ... 
}
```

1.4 const SSL_METHOD* TLSv1_2_client_method (void)

Arguments:

none

Return:

TLSV1.2 version SSL context client method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ... 
}
```

1.5 const SSL_METHOD* TLS_client_method (void)

Arguments:

none

Return:

TLSV1.2 version SSL context client method point

Description:

create the default SSL context method, it's always to be TLSV1.2

Example:
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}

1.6 const SSL_METHOD* SSLv3_server_method (void)
Arguments:

none

Return:

SSLV3.0 version SSL context server method point

Description:
create the target SSL context method

Example:

void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();
    ...
}

1.7 const SSL_METHOD* TLSv1_server_method (void)
Arguments:

none

Return:

TLSV1.0 version SSL context server method point

Description:
create the target SSL context method

Example:

void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
    ...
}

1.8 const SSL_METHOD* TLSv1_1_server_method (void)
Arguments:

none

Return:

TLSV1.1 version SSL context server method point
Chapter 2. API Reference

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();
    ...
}
```

1.9 const SSL_METHOD* TLSv1_2_server_method (void)

Arguments:
none

Return:
TLSV1.2 version SSL context server method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

1.10 const SSL_METHOD* TLS_server_method (void)

Arguments:
none

Return:
TLSV1.2 version SSL context server method point

Description:
create the default SSL context method, it's always to be TLSV1.2

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

Chapter 2. SSL Context Function

2.1 SSL_CTX* SSL_CTX_new (const SSL_METHOD * method)
Chapter 2. API Reference

Arguments:

method - the SSL context method point

Return:

context point

Description:

create a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

2.2 void SSL_CTX_free(SSL_CTX *ctx)

Arguments:

ctx - the SSL context point

Return:

none

Description:

free a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx;
    ...
    SSL_CTX_free(ctx);
}
```

2.3 int SSL_CTX_set_ssl_version(SSL_CTX *ctx, const SSL_METHOD *meth)

Arguments:

ctx - SSL context point
meth - SSL method point

Return:

1 : OK
0 : failed

Description:

set the SSL context version

Example:
Chapter 2. API Reference

```c
void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;
    ...
    SSL_CTX_set_ssl_version(ctx, meth);
}
```

2.4 const SSL_METHOD* SSL_CTX_get_ssl_method (SSL_CTX * ctx)

**Arguments:**

ctx - SSL context point

**Return:**

SSL context method

**Description:**

get the SSL context method

**Example:**

```c
void example(void)
{
    const SSL_METHOD *method;
    SSL_CTX *ctx;
    ...
    method = SSL_CTX_get_ssl_method(ctx);
}
```

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX * ctx)

**Arguments:**

ctx - SSL context point

**Return:**

SSL method

**Description:**

create a SSL

**Example:**

```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ...
}
```

(continues on next page)
ssl = SSL_new(ctx);
}

### 3.2 voidSSL_free (SSL * ssl)

**Arguments:**

- **ssl** - SSL point

**Return:**

- None

**Description:**

Free SSL

**Example:**

```c
void example(void)
{
    SSL *ssl;
    ...
    SSL_free(ssl);
}
```

### 3.3 intSSL_do_handshake (SSL * ssl)

**Arguments:**

- **ssl** - SSL point

**Return:**

- 1 : OK
- 0 : failed, connect is close by remote
- -1 : a error catch

**Description:**

Perform the SSL handshake

**Example:**

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_do_handshake(ssl);
}
```

### 3.4 intSSL_connect (SSL * ssl)

**Arguments:**

- **ssl** - SSL point

**Return:**
**Chapter 2. API Reference**

| 1 : OK  |
| 0 : failed, connect is close by remote |
| -1 : a error catch |

**Description:**

connect to the remote SSL server

**Example:**

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_connect(ssl);
}
```

3.5 **int SSL_accept (SSL * ssl)**

**Arguments:**

ssl - SSL point

**Return:**

| 1 : OK  |
| 0 : failed, connect is close by remote |
| -1 : a error catch |

**Description:**

accept the remote connection

**Example:**

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_accept(ssl);
}
```

3.6 **int SSL_shutdown (SSL * ssl)**

**Arguments:**

ssl - SSL point

**Return:**

| 1 : OK  |
| 0 : failed, connect is close by remote |
| -1 : a error catch |

**Description:**
Chapter 2. API Reference

shutdown the connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_shutdown(ssl);
}
```

3.7 int SSL_clear (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed

Description:

shutdown the connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_clear(ssl);
}
```

3.8 int SSL_read (SSL * ssl, void * buffer, int len)

Arguments:

ssl - point
buffer - data buffer point
len - data length

Return:

> 0 : OK, and return received data bytes
= 0 : no data received or connection is closed
< 0 : an error catch

Description:

read data from remote

Example:
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;
    ...
    ret = SSL_read(ssl, buf, len);
}

3.9 int SSL_write (SSL *ssl, const void *buffer, int len)

Arguments:

ssl - SSL point
buffer - data buffer point
len - data length

Return:

> 0 : OK, and return received data bytes
= 0 : no data sent or connection is closed
< 0 : an error catch

Description:

send the data to remote

Example:

void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;
    ...
    ret = SSL_write(ssl, buf, len);
}

3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL *ssl)

Arguments:

ssl - SSL point

Return:

SSL context

Description:

get SSL context of the SSL

Example:

void example(void)
{  
    SSL *ssl;
    char *buf;
    int len;
    int ret;
    ...
    ret = SSL_write(ssl, buf, len);
}
3.11 int SSL_get_shutdown (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

shutdown mode

Description:

get SSL shutdown mode

Example:

```c
void example(void)
{
    SSL *ssl;
    int mode;
    ...
    mode = SSL_get_SSL_CTX(ssl);
}
```

3.12 void SSL_set_shutdown (SSL * ssl, int mode)

Arguments:

ssl - SSL point

Return:

shutdown mode

Description:

set SSL shutdown mode

Example:

```c
void example(void)
{
    SSL *ssl;
    int mode = 0;
    ...
    SSL_set_shutdown(ssl, mode);
}
```

3.13 const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)

Arguments:
Chapter 2. API Reference

### 3.14 int SSL_set_ssl_method (SSL * ssl, const SSL_METHOD * method)

**Arguments:**
- ssl - SSL point
- meth - SSL method point

**Return:**
- 1 : OK
- 0 : failed

**Description:**
set the SSL method

**Example:**
```c
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;
    ... ... 
    ret = SSL_set_ssl_method(ssl, method);
}
```

### 3.15 int SSL_pending (const SSL * ssl)

**Arguments:**
- ssl - SSL point

**Return:**
- data bytes

**Description:**
get received data bytes

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ...
    ret = SSL_pending(ssl);
}
```

3.16 int SSL_has_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : Yes
0 : No

Description:

check if data is received

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ...
    ret = SSL_has_pending(ssl);
}
```

3.17 int SSL_get_fd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the socket of the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ...
    ret = SSL_has_pending(ssl);
}
```
3.18 int SSL_get_rfd (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
>= 0 : socket id
< 0 : a error catch

Description:
get the read only socket of the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_rfd(ssl);
}
```

3.19 int SSL_get_wfd (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
>= 0 : socket id
< 0 : a error catch

Description:
get the write only socket of the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_wfd(ssl);
}
```

3.20 int SSL_set_fd (SSL * ssl, int fd)

Arguments:
Chapter 2. API Reference

3.21 int SSL_set_rfd (SSL * ssl, int fd)

Arguments:

<table>
<thead>
<tr>
<th>ssl - SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd - socket id</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>1 : OK</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 : failed</td>
</tr>
</tbody>
</table>

Description:

set read only socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_rfd(ssl, socket);
}
```

3.22 int SSL_set_wfd (SSL * ssl, int fd)

Arguments:

<table>
<thead>
<tr>
<th>ssl - SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd - socket id</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>1 : OK</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 : failed</td>
</tr>
</tbody>
</table>

Description:

set socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_wfd(ssl, socket);
}
```
1 : OK
0 : failed

Description:
set write only socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_wfd(ssl, socket);
}
```

3.23 int SSL_version (const SSL * ssl)

Arguments:

- ssl - SSL point

Return:
SSL version

Description:
get SSL version

Example:

```c
void example(void)
{
    int version;
    SSL *ssl;
    ...
    version = SSL_version(ssl);
}
```

3.24 const char* SSL_get_version (const SSL * ssl)

Arguments:

- ssl - SSL point

Return:
SSL version string

Description:
get the SSL current version string

Example:
### 3.25 OSSL_HANDSHAKE_STATE SSL_get_state (const SSL * ssl)

**Arguments:**

- **ssl** - SSL point

**Return:**

SSL state

**Description:**

get the SSL state

**Example:**

```c
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;
    ...
    state = SSL_get_state(ssl);
}
```

### 3.26 const char* SSL_alert_desc_string (int value)

**Arguments:**

- **value** - SSL description

**Return:**

alert value string

**Description:**

get alert description string

**Example:**

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string(val);
}
```

### 3.27 const char* SSL_alert_desc_string_long (int value)

---

Espressif Systems

Submit Document Feedback
Arguments:

value - SSL description

Return:

alert value long string

Description:

get alert description long string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string_long(val);
}
```

3.28 const char* SSL_alert_type_string (int value)

Arguments:

value - SSL type description

Return:

alert type string

Description:

get alert type string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_type_string(val);
}
```

3.29 const char* SSL_alert_type_string_long (int value)

Arguments:

value - SSL type description

Return:

alert type long string

Description:
get alert type long string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_type_string_long(val);
}
```

3.30 `const char* SSL_rstate_string (SSL * ssl)`

Arguments:

```c
ssl - SSL point
```

Return:

```c
state string
```

Description:

get the state string where SSL is reading

Example:

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_rstate_string(ssl);
}
```

3.31 `const char* SSL_rstate_string_long (SSL * ssl)`

Arguments:

```c
ssl - SSL point
```

Return:

```c
state long string
```

Description:

get the state long string where SSL is reading

Example:

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
}
```
3.32 const char* SSL_state_string (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

state string

Description:

get the state string

Example:

```c
void example(void)
{
    SSL *ssl;
    const char *str;
    ...
    str = SSL_state_string(ssl);
}
```

3.33 char* SSL_state_string_long (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

state long string

Description:

get the state long string

Example:

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_state_string(ssl);
}
```

3.34 int SSL_get_error (const SSL * ssl, int ret_code)

Arguments:

ssl - SSL point
ret_code - SSL return code
Return:
SSL error number

Description:
get SSL error code

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    int err;
    ...
    err = SSL_get_error(ssl, ret);
}
```

3.35 int SSL_want (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
specific statement

Description:
get the SSL specific statement

Example:

```c
void example(void)
{
    SSL *ssl;
    int state;
    ...
    state = SSL_want(ssl);
}
```

3.36 int SSL_want_nothing (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
0 : false
1 : true

Description:
check if SSL want nothing

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want(ssl);
}

3.37 int SSL_want_read (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true

Description:

check if SSL want to read

Example:

void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_read(ssl);
}

3.38 int SSL_want_write (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true

Description:

check if SSL want to write

Example:

void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_write(ssl);
}
Chapter 4. SSL X509 Certification and Private Key Function

4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)

Arguments:
- cert - a point pointed to X509 certification
- buffer - a point pointed to the certification context memory point
- length - certification bytes

Return:
X509 certification object point

Description:
load a character certification context into system context. If 'cert' is
pointed to the certification, then load certification into it. Or create a new X509
certification object

Example:
```c
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ...
    new = d2i_X509(&cert, buffer, len);
}
```

4.2 int SSL_add_client_CA (SSL * ssl, X509 * x)

Arguments:
- ssl - SSL point
- x - CA certification point

Return:
1 : OK
0 : failed

Description:
add CA client certification into the SSL

Example:
```c
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;
    ...
    ret = SSL_add_client_CA(ssl, new);
}
```

4.3 int SSL_CTX_add_client_CA (SSL_CTX * ctx, X509 * x)
Chapter 2. API Reference

Arguments:

\[
\begin{align*}
\text{ctx} & \quad \text{- SSL context point} \\
\text{x} & \quad \text{- CA certification point}
\end{align*}
\]

Return:

\[
\begin{align*}
1 & : \text{OK} \\
0 & : \text{failed}
\end{align*}
\]

Description:
add CA client certification into the SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    X509 *new;
    ...
    ret = SSL_add_client_CA(ctx, new);
}
```

4.4 `X509* SSL_get_certificate (const SSL * ssl)`

Arguments:

\[
\text{ssl} - \text{SSL point}
\]

Return:

SSL certification point

Description:
get the SSL certification point

Example:

```c
void example(void)
{
    SSL *ssl;
    X509 *cert;
    ...
    cert = SSL_get_certificate(ssl);
}
```

4.5 `long SSL_get_verify_result (const SSL * ssl)`

Arguments:

\[
\text{ssl} - \text{SSL point}
\]

Return:

the result of verifying

Description:
get the verifying result of the SSL certification

Example:

```c
void example(void)
{
    SSL *ssl;
    long ret;
    ...
    ret = SSL_get_verify_result(ssl);
}
```

4.6 `int SSL_CTX_use_certificate(SSL_CTX *ctx, X509 *x)`

Arguments:

<table>
<thead>
<tr>
<th>ctx</th>
<th>the SSL context point</th>
</tr>
</thead>
<tbody>
<tr>
<td>pkey</td>
<td>certification object point</td>
</tr>
</tbody>
</table>

Return:

1 : OK
0 : failed

Description:

load the certification into the SSL_CTX or SSL object

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;
    ...
    ret = SSL_CTX_use_certificate(ctx, new);
}
```

4.7 `int SSL_CTX_use_certificate_ASN1(SSL_CTX *ctx, int len, const unsigned char *d)`

Arguments:

<table>
<thead>
<tr>
<th>ctx</th>
<th>SSL context point</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>certification length</td>
</tr>
<tr>
<td>d</td>
<td>data point</td>
</tr>
</tbody>
</table>

Return:

1 : OK
0 : failed

Description:

load the ASN1 certification into SSL context

Example:
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    int len;
    ...
    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);
}

4.8 int SSL_CTX_use_PrivateKey (SSL_CTX * ctx, EVP_PKEY * pkey)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>SSL context point</td>
</tr>
<tr>
<td>pkey</td>
<td>private key object point</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>OK</td>
</tr>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

load the private key into the context object

Example:

void example(void)
{
    int ret;
    SSL_CTX *ctx;
    EVP_PKEY *pkey;
    ...
    ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}

4.9 int SSL_CTX_use_PrivateKey_ASN1 (int pk, SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>SSL context point</td>
</tr>
<tr>
<td>d</td>
<td>data point</td>
</tr>
<tr>
<td>len</td>
<td>private key length</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>OK</td>
</tr>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

load the ASN1 private key into SSL context

Example:

void example(void)
{
    ...
}
4.10 int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

- ctx - SSL context point
- d - data point
- len - private key length

Return:

- 1 : OK
- 0 : failed

Description:

load the RSA ASN1 private key into SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;
    ...
    ret = SSL_CTX_use_RSAPrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.11 int SSL_use_certificate_ASN1 (SSL * ssl, int len, const unsigned char * d)

Arguments:

- ssl - SSL point
- len - data bytes
- d - data point

Return:

- 1 : OK
- 0 : failed

Description:

load certification into the SSL

Example:
void example(void)
{
    int ret;
    SSL *ssl;
    const unsigned char *buf;
    long len;

    ret = SSL_use_certificate_ASN1(ssl, len, buf);
}

4.12 X509* SSL_get_peer_certificate (const SSL *ssl)

Arguments:

ssl - SSL point

Return:

peer certification

Description:

get peer certification

Example:

void example(void)
{
    SSL *ssl;
    X509 *peer;

    peer = SSL_get_peer_certificate(ssl);
}

2.4.5 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- **esp_http_client_init():** To use the HTTP client, the first thing we must do is create an esp_http_client bypass into this function with the esp_http_client_config_t configurations. Which configuration values we do not define, the library will use default.
- **esp_http_client_perform():** The esp_http_client argument created from the init function is needed. This function performs all operations of the esp_http_client, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the event_handle (defined by esp_http_client_config_t). This function performs its job and blocks the current task until it’s done.
- **esp_http_client_cleanup():** After completing our esp_http_client’s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client.
Application Example

```c
esp_err_t _http_event_handle(esp_http_client_event_t *evt) {
    switch(evt->event_id) {
    case HTTP_EVENT_ERROR:
        ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
        break;
    case HTTP_EVENT_ON_CONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
        break;
    case HTTP_EVENT_HEADER_SENT:
        ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
        break;
    case HTTP_EVENT_ON_HEADER:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
        printf("%.s", evt->data_len, (char*)evt->data);
        break;
    case HTTP_EVENT_ON_DATA:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA", len=%d, evt->data_len);
        if (!esp_http_client_is_chunked_response(evt->client)) {
            printf("%.s", evt->data_len, (char*)evt->data);
        }
        break;
    case HTTP_EVENT_ON_FINISH:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
        break;
    case HTTP_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
        break;
    }
    return ESP_OK;
}
```

```c
const esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
```

```c
esp_http_client_handle_t client = esp_http_client_init(&config);
```

```c
esp_err_t err = esp_http_client_perform(client);
```

```c
if (err == ESP_OK)
```

```c
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
             esp_http_client_get_status_code(client),
             esp_http_client_get_content_length(client));
```

```c
esp_http_client_cleanup(client);
```

Persistent Connections

Persistent connections means that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the Connection: close header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

Persistent Connections example
```c
esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);
esp_http_client_cleanup(client);
```

### HTTPS

The HTTP client supports SSL connections using mbed TLS, with the **url** configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

**Note:** By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to **cert_pem** in `esp_http_client_config_t`

### HTTPS example

```c
static void https() {
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

### HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. The HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always to called first to get the handle. Perform that functions in the order below:

- **esp_http_client_init()**: to create and handle
- **esp_http_client_set_*** or **esp_http_client_delete_***: to modify the http connection information (optional)
- **esp_http_client_open()**: Open the http connection with *write_len* parameter, *write_len*=0 if we only need read
Chapter 2. API Reference

- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len`=0
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should close the connection after finish
- `esp_http_client_cleanup()`: And release the resources

Perform HTTP request as Stream reader Check the example function `http_perform_as_stream_reader` at protocols/esp_http_client.

HTTP Authentication

The HTTP client supports both **Basic** and **Digest** Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of config entry. And with `auth_type` = `HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type` = `HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

Config authentication example with URI

```c
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

Config authentication example with username, password entry

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: protocols/esp_http_client.

API Reference

Header File

- components/esp_http_client/include/esp_http_client.h

Functions

`esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)`

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

Return

- `esp_http_client_handle_t`
- NULL if any errors

Parameters

- [in] `config`: The configurations, see `http_client_config_t`
**esp_err_t esp_http_client_perform(esp_http_client_handle_t client)**

Invoke this function after esp_http_client_init and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same esp_http_client_handle_t as input as the esp_http_client_init call returned. esp_http_client_perform performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking esp_http_client_perform(), is_async member of esp_http_client_config_t must be set while making a call to esp_http_client_init() API. You can do any amount of calls to esp_http_client_perform while using the same esp_http_client_handle_t. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. esp_http_client will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use esp_http_client_set_** between the invoke to set options for the following esp_http_client_perform.

**Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several esp_http_client_handle_t. This function include esp_http_client_open -> esp_http_client_write -> esp_http_client_fetch_headers -> esp_http_client_read (and option) esp_http_client_close.

**Return**
- ESP_OK on successful
- ESP_FAIL on error

**Parameters**
- client: The esp_http_client handle

**esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)**

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] url: The url

**esp_err_t esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data, int len)**

Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] data: post data pointer
- [in] len: post length

**int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)**

Get current post field information.

**Return** Size of post data

**Parameters**
- [in] client: The client
- [out] data: Point to post data pointer

**esp_err_t esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)**

Set http request header, this function must be called after esp_http_client_init and before any perform function.

**Return**
**Parameters**

- **[in] client**: The `esp_http_client` handle
- **[in] key**: The header key
- **[in] value**: The header value

```c
esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)
```

Get HTTP request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)
```

Get HTTP request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)
```

Set HTTP request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)
```

Get HTTP request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)
```

Set HTTP request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**

- ESP_OK
- ESP_ERR_INVALID_ARG
Chapter 2. API Reference

- [in] client: The esp_http_client handle
- [in] password: The password value

**esp_err_t esp_http_client_set_auth_type(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)**

Set http request auth_type.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] auth_type: The esp_http_client auth type

**int esp_http_client_get_errno(esp_http_client_handle_t client)**

Get HTTP client session errno.

Return
- (-1) if invalid argument
- errno

Parameters
- [in] client: The esp_http_client handle

**esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)**

Set http request method.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] method: The method

**esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)**

Set http request timeout.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] timeout_ms: The timeout value

**esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)**

Delete http request header.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [in] key: The key

**esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)**

This function will be open the connection, write all header strings and return.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [in] write_len: HTTP Content length need to write to the server
int **esp_http_client_write**(esp_http_client_handle_t client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

**Return**

- (-1) if any errors
- Length of data written

**Parameters**

- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

int **esp_http_client_fetch_headers**(esp_http_client_handle_t client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**Return**

- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**

- [in] client: The esp_http_client handle

bool **esp_http_client_is_chunked_response**(esp_http_client_handle_t client)

Check response data is chunked.

**Return** true or false

**Parameters**

- [in] client: The esp_http_client handle

int **esp_http_client_read**(esp_http_client_handle_t client, char *buffer, int len)

Read data from http stream.

**Return**

- (-1) if any errors
- Length of data was read

**Parameters**

- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: The length

int **esp_http_client_get_status_code**(esp_http_client_handle_t client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

**Return** Status code

**Parameters**

- [in] client: The esp_http_client handle

int **esp_http_client_get_content_length**(esp_http_client_handle_t client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

**Return**

- (-1) Chunked transfer
- Content-Length value as bytes

**Parameters**

- [in] client: The esp_http_client handle

**esp_err_t esp_http_client_close**(esp_http_client_handle_t client)

Close http connection, still kept all http request resources.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**
• [in] client: The esp_http_client handle

```c
esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)
```

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- [in] client: The esp_http_client handle

```c
esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)
```

Get transport type.

**Return**

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

**Parameters**

- [in] client: The esp_http_client handle

```c
esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)
```

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- [in] client: The esp_http_client handle

```c
void esp_http_client_addAuth(esp_http_client_handle_t client)
```

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note** There is a possibility of receiving body message with redirection status codes, thus make sure to flush body data after calling this API.

**Parameters**

- [in] client: The esp_http_client handle

```c
bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)
```

Checks if entire data in the response has been read without any error.

**Return**

- true
- false

**Parameters**

- [in] client: The esp_http_client handle

```c
int esp_http_client_read_response(esp_http_client_handle_t client, char *buffer, int len)
```

Helper API to read larger data chunks. This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

**Return**

- Length of data was read

**Parameters**

- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: The buffer length
**esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int *len)**

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Return**
- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

**Parameters**
- [in] client: The esp_http_client handle
- [len]: Length of data discarded

**esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)**

Get URL from client.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [inout] url: The buffer to store URL
- [in] len: The buffer length

**esp_err_t esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)**

Get Chunk-Length from client.

**Return**
- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

**Parameters**
- [in] client: The esp_http_client handle
- [out] len: Variable to store length

**Structures**

**struct esp_http_client_event**
HTTP Client events data.

**Public Members**

**esp_http_client_event_id_t event_id**

event_id, to know the cause of the event

**esp_http_client_handle_t client**

esp_http_client_handle_t context

void *data
data of the event

int data_len
data length of data

void *user_data
user_data context, from esp_http_client_config_t user_data

char *header_key
For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value
For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value
struct esp_http_client_config_t
  HTTP configuration.

Public Members

const char *url
  HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
  Domain or IP as string

int port
  Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
  Using for Http authentication

const char *password
  Using for Http authentication

esp_http_client_auth_type_t auth_type
  Http authentication type, see esp_http_client_auth_type_t

const char *path
  HTTP Path, if not set, default is /

const char *query
  HTTP query

const char *cert_pem
  SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
  Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
  SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
  Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
  SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
  Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
  Client key decryption password string

size_t client_key_password_len
  String length of the password pointed to by client_key_password

const char *user_agent
  The User Agent string to send with HTTP requests

esp_http_client_method_t method
  HTTP Method

int timeout_ms
  Network timeout in milliseconds

bool disable_auto_redirect
  Disable HTTP automatic redirects

int max_redirection_count
  Max number of redirections on receiving HTTP redirect status code, using default value if zero
int max_authorization_retries
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle cb event_handler
HTTP Event Handle

esp_http_client_transport_t transport_type
HTTP transport type, see esp_http_client_transport_t

int buffer_size
HTTP receive buffer size

int buffer_size_tx
HTTP transmit buffer size

void *user_data
HTTP user_data context

bool is_async
Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)

int keep_alive_count
Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

Macros

DEFAULT_HTTP_BUF_SIZE
ESP_ERR_HTTP_BASE
Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
There are no transport support for the input scheme
Chapter 2. API Reference

**ESP_ERR_HTTP_CONNECTING**
HTTP connection hasn’t been established yet

**ESP_ERR_HTTP_EAGAIN**
Mapping of errno EAGAIN to esp_err_t

**ESP_ERR_HTTP_CONNECTION_CLOSED**
Read FIN from peer and the connection closed

**Type Definitions**
```c
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t
typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.
typedef esp_err_t (http_event_handle_cb) (esp_http_client_event_t *evt)
```

**Enumerations**
```c
enum esp_http_client_event_id_t
HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected
```

```c
enum esp_http_client_transport_t
HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl
```

```c
enum esp_http_client_method_t
HTTP method.

Values:
```
HTTP_METHOD_GET = 0
HTTP GET Method

HTTP_METHOD_POST
HTTP POST Method

HTTP_METHOD_PUT
HTTP PUT Method

HTTP_METHOD_PATCH
HTTP PATCH Method

HTTP_METHOD_DELETE
HTTP DELETE Method

HTTP_METHOD_HEAD
HTTP HEAD Method

HTTP_METHOD_NOTIFY
HTTP NOTIFY Method

HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method

HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method

HTTP_METHOD_OPTIONS
HTTP OPTIONS Method

HTTP_METHOD_COPY
HTTP COPY Method

HTTP_METHOD_MOVE
HTTP MOVE Method

HTTP_METHOD_LOCK
HTTP LOCK Method

HTTP_METHOD_UNLOCK
HTTP UNLOCK Method

HTTP_METHOD_PROPFIND
HTTP PROPFIND Method

HTTP_METHOD_PROPPATCH
HTTP PROPPATCH Method

HTTP_METHOD_MKCOL
HTTP MKCOL Method

HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
HTTP Authentication type.

Values:

HTTP_AUTH_TYPE_NONE = 0
No authention

HTTP_AUTH_TYPE_BASIC
HTTP Basic authentication

HTTP_AUTH_TYPE_DIGEST
HTTP Disgest authentication

enum HttpStatus_Code
Enum for the HTTP status codes.
Values:

HttpStatus_Ok = 200
HttpStatus_MultipleChoices = 300
HttpStatus_MovedPermanently = 301
HttpStatus_Found = 302
HttpStatus_TemporaryRedirect = 307
HttpStatus_BadRequest = 400
HttpStatus_Unauthorized = 401
HttpStatus_Forbidden = 403
HttpStatus_NotFound = 404
HttpStatus_InternalError = 500

2.4.6 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
  /* Send a simple response */
  const char resp[] = "URI GET Response";
  httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
  return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
  /* Destination buffer for content of HTTP POST request.
   * httpd_req_recv() accepts char* only, but content could
   * as well be any binary data (needs type casting).
```
* In case of string data, null termination will be absent, and content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling httpd_req_recv(), but to keep it simple, here we respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will ensure that the underlying socket is closed */
        return ESP_FAIL;
    }
    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void) {
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}
/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP server example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE));  /* Pointer to context data */
        req->free_ctx = free_ctx_func;  /* Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* Respond */
    ...............
    ...............
    ...............

    return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.

Websocket server

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see CONFIG_HTTPD_WS_SUPPORT. Please check the example under protocols/http_server/ws_echo_server.
API Reference

Header File

- components/esp_http_server/include/esp_http_server.h

Functions

`esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

Note: URI handlers can be registered in real time as long as the server handle is valid.

Return

- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

Parameters

- [in] handle: handle to HTTPD server instance
- [in] uri_handler: pointer to handler that needs to be registered

`esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)`

Unregister a URI handler.

Return

- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: Handler with specified URI and method not found
**Chapter 2. API Reference**

**Parameters**
- `[in] handle`: handle to HTTPD server instance
- `[in] uri`: URI string
- `[in] method`: HTTP method

```c
esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char *uri)
```
Unregister all URI handlers with the specified uri string.

**Return**
- **ESP_OK**: On successfully deregistering all such handlers
- **ESP_ERR_INVALID_ARG**: Null arguments
- **ESP_ERR_NOT_FOUND**: No handler registered with specified uri string

**Parameters**
- `[in] handle`: handle to HTTPD server instance
- `[in] uri`: uri string specifying all handlers that need to be deregistered

```c
esp_err_t httpd_sess_set_recv_override(httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)
```
Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- **ESP_OK**: On successfully registering override
- **ESP_ERR_INVALID_ARG**: Null arguments

**Parameters**
- `[in] hd`: HTTPD instance handle
- `[in] sockfd`: Session socket FD
- `[in] recv_func`: The receive function to be set for this session

```c
esp_err_t httpd_sess_set_send_override(httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)
```
Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- **ESP_OK**: On successfully registering override
- **ESP_ERR_INVALID_ARG**: Null arguments

**Parameters**
- `[in] hd`: HTTPD instance handle
- `[in] sockfd`: Session socket FD
- `[in] send_func`: The send function to be set for this session

```c
esp_err_t httpd_sess_set_pending_override(httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
```
Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- **ESP_OK**: On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

Parameters
• [in] hd: HTTPD instance handle
• [in] sockfd: Session socket FD
• [in] pending_func: The receive function to be set for this session

int httpd_req_to_sockfd (httpd_req_t *r)
Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, i.e.: httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

Note This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

Return
• Socket descriptor : The socket descriptor for this request
• -1 : Invalid/NULL request pointer

Parameters
• [in] r: The request whose socket descriptor should be found

int httpd_req_recv (httpd_req_t *r, char* buf, size_t buf_len)
API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
• Presently Chunked Encoding is not supported

Return
• Bytes : Number of bytes read into the buffer successfully
• 0 : Buffer length parameter is zero / connection closed by peer
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

Parameters
• [in] r: The request being responded to
• [in] buf: Pointer to a buffer that the data will be read into
• [in] buf_len: Length of the buffer

size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char* field)
Search for a field in request headers and return the string length of it’s value.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• Length : If field is found in the request URL
• Zero : Field not found / Invalid request / Null arguments

Parameters
• [in] r: The request being responded to
• [in] field: The header field to be searched in the request

esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char* field, char *val, size_t val_size)
Get the value string of a field from the request headers.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use httpd_req_get_hdr_value_len() to know the right buffer length

**Return**
- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

**Parameters**
- `[in]` *r*: The request being responded to
- `[in]` `field`: The field to be searched in the header
- `[out]` `val`: Pointer to the buffer into which the value will be copied if the field is found
- `[in]` `val_size`: Size of the user buffer “val”

`size_t httpd_req_get_url_query_len(httpd_req_t *r)`

Get Query string length from the request URL.

**Note**
This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

**Return**
- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

**Parameters**
- `[in]` *r*: The request being responded to

`esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)`

Get Query string from the request URL.

**Note**
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

**Return**
- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

**Parameters**
- `[in]` *r*: The request being responded to
- `[out]` `buf`: Pointer to the buffer into which the query string will be copied (if found)
- `[in]` `buf_len`: Length of output buffer

`esp_err_t httpd_query_key_value(const char *qry, const char *key, char *val, size_t val_size)`

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.
Chapter 2. API Reference

**Note**
- The components of URL query string (keys and values) are not URL decoded. The user must check for the ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

**Return**
- ESP_OK: Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

**Parameters**
- [in] qry: Pointer to query string
- [in] key: The key to be searched in the query string
- [out] val: Pointer to the buffer into which the value will be copied if the key is found
- [in] val_size: Size of the user buffer “val”

```plaintext
esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)
```

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

**Return**
- ESP_OK: Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
- ESP_ERR_NO_MEM: Memory allocation failure

**Parameters**
- [in] req: Pointer to the HTTP request
- [in] cookie_name: The cookie name to be searched in the request
- [out] val: Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- [inout] val_size: Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

```plaintext
bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)
```

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:
- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backlash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/? or /foo/*/ (sans the backlash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

**Return** true if a match was found

**Parameters**
- [in] uri_template: URI template (pattern)
- [in] uri_to_match: URI to be matched
- [in] match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

```plaintext
esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response
ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: httpd_resp_set_status(), - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.  
- Once this API is called, the request has been responded to.  
- No additional data can then be sent for the request.  
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
- [in] r: The request being responded to 
- [in] buf: Buffer from where the content is to be fetched  
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

ESP_ERR_HTTPD_RESP_HDR

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.  
- When you are finished sending all your chunks, you must call this function with buf_len as 0.  
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK : On successfully sending the response packet chunk  
- ESP_ERR_INVALID_ARG : Null request pointer  
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer  
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send  
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
- [in] r: The request being responded to  
- [in] buf: Pointer to a buffer that stores the data  
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

static ESP_ERR_t httpd_resp_sendstr(httpd_req_t *r, const char *str)

This API simply calls httpd_resp_send with buffer length set to string length assuming the buffer contains a null terminated string.

Return
- ESP_OK : On successfully sending the response packet
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters
- `[in] r`: The request being responded to
- `[in] str`: String to be sent as response body

```c
static esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)
```

API to send a string as an HTTP response chunk.

This API simply calls http_respond_chunk with buffer length set to string length assuming the buffer contains a null terminated string

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters
- `[in] r`: The request being responded to
- `[in] str`: String to be sent as response body (NULL to finish response packet)

```c
esp_err_t httpd_resp_set_status(httpd_req_t *r, const char *status)
```

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

Return
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- `[in] r`: The request being responded to
- `[in] status`: The HTTP status code of this response

```c
esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)
```

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

Return
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- `[in] r`: The request being responded to
- `[in] type`: The Content Type of the response
**esp_err_t** `httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)`

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Return**
- ESP_OK: On successfully appending new header
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_HDR: Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**
- [in] r: The request being responded to
- [in] field: The field name of the HTTP header
- [in] value: The value of this HTTP header

**esp_err_t** `httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)`

For sending out error code in response to HTTP request.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Return**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**
- [in] req: Pointer to the HTTP request for which the response needs to be sent
- [in] error: Error type to send
- [in] msg: Error message string (pass NULL for default message)

**static esp_err_t** `httpd_resp_send_404(httpd_req_t *r)`

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req.t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**
- [in] r: The request being responded to

**static esp_err_t** `httpd_resp_send_408(httpd_req_t *r)`
Chapter 2. API Reference

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
- [in] r: The request being responded to

static esp_err_t httpd_resp_send_500 (httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
- [in] r: The request being responded to

int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of: httpd_resp_send(), httpd_resp_send_chunk()
### `httpd_socket_send` (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket.

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

**Return**
- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

**Parameters**
- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the send() function

### `httpd_socket_recv` (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket.

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Return**
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero/connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

**Parameters**
- [in] `hd`: server instance
- [in] `sockfd`: session socket file descriptor
- [in] `buf`: buffer with bytes to send
- [in] `buf_len`: data size
- [in] `flags`: flags for the send() function

### `httpd_register_err_handler` (httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

**Return**
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

**Parameters**
- [in] `handle`: HTTP server handle
- [in] `error`: Error type
- [in] `handler_fn`: User implemented handler function (Pass NULL to unset any previously set handler)

### `httpd_start` (httpd_handle_t *handle, const httpd_config_t *config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();
    // Empty handle to httpd
    httpd_handle_t server = NULL;
    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}

Return
• ESP_OK : Instance created successfully
• ESP_ERR_INVALID_ARG : Null argument(s)
• ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
• ESP_ERR_HTTPD_TASK : Failed to launch server task

Parameters
• [in] config: Configuration for new instance of the server
• [out] handle: Handle to newly created instance of the server. NULL on error

esp_err_t httpd_stop(httpd_handle_t handle)

Stops the web server.
Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}

Return
• ESP_OK : Server stopped successfully
• ESP_ERR_INVALID_ARG : Handle argument is Null

Parameters
• [in] handle: Handle to server returned by httpd_start

esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return
• ESP_OK : On successfully queueing the work
• ESP_FAIL : Failure in control socket
• ESP_ERR_INVALID_ARG : Null arguments
Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] work: Pointer to the function to be executed in the HTTPD’s context
- [in] arg: Pointer to the arguments that should be passed to this function

```c
void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
```

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return
- void*: Pointer to the context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.

```c
void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session context by socket descriptor.

See httpd_sess_get_ctx()

Return
- void*: Pointer to the context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free_fn: Function that should be called to free the context

```c
void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
```

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See httpd_sess_get_ctx()

Return
- void*: Pointer to the transport context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.

```c
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session ‘transport’ context by socket descriptor.

See httpd_sess_set_ctx()

Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Transport context object to assign to the session
- [in] free_fn: Function that should be called to free the transport context

```c
void *httpd_get_global_user_ctx(httpd_handle_t handle)
```

Get HTTPD global user context (it was set in the server config struct)

Return global user context

Parameters
- [in] handle: Handle to server returned by httpd_start

```c
void *httpd_get_global_transport_ctx(httpd_handle_t handle)
```

Get HTTPD global transport context (it was set in the server config struct)

Return global transport context

Parameters
Chapter 2. API Reference

- [in] handle: Handle to server returned by httpd_start

**esp_err_t** httpd_sess_trigger_close (httpd_handle_t handle, int sockfd)

Trigger an httpd session close externally.

**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Return**
- ESP_OK: On successfully initiating closure
- ESP_FAIL: Failure to queue work
- ESP_ERR_NOT_FOUND: Socket fd not found
- ESP_ERR_INVALID_ARG: Null arguments

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor of the session to be closed

**esp_err_t** httpd_sess_update_lru_counter (httpd_handle_t handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**
- ESP_OK: Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND: Socket not found
- ESP_ERR_INVALID_ARG: Null arguments

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor of the session for which LRU counter is to be updated

**esp_err_t** httpd_get_client_list (httpd_handle_t handle, size_t* fds, int* client_fds)

Returns list of current socket descriptors of active sessions.

**Note** Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

**Return**
- ESP_OK: Successfully retrieved session list
- ESP_ERR_INVALID_ARG: Wrong arguments or list is longer than provided array

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [inout] fds: In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- [out] client_fds: Array of client fds

**Structures**

**struct httpd_config**

HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.
Public Members

unsigned **task_priority**
  Priority of FreeRTOS task which runs the server

size_t **stack_size**
  The maximum stack size allowed for the server task

BaseType_t **core_id**
  The core the HTTP server task will run on

uint16_t **server_port**
  TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**
  UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_open_sockets**
  Max number of sockets/clients connected at any time

uint16_t **max_uri_handlers**
  Maximum allowed uri handlers

uint16_t **max_resp_headers**
  Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**
  Number of backlog connections

bool **lru_purge_enable**
  Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**
  Timeout for recv function (in seconds)

uint16_t **send_wait_timeout**
  Timeout for send function (in seconds)

void (* **global_user_ctx**)
  Global user context.
  This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.
  When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t **global_user_ctx_free_fn**
  Free function for global user context

void (* **global_transport_ctx**)
  Global transport context.
  Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t **global_transport_ctx_free_fn**
  Free function for global transport context

httpd_open_func_t **open_fn**
  Custom session opening callback.
  Called on a new session socket just after accept(), but before reading any data.
  This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.
If a context needs to be maintained between these functions, store it in the session using
httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

Returning a value other than ESP_OK will immediately close the new socket.

**httpd_close_func_t close_fn**  
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket.
This is a place for custom de-init code common to all sockets.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the
network stack - that is, the file descriptor may not be valid anymore.

**httpd_uri_match_func_t uri_match_fn**  
URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP
request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using
httpd_register_uri_handler()

Available options are: 1) NULL : Internally do basic matching using strncmp() 2)
httpd_uri_match_wildcard(): URI wildcard matcher

Users can implement their own matching functions (See description of the
httpd_uri_match_func_t function prototype)

**struct httpd_req**  
HTTP Request Data Structure.

**Public Members**

**httpd_handle_t handle**  
Handle to server instance

**int method**  
The type of HTTP request, -1 if unsupported method

**const char uri[HTTPD_MAX_URI_LEN + 1]**  
The URI of this request (1 byte extra for null termination)

**size_t content_len**  
Length of the request body

**void *aux**  
Internally used members

**void *user_ctx**  
User context pointer passed during URI registration.

**void *sess_ctx**  
Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One
session could have multiple request responses. The web server will ensure that the context persists across
all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context
by calling free(), unless free_ctx function is set.

**httpd_free_ctx_fn_t free_ctx**  
Pointer to free context hook

Function to free session context
If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

bool ignore_sess_ctx_changes
Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri
Structure for URI handler.

Public Members

const char *uri
The URI to handle

httpd_method_t method
Method supported by the URI

esp_err_t (*handler) (httpd_req_t *r)
Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void **user_ctx
Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN
HTTPD_MAX_URI_LEN
HTTPD_SOCK_ERR_FAIL
HTTPD_SOCK_ERR_INVALID
HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200
HTTP Response 200

HTTPD_204
HTTP Response 204

HTTPD_207
HTTP Response 207

HTTPD_400
HTTP Response 400

HTTPD_404
HTTP Response 404

HTTPD_408
HTTP Response 408

HTTPD_500
HTTP Response 500

HTTPD_TYPE_JSON
HTTP Content type JSON

HTTPD_TYPE_TEXT
HTTP Content type text/HTML
Chapter 2. API Reference

HTTPD_TYPE_OCTET
   HTTP Content type octet-stream

HTTPD_DEFAULT_CONFIG()

ESP_ERR_HTTPD_BASE
   Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
   All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
   URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
   Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
   Result string truncated

ESP_ERR_HTTPD_RESP_HDR
   Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
   Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
   Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
   Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct httpd_req httpd_req_t
   HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
   Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char* buf, size_t buf_len, int flags)
   Prototype for HTTPD's low-level send function.

   Note User specified send function must handle errors internally, depending upon the set value of errno,
   and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value
   of httpd_send() function

Return
   • Bytes: The number of bytes sent successfully
   • HTTPD_SOCK_ERR_INVALID: Invalid arguments
   • HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
   • HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters
   • [in] hd: server instance
   • [in] sockfd: session socket file descriptor
   • [in] buf: buffer with bytes to send
   • [in] buf_len: data size
   • [in] flags: flags for the send() function

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char* buf, size_t buf_len, int flags)
   Prototype for HTTPD's low-level recv function.
**Chapter 2. API Reference**

**Note** User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function.

**Return**
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

**typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)**
Prototype for HTTPD low-level “get pending bytes” function.

**Note** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

**Return**
- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

**typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)**
Function prototype for HTTP error handling.
