This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

**Thread Safety** All the public DAC APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the DAC driver uses mutex lock to ensure the thread safety, thus the APIs except `dac_oneshot_output_voltage()` are not allowed to be used in ISR.

### Kconfig Options

- `CONFIG_DAC_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_DAC_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the warning message compilation while using the legacy DAC driver.
- `CONFIG_DAC_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.
- `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` auto expands the 8-bit data to 16-bit data in the driver to satisfy the I2S DMA format.

### Application Example

The basic examples for the One-shot Mode, Continuous Mode, and Cosine Mode can be found in:

- [peripherals/dac/dac\\_oneshot](#)
- [peripherals/dac/dac\\_continuous](#)
- [peripherals/dac/dac\\_cosine\\_wave](#)

## API Reference

### Header File

- [components/driver/dac/include/driver/dac\\_oneshot.h](#)
- This header file can be included with:

```
#include "driver/dac_oneshot.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t dac_oneshot_new_channel` (const `dac_oneshot_config_t` \*oneshot\_cfg, `dac_oneshot_handle_t` \*ret\_handle)

Allocate a new DAC oneshot channel.

---

**Note:** The channel will be enabled as well when the channel allocated

---

### Parameters

- `oneshot_cfg` -- [in] The configuration for the oneshot channel

- **ret\_handle** -- [out] The returned oneshot channel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid
- ESP\_ERR\_INVALID\_STATE The DAC channel has been registered already
- ESP\_ERR\_NO\_MEM No memory for the DAC oneshot channel resources
- ESP\_OK Allocate the new DAC oneshot channel success

*esp\_err\_t* **dac\_oneshot\_del\_channel** (*dac\_oneshot\_handle\_t* handle)

Delete the DAC oneshot channel.

---

**Note:** The channel will be disabled as well when the channel deleted

---

**Parameters** **handle** -- [in] The DAC oneshot channel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid
- ESP\_ERR\_INVALID\_STATE The channel has already been de-registered
- ESP\_OK Delete the oneshot channel success

*esp\_err\_t* **dac\_oneshot\_output\_voltage** (*dac\_oneshot\_handle\_t* handle, uint8\_t *digi\_value*)

Output the voltage.

---

**Note:** Generally it'll take 7~11 us on ESP32 and 10~21 us on ESP32-S2

---

**Parameters**

- **handle** -- [in] The DAC oneshot channel handle
- **digi\_value** -- [in] The digital value that need to be converted

**Returns**

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid
- ESP\_OK Convert the digital value success

**Structures**

struct **dac\_oneshot\_config\_t**

DAC oneshot channel configuration.

**Public Members**

*dac\_channel\_t* **chan\_id**

DAC channel id

**Type Definitions**

typedef struct *dac\_oneshot\_s* \***dac\_oneshot\_handle\_t**

DAC oneshot channel handle

**Header File**

- `components/driver/dac/include/driver/dac_cosine.h`
- This header file can be included with:

```
#include "driver/dac_cosine.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **dac\_cosine\_new\_channel** (const *dac\_cosine\_config\_t* \**cos\_cfg*, *dac\_cosine\_handle\_t* \**ret\_handle*)

Allocate a new DAC cosine wave channel.

---

**Note:** Since there is only one cosine wave generator, only the first channel can set the frequency of the cosine wave. Normally, the latter one is not allowed to set a different frequency, but it can be forced to set by setting the bit `force_set_freq` in the configuration, notice that another channel will be affected as well when the frequency is updated.

---

### Parameters

- **cos\_cfg** -- [in] The configuration of cosine wave channel
- **ret\_handle** -- [out] The returned cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The DAC channel has been registered already
- `ESP_ERR_NO_MEM` No memory for the DAC cosine wave channel resources
- `ESP_OK` Allocate the new DAC cosine wave channel success

*esp\_err\_t* **dac\_cosine\_del\_channel** (*dac\_cosine\_handle\_t* handle)

Delete the DAC cosine wave channel.

**Parameters** **handle** -- [in] The DAC cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The channel has already been deregistered
- `ESP_OK` Delete the cosine wave channel success

*esp\_err\_t* **dac\_cosine\_start** (*dac\_cosine\_handle\_t* handle)

Start outputting the cosine wave on the channel.

**Parameters** **handle** -- [in] The DAC cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The channel has been started already
- `ESP_OK` Start the cosine wave success

*esp\_err\_t* **dac\_cosine\_stop** (*dac\_cosine\_handle\_t* handle)

Stop outputting the cosine wave on the channel.

**Parameters** **handle** -- [in] The DAC cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The channel has been stopped already
- `ESP_OK` Stop the cosine wave success

## Structures

struct **dac\_cosine\_config\_t**

DAC cosine channel configurations.

### Public Members

*dac\_channel\_t* **chan\_id**

The cosine wave channel id

uint32\_t **freq\_hz**

The frequency of cosine wave, unit: Hz. The cosine wave generator is driven by RTC\_FAST clock which is divide from RC\_FAST, With the default RTC clock, the minimum frequency of cosine wave is about 130 Hz, Although it can support up to several MHz frequency theoretically, the waveform will distort at high frequency due to the hardware limitation. Typically not suggest to set the frequency higher than 200 KHz

*dac\_cosine\_clk\_src\_t* **clk\_src**

The clock source of the cosine wave generator, currently only support DAC\_COSINE\_CLK\_SRC\_DEFAULT

*dac\_cosine\_atten\_t* **atten**

The attenuation of cosine wave amplitude

*dac\_cosine\_phase\_t* **phase**

The phase of cosine wave, can only support DAC\_COSINE\_PHASE\_0 or DAC\_COSINE\_PHASE\_180, default as 0 while setting an unsupported phase

int8\_t **offset**

The DC offset of cosine wave

bool **force\_set\_freq**

Force to set the cosine wave frequency

struct *dac\_cosine\_config\_t*::[anonymous] **flags**

Flags of cosine mode

### Type Definitions

typedef struct dac\_cosine\_s \***dac\_cosine\_handle\_t**

DAC cosine wave channel handle

### Header File

- [components/driver/dac/include/driver/dac\\_continuous.h](#)
- This header file can be included with:

```
#include "driver/dac_continuous.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

PRIV\_REQUIRES driver

## Functions

*esp\_err\_t* **dac\_continuous\_new\_channels** (const *dac\_continuous\_config\_t* \*cont\_cfg,  
*dac\_continuous\_handle\_t* \*ret\_handle)

Allocate new DAC channels in continuous mode.

---

**Note:** The DAC channels can't be registered to continuous mode separately

---

### Parameters

- **cont\_cfg** -- **[in]** Continuous mode configuration
- **ret\_handle** -- **[out]** The returned continuous mode handle

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The DAC channel has been registered already
- **ESP\_ERR\_NOT\_FOUND** Not found the available dma peripheral, might be occupied
- **ESP\_ERR\_NO\_MEM** No memory for the DAC continuous mode resources
- **ESP\_OK** Allocate the new DAC continuous mode success

*esp\_err\_t* **dac\_continuous\_del\_channels** (*dac\_continuous\_handle\_t* handle)

Delete the DAC continuous handle.

**Parameters** **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The channels have already been deregistered or not disabled
- **ESP\_OK** Delete the continuous channels success

*esp\_err\_t* **dac\_continuous\_enable** (*dac\_continuous\_handle\_t* handle)

Enabled the DAC continuous mode.

---

**Note:** Must enable the channels before

---

**Parameters** **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The channels have been enabled already
- **ESP\_OK** Enable the continuous output success

*esp\_err\_t* **dac\_continuous\_disable** (*dac\_continuous\_handle\_t* handle)

Disable the DAC continuous mode.

**Parameters** **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The channels have been enabled already
- **ESP\_OK** Disable the continuous output success

*esp\_err\_t* **dac\_continuous\_write** (*dac\_continuous\_handle\_t* handle, uint8\_t \*buf, size\_t buf\_size, size\_t \*bytes\_loaded, int timeout\_ms)

Write DAC data continuously.

---

**Note:** The data in buffer will only be converted one time, This function will be blocked until all data loaded or timeout then the DAC output will keep outputting the voltage of the last data in the buffer

---

---

**Note:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available, The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` in `menuconfig`.

---

#### Parameters

- **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **buf** -- **[in]** The digital data buffer to convert
- **buf\_size** -- **[in]** The buffer size of digital data buffer
- **bytes\_loaded** -- **[out]** The bytes that has been loaded into DMA buffer, can be NULL if don't need it
- **timeout\_ms** -- **[in]** The timeout time in millisecond, set a minus value means will block forever

#### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The DAC continuous mode has not been enabled yet
- `ESP_ERR_TIMEOUT` Waiting for semaphore or message queue timeout
- `ESP_OK` Success to output the acyclic DAC data

*esp\_err\_t* **dac\_continuous\_write\_cyclically** (*dac\_continuous\_handle\_t* handle, *uint8\_t* \*buf, *size\_t* buf\_size, *size\_t* \*bytes\_loaded)

Write DAC continuous data cyclically.

---

**Note:** The data in buffer will be converted cyclically using DMA once this function is called, This function will return once the data loaded into DMA buffers.

---

---

**Note:** The buffer size of cyclically output is limited by the descriptor number and dma buffer size while initializing the continuous mode. Concretely, in order to load all the data into descriptors, the cyclic buffer size is not supposed to be greater than `desc_num * buf_size`

---

---

**Note:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available, The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` in `menuconfig`.

---

#### Parameters

- **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **buf** -- **[in]** The digital data buffer to convert
- **buf\_size** -- **[in]** The buffer size of digital data buffer
- **bytes\_loaded** -- **[out]** The bytes that has been loaded into DMA buffer, can be NULL if don't need it

#### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The DAC continuous mode has not been enabled yet

- ESP\_OK Success to output the acyclic DAC data

*esp\_err\_t* **dac\_continuous\_register\_event\_callback** (*dac\_continuous\_handle\_t* handle, const *dac\_event\_callbacks\_t* \*callbacks, void \*user\_data)

Set event callbacks for DAC continuous mode.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

---

---

**Note:** When `CONFIG_DAC_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in this function, including the `user_data`, should be in the internal RAM as well.

---

#### Parameters

- **handle** -- [in] The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **callbacks** -- [in] Group of callback functions, input NULL to clear the former callbacks
- **user\_data** -- [in] User data, which will be passed to callback functions directly

#### Returns

- ESP\_OK Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG Set event callbacks failed because of invalid argument

*esp\_err\_t* **dac\_continuous\_start\_async\_writing** (*dac\_continuous\_handle\_t* handle)

Start the async writing.

---

**Note:** When the asynchronous writing start, the DAC will keep outputting '0' until the data are loaded into the DMA buffer. To loaded the data into DMA buffer, 'on\_convert\_done' callback is required, which can be registered by 'dac\_continuous\_register\_event\_callback' before enabling

---

**Parameters** **handle** -- [in] The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

#### Returns

- ESP\_OK Start asynchronous writing successfully
- ESP\_ERR\_INVALID\_ARG The handle is NULL
- ESP\_ERR\_INVALID\_STATE The channel is not enabled or the 'on\_convert\_done' callback is not registered

*esp\_err\_t* **dac\_continuous\_stop\_async\_writing** (*dac\_continuous\_handle\_t* handle)

Stop the sync writing.

**Parameters** **handle** -- [in] The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

#### Returns

- ESP\_OK Stop asynchronous writing successfully
- ESP\_ERR\_INVALID\_ARG The handle is NULL
- ESP\_ERR\_INVALID\_STATE Asynchronous writing has not started

*esp\_err\_t* **dac\_continuous\_write\_asynchronously** (*dac\_continuous\_handle\_t* handle, uint8\_t \*dma\_buf, size\_t dma\_buf\_len, const uint8\_t \*data, size\_t data\_len, size\_t \*bytes\_loaded)

Write DAC data asynchronously.

**Note:** This function can be called when the asynchronous writing started, and it can be called in the callback directly but recommend to writing data in a task, referring to `:example:peripherals/dac/dac_continuous/dac_audio`

---

### Parameters

- **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **dma\_buf** -- **[in]** The DMA buffer address, it can be acquired from '*dac\_event\_data\_t*' in the 'on\_convert\_done' callback
- **dma\_buf\_len** -- **[in]** The DMA buffer length, it can be acquired from '*dac\_event\_data\_t*' in the 'on\_convert\_done' callback
- **data** -- **[in]** The data that need to be written
- **data\_len** -- **[in]** The data length the need to be written
- **bytes\_loaded** -- **[out]** The bytes number that has been loaded/written into the DMA buffer

### Returns

- ESP\_OK Write the data into DMA buffer successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE The channels haven't start the asynchronous writing
- ESP\_ERR\_NOT\_FOUND The param 'dam\_buf' not match any existed DMA buffer

## Structures

struct **dac\_continuous\_config\_t**

DAC continuous channels' configurations.

## Public Members

*dac\_channel\_mask\_t* **chan\_mask**

DAC channels' mask for selecting which channels are used

uint32\_t **desc\_num**

The number of DMA descriptor, at least 2 descriptors are required The number of descriptors is directly proportional to the max data buffer size while converting in cyclic output but only need to ensure it is greater than '1' in acyclic output Typically, suggest to set the number bigger than 5, in case the DMA stopped while sending a short buffer

size\_t **buf\_size**

The DMA buffer size, should be within 32~4092 bytes. Each DMA buffer will be attached to a DMA descriptor, i.e. the number of DMA buffer will be equal to the DMA descriptor number The DMA buffer size is not allowed to be greater than 4092 bytes The total DMA buffer size equal to `desc_num * buf_size` Typically, suggest to set the size to the multiple of 4

uint32\_t **freq\_hz**

The frequency of DAC conversion in continuous mode, unit: Hz The supported range is related to the target and the clock source. For the clock `DAC_DIGI_CLK_SRC_DEFAULT`: the range is 19.6 KHz to several MHz on ESP32 and 77 Hz to several MHz on ESP32-S2. For the clock `DAC_DIGI_CLK_SRC_APLL`: the range is 648 Hz to several MHz on ESP32 and 6 Hz to several MHz on ESP32-S2. Typically not suggest to set the frequency higher than 2 MHz, otherwise the severe distortion will appear

**int8\_t offset**

The offset of the DAC digital data. Range -128~127

***dac\_continuous\_digi\_clk\_src\_t clk\_src***

The clock source of digital controller, which can affect the range of supported frequency. Currently DAC\_DIGI\_CLK\_SRC\_DEFAULT and DAC\_DIGI\_CLK\_SRC\_APLL are available

***dac\_continuous\_channel\_mode\_t chan\_mode***

The channel mode of continuous mode, only take effect when multiple channels enabled, depends converting the buffer alternately or simultaneously

struct **dac\_event\_data\_t**

Event structure used in DAC event queue.

### Public Members

void \***buf**

The pointer of DMA buffer that just finished sending

size\_t **buf\_size**

The writable buffer size of the DMA buffer, equal to '*dac\_continuous\_config\_t::buf\_size*'

size\_t **write\_bytes**

The number of bytes that be written successfully

struct **dac\_event\_callbacks\_t**

Group of DAC callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_DAC\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

***dac\_isr\_callback\_t on\_convert\_done***

Callback of data conversion done event. An event data buffer previously loaded to the driver has been output and converted. The event data includes DMA buffer address and size that just finished converting.

***dac\_isr\_callback\_t on\_stop***

Callback of finished sending all the data. All loaded event data buffers are converted. Driver is pending for new data buffers to be loaded. The event data will be NULL in this callback.

### Type Definitions

typedef struct dac\_continuous\_s \***dac\_continuous\_handle\_t**

DAC continuous channel handle

```
typedef bool (*dac_isr_callback_t)(dac_continuous_handle_t handle, const dac_event_data_t *event, void *user_data)
```

DAC event callback.

**Param handle [in]** DAC channel handle, created from `dac_continuous_new_channels()`

**Param event [in]** DAC event data

**Param user\_data [in]** User registered context, passed from `dac_continuous_register_event_callback()`

**Return** Whether a high priority task has been waken up by this callback function

## Enumerations

```
enum dac_channel_mask_t
```

DAC channel mask.

*Values:*

enumerator **DAC\_CHANNEL\_MASK\_CH0**

DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator **DAC\_CHANNEL\_MASK\_CH1**

DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator **DAC\_CHANNEL\_MASK\_ALL**

Both DAC channel 0 and channel 1

## Header File

- `components/driver/dac/include/driver/dac_types.h`
- This header file can be included with:

```
#include "driver/dac_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Type Definitions

```
typedef soc_periph_dac_digi_clk_src_t dac_continuous_digi_clk_src_t
```

DAC DMA (digital controller) clock source.

```
typedef soc_periph_dac_cosine_clk_src_t dac_cosine_clk_src_t
```

DAC cosine wave generator clock source.

## Enumerations

```
enum dac_continuous_channel_mode_t
```

DAC channel work mode in dma mode.

---

**Note:** Only take effect when multiple channels enabled.

---

---

**Note:** Assume the data in buffer is 'A B C D E F' DAC\_CHANNEL\_MODE\_SIMUL:

- channel 0: A B C D E F
  - channel 1: A B C D E F DAC\_CHANNEL\_MODE\_ALTER:
  - channel 0: A C E
  - channel 1: B D F
- 

*Values:*

enumerator **DAC\_CHANNEL\_MODE\_SIMUL**

The data in the DMA buffer is simultaneously output to the enable channel of the DAC.

enumerator **DAC\_CHANNEL\_MODE\_ALTER**

The data in the DMA buffer is alternately output to the enable channel of the DAC.

### Header File

- [components/hal/include/hal/dac\\_types.h](#)
- This header file can be included with:

```
#include "hal/dac_types.h"
```

### Enumerations

enum **dac\_channel\_t**

*Values:*

enumerator **DAC\_CHAN\_0**

DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator **DAC\_CHAN\_1**

DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator **DAC\_CHANNEL\_1**

Alias of 'DAC\_CHAN\_0', now the channel index start from '0'

enumerator **DAC\_CHANNEL\_2**

Alias of 'DAC\_CHAN\_1', now the channel index start from '0'

enum **dac\_cosine\_atten\_t**

The attenuation of the amplitude of the cosine wave generator. The max amplitude is VDD3P3\_RTC.

*Values:*

enumerator **DAC\_COSINE\_ATTEN\_DEFAULT**

No attenuation to the DAC cosine wave amplitude. Default.

enumerator **DAC\_COSINE\_ATTEN\_DB\_0**

Original amplitude of the DAC cosine wave, equals to DAC\_COSINE\_ATTEN\_DEFAULT

enumerator **DAC\_COSINE\_ATTEN\_DB\_6**

1/2 amplitude of the DAC cosine wave

enumerator **DAC\_COSINE\_ATTEN\_DB\_12**

1/4 amplitude of the DAC cosine wave

enumerator **DAC\_COSINE\_ATTEN\_DB\_18**

1/8 amplitude of the DAC cosine wave

enum **dac\_cosine\_phase\_t**

Set the phase of the cosine wave generator output.

---

**Note:** Only 0 or 180 are supported, it will be set to 0 as default if configured to an unsupported phase.

---

*Values:*

enumerator **DAC\_COSINE\_PHASE\_0**

Phase shift +0°

enumerator **DAC\_COSINE\_PHASE\_180**

Phase shift +180°

## 2.6.6 GPIO & RTC GPIO

### GPIO Summary

The ESP32 chip features 34 physical GPIO pins (GPIO0 ~ GPIO19, GPIO21 ~ GPIO23, GPIO25 ~ GPIO27, and GPIO32 ~ GPIO39). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through IO MUX, RTC IO MUX and the GPIO matrix, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	RTC GPIO	Comments
GPIO0	ADC2_CH1	RTC_GPIO11	Strapping pin
GPIO1			TXD
GPIO2	ADC2_CH2	RTC_GPIO12	Strapping pin
GPIO3			RXD
GPIO4	ADC2_CH0	RTC_GPIO10	
GPIO5			Strapping pin
GPIO6			SPI0/1
GPIO7			SPI0/1
GPIO8			SPI0/1
GPIO9			SPI0/1
GPIO10			SPI0/1
GPIO11			SPI0/1
GPIO12	ADC2_CH5	RTC_GPIO15	Strapping pin; JTAG

continues on next page

Table 2 – continued from previous page

GPIO	Analog Function	RTC GPIO	Comments
GPIO13	ADC2_CH4	RTC_GPIO14	JTAG
GPIO14	ADC2_CH6	RTC_GPIO16	JTAG
GPIO15	ADC2_CH3	RTC_GPIO13	Strapping pin; JTAG
GPIO16			SPI0/1
GPIO17			SPI0/1
GPIO18			
GPIO19			
GPIO21			
GPIO22			
GPIO23			
GPIO25	ADC2_CH8	RTC_GPIO6	
GPIO26	ADC2_CH9	RTC_GPIO7	
GPIO27	ADC2_CH7	RTC_GPIO17	
GPIO32	ADC1_CH4	RTC_GPIO9	
GPIO33	ADC1_CH5	RTC_GPIO8	
GPIO34	ADC1_CH6	RTC_GPIO4	GPI
GPIO35	ADC1_CH7	RTC_GPIO5	GPI
GPIO36	ADC1_CH0	RTC_GPIO0	GPI
GPIO37	ADC1_CH1	RTC_GPIO1	GPI
GPIO38	ADC1_CH2	RTC_GPIO2	GPI
GPIO39	ADC1_CH3	RTC_GPIO3	GPI

**Note:**

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to [ESP32 datasheet](#).
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you are having trouble getting the value from an ADC2 GPIO while using Wi-Fi, you may consider using an ADC1 GPIO instead, which should solve your problem. For more details, please refer to [Hardware Limitations of ADC Continuous Mode](#) and [Hardware Limitations of ADC Oneshot Mode](#).
- Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to [ESP32 ECO and Workarounds for Bugs](#) > Section 3.11 for the detailed description of the issue.

GPIO driver offers a dump function `gpio_dump_io_configuration()` to show the configurations of the IOs at the moment, such as pull-up / pull-down, input / output enable, pin mapping etc. Below is an example dump:

```

=====IO DUMP Start=====
IO[4] -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigIn ID: (simple GPIO input)
  SleepSelEn: 1

IO[18] -
  Pullup: 0, Pulldown: 0, DriveCap: 2
  InputEn: 0, OutputEn: 1, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigOut ID: 256 (simple GPIO output)

```

(continues on next page)

```

SleepSelEn: 1

IO[26] **RESERVED** -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 0 (IOMUX)
  SleepSelEn: 1

=====IO DUMP End=====

```

If an IO pin is routed to a peripheral signal through the GPIO matrix, the signal ID printed in the dump information is defined in the `soc/gpio_sig_map.h` file. The word `**RESERVED**` indicates the IO is occupied by either FLASH or PSRAM. It is strongly not recommended to reconfigure them for other application purposes.

There is also separate "RTC GPIO" support, which functions when GPIOs are routed to the "RTC" low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use

### Application Example

- GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

### API Reference - Normal GPIO

#### Header File

- [components/driver/gpio/include/driver/gpio.h](#)
- This header file can be included with:

```
#include "driver/gpio.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

#### Functions

`esp_err_t gpio_config` (const `gpio_config_t` \*pGPIOConfig)

GPIO common configuration.

```
Configure GPIO's Mode, pull-up, PullDown, IntrType
```

**Parameters** `pGPIOConfig` -- Pointer to GPIO configure struct

#### Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_reset\_pin** (gpio\_num\_t gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

---

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

---

**Parameters** **gpio\_num** -- GPIO number.

**Returns** Always return ESP\_OK.

*esp\_err\_t* **gpio\_set\_intr\_type** (gpio\_num\_t gpio\_num, *gpio\_int\_type\_t* intr\_type)

GPIO set interrupt trigger type.

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **intr\_type** -- Interrupt type, select from gpio\_int\_type\_t

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_enable** (gpio\_num\_t gpio\_num)

Enable GPIO module interrupt signal.

---

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue.

---

**Parameters** **gpio\_num** -- GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_disable** (gpio\_num\_t gpio\_num)

Disable GPIO module interrupt signal.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters** **gpio\_num** -- GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_level** (gpio\_num\_t gpio\_num, uint32\_t level)

GPIO set output level.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set the output level of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **level** -- Output level. 0: low ; 1: high

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO number error

int **gpio\_get\_level** (gpio\_num\_t gpio\_num)

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters** **gpio\_num** -- GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

*esp\_err\_t* **gpio\_set\_direction** (gpio\_num\_t gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction.

Configure GPIO direction, such as output\_only, input\_only, output\_and\_input

**Parameters**

- **gpio\_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_set\_pull\_mode** (gpio\_num\_t gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** -- GPIO pull up/down mode.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_wakeup\_enable** (gpio\_num\_t gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable GPIO wake-up function.

**Parameters**

- **gpio\_num** -- GPIO number.
- **intr\_type** -- GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_wakeup\_disable** (gpio\_num\_t gpio\_num)

Disable GPIO wake-up function.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

**Parameters**

- **fn** -- Interrupt handler function.
- **arg** -- Parameter for handler function
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (gpio\_num\_t gpio\_num)

Enable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pullup\_dis** (gpio\_num\_t gpio\_num)

Disable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pulldown\_en** (gpio\_num\_t gpio\_num)

Enable pull-down on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pulldown\_dis** (gpio\_num\_t gpio\_num)

Disable pull-down on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the GPIO driver's ETS\_GPIO\_INTR\_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Parameters** `intr_alloc_flags` -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` No memory to install this service
- `ESP_ERR_INVALID_STATE` ISR service already installed.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_INVALID_ARG` GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (gpio\_num\_t gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**

- `gpio_num` -- GPIO number
- `isr_handler` -- ISR handler function for the corresponding GPIO number.
- `args` -- parameter for ISR handler.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_isr\_handler\_remove** (gpio\_num\_t gpio\_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters** `gpio_num` -- GPIO number

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* strength)

Set GPIO pad drive capability.

**Parameters**

- `gpio_num` -- GPIO number, only support output GPIOs
- `strength` -- Drive capability of the pad

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_get\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get GPIO pad drive capability.

**Parameters**

- `gpio_num` -- GPIO number, only support output GPIOs
- `strength` -- Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_hold\_en** (gpio\_num\_t gpio\_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the power domain of where GPIO/IOMUX belongs to becomes off. For example, chip or system is reset (e.g. watchdog time-out, deep-sleep events are triggered), or peripheral power-down in light-sleep.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters** `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

*esp\_err\_t* **gpio\_hold\_dis** (gpio\_num\_t gpio\_num)

Disable gpio pad hold function.

When the chip is woken up from peripheral power-down sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters** `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

void **gpio\_deep\_sleep\_hold\_en** (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void **gpio\_deep\_sleep\_hold\_dis** (void)

Disable all digital gpio pads hold function during Deep-sleep.

void **gpio\_iomux\_in** (uint32\_t gpio\_num, uint32\_t signal\_idx)

SOC\_GPIO\_SUPPORT\_HOLD\_SINGLE\_IO\_IN\_DSLP.

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- `gpio_num` -- GPIO number of the pad.

- **signal\_idx** -- Peripheral signal id to input. One of the \*\_IN\_IDX signals in `soc/gpio_sig_map.h`.

void **gpio\_iomux\_out** (uint8\_t gpio\_num, int func, bool oen\_inv)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- **gpio\_num** -- gpio\_num GPIO number of the pad.
- **func** -- The function number of the peripheral pin to output pin. One of the FUNC\_X\_\* of specified pin (X) in `soc/io_mux_reg.h`.
- **oen\_inv** -- True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* **gpio\_sleep\_sel\_en** (gpio\_num\_t gpio\_num)

Enable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** **gpio\_num** -- GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_sel\_dis** (gpio\_num\_t gpio\_num)

Disable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** **gpio\_num** -- GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_set\_direction** (gpio\_num\_t gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

**Parameters**

- **gpio\_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_sleep\_set\_pull\_mode** (gpio\_num\_t gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** -- GPIO pull up/down mode.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_dump\_io\_configuration** (FILE \*out\_stream, uint64\_t io\_bit\_mask)

Dump IO configuration information to console.

**Parameters**

- **out\_stream** -- IO stream (e.g. stdout)
- **io\_bit\_mask** -- IO pin bit mask, each bit maps to an IO

**Returns**

- ESP\_OK Success

- `ESP_ERR_INVALID_ARG` Parameter error

## Structures

struct **gpio\_config\_t**

Configuration parameters of GPIO pad for `gpio_config` function.

### Public Members

`uint64_t pin_bit_mask`

GPIO pin: set with bit mask, each bit maps to a GPIO

`gpio_mode_t mode`

GPIO mode: set input/output mode

`gpio_pullup_t pull_up_en`

GPIO pull-up

`gpio_pulldown_t pull_down_en`

GPIO pull-down

`gpio_int_type_t intr_type`

GPIO interrupt type

## Macros

`GPIO_PIN_COUNT`

`GPIO_IS_VALID_GPIO` (`gpio_num`)

Check whether it is a valid GPIO number.

`GPIO_IS_VALID_OUTPUT_GPIO` (`gpio_num`)

Check whether it can be a valid GPIO number of output mode.

`GPIO_IS_VALID_DIGITAL_IO_PAD` (`gpio_num`)

Check whether it can be a valid digital I/O pad.

## Type Definitions

typedef `intr_handle_t gpio_isr_handle_t`

typedef void (\*`gpio_isr_t`)(void \*arg)

GPIO interrupt handler.

**Param arg** User registered data

### Enumerations

enum `gpio_port_t`

*Values:*

enumerator `GPIO_PORT_0`

enumerator `GPIO_PORT_MAX`

enum `gpio_int_type_t`

*Values:*

enumerator `GPIO_INTR_DISABLE`

Disable GPIO interrupt

enumerator `GPIO_INTR_POSEDGE`

GPIO interrupt type : rising edge

enumerator `GPIO_INTR_NEGEDGE`

GPIO interrupt type : falling edge

enumerator `GPIO_INTR_ANYEDGE`

GPIO interrupt type : both rising and falling edge

enumerator **GPIO\_INTR\_LOW\_LEVEL**

GPIO interrupt type : input low level trigger

enumerator **GPIO\_INTR\_HIGH\_LEVEL**

GPIO interrupt type : input high level trigger

enumerator **GPIO\_INTR\_MAX**

enum **gpio\_mode\_t**

*Values:*

enumerator **GPIO\_MODE\_DISABLE**

GPIO mode : disable input and output

enumerator **GPIO\_MODE\_INPUT**

GPIO mode : input only

enumerator **GPIO\_MODE\_OUTPUT**

GPIO mode : output only mode

enumerator **GPIO\_MODE\_OUTPUT\_OD**

GPIO mode : output only with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT\_OD**

GPIO mode : output and input with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT**

GPIO mode : output and input mode

enum **gpio\_pullup\_t**

*Values:*

enumerator **GPIO\_PULLUP\_DISABLE**

Disable GPIO pull-up resistor

enumerator **GPIO\_PULLUP\_ENABLE**

Enable GPIO pull-up resistor

enum **gpiopulldown\_t**

*Values:*

enumerator **GPIO\_PULLDOWN\_DISABLE**

Disable GPIO pull-down resistor

enumerator **GPIO\_PULLDOWN\_ENABLE**

Enable GPIO pull-down resistor

enum **gpio\_pull\_mode\_t**

*Values:*

enumerator **GPIO\_PULLUP\_ONLY**

Pad pull up

enumerator **GPIO\_PULLDOWN\_ONLY**

Pad pull down

enumerator **GPIO\_PULLUP\_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO\_FLOATING**

Pad floating

enum **gpio\_drive\_cap\_t**

*Values:*

enumerator **GPIO\_DRIVE\_CAP\_0**

Pad drive capability: weak

enumerator **GPIO\_DRIVE\_CAP\_1**

Pad drive capability: stronger

enumerator **GPIO\_DRIVE\_CAP\_2**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_DEFAULT**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_3**

Pad drive capability: strongest

enumerator **GPIO\_DRIVE\_CAP\_MAX**

## API Reference - RTC GPIO

### Header File

- [components/driver/gpio/include/driver/rtc\\_io.h](#)
- This header file can be included with:

```
#include "driver/rtc_io.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

bool **rtc\_gpio\_is\_valid\_gpio** (gpio\_num\_t gpio\_num)

Determine if the specified GPIO is a valid RTC GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns** true if GPIO is valid for RTC GPIO use. false otherwise.

int **rtc\_io\_number\_get** (gpio\_num\_t gpio\_num)

Get RTC IO index number by gpio number.

**Parameters** **gpio\_num** -- GPIO number

**Returns** >=0: Index of rtcio. -1 : The gpio is not rtcio.

*esp\_err\_t* **rtc\_gpio\_init** (gpio\_num\_t gpio\_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_deinit** (gpio\_num\_t gpio\_num)

Init a GPIO as digital GPIO.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

uint32\_t **rtc\_gpio\_get\_level** (gpio\_num\_t gpio\_num)

Get the RTC IO input level.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- 1 High level
- 0 Low level
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_level** (gpio\_num\_t gpio\_num, uint32\_t level)

Set the RTC IO output level.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **level** -- output level

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction** (gpio\_num\_t gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction\_in\_sleep** (gpio\_num\_t gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 supports INPUT\_ONLY mode. The rest targets support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_en** (gpio\_num\_t gpio\_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_en** (gpio\_num\_t gpio\_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_dis** (gpio\_num\_t gpio\_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_dis** (gpio\_num\_t gpio\_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* strength)

Set RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_iomux\_func\_sel** (gpio\_num\_t gpio\_num, int func)

Select a RTC IOMUX function for the RTC IO.

**Parameters**

- **gpio\_num** -- GPIO number
- **func** -- Function to assign to the pin

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_hold\_en** (gpio\_num\_t gpio\_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_hold\_dis** (gpio\_num\_t gpio\_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_force\_hold\_en\_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a "force hold" input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

*esp\_err\_t* **rtc\_gpio\_force\_hold\_dis\_all** (void)

Disable force hold signal for all RTC IOs.

*esp\_err\_t* **rtc\_gpio\_wakeup\_enable** (gpio\_num\_t gpio\_num, *gpio\_intr\_type\_t* intr\_type)

Enable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio\_num** -- GPIO number
- **intr\_type** -- Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO, or intr\_type is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

*esp\_err\_t* **rtc\_gpio\_wakeup\_disable** (gpio\_num\_t gpio\_num)

Disable wakeup from sleep mode using specific GPIO.

**Parameters** `gpio_num` -- GPIO number

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `gpio_num` is not an RTC IO

### Macros

**RTC\_GPIO\_IS\_VALID\_GPIO** (gpio\_num)

### Header File

- [components/driver/gpio/include/driver/lp\\_io.h](#)

#include "hal/rtc_io_types.h"
```

### Enumerations

enum **rtc\_gpio\_mode\_t**

RTCIO output/input mode type.

*Values:*

enumerator **RTC\_GPIO\_MODE\_INPUT\_ONLY**

Pad input

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_ONLY**

Pad output

enumerator **RTC\_GPIO\_MODE\_INPUT\_OUTPUT**

Pad input + output

enumerator **RTC\_GPIO\_MODE\_DISABLED**

Pad (output + input) disable

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_OD**

Pad open-drain output

enumerator `RTC_GPIO_MODE_INPUT_OUTPUT_OD`

Pad input + open-drain output

## 2.6.7 General Purpose Timer (GPTimer)

### Introduction

GPTimer (General Purpose Timer) is the driver of ESP32 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

### Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- *Resource Allocation* - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- *Set and Get Count Value* - covers how to force the timer counting from a start point and how to get the count value at anytime.
- *Set up Alarm Action* - covers the parameters that should be set up to enable the alarm event.
- *Register Event Callbacks* - covers how to hook user specific code to the alarm event callback function.
- *Enable and Disable Timer* - covers how to enable and disable the timer.
- *Start and Stop Timer* - shows some typical use cases that start the timer with different alarm behavior.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.<sup>1</sup>

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind manages all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section *Power Management*.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to  $1 / \text{resolution\_hz}$  seconds.

---

<sup>1</sup> Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to **ESP32 Technical Reference Manual** > Chapter **Timer Group (TIMG)** [PDF]. The driver does forbid you from applying for more timers, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `gptimer_new_timer()`).

- `gptimer_config::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to [Interrupt Handling](#).

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e., all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value depends on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This allows the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

### Creating a GPTimer Handle with Resolution of 1 MHz

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**Set and Get Count Value** When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

**Set up Alarm Action** For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that triggers the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless. Please also note, because of the interrupt latency, it's not recommended to set the alarm period smaller than 5 us.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

---

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

---

**Register Event Callbacks** After the timer starts up, it can generate a specific event (e.g., the "Alarm Event") dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function lazy installs the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section [Enable and Disable Timer](#) for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function:

- Switches the timer driver state from **init** to **enable**.
- Enables the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See Section [Power Management](#) for more information.

Calling `gptimer_disable()` does the opposite, that is, put the timer driver back to the **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

Calling `gptimer_start()` transits the driver state from **enable** to **run**, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the "start protection" state (i.e., `gptimer_start()` is called but not finished).

### Start Timer as a Wall Clock

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

### Trigger Period Events

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
```

(continues on next page)

```

};
// Optional: send the event data to other task by OS queue
// Do not introduce complex logics in callbacks
// Suggest dealing with event data in the main loop, instead of in this_
↪callback
xQueueSendFromISR(queue, &ele, &high_task_awoken);
// return whether we need to yield at the end of ISR
return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

### Trigger One-Shot Event

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**Dynamic Alarm Update** Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

**Power Management** There are some power management strategies, which might turn off or change the frequency of GPTimer's source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver increases the reference count of that power management lock in the `gptimer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable between `gptimer_enable()` and `gptimer_disable()`.

**IRAM Safe** By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM<sup>2</sup>
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

<sup>2</sup> `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

### Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash).
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or flash).
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled, see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

- Typical use cases of GPTimer are listed in the example [peripherals/timer\\_group/gptimer](#).

### API Reference

#### Header File

- `components/driver/gptimer/include/driver/gptimer.h`
- This header file can be included with:

```
#include "driver/gptimer.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **gptimer\_new\_timer** (const *gptimer\_config\_t* \*config, *gptimer\_handle\_t* \*ret\_timer)

Create a new General Purpose Timer, and return the handle.

---

**Note:** The newly created timer is put in the "init" state.

---

### Parameters

- **config** -- [in] GPTimer configuration
- **ret\_timer** -- [out] Returned timer handle

### Returns

- ESP\_OK: Create GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Create GPTimer failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPTimer failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP\_FAIL: Create GPTimer failed because of other error

*esp\_err\_t* **gptimer\_del\_timer** (*gptimer\_handle\_t* timer)

Delete the GPTimer handle.

---

**Note:** A timer must be in the "init" state before it can be deleted.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

### Returns

- ESP\_OK: Delete GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Delete GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete GPTimer failed because the timer is not in init state
- ESP\_FAIL: Delete GPTimer failed because of other error

*esp\_err\_t* **gptimer\_set\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t value)

Set GPTimer raw count value.

---

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

---

**Note:** This function is allowed to run within ISR context

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [in] Count value to be set

### Returns

- ESP\_OK: Set GPTimer raw count value successfully
- ESP\_ERR\_INVALID\_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP\_FAIL: Set GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer raw count value.

---

**Note:** This function will trigger a software capture event and then return the captured count value.

---

---

**Note:** With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned GPTimer count value

#### Returns

- `ESP_OK`: Get GPTimer raw count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer raw count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_resolution** (*gptimer\_handle\_t* timer, uint32\_t \*out\_resolution)

Return the real resolution of the timer.

---

**Note:** usually the timer resolution is same as what you configured in the `gptimer_config_t::resolution_hz`, but some unstable clock source (e.g. `RC_FAST`) will do a calibration, the real resolution can be different from the configured one.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **out\_resolution** -- [out] Returned timer resolution, in Hz

#### Returns

- `ESP_OK`: Get GPTimer resolution successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer resolution failed because of invalid argument
- `ESP_FAIL`: Get GPTimer resolution failed because of other error

*esp\_err\_t* **gptimer\_get\_captured\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer captured count value.

---

**Note:** The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned captured count value

**Returns**

- `ESP_OK`: Get GPTimer captured count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer captured count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer captured count value failed because of other error

*esp\_err\_t* `gptimer_register_event_callbacks` (*gptimer\_handle\_t* timer, const *gptimer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for GPTimer.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `gptimer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the timer is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `gptimer_set_alarm_action` (*gptimer\_handle\_t* timer, const *gptimer\_alarm\_config\_t* \*config)

Set alarm event actions for GPTimer.

---

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] Alarm configuration, especially, set `config` to `NULL` means disabling the alarm function

**Returns**

- ESP\_OK: Set alarm action for GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP\_FAIL: Set alarm action for GPTimer failed because of other error

*esp\_err\_t* **gptimer\_enable** (*gptimer\_handle\_t* timer)

Enable GPTimer.

---

**Note:** This function will transit the timer state from "init" to "enable".

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.

---

---

**Note:** Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP\_OK: Enable GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Enable GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable GPTimer failed because the timer is already enabled
- ESP\_FAIL: Enable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_disable** (*gptimer\_handle\_t* timer)

Disable GPTimer.

---

**Note:** This function will transit the timer state from "enable" to "init".

---

---

**Note:** This function will disable the interrupt service if it's installed.

---

---

**Note:** This function will release the PM lock if it's acquired in the `gptimer_enable`.

---

---

**Note:** Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP\_OK: Disable GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Disable GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP\_FAIL: Disable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_start** (*gptimer\_handle\_t* timer)

Start GPTimer (internal counter starts counting)

---

**Note:** This function will transit the timer state from "enable" to "run".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Start GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Start GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start GPTimer failed because the timer is not enabled or is already in running
- `ESP_FAIL`: Start GPTimer failed because of other error

*esp\_err\_t* **gptimer\_stop** (*gptimer\_handle\_t* timer)

Stop GPTimer (internal counter stops counting)

---

**Note:** This function will transit the timer state from "run" to "enable".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Stop GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Stop GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop GPTimer failed because the timer is not in running.
- `ESP_FAIL`: Stop GPTimer failed because of other error

## Structures

struct **gptimer\_config\_t**

General Purpose Timer configuration.

## Public Members

*gptimer\_clock\_source\_t* **clk\_src**

GPTimer clock source

*gptimer\_count\_direction\_t* **direction**

Count direction

uint32\_t **resolution\_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution\_hz) seconds

int **intr\_priority**

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **intr\_shared**

Set true, the timer interrupt number can be shared with other peripherals

struct *gptimer\_config\_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer\_event\_callbacks\_t**

Group of supported GPTimer callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

## Public Members

*gptimer\_alarm\_cb\_t* **on\_alarm**

Timer alarm callback

struct **gptimer\_alarm\_config\_t**

General Purpose Timer alarm configuration.

## Public Members

uint64\_t **alarm\_count**

Alarm target count value

uint64\_t **reload\_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32\_t **auto\_reload\_on\_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer\_alarm\_config\_t*::[anonymous] **flags**

Alarm config flags

## Header File

- `components/driver/gptimer/include/driver/gptimer_etm.h`
- This header file can be included with:

```
#include "driver/gptimer_etm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

`esp_err_t gptimer_new_etm_event` (`gptimer_handle_t` timer, const `gptimer_etm_event_config_t` \*config, `esp_etm_event_handle_t` \*out\_event)

Get the ETM event for GPTimer.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM event configuration
- **out\_event** -- [out] Returned ETM event handle

### Returns

- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

`esp_err_t gptimer_new_etm_task` (`gptimer_handle_t` timer, const `gptimer_etm_task_config_t` \*config, `esp_etm_task_handle_t` \*out\_task)

Get the ETM task for GPTimer.

---

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM task configuration
- **out\_task** -- [out] Returned ETM task handle

### Returns

- `ESP_OK`: Get ETM task successfully
- `ESP_ERR_INVALID_ARG`: Get ETM task failed because of invalid argument
- `ESP_FAIL`: Get ETM task failed because of other error

## Structures

struct `gptimer_etm_event_config_t`

GPTimer ETM event configuration.

## Public Members

*gptimer\_etm\_event\_type\_t* **event\_type**

GPTimer ETM event type

struct **gptimer\_etm\_task\_config\_t**

GPTimer ETM task configuration.

### Public Members

*gptimer\_etm\_task\_type\_t* **task\_type**

GPTimer ETM task type

### Header File

- `components/driver/gptimer/include/driver/gptimer_types.h`
- This header file can be included with:

```
#include "driver/gptimer_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Structures

struct **gptimer\_alarm\_event\_data\_t**

GPTimer alarm event data.

### Public Members

uint64\_t **count\_value**

Current count value

uint64\_t **alarm\_value**

Current alarm value

### Type Definitions

typedef struct gptimer\_t \***gptimer\_handle\_t**

Type of General Purpose Timer handle.

typedef bool (\***gptimer\_alarm\_cb\_t**)(*gptimer\_handle\_t* timer, const *gptimer\_alarm\_event\_data\_t* \*edata, void \*user\_ctx)

Timer alarm callback prototype.

**Param timer** [in] Timer handle created by `gptimer_new_timer`

**Param edata** [in] Alarm event data, fed by driver

**Param user\_ctx** [in] User data, passed from `gptimer_register_event_callbacks`

**Return** Whether a high priority task has been waken up by this function

### Header File

- [components/hal/include/hal/timer\\_types.h](#)
- This header file can be included with:

```
#include "hal/timer_types.h"
```

### Type Definitions

typedef *soc\_periph\_gptimer\_clk\_src\_t* **gptimer\_clock\_source\_t**  
GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

enum **gptimer\_count\_direction\_t**  
GPTimer count direction.

*Values:*

enumerator **GPTIMER\_COUNT\_DOWN**  
Decrease count value

enumerator **GPTIMER\_COUNT\_UP**  
Increase count value

enum **gptimer\_etm\_task\_type\_t**  
GPTimer specific tasks that supported by the ETM module.

*Values:*

enumerator **GPTIMER\_ETM\_TASK\_START\_COUNT**  
Start the counter

enumerator **GPTIMER\_ETM\_TASK\_STOP\_COUNT**  
Stop the counter

enumerator **GPTIMER\_ETM\_TASK\_EN\_ALARM**  
Enable the alarm

enumerator **GPTIMER\_ETM\_TASK\_RELOAD**  
Reload preset value into counter

enumerator **GPTIMER\_ETM\_TASK\_CAPTURE**  
Capture current count value into specific register

enumerator **GPTIMER\_ETM\_TASK\_MAX**  
Maximum number of tasks

enum `gptimer_etm_event_type_t`

GPTimer specific events that supported by the ETM module.

*Values:*

enumerator `GPTIMER_ETM_EVENT_ALARM_MATCH`

Count value matches the alarm target value

enumerator `GPTIMER_ETM_EVENT_MAX`

Maximum number of events

## 2.6.8 Inter-Integrated Circuit (I2C)

### Introduction

I2C is a serial, synchronous, multi-device, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. I2C uses two bidirectional open-drain lines: serial data line (SDA) and serial clock line (SCL), pulled up by resistors.

ESP32 has 2 I2C controller (also called port), responsible for handling communication on the I2C bus. A single I2C controller can be a master or a slave.

Typically, an I2C slave device has a 7-bit address or 10-bit address. ESP32 supports both I2C Standard-mode (Sm) and Fast-mode (Fm) which can go up to 100KHz and 400KHz respectively.

**Warning:** The clock frequency of SCL in master mode should not be larger than 400 KHz

---

**Note:** The frequency of SCL is influenced by both the pull-up resistor and the wire capacitance. Therefore, users are strongly recommended to choose appropriate pull-up resistors to make the frequency accurate. The recommended value for pull-up resistors usually ranges from 1K Ohms to 10K Ohms.

Keep in mind that the higher the frequency, the smaller the pull-up resistor should be (but not less than 1 KOhms). Indeed, large resistors will decline the current, which will increase the clock switching time and reduce the frequency. We usually recommend a range of 2 KOhms to 5 KOhms, but users may also need to make some adjustments depending on their current draw requirements.

---

### I2C Clock Configuration

- `i2c_clock_source_t::I2C_CLK_SRC_DEFAULT`: Default I2C source clock.
- `i2c_clock_source_t::I2C_CLK_SRC_APB`: APB clock as I2C clock source.

### I2C File Structure

#### Public headers that need to be included in the I2C application

- `i2c.h`: The header file of legacy I2C APIs (for apps using legacy driver).
- `i2c_master.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with master mode).
- `i2c_slave.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with slave mode).

Fig. 8: I2C file structure

**Note:** The legacy driver can't coexist with the new driver. Include `i2c.h` to use the legacy driver or the other two headers to use the new driver. Please keep in mind that the legacy driver is now deprecated and will be removed in future.

### Public headers that have been included in the headers above

- `i2c_types_legacy.h`: The legacy public types that only used in the legacy driver.
- `i2c_types.h`: The header file that provides public types.

### Functional Overview

The I2C driver offers following services:

- **Resource Allocation** - covers how to allocate I2C bus with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **I2C Master Controller** - covers behavior of I2C master controller. Introduce data transmit, data receive, and data transmit and receive.
- **I2C Slave Controller** - covers behavior of I2C slave controller. Involve data transmit and data receive.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the I2C interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation** Both I2C master bus and I2C slave bus, when supported, are represented by `i2c_bus_handle_t` in the driver. The available ports are managed in a resource pool that allocates a free port on request.

**Install I2C master bus and device** The I2C master is designed based on bus-device model. So `i2c_master_bus_config_t` and `i2c_device_config_t` are required separately to allocate the I2C master bus instance and I2C device instance.

Fig. 9: I2C master bus-device module

I2C master bus requires the configuration that specified by `i2c_master_bus_config_t`:

- `i2c_master_bus_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_master_bus_config_t::sda_io_num` sets the GPIO number for the serial data bus (SDA).
- `i2c_master_bus_config_t::scl_io_num` sets the GPIO number for the serial clock bus (SCL).
- `i2c_master_bus_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to *Power Management* section.
- `i2c_master_bus_config_t::glitch_ignore_cnt` sets the glitch period of master bus, if the glitch period on the line is less than this value, it can be filtered out, typically value is 7.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)).
- `i2c_master_bus_config_t::trans_queue_depth` Depth of internal transfer queue. Only valid in asynchronous transaction.
- `i2c_master_bus_config_t::enable_internal_pullup` Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. A suitable external pullup is recommended.

If the configurations in `i2c_master_bus_config_t` is specified, users can call `i2c_new_master_bus()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

I2C master device requires the configuration that specified by `i2c_device_config_t`:

- `i2c_device_config_t::dev_addr_length` configure the address bit length of the slave device. User can choose from enumerator `I2C_ADDR_BIT_LEN_7` or `I2C_ADDR_BIT_LEN_10` (if supported).
- `i2c_device_config_t::device_address` I2C device raw address. Please parse the device address to this member directly. For example, the device address is 0x28, then parse 0x28 to `i2c_device_config_t::device_address`, don't carry a write/read bit.
- `i2c_device_config_t::scl_speed_hz` set the scl line frequency of this device.
- `i2c_device_config_t::scl_wait_us`. SCL await time (in us). Usually this value should not be very small because slave stretch will happen in pretty long time. (It's possible even stretch for 12ms). Set 0 means use default reg value.

Once the `i2c_device_config_t` structure is populated with mandatory parameters, users can call `i2c_master_bus_add_device()` to allocate an I2C device instance and mounted to the master bus then. This function will return an I2C device handle if it runs correctly. Specifically, when the I2C bus is not initialized properly, calling this function will result in a `ESP_ERR_INVALID_ARG` error.

```
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```

**Get I2C master handle via port** Given that i2c master handle has been initialized in some module(e.g. an audio module), an another module(e.g. a video module) is not convenient to reused the handle. We have a helper function, `i2c_master_get_bus_handle()` for getting the initialized handle via port. However, please make sure the handle has already been initialized ahead of time. Otherwise an error would be reported.

```
// Source File 1
#include "driver/i2c_master.h"
i2c_master_bus_handle_t bus_handle;
i2c_master_bus_config_t i2c_mst_config = {
    ... // same as others
};
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

// Source File 2
#include "driver/i2c_master.h"
i2c_master_bus_handle_t handle;
ESP_ERROR_CHECK(i2c_master_get_bus_handle(0, &handle));
```

**Uninstall I2C master bus and device** If a previously installed I2C bus or device is no longer needed, it's recommended to recycle the resource by calling `i2c_master_bus_rm_device()` or `i2c_del_master_bus()`, so that to release the underlying hardware.

**Install I2C slave device** I2C slave requires the configuration that specified by `i2c_slave_config_t`:

- `i2c_slave_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_slave_config_t::sda_io_num` sets the GPIO number for serial data bus (SDA).
- `i2c_slave_config_t::scl_io_num` sets the GPIO number for serial clock bus (SCL).

- `i2c_slave_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to [Power Management](#) section.
- `i2c_slave_config_t::send_buf_depth` sets the sending buffer length.
- `i2c_slave_config_t::slave_addr` sets the slave address
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0 , then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority` Please use the number form (1,2,3) , not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `i2c_del_master_bus()` is called.
- `i2c_slave_config_t::addr_bit_len` sets true if you need the slave to have a 10-bit address.

Once the `i2c_slave_config_t` structure is populated with mandatory parameters, users can call `i2c_new_slave_device()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

```
i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
```

**Uninstall I2C slave device** If a previously installed I2C bus is no longer needed, it's recommended to recycle the resource by calling `i2c_del_slave_device()`, so that to release the underlying hardware.

**I2C Master Controller** After installing the i2c master driver by `i2c_new_master_bus()`, ESP32 is ready to communicate with other I2C devices. I2C APIs allow the standard transactions. Like the wave as follows:

**I2C Master Write** After installing I2C master bus successfully, you can simply call `i2c_master_transmit()` to write data to the slave device. The principle of this function can be explained by following chart.

In order to organize the process, the driver uses a command link, that should be populated with a sequence of commands and then passed to I2C controller for execution.

Fig. 10: I2C master write to slave

Simple example for writing data to slave:

```
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

ESP_ERROR_CHECK(i2c_master_transmit(dev_handle, data_wr, DATA_LENGTH, -1));
```

**I2C Master Read** After installing I2C master bus successfully, you can simply call `i2c_master_receive()` to read data from the slave device. The principle of this function can be explained by following chart.

Fig. 11: I2C master read from slave

Simple example for reading data from slave:

```
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

i2c_master_receive(dev_handle, data_rd, DATA_LENGTH, -1);
```

**I2C Master Write and Read** Some I2C device needs write configurations before reading data from it, therefore, an interface called `i2c_master_transmit_receive()` can help. The principle of this function can be explained by following chart.

Fig. 12: I2C master write to slave and read from slave

Simple example for writing and reading from slave:

```
i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(I2C_PORT_NUM_0, &dev_cfg, &dev_handle));
uint8_t buf[20] = {0x20};
uint8_t buffer[2];
ESP_ERROR_CHECK(i2c_master_transmit_receive(i2c_bus_handle, buf, sizeof(buf),
↪buffer, 2, -1));
```

**I2C Master Probe** I2C driver can use `i2c_master_probe()` to detect whether the specific device has been connected on I2C bus. If this function return `ESP_OK`, that means the device has been detected.

**Important:** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get `ESP_ERR_TIMEOUT` while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, setting `flags.enable_internal_pullup` as true is also acceptable.

Fig. 13: I2C master probe

Simple example for probing an I2C device:

```
i2c_master_bus_config_t i2c_mst_config_1 = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config_1, &bus_handle));
ESP_ERROR_CHECK(i2c_master_probe(bus_handle, 0x22, -1));
ESP_ERROR_CHECK(i2c_del_master_bus(bus_handle));
```

**I2C Slave Controller** After installing the i2c slave driver by `i2c_new_slave_device()`, ESP32 is ready to communicate with other I2C master as a slave.

**I2C Slave Write** The send buffer of the I2C slave is used as a FIFO to store the data to be sent. The data will queue up until the master requests them. You can call `i2c_slave_transmit()` to transfer data.

Simple example for writing data to FIFO:

```
uint8_t *data_wr = (uint8_t *) malloc(DATA_LENGTH);

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,    // 7-bit address
    .clk_source = I2C_CLK_SRC_DEFAULT,    // set the clock source
    .i2c_port = 0,                        // set I2C port number
    .send_buf_depth = 256,                // set tx buffer length
    .scl_io_num = 2,                      // SCL gpio number
    .sda_io_num = 1,                      // SDA gpio number
    .slave_addr = 0x58,                   // slave address
};

i2c_bus_handle_t i2c_bus_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &i2c_bus_handle));
for (int i = 0; i < DATA_LENGTH; i++) {
    data_wr[i] = i;
}

ESP_ERROR_CHECK(i2c_slave_transmit(i2c_bus_handle, data_wr, DATA_LENGTH, 10000));
```

**I2C Slave Read** Whenever the master writes data to the slave, the slave will automatically store data in the receive buffer. This allows the slave application to call the function `i2c_slave_receive()` as its own discretion. As `i2c_slave_receive()` is designed as a non-blocking interface. So the user needs to register callback `i2c_slave_register_event_callbacks()` to know when the receive has finished.

```
static IRAM_ATTR bool i2c_slave_rx_done_callback(i2c_slave_dev_handle_t channel,
↳const i2c_slave_rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    return high_task_wakeup == pdTRUE;
}

uint8_t *data_rd = (uint8_t *) malloc(DATA_LENGTH);
uint32_t size_rd = 0;

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));

s_receive_queue = xQueueCreate(1, sizeof(i2c_slave_rx_done_event_data_t));
i2c_slave_event_callbacks_t cbs = {
    .on_recv_done = i2c_slave_rx_done_callback,
};
ESP_ERROR_CHECK(i2c_slave_register_event_callbacks(slave_handle, &cbs, s_receive_
↳queue));
```

(continues on next page)

(continued from previous page)

```
i2c_slave_rx_done_event_data_t rx_data;
ESP_ERROR_CHECK(i2c_slave_receive(slave_handle, data_rd, DATA_LENGTH));
xQueueReceive(s_receive_queue, &rx_data, pdMS_TO_TICKS(10000));
// Receive done.
```

## Register Event Callbacks

**I2C master callbacks** When an I2C master bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some functions that need to be called when those events occurred, you can hook your functions to the ISR (Interrupt Service Routine) by calling `i2c_master_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback functions are required to return a boolean value, to tell the ISR whether a high priority task is woke up by it.

I2C master event callbacks are listed in the `i2c_master_event_callbacks_t`.

Although I2C is a synchronous communication protocol, we also support asynchronous behavior by registering above callback. In this way, I2C APIs will be non-blocking interface. But note that on the same bus, only one device can adopt asynchronous operation.

---

**Important:** I2C master asynchronous transaction is still an experimental feature. (The issue is when asynchronous transaction is very large, it will cause memory problem.)

---

- `i2c_master_event_callbacks_t::on_recv_done` sets a callback function for master "transaction-done" event. The function prototype is declared in `i2c_master_callback_t`.

**I2C slave callbacks** When an I2C slave bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `i2c_slave_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

I2C slave event callbacks are listed in the `i2c_slave_event_callbacks_t`.

- `i2c_slave_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `i2c_slave_received_callback_t`.

**Power Management** When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2C fifo before going into light sleep, thus potentially changing the I2C signals and leading to transmitting or receiving invalid data.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever user creates an I2C bus that has selected `I2C_CLK_SRC_APB` as the clock source, the driver will guarantee that the power management lock is acquired when I2C operations begin and release the lock automatically when I2C operations finish.

**IRAM Safe** By default, the I2C interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_I2C_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety** The factory function `i2c_new_master_bus()` and `i2c_new_slave_device()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other public I2C APIs are not thread safe. which means the user should avoid calling them from multiple tasks, if user strongly needs to call them in multiple tasks, please add extra lock.

### Kconfig Options

- `CONFIG_I2C_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_I2C_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

### API Reference

#### Header File

- `components/driver/i2c/include/driver/i2c_master.h`
- This header file can be included with:

```
#include "driver/i2c_master.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

#### Functions

`esp_err_t i2c_new_master_bus` (const `i2c_master_bus_config_t` \*bus\_config, `i2c_master_bus_handle_t` \*ret\_bus\_handle)

Allocate an I2C master bus.

##### Parameters

- `bus_config` -- [in] I2C master bus configuration.
- `ret_bus_handle` -- [out] I2C bus handle

##### Returns

- `ESP_OK`: I2C master bus initialized successfully.
- `ESP_ERR_INVALID_ARG`: I2C bus initialization failed because of invalid argument.
- `ESP_ERR_NO_MEM`: Create I2C bus failed because of out of memory.
- `ESP_ERR_NOT_FOUND`: No more free bus.

`esp_err_t i2c_master_bus_add_device` (`i2c_master_bus_handle_t` bus\_handle, const `i2c_device_config_t` \*dev\_config, `i2c_master_dev_handle_t` \*ret\_handle)

Add I2C master BUS device.

##### Parameters

- `bus_handle` -- [in] I2C bus handle.
- `dev_config` -- [in] device config.
- `ret_handle` -- [out] device handle.

**Returns**

- ESP\_OK: Create I2C master device successfully.
- ESP\_ERR\_INVALID\_ARG: I2C bus initialization failed because of invalid argument.
- ESP\_ERR\_NO\_MEM: Create I2C bus failed because of out of memory.

*esp\_err\_t* **i2c\_del\_master\_bus** (*i2c\_master\_bus\_handle\_t* bus\_handle)

Deinitialize the I2C master bus and delete the handle.

**Parameters** **bus\_handle** -- [in] I2C bus handle.

**Returns**

- ESP\_OK: Delete I2C bus success, otherwise, failed.
- Otherwise: Some module delete failed.

*esp\_err\_t* **i2c\_master\_bus\_rm\_device** (*i2c\_master\_dev\_handle\_t* handle)

I2C master bus delete device.

**Parameters** **handle** -- i2c device handle

**Returns**

- ESP\_OK: If device is successfully deleted.

*esp\_err\_t* **i2c\_master\_transmit** (*i2c\_master\_dev\_handle\_t* i2c\_dev, const uint8\_t \*write\_buffer, size\_t write\_size, int xfer\_timeout\_ms)

Perform a write transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

**Parameters**

- **i2c\_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **write\_buffer** -- [in] Data bytes to send on the I2C bus.
- **write\_size** -- [in] Size, in bytes, of the write buffer.
- **xfer\_timeout\_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- ESP\_OK: I2C master transmit success
- ESP\_ERR\_INVALID\_ARG: I2C master transmit parameter invalid.
- ESP\_ERR\_TIMEOUT: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

*esp\_err\_t* **i2c\_master\_transmit\_receive** (*i2c\_master\_dev\_handle\_t* i2c\_dev, const uint8\_t \*write\_buffer, size\_t write\_size, uint8\_t \*read\_buffer, size\_t read\_size, int xfer\_timeout\_ms)

Perform a write-read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

**Parameters**

- **i2c\_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.

- **write\_buffer** -- [in] Data bytes to send on the I2C bus.
- **write\_size** -- [in] Size, in bytes, of the write buffer.
- **read\_buffer** -- [out] Data bytes received from i2c bus.
- **read\_size** -- [in] Size, in bytes, of the read buffer.
- **xfer\_timeout\_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- ESP\_OK: I2C master transmit-receive success
- ESP\_ERR\_INVALID\_ARG: I2C master transmit parameter invalid.
- ESP\_ERR\_TIMEOUT: Operation timeout(larger than xfer\_timeout\_ms) because the bus is busy or hardware crash.

```
esp_err_t i2c_master_receive(i2c_master_dev_handle_t i2c_dev, uint8_t *read_buffer, size_t read_size, int xfer_timeout_ms)
```

Perform a read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

**Parameters**

- **i2c\_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **read\_buffer** -- [out] Data bytes received from i2c bus.
- **read\_size** -- [in] Size, in bytes, of the read buffer.
- **xfer\_timeout\_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- ESP\_OK: I2C master receive success
- ESP\_ERR\_INVALID\_ARG: I2C master receive parameter invalid.
- ESP\_ERR\_TIMEOUT: Operation timeout(larger than xfer\_timeout\_ms) because the bus is busy or hardware crash.

```
esp_err_t i2c_master_probe(i2c_master_bus_handle_t bus_handle, uint16_t address, int xfer_timeout_ms)
```

Probe I2C address, if address is correct and ACK is received, this function will return ESP\_OK.

**Attention** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get ESP\_ERR\_TIMEOUT while xfer\_timeout\_ms was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, `flags.enable_internal_pullup`` is also acceptable.

---

**Note:** The principle of this function is to sent device address with a write command. If the device on your I2C bus, there would be an ACK signal and function returns ESP\_OK. If the device is not on your I2C bus, there would be a NACK signal and function returns ESP\_ERR\_NOT\_FOUND. ESP\_ERR\_TIMEOUT is not an expected failure, which indicated that the i2c probe not works properly, usually caused by pull-up resistors not be connected properly. Suggestion check data on SDA/SCL line to see whether there is ACK/NACK signal is on line when i2c probe function fails.

---

---

**Note:** There are lots of I2C devices all over the world, we assume that not all I2C device support the behavior like `device_address+nack/ack`. So, if the on line data is strange and no ack/nack got respond. Please check the device datasheet.

---

**Parameters**

- **bus\_handle** -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- **address** -- **[in]** I2C device address that you want to probe.
- **xfer\_timeout\_ms** -- **[in]** Wait timeout, in ms. Note: -1 means wait forever (Not recommended in this function).

**Returns**

- **ESP\_OK**: I2C device probe successfully
- **ESP\_ERR\_NOT\_FOUND**: I2C probe failed, doesn't find the device with specific address you gave.
- **ESP\_ERR\_TIMEOUT**: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_register_event_callbacks` (`i2c_master_dev_handle_t` i2c\_dev, const `i2c_master_event_callbacks_t` \*cbs, void \*user\_data)

Register I2C transaction callbacks for a master device.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

---

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

---

**Note:** If the callback is used for helping asynchronous transaction. On the same bus, only one device can be used for performing asynchronous operation.

---

**Parameters**

- **i2c\_dev** -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- **ESP\_OK**: Set I2C transaction callbacks successfully
- **ESP\_ERR\_INVALID\_ARG**: Set I2C transaction callbacks failed because of invalid argument
- **ESP\_FAIL**: Set I2C transaction callbacks failed because of other error

`esp_err_t i2c_master_bus_reset` (`i2c_master_bus_handle_t` bus\_handle)

Reset the I2C master bus.

**Parameters** `bus_handle` -- I2C bus handle.

**Returns**

- **ESP\_OK**: Reset succeed.
- **ESP\_ERR\_INVALID\_ARG**: I2C master bus handle is not initialized.
- Otherwise: Reset failed.

`esp_err_t i2c_master_bus_wait_all_done` (`i2c_master_bus_handle_t` bus\_handle, int timeout\_ms)

Wait for all pending I2C transactions done.

**Parameters**

- **bus\_handle** -- **[in]** I2C bus handle
- **timeout\_ms** -- **[in]** Wait timeout, in ms. Specially, -1 means to wait forever.

**Returns**

- ESP\_OK: Flush transactions successfully
- ESP\_ERR\_INVALID\_ARG: Flush transactions failed because of invalid argument
- ESP\_ERR\_TIMEOUT: Flush transactions failed because of timeout
- ESP\_FAIL: Flush transactions failed because of other error

*esp\_err\_t* **i2c\_master\_get\_bus\_handle** (*i2c\_port\_num\_t* port\_num, *i2c\_master\_bus\_handle\_t* \*ret\_handle)

Retrieves the I2C master bus handle for a specified I2C port number.

This function retrieves the I2C master bus handle for the given I2C port number. Please make sure the handle has already been initialized, and this function would simply returns the existing handle. Note that the returned handle still can't be used concurrently

**Parameters**

- **port\_num** -- I2C port number for which the handle is to be retrieved.
- **ret\_handle** -- Pointer to a variable where the retrieved handle will be stored.

**Returns**

- ESP\_OK: Success. The handle is retrieved successfully.
- ESP\_ERR\_INVALID\_ARG: Invalid argument, such as invalid port number
- ESP\_ERR\_INVALID\_STATE: Invalid state, such as the I2C port is not initialized.

**Structures**

struct **i2c\_master\_bus\_config\_t**

I2C master bus specific configurations.

**Public Members**

*i2c\_port\_num\_t* **i2c\_port**

I2C port number, -1 for auto selecting

*gpio\_num\_t* **sda\_io\_num**

GPIO number of I2C SDA signal, pulled-up internally

*gpio\_num\_t* **scl\_io\_num**

GPIO number of I2C SCL signal, pulled-up internally

*i2c\_clock\_source\_t* **clk\_source**

Clock source of I2C master bus, channels in the same group must use the same clock source

*uint8\_t* **glitch\_ignore\_cnt**

If the glitch period on the line is less than this value, it can be filtered out, typically value is 7 (unit: I2C module clock cycle)

*int* **intr\_priority**

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

*size\_t* **trans\_queue\_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background, only valid in asynchronous transaction. (Typically max\_device\_num \* per\_transaction)

uint32\_t **enable\_internal\_pullup**

Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. Recommend proper external pull-up if possible

struct *i2c\_master\_bus\_config\_t*::[anonymous] **flags**

I2C master config flags

struct **i2c\_device\_config\_t**

I2C device configuration.

### Public Members

*i2c\_addr\_bit\_len\_t* **dev\_addr\_length**

Select the address length of the slave device.

uint16\_t **device\_address**

I2C device raw address. (The 7/10 bit address without read/write bit)

uint32\_t **scl\_speed\_hz**

I2C SCL line frequency.

uint32\_t **scl\_wait\_us**

Timeout value. (unit: us). Please note this value should not be so small that it can handle stretch/disturbance properly. If 0 is set, that means use the default reg value

uint32\_t **disable\_ack\_check**

Disable ACK check. If this is set false, that means ack check is enabled, the transaction will be stoped and API returns error when nack is detected.

struct *i2c\_device\_config\_t*::[anonymous] **flags**

I2C device config flags

struct **i2c\_master\_event\_callbacks\_t**

Group of I2C master callbacks, can be used to get status during transaction or doing other small things. But take care potential concurrency issues.

---

**Note:** The callbacks are all running under ISR context

---

---

**Note:** When CONFIG\_I2C\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

*i2c\_master\_callback\_t* **on\_trans\_done**

I2C master transaction finish callback

## Header File

- This header file can be included with:

```
#include "driver/i2c_slave.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

`esp_err_t i2c_new_slave_device` (const `i2c_slave_config_t` \*slave\_config, `i2c_slave_dev_handle_t` \*ret\_handle)

Initialize an I2C slave device.

### Parameters

- **slave\_config** -- [in] I2C slave device configurations
- **ret\_handle** -- [out] Return a generic I2C device handle

### Returns

- `ESP_OK`: I2C slave device initialized successfully
- `ESP_ERR_INVALID_ARG`: I2C device initialization failed because of invalid argument.
- `ESP_ERR_NO_MEM`: Create I2C device failed because of out of memory.

`esp_err_t i2c_del_slave_device` (`i2c_slave_dev_handle_t` i2c\_slave)

Deinitialize the I2C slave device.

**Parameters** **i2c\_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.

### Returns

- `ESP_OK`: Delete I2C device successfully.
- `ESP_ERR_INVALID_ARG`: I2C device initialization failed because of invalid argument.

`esp_err_t i2c_slave_receive` (`i2c_slave_dev_handle_t` i2c\_slave, `uint8_t` \*data, `size_t` buffer\_size)

Read bytes from I2C internal buffer. Start a job to receive I2C data.

---

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `i2c_slave_register_event_callbacks()`.

---

### Parameters

- **i2c\_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- [out] Buffer to store data from I2C fifo. Should be valid until `on_recv_done` is triggered.
- **buffer\_size** -- [in] Buffer size of data that provided by users.

### Returns

- `ESP_OK`: I2C slave receive success.
- `ESP_ERR_INVALID_ARG`: I2C slave receive parameter invalid.
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in fifo mode, but `I2C_SLAVE_NONFIFO` mode is configured

`esp_err_t i2c_slave_transmit` (`i2c_slave_dev_handle_t` i2c\_slave, const `uint8_t` \*data, `int` size, `int` xfer\_timeout\_ms)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

---

**Note:** If you connect this slave device to some master device, the data transaction direction is from slave device to master device.

---

#### Parameters

- **i2c\_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- **[in]** Buffer to write to slave fifo, can pickup by master. Can be freed after this function returns. Equal or larger than `size`.
- **size** -- **[in]** In bytes, of `data` buffer.
- **xfer\_timeout\_ms** -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

#### Returns

- **ESP\_OK**: I2C slave transmit success.
- **ESP\_ERR\_INVALID\_ARG**: I2C slave transmit parameter invalid.
- **ESP\_ERR\_TIMEOUT**: Operation timeout(larger than `xfer_timeout_ms`) because the device is busy or hardware crash.
- **ESP\_ERR\_NOT\_SUPPORTED**: This function should be work in fifo mode, but I2C\_SLAVE\_NONFIFO mode is configured

`esp_err_t i2c_slave_register_event_callbacks` (`i2c_slave_dev_handle_t` i2c\_slave, const `i2c_slave_event_callbacks_t` \*cbs, void \*user\_data)

Set I2C slave event callbacks for I2C slave channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

---

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- **i2c\_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- **ESP\_OK**: Set I2C transaction callbacks successfully
- **ESP\_ERR\_INVALID\_ARG**: Set I2C transaction callbacks failed because of invalid argument
- **ESP\_FAIL**: Set I2C transaction callbacks failed because of other error

### Structures

struct `i2c_slave_config_t`

I2C slave specific configurations.

### Public Members

***i2c\_port\_num\_t* i2c\_port**

I2C port number, -1 for auto selecting

**gpio\_num\_t sda\_io\_num**

SDA IO number used by I2C bus

**gpio\_num\_t scl\_io\_num**

SCL IO number used by I2C bus

***i2c\_clock\_source\_t* clk\_source**

Clock source of I2C bus.

**uint32\_t send\_buf\_depth**

Depth of internal transfer ringbuffer, increase this value can support more transfers pending in the background

**uint16\_t slave\_addr**

I2C slave address

***i2c\_addr\_bit\_len\_t* addr\_bit\_len**

I2C slave address in bit length

**int intr\_priority**

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

**struct *i2c\_slave\_config\_t*::[anonymous] flags**

I2C slave config flags

**struct *i2c\_slave\_event\_callbacks\_t***

Group of I2C slave callbacks (e.g. get i2c slave stretch cause). But take care of potential concurrency issues.

---

**Note:** The callbacks are all running under ISR context

---

---

**Note:** When CONFIG\_I2C\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

***i2c\_slave\_received\_callback\_t* on\_recv\_done**

I2C slave receive done callback

- This header file can be included with:

```
#include "driver/i2c_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Structures

struct **i2c\_master\_event\_data\_t**

Data type used in I2C event callback.

## Public Members

*i2c\_master\_event\_t* **event**

The I2C hardware event that I2C callback is called.

struct **i2c\_slave\_rx\_done\_event\_data\_t**

Event structure used in I2C slave.

## Public Members

uint8\_t \***buffer**

Pointer for buffer received in callback.

## Type Definitions

typedef int **i2c\_port\_num\_t**

I2C port number.

typedef struct i2c\_master\_bus\_t \***i2c\_master\_bus\_handle\_t**

Type of I2C master bus handle.

typedef struct i2c\_master\_dev\_t \***i2c\_master\_dev\_handle\_t**

Type of I2C master bus device handle.

typedef struct i2c\_slave\_dev\_t \***i2c\_slave\_dev\_handle\_t**

Type of I2C slave device handle.

typedef bool (\***i2c\_master\_callback\_t**)(*i2c\_master\_dev\_handle\_t* i2c\_dev, const *i2c\_master\_event\_data\_t* \**evt\_data*, void \**arg*)

An callback for I2C transaction.

**Param i2c\_dev [in]** Handle for I2C device.

**Param evt\_data [out]** I2C capture event data, fed by driver

**Param arg [in]** User data, set in `i2c_master_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*i2c_slave_received_callback_t)(i2c_slave_dev_handle_t i2c_slave, const  
i2c_slave_rx_done_event_data_t *evt_data, void *arg)
```

Callback signature for I2C slave.

**Param i2c\_slave [in]** Handle for I2C slave.

**Param evt\_data [out]** I2C capture event data, fed by driver

**Param arg [in]** User data, set in `i2c_slave_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

## Enumerations

```
enum i2c_master_status_t
```

Enumeration for I2C fsm status.

*Values:*

enumerator **I2C\_STATUS\_READ**

read status for current master command

enumerator **I2C\_STATUS\_WRITE**

write status for current master command

enumerator **I2C\_STATUS\_START**

Start status for current master command

enumerator **I2C\_STATUS\_STOP**

stop status for current master command

enumerator **I2C\_STATUS\_IDLE**

idle status for current master command

enumerator **I2C\_STATUS\_ACK\_ERROR**

ack error status for current master command

enumerator **I2C\_STATUS\_DONE**

I2C command done

enumerator **I2C\_STATUS\_TIMEOUT**

I2C bus status error, and operation timeout

```
enum i2c_master_event_t
```

Enumeration for I2C event.

*Values:*

enumerator **I2C\_EVENT\_ALIVE**

i2c bus in alive status.

enumerator **I2C\_EVENT\_DONE**

i2c bus transaction done

enumerator **I2C\_EVENT\_NACK**

i2c bus nack

enumerator **I2C\_EVENT\_TIMEOUT**

i2c bus timeout

### Header File

- [components/hal/include/hal/i2c\\_types.h](#)
- This header file can be included with:

```
#include "hal/i2c_types.h"
```

### Structures

struct **i2c\_hal\_clk\_config\_t**

Data structure for calculating I2C bus timing.

### Public Members

uint16\_t **clkm\_div**

I2C core clock divider

uint16\_t **scl\_low**

I2C scl low period

uint16\_t **scl\_high**

I2C scl high period

uint16\_t **scl\_wait\_high**

I2C scl wait\_high period

uint16\_t **sda\_hold**

I2C scl low period

uint16\_t **sda\_sample**

I2C sda sample time

uint16\_t **setup**

I2C start and stop condition setup period

uint16\_t **hold**

I2C start and stop condition hold period

uint16\_t **tout**

I2C bus timeout period

## Type Definitions

typedef *soc\_periph\_i2c\_clk\_src\_t* **i2c\_clock\_source\_t**

I2C group clock source.

## Enumerations

enum **i2c\_port\_t**

I2C port number, can be I2C\_NUM\_0 ~ (I2C\_NUM\_MAX-1).

*Values:*

enumerator **I2C\_NUM\_0**

I2C port 0

enumerator **I2C\_NUM\_1**

I2C port 1

enumerator **I2C\_NUM\_MAX**

I2C port max

enum **i2c\_addr\_bit\_len\_t**

Enumeration for I2C device address bit length.

*Values:*

enumerator **I2C\_ADDR\_BIT\_LEN\_7**

i2c address bit length 7

enumerator **I2C\_ADDR\_BIT\_LEN\_10**

i2c address bit length 10

enum **i2c\_mode\_t**

*Values:*

enumerator **I2C\_MODE\_SLAVE**

I2C slave mode

enumerator **I2C\_MODE\_MASTER**

I2C master mode

enumerator **I2C\_MODE\_MAX**

enum **i2c\_rw\_t**

*Values:*

enumerator **I2C\_MASTER\_WRITE**

I2C write data

enumerator **I2C\_MASTER\_READ**

I2C read data

enum **i2c\_trans\_mode\_t**

*Values:*

enumerator **I2C\_DATA\_MODE\_MSB\_FIRST**

I2C data msb first

enumerator **I2C\_DATA\_MODE\_LSB\_FIRST**

I2C data lsb first

enumerator **I2C\_DATA\_MODE\_MAX**

enum **i2c\_addr\_mode\_t**

*Values:*

enumerator **I2C\_ADDR\_BIT\_7**

I2C 7bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_10**

I2C 10bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_MAX**

enum **i2c\_ack\_type\_t**

*Values:*

enumerator **I2C\_MASTER\_ACK**

I2C ack for each byte read

enumerator **I2C\_MASTER\_NACK**

I2C nack for each byte read

enumerator **I2C\_MASTER\_LAST\_NACK**

I2C nack for the last byte

enumerator **I2C\_MASTER\_ACK\_MAX**

enum **i2c\_slave\_stretch\_cause\_t**

Enum for I2C slave stretch causes.

*Values:*

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_ADDRESS\_MATCH**

Stretching SCL low when the slave is read by the master and the address just matched

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_TX\_EMPTY**

Stretching SCL low when TX FIFO is empty in slave mode

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_RX\_FULL**

Stretching SCL low when RX FIFO is full in slave mode

enumerator `I2C_SLAVE_STRETCH_CAUSE_SENDING_ACK`

Stretching SCL low when slave sending ACK

## 2.6.9 Inter-IC Sound (I2S)

### Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK:** Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK:** Bit clock line. The bit clock for data line.
- **WS:** Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT:** Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

An I2S bus that communicates in PDM mode consists of the following lines:

- **CLK:** PDM clock line.
- **DIN/DOUT:** Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller supports single RX or TX simplex communication. As RX and TX channels share a clock, they can only be combined with the same configuration to establish a full-duplex communication.

### I2S File Structure

**Public headers that need to be included in the I2S application are as follows:**

- `i2s.h`: The header file that provides legacy I2S APIs (for apps using legacy driver).
- `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

---

**Note:** The legacy driver cannot coexist with the new driver. Include `i2s.h` to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

---

**Public headers that have been included in the headers above are as follows:**

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

Fig. 14: I2S File Structure

## I2S Clock

### Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, which is more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate. However, if APLL has been occupied by EMAC or other channels, the APLL frequency cannot be changed, and the driver will try to work under this APLL frequency. If this frequency cannot meet the requirements of I2S, the clock configuration will fail.

### Clock Terminology

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note:** Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to the sample rate. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

## I2S Communication Mode

### Overview of All Modes

Target	Standard	PDM TX	PDM RX	TDM	ADC/DAC	LCD/Camera
ESP32	I2S 0/1	I2S 0	I2S 0	none	I2S 0	I2S 0
ESP32-S2	I2S 0	none	none	none	none	I2S 0
ESP32-C3	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-C6	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	none	none
ESP32-H2	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-P4	I2S 0~2	I2S 0	I2S 0	I2S 0~2	none	none

**Standard Mode** In standard mode, there are always two sound channels, i.e., the left and right channels, which are called "slots". These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the followings:

- **Philips Format:** Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

- **MSB Format:** Basically the same as Philips format, but without data shift.

- **PCM Short Format:** Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

**PDM Mode (TX)** PDM (Pulse-density Modulation) mode for the TX channel can convert PCM data into PDM format which always has left and right slots. PDM TX is only supported on I2S0 and it only supports 16-bit width sample data. It needs at least a CLK pin for clock signal and a DOUT pin for data signal (i.e., the WS and SD signal in the following figure; the BCK signal is an internal bit sampling clock, which is not needed between PDM devices). This mode allows users to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by  $up\_sample\_rate = i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fp / i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fs$ . There are two up-sampling modes in PDM TX:

- **Fixed Clock Frequency:** In this mode, the up-sampling rate changes according to the sample rate. Setting  $fp = 960$  and  $fs = sample\_rate / 100$ , then the clock frequency (Fpdm) on CLK pin will be fixed to  $128 * 48\text{ KHz} = 6.144\text{ MHz}$ . Note that this frequency is not equal to the sample rate (Fpcm).
- **Fixed Up-sampling Rate:** In this mode, the up-sampling rate is fixed to 2. Setting  $fp = 960$  and  $fs = 480$ , then the clock frequency (Fpdm) on CLK pin will be  $128 * sample\_rate$ .

**PDM Mode (RX)** PDM (Pulse-density Modulation) mode for RX channel can receive PDM-format data and convert the data into PCM format. PDM RX is only supported on I2S0, and it only supports 16-bit width sample data. PDM RX needs at least a CLK pin for clock signal and a DIN pin for data signal. This mode allows users to configure the down-sampling parameter `i2s_pdm_rx_clk_config_t::dn_sample_mode`. There are two down-sampling modes in PDM RX:

- `i2s_pdm_dsr_t::I2S_PDM_DSR_8S`: In this mode, the clock frequency (Fpdm) on the WS pin is  $sample\_rate (Fpcm) * 64$ .
- `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`: In this mode, the clock frequency (Fpdm) on the WS pin is  $sample\_rate (Fpcm) * 128$ .

**LCD/Camera Mode** LCD/Camera mode is only supported on I2S0 over a parallel bus. For LCD mode, I2S0 should work at master TX mode. For camera mode, I2S0 should work at slave RX mode. These two modes are not implemented by the I2S driver. Please refer to *LCD* for details about the LCD implementation. For more information, see [ESP32 Technical Reference Manual > I2S Controller \(I2S\) > LCD Mode \[PDF\]](#).

**ADC/DAC Mode** ADC and DAC modes only exist on ESP32 and are only supported on I2S0. Actually, they are two sub-modes of LCD/Camera mode. I2S0 can be routed directly to the internal analog-to-digital converter (ADC) and digital-to-analog converter (DAC). In other words, ADC and DAC peripherals can read or write continuously via I2S0 DMA. As they are not actual communication modes, the I2S driver does not implement them.

## Functional Overview

The I2S driver offers the following services:

**Resource Management** There are three levels of resources in the I2S driver:

- `platform` level: Resources of all I2S controllers in the current target.
- `controller` level: Resources in one I2S controller.
- `channel` level: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels' resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver guarantees that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

**Finite State Machine** There are three states for an I2S channel, namely, `registered`, `ready`, and `running`. Their relationship is shown in the following diagram:

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the *I2S Communication Mode* section.

**Data Transport** The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keeps waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

**Configuration** Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding `reconfig`

Fig. 15: I2S Finite State Machine

functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that:

1. Keeps the interrupt being serviced even when the cache is disabled.
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

### Kconfig Options

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.

### Application Example

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to *Standard Mode* for information about STD API. And for more details, please refer to `driver/i2s/include/driver/i2s_std.h`.

**STD TX Mode** Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit mode	slot mask	WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high
16 bit	mono	left	0x0002	0x0000	0x0001	0x0000	0x0004	0x0000	0x0003	0x0000
		right	0x0000	0x0002	0x0000	0x0001	0x0000	0x0004	0x0000	0x0003
		both	0x0002	0x0002	0x0001	0x0001	0x0004	0x0004	0x0003	0x0003
	stereo	left	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007
		right	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		both	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** It is similar when the data is 32-bit width, but take care when using 8-bit and 24-bit data width. For 8-bit width, the written buffer should still use `uint16_t` (i.e., align with 2 bytes), and only the high 8 bits are valid while the low 8 bits are dropped. For 24-bit width, the buffer is supposed to use `uint32_t` (i.e., align with 4 bytes), and only the high 24 bits are valid while the low 8 bits are dropped.

Besides, for 8-bit and 16-bit mono modes, the real data on the line is swapped. To get the correct data sequence, the writing buffer needs to swap the data every two bytes.

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro.
 * This helper macro is defined in `i2s_common.h` and shared by all the I2S_
 * communication modes.
 * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can_
↳be generated by the macros
 * These two helper macros are defined in `i2s_std.h` which can only be used in_
↳STD mode.
 * They can help to specify the slot and clock configurations for initialization_
↳or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {

        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
↳wait);
```

(continues on next page)

(continued from previous page)

```

/* If the configurations of slot or clock need to be updated,
 * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_
↳resources */
i2s_del_channel(tx_handle);

```

**STD RX Mode** Taking 16-bit data width for example, when the data on the line are:

WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit	slot mode	slot mask	data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7
16 bit		mono	left	0x0001	0x0000	0x0005	0x0003	0x0009	0x0007	0x000d	0x000b
			right	0x0002	0x0000	0x0006	0x0004	0x000a	0x0008	0x000e	0x000c
		stereo	any	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** The receive case is a little bit complicated on ESP32. Firstly, when the data width is 8-bit or 24-bit, the received data will still align with two bytes or four bytes, which means that the valid data are put in the high 8 bits in every two bytes and high 24 bits in every four bytes. For example, the received data will be 0x5A00 when the data on the line is 0x5A in 8-bit width, and 0x0000 5A00 if the data on the line is 0x00 005A. Secondly, for the 8-bit or 16-bit mono case, the data in buffer is swapped every two data, so it may be necessary to manually swap the data back to the correct order.

```

/* If the handle is not needed any more, delete it to release the channel_
↳resources */
i2s_del_channel(rx_handle);

```

**PDM TX Usage** For PDM mode in TX channel, the slot configuration helper macro is:

- `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

- `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

Please refer to [PDM Mode](#) for information about PDM TX API. And for more details, please refer to [driver/i2s/include/driver/i2s\\_pdm.h](#).

The PDM data width is fixed to 16-bit. When the data in an `int16_t` writing buffer is:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_pdm_tx_slot_config_t::slot_mode` and `i2s_pdm_tx_slot_config_t::slot_mask` (The PDM format on the line is transferred to PCM format for better comprehension).

slot mode	slot mask	left	right	left	right	left	right	left	right
mono	left	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
	right	0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
	both	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
stereo	left	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007
	right	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
	both	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

```

#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);

...

```

**PDM RX Usage** For PDM mode in RX channel, the slot configuration helper macro is:

- [I2S\\_PDM\\_RX\\_SLOT\\_DEFAULT\\_CONFIG](#)

The clock configuration helper macro is:

- [I2S\\_PDM\\_RX\\_CLK\\_DEFAULT\\_CONFIG](#)

Please refer to [PDM Mode](#) for information about PDM RX API. And for more details, please refer to [driver/i2s/include/driver/i2s\\_pdm.h](#).

The PDM data width is fixed to 16-bit. When the data on the line (The PDM format on the line is transferred to PCM format for easier comprehension) is:

left	right	left	right	left	right	left	right	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in a `int16_t` buffer with different `i2s_pdm_rx_slot_config_t::slot_mode` and `i2s_pdm_rx_slot_config_t::slot_mask`.

slot mode	slot mask	data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7
mono	left	0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
	right	0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
stereo	both	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

```

#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* Allocate an I2S RX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

```

(continues on next page)

(continued from previous page)

```

/* Init the channel into PDM RX mode */
i2s_pdm_rx_config_t pdm_rx_cfg = {
    .clk_cfg = I2S_PDM_RX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_RX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↳MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_rx_mode(rx_handle, &pdm_rx_cfg);

...

```

**Full-duplex** Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels share the BCLK and WS signals. Currently, STD and TDM communication modes supports full-duplex mode in the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate for TX and RX channel at the same time, then they will work in full-
↳duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since TX and RX channel have to_
↳be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);

```

(continues on next page)

(continued from previous page)

```

i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...

```

**Simplex Mode** To allocate a channel handle in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32 are not independent, so the TX and RX channel cannot coexist on the same I2S port in simplex mode.

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* RX channel will be registered on another I2S, if no other available I2S unit_
↳found
 * it will return ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};

```

(continues on next page)

(continued from previous page)

```

    },
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

### Application Notes

**How to Prevent Data Lost** For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t_
↪handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

```

interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092

```

2. Determine `dma_desc_num`. `dma_desc_num` is decided by the maximum time of `i2s_channel_read` polling cycle. All the received data is supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

```

dma_desc_num > polling_cycle / interrupt_interval

```

3. Determine the receiving buffer size. The receiving buffer offered by users in `i2s_channel_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

```

recv_buffer_size > dma_desc_num * dma_buffer_size

```

For example, if there is an I2S application, and the known values are:

```

sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms

```

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

```

dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↪549 ms

```

(continues on next page)

(continued from previous page)

```

dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↔= 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes

```

## API Reference

### Standard Mode

#### Header File

- `components/driver/i2s/include/driver/i2s_std.h`
- This header file can be included with:

```
#include "driver/i2s_std.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

#### Functions

`esp_err_t i2s_channel_init_std_mode` (`i2s_chan_handle_t` handle, const `i2s_std_config_t` \*std\_cfg)

Initialize I2S channel to standard mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

#### Parameters

- **handle** -- [in] I2S channel handler
- **std\_cfg** -- [in] Configurations for standard mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

#### Returns

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

`esp_err_t i2s_channel_reconfig_std_clock` (`i2s_chan_handle_t` handle, const `i2s_std_clk_config_t` \*clk\_cfg)

Reconfigure the I2S clock for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **clk\_cfg** -- **[in]** Standard mode clock configuration, can be generated by `I2S_STD_CLK_DEFAULT_CONFIG`

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* `i2s_channel_reconfig_std_slot` (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for standard mode.

---

**Note:** Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **slot\_cfg** -- **[in]** Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* `i2s_channel_reconfig_std_gpio` (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S GPIO for standard mode.

---

**Note:** Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **gpio\_cfg** -- **[in]** Standard mode GPIO configuration, specified by user

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not standard mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

## Structures

struct **i2s\_std\_slot\_config\_t**

I2S slot configuration for standard mode.

### Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample)

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot)

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

*i2s\_std\_slot\_mask\_t* **slot\_mask**

Select the left, right or both slot

uint32\_t **ws\_width**

WS signal width (i.e. the number of BCLK ticks that WS signal is high)

bool **ws\_pol**

WS signal polarity, set true to enable high lever first

bool **bit\_shift**

Set to enable bit shift in Philips mode

bool **msb\_right**

Set to place right channel data at the MSB in the FIFO

struct **i2s\_std\_clk\_config\_t**

I2S clock configuration for standard mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source, see `soc_periph_i2s_clk_src_t` for the supported clock sources. selected I2S\_CLK\_SRC\_EXTERNAL (if supports) to enable the external source clock input via MCLK pin,

***i2s\_mclk\_multiple\_t* mclk\_multiple**

The multiple of MCLK to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of 3 (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s\_std\_gpio\_config\_t**

I2S standard mode GPIO pins configuration.

**Public Members**

gpio\_num\_t **mclk**

MCK pin, output by default, input if the clock source is selected to I2S\_CLK\_SRC\_EXTERNAL

gpio\_num\_t **bclk**

BCK pin, input in slave role, output in master role

gpio\_num\_t **ws**

WS pin, input in slave role, output in master role

gpio\_num\_t **dout**

DATA pin, output

gpio\_num\_t **din**

DATA pin, input

uint32\_t **mclk\_inv**

Set 1 to invert the MCLK input/output

uint32\_t **bclk\_inv**

Set 1 to invert the BCLK input/output

uint32\_t **ws\_inv**

Set 1 to invert the WS input/output

struct *i2s\_std\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_std\_config\_t**

I2S standard mode major configuration that including clock/slot/GPIO configuration.

**Public Members**

*i2s\_std\_clk\_config\_t* **clk\_cfg**

Standard mode clock configuration, can be generated by macro I2S\_STD\_CLK\_DEFAULT\_CONFIG

*i2s\_std\_slot\_config\_t* **slot\_cfg**

Standard mode slot configuration, can be generated by macros I2S\_STD\_[mode]\_SLOT\_DEFAULT\_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

### *i2s\_std\_gpio\_config\_1* **gpio\_cfg**

Standard mode GPIO configuration, specified by user

## Macros

**I2S\_STD\_PHILIPS\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PCM(short) format in 2 slots.

---

**Note:** PCM(long) is same as Philips in 2 slots

---

### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

MSB format in 2 slots.

### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default standard clock configuration.

---

**Note:** Please set the `mclk_multiple` to `I2S_MCLK_MULTIPLE_384` while using 24 bits data width. Otherwise the sample rate might be imprecise since the BCLK division is not an integer.

---

### Parameters

- **rate** -- sample rate

## PDM Mode

### Header File

- [components/driver/i2s/include/driver/i2s\\_pdm.h](#)
- This header file can be included with:

```
#include "driver/i2s_pdm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

PRIV\_REQUIRES driver

## Functions

*esp\_err\_t* **i2s\_channel\_init\_pdm\_rx\_mode** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_config\_t* \*pdm\_rx\_cfg)

Initialize I2S channel to PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

### Parameters

- **handle** -- [in] I2S RX channel handler
- **pdm\_rx\_cfg** -- [in] Configurations for PDM RX mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_PDM_RX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_rx\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

---

### Parameters

- **handle** -- [in] I2S RX channel handler
- **clk\_cfg** -- [in] PDM RX mode clock configuration, can be generated by `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_rx\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- [in] I2S RX channel handler
- **slot\_cfg** -- [in] PDM RX mode slot configuration, can be generated by `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* `i2s_channel_reconfig_pdm_rx_gpio` (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S GPIO for PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- [in] I2S RX channel handler
- **gpio\_cfg** -- [in] PDM RX mode GPIO configuration, specified by user

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* `i2s_channel_init_pdm_tx_mode` (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_config\_t* \*pdm\_tx\_cfg)

Initialize I2S channel to PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is `REGISTERED`, (i.e., channel has been allocated, but not initialized) and the state will be updated to `READY` if initialization success, otherwise the state will return to `REGISTERED`.

---

**Parameters**

- **handle** -- [in] I2S TX channel handler
- **pdm\_tx\_cfg** -- [in] Configurations for PDM TX mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**Returns**

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_tx\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S TX channel handler
- **clk\_cfg** -- [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

#### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_tx\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S TX channel handler
- **slot\_cfg** -- [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

#### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_tx\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S GPIO for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S TX channel handler
- **gpio\_cfg** -- [in] PDM TX mode GPIO configuration, specified by user

#### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

### Structures

struct **i2s\_pdm\_rx\_slot\_config\_t**

I2S slot configuration for PDM RX mode.

#### Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot) , only support 16 bits for PDM mode

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO`

*i2s\_pdm\_slot\_mask\_t* **slot\_mask**

Choose the slots to activate

struct **i2s\_pdm\_rx\_clk\_config\_t**

I2S clock configuration for PDM RX mode.

#### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of MCLK to the sample rate

*i2s\_pdm\_dsr\_t* **dn\_sample\_mode**

Down-sampling rate mode

uint32\_t **bclk\_div**

The division from MCLK to BCLK. The typical and minimum value is I2S\_PDM\_RX\_BCLK\_DIV\_MIN. It will be set to I2S\_PDM\_RX\_BCLK\_DIV\_MIN by default if it is smaller than I2S\_PDM\_RX\_BCLK\_DIV\_MIN

struct **i2s\_pdm\_rx\_gpio\_config\_t**

I2S PDM TX mode GPIO pins configuration.

### Public Members

gpio\_num\_t **clk**

PDM clk pin, output

gpio\_num\_t **din**

DATA pin 0, input

gpio\_num\_t **dins**[(1U)]

DATA pins, input, only take effect when corresponding I2S\_PDM\_RX\_LINE<sub>x</sub>\_SLOT<sub>xxx</sub> is enabled in *i2s\_pdm\_rx\_slot\_config\_t::slot\_mask*

uint32\_t **clk\_inv**

Set 1 to invert the clk output

struct *i2s\_pdm\_rx\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_pdm\_rx\_config\_t**

I2S PDM RX mode major configuration that including clock/slot/GPIO configuration.

### Public Members

*i2s\_pdm\_rx\_clk\_config\_t* **clk\_cfg**

PDM RX clock configurations, can be generated by macro I2S\_PDM\_RX\_CLK\_DEFAULT\_CONFIG

*i2s\_pdm\_rx\_slot\_config\_t* **slot\_cfg**

PDM RX slot configurations, can be generated by macro I2S\_PDM\_RX\_SLOT\_DEFAULT\_CONFIG

*i2s\_pdm\_rx\_gpio\_config\_t* **gpio\_cfg**

PDM RX slot configurations, specified by user

struct **i2s\_pdm\_tx\_slot\_config\_t**

I2S slot configuration for PDM TX mode.

### Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

***i2s\_slot\_bit\_width\_t* slot\_bit\_width**

I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

***i2s\_slot\_mode\_t* slot\_mode**

Set mono or stereo mode with I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

***i2s\_pdm\_slot\_mask\_t* slot\_mask**

Slot mask to choose left or right slot

**uint32\_t sd\_prescale**

Sigma-delta filter prescale

***i2s\_pdm\_sig\_scale\_t* sd\_scale**

Sigma-delta filter scaling value

***i2s\_pdm\_sig\_scale\_t* hp\_scale**

High pass filter scaling value

***i2s\_pdm\_sig\_scale\_t* lp\_scale**

Low pass filter scaling value

***i2s\_pdm\_sig\_scale\_t* sinc\_scale**

Sinc filter scaling value

**struct *i2s\_pdm\_tx\_clk\_config\_t***

I2S clock configuration for PDM TX mode.

**Public Members****uint32\_t sample\_rate\_hz**

I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear

***i2s\_clock\_src\_t* clk\_src**

Choose clock source

***i2s\_mclk\_multiple\_t* mclk\_multiple**

The multiple of MCLK to the sample rate

**uint32\_t up\_sample\_fp**

Up-sampling param fp

**uint32\_t up\_sample\_fs**

Up-sampling param fs, not allowed to be greater than 480

uint32\_t **blk\_div**

The division from MCLK to BCLK. The minimum value is I2S\_PDM\_TX\_BCLK\_DIV\_MIN. It will be set to I2S\_PDM\_TX\_BCLK\_DIV\_MIN by default if it is smaller than I2S\_PDM\_TX\_BCLK\_DIV\_MIN

struct **i2s\_pdm\_tx\_gpio\_config\_t**

I2S PDM TX mode GPIO pins configuration.

### Public Members

gpio\_num\_t **clk**

PDM clk pin, output

gpio\_num\_t **dout**

DATA pin, output

uint32\_t **clk\_inv**

Set 1 to invert the clk output

struct *i2s\_pdm\_tx\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_pdm\_tx\_config\_t**

I2S PDM TX mode major configuration that including clock/slot/GPIO configuration.

### Public Members

*i2s\_pdm\_tx\_clk\_config\_t* **clk\_cfg**

PDM TX clock configurations, can be generated by macro I2S\_PDM\_TX\_CLK\_DEFAULT\_CONFIG

*i2s\_pdm\_tx\_slot\_config\_t* **slot\_cfg**

PDM TX slot configurations, can be generated by macro I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG

*i2s\_pdm\_tx\_gpio\_config\_t* **gpio\_cfg**

PDM TX GPIO configurations, specified by user

### Macros

**I2S\_PDM\_RX\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PDM format in 2 slots(RX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM TX/RX mode
- Fixed to 2 slots
- Data bit width only support 16 bits

### Parameters

- **bits\_per\_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_PDM\_RX\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default PDM RX clock configuration.

**Parameters**

- **rate** -- sample rate

**I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PDM style in 2 slots(TX) for codec line mode.

**Parameters**

- **bits\_per\_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_PDM\_TX\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default PDM TX clock configuration for codec line mode.

---

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample\_rate\_hz / 100, in this case, Fpdm = 128\*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128\*Fpcm = 128\*sample\_rate\_hz If the PDM receiver do not care the PDM serial clock, it's recommended set Fpdm = 128\*48000. Otherwise, the second configuration should be adopted.

---

**Parameters**

- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

**I2S\_PDM\_TX\_CLK\_DAC\_DEFAULT\_CONFIG** (rate)

I2S default PDM TX clock configuration for DAC line mode.

---

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample\_rate\_hz / 100, in this case, Fpdm = 128\*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128\*Fpcm = 128\*sample\_rate\_hz If the PDM receiver do not care the PDM serial clock, it's recommended set Fpdm = 128\*48000. Otherwise, the second configuration should be adopted.

---

---

**Note:** The noise might be different with different configurations, this macro provides a set of configurations that have relatively high SNR (Signal Noise Ratio), you can also adjust them to fit your case.

---

**Parameters**

- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

## I2S Driver

### Header File

- `components/driver/i2s/include/driver/i2s_common.h`
- This header file can be included with:

```
#include "driver/i2s_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

PRIV\_REQUIRES driver

### Functions

*esp\_err\_t* **i2s\_new\_channel** (const *i2s\_chan\_config\_t* \*chan\_cfg, *i2s\_chan\_handle\_t* \*ret\_tx\_handle, *i2s\_chan\_handle\_t* \*ret\_rx\_handle)

Allocate new I2S channel(s)

---

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

---

---

**Note:** When the port id in channel configuration is I2S\_NUM\_AUTO, driver will allocate I2S port automatically on one of the I2S controller, otherwise driver will try to allocate the new channel on the selected port.

---

---

**Note:** If both tx\_handle and rx\_handle are not NULL, it means this I2S controller will work at full-duplex mode, the RX and TX channels will be allocated on a same I2S port in this case. Note that some configurations of TX/RX channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee TX/RX channels write/read synchronously, they can only share the clock signals for now.

---

---

**Note:** If tx\_handle OR rx\_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both RX and TX channel) will be occupied, even if only one of RX or TX channel is registered. For the other targets, another channel on this controller will still available.

---

#### Parameters

- **chan\_cfg** -- [in] I2S controller channel configurations
- **ret\_tx\_handle** -- [out] I2S channel handler used for managing the sending channel(optional)
- **ret\_rx\_handle** -- [out] I2S channel handler used for managing the receiving channel(optional)

#### Returns

- ESP\_OK Allocate new channel(s) success
- ESP\_ERR\_NOT\_SUPPORTED The communication mode is not supported on the current chip
- ESP\_ERR\_INVALID\_ARG NULL pointer or illegal parameter in *i2s\_chan\_config\_t*
- ESP\_ERR\_NOT\_FOUND No available I2S channel found

*esp\_err\_t* **i2s\_del\_channel** (*i2s\_chan\_handle\_t* handle)

Delete the I2S channel.

---

**Note:** Only allowed to be called when the I2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

---

---

**Note:** Resource will be free automatically if all channels in one port are deleted

---

#### Parameters **handle** -- [in] I2S channel handler

- ESP\_OK Delete successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer

*esp\_err\_t* **i2s\_channel\_get\_info** (*i2s\_chan\_handle\_t* handle, *i2s\_chan\_info\_t* \*chan\_info)

Get I2S channel information.

**Parameters**

- **handle** -- [in] I2S channel handler
- **chan\_info** -- [out] I2S channel basic information

**Returns**

- ESP\_OK Get I2S channel information success
- ESP\_ERR\_NOT\_FOUND The input handle doesn't match any registered I2S channels, it may not an I2S channel handle or not available any more
- ESP\_ERR\_INVALID\_ARG The input handle or chan\_info pointer is NULL

*esp\_err\_t* **i2s\_channel\_enable** (*i2s\_chan\_handle\_t* handle)

Enable the I2S channel.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

---

---

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting BCLK and WS signal. For MCLK signal, it will start to output when initialization is finished

---

**Parameters** **handle** -- [in] I2S channel handler

- ESP\_OK Start successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not initialized or already started

*esp\_err\_t* **i2s\_channel\_disable** (*i2s\_chan\_handle\_t* handle)

Disable the I2S channel.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

---

---

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop BCLK and WS signal but not MCLK signal

---

**Parameters** **handle** -- [in] I2S channel handler

**Returns**

- ESP\_OK Stop successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* **i2s\_channel\_preload\_data** (*i2s\_chan\_handle\_t* tx\_handle, const void \*src, size\_t size, size\_t \*bytes\_loaded)

Preload the data into TX DMA buffer.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

---

---

**Note:** As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted

---

immediately after the channel is enabled.

---

**Note:** This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

---

#### Parameters

- **tx\_handle** -- [in] I2S TX channel handler
- **src** -- [in] The pointer of the source buffer to be loaded
- **size** -- [in] The source buffer size
- **bytes\_loaded** -- [out] The bytes that successfully been loaded into the TX DMA buffer

#### Returns

- ESP\_OK Load data successful
- ESP\_ERR\_INVALID\_ARG NULL pointer or not TX direction
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* **i2s\_channel\_write** (*i2s\_chan\_handle\_t* handle, const void \*src, size\_t size, size\_t \*bytes\_written, uint32\_t timeout\_ms)

I2S write data.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., TX channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

#### Parameters

- **handle** -- [in] I2S channel handler
- **src** -- [in] The pointer of sent data buffer
- **size** -- [in] Max data buffer length
- **bytes\_written** -- [out] Byte number that actually be sent, can be NULL if not needed
- **timeout\_ms** -- [in] Max block time

#### Returns

- ESP\_OK Write successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not TX handle
- ESP\_ERR\_TIMEOUT Writing timeout, no writing event received from ISR within `ticks_to_wait`
- ESP\_ERR\_INVALID\_STATE I2S is not ready to write

*esp\_err\_t* **i2s\_channel\_read** (*i2s\_chan\_handle\_t* handle, void \*dest, size\_t size, size\_t \*bytes\_read, uint32\_t timeout\_ms)

I2S read data.

---

**Note:** Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

#### Parameters

- **handle** -- [in] I2S channel handler
- **dest** -- [in] The pointer of receiving data buffer
- **size** -- [in] Max data buffer length
- **bytes\_read** -- [out] Byte number that actually be read, can be NULL if not needed
- **timeout\_ms** -- [in] Max block time

**Returns**

- ESP\_OK Read successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not RX handle
- ESP\_ERR\_TIMEOUT Reading timeout, no reading event received from ISR within ticks\_to\_wait
- ESP\_ERR\_INVALID\_STATE I2S is not ready to read

*esp\_err\_t* **i2s\_channel\_register\_event\_callback** (*i2s\_chan\_handle\_t* handle, const *i2s\_event\_callbacks\_t* \*callbacks, void \*user\_data)

Set event callbacks for I2S channel.

---

**Note:** Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

---

**Parameters**

- **handle** -- [in] I2S channel handler
- **callbacks** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

**Structures**

```
struct i2s_event_callbacks_t
```

Group of I2S callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

**Public Members**

*i2s\_isr\_callback\_t* **on\_recv**

Callback of data received event, only for RX channel The event data includes DMA buffer address and size that just finished receiving data

***i2s\_isr\_callback\_t on\_recv\_q\_ovf***

Callback of receiving queue overflowed event, only for RX channel The event data includes buffer size that has been overwritten

***i2s\_isr\_callback\_t on\_sent***

Callback of data sent event, only for TX channel The event data includes DMA buffer address and size that just finished sending data

***i2s\_isr\_callback\_t on\_send\_q\_ovf***

Callback of sending queue overflowed event, only for TX channel The event data includes buffer size that has been overwritten

struct **i2s\_chan\_config\_t**

I2S controller channel configuration.

**Public Members*****i2s\_port\_t id***

I2S port id

***i2s\_role\_t role***

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

**uint32\_t dma\_desc\_num**

I2S DMA buffer number, it is also the number of DMA descriptor

**uint32\_t dma\_frame\_num**

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of 3 when the data bit width is 24.

**bool auto\_clear**

Set to auto clear DMA TX buffer, I2S will always send zero automatically if no data to send

**int intr\_priority**

I2S interrupt priority, range [0, 7], if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct **i2s\_chan\_info\_t**

I2S channel information.

**Public Members*****i2s\_port\_t id***

I2S port id

***i2s\_role\_t role***

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

*i2s\_dir\_t* **dir**

I2S channel direction

*i2s\_comm\_mode\_t* **mode**

I2S channel communication mode

*i2s\_chan\_handle\_t* **pair\_chan**

I2S pair channel handle in duplex mode, always NULL in simplex mode

### Macros

**I2S\_CHANNEL\_DEFAULT\_CONFIG** (i2s\_num, i2s\_role)

get default I2S property

**I2S\_GPIO\_UNUSED**

Used in *i2s\_gpio\_config\_t* for signals which are not used

### I2S Types

#### Header File

- [components/driver/i2s/include/driver/i2s\\_types.h](#)
- This header file can be included with:

```
#include "driver/i2s_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Structures

struct **i2s\_event\_data\_t**

Event structure used in I2S event queue.

#### Public Members

void \***data**

The pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback  
NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

size\_t **size**

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the `dma_frame_num` and `data_bit_width`, typically it is fixed when `data_bit_width` is not changed.

## Type Definitions

typedef struct i2s\_channel\_obj\_t \***i2s\_chan\_handle\_t**

I2S channel object handle, the control unit of the I2S driver

typedef bool (\***i2s\_isr\_callback\_t**)(*i2s\_chan\_handle\_t* handle, *i2s\_event\_data\_t* \*event, void \*user\_ctx)

I2S event callback.

**Param handle [in]** I2S channel handle, created from `i2s_new_channel()`

**Param event [in]** I2S event data

**Param user\_ctx [in]** User registered context, passed from `i2s_channel_register_event_callback()`

**Return** Whether a high priority task has been waken up by this callback function

## Enumerations

enum **i2s\_port\_t**

I2S controller port number, the max port number is (SOC\_I2S\_NUM -1).

*Values:*

enumerator **I2S\_NUM\_0**

I2S controller port 0

enumerator **I2S\_NUM\_1**

I2S controller port 1

enumerator **I2S\_NUM\_AUTO**

Select whichever port is available

enum **i2s\_comm\_mode\_t**

I2S controller communication mode.

*Values:*

enumerator **I2S\_COMM\_MODE\_STD**

I2S controller using standard communication mode, support Philips/MSB/PCM format

enumerator **I2S\_COMM\_MODE\_PDM**

I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S\_COMM\_MODE\_NONE**

Unspecified I2S controller mode

enum **i2s\_mclk\_multiple\_t**

The multiple of MCLK to sample rate.

*Values:*

enumerator **I2S\_MCLK\_MULTIPLE\_128**

MCLK = sample\_rate \* 128

enumerator **I2S\_MCLK\_MULTIPLE\_256**

MCLK = sample\_rate \* 256

enumerator **I2S\_MCLK\_MULTIPLE\_384**

MCLK = sample\_rate \* 384

enumerator **I2S\_MCLK\_MULTIPLE\_512**

MCLK = sample\_rate \* 512

### Header File

- [components/hal/include/hal/i2s\\_types.h](#)
- This header file can be included with:

```
#include "hal/i2s_types.h"
```

### Type Definitions

typedef *soc\_periph\_i2s\_clk\_src\_t* **i2s\_clock\_src\_t**

I2S clock source

### Enumerations

enum **i2s\_slot\_mode\_t**

I2S channel slot mode.

*Values:*

enumerator **I2S\_SLOT\_MODE\_MONO**

I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S\_SLOT\_MODE\_STEREO**

I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s\_dir\_t**

I2S channel direction.

*Values:*

enumerator **I2S\_DIR\_RX**

I2S channel direction RX

enumerator **I2S\_DIR\_TX**

I2S channel direction TX

enum **i2s\_role\_t**

I2S controller role.

*Values:*

enumerator **I2S\_ROLE\_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S\_ROLE\_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s\_data\_bit\_width\_t**

Available data bit width in one slot.

*Values:*

enumerator **I2S\_DATA\_BIT\_WIDTH\_8BIT**

I2S channel data bit-width: 8

enumerator **I2S\_DATA\_BIT\_WIDTH\_16BIT**

I2S channel data bit-width: 16

enumerator **I2S\_DATA\_BIT\_WIDTH\_24BIT**

I2S channel data bit-width: 24

enumerator **I2S\_DATA\_BIT\_WIDTH\_32BIT**

I2S channel data bit-width: 32

enum **i2s\_slot\_bit\_width\_t**

Total slot bit width in one slot.

*Values:*

enumerator **I2S\_SLOT\_BIT\_WIDTH\_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S\_SLOT\_BIT\_WIDTH\_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S\_SLOT\_BIT\_WIDTH\_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S\_SLOT\_BIT\_WIDTH\_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S\_SLOT\_BIT\_WIDTH\_32BIT**

I2S channel slot bit-width: 32

enum **i2s\_pdm\_dsr\_t**

I2S PDM RX down-sampling mode.

*Values:*

enumerator **I2S\_PDM\_DSR\_8S**

downsampling number is 8 for PDM RX mode

enumerator **I2S\_PDM\_DSR\_16S**

downsampling number is 16 for PDM RX mode

enumerator **I2S\_PDM\_DSR\_MAX**

enum **i2s\_pdm\_sig\_scale\_t**

pdm tx signal scaling mode

*Values:*

enumerator **I2S\_PDM\_SIG\_SCALING\_DIV\_2**

I2S TX PDM signal scaling: /2

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_1**

I2S TX PDM signal scaling: x1

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_2**

I2S TX PDM signal scaling: x2

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_4**

I2S TX PDM signal scaling: x4

enum **i2s\_std\_slot\_mask\_t**

I2S slot select in standard mode.

---

**Note:** It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference.

---

*Values:*

enumerator **I2S\_STD\_SLOT\_LEFT**

I2S transmits or receives left slot

enumerator **I2S\_STD\_SLOT\_RIGHT**

I2S transmits or receives right slot

enumerator **I2S\_STD\_SLOT\_BOTH**

I2S transmits or receives both left and right slot

enum **i2s\_pdm\_slot\_mask\_t**

I2S slot select in PDM mode.

*Values:*

enumerator **I2S\_PDM\_SLOT\_RIGHT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled up

enumerator **I2S\_PDM\_SLOT\_LEFT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled down

enumerator **I2S\_PDM\_SLOT\_BOTH**

I2S PDM transmits or receives both two slots

## 2.6.10 LCD

### Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

### Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller's internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g., ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the [Espressif Component Registry](#).
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *I80 Interfaced LCD* describes the steps to install the I80 LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

### SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

Currently the driver supports SPI, Quad SPI and Octal SPI (simulate Intel 8080 timing) modes.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
    ↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one
    ↪SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
    ↪AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver uses this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver uses this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e., this LCD), you can set the gpio number to `-1` to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver uses this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.

- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
↪HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

## I2C Interfaced LCD

1. Create I2C bus. Please refer to [I2C API doc](#) for more details.

```
i2c_master_bus_handle_t i2c_bus = NULL;
i2c_master_bus_config_t bus_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .glitch_ignore_cnt = 7,
    .i2c_port = I2C_BUS_PORT,
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .flags.enable_internal_pullup = true,
};
ESP_ERROR_CHECK(i2c_new_master_bus(&bus_config, &i2c_bus));
```

- Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:
  - `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver uses this address to communicate with the LCD controller chip.
  - `esp_lcd_panel_io_i2c_config_t::scl_speed_hz` sets the I2C clock frequency in Hz. The value should not exceed the range recommended in the LCD spec.
  - `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .scl_speed_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6,      // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c(i2c_bus, &io_config, &io_
↪handle));
```

- Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:
  - `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
  - `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↪panel_handle));
```

## I80 Interfaced LCD

- Create I80 bus by `esp_lcd_new_i80_bus()`. You need to set up the following parameters for an Intel 8080 parallel bus:
  - `esp_lcd_i80_bus_config_t::clk_src` sets the clock source of the I80 bus. Note, the default clock source may be different between ESP targets.
  - `esp_lcd_i80_bus_config_t::wr_gpio_num` sets the GPIO number of the pixel clock (also referred as WR in some LCD spec)
  - `esp_lcd_i80_bus_config_t::dc_gpio_num` sets the GPIO number of the data/command select pin (also referred as RS in some LCD spec)
  - `esp_lcd_i80_bus_config_t::bus_width` sets the bit width of the data bus (only support 8 or 16)
  - `esp_lcd_i80_bus_config_t::data_gpio_nums` is the array of the GPIO number of the data bus. The number of GPIOs should be equal to the `esp_lcd_i80_bus_config_t::bus_width` value.
  - `esp_lcd_i80_bus_config_t::max_transfer_bytes` sets the maximum number of bytes that can be transferred in one transaction.

```

esp_lcd_i80_bus_handle_t i80_bus = NULL;
esp_lcd_i80_bus_config_t bus_config = {
    .clk_src = LCD_CLK_SRC_DEFAULT,
    .dc_gpio_num = EXAMPLE_PIN_NUM_DC,
    .wr_gpio_num = EXAMPLE_PIN_NUM_PCLK,
    .data_gpio_nums = {
        EXAMPLE_PIN_NUM_DATA0,
        EXAMPLE_PIN_NUM_DATA1,
        EXAMPLE_PIN_NUM_DATA2,
        EXAMPLE_PIN_NUM_DATA3,
        EXAMPLE_PIN_NUM_DATA4,
        EXAMPLE_PIN_NUM_DATA5,
        EXAMPLE_PIN_NUM_DATA6,
        EXAMPLE_PIN_NUM_DATA7,
    },
    .bus_width = 8,
    .max_transfer_bytes = EXAMPLE_LCD_H_RES * 100 * sizeof(uint16_t), /
    ↪ / transfer 100 lines of pixels (assume pixel is RGB565) at most in
    ↪ one transaction
    .psram_trans_align = EXAMPLE_PSRAM_DATA_ALIGNMENT,
    .sram_trans_align = 4,
};
ESP_ERROR_CHECK(esp_lcd_new_i80_bus(&bus_config, &i80_bus));

```

2. Allocate an LCD IO device handle from the I80 bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i80_config_t::cs_gpio_num` sets the GPIO number of the chip select pin.
- `esp_lcd_panel_io_i80_config_t::pclk_hz` sets the pixel clock frequency in Hz. Higher pixel clock frequency results in higher refresh rate, but may cause flickering if the DMA bandwidth is not sufficient or the LCD controller chip does not support high pixel clock frequency.
- `esp_lcd_panel_io_i80_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i80_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_i80_config_t::trans_queue_depth` sets the maximum number of transactions that can be queued in the LCD IO device. A bigger value means more transactions can be queued up, but it also consumes more memory.

```

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i80_config_t io_config = {
    .cs_gpio_num = EXAMPLE_PIN_NUM_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .trans_queue_depth = 10,
    .dc_levels = {
        .dc_idle_level = 0,
        .dc_cmd_level = 0,
        .dc_dummy_level = 0,
        .dc_data_level = 1,
    },
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i80(i80_bus, &io_config, &io_
    ↪ handle));

```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I80 IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the GPIO number of the reset pin. If the LCD controller chip does not have a reset pin, you can set this value to `-1`.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the color order the pixel color data.

```
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_RGB,
    .bits_per_pixel = 16,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

### More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in [ESP-IDF Component Registry](#). The list of available and planned drivers with links is in this [table](#).

### LCD Panel IO Operations

- `esp_lcd_panel_reset()` can reset the LCD panel.
- `esp_lcd_panel_init()` performs a basic initialization of the panel. To perform more manufacture specific initialization, please go to [Steps to Add Manufacture Specific Initialization](#).
- Through combined use of `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen by cutting down the output path from the frame buffer to the LCD screen.
- `esp_lcd_panel_disp_sleep()` can reduce the power consumption of the LCD screen by entering the sleep mode. The internal frame buffer is still retained.
- `esp_lcd_panel_draw_bitmap()` is the most significant function, which does the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

### Steps to Add Manufacture Specific Initialization

The LCD controller drivers (e.g., `st7789`) in `esp-idf` only provide basic initialization in the `esp_lcd_panel_init()`, leaving the vast majority of settings to the default values. Some LCD modules need to set a bunch of manufacture specific configurations before it can display normally. These configurations usually include gamma, power voltage and so on. If you want to add manufacture specific initialization, please follow the steps below:

```
esp_lcd_panel_reset(panel_handle);
esp_lcd_panel_init(panel_handle);
// set extra configurations e.g., gamma control
// with the underlying IO handle
// please consult your manufacture for special commands and corresponding values
esp_lcd_panel_io_tx_param(io_handle, GAMMA_CMD, (uint8_t[]) {
    GAMMA_ARRAY
}, N);
// turn on the display
esp_lcd_panel_disp_on_off(panel_handle, true);
```

### Application Example

### Header File

- [components/hal/include/hal/lcd\\_types.h](#)
- This header file can be included with:

```
#include "hal/lcd_types.h"
```

### Type Definitions

typedef [soc\\_periph\\_lcd\\_clk\\_src\\_t](#) **lcd\_clock\_source\_t**  
LCD clock source.

### Enumerations

enum **lcd\_rgb\_element\_order\_t**

RGB color endian.

*Values:*

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_RGB**

RGB element order: RGB

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_BGR**

RGB element order: BGR

enum **lcd\_rgb\_data\_endian\_t**

RGB data endian.

*Values:*

enumerator **LCD\_RGB\_DATA\_ENDIAN\_BIG**

RGB data endian: MSB first

enumerator **LCD\_RGB\_DATA\_ENDIAN\_LITTLE**

RGB data endian: LSB first

enum **lcd\_color\_space\_t**

LCD color space.

*Values:*

enumerator **LCD\_COLOR\_SPACE\_RGB**

Color space: RGB

enumerator **LCD\_COLOR\_SPACE\_YUV**

Color space: YUV

enum **lcd\_color\_range\_t**

LCD color range.

*Values:*

enumerator **LCD\_COLOR\_RANGE\_LIMIT**

Limited color range

enumerator **LCD\_COLOR\_RANGE\_FULL**

Full color range

enum **lcd\_yuv\_sample\_t**

YUV sampling method.

*Values:*

enumerator **LCD\_YUV\_SAMPLE\_422**

YUV 4:2:2 sampling

enumerator **LCD\_YUV\_SAMPLE\_420**

YUV 4:2:0 sampling

enumerator **LCD\_YUV\_SAMPLE\_411**

YUV 4:1:1 sampling

enum **lcd\_yuv\_conv\_std\_t**

The standard used for conversion between RGB and YUV.

*Values:*

enumerator **LCD\_YUV\_CONV\_STD\_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD\_YUV\_CONV\_STD\_BT709**

YUV<->RGB conversion standard: BT.709

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_types.h](#)
- This header file can be included with:

```
#include "esp_lcd_types.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

## Type Definitions

typedef struct esp\_lcd\_panel\_io\_t \***esp\_lcd\_panel\_io\_handle\_t**

Type of LCD panel IO handle

typedef struct esp\_lcd\_panel\_t \***esp\_lcd\_panel\_handle\_t**

Type of LCD panel handle

## Header File

- `components/esp_lcd/include/esp_lcd_panel_io.h`
- This header file can be included with:

```
#include "esp_lcd_panel_io.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

## Functions

*esp\_err\_t* **esp\_lcd\_panel\_io\_rx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, void \*param, size\_t param\_size)

Transmit LCD command and receive corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

### Parameters

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [out] Buffer for the command data
- **param\_size** -- [in] Size of param buffer

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_tx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*param, size\_t param\_size)

Transmit LCD command and corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

### Parameters

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param\_size** -- [in] Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_tx\_color** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*color, size\_t color\_size)

Transmit LCD RGB data.

---

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

---

**Parameters**

- **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **color** -- [in] Buffer that holds the RGB color data
- **color\_size** -- [in] Size of `color` in memory, in bytes

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_del** (*esp\_lcd\_panel\_io\_handle\_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters** **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_register\_event\_callbacks** (*esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_io\_callbacks\_t* \*cbs, void \*user\_ctx)

Register LCD panel IO callbacks.

**Parameters**

- **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** -- [in] structure with all LCD panel IO callbacks
- **user\_ctx** -- [in] User private data, passed directly to callback's `user_ctx`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_spi** (*esp\_lcd\_spi\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_spi\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for SPI interface.

**Parameters**

- **bus** -- [in] SPI bus handle

- **io\_config** -- **[in]** IO configuration, for SPI interface
- **ret\_io** -- **[out]** Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c\_v1** (uint32\_t bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface in legacy implementation.

---

**Note:** Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

---

**Parameters**

- **bus** -- **[in]** I2C bus handle, (in uint32\_t)
- **io\_config** -- **[in]** IO configuration, for I2C interface
- **ret\_io** -- **[out]** Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c\_v2** (*i2c\_master\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface in new implementation.

---

**Note:** Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

---

**Parameters**

- **bus** -- **[in]** I2C bus handle, (in *i2c\_master\_dev\_handle\_t*)
- **io\_config** -- **[in]** IO configuration, for I2C interface
- **ret\_io** -- **[out]** Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_i80\_bus** (const *esp\_lcd\_i80\_bus\_config\_t* \*bus\_config, *esp\_lcd\_i80\_bus\_handle\_t* \*ret\_bus)

Create Intel 8080 bus handle.

**Parameters**

- **bus\_config** -- **[in]** Bus configuration
- **ret\_bus** -- **[out]** Returned bus handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_NOT\_FOUND if no free bus is available
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_del\_i80\_bus** (*esp\_lcd\_i80\_bus\_handle\_t* bus)

Destroy Intel 8080 bus handle.

**Parameters** **bus** -- [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if there still be some device attached to the bus
- `ESP_OK` on success

`esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const esp_lcd_panel_io_i80_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`

Create LCD panel IO, for Intel 8080 interface.

**Parameters**

- **bus** -- [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- **io\_config** -- [in] IO configuration, for i80 interface
- **ret\_io** -- [out] Returned panel IO handle

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if some configuration can't be satisfied, e.g. pixel clock out of the range
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

## Structures

struct `esp_lcd_panel_io_event_data_t`

Type of LCD panel IO event data.

struct `esp_lcd_panel_io_callbacks_t`

Type of LCD panel IO callbacks.

## Public Members

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`

Callback invoked when color data transfer has finished

struct `esp_lcd_panel_io_spi_config_t`

Panel IO configuration structure, for SPI interface.

## Public Members

int `cs_gpio_num`

GPIO used for CS line

int `dc_gpio_num`

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int `spi_mode`

Traditional SPI mode (0~3)

unsigned int `pclk_hz`

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Size of internal transaction queue

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to on\_color\_trans\_done's user\_ctx

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_high\_on\_cmd**

If enabled, DC level = 1 indicates command transfer

unsigned int **dc\_low\_on\_data**

If enabled, DC level = 0 indicates color data transfer

unsigned int **dc\_low\_on\_param**

If enabled, DC level = 0 indicates parameter transfer

unsigned int **octal\_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad\_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio\_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb\_first**

transmit LSB bit first

unsigned int **cs\_high\_active**

CS line is high active

struct *esp\_lcd\_panel\_io\_spi\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp\_lcd\_panel\_io\_i2c\_config\_t**

Panel IO configuration structure, for I2C interface.

### Public Members

uint32\_t **dev\_addr**

I2C device address

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to on\_color\_trans\_done's user\_ctx

size\_t **control\_phase\_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc\_bit\_offset**

Offset of the D/C selection bit in control phase

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable\_control\_phase**

If this flag is enabled, the control phase isn't used

struct *esp\_lcd\_panel\_io\_i2c\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

uint32\_t **scl\_speed\_hz**

I2C LCD SCL frequency (hz)

struct **esp\_lcd\_i80\_bus\_config\_t**

LCD Intel 8080 bus configuration structure.

### Public Members

int **dc\_gpio\_num**

GPIO used for D/C line

int **wr\_gpio\_num**

GPIO used for WR line

*lcd\_clock\_source\_t* **clk\_src**

Clock source for the I80 LCD peripheral

int **data\_gpio\_nums**[(24)]

GPIOs used for data lines

size\_t **bus\_width**

Number of data lines, 8 or 16

size\_t **max\_transfer\_bytes**

Maximum transfer size, this determines the length of internal DMA link

size\_t **psram\_trans\_align**

DMA transfer alignment for data allocated from PSRAM

size\_t **sram\_trans\_align**

DMA transfer alignment for data allocated from SRAM

struct **esp\_lcd\_panel\_io\_i80\_config\_t**

Panel IO configuration structure, for intel 8080 interface.

### Public Members

int **cs\_gpio\_num**

GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

uint32\_t **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Transaction queue size, larger queue, higher throughput

[\*esp\\_lcd\\_panel\\_io\\_color\\_trans\\_done\\_cb\\_t\*](#) **on\_color\_trans\_done**

Callback invoked when color data was transferred done

void \***user\_ctx**

User private data, passed directly to on\_color\_trans\_done's user\_ctx

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_idle\_level**

Level of DC line in IDLE phase

unsigned int **dc\_cmd\_level**

Level of DC line in CMD phase

unsigned int **dc\_dummy\_level**

Level of DC line in DUMMY phase

unsigned int **dc\_data\_level**

Level of DC line in DATA phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **dc\_levels**

Each i80 device might have its own D/C control logic

unsigned int **cs\_active\_high**

If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse\_color\_bits**

Reverse the data bits, D[N:0] -> D[0:N]

unsigned int **swap\_color\_bytes**

Swap adjacent two color bytes

unsigned int **pclk\_active\_neg**

The display will write data lines when there's a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk\_idle\_low**

The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **flags**

Panel IO config flags

## Macros

**esp\_lcd\_new\_panel\_io\_i2c** (bus, io\_config, ret\_io)

Create LCD panel IO handle.

### Parameters

- **bus** -- [in] I2C bus handle
- **io\_config** -- [in] IO configuration, for I2C interface
- **ret\_io** -- [out] Returned IO handle

### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Type Definitions

typedef void \***esp\_lcd\_spi\_bus\_handle\_t**

Type of LCD SPI bus handle

typedef uint32\_t **esp\_lcd\_i2c\_bus\_handle\_t**

Type of LCD I2C bus handle

typedef struct esp\_lcd\_i80\_bus\_t \***esp\_lcd\_i80\_bus\_handle\_t**

Type of LCD intel 8080 bus handle

```
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel\_io [in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Param edata [in]** Panel IO event data, fed by driver

**Param user\_ctx [in]** User data, passed from `esp_lcd_panel_io_XXX_config_t`

**Return** Whether a high priority task has been waken up by this function

## Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`
- This header file can be included with:

```
#include "esp_lcd_panel_ops.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

## Functions

`esp_err_t esp_lcd_panel_reset(esp_lcd_panel_handle_t panel)`

Reset LCD panel.

---

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

---

**Parameters panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

`esp_err_t esp_lcd_panel_init(esp_lcd_panel_handle_t panel)`

Initialize LCD panel.

---

**Note:** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

---

**Parameters panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

`esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)`

Deinitialize the LCD panel.

**Parameters panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_draw\_bitmap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_start, int y\_start, int x\_end, int y\_end, const void \*color\_data)

Draw bitmap on LCD panel.

#### Parameters

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_start** -- [in] Start index on x-axis (x\_start included)
- **y\_start** -- [in] Start index on y-axis (y\_start included)
- **x\_end** -- [in] End index on x-axis (x\_end not included)
- **y\_end** -- [in] End index on y-axis (y\_end not included)
- **color\_data** -- [in] RGB color data that will be dumped to the specific window range

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_mirror** (*esp\_lcd\_panel\_handle\_t* panel, bool mirror\_x, bool mirror\_y)

Mirror the LCD panel on specific axis.

---

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

---

#### Parameters

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror\_x** -- [in] Whether the panel will be mirrored about the x axis
- **mirror\_y** -- [in] Whether the panel will be mirrored about the y axis

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_swap\_xy** (*esp\_lcd\_panel\_handle\_t* panel, bool swap\_axes)

Swap/Exchange x and y axis.

---

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

---

#### Parameters

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap\_axes** -- [in] Whether to swap the x and y axis

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_set\_gap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_gap, int y\_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

---

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

---

#### Parameters

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_gap** -- [in] Extra gap on x axis, in pixels

- **y\_gap** -- [in] Extra gap on y axis, in pixels

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_invert\_color** (*esp\_lcd\_panel\_handle\_t* panel, bool invert\_color\_data)

Invert the color (bit-wise invert the color data line)

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert\_color\_data** -- [in] Whether to invert the color data

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_disp\_on\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool on\_off)

Turn on or off the display.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on\_off** -- [in] True to turns on display, False to turns off display

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_disp\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool off)

Turn off the display.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** -- [in] Whether to turn off the screen

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_disp\_sleep** (*esp\_lcd\_panel\_handle\_t* panel, bool sleep)

Enter or exit sleep mode.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **sleep** -- [in] True to enter sleep mode, False to wake up

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

**Header File**

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`
- This header file can be included with:

```
#include "esp_lcd_panel_rgb.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

### Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`
- This header file can be included with:

```
#include "esp_lcd_panel_vendor.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

### Functions

`esp_err_t esp_lcd_new_panel_st7789` (const `esp_lcd_panel_io_handle_t` io, const `esp_lcd_panel_dev_config_t` \*panel\_dev\_config, `esp_lcd_panel_handle_t` \*ret\_panel)

Create LCD panel for model ST7789.

#### Parameters

- **io** -- **[in]** LCD panel IO handle
- **panel\_dev\_config** -- **[in]** general panel device configuration
- **ret\_panel** -- **[out]** Returned LCD panel handle

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t esp_lcd_new_panel_nt35510` (const `esp_lcd_panel_io_handle_t` io, const `esp_lcd_panel_dev_config_t` \*panel\_dev\_config, `esp_lcd_panel_handle_t` \*ret\_panel)

Create LCD panel for model NT35510.

#### Parameters

- **io** -- **[in]** LCD panel IO handle
- **panel\_dev\_config** -- **[in]** general panel device configuration
- **ret\_panel** -- **[out]** Returned LCD panel handle

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t esp_lcd_new_panel_ssd1306` (const `esp_lcd_panel_io_handle_t` io, const `esp_lcd_panel_dev_config_t` \*panel\_dev\_config, `esp_lcd_panel_handle_t` \*ret\_panel)

Create LCD panel for model SSD1306.

#### Parameters

- **io** -- **[in]** LCD panel IO handle
- **panel\_dev\_config** -- **[in]** general panel device configuration
- **ret\_panel** -- **[out]** Returned LCD panel handle

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

## Structures

struct **esp\_lcd\_panel\_dev\_config\_t**

Configuration structure for panel device.

### Public Members

int **reset\_gpio\_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

esp\_lcd\_color\_space\_t **color\_space**

*Deprecated:*

Set RGB color space, please use rgb\_ele\_order instead

lcd\_color\_rgb\_endian\_t **rgb\_endian**

*Deprecated:*

Set RGB data endian, please use rgb\_ele\_order instead

*lcd\_rgb\_element\_order\_t* **rgb\_ele\_order**

Set RGB element order, RGB or BGR

*lcd\_rgb\_data\_endian\_t* **data\_endian**

Set the data endian for color data larger than 1 byte

unsigned int **bits\_per\_pixel**

Color depth, in bpp

unsigned int **reset\_active\_high**

Setting this if the panel reset is high level active

struct *esp\_lcd\_panel\_dev\_config\_t*::[anonymous] **flags**

LCD panel config flags

void \***vendor\_config**

vendor specific configuration, optional, left as NULL if not used

## 2.6.11 LED Control (LEDC)

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

LEDC channels are divided into two groups of 8 channels each. One group of LEDC channels operates in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other group of channels operate in low speed mode, the PWM duty cycle must be changed by the driver in software. Each group of channels is also able to use different clock sources.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Setting up a channel of the LEDC in either *high or low speed mode* is done in three steps:

1. *Timer Configuration* by specifying the PWM signal's frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

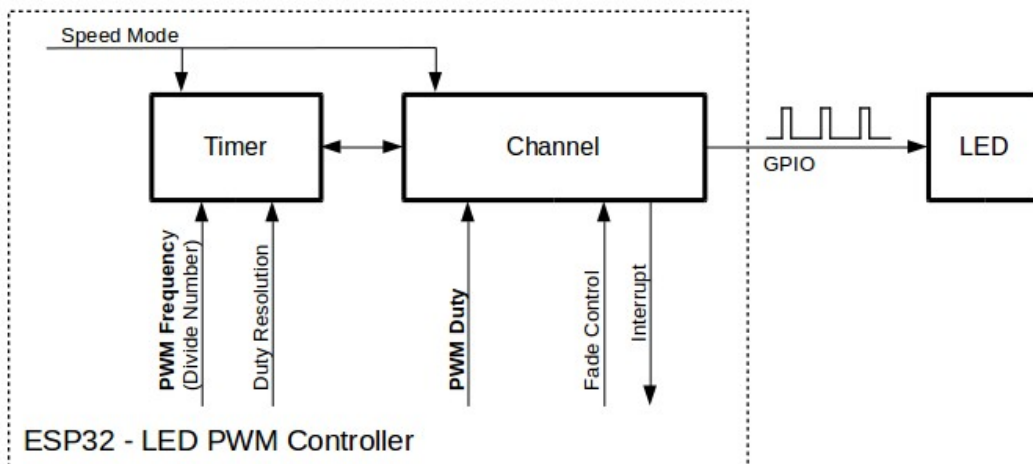

Fig. 16: Key Settings of LED PWM Controller's API

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling `ledc_timer_config()`), and then for the channels (by calling `ledc_channel_config()`). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode `ledc_mode_t`
- Timer number `ledc_timer_t`
- PWM signal frequency in Hz
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 3: Characteristics of ESP32 LEDC source clocks

Clock name	Clock freq	Speed mode	Clock capabilities
APB_CLK	80 MHz	High / Low	/
REF_TICK	1 MHz	High / Low	Dynamic Frequency Scaling compatible
RC_FAST_CLK	8 MHz	Low	Dynamic Frequency Scaling compatible, Light sleep compatible

**Note:**

1. On ESP32, if RC\_FAST\_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

The LEDC driver offers a helper function `ledc_find_suitable_duty_resolution()` to find the maximum possible resolution for the timer, given the source clock frequency and the desired PWM signal frequency.

When a timer is no longer needed by any channel, it can be deconfigured by calling the same function `ledc_timer_config()`. The configuration structure `ledc_timer_config_t` passes in should be:

- `ledc_timer_config_t::speed_mode` The speed mode of the timer which wants to be deconfigured belongs to (`ledc_mode_t`)
- `ledc_timer_config_t::timer_num` The ID of the timers which wants to be deconfigured (`ledc_timer_t`)
- `ledc_timer_config_t::deconfigure` Set this to true so that the timer specified can be deconfigured

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2 ** \text{duty\_resolution})$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of ~0.1%.

**Warning:** On ESP32, when channel's binded timer selects its maximum duty resolution, the duty cycle value cannot be set to  $(2 ** \text{duty\_resolution})$ . Otherwise, the internal duty counter in the hardware will overflow and be messed up.

**Change PWM Duty Cycle Using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes. Due to hardware limitations, there is no way to stop a fade before it reaches its target duty.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency "on the fly":

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel's timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several individual timer-specific functions that can be used to change PWM output:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called "behind the scenes" by `ledc_timer_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

### LEDC High and Low Speed Mode

High speed mode enables a glitch-free changeover of timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, see [ESP32 Technical Reference Manual > LED PWM Controller \(LEDC\) \[PDF\]](#).

## Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of  $\sim 0.012\%$  ( $2^{13} = 8192$  discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the [ESP32 Technical Reference Manual > LED PWM Controller \(LEDC\) \[PDF\]](#)).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits results in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 resolves this issue and makes it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver also captures and reports attempts to configure frequency/duty resolution combinations that are below the supported minimum, e.g.,:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

## Application Example

The LEDC basic example: [peripherals/ledc/ledc\\_basic](#).

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc\\_fade](#).

## API Reference

### Header File

- `components/driver/ledc/include/driver/ledc.h`
- This header file can be included with:

```
#include "driver/ledc.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` \*ledc\_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty.

**Parameters** `ledc_conf` -- Pointer of LEDC channel configure struct

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`uint32_t ledc_find_suitable_duty_resolution` (`uint32_t src_clk_freq`, `uint32_t timer_freq`)

Helper function to find the maximum possible duty resolution in bits for `ledc_timer_config()`

**Parameters**

- `src_clk_freq` -- LEDC timer source clock frequency (Hz) (See doxygen comments of `ledc_clk_cfg_t` or get from `esp_clk_tree_src_get_freq_hz`)
- `timer_freq` -- Desired LEDC timer frequency (Hz)

**Returns**

- 0 The timer frequency cannot be achieved
- Others The largest duty resolution value to be set

*esp\_err\_t* `ledc_timer_config` (`const ledc_timer_config_t *timer_conf`)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

**Parameters** `timer_conf` -- Pointer of LEDC timer configure struct

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.
- `ESP_ERR_INVALID_STATE` Timer cannot be de-configured because timer is not configured or is not paused

*esp\_err\_t* `ledc_update_duty` (`ledc_mode_t speed_mode`, `ledc_channel_t channel`)

LEDC update channel parameters.

---

**Note:** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

---

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

---

**Note:** If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

---

---

**Note:** This function is allowed to run within ISR context.

---

**Parameters**

- `speed_mode` -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* `ledc_set_pin` (`int gpio_num`, `ledc_mode_t speed_mode`, `ledc_channel_t ledc_channel`)

Set LEDC output gpio.

---

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

---

**Parameters**

- **gpio\_num** -- The LEDC output gpio
- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc\_channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t idle\_level)

LEDC stop. Disable LEDC output, and set idle level.

---

**Note:** If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

---

---

**Note:** This function is allowed to run within ISR context.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **idle\_level** -- Set output idle level after LEDC stops.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num, uint32\_t freq\_hz)

LEDC set channel frequency (Hz)

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`
- **freq\_hz** -- Set the LEDC frequency

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

uint32\_t **ledc\_get\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num)

LEDC get channel frequency (Hz)

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- 0 error

- Others Current LEDC frequency

*esp\_err\_t* **ledc\_set\_duty\_with\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

LEDC set duty and hpoint value Only after calling ledc\_update\_duty will the duty update.

---

**Note:** ledc\_set\_duty, ledc\_set\_duty\_with\_hpoint and ledc\_update\_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc\_set\_duty\_and\_update

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

int **ledc\_get\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t

#### Returns

- LEDC\_ERR\_VAL if parameter error
- Others Current hpoint value of LEDC channel

*esp\_err\_t* **ledc\_set\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc\_set\_duty\_with\_hpoint. only after calling ledc\_update\_duty will the duty update.

---

**Note:** ledc\_set\_duty, ledc\_set\_duty\_with\_hpoint and ledc\_update\_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc\_set\_duty\_and\_update.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

uint32\_t **ledc\_get\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

*esp\_err\_t* **ledc\_set\_fade** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, *ledc\_duty\_direction\_t* fade\_direction, uint32\_t step\_num, uint32\_t duty\_cycle\_num, uint32\_t duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_direction** -- Set the direction of the gradient
- **step\_num** -- Set the number of the gradient
- **duty\_cycle\_num** -- Set how many LEDC tick each time the gradient lasts
- **duty\_scale** -- Set gradient change amplitude

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** -- Interrupt handler function.
- **arg** -- User-supplied argument passed to the handler function.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Failed to find available interrupt source

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- Timer index (0-3), there are 4 timers in LEDC module
- **clock\_divider** -- Timer clock divide value, the timer clock is divided from the selected clock source
- **duty\_resolution** -- Resolution of duty setting in number of bits. The range is [1, SOC\_LEDC\_TIMER\_BIT\_WIDTH]
- **clk\_src** -- Select LEDC source clock.

#### Returns

- (-1) Parameter error
- Other Current LEDC duty

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num)

Set LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every `cycle_num` cycles

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_with\_time** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_fade\_func\_install** (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters** **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Intr flag error
- ESP\_ERR\_NOT\_FOUND Failed to find available interrupt source
- ESP\_ERR\_INVALID\_STATE Fade function already installed

void **ledc\_fade\_func\_uninstall** (void)

Uninstall LEDC fade function.

*esp\_err\_t* **ledc\_fade\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

---

---

**Note:** Starting fade operation with this API is not thread-safe, use with care.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number
- **fade\_mode** -- Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if LEDC\_FADE\_WAIT\_DONE mode is selected.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Channel not initialized or fade function not installed.
- ESP\_ERR\_INVALID\_ARG Parameter error.

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Fade function init error

`esp_err_t ledc_set_fade_time_and_start` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, uint32\_t target\_duty, uint32\_t max\_fade\_time\_ms, `ledc_fade_mode_t` fade\_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once, before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).
- **fade\_mode** -- choose blocking or non-blocking mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

`esp_err_t ledc_set_fade_step_and_start` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num, `ledc_fade_mode_t` fade\_mode)

A thread-safe API to set and start LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every cycle\_num cycles
- **fade\_mode** -- choose blocking or non-blocking mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

`esp_err_t ledc_cb_register` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `ledc_cbs_t` \*cbs, void \*user\_arg)

LEDC callback registration function.

---

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **cbs** -- Group of LEDC callback functions
- **user\_arg** -- user registered data for the callback function

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

**Structures**

struct `ledc_channel_config_t`

Configuration parameters of LEDC channel for `ledc_channel_config` function.

**Public Members**

int `gpio_num`

the LEDC output gpio\_num, if you want to use gpio16, `gpio_num = 16`

`ledc_mode_t` `speed_mode`

LEDC speed speed\_mode, high-speed mode (only exists on esp32) or low-speed mode

`ledc_channel_t` `channel`

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

***ledc\_intr\_type\_t* intr\_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

***ledc\_timer\_t* timer\_sel**

Select the timer source of channel (0 - LEDC\_TIMER\_MAX-1)

**uint32\_t duty**

LEDC channel duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

**int hpoint**

LEDC channel hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

**unsigned int output\_invert**

Enable (1) or disable (0) gpio output invert

**struct *ledc\_channel\_config\_t*::[anonymous] flags**

LEDC flags

**struct *ledc\_timer\_config\_t***

Configuration parameters of LEDC timer for `ledc_timer_config` function.

**Public Members*****ledc\_mode\_t* speed\_mode**

LEDC speed `speed_mode`, high-speed mode (only exists on esp32) or low-speed mode

***ledc\_timer\_bit\_t* duty\_resolution**

LEDC channel duty resolution

***ledc\_timer\_t* timer\_num**

The timer source of channel (0 - LEDC\_TIMER\_MAX-1)

**uint32\_t freq\_hz**

LEDC timer frequency (Hz)

***ledc\_clk\_cfg\_t* clk\_cfg**

Configure LEDC source clock from `ledc_clk_cfg_t`. Note that `LEDC_USE_RC_FAST_CLK` and `LEDC_USE_XTAL_CLK` are non-timer-specific clock sources. You can not have one LEDC timer uses `RC_FAST_CLK` as the clock source and have another LEDC timer uses `XTAL_CLK` as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

**bool deconfigure**

Set this field to de-configure a LEDC timer which has been configured before. Note that it will not check whether the timer wants to be de-configured is binded to any channel. Also, the timer has to be paused first before it can be de-configured. When this field is set, `duty_resolution`, `freq_hz`, `clk_cfg` fields are ignored.

**struct *ledc\_cb\_param\_t***

LEDC callback parameter.

### Public Members

*ledc\_cb\_event\_t* **event**

Event name

uint32\_t **speed\_mode**

Speed mode of the LEDC channel group

uint32\_t **channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

uint32\_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2\*\*duty\_resolution)]

struct **ledc\_cbs\_t**

Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*ledc\_cb\_t* **fade\_cb**

LEDC fade\_end callback function

### Macros

**LEDC\_APB\_CLK\_HZ**

Frequency of one of the LEDC peripheral clock sources, APB\_CLK.

---

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

---

**LEDC\_REF\_CLK\_HZ**

Frequency of one of the LEDC peripheral clock sources, REF\_TICK.

---

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

---

**LEDC\_ERR\_DUTY**

**LEDC\_ERR\_VAL**

### Type Definitions

typedef *intr\_handle\_t* **ledc\_isr\_handle\_t**

typedef bool (**ledc\_cb\_t**)(const *ledc\_cb\_param\_t* \*param, void \*user\_arg)

Type of LEDC event callback.

**Param param** LEDC callback parameter

**Param user\_arg** User registered data

**Return** Whether a high priority task has been waken up by this function

### Enumerations

enum **ledc\_cb\_event\_t**

LEDC callback event type.

*Values:*

enumerator **LEDC\_FADE\_END\_EVT**

LEDC fade end event

### Header File

- [components/hal/include/hal/ledc\\_types.h](#)
- This header file can be included with:

```
#include "hal/ledc_types.h"
```

### Type Definitions

typedef *soc\_periph\_ledc\_clk\_src\_legacy\_t* **ledc\_clk\_cfg\_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, *ledc\_clk\_src\_t*, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

### Enumerations

enum **ledc\_mode\_t**

*Values:*

enumerator **LEDC\_HIGH\_SPEED\_MODE**

LEDC high speed speed\_mode

enumerator **LEDC\_LOW\_SPEED\_MODE**

LEDC low speed speed\_mode

enumerator **LEDC\_SPEED\_MODE\_MAX**

LEDC speed limit

enum **ledc\_intr\_type\_t**

*Values:*

enumerator **LEDC\_INTR\_DISABLE**

Disable LEDC interrupt

enumerator **LEDC\_INTR\_FADE\_END**

Enable LEDC interrupt

enumerator **LEDC\_INTR\_MAX**

enum **ledc\_duty\_direction\_t**

*Values:*

enumerator **LEDC\_DUTY\_DIR\_DECREASE**

LEDC duty decrease direction

enumerator **LEDC\_DUTY\_DIR\_INCREASE**

LEDC duty increase direction

enumerator **LEDC\_DUTY\_DIR\_MAX**

enum **ledc\_slow\_clk\_sel\_t**

LEDC global clock sources.

*Values:*

enumerator **LEDC\_SLOW\_CLK\_RC\_FAST**

LEDC low speed timer clock source is RC\_FAST clock

enumerator **LEDC\_SLOW\_CLK\_APB**

LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC\_SLOW\_CLK\_RTC8M**

Alias of 'LEDC\_SLOW\_CLK\_RC\_FAST'

enum **ledc\_clk\_src\_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match `ledc_clk_cfg_t` values are a hack to avoid collision with `LEDC_AUTO_CLK` in the driver, as these enums have very similar names and user may pass one of these by mistake.

*Values:*

enumerator **LEDC\_REF\_TICK**

LEDC timer clock divided from reference tick (1Mhz)

enumerator **LEDC\_APB\_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC\_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_APB_CLK_SEL`

enum **ledc\_timer\_t**

*Values:*

enumerator **LEDC\_TIMER\_0**

LEDC timer 0

enumerator **LEDC\_TIMER\_1**

LEDC timer 1

enumerator **LEDC\_TIMER\_2**

LEDC timer 2

enumerator **LEDC\_TIMER\_3**

LEDC timer 3

enumerator **LEDC\_TIMER\_MAX**

enum **ledc\_channel\_t**

*Values:*

enumerator **LEDC\_CHANNEL\_0**

LEDC channel 0

enumerator **LEDC\_CHANNEL\_1**

LEDC channel 1

enumerator **LEDC\_CHANNEL\_2**

LEDC channel 2

enumerator **LEDC\_CHANNEL\_3**

LEDC channel 3

enumerator **LEDC\_CHANNEL\_4**

LEDC channel 4

enumerator **LEDC\_CHANNEL\_5**

LEDC channel 5

enumerator **LEDC\_CHANNEL\_6**

LEDC channel 6

enumerator **LEDC\_CHANNEL\_7**

LEDC channel 7

enumerator **LEDC\_CHANNEL\_MAX**

enum **ledc\_timer\_bit\_t**

*Values:*

enumerator **LEDC\_TIMER\_1\_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC\_TIMER\_5\_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC\_TIMER\_6\_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC\_TIMER\_7\_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC\_TIMER\_8\_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC\_TIMER\_9\_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC\_TIMER\_10\_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC\_TIMER\_11\_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC\_TIMER\_12\_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC\_TIMER\_13\_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC\_TIMER\_14\_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC\_TIMER\_15\_BIT**

LEDC PWM duty resolution of 15 bits

enumerator **LEDC\_TIMER\_16\_BIT**

LEDC PWM duty resolution of 16 bits

enumerator **LEDC\_TIMER\_17\_BIT**

LEDC PWM duty resolution of 17 bits

enumerator **LEDC\_TIMER\_18\_BIT**

LEDC PWM duty resolution of 18 bits

enumerator **LEDC\_TIMER\_19\_BIT**

LEDC PWM duty resolution of 19 bits

enumerator **LEDC\_TIMER\_20\_BIT**

LEDC PWM duty resolution of 20 bits

enumerator **LEDC\_TIMER\_BIT\_MAX**

enum **ledc\_fade\_mode\_t**

*Values:*

enumerator **LEDC\_FADE\_NO\_WAIT**

LEDC fade function will return immediately

enumerator **LEDC\_FADE\_WAIT\_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC\_FADE\_MAX**

## 2.6.12 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power, and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g., brushed/brushless DC motor, RC servo motor
- Switch mode-based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog values like speed, distance
- Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

Fig. 17: MCPWM Overview

- **MCPWM Timer:** The time base of the final PWM signal. It also determines the event timing of other submodules.
- **MCPWM Operator:** The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead time, and carrier modulator.
- **MCPWM Comparator:** The compare module takes the time-base count value as input, and continuously compares it to the threshold value configured. When the timer is equal to any of the threshold values, a compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator:** One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered by other submodules like MCPWM Timer and MCPWM Comparator.
- **MCPWM Fault:** The fault module is used to detect the fault condition from outside, mainly via the GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state to protect the system from damage.
- **MCPWM Sync:** The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from the GPIO matrix or from an MCPWM Timer event.
- **Dead Time:** This submodule is used to insert extra delay to the existing PWM edges generated in the previous steps.
- **Carrier Modulation:** The carrier submodule can modulate a high-frequency carrier signal into PWM waveforms by the generator and dead time submodules. This capability is mandatory for controlling the power-switching elements.
- **Brake:** MCPWM operator can set how to brake the generators when a particular fault is detected. You can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depending on how critical the fault is.
- **MCPWM Capture:** This is a standalone submodule that can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels, with each channel connected to the GPIO. A pulse on the GPIO triggers the capture timer to store the time-base count value and then notify you by an interrupt. Using this feature, you can measure a pulse width precisely. What is more, the capture timer can also be synchronized by the MCPWM Sync submodule.

## Functional Overview

Description of the MCPWM functionality is divided into the following sections:

- *Resource Allocation and Initialization* - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.
- *Timer Operations and Events* - describes control functions and event callbacks supported by the MCPWM timer.
- *Comparator Operations and Events* - describes control functions and event callbacks supported by the MCPWM comparator.
- *Generator Actions on Events* - describes how to set actions for MCPWM generators on particular events that are generated by the MCPWM timer and comparators.
- *Generator Configurations for Classical PWM Waveforms* - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.
- *Dead Time* - describes how to set dead time for MCPWM generators.
- *Dead Time Configurations for Classical PWM Waveforms* - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.
- *Carrier Modulation* - describes how to set and modulate a high frequency onto the final PWM waveforms.
- *Faults and Brake Actions* - describes how to set brake actions for MCPWM operators on particular fault events.
- *Generator Force Actions* - describes how to control the generator output level asynchronously in a forceful way.
- *Synchronization* - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.
- *Capture* - describes how to use the MCPWM capture module to measure the pulse width of a signal.
- *Power Management* - describes how different source clocks affects power consumption.
- *IRAM Safe* - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.

- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization** As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers** You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, timers located in different groups are totally independent.
- `mcpwm_timer_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.
- `mcpwm_timer_config_t::resolution_hz` sets the expected resolution of the timer. The driver internally sets a proper divider based on the clock source and the resolution.
- `mcpwm_timer_config_t::count_mode` sets the count mode of the timer.
- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).
- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.
- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free timers in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

On the contrary, calling the `mcpwm_del_timer()` function will free the allocated timer object.

**MCPWM Operators** You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_operator_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, operators located in different groups are totally independent.
- `mcpwm_operator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_operator_config_t::update_gen_action_on_tez` sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_operator_config_t::update_gen_action_on_tep` sets whether to update the generator action when the timer counts to peak.
- `mcpwm_operator_config_t::update_gen_action_on_sync` sets whether to update the generator action when the timer takes a sync signal.
- `mcpwm_operator_config_t::update_dead_time_on_tez` sets whether to update the dead time when the timer counts to zero.
- `mcpwm_operator_config_t::update_dead_time_on_tep` sets whether to update the dead time when the timer counts to the peak.
- `mcpwm_operator_config_t::update_dead_time_on_sync` sets whether to update the dead time when the timer takes a sync signal.

The `mcpwm_new_operator()` will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free operators in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

<sup>1</sup> Different ESP chip series might have a different number of MCPWM resources (e.g., groups, timers, comparators, operators, generators, triggers and so on). Please refer to the [TRM] for details. The driver does not forbid you from applying for more MCPWM resources, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation and Initialization*.

On the contrary, calling `mcpwm_del_operator()` function will free the allocated operator object.

**MCPWM Comparators** You can allocate a MCPWM comparator object by calling the `mcpwm_new_comparator()` function, with a MCPWM operator handle and configuration structure `mcpwm_comparator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_comparator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.
- `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to the peak.
- `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

The `mcpwm_new_comparator()` will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error. [Page 1308, 1](#)

On the contrary, calling the `mcpwm_del_comparator()` function will free the allocated comparator object.

**MCPWM Generators** You can allocate a MCPWM generator object by calling the `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
- `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
- `mcpwm_generator_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.
- `mcpwm_generator_config_t::io_od_mode` configures the PWM GPIO as open-drain output.
- `mcpwm_generator_config_t::pull_up` and `mcpwm_generator_config_t::pull_down` controls whether to enable the internal pull-up and pull-down resistors accordingly.

The `mcpwm_new_generator()` will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error. [Page 1308, 1](#)

On the contrary, calling the `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults** There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software.

To allocate a GPIO fault object, you can call the `mcpwm_new_gpio_fault()` function, with the configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO faults located in different groups are totally independent, i.e., GPIO faults in group 0 can not be detected by the operator in group 1.
- `mcpwm_gpio_fault_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
- `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
- `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loopback mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. <sup>Page 1308, 1</sup>

Software fault object can be used to trigger a fault by calling the function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling the `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

The `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the fault object, this function will return the `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, the returned fault handle is of the same type.

On the contrary, calling the `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

**MCPWM Sync Sources** The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There are three types of sync sources: a sync source reflected from the GPIO, a sync source generated by software, and a sync source generated by an MCPWM timer event.

To allocate a GPIO sync source, you can call the `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, the GPIO sync sources located in different groups are totally independent, i.e., GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edges.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. <sup>Page 1308, 1</sup>

To allocate a timer event sync source, you can call the `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e., the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, if a sync source has been allocated from the same timer before, this function will return the `ESP_ERR_INVALID_STATE` error.

Last but not least, to allocate a software sync source, you can call the `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

`mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the sync source object, this function will return the `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, do not forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling the `mcpwm_del_sync_src()` function will free the allocated sync source object. This function works for all types of sync sources.

**MCPWM Capture Timer and Channels** The MCPWM group has a dedicated timer which is used to capture the timestamp when a specific event occurred. The capture timer is connected to several independent channels, each channel is assigned a GPIO.

To allocate a capture timer, you can call the `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range.
- `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.
- `mcpwm_capture_timer_config_t::resolution_hz` The driver internally will set a proper divider based on the clock source and the resolution. If it is set to 0, the driver will pick an appropriate resolution on its own, and you can subsequently view the current timer resolution via `mcpwm_capture_timer_get_resolution()`.

---

**Note:** In ESP32, `mcpwm_capture_timer_config_t::resolution_hz` parameter is invalid, the capture timer resolution is always equal to the `MCPWM_CAPTURE_CLK_SRC_APB`.

---

The `mcpwm_new_capture_timer()` will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture timer left in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. [Page 1308, 1](#)

Next, to allocate a capture channel, you can call the `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_channel_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
- `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
- `mcpwm_capture_channel_config_t::pos_edge` and `mcpwm_capture_channel_config_t::neg_edge` set whether to capture on the positive and/or falling edge of the input signal.
- `mcpwm_capture_channel_config_t::pull_up` and `mcpwm_capture_channel_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_capture_channel_config_t::invert_cap_signal` sets whether to invert the capture signal.
- `mcpwm_capture_channel_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_capture_channel()` will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture channel left in the capture timer, this function will return the `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` will free the allocated capture channel and timer object accordingly.

**MCPWM Interrupt Priority** MCPWM allows configuring interrupts separately for timer, operator, comparator, fault, and capture events. The interrupt priority is determined by the respective `config_t::intr_priority`. Additionally, events within the same MCPWM group share a common interrupt source. When registering multiple interrupt events, the interrupt priorities need to remain consistent.

**Note:** When registering multiple interrupt events within an MCPWM group, the driver will use the interrupt priority of the first registered event as the MCPWM group's interrupt priority.

---

## Timer Operations and Events

**Update Period** The timer period is initialized by the `mcpwm_timer_config_t::period_ticks` parameter in `mcpwm_timer_config_t`. You can update the period at runtime by calling `mcpwm_timer_set_period()` function. The new period will take effect based on how you set the `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` parameters in `mcpwm_timer_config_t`. If none of them are set, the timer period will take effect immediately.

**Register Timer Event Callbacks** The MCPWM timer can generate different events at runtime. If you have some function that should be called when a particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets the callback function for the timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets the callback function for the timer when it counts to zero.
- `mcpwm_timer_event_callbacks_t::on_stop` sets the callback function for the timer when it is stopped.

The callback functions above are called within the ISR context, so they should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_timer_register_event_callbacks()` function is used to save your own context. It is passed to each callback function directly.

This function will lazy the install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also *Enable and Disable timer* for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you need to enable the timer first, by calling `mcpwm_timer_enable()`. This function:

- switches the timer state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
- acquire a proper power management lock if a specific clock source (e.g., PLL\_160M clock) is selected. See also *Power management* for more information.

On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to the **init** state, disable the interrupt service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What is more, you can even start the timer for only one round, which means, the timer will count to peak value or zero, and then stop itself.

**Connect Timer with Operator** The allocated MCPWM timer should be connected with an MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Please make sure the MCPWM timer and operator are in the same group. Otherwise, this function will return the `ESP_ERR_INVALID_ARG` error.

## Comparator Operations and Events

**Register Comparator Event Callbacks** The MCPWM comparator can inform you when the timer counter equals the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

- `mcpwm_comparator_event_callbacks_t::on_reach` sets the callback function for the comparator when the timer counter equals the compare value.

The callback function provides event-specific data of type `mcpwm_compare_event_data_t` to you. The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the installation of interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

**Set Compare Value** You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There are a few points to note:

- A new compare value might not take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp_on_tep`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return the error code `ESP_ERR_INVALID_STATE`.
- The compare value should not exceed the timer's count peak, otherwise, the compare event will never get triggered.

## Generator Actions on Events

**Set Generator Action on Timer Event** One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` **must** be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

You can also set the timer action one by one by calling `mcpwm_generator_set_action_on_timer_event()` without varargs.

**Set Generator Action on Compare Event** One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See [MCPWM Comparators](#) for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` **must** be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

You can also set the compare action one by one by calling `mcpwm_generator_set_action_on_compare_event()` without varargs.

**Set Generator Action on Fault Event** One generator can set action on fault based trigger events, by calling `mcpwm_generator_set_action_on_fault_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_fault_event_action_t`:

- `mcpwm_gen_fault_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_fault_event_action_t::fault` specifies the fault used for the trigger. See [MCPWM Faults](#) for how to allocate a fault.
- `mcpwm_gen_fault_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1308, 1

The trigger only support GPIO fault. when the input is not a GPIO fault, this function will return the `ESP_ERR_NOT_SUPPORTED` error.

There is a helper macro `MCPWM_GEN_FAULT_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, fault event does not have variadic function like `mcpwm_generator_set_actions_on_fault_event()`.

**Set Generator Action on Sync Event** One generator can set action on sync based trigger events, by calling `mcpwm_generator_set_action_on_sync_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_sync_event_action_t`:

- `mcpwm_gen_sync_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_sync_event_action_t::sync` specifies the sync source used for the trigger. See [MCPWM Sync Sources](#) for how to allocate a sync source.
- `mcpwm_gen_sync_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1308, 1

The trigger only support one sync action, regardless of the kinds. When set sync actions more than once, this function will return the `ESP_ERR_INVALID_STATE` error.

There is a helper macro `MCPWM_GEN_SYNC_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, sync event does not have variadic function like `mcpwm_generator_set_actions_on_sync_event()`.

**Generator Configurations for Classical PWM Waveforms** This section will demonstrate the classical PWM waveforms that can be generated by the pair of generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The **Symmetric** or **Asymmetric** of the waveforms is determined by the count mode of the MCPWM timer.
- The **active level** of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer's period and count mode.
- The duty cycle of the PWM waveform is determined by the generator's various action combinations.

### Single Edge Asymmetric Waveform - Active High

```

}

```

**Dead Time** In power electronics, the rectifier and inverter are commonly used. This requires the use of a rectifier bridge and an inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm can not conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave generated by setting *Generator Actions on Events*.

The dead time driver works like a **decorator**. This is also reflected in the function parameters of *mcpwm\_generator\_set\_dead\_time()*, where it takes the primary generator handle (*in\_generator*), and returns a new generator (*out\_generator*) after applying the dead time. Please note, if the *out\_generator* and *in\_generator* are the same, it means you are adding the time delay to the PWM waveform in an "in-place" fashion. In turn, if the *out\_generator* and *in\_generator* are different, it means you are deriving a new PWM waveform from the existing *in\_generator*.

Dead time specific configuration is listed in the *mcpwm\_dead\_time\_config\_t* structure:

- *mcpwm\_dead\_time\_config\_t::posedge\_delay\_ticks* and *mcpwm\_dead\_time\_config\_t::negedge\_delay\_ticks* set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means bypassing the dead time module. The resolution of the dead time tick is the same as the timer that is connected with the operator by *mcpwm\_operator\_connect\_timer()*.
- *mcpwm\_dead\_time\_config\_t::invert\_output* sets whether to invert the signal after applying the dead time, which can be used to control the delay edge polarity.

**Warning:** Due to the hardware limitation, one delay module (either *posedge delay* or *negedge delay*) can not be applied to multiple MCPWM generators at the same time. e.g., the following configuration is **invalid**:

```

mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,

```

```
};
// Set posedge delay to generator A
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: This is invalid, you can not apply the posedge delay to another
↳generator
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);
```

However, you can apply `posedge` delay to generator A and `negedge` delay to generator B. You can also set both `posedge` delay and `negedge` delay for generator B, while letting generator A bypass the dead time module. Note that if `negedge` delay and `posedge` delay are both set for generator A, generator B will not be available. Where generator A is the first generator requested through the operator handle and generator B is the second generator requested through an operator handle.

**Note:** It is also possible to generate the required dead time by setting *Generator Actions on Events*, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time with polarity control is required, then the dead time submodule should be used.

**Dead Time Configurations for Classical PWM Waveforms** This section demonstrates the classical PWM waveforms that can be generated by the dead time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.

### Active High Complementary

```
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb,

```

**Carrier Modulation** The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g., isolated digital power application) by passing the PWM output signals through transformers. Any of the PWM output signals may be at 100% duty and not changing whenever a motor is required to run steadily at the full load. Coupling with non-alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call `mcpwm_operator_apply_carrier()`, and provide configuration structure `mcpwm_carrier_config_t`:

- `mcpwm_carrier_config_t::clk_src` sets the clock source of the carrier.
- `mcpwm_carrier_config_t::frequency_hz` indicates carrier frequency in Hz.

- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver searches for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can not be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a NULL configuration.

**Faults and Brake Actions** The MCPWM operator is able to sense external signals with information about the failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

You should determine possible failure modes of the motor and what action should be performed on detection of a particular fault, e.g., drive all outputs low for a brushed motor, lock current state for a stepper motor, etc. Because of this action, the motor should be put into a safe state to reduce the likelihood of damage caused by the fault.

**Set Operator Brake Mode on Fault** The way that MCPWM operator reacts to the fault is called **Brake**. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Specific brake configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` sets which fault the operator should react to.
- `mcpwm_brake_config_t::brake_mode` sets the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator recovers itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST` mode, the operator can not recover even though the fault disappears. You have to call `mcpwm_operator_recover_from_fault()` to manually recover it.

**Set Generator Action on Brake Event** One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:

- `mcpwm_gen_brake_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`.
- `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` **must** be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

**Register Fault Event Callbacks** The MCPWM fault detector can inform you when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such an event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`.

The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

- `mcpwm_fault_event_callbacks_t::on_fault_enter` sets the callback function that will be called when a fault is detected.
- `mcpwm_fault_event_callbacks_t::on_fault_exit` sets the callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks** The MCPWM operator can inform you when it is going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets the callback function that will be called when the operator is going to take a **CBC** action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets the callback function that will be called when the operator is going to take an **OST** action.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_operator_register_event_callbacks()` function is used to save your own context. It will be passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

**Generator Force Actions** Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g., `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator's output level will be controlled by the event actions again.
- Set the `hold_on` to true, and the force output level will keep alive until it is removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, and any upcoming event can override it.

**Synchronization** When a sync signal is taken by the MCPWM timer, the timer will be forced into a pre-defined **phase**, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See [MCPWM Sync Sources](#) for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the *MCPWM Capture Timer* can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: `MCPWM_TIMER_DIRECTION_UP`.

Fig. 18: GPIO Sync All MCPWM Timers

### Sync Timers by GPIO

```

static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        .group_id = 0, // GPIO fault should be in the same group of
↳the above timers
        .gpio_num = EXAMPLE_SYNC_GPIO,
        .flags.pull_down = true,
        .flags.active_neg = false, // By default, a posedge pulse can trigger a
↳sync event
    };
    ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

    mcpwm_timer_sync_phase_config_t sync_phase_config = {
        .count_value = 0, // sync phase: target count value
        .direction = MCPWM_TIMER_DIRECTION_UP, // sync phase: count direction
        .sync_src = gpio_sync_source, // sync source
    };
}
  
```

(continues on next page)

```

for (int i = 0; i < 3; i++) {
    ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_
↪config));
}
}

```

**Capture** The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantities like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, you can use the capture submodule to sense the rotor position from the Hall sensor.

Fig. 19: MCPWM BLDC with Hall Sensor

The capture timer is usually connected to several capture channels. Please refer to [MCPWM Capture Timer and Channels](#) for more information about resource allocation.

**Register Capture Event Callbacks** The MCPWM capture channel can inform you when there is a valid edge detected on the signal. You have to register a callback function to get the timer count value of the captured moment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets the callback function for the capture channel when a valid edge is detected.

The callback function provides event-specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into a timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save your context. It is passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

**Enable and Disable Capture Channel** The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

**Enable and Disable Capture Timer** Before doing IO control to the capture timer, you need to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function:

- switches the capture timer state from **init** to **enable**.
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also [Power management](#) for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to **init** state, and release the power management lock.

**Start and Stop Capture Timer** The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

**Trigger a Software Capture Event** Sometimes, the software also wants to trigger a "fake" capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it is a "fake" capture event, it can still cause an interrupt, thus your capture event callback function gets invoked as well.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the PLL and APB frequency before going into Light-sleep, thus potentially changing the period of an MCPWM timers' counting step and leading to inaccurate time-keeping.

However, the driver can prevent the system from going into Light-sleep by acquiring a power management lock of type `ESP_PM_NO_LIGHT_SLEEP`. Whenever the driver creates an MCPWM timer instance that has selected PLL as its clock source, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_timer_enable()`. On the contrary, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.

Likewise, whenever the driver creates an MCPWM capture timer instance, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_capture_timer_enable()`. And releases the lock in `mcpwm_capture_timer_disable()`.

**IRAM Safe** By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that:

- enables the interrupt to be serviced even when the cache is disabled
- places all functions used by the ISR into IRAM<sup>2</sup>
- places the driver object into DRAM (in case it is mapped to PSRAM by accident)

---

<sup>2</sup> The callback function and the sub-functions invoked by itself should also be placed in IRAM. You need to take care of this by yourself.

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. The IO control function is as follows:

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

**Thread Safety** The factory functions like `mcpwm_new_timer()` are guaranteed to be thread-safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following function is allowed to run under the ISR context, as the driver uses a critical section to prevent them from being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

Other functions that are not related to *Resource Allocation and Initialization*, are not thread-safe. Thus, you should avoid calling them in different tasks without mutex protection.

### Kconfig Options

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see *IRAM Safe* for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option will increase the firmware binary size.

### Application Examples

- Brushed DC motor speed control by PID algorithm: [peripherals/mcpwm/mcpwm\\_bdc\\_speed\\_control](#)
- BLDC motor control with hall sensor feedback: [peripherals/mcpwm/mcpwm\\_bldc\\_hall\\_control](#)
- Ultrasonic sensor (HC-SR04) distance measurement: [peripherals/mcpwm/mcpwm\\_capture\\_hc\\_sr04](#)
- Servo motor angle control: [peripherals/mcpwm/mcpwm\\_servo\\_control](#)
- MCPWM synchronization between timers: [peripherals/mcpwm/mcpwm\\_sync](#)

### API Reference

#### Header File

- `components/driver/mcpwm/include/driver/mcpwm_timer.h`
- This header file can be included with:

```
#include "driver/mcpwm_timer.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

#### Functions

*esp\_err\_t* **mcpwm\_new\_timer** (const *mcpwm\_timer\_config\_t* \*config, *mcpwm\_timer\_handle\_t* \*ret\_timer)

Create MCPWM timer.

**Parameters**

- **config** -- [in] MCPWM timer configuration
- **ret\_timer** -- [out] Returned MCPWM timer handle

**Returns**

- ESP\_OK: Create MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM timer failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM timer failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one
- ESP\_FAIL: Create MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_del\_timer** (*mcpwm\_timer\_handle\_t* timer)

Delete MCPWM timer.

**Parameters** **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP\_OK: Delete MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete MCPWM timer failed because timer is not in init state
- ESP\_FAIL: Delete MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_timer\_set\_period** (*mcpwm\_timer\_handle\_t* timer, `uint32_t` period\_ticks)

Set a new period for MCPWM timer.

---

**Note:** If `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` are not set, the new period will take effect immediately. Otherwise, the new period will take effect when timer counts to zero or on sync event.

---

---

**Note:** You may need to use `mcpwm_comparator_set_compare_value` to set a new compare value for MCPWM comparator in order to keep the same PWM duty cycle.

---

**Parameters**

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer`
- **period\_ticks** -- [in] New period in count ticks

**Returns**

- ESP\_OK: Set new period for MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Set new period for MCPWM timer failed because of invalid argument
- ESP\_FAIL: Set new period for MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_timer\_enable** (*mcpwm\_timer\_handle\_t* timer)

Enable MCPWM timer.

**Parameters** **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP\_OK: Enable MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Enable MCPWM timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable MCPWM timer failed because timer is enabled already
- ESP\_FAIL: Enable MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_timer\_disable** (*mcpwm\_timer\_handle\_t* timer)

Disable MCPWM timer.

**Parameters** `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- `ESP_OK`: Disable MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Disable MCPWM timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable MCPWM timer failed because timer is disabled already
- `ESP_FAIL`: Disable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_start_stop(mcpwm_timer_handle_t timer, mcpwm_timer_start_stop_cmd_t command)`

Send specific start/stop commands to MCPWM timer.

**Parameters**

- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `command` -- [in] Supported command list for MCPWM timer

**Returns**

- `ESP_OK`: Start or stop MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Start or stop MCPWM timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start or stop MCPWM timer failed because timer is not enabled
- `ESP_FAIL`: Start or stop MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_register_event_callbacks(mcpwm_timer_handle_t timer, const mcpwm_timer_event_callbacks_t *cbs, void *user_data)`

Set event callbacks for MCPWM timer.

---

**Note:** The first call to this function needs to be before the call to `mcpwm_timer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because timer is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

`esp_err_t mcpwm_timer_set_phase_on_sync(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_phase_config_t *config)`

Set sync phase for MCPWM timer.

**Parameters**

- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `config` -- [in] MCPWM timer sync phase configuration

**Returns**

- `ESP_OK`: Set sync phase for MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Set sync phase for MCPWM timer failed because of invalid argument
- `ESP_FAIL`: Set sync phase for MCPWM timer failed because of other error

## Structures

struct **mcpwm\_timer\_event\_callbacks\_t**

Group of supported MCPWM timer event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_timer\_event\_cb\_t* **on\_full**

callback function when MCPWM timer counts to peak value

*mcpwm\_timer\_event\_cb\_t* **on\_empty**

callback function when MCPWM timer counts to zero

*mcpwm\_timer\_event\_cb\_t* **on\_stop**

callback function when MCPWM timer stops

struct **mcpwm\_timer\_config\_t**

MCPWM timer configuration.

### Public Members

int **group\_id**

Specify from which group to allocate the MCPWM timer

*mcpwm\_timer\_clock\_source\_t* **clk\_src**

MCPWM timer clock source

uint32\_t **resolution\_hz**

Counter resolution in Hz The step size of each count tick equals to (1 / resolution\_hz) seconds

*mcpwm\_timer\_count\_mode\_t* **count\_mode**

Count mode

uint32\_t **period\_ticks**

Number of count ticks within a period

int **intr\_priority**

MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **update\_period\_on\_empty**

Whether to update period when timer counts to zero

uint32\_t **update\_period\_on\_sync**

Whether to update period on sync event

struct *mcpwm\_timer\_config\_t*::[anonymous] **flags**

Extra configuration flags for timer

struct **mcpwm\_timer\_sync\_phase\_config\_t**

MCPWM Timer sync phase configuration.

### Public Members

*mcpwm\_sync\_handle\_t* **sync\_src**

The sync event source. Set to NULL will disable the timer being synced by others

uint32\_t **count\_value**

The count value that should lock to upon sync event

*mcpwm\_timer\_direction\_t* **direction**

The count direction that should lock to upon sync event

### Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_oper.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_oper.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **mcpwm\_new\_operator** (const *mcpwm\_operator\_config\_t* \*config, *mcpwm\_oper\_handle\_t* \*ret\_oper)

Create MCPWM operator.

#### Parameters

- **config** -- [in] MCPWM operator configuration
- **ret\_oper** -- [out] Returned MCPWM operator handle

#### Returns

- **ESP\_OK**: Create MCPWM operator successfully
- **ESP\_ERR\_INVALID\_ARG**: Create MCPWM operator failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create MCPWM operator failed because out of memory
- **ESP\_ERR\_NOT\_FOUND**: Create MCPWM operator failed because can't find free resource
- **ESP\_FAIL**: Create MCPWM operator failed because of other error

*esp\_err\_t* **mcpwm\_del\_operator** (*mcpwm\_oper\_handle\_t* oper)

Delete MCPWM operator.

**Parameters** **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`

#### Returns

- **ESP\_OK**: Delete MCPWM operator successfully

- `ESP_ERR_INVALID_ARG`: Delete MCPWM operator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM operator failed because of other error

*esp\_err\_t* `mcpwm_operator_connect_timer` (*mcpwm\_oper\_handle\_t* oper, *mcpwm\_timer\_handle\_t* timer)

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

#### Parameters

- **oper** -- **[in]** MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **timer** -- **[in]** MCPWM timer handle, allocated by `mcpwm_new_timer()`

#### Returns

- `ESP_OK`: Connect MCPWM operator and timer successfully
- `ESP_ERR_INVALID_ARG`: Connect MCPWM operator and timer failed because of invalid argument
- `ESP_FAIL`: Connect MCPWM operator and timer failed because of other error

*esp\_err\_t* `mcpwm_operator_set_brake_on_fault` (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_brake\_config\_t* \*config)

Set brake method for MCPWM operator.

#### Parameters

- **oper** -- **[in]** MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- **[in]** MCPWM brake configuration

#### Returns

- `ESP_OK`: Set trip for operator successfully
- `ESP_ERR_INVALID_ARG`: Set trip for operator failed because of invalid argument
- `ESP_FAIL`: Set trip for operator failed because of other error

*esp\_err\_t* `mcpwm_operator_recover_from_fault` (*mcpwm\_oper\_handle\_t* oper, *mcpwm\_fault\_handle\_t* fault)

Try to make the operator recover from fault.

---

**Note:** To recover from fault or escape from trip, you make sure the fault signal has disappeared already. Otherwise the recovery can't succeed.

---

#### Parameters

- **oper** -- **[in]** MCPWM operator, allocated by `mcpwm_new_operator()`
- **fault** -- **[in]** MCPWM fault handle

#### Returns

- `ESP_OK`: Recover from fault successfully
- `ESP_ERR_INVALID_ARG`: Recover from fault failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Recover from fault failed because the fault source is still active
- `ESP_FAIL`: Recover from fault failed because of other error

*esp\_err\_t* `mcpwm_operator_register_event_callbacks` (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_operator\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM operator.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

#### Parameters

- **oper** -- **[in]** MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **cbs** -- **[in]** Group of callback functions

- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **mcpwm\_operator\_apply\_carrier** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_carrier\_config\_t* \*config)

Apply carrier feature for MCPWM operator.

**Parameters**

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM carrier specific configuration

**Returns**

- ESP\_OK: Set carrier for operator successfully
- ESP\_ERR\_INVALID\_ARG: Set carrier for operator failed because of invalid argument
- ESP\_FAIL: Set carrier for operator failed because of other error

**Structures**

struct **mcpwm\_operator\_config\_t**

MCPWM operator configuration.

**Public Members**

int **group\_id**

Specify from which group to allocate the MCPWM operator

int **intr\_priority**

MCPWM operator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **update\_gen\_action\_on\_tez**

Whether to update generator action when timer counts to zero

uint32\_t **update\_gen\_action\_on\_tep**

Whether to update generator action when timer counts to peak

uint32\_t **update\_gen\_action\_on\_sync**

Whether to update generator action on sync event

uint32\_t **update\_dead\_time\_on\_tez**

Whether to update dead time when timer counts to zero

uint32\_t **update\_dead\_time\_on\_tep**

Whether to update dead time when timer counts to peak

uint32\_t **update\_dead\_time\_on\_sync**

Whether to update dead time on sync event

struct *mcpwm\_operator\_config\_t*::[anonymous] **flags**

Extra configuration flags for operator

struct **mcpwm\_brake\_config\_t**

MCPWM brake configuration structure.

### Public Members

*mcpwm\_fault\_handle\_t* **fault**

Which fault causes the operator to brake

*mcpwm\_operator\_brake\_mode\_t* **brake\_mode**

Brake mode

uint32\_t **cbc\_recover\_on\_tez**

Recovery CBC brake state on tez event

uint32\_t **cbc\_recover\_on\_tep**

Recovery CBC brake state on tep event

struct *mcpwm\_brake\_config\_t*::[anonymous] **flags**

Extra flags for brake configuration

struct **mcpwm\_operator\_event\_callbacks\_t**

Group of supported MCPWM operator event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_brake\_event\_cb\_t* **on\_brake\_cbc**

callback function when mcpwm operator brakes in CBC

*mcpwm\_brake\_event\_cb\_t* **on\_brake\_ost**

callback function when mcpwm operator brakes in OST

struct **mcpwm\_carrier\_config\_t**

MCPWM carrier configuration structure.

### Public Members

*mcpwm\_carrier\_clock\_source\_t* **clk\_src**

MCPWM carrier clock source

uint32\_t **frequency\_hz**

Carrier frequency in Hz

uint32\_t **first\_pulse\_duration\_us**

The duration of the first PWM pulse, in us

float **duty\_cycle**

Carrier duty cycle

uint32\_t **invert\_before\_modulate**

Invert the raw signal

uint32\_t **invert\_after\_modulate**

Invert the modulated signal

struct *mcpwm\_carrier\_config\_t*::[anonymous] **flags**

Extra flags for carrier configuration

### Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_cmpr.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_cmpr.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **mcpwm\_new\_comparator** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_comparator\_config\_t* \*config, *mcpwm\_cmpr\_handle\_t* \*ret\_cmpr)

Create MCPWM comparator.

#### Parameters

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
- **config** -- [in] MCPWM comparator configuration
- **ret\_cmpr** -- [out] Returned MCPWM comparator

#### Returns

- ESP\_OK: Create MCPWM comparator successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM comparator failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM comparator failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM comparator failed because can't find free resource
- ESP\_FAIL: Create MCPWM comparator failed because of other error

*esp\_err\_t* **mcpwm\_del\_comparator** (*mcpwm\_cmpr\_handle\_t* cmpr)

Delete MCPWM comparator.

**Parameters** **cmpr** -- [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`

#### Returns

- ESP\_OK: Delete MCPWM comparator successfully

- `ESP_ERR_INVALID_ARG`: Delete MCPWM comparator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM comparator failed because of other error

`esp_err_t mcpwm_comparator_register_event_callbacks` (*mcpwm\_cmpr\_handle\_t* cmpr, const *mcpwm\_comparator\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM comparator.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

#### Parameters

- **cmpr** -- **[in]** MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

`esp_err_t mcpwm_comparator_set_compare_value` (*mcpwm\_cmpr\_handle\_t* cmpr, `uint32_t` cmp\_ticks)

Set MCPWM comparator's compare value.

#### Parameters

- **cmpr** -- **[in]** MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cmp\_ticks** -- **[in]** The new compare value

#### Returns

- `ESP_OK`: Set MCPWM compare value successfully
- `ESP_ERR_INVALID_ARG`: Set MCPWM compare value failed because of invalid argument (e.g. the `cmp_ticks` is out of range)
- `ESP_ERR_INVALID_STATE`: Set MCPWM compare value failed because the operator doesn't have a timer connected
- `ESP_FAIL`: Set MCPWM compare value failed because of other error

## Structures

struct `mcpwm_comparator_config_t`

MCPWM comparator configuration.

### Public Members

`int intr_priority`

MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

`uint32_t update_cmp_on_tez`

Whether to update compare value when timer count equals to zero (tez)

`uint32_t update_cmp_on_tep`

Whether to update compare value when timer count equals to peak (tep)

uint32\_t **update\_cmp\_on\_sync**

Whether to update compare value on sync event

struct *mcpwm\_comparator\_config\_t*::[anonymous] **flags**

Extra configuration flags for comparator

struct **mcpwm\_comparator\_event\_callbacks\_t**

Group of supported MCPWM compare event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

## Public Members

*mcpwm\_compare\_event\_cb\_t* **on\_reach**

ISR callback function which would be invoked when counter reaches compare value

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_gen.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_gen.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **mcpwm\_new\_generator** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_generator\_config\_t* \*config, *mcpwm\_gen\_handle\_t* \*ret\_gen)

Allocate MCPWM generator from given operator.

### Parameters

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM generator configuration
- **ret\_gen** -- [out] Returned MCPWM generator

### Returns

- `ESP_OK`: Create MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM generator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM generator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM generator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM generator failed because of other error

*esp\_err\_t* **mcpwm\_del\_generator** (*mcpwm\_gen\_handle\_t* gen)

Delete MCPWM generator.

**Parameters** **gen** -- [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`

### Returns

- ESP\_OK: Delete MCPWM generator successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM generator failed because of invalid argument
- ESP\_FAIL: Delete MCPWM generator failed because of other error

*esp\_err\_t* **mcpwm\_generator\_set\_force\_level** (*mcpwm\_gen\_handle\_t* gen, int level, bool hold\_on)

Set force level for MCPWM generator.

---

**Note:** The force level will be applied to the generator immediately, regardless any other events that would change the generator's behaviour.

---

---

**Note:** If the `hold_on` is `true`, the force level will retain forever, until user removes the force level by setting the force level to `-1`.

---

---

**Note:** If the `hold_on` is `false`, the force level can be overridden by the next event action.

---

---

**Note:** The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn't equal to the final output level.

---

#### Parameters

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **level** -- **[in]** GPIO level to be applied to MCPWM generator, specially, `-1` means to remove the force level
- **hold\_on** -- **[in]** Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

#### Returns

- ESP\_OK: Set force level for MCPWM generator successfully
- ESP\_ERR\_INVALID\_ARG: Set force level for MCPWM generator failed because of invalid argument
- ESP\_FAIL: Set force level for MCPWM generator failed because of other error

*esp\_err\_t* **mcpwm\_generator\_set\_action\_on\_timer\_event** (*mcpwm\_gen\_handle\_t* gen,  
*mcpwm\_gen\_timer\_event\_action\_t*  
ev\_act)

Set generator action on MCPWM timer event.

#### Parameters

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM timer event action, can be constructed by `MCPWM_GEN_TIMER_EVENT_ACTION` helper macro

#### Returns

- ESP\_OK: Set generator action successfully
- ESP\_ERR\_INVALID\_ARG: Set generator action failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set generator action failed because of timer is not connected to operator
- ESP\_FAIL: Set generator action failed because of other error

*esp\_err\_t* **mcpwm\_generator\_set\_actions\_on\_timer\_event** (*mcpwm\_gen\_handle\_t* gen,  
*mcpwm\_gen\_timer\_event\_action\_t*  
ev\_act, ...)

Set generator actions on multiple MCPWM timer events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

---

**Parameters**

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

**Returns**

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set generator actions failed because of timer is not connected to operator
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_compare_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_compare\_event\_action\_t* ev\_act)

Set generator action on MCPWM compare event.

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_compare_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_compare\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM compare events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

---

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

**Returns**

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_brake_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_brake\_event\_action\_t* ev\_act)

Set generator action on MCPWM brake event.

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`

- **ev\_act** -- **[in]** MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_brake_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_brake\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM brake events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

---

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

**Returns**

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_fault_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_fault\_event\_action\_t* ev\_act)

Set generator action on MCPWM Fault event.

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_FAULT_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_sync_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_sync\_event\_action\_t* ev\_act)

Set generator action on MCPWM Sync event.

---

**Note:** The trigger only support one sync action, regardless of the kinds. Should not call this function more than once.

---

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_SYNC_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

`esp_err_t mcpwm_generator_set_dead_time` (*mcpwm\_gen\_handle\_t* in\_generator, *mcpwm\_gen\_handle\_t* out\_generator, const *mcpwm\_dead\_time\_config\_t* \*config)

Set dead time for MCPWM generator.

---

**Note:** Due to a hardware limitation, you can't set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

---

#### Parameters

- **in\_generator** -- [in] MCPWM generator, before adding the dead time
- **out\_generator** -- [in] MCPWM generator, after adding the dead time
- **config** -- [in] MCPWM dead time configuration

#### Returns

- ESP\_OK: Set dead time for MCPWM generator successfully
- ESP\_ERR\_INVALID\_ARG: Set dead time for MCPWM generator failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)
- ESP\_FAIL: Set dead time for MCPWM generator failed because of other error

### Structures

struct **mcpwm\_generator\_config\_t**

MCPWM generator configuration.

#### Public Members

int **gen\_gpio\_num**

The GPIO number used to output the PWM signal

uint32\_t **invert\_pwm**

Whether to invert the PWM signal (done by GPIO matrix)

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **io\_od\_mode**

Configure the GPIO as open-drain mode

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

struct *mcpwm\_generator\_config\_t*::[anonymous] **flags**

Extra configuration flags for generator

struct **mcpwm\_gen\_timer\_event\_action\_t**

Generator action on specific timer event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_timer\_event\_t* **event**

Timer event

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_compare\_event\_action\_t**

Generator action on specific comparator event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_cmpr\_handle\_t* **comparator**

Comparator handle

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_brake\_event\_action\_t**

Generator action on specific brake event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_operator\_brake\_mode\_t* **brake\_mode**

Brake mode

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_fault\_event\_action\_t**

Generator action on specific fault event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_fault\_handle\_t* **fault**

Which fault as the trigger. Only support GPIO fault

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_sync\_event\_action\_t**

Generator action on specific sync event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_sync\_handle\_t* **sync**

Which sync as the trigger

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_dead\_time\_config\_t**

MCPWM dead time configuration structure.

### Public Members

uint32\_t **posedge\_delay\_ticks**

delay time applied to rising edge, 0 means no rising delay time

uint32\_t **negedge\_delay\_ticks**

delay time applied to falling edge, 0 means no falling delay time

uint32\_t **invert\_output**

Invert the signal after applied the dead time

struct *mcpwm\_dead\_time\_config\_t*::[anonymous] **flags**

Extra flags for dead time configuration

### Macros

**MCPWM\_GEN\_TIMER\_EVENT\_ACTION** (dir, ev, act)

Help macros to construct a *mcpwm\_gen\_timer\_event\_action\_t* entry.

**MCPWM\_GEN\_TIMER\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_COMPARE\_EVENT\_ACTION** (dir, cmp, act)

Help macros to construct a *mcpwm\_gen\_compare\_event\_action\_t* entry.

**MCPWM\_GEN\_COMPARE\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_BRAKE\_EVENT\_ACTION** (dir, mode, act)

Help macros to construct a *mcpwm\_gen\_brake\_event\_action\_t* entry.

**MCPWM\_GEN\_BRAKE\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_FAULT\_EVENT\_ACTION** (dir, flt, act)

Help macros to construct a *mcpwm\_gen\_fault\_event\_action\_t* entry.

**MCPWM\_GEN\_SYNC\_EVENT\_ACTION** (dir, syn, act)

Help macros to construct a *mcpwm\_gen\_sync\_event\_action\_t* entry.

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_fault.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_fault.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **mcpwm\_new\_gpio\_fault** (const *mcpwm\_gpio\_fault\_config\_t* \*config, *mcpwm\_fault\_handle\_t* \*ret\_fault)

Create MCPWM GPIO fault.

### Parameters

- **config** -- [in] MCPWM GPIO fault configuration
- **ret\_fault** -- [out] Returned GPIO fault handle

### Returns

- **ESP\_OK**: Create MCPWM GPIO fault successfully
- **ESP\_ERR\_INVALID\_ARG**: Create MCPWM GPIO fault failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create MCPWM GPIO fault failed because out of memory
- **ESP\_ERR\_NOT\_FOUND**: Create MCPWM GPIO fault failed because can't find free resource
- **ESP\_FAIL**: Create MCPWM GPIO fault failed because of other error

*esp\_err\_t* **mcpwm\_new\_soft\_fault** (const *mcpwm\_soft\_fault\_config\_t* \*config, *mcpwm\_fault\_handle\_t* \*ret\_fault)

Create MCPWM software fault.

### Parameters

- **config** -- [in] MCPWM software fault configuration
- **ret\_fault** -- [out] Returned software fault handle

### Returns

- **ESP\_OK**: Create MCPWM software fault successfully
- **ESP\_ERR\_INVALID\_ARG**: Create MCPWM software fault failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create MCPWM software fault failed because out of memory
- **ESP\_FAIL**: Create MCPWM software fault failed because of other error

*esp\_err\_t* **mcpwm\_del\_fault** (*mcpwm\_fault\_handle\_t* fault)

Delete MCPWM fault.

**Parameters** **fault** -- [in] MCPWM fault handle allocated by `mcpwm_new_gpio_fault()` or `mcpwm_new_soft_fault()`

### Returns

- ESP\_OK: Delete MCPWM fault successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM fault failed because of invalid argument
- ESP\_FAIL: Delete MCPWM fault failed because of other error

*esp\_err\_t* **mcpwm\_soft\_fault\_activate** (*mcpwm\_fault\_handle\_t* fault)

Activate the software fault, trigger the fault event for once.

**Parameters** **fault** -- **[in]** MCPWM soft fault, allocated by `mcpwm_new_soft_fault()`

**Returns**

- ESP\_OK: Trigger MCPWM software fault event successfully
- ESP\_ERR\_INVALID\_ARG: Trigger MCPWM software fault event failed because of invalid argument
- ESP\_FAIL: Trigger MCPWM software fault event failed because of other error

*esp\_err\_t* **mcpwm\_fault\_register\_event\_callbacks** (*mcpwm\_fault\_handle\_t* fault, const *mcpwm\_fault\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM fault.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **fault** -- **[in]** MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_FAIL: Set event callbacks failed because of other error

## Structures

struct **mcpwm\_gpio\_fault\_config\_t**

MCPWM GPIO fault configuration structure.

## Public Members

int **group\_id**

In which MCPWM group that the GPIO fault belongs to

int **intr\_priority**

MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

int **gpio\_num**

GPIO used by the fault signal

uint32\_t **active\_level**

On which level the fault signal is treated as active

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

struct *mcpwm\_gpio\_fault\_config\_t*::[anonymous] **flags**

Extra configuration flags for GPIO fault

struct **mcpwm\_soft\_fault\_config\_t**

MCPWM software fault configuration structure.

struct **mcpwm\_fault\_event\_callbacks\_t**

Group of supported MCPWM fault event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

## Public Members

*mcpwm\_fault\_event\_cb\_t* **on\_fault\_enter**

ISR callback function that would be invoked when fault signal becomes active

*mcpwm\_fault\_event\_cb\_t* **on\_fault\_exit**

ISR callback function that would be invoked when fault signal becomes inactive

## Header File

- `components/driver/mcpwm/include/driver/mcpwm_sync.h`
- This header file can be included with:

```
#include "driver/mcpwm_sync.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **mcpwm\_new\_timer\_sync\_src** (*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_sync\_src\_config\_t* \*config, *mcpwm\_sync\_handle\_t* \*ret\_sync)

Create MCPWM timer sync source.

### Parameters

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

- **config** -- **[in]** MCPWM timer sync source configuration
- **ret\_sync** -- **[out]** Returned MCPWM sync handle

**Returns**

- ESP\_OK: Create MCPWM timer sync source successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM timer sync source failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM timer sync source failed because out of memory
- ESP\_ERR\_INVALID\_STATE: Create MCPWM timer sync source failed because the timer has created a sync source before
- ESP\_FAIL: Create MCPWM timer sync source failed because of other error

*esp\_err\_t* **mcpwm\_new\_gpio\_sync\_src** (const *mcpwm\_gpio\_sync\_src\_config\_t* \*config, *mcpwm\_sync\_handle\_t* \*ret\_sync)

Create MCPWM GPIO sync source.

**Parameters**

- **config** -- **[in]** MCPWM GPIO sync source configuration
- **ret\_sync** -- **[out]** Returned MCPWM GPIO sync handle

**Returns**

- ESP\_OK: Create MCPWM GPIO sync source successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM GPIO sync source failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM GPIO sync source failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM GPIO sync source failed because can't find free resource
- ESP\_FAIL: Create MCPWM GPIO sync source failed because of other error

*esp\_err\_t* **mcpwm\_new\_soft\_sync\_src** (const *mcpwm\_soft\_sync\_config\_t* \*config, *mcpwm\_sync\_handle\_t* \*ret\_sync)

Create MCPWM software sync source.

**Parameters**

- **config** -- **[in]** MCPWM software sync source configuration
- **ret\_sync** -- **[out]** Returned software sync handle

**Returns**

- ESP\_OK: Create MCPWM software sync successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM software sync failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM software sync failed because out of memory
- ESP\_FAIL: Create MCPWM software sync failed because of other error

*esp\_err\_t* **mcpwm\_del\_sync\_src** (*mcpwm\_sync\_handle\_t* sync)

Delete MCPWM sync source.

**Parameters** **sync** -- **[in]** MCPWM sync handle, allocated by `mcpwm_new_timer_sync_src()` or `mcpwm_new_gpio_sync_src()` or `mcpwm_new_soft_sync_src()`

**Returns**

- ESP\_OK: Delete MCPWM sync source successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM sync source failed because of invalid argument
- ESP\_FAIL: Delete MCPWM sync source failed because of other error

*esp\_err\_t* **mcpwm\_soft\_sync\_activate** (*mcpwm\_sync\_handle\_t* sync)

Activate the software sync, trigger the sync event for once.

**Parameters** **sync** -- **[in]** MCPWM soft sync handle, allocated by `mcpwm_new_soft_sync_src()`

**Returns**

- ESP\_OK: Trigger MCPWM software sync event successfully
- ESP\_ERR\_INVALID\_ARG: Trigger MCPWM software sync event failed because of invalid argument

- `ESP_FAIL`: Trigger MCPWM software sync event failed because of other error

## Structures

struct `mcpwm_timer_sync_src_config_t`

MCPWM timer sync source configuration.

### Public Members

*mcpwm\_timer\_event\_t* `timer_event`

Timer event, upon which MCPWM timer will generate the sync signal

uint32\_t `propagate_input_sync`

The input sync signal would be routed to its sync output

struct *mcpwm\_timer\_sync\_src\_config\_t*::[anonymous] `flags`

Extra configuration flags for timer sync source

struct `mcpwm_gpio_sync_src_config_t`

MCPWM GPIO sync source configuration.

### Public Members

int `group_id`

MCPWM group ID

int `gpio_num`

GPIO used by sync source

uint32\_t `active_neg`

Whether the sync signal is active on negedge, by default, the sync signal's posedge is treated as active

uint32\_t `io_loop_back`

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t `pull_up`

Whether to pull up internally

uint32\_t `pull_down`

Whether to pull down internally

struct *mcpwm\_gpio\_sync\_src\_config\_t*::[anonymous] `flags`

Extra configuration flags for GPIO sync source

struct `mcpwm_soft_sync_config_t`

MCPWM software sync configuration structure.

## Header File

- `components/driver/mcpwm/include/driver/mcpwm_cap.h`
- This header file can be included with:

```
#include "driver/mcpwm_cap.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

`esp_err_t mcpwm_new_capture_timer` (const `mcpwm_capture_timer_config_t` \*config, `mcpwm_cap_timer_handle_t` \*ret\_cap\_timer)

Create MCPWM capture timer.

### Parameters

- **config** -- [in] MCPWM capture timer configuration
- **ret\_cap\_timer** -- [out] Returned MCPWM capture timer handle

### Returns

- `ESP_OK`: Create MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM capture timer failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM capture timer failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM capture timer failed because can't find free resource
- `ESP_FAIL`: Create MCPWM capture timer failed because of other error

`esp_err_t mcpwm_del_capture_timer` (`mcpwm_cap_timer_handle_t` cap\_timer)

Delete MCPWM capture timer.

**Parameters** **cap\_timer** -- [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

### Returns

- `ESP_OK`: Delete MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_enable` (`mcpwm_cap_timer_handle_t` cap\_timer)

Enable MCPWM capture timer.

**Parameters** **cap\_timer** -- [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

### Returns

- `ESP_OK`: Enable MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM capture timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM capture timer failed because timer is enabled already
- `ESP_FAIL`: Enable MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_disable` (`mcpwm_cap_timer_handle_t` cap\_timer)

Disable MCPWM capture timer.

**Parameters** **cap\_timer** -- [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

**Returns**

- ESP\_OK: Disable MCPWM capture timer successfully
- ESP\_ERR\_INVALID\_ARG: Disable MCPWM capture timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable MCPWM capture timer failed because timer is disabled already
- ESP\_FAIL: Disable MCPWM capture timer failed because of other error

*esp\_err\_t* **mcpwm\_capture\_timer\_start** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer)

Start MCPWM capture timer.

**Parameters** **cap\_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**

- ESP\_OK: Start MCPWM capture timer successfully
- ESP\_ERR\_INVALID\_ARG: Start MCPWM capture timer failed because of invalid argument
- ESP\_FAIL: Start MCPWM capture timer failed because of other error

*esp\_err\_t* **mcpwm\_capture\_timer\_stop** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer)

Stop MCPWM capture timer.

**Parameters** **cap\_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**

- ESP\_OK: Stop MCPWM capture timer successfully
- ESP\_ERR\_INVALID\_ARG: Stop MCPWM capture timer failed because of invalid argument
- ESP\_FAIL: Stop MCPWM capture timer failed because of other error

*esp\_err\_t* **mcpwm\_capture\_timer\_get\_resolution** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer, `uint32_t` \*out\_resolution)

Get MCPWM capture timer resolution, in Hz.

**Parameters**

- **cap\_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- **out\_resolution** -- **[out]** Returned capture timer resolution, in Hz

**Returns**

- ESP\_OK: Get capture timer resolution successfully
- ESP\_ERR\_INVALID\_ARG: Get capture timer resolution failed because of invalid argument
- ESP\_FAIL: Get capture timer resolution failed because of other error

*esp\_err\_t* **mcpwm\_capture\_timer\_set\_phase\_on\_sync** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer, `const mcpwm_capture_timer_sync_phase_config_t` \*config)

Set sync phase for MCPWM capture timer.

**Parameters**

- **cap\_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- **config** -- **[in]** MCPWM capture timer sync phase configuration

**Returns**

- ESP\_OK: Set sync phase for MCPWM capture timer successfully
- ESP\_ERR\_INVALID\_ARG: Set sync phase for MCPWM capture timer failed because of invalid argument
- ESP\_FAIL: Set sync phase for MCPWM capture timer failed because of other error

*esp\_err\_t* **mcpwm\_new\_capture\_channel** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer, `const mcpwm_capture_channel_config_t` \*config, *mcpwm\_cap\_channel\_handle\_t* \*ret\_cap\_channel)

Create MCPWM capture channel.

---

**Note:** The created capture channel won't be enabled until calling `mcpwm_capture_channel_enable`

---

#### Parameters

- **cap\_timer** -- [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
- **config** -- [in] MCPWM capture channel configuration
- **ret\_cap\_channel** -- [out] Returned MCPWM capture channel

#### Returns

- `ESP_OK`: Create MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM capture channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM capture channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM capture channel failed because can't find free resource
- `ESP_FAIL`: Create MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_del_capture_channel` (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Delete MCPWM capture channel.

**Parameters** `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

#### Returns

- `ESP_OK`: Delete MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM capture channel failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_enable` (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Enable MCPWM capture channel.

---

**Note:** This function will transit the channel state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

---

**Parameters** `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

#### Returns

- `ESP_OK`: Enable MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM capture channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM capture channel failed because the channel is already enabled
- `ESP_FAIL`: Enable MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_disable` (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Disable MCPWM capture channel.

**Parameters** `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- ESP\_OK: Disable MCPWM capture channel successfully
- ESP\_ERR\_INVALID\_ARG: Disable MCPWM capture channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable MCPWM capture channel failed because the channel is not enabled yet
- ESP\_FAIL: Disable MCPWM capture channel failed because of other error

*esp\_err\_t* **mcpwm\_capture\_channel\_register\_event\_callbacks** (*mcpwm\_cap\_channel\_handle\_t* cap\_channel, const *mcpwm\_capture\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM capture channel.

---

**Note:** The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **cap\_channel** -- **[in]** MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set event callbacks failed because the channel is not in init state
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **mcpwm\_capture\_channel\_trigger\_soft\_catch** (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Trigger a catch by software.

**Parameters** **cap\_channel** -- **[in]** MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- ESP\_OK: Trigger software catch successfully
- ESP\_ERR\_INVALID\_ARG: Trigger software catch failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Trigger software catch failed because the channel is not enabled yet
- ESP\_FAIL: Trigger software catch failed because of other error

**Structures**

struct **mcpwm\_capture\_timer\_config\_t**

MCPWM capture timer configuration structure.

**Public Members**

int **group\_id**

Specify from which group to allocate the capture timer

*mcpwm\_capture\_clock\_source\_t* **clk\_src**

MCPWM capture timer clock source

uint32\_t **resolution\_hz**

Resolution of capture timer

struct **mcpwm\_capture\_timer\_sync\_phase\_config\_t**

MCPWM Capture timer sync phase configuration.

### Public Members

*mcpwm\_sync\_handle\_t* **sync\_src**

The sync event source

uint32\_t **count\_value**

The count value that should lock to upon sync event

*mcpwm\_timer\_direction\_t* **direction**

The count direction that should lock to upon sync event

struct **mcpwm\_capture\_channel\_config\_t**

MCPWM capture channel configuration structure.

### Public Members

int **gpio\_num**

GPIO used capturing input signal

int **intr\_priority**

MCPWM capture interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **prescale**

Prescale of input signal, effective frequency = cap\_input\_clk/prescale

uint32\_t **pos\_edge**

Whether to capture on positive edge

uint32\_t **neg\_edge**

Whether to capture on negative edge

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

uint32\_t **invert\_cap\_signal**

Invert the input capture signal

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **keep\_io\_conf\_at\_exit**

For debug/test, whether to keep the GPIO configuration when capture channel is deleted. By default, driver will reset the GPIO pin at exit.

struct *mcpwm\_capture\_channel\_config\_t*::[anonymous] **flags**

Extra configuration flags for capture channel

struct **mcpwm\_capture\_event\_callbacks\_t**

Group of supported MCPWM capture event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

## Public Members

*mcpwm\_capture\_event\_cb\_t* **on\_cap**

Callback function that would be invoked when capture event occurred

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_etm.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_etm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **mcpwm\_comparator\_new\_etm\_event** (*mcpwm\_cmpr\_handle\_t* cmpr, const *mcpwm\_cmpr\_etm\_event\_config\_t* \*config, *esp\_etm\_event\_handle\_t* \*out\_event)

Get the ETM event for MCPWM comparator.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

### Parameters

- **cmpr** -- [in] MCPWM comparator, allocated by `mcpwm_new_comparator()` or `mcpwm_new_event_comparator()`

- **config** -- **[in]** MCPWM ETM comparator event configuration
- **out\_event** -- **[out]** Returned ETM event handle

**Returns**

- ESP\_OK: Get ETM event successfully
- ESP\_ERR\_INVALID\_ARG: Get ETM event failed because of invalid argument
- ESP\_FAIL: Get ETM event failed because of other error

**Structures**

struct **mcpwm\_cmpr\_etm\_event\_config\_t**  
MCPWM event comparator ETM event configuration.

**Public Members**

*mcpwm\_comparator\_etm\_event\_type\_t* **event\_type**  
MCPWM comparator ETM event type

**Header File**

- [components/driver/mcpwm/include/driver/mcpwm\\_types.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Structures**

struct **mcpwm\_timer\_event\_data\_t**  
MCPWM timer event data.

**Public Members**

uint32\_t **count\_value**  
MCPWM timer count value

*mcpwm\_timer\_direction\_t* **direction**  
MCPWM timer count direction

struct **mcpwm\_brake\_event\_data\_t**  
MCPWM brake event data.

struct **mcpwm\_fault\_event\_data\_t**  
MCPWM fault event data.

struct **mcpwm\_compare\_event\_data\_t**  
MCPWM compare event data.

### Public Members

uint32\_t **compare\_ticks**

Compare value

*mcpwm\_timer\_direction\_t* **direction**

Count direction

struct **mcpwm\_capture\_event\_data\_t**

MCPWM capture event data.

### Public Members

uint32\_t **cap\_value**

Captured value

*mcpwm\_capture\_edge\_t* **cap\_edge**

Capture edge

### Type Definitions

typedef struct mcpwm\_timer\_t \***mcpwm\_timer\_handle\_t**

Type of MCPWM timer handle.

typedef struct mcpwm\_oper\_t \***mcpwm\_oper\_handle\_t**

Type of MCPWM operator handle.

typedef struct mcpwm\_cmpr\_t \***mcpwm\_cmpr\_handle\_t**

Type of MCPWM comparator handle.

typedef struct mcpwm\_gen\_t \***mcpwm\_gen\_handle\_t**

Type of MCPWM generator handle.

typedef struct mcpwm\_fault\_t \***mcpwm\_fault\_handle\_t**

Type of MCPWM fault handle.

typedef struct mcpwm\_sync\_t \***mcpwm\_sync\_handle\_t**

Type of MCPWM sync handle.

typedef struct mcpwm\_cap\_timer\_t \***mcpwm\_cap\_timer\_handle\_t**

Type of MCPWM capture timer handle.

typedef struct mcpwm\_cap\_channel\_t \***mcpwm\_cap\_channel\_handle\_t**

Type of MCPWM capture channel handle.

typedef bool (\***mcpwm\_timer\_event\_cb\_t**)(*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_event\_data\_t* \*edata, void \*user\_ctx)

MCPWM timer event callback function.

**Param timer** [in] MCPWM timer handle

**Param edata [in]** MCPWM timer event data, fed by driver  
**Param user\_ctx [in]** User data, set in `mcpwm_timer_register_event_callbacks()`  
**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_brake_event_cb_t)(mcpwm_oper_handle_t oper, const mcpwm_brake_event_data_t *edata, void *user_ctx)
```

MCPWM operator brake event callback function.

**Param oper [in]** MCPWM operator handle  
**Param edata [in]** MCPWM brake event data, fed by driver  
**Param user\_ctx [in]** User data, set in `mcpwm_operator_register_event_callbacks()`  
**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_fault_event_cb_t)(mcpwm_fault_handle_t fault, const mcpwm_fault_event_data_t *edata, void *user_ctx)
```

MCPWM fault event callback function.

**Param fault** MCPWM fault handle  
**Param edata** MCPWM fault event data, fed by driver  
**Param user\_ctx** User data, set in `mcpwm_fault_register_event_callbacks()`  
**Return** whether a task switch is needed after the callback returns

```
typedef bool (*mcpwm_compare_event_cb_t)(mcpwm_cmpr_handle_t comparator, const mcpwm_compare_event_data_t *edata, void *user_ctx)
```

MCPWM comparator event callback function.

**Param comparator** MCPWM comparator handle  
**Param edata** MCPWM comparator event data, fed by driver  
**Param user\_ctx** User data, set in `mcpwm_comparator_register_event_callbacks()`  
**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_capture_event_cb_t)(mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_data_t *edata, void *user_ctx)
```

MCPWM capture event callback function.

**Param cap\_channel** MCPWM capture channel handle  
**Param edata** MCPWM capture event data, fed by driver  
**Param user\_ctx** User data, set in `mcpwm_capture_channel_register_event_callbacks()`  
**Return** Whether a high priority task has been waken up by this function

## Header File

- `components/hal/include/hal/mcpwm_types.h`
- This header file can be included with:

```
#include "hal/mcpwm_types.h"
```

## Type Definitions

```
typedef soc_periph_mcpwm_timer_clk_src_t mcpwm_timer_clock_source_t
```

MCPWM timer clock source.

```
typedef soc_periph_mcpwm_capture_clk_src_t mcpwm_capture_clock_source_t
```

MCPWM capture clock source.

```
typedef soc_periph_mcpwm_carrier_clk_src_t mcpwm_carrier_clock_source_t
```

MCPWM carrier clock source.

## Enumerations

enum **mcpwm\_timer\_direction\_t**

MCPWM timer count direction.

*Values:*

enumerator **MCPWM\_TIMER\_DIRECTION\_UP**

Counting direction: Increase

enumerator **MCPWM\_TIMER\_DIRECTION\_DOWN**

Counting direction: Decrease

enum **mcpwm\_timer\_event\_t**

MCPWM timer events.

*Values:*

enumerator **MCPWM\_TIMER\_EVENT\_EMPTY**

MCPWM timer counts to zero (i.e. counter is empty)

enumerator **MCPWM\_TIMER\_EVENT\_FULL**

MCPWM timer counts to peak (i.e. counter is full)

enumerator **MCPWM\_TIMER\_EVENT\_INVALID**

MCPWM timer invalid event

enum **mcpwm\_timer\_count\_mode\_t**

MCPWM timer count modes.

*Values:*

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_PAUSE**

MCPWM timer paused

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_UP**

MCPWM timer counting up

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_DOWN**

MCPWM timer counting down

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_UP\_DOWN**

MCPWM timer counting up and down

enum **mcpwm\_timer\_start\_stop\_cmd\_t**

MCPWM timer commands, specify the way to start or stop the timer.

*Values:*

enumerator **MCPWM\_TIMER\_STOP\_EMPTY**

MCPWM timer stops when next count reaches zero

enumerator **MCPWM\_TIMER\_STOP\_FULL**

MCPWM timer stops when next count reaches peak

enumerator **MCPWM\_TIMER\_START\_NO\_STOP**

MCPWM timer starts counting, and don't stop until received stop command

enumerator **MCPWM\_TIMER\_START\_STOP\_EMPTY**

MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM\_TIMER\_START\_STOP\_FULL**

MCPWM timer starts counting and stops when next count reaches peak

enum **mcpwm\_generator\_action\_t**

MCPWM generator actions.

*Values:*

enumerator **MCPWM\_GEN\_ACTION\_KEEP**

Generator action: Keep the same level

enumerator **MCPWM\_GEN\_ACTION\_LOW**

Generator action: Force to low level

enumerator **MCPWM\_GEN\_ACTION\_HIGH**

Generator action: Force to high level

enumerator **MCPWM\_GEN\_ACTION\_TOGGLE**

Generator action: Toggle level

enum **mcpwm\_operator\_brake\_mode\_t**

MCPWM operator brake mode.

*Values:*

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_CBC**

Brake mode: CBC (cycle by cycle)

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_OST**

Brake mode: OST (one shot)

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_INVALID**

MCPWM operator invalid brake mode

enum **mcpwm\_capture\_edge\_t**

MCPWM capture edge.

*Values:*

enumerator **MCPWM\_CAP\_EDGE\_POS**

Capture on the positive edge

enumerator **MCPWM\_CAP\_EDGE\_NEG**

Capture on the negative edge

enum **mcpwm\_comparator\_etm\_event\_type\_t**

MCPWM comparator specific events that supported by the ETM module.

*Values:*

enumerator **MCPWM\_CMPR\_ETM\_EVENT\_EQUAL**

The count value equals the value of comparator

enumerator **MCPWM\_CMPR\_ETM\_EVENT\_MAX**

Maximum number of comparator events

## 2.6.13 Pulse Counter (PCNT)

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32 contains multiple pulse counter units in the module.<sup>1</sup> Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of **edge** type and **level** type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit's counter on each edge. The level signal is the so-called **control signal**, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a **quadrature decoder**.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal's frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

### Functional Overview

Description of the PCNT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Set Up Channel Actions* - covers how to configure the PCNT channel to behave on different signal edges and levels.
- *Watch Points* - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- *Register Event Callbacks* - describes how to hook your specific code to the watch point event callback function.
- *Set Glitch Filter* - describes how to enable and set the timing parameters for the internal glitch filter.
- *Enable and Disable Unit* - describes how to enable and disable the PCNT unit.
- *Unit IO Control* - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- *Power Management* - describes what functionality will prevent the chip from going into low power mode.

---

<sup>1</sup> Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver does not forbid you from applying for more PCNT units and channels, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `pcnt_new_unit()`).

- *IRAM Safe* - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there is a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter's width, which by default is 16 bit at most, defined in the hardware. See also *Compensate Overflow Loss* for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

---

**Note:** Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

---

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e., unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it is recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by **edge** type signal and **level** type signal. Please note, either of them can be assigned to -1 if it is not actually used, and thus it will become a **virtual IO**. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO

by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO causes that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.

- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for **edge** and **level** input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to `-1`.
- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.
- `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO's input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e., channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it is recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

**Set Up Channel Actions** The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to `-1` when allocating PCNT channel by `pcnt_new_channel()`.

```
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
↪DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_
↪counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
↪KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

**Watch Points** Each PCNT unit can be configured to watch several different values that you are interested in. The value to be watched is also called **Watch Point**. The watch point itself can not exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and

`pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See *Register Event Callbacks* for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly-used watch points are: **zero cross**, **maximum/minimum count** and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can not find any free hardware resource to save the watch point. You can not add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

**Note:** Due to the hardware limitation, after adding a watch point, you should call `pcnt_unit_clear_count()` to make it take effect.

**Register Event Callbacks** When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different **counting direction** and **counting step size**.

Registering callback function results in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_
↳data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &(edata->watch_point_value), &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}
```

(continues on next page)

(continued from previous page)

```
pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```

**Set Glitch Filter** The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in [pcnt\\_glitch\\_filter\\_config\\_t](#):

- [pcnt\\_glitch\\_filter\\_config\\_t::max\\_glitch\\_ns](#) sets the maximum glitch width, in nano seconds. If a signal pulse's width is smaller than this value, then it will be treated as noise and will not increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#) with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#) with a NULL filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return [ESP\\_ERR\\_INVALID\\_STATE](#) error.

---

**Note:** The glitch filter operates using the APB clock. To ensure the counter does not miss any pulses, the maximum glitch width should be longer than one APB\_CLK cycle (typically 12.5 ns if APB is 80 MHz). Since the APB frequency can change with Dynamic Frequency Scaling (DFS), the filter may not function as expected in such cases. Therefore, the driver installs a power management lock for each PCNT unit. For more details on the power management strategy used in the PCNT driver, please refer to [Power Management](#).

---

```
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

**Enable and Disable Unit** Before doing IO control to the PCNT unit, you need to enable it first, by calling [pcnt\\_unit\\_enable\(\)](#). Internally, this function:

- switches the PCNT driver state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed in [pcnt\\_unit\\_register\\_event\\_callbacks\(\)](#).
- acquires a proper power management lock if it has been installed. See also [Power Management](#) for more information.

On the contrary, calling [pcnt\\_unit\\_disable\(\)](#) will do the opposite, that is, put the PCNT driver back to the **init** state, disable the interrupts service and release the power management lock.

## Unit IO Control

**Start/Stop and Clear** Calling [pcnt\\_unit\\_start\(\)](#) makes the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling [pcnt\\_unit\\_stop\(\)](#) will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling [pcnt\\_unit\\_clear\\_count\(\)](#).

Note, [pcnt\\_unit\\_start\(\)](#) and [pcnt\\_unit\\_stop\(\)](#) should be called when the unit has been enabled by [pcnt\\_unit\\_enable\(\)](#). Otherwise, it will return [ESP\\_ERR\\_INVALID\\_STATE](#) error.

**Get Count Value** You can read current count value at any time by calling [pcnt\\_unit\\_get\\_count\(\)](#). The returned count value is a **signed** integer, where the sign can be used to reflect the direction.

```
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

**Compensate Overflow Loss** The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter's bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the *Watch Points*.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware's count value, but also accumulates the high/low overflow loss to it.

---

**Note:** `pcnt_unit_clear_count()` resets the accumulated count value as well.

---

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system adjusts the APB frequency before entering light sleep, which can cause the PCNT glitch filter to misinterpret valid signals as noise.

To prevent this, the driver can acquire a power management lock of type `ESP_PM_APB_FREQ_MAX`, ensuring the APB frequency remains constant. This lock is acquired when the PCNT unit is enabled via `pcnt_unit_enable()` and released when the unit is disabled via `pcnt_unit_disable()`.

**IRAM Safe** By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM<sup>2</sup>
3. Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety** The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

---

<sup>2</sup> `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

## Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

## Application Examples

- Decode the quadrature signals from rotary encoder: [peripherals/pcnt/rotary\\_encoder](#).

## API Reference

### Header File

- `components/driver/pcnt/include/driver/pulse_cnt.h`
- This header file can be included with:

```
#include "driver/pulse_cnt.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t pcnt_new_unit` (const `pcnt_unit_config_t` \*config, `pcnt_unit_handle_t` \*ret\_unit)

Create a new PCNT unit, and return the handle.

---

**Note:** The newly created PCNT unit is put in the init state.

---

#### Parameters

- `config` -- [in] PCNT unit configuration
- `ret_unit` -- [out] Returned PCNT unit handle

#### Returns

- `ESP_OK`: Create PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- `ESP_ERR_NO_MEM`: Create PCNT unit failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create PCNT unit failed because all PCNT units are used up and no more free one
- `ESP_FAIL`: Create PCNT unit failed because of other error

`esp_err_t pcnt_del_unit` (`pcnt_unit_handle_t` unit)

Delete the PCNT unit handle.

---

**Note:** A PCNT unit can't be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Delete the PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- `ESP_FAIL`: Delete the PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_set_glitch_filter` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_glitch\_filter\_config\_t* \*config)

Set glitch filter for PCNT unit.

---

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won't be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

---

---

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` -- [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**

- `ESP_OK`: Set glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- `ESP_ERR_INVALID_STATE`: Set glitch filter failed because the unit is not in the init state
- `ESP_FAIL`: Set glitch filter failed because of other error

*esp\_err\_t* `pcnt_unit_enable` (*pcnt\_unit\_handle\_t* unit)

Enable the PCNT unit.

---

**Note:** This function will transit the unit state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `pcnt_unit_register_event_callbacks()`.

---

---

**Note:** This function will acquire the PM lock if it's lazy installed in `pcnt_unit_set_glitch_filter()`.

---

---

**Note:** Enable a PCNT unit doesn't mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Enable PCNT unit successfully

- `ESP_ERR_INVALID_ARG`: Enable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable PCNT unit failed because the unit is already enabled
- `ESP_FAIL`: Enable PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_disable` (*pcnt\_unit\_handle\_t* unit)

Disable the PCNT unit.

---

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

---

---

**Note:** Disable a PCNT unit doesn't mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Disable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Disable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Disable PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_start` (*pcnt\_unit\_handle\_t* unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_stop` (*pcnt\_unit\_handle\_t* unit)

Stop PCNT from counting.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** The stop operation won't clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Stop PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Stop PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_clear_count` (*pcnt\_unit\_handle\_t* unit)

Clear PCNT pulse count value to zero.

---

**Note:** It's recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Clear PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Clear PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Clear PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_get_count` (*pcnt\_unit\_handle\_t* unit, int \*value)

Get PCNT count value.

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `value` -- [out] Returned count value

**Returns**

- `ESP_OK`: Get PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Get PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Get PCNT pulse count failed because of other error

*esp\_err\_t* **pcnt\_unit\_register\_event\_callbacks** (*pcnt\_unit\_handle\_t* unit, const *pcnt\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for PCNT unit.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `pcnt_unit_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

#### Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the unit is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* **pcnt\_unit\_add\_watch\_point** (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

#### Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** -- [in] Value to be watched

#### Returns

- `ESP_OK`: Add watch point successfully
- `ESP_ERR_INVALID_ARG`: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- `ESP_ERR_INVALID_STATE`: Add watch point failed because the same watch point has already been added
- `ESP_ERR_NOT_FOUND`: Add watch point failed because no more hardware watch point can be configured
- `ESP_FAIL`: Add watch point failed because of other error

*esp\_err\_t* **pcnt\_unit\_remove\_watch\_point** (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Remove a watch point for PCNT unit.

#### Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** -- [in] Watch point value

#### Returns

- `ESP_OK`: Remove watch point successfully
- `ESP_ERR_INVALID_ARG`: Remove watch point failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- `ESP_FAIL`: Remove watch point failed because of other error

*esp\_err\_t* **pcnt\_new\_channel** (*pcnt\_unit\_handle\_t* unit, const *pcnt\_chan\_config\_t* \*config, *pcnt\_channel\_handle\_t* \*ret\_chan)

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

**Note:** This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

---

**Parameters**

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **config** -- **[in]** PCNT channel configuration
- **ret\_chan** -- **[out]** Returned channel handle

**Returns**

- **ESP\_OK**: Create PCNT channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Create PCNT channel failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create PCNT channel failed because of insufficient memory
- **ESP\_ERR\_NOT\_FOUND**: Create PCNT channel failed because all PCNT channels are used up and no more free one
- **ESP\_ERR\_INVALID\_STATE**: Create PCNT channel failed because the unit is not in the init state
- **ESP\_FAIL**: Create PCNT channel failed because of other error

*esp\_err\_t* `pcnt_del_channel` (*pcnt\_channel\_handle\_t* chan)

Delete the PCNT channel.

**Parameters** **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`

**Returns**

- **ESP\_OK**: Delete the PCNT channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Delete the PCNT channel failed because of invalid argument
- **ESP\_FAIL**: Delete the PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_edge_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_edge\_action\_t* pos\_act, *pcnt\_channel\_edge\_action\_t* neg\_act)

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

**Parameters**

- **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- **pos\_act** -- **[in]** Action on posedge signal
- **neg\_act** -- **[in]** Action on negedge signal

**Returns**

- **ESP\_OK**: Set edge action for PCNT channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Set edge action for PCNT channel failed because of invalid argument
- **ESP\_FAIL**: Set edge action for PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_level_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_level\_action\_t* high\_act, *pcnt\_channel\_level\_action\_t* low\_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

**Parameters**

- **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- **high\_act** -- **[in]** Action on high level signal
- **low\_act** -- **[in]** Action on low level signal

**Returns**

- **ESP\_OK**: Set level action for PCNT channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Set level action for PCNT channel failed because of invalid argument
- **ESP\_FAIL**: Set level action for PCNT channel failed because of other error

## Structures

struct **pcnt\_watch\_event\_data\_t**

PCNT watch event data.

### Public Members

int **watch\_point\_value**

Watch point value that triggered the event

*pcnt\_unit\_zero\_cross\_mode\_t* **zero\_cross\_mode**

Zero cross mode

struct **pcnt\_event\_callbacks\_t**

Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_PCNT\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

### Public Members

*pcnt\_watch\_cb\_t* **on\_reach**

Called when PCNT unit counter reaches any watch point

struct **pcnt\_unit\_config\_t**

PCNT unit configuration.

### Public Members

int **low\_limit**

Low limitation of the count unit, should be lower than 0

int **high\_limit**

High limitation of the count unit, should be higher than 0

int **intr\_priority**

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **accum\_count**

Whether to accumulate the count value when overflows at the high/low limit

struct *pcnt\_unit\_config\_t*::[anonymous] **flags**

Extra flags

struct **pcnt\_chan\_config\_t**  
PCNT channel configuration.

### Public Members

int **edge\_gpio\_num**  
GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int **level\_gpio\_num**  
GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32\_t **invert\_edge\_input**  
Invert the input edge signal

uint32\_t **invert\_level\_input**  
Invert the input level signal

uint32\_t **virt\_edge\_io\_level**  
Virtual edge IO level, 0: low, 1: high. Only valid when edge\_gpio\_num is set to -1

uint32\_t **virt\_level\_io\_level**  
Virtual level IO level, 0: low, 1: high. Only valid when level\_gpio\_num is set to -1

uint32\_t **io\_loop\_back**  
For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt\_chan\_config\_t*::[anonymous] **flags**  
Channel config flags

struct **pcnt\_glitch\_filter\_config\_t**  
PCNT glitch filter configuration.

### Public Members

uint32\_t **max\_glitch\_ns**  
Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

### Type Definitions

typedef struct pcnt\_unit\_t **\*pcnt\_unit\_handle\_t**  
Type of PCNT unit handle.

typedef struct pcnt\_chan\_t **\*pcnt\_channel\_handle\_t**  
Type of PCNT channel handle.

typedef bool (**\*pcnt\_watch\_cb\_t**)(*pcnt\_unit\_handle\_t* unit, const *pcnt\_watch\_event\_data\_t* \*edata, void \*user\_ctx)

PCNT watch event callback prototype.

---

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

---

**Param unit [in]** PCNT unit handle

**Param edata [in]** PCNT event data, fed by the driver

**Param user\_ctx [in]** User data, passed from `pcnt_unit_register_event_callbacks()`

**Return** Whether a high priority task has been woken up by this function

### Header File

- [components/hal/include/hal/pcnt\\_types.h](#)
- This header file can be included with:

```
#include "hal/pcnt_types.h"
```

### Enumerations

enum `pcnt_channel_level_action_t`

PCNT channel action on control level.

*Values:*

enumerator `PCNT_CHANNEL_LEVEL_ACTION_KEEP`

Keep current count mode

enumerator `PCNT_CHANNEL_LEVEL_ACTION_INVERSE`

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator `PCNT_CHANNEL_LEVEL_ACTION_HOLD`

Hold current count value

enum `pcnt_channel_edge_action_t`

PCNT channel action on signal edge.

*Values:*

enumerator `PCNT_CHANNEL_EDGE_ACTION_HOLD`

Hold current count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_INCREASE`

Increase count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_DECREASE`

Decrease count value

enum `pcnt_unit_zero_cross_mode_t`

PCNT unit zero cross mode.

*Values:*

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_ZERO**

start from positive value, end to zero, i.e. +N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_ZERO**

start from negative value, end to zero, i.e. -N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_POS**

start from negative value, end to positive value, i.e. -N->+M

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_NEG**

start from positive value, end to negative value, i.e. +N->-M

## 2.6.14 Remote Control Transceiver (RMT)

### Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32 contains multiple channels in the RMT peripheral<sup>1</sup>. Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols** The RMT hardware defines data in its own pattern -- the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal's duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal's logic level, i.e., high or low.

**RMT Transmitter Overview** The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver encodes the user's data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview** The data path and control path of an RMT RX channel is illustrated in the figure below:

---

<sup>1</sup> Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation*.

Fig. 20: Structure of RMT symbols (L - signal level)

Fig. 21: RMT Transmitter Overview

Fig. 22: RMT Receiver Overview

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal's stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

## Functional Overview

The description of the RMT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- *Carrier Modulation and Demodulation* - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- *Register Event Callbacks* - covers how to register user-provided event callbacks to receive RMT channel events.
- *Enable and Disable Channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for a TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for an RX channel.
- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- *RMT Encoder* - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- *Power Management* - describes how different clock sources affects power consumption.
- *IRAM Safe* - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation** Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel** To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the *Power Management* section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, you can set a larger value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel's assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .trans_queue_depth = 4,           // set the number of transactions that can
    ↪pend in the background
    .flags.invert_out = false,        // do not invert output signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

**Install RMT RX Channel** To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the [Power Management](#) section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form

(1,2,3) , not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2,                    // GPIO number
    .flags.invert_in = false,          // do not invert input signal
    .flags.with_dma = false,           // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

**Note:** Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

**Uninstall RMT Channel** If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

**Carrier Modulation and Demodulation** The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal's frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

**Note:** For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,                // duty cycle 33%
    .frequency_hz = 38000,             // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_
↔level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));
```

(continues on next page)

(continued from previous page)

```

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,           // duty cycle 33%
    .frequency_hz = 25000,       // 25 KHz carrier, should be smaller than
    →the transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));

```

**Register Event Callbacks** When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver's ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the "trans-done" event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid during the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

**Enable and Disable Channel** `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`.

`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

**Initiate TX Transaction** RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to [RMT Encoder](#).

Once you created an encoder, you can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, you also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The "trans-done" event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the "trans-done" event is when the specified number of iterations have completed.

---

**Note:** The **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

---

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
- `rmt_transmit_config_t::queue_nonblocking` sets whether to wait for a free slot in the transaction queue when it is full. If this value is set to `true`, then the function will return with an error code `ESP_ERR_INVALID_STATE` when the queue is full. Otherwise, the function will block until a free slot is available in the queue.

---

**Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
  - Customize an encoder and construct an infinite loop in the encoding function. See also [RMT Encoder](#).
- 

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission** In some real-time control applications (e.g., to make two robotic arms move simultaneously), you do not want any time drift between different channels. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

**Install RMT Sync Manager** To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

Fig. 23: RMT TX Sync

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that
        ↪ can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),

```

(continues on next page)

(continued from previous page)

```
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
↳num * 3, &transmit_config));
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for_
↳tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
↳num * 3, &transmit_config));
```

**Initiate RX Transaction** As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames are truncated by the hardware, and the driver reports an error message: `hw buffer too small, received symbols truncated`.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also *Register Event Callbacks* for more information.

```
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_
↳rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// the following timing requirement is based on NEC protocol
```

(continues on next page)

(continued from previous page)

```

rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // the shortest duration for NEC signal is
    ↪560 μs, 1250 ns < 560 μs, valid signal is not treated as noise
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is
    ↪9000 μs, 12000000 ns > 9000 μs, the receive does not stop early
};

rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a
    ↪standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
    ↪config));
// wait for the RX-done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

```

**RMT Encoder** An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, the driver utilizes a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also [Composite Pattern](#) for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
  - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
  - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
  - If the result contains `RMT_ENCODING_MEM_FULL`, the program needs to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
  - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

**Copy Encoder** A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

**Bytes Encoder** A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode

dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianness of each byte. If it is set to true, the encoder encodes the **Most Significant Bit** first. Otherwise, it encodes the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

Fig. 24: RMT Encoder Chain

**Customize RMT Encoder for NEC Protocol** This section demonstrates how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is  $562.5 \mu\text{s}$  in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a  $562.5 \mu\text{s}$  pulse burst followed by a  $562.5 \mu\text{s}$  space, with a total transmit time of  $1.125 \text{ ms}$
- Logical 1: a  $562.5 \mu\text{s}$  pulse burst followed by a  $1.6875 \text{ ms}$  space, with a total transmit time of  $2.25 \text{ ms}$

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

Fig. 25: IR NEC Frame

- $9 \text{ ms}$  leading pulse burst, also called the "AGC pulse"
- $4.5 \text{ ms}$  space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command

- 8-bit logical inverse of the command
- a final 562.5  $\mu$ s pulse burst to signify the end of message transmission

Then you can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard_
    ↪encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading_
    ↪and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address_
    ↪and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT_
    ↪representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT_
    ↪representation
    int state; // record the current encoding state, i.e., we are in which_
    ↪encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t_
    ↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
    ↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
    ↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
            ↪encoder->nec_leading_symbol,
                sizeof(rmt_symbol_word_t), &
            ↪session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; // we can only switch to the next state when_
            ↪the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding_
            ↪artifacts
            }
            // fall-through
            case 1: // send address
                encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
            ↪code->address, sizeof(uint16_t), &session_state);
                if (session_state & RMT_ENCODING_COMPLETE) {
                    nec_encoder->state = 2; // we can only switch to the next state when_
            ↪the current encoder finished
                }
                if (session_state & RMT_ENCODING_MEM_FULL) {
```

(continues on next page)

```

        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding_
↪artifacts
    }
    // fall-through
    case 2: // send command
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->command, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 3; // we can only switch to the next state when_
↪the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding_
↪artifacts
        }
        // fall-through
        case 3: // send ending code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_ending_symbol,
                                                    sizeof(rmt_symbol_word_t), &
↪session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = RMT_ENCODING_RESET; // back to the initial_
↪encoding session
                state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding_
↪has finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding_
↪artifacts
            }
        }
    }
out:
    *ret_state = state;
    return encoded_symbols;
}

```

A full sample code can be found in [peripherals/rmt/ir\\_nec\\_transceiver](#). In the above snippet, we use a switch-case and several goto statements to implement a [Finite-state machine](#). With this pattern, users can construct much more complex IR protocols.

**Power Management** When power management is enabled, i.e., [CONFIG\\_PM\\_ENABLE](#) is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type [ESP\\_PM\\_APB\\_FREQ\\_MAX](#). Whenever the user creates an RMT channel that has selected [RMT\\_CLK\\_SRC\\_APB](#) as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by [rmt\\_enable\(\)](#). Likewise, the driver releases the lock after [rmt\\_disable\(\)](#) is called for the same channel. This also reveals that the [rmt\\_enable\(\)](#) and [rmt\\_disable\(\)](#) should appear in pairs.

If the channel clock source is selected to others like [RMT\\_CLK\\_SRC\\_XTAL](#), then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-

time application. What is worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM<sup>2</sup>
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt handler to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Another Kconfig option `CONFIG_RMT_RECV_FUNC_IN_IRAM` can place `rmt_receive()` into the IRAM as well. So that the receive function can be used even when the flash cache is disabled.

**Thread Safety** The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

The following functions are allowed to use under ISR context as well.

- `rmt_receive()`

### Kconfig Options

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.
- `CONFIG_RMT_RECV_FUNC_IN_IRAM` controls where to place the RMT receive function (IRAM or Flash), see *IRAM Safe* for more information.

### Application Examples

- RMT-based RGB LED strip customized encoder: [peripherals/rmt/led\\_strip](#)
- RMT IR NEC protocol encoding and decoding: [peripherals/rmt/ir\\_nec\\_transceiver](#)
- RMT transactions in queue: [peripherals/rmt/musical\\_buzzer](#)
- RMT-based stepper motor with S-curve algorithm: [peripherals/rmt/stepper\\_motor](#)
- RMT infinite loop for driving DShot ESC: [peripherals/rmt/dshot\\_esc](#)
- RMT simulate 1-wire protocol (take DS18B20 as example): [peripherals/rmt/onewire](#)

### FAQ

- Why the RMT encoder results in more data than expected?

The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes **faster** than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 64.
- Place the encoding function in the IRAM.
- Enables the `rmt_tx_channel_config_t::with_dma` if it is available for your chip.

---

<sup>2</sup> The callback function, e.g., `rmt_tx_event_callbacks_t::on_trans_done`, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

## API Reference

### Header File

- [components/driver/rmt/include/driver/rmt\\_tx.h](#)
- This header file can be included with:

```
#include "driver/rmt_tx.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **rmt\_new\_tx\_channel** (const *rmt\_tx\_channel\_config\_t* \*config, *rmt\_channel\_handle\_t* \*ret\_chan)

Create a RMT TX channel.

#### Parameters

- **config** -- [in] TX channel configurations
- **ret\_chan** -- [out] Returned generic RMT channel handle

#### Returns

- **ESP\_OK**: Create RMT TX channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Create RMT TX channel failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create RMT TX channel failed because out of memory
- **ESP\_ERR\_NOT\_FOUND**: Create RMT TX channel failed because all RMT channels are used up and no more free one
- **ESP\_ERR\_NOT\_SUPPORTED**: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- **ESP\_FAIL**: Create RMT TX channel failed because of other error

*esp\_err\_t* **rmt\_transmit** (*rmt\_channel\_handle\_t* tx\_channel, *rmt\_encoder\_handle\_t* encoder, const void \*payload, size\_t payload\_bytes, const *rmt\_transmit\_config\_t* \*config)

Transmit data by RMT TX channel.

---

**Note:** This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there's another one under processing. Based on the setting of *rmt\_transmit\_config\_t::queue\_nonblocking*, if there're too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

---

---

**Note:** The data to be transmitted will be encoded into RMT symbols by the specific *encoder*.

---

#### Parameters

- **tx\_channel** -- [in] RMT TX channel that created by `rmt_new_tx_channel()`
- **encoder** -- [in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- **payload** -- [in] The raw data to be encoded into RMT symbols
- **payload\_bytes** -- [in] Size of the `payload` in bytes
- **config** -- [in] Transmission specific configuration

#### Returns

- **ESP\_OK**: Transmit data successfully
- **ESP\_ERR\_INVALID\_ARG**: Transmit data failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE**: Transmit data failed because channel is not enabled

- `ESP_ERR_NOT_SUPPORTED`: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- `ESP_FAIL`: Transmit data failed because of other error

*esp\_err\_t* `rmt_tx_wait_all_done` (*rmt\_channel\_handle\_t* tx\_channel, int timeout\_ms)

Wait for all pending TX transactions done.

---

**Note:** This function will block forever if the pending transaction can't be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

---

#### Parameters

- `tx_channel` -- [in] RMT TX channel that created by `rmt_new_tx_channel()`
- `timeout_ms` -- [in] Wait timeout, in ms. Specially, -1 means to wait forever.

#### Returns

- `ESP_OK`: Flush transactions successfully
- `ESP_ERR_INVALID_ARG`: Flush transactions failed because of invalid argument
- `ESP_ERR_TIMEOUT`: Flush transactions failed because of timeout
- `ESP_FAIL`: Flush transactions failed because of other error

*esp\_err\_t* `rmt_tx_register_event_callbacks` (*rmt\_channel\_handle\_t* tx\_channel, const *rmt\_tx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for RMT TX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- `tx_channel` -- [in] RMT generic channel that created by `rmt_new_tx_channel()`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `rmt_new_sync_manager` (const *rmt\_sync\_manager\_config\_t* \*config, *rmt\_sync\_manager\_handle\_t* \*ret\_synchro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

---

**Note:** All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

---

#### Parameters

- `config` -- [in] Synchronization manager configuration
- `ret_synchro` -- [out] Returned synchronization manager handle

**Returns**

- ESP\_OK: Create sync manager successfully
- ESP\_ERR\_INVALID\_ARG: Create sync manager failed because of invalid argument
- ESP\_ERR\_NOT\_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP\_ERR\_INVALID\_STATE: Create sync manager failed because not all channels are enabled
- ESP\_ERR\_NO\_MEM: Create sync manager failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP\_FAIL: Create sync manager failed because of other error

*esp\_err\_t* **rmt\_del\_sync\_manager** (*rmt\_sync\_manager\_handle\_t* synchro)

Delete synchronization manager.

**Parameters** **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- ESP\_OK: Delete the synchronization manager successfully
- ESP\_ERR\_INVALID\_ARG: Delete the synchronization manager failed because of invalid argument
- ESP\_FAIL: Delete the synchronization manager failed because of other error

*esp\_err\_t* **rmt\_sync\_reset** (*rmt\_sync\_manager\_handle\_t* synchro)

Reset synchronization manager.

**Parameters** **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- ESP\_OK: Reset the synchronization manager successfully
- ESP\_ERR\_INVALID\_ARG: Reset the synchronization manager failed because of invalid argument
- ESP\_FAIL: Reset the synchronization manager failed because of other error

**Structures**

struct **rmt\_tx\_event\_callbacks\_t**

Group of RMT TX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_RMT\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

**Public Members**

*rmt\_tx\_done\_callback\_t* **on\_trans\_done**

Event callback, invoked when transmission is finished

struct **rmt\_tx\_channel\_config\_t**

RMT TX channel specific configuration.

### Public Members

`gpio_num_t` **gpio\_num**

GPIO number used by RMT TX channel. Set to -1 if unused

`rmt_clock_source_t` **clk\_src**

Clock source of RMT TX channel, channels in the same group must use the same clock source

`uint32_t` **resolution\_hz**

Channel clock resolution, in Hz

`size_t` **mem\_block\_symbols**

Size of memory block, in number of `rmt_symbol_word_t`, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

`size_t` **trans\_queue\_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background

`int` **intr\_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

`uint32_t` **invert\_out**

Whether to invert the RMT channel signal before output to GPIO pad

`uint32_t` **with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

`uint32_t` **io\_loop\_back**

The signal output from the GPIO will be fed to the input path as well

`uint32_t` **io\_od\_mode**

Configure the GPIO as open-drain mode

struct `rmt_tx_channel_config_t`::[anonymous] **flags**

TX channel config flags

struct **rmt\_transmit\_config\_t**

RMT transmit specific configuration.

### Public Members

`int` **loop\_count**

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

`uint32_t` **eot\_level**

Set the output level for the "End Of Transmission"

uint32\_t **queue\_nonblocking**

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *rmt\_transmit\_config\_t*::[anonymous] **flags**

Transmit specific config flags

struct **rmt\_sync\_manager\_config\_t**

Synchronous manager configuration.

## Public Members

const *rmt\_channel\_handle\_t* \***tx\_channel\_array**

Array of TX channels that are about to be managed by a synchronous controller

size\_t **array\_size**

Size of the `tx_channel_array`

## Header File

- [components/driver/rmt/include/driver/rmt\\_rx.h](#)
- This header file can be included with:

```
#include "driver/rmt_rx.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **rmt\_new\_rx\_channel** (const *rmt\_rx\_channel\_config\_t* \*config, *rmt\_channel\_handle\_t* \*ret\_chan)

Create a RMT RX channel.

### Parameters

- **config** -- [in] RX channel configurations
- **ret\_chan** -- [out] Returned generic RMT channel handle

### Returns

- `ESP_OK`: Create RMT RX channel successfully
- `ESP_ERR_INVALID_ARG`: Create RMT RX channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT RX channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create RMT RX channel failed because all RMT channels are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- `ESP_FAIL`: Create RMT RX channel failed because of other error

*esp\_err\_t* **rmt\_receive** (*rmt\_channel\_handle\_t* rx\_channel, void \*buffer, size\_t buffer\_size, const *rmt\_receive\_config\_t* \*config)

Initiate a receive job for RMT RX channel.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

---

**Note:** This function can also be called in ISR context.

---

**Note:** If you want this function to work even when the flash cache is disabled, please enable the `CONFIG_RMT_RECV_FUNC_IN_IRAM` option.

---

#### Parameters

- **rx\_channel** -- **[in]** RMT RX channel that created by `rmt_new_rx_channel()`
- **buffer** -- **[in]** The buffer to store the received RMT symbols
- **buffer\_size** -- **[in]** size of the `buffer`, in bytes
- **config** -- **[in]** Receive specific configurations

#### Returns

- `ESP_OK`: Initiate receive job successfully
- `ESP_ERR_INVALID_ARG`: Initiate receive job failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Initiate receive job failed because channel is not enabled
- `ESP_FAIL`: Initiate receive job failed because of other error

`esp_err_t rmt_rx_register_event_callbacks(rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t *cbs, void *user_data)`

Set callbacks for RMT RX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- **rx\_channel** -- **[in]** RMT generic channel that created by `rmt_new_rx_channel()`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

### Structures

struct `rmt_rx_event_callbacks_t`

Group of RMT RX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

*rmt\_rx\_done\_callback\_t* **on\_recv\_done**

Event callback, invoked when one RMT channel receiving transaction completes

struct **rmt\_rx\_channel\_config\_t**

RMT RX channel specific configuration.

### Public Members

gpio\_num\_t **gpio\_num**

GPIO number used by RMT RX channel. Set to -1 if unused

*rmt\_clock\_source\_t* **clk\_src**

Clock source of RMT RX channel, channels in the same group must use the same clock source

uint32\_t **resolution\_hz**

Channel clock resolution, in Hz

size\_t **mem\_block\_symbols**

Size of memory block, in number of *rmt\_symbol\_word\_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

uint32\_t **invert\_in**

Whether to invert the incoming RMT channel signal

uint32\_t **with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *rmt\_rx\_channel\_config\_t*::[anonymous] **flags**

RX channel config flags

int **intr\_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct **rmt\_receive\_config\_t**

RMT receive specific configuration.

## Public Members

uint32\_t **signal\_range\_min\_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32\_t **signal\_range\_max\_ns**

RMT will stop receiving if one symbol level has kept more than `signal_range_max_ns`

## Header File

- [components/driver/rmt/include/driver/rmt\\_common.h](#)
- This header file can be included with:

```
#include "driver/rmt_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **rmt\_del\_channel** (*rmt\_channel\_handle\_t* channel)

Delete an RMT channel.

**Parameters** **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

### Returns

- `ESP_OK`: Delete RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Delete RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete RMT channel failed because it is still in working
- `ESP_FAIL`: Delete RMT channel failed because of other error

*esp\_err\_t* **rmt\_apply\_carrier** (*rmt\_channel\_handle\_t* channel, const *rmt\_carrier\_config\_t* \*config)

Apply modulation feature for TX channel or demodulation feature for RX channel.

### Parameters

- **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** -- **[in]** Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

### Returns

- `ESP_OK`: Apply carrier configuration successfully
- `ESP_ERR_INVALID_ARG`: Apply carrier configuration failed because of invalid argument
- `ESP_FAIL`: Apply carrier configuration failed because of other error

*esp\_err\_t* **rmt\_enable** (*rmt\_channel\_handle\_t* channel)

Enable the RMT channel.

---

**Note:** This function will acquire a PM lock that might be installed during channel allocation

---

**Parameters** **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- ESP\_OK: Enable RMT channel successfully
- ESP\_ERR\_INVALID\_ARG: Enable RMT channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable RMT channel failed because it's enabled already
- ESP\_FAIL: Enable RMT channel failed because of other error

*esp\_err\_t* **rmt\_disable** (*rmt\_channel\_handle\_t* channel)

Disable the RMT channel.

---

**Note:** This function will release a PM lock that might be installed during channel allocation

---

**Parameters** **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- ESP\_OK: Disable RMT channel successfully
- ESP\_ERR\_INVALID\_ARG: Disable RMT channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable RMT channel failed because it's not enabled yet
- ESP\_FAIL: Disable RMT channel failed because of other error

**Structures**

struct **rmt\_carrier\_config\_t**

RMT carrier wave configuration (for either modulation or demodulation)

**Public Members**

uint32\_t **frequency\_hz**

Carrier wave frequency, in Hz, 0 means disabling the carrier

float **duty\_cycle**

Carrier wave duty cycle (0~100%)

uint32\_t **polarity\_active\_low**

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32\_t **always\_on**

If set, the carrier can always exist even there's not transfer undergoing

struct *rmt\_carrier\_config\_t*::[anonymous] **flags**

Carrier config flags

**Header File**

- `components/driver/rmt/include/driver/rmt_encoder.h`
- This header file can be included with:

```
#include "driver/rmt_encoder.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **rmt\_new\_bytes\_encoder** (const *rmt\_bytes\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

### Parameters

- **config** -- [in] Bytes encoder configuration
- **ret\_encoder** -- [out] Returned encoder handle

### Returns

- ESP\_OK: Create RMT bytes encoder successfully
- ESP\_ERR\_INVALID\_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create RMT bytes encoder failed because out of memory
- ESP\_FAIL: Create RMT bytes encoder failed because of other error

*esp\_err\_t* **rmt\_bytes\_encoder\_update\_config** (*rmt\_encoder\_handle\_t* bytes\_encoder, const *rmt\_bytes\_encoder\_config\_t* \*config)

Update the configuration of the bytes encoder.

---

**Note:** The configurations of the bytes encoder is also set up by `rmt_new_bytes_encoder()`. This function is used to update the configuration of the bytes encoder at runtime.

---

### Parameters

- **bytes\_encoder** -- [in] Bytes encoder handle, created by e.g `rmt_new_bytes_encoder()`
- **config** -- [in] Bytes encoder configuration

### Returns

- ESP\_OK: Update RMT bytes encoder successfully
- ESP\_ERR\_INVALID\_ARG: Update RMT bytes encoder failed because of invalid argument
- ESP\_FAIL: Update RMT bytes encoder failed because of other error

*esp\_err\_t* **rmt\_new\_copy\_encoder** (const *rmt\_copy\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

### Parameters

- **config** -- [in] Copy encoder configuration
- **ret\_encoder** -- [out] Returned encoder handle

### Returns

- ESP\_OK: Create RMT copy encoder successfully
- ESP\_ERR\_INVALID\_ARG: Create RMT copy encoder failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create RMT copy encoder failed because out of memory
- ESP\_FAIL: Create RMT copy encoder failed because of other error

*esp\_err\_t* **rmt\_del\_encoder** (*rmt\_encoder\_handle\_t* encoder)

Delete RMT encoder.

**Parameters** **encoder** -- [in] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

### Returns

- ESP\_OK: Delete RMT encoder successfully
- ESP\_ERR\_INVALID\_ARG: Delete RMT encoder failed because of invalid argument
- ESP\_FAIL: Delete RMT encoder failed because of other error

*esp\_err\_t* **rmt\_encoder\_reset** (*rmt\_encoder\_handle\_t* encoder)

Reset RMT encoder.

**Parameters** **encoder** -- [in] RMT encoder handle, created by e.g. `rmt_new_bytes_encoder()`

**Returns**

- ESP\_OK: Reset RMT encoder successfully
- ESP\_ERR\_INVALID\_ARG: Reset RMT encoder failed because of invalid argument
- ESP\_FAIL: Reset RMT encoder failed because of other error

void \***rmt\_alloc\_encoder\_mem** (size\_t size)

A helper function to allocate a proper memory for RMT encoder.

**Parameters** **size** -- Size of memory to be allocated

**Returns** Pointer to the allocated memory if the allocation is successful, NULL otherwise

## Structures

struct **rmt\_encoder\_t**

Interface of RMT encoder.

## Public Members

size\_t (**\*encode**)(*rmt\_encoder\_t* \*encoder, *rmt\_channel\_handle\_t* tx\_channel, const void \*primary\_data, size\_t data\_size, *rmt\_encode\_state\_t* \*ret\_state)

Encode the user data into RMT symbols and write into RMT memory.

---

**Note:** The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

---

---

**Note:** It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

---

**Param encoder** [in] Encoder handle

**Param tx\_channel** [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`

**Param primary\_data** [in] App data to be encoded into RMT symbols

**Param data\_size** [in] Size of primary\_data, in bytes

**Param ret\_state** [out] Returned current encoder's state

**Return** Number of RMT symbols that the primary data has been encoded into

*esp\_err\_t* (**\*reset**)(*rmt\_encoder\_t* \*encoder)

Reset encoding state.

**Param encoder** [in] Encoder handle

**Return**

- ESP\_OK: reset encoder successfully
- ESP\_FAIL: reset encoder failed

`esp_err_t (*del)(rmt_encoder_t *encoder)`

Delete encoder object.

**Param encoder [in]** Encoder handle

**Return**

- ESP\_OK: delete encoder successfully
- ESP\_FAIL: delete encoder failed

struct **rmt\_bytes\_encoder\_config\_t**

Bytes encoder configuration.

### Public Members

`rmt_symbol_word_t bit0`

How to represent BIT0 in RMT symbol

`rmt_symbol_word_t bit1`

How to represent BIT1 in RMT symbol

`uint32_t msb_first`

Whether to encode MSB bit first

struct `rmt_bytes_encoder_config_t::[anonymous] flags`

Encoder config flag

struct **rmt\_copy\_encoder\_config\_t**

Copy encoder configuration.

### Enumerations

enum **rmt\_encode\_state\_t**

RMT encoding state.

*Values:*

enumerator **RMT\_ENCODING\_RESET**

The encoding session is in reset state

enumerator **RMT\_ENCODING\_COMPLETE**

The encoding session is finished, the caller can continue with subsequent encoding

enumerator **RMT\_ENCODING\_MEM\_FULL**

The encoding artifact memory is full, the caller should return from current encoding session

### Header File

- `components/driver/rmt/include/driver/rmt_types.h`
- This header file can be included with:

```
#include "driver/rmt_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Structures

struct **rmt\_tx\_done\_event\_data\_t**

Type of RMT TX done event data.

### Public Members

size\_t **num\_symbols**

The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct **rmt\_rx\_done\_event\_data\_t**

Type of RMT RX done event data.

### Public Members

*rmt\_symbol\_word\_t* \***received\_symbols**

Point to the received RMT symbols

size\_t **num\_symbols**

The number of received RMT symbols

## Type Definitions

typedef struct rmt\_channel\_t \***rmt\_channel\_handle\_t**

Type of RMT channel handle.

typedef struct rmt\_sync\_manager\_t \***rmt\_sync\_manager\_handle\_t**

Type of RMT synchronization manager handle.

typedef struct *rmt\_encoder\_t* \***rmt\_encoder\_handle\_t**

Type of RMT encoder handle.

typedef bool (\***rmt\_tx\_done\_callback\_t**)(*rmt\_channel\_handle\_t* tx\_chan, const *rmt\_tx\_done\_event\_data\_t* \*edata, void \*user\_ctx)

Prototype of RMT event callback.

**Param tx\_chan [in]** RMT channel handle, created from `rmt_new_tx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `rmt_tx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this callback function

```
typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const  
rmt_rx_done_event_data_t *edata, void *user_ctx)
```

Prototype of RMT event callback.

**Param rx\_chan [in]** RMT channel handle, created from `rmt_new_rx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `rmt_rx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

## Header File

- `components/hal/include/hal/rmt_types.h`
- This header file can be included with:

```
#include "hal/rmt_types.h"
```

## Unions

```
union rmt_symbol_word_t
```

`#include <rmt_types.h>` The layout of RMT symbol stored in memory, which is decided by the hardware design.

### Public Members

```
uint16_t duration0
```

Duration of level0

```
uint16_t level0
```

Level of the first part

```
uint16_t duration1
```

Duration of level1

```
uint16_t level1
```

Level of the second part

```
struct rmt_symbol_word_t::[anonymous] [anonymous]
```

```
uint32_t val
```

Equivalent unsigned value for the RMT symbol

## Type Definitions

```
typedef soc_periph_rmt_clk_src_t rmt_clock_source_t
```

RMT group clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

## 2.6.15 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products needs to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see *MTDI Strapping Pin* below.

This document has the following structure:

- *Overview of compatibility* between the default pull states on pins of Espressif's products and the states required by the SD bus
- *Solutions* - ideas on how to resolve compatibility issues
- *Related information* - other relevant information

### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

### Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see [ESP32 datasheet](#)):
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2* for models with 3.3 V flash chip
- ESP32-D2WD:
  - *No Pull-ups*
  - *No Pull-up on GPIO12*

### Systems in Packages (SIP)

- ESP32-PICO-D4:
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*

### Modules

- ESP32-WROOM-32 Series, including ESP32-WROOM-32, ESP32-WROOM-32D, ESP32-WROOM-32U, and ESP32-SOLO-1
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
- ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  - *No Pull-ups*
- ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*

## Development Boards

- ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
  - *Download Mode Not Working (minor issue)*
- ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  - *No Pull-ups*
  - *Conflicts Between Bootstrap and SDIO on DAT2*
  - *Download Mode Not Working (minor issue)*
- ESP-WROVER-KIT
  - Required pull-ups are provided
  - *Pull-up Conflicts on GPIO13* (v4.1, v3, v2, and v1)
  - *Conflicts Between Bootstrap and SDIO on DAT2* (v4.1, v2, and v1)
  - *Download Mode Not Working (minor issue)* (v2, v1)

You can determine the version of your ESP23-WROVER-KIT by checking which module is mounted on it:

- ESP32-WROVER-B on v4.1
  - ESP32-WROVER on v3
  - ESP32-WROOM-32 on v1 and v2
- ESP32-LyraTD-MS-C
    - Required pull-ups are provided
    - *Conflicts Between Bootstrap and SDIO on DAT2*
  - ESP32-LyraT
    - Required pull-ups are provided
    - *Pull-up Conflicts on GPIO13*

**Non-Espressif Hosts** Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

## Solutions

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

**Pull-up Conflicts on GPIO13** If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device's DAT3 to VDD
- Use SPI mode
- **Perform one of the following actions on the GPIO13 pin:**
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

**Conflicts Between Bootstrap and SDIO on DAT2** There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see [MTDI Strapping Pin](#).

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This permanently configures the internal regulator's output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

**Warning:** Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on <https://www.espressif.com/>. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command burns the XPD\_SDIO\_TIEH, XPD\_SDIO\_FORCE, and XPD\_SDIO\_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD\_SDIO flash voltage regulator is permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....

Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:

```
` `components/esptool_py/esptool/espefuse.py summary` `
```

If running from an automated flashing script, `espefuse.py` has an option `--do-not-confirm`.

For more details, see **ESP32 Technical Reference Manual [PDF]**.

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one the following:

- Leave the host's DAT2 floating and directly connect the slave's DAT2 to VDD.
- For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option helps avoid slave detecting on the DAT2 line. Note that 4-bit SD mode is no longer supported by the standard Card Common Control Register (CCCR); however, the host is not aware of that. The use of 4-bit SD mode has to be disabled on the host's side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit pulls GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

## Related Information

**MTDI Strapping Pin** MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD\_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low level at startup, which leads to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD\_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif's boards with the SD card operation, see [Overview of Compatibility](#).

**Internal Pull-ups and Strapping Requirements** Using external resistors is always preferable. However, Espressif's products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups/pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

Table 4: Default pull-up and pull-down states of the CMD and DATA pins

GPIO number	Pin Name	Startup State	Strapping Requirement
15	CMD	WPU	
2	DAT0	WPD	Low for Download mode
4	DAT1	WPD	
12	DAT2	PU for 1.8 V flash; WPD for 3.3 V flash	High for 1.8 V flash; Low for 3.3 V flash
13	DAT3	WPU	

## 2.6.16 SDMMC Host Driver

### Overview

ESP32's SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device, or eMMC chip.

- Slot 0 (SDMMC\_HOST\_SLOT\_0) is an 8-bit slot. It uses HS1\_\* signals in the PIN MUX.
- Slot 1 (SDMMC\_HOST\_SLOT\_1) is a 4-bit slot. It uses HS2\_\* signals in the PIN MUX.

The slots are connected to ESP32 GPIOs using IO MUX. Pin mappings of these slots are given in the table below.

Signal	Slot 0	Slot 1
CMD	GPIO11	GPIO15
CLK	GPIO6	GPIO14
D0	GPIO7	GPIO2
D1	GPIO8	GPIO4
D2	GPIO9	GPIO12
D3	GPIO10	GPIO13
D4	GPIO16	
D5	GPIO17	
D6	GPIO5	
D7	GPIO18	
CD	any input via GPIO matrix	any input via GPIO matrix
WP	any input via GPIO matrix	any input via GPIO matrix

The Card Detect (CD) and Write Protect (WP) signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `cd` and `wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a CD pin when working with SDIO cards, because the CD signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (`HS1_*`) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be concurrently shared between an SD card and an SPI flash. If you need to use Slot 0, establish an alternative connection for the SPI flash using different pins and configure the necessary eFuses accordingly.

## Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed (40 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed DDR (40 MHz): 4-line with 3.3 V eMMC

Speed modes not supported at present:

- High Speed DDR mode: 8-line eMMC
- UHS-I 1.8 V modes: 4-line SD cards

## Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

## Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t`, i.e., `SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`, SDMMC Host driver will attempt to use the widest bus supported by the

card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

If you need a specific frequency other than standard speeds, you are free to use any value from within an appropriate range of the SD interface given (SDMMC or SDSPI). However, the real clock frequency shall be calculated by the underlying driver and the value can be different from the one required.

For the SDMMC, `max_freq_khz` works as the upper limit so the final frequency value shall be always lower or equal. For the SDSPI, the nearest fitting frequency is supplied and thus the value can be greater than/equal to/lower than `max_freq_khz`.

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

### DDR Mode for eMMC Chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping the `SDMMC_FREQ_HIGHSPEED` frequency, clear the `SDMMC_HOST_FLAG_DDR` bit in `sdmmc_host_t::flags` field of the `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

### See also

- [SD/SDIO/MMC Driver](#): introduces the higher-level driver which implements the protocol layer.
- [SD SPI Host Driver](#): introduces a similar driver that uses the SPI controller and is limited to SD protocol's SPI mode.
- [SD Pull-up Requirements](#): introduces pull-up support and compatibilities of modules and development kits.

## API Reference

### Header File

- [components/driver/sdmmc/include/driver/sdmmc\\_host.h](#)
- This header file can be included with:

```
#include "driver/sdmmc_host.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **sdmmc\_host\_init** (void)

Initialize SDMMC host peripheral.

---

**Note:** This function is not thread safe

---

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if sdmmc\_host\_init was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated

*esp\_err\_t* **sdmmc\_host\_init\_slot** (int slot, const *sdmmc\_slot\_config\_t* \*slot\_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1\_\* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2\_\* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

---

**Note:** This function is not thread safe

---

### Parameters

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **slot\_config** -- additional configuration for the slot

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if host has not been initialized using sdmmc\_host\_init

*esp\_err\_t* **sdmmc\_host\_set\_bus\_width** (int slot, size\_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD\_APP\_SET\_BUS\_WIDTH)

---

**Note:** This function is not thread safe

---

### Parameters

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **width** -- bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if slot number or width is not valid

size\_t **sdmmc\_host\_get\_slot\_width** (int slot)

Get bus width configured in sdmmc\_host\_init\_slot to be used for data transfer.

**Parameters** **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)

**Returns** configured bus width of the specified slot.

*esp\_err\_t* **sdmmc\_host\_set\_card\_clk** (int slot, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**Note:** This function is not thread safe

---

**Parameters**

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **freq\_khz** -- card clock frequency, in kHz

**Returns**

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdmmc\_host\_set\_bus\_ddr\_mode** (int slot, bool ddr\_enabled)

Enable or disable DDR mode of SD interface.

**Parameters**

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **ddr\_enabled** -- enable or disable DDR mode

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if DDR mode is not supported on this slot

*esp\_err\_t* **sdmmc\_host\_set\_cclk\_always\_on** (int slot, bool cclk\_always\_on)

Enable or disable always-on card clock. When `cclk_always_on` is false, the host controller is allowed to shut down the card clock between the commands. When `cclk_always_on` is true, the clock is generated even if no command is in progress.

**Parameters**

- **slot** -- slot number
- **cclk\_always\_on** -- enable or disable always-on clock

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the slot number is invalid

*esp\_err\_t* **sdmmc\_host\_do\_transaction** (int slot, *sdmmc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Attention** Data buffer passed in `cmdinfo->data` must be in DMA capable memory

---

**Note:** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

---

**Parameters**

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **cmdinfo** -- pointer to structure describing command and data to transfer

**Returns**

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response
- ESP\_ERR\_INVALID\_SIZE if the size of data transfer is not valid in SD protocol
- ESP\_ERR\_INVALID\_ARG if the data buffer is not in DMA capable memory

*esp\_err\_t* **sdmmc\_host\_io\_int\_enable** (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Parameters** **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)

**Returns** returns ESP\_OK, other errors possible in the future

*esp\_err\_t* **sdmmc\_host\_io\_int\_wait** (int slot, TickType\_t timeout\_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**Parameters**

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **timeout\_ticks** -- number of RTOS ticks to wait for the interrupt

**Returns**

- ESP\_OK on success (interrupt received)
- ESP\_ERR\_TIMEOUT if the interrupt did not occur within timeout\_ticks

*esp\_err\_t* **sdmmc\_host\_deinit** (void)

Disable SDMMC host and release allocated resources.

---

**Note:** This function is not thread safe

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if sdmmc\_host\_init function has not been called

*esp\_err\_t* **sdmmc\_host\_get\_real\_freq** (int slot, int \*real\_freq\_khz)

Provides a real frequency used for an SD card installed on specific slot of SD/MMC host controller.

This function calculates real working frequency given by current SD/MMC host controller setup for required slot: it reads associated host and card dividers from corresponding SDMMC registers, calculates respective frequency and stores the value into the 'real\_freq\_khz' parameter

**Parameters**

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **real\_freq\_khz** -- [out] output parameter for the result frequency (in kHz)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG on real\_freq\_khz == NULL or invalid slot number used

*esp\_err\_t* **sdmmc\_host\_set\_input\_delay** (int slot, *sdmmc\_delay\_phase\_t* delay\_phase)

set input delay

- This API sets delay when the SDMMC Host samples the signal from the SD Slave.
- This API will check if the given `delay_phase` is valid or not.
- This API will print out the delay time, in picosecond (ps)

---

**Note:** ESP32 doesn't support this feature, you will get an ESP\_ERR\_NOT\_SUPPORTED

---

**Parameters**

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **delay\_phase** -- delay phase, this API will convert the phase into picoseconds and print it out

**Returns**

- ESP\_OK: ON success.
- ESP\_ERR\_INVALID\_ARG: Invalid argument.

- `ESP_ERR_NOT_SUPPORTED`: ESP32 doesn't support this feature.

## Structures

struct **`sdmmc_slot_config_t`**

Extra configuration for SDMMC peripheral slot

### Public Members

`gpio_num_t` **`gpio_cd`**

GPIO number of card detect signal.

`gpio_num_t` **`cd`**

GPIO number of card detect signal; shorter name.

`gpio_num_t` **`gpio_wp`**

GPIO number of write protect signal.

`gpio_num_t` **`wp`**

GPIO number of write protect signal; shorter name.

`uint8_t` **`width`**

Bus width used by the slot (might be less than the max width supported)

`uint32_t` **`flags`**

Features used by this slot.

## Macros

### **`SDMMC_SLOT_FLAG_INTERNAL_PULLUP`**

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

### **`SDMMC_SLOT_FLAG_WP_ACTIVE_HIGH`**

GPIO write protect polarity. 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

## 2.6.17 SD SPI Host Driver

### Overview

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle `sdspi_dev_handle_t`, which returns when the device is attached to an SPI bus by calling `sdspi_host_init_device()`. It is important to note that the SPI bus should be initialized beforehand by `spi_bus_initialize()`.

This driver's naming pattern was adopted from the *SDMMC Host Driver* due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver that accesses the SD card in SPI mode offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral's signals can be routed to any ESP32 pin. Otherwise, if an SDMMC host driver is used (see [SDMMC Host Driver](#)) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached while requiring routing the signals through their dedicated IO\_MUX pins only.

With the help of [SPI Master Driver](#) the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

### How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize the structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use the `SDSPI_HOST_DEFAULT` macro to initialize the `sdmmc_host_t` structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device SD SPI handle just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

### Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [SD/SDIO/MMC Driver](#).

---

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

<p><b>Warning:</b> If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see <a href="#">Sharing the SPI Bus Among SD Cards and Other SPI Devices</a>.</p>
---

#### Sharing the SPI Bus Among SD Cards and Other SPI Devices

The SD card has an SPI mode, enabling it to function as an SPI device, but there are some restrictions that we need to pay attention to.

**Pin Loading of Other Devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC Loading** SD cards, designed for high-speed communications, have small pin capacitors (AC loading) to work until 50 MHz. However, the other attached devices will increase the pin's AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother, i.e., the gradient of the edge is smaller. The setup timing requirements of an SD card may be violated when the card is connected to a bus with a high AC load. Even worse, high AC loads may cause the SD card and other SPI devices to fail to properly resolve clock signals from the host, affecting communication stability.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors. The larger the pin capacity, the greater the pin response time, the smaller the max frequency the SD bus can work.

To see if your pin AC loading is too heavy, you can try the following tests:

Terminology:

- **launch edge:** at which clock edge the data starts to toggle;
- **latch edge:** at which clock edge the data is supposed to be sampled by the receiver. For SD card, it is the rising edge.

1. Use an oscilloscope to see the clock and compare the data line to the clock.
  - If you see the clock is not fast enough, e.g., the rising/falling edge is longer than 1/4 of the clock cycle, it means the clock is skewed too much.
  - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

You may also observe the corresponding phenomenon that data delayed largely from the launching edge of the clock with logic analyzers. But it is not as obvious as with an oscilloscope.

2. Try to use a slower clock frequency.

If the lower frequency can work while the higher frequency cannot, it is an indication that the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices with lower pin load or slow down the clock speed.

**DC Loading** The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700  $\mu$ A, otherwise, the device output may not be read correctly.

### Initialization Sequence

---

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed, such as setting `SDMMC_FREQ_PROBING` to 400 kHz for SD card, to avoid the influence of pin AC loading, as discussed in the previous section.

---

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed. Refer to [storage/sd\\_card](#) for further details.

1. Initialize the SPI bus properly by `spi_bus_initialize()`.
2. Tie the CS lines of all other devices than the SD card to idle state (by default it's high). This is to avoid conflicts with the SD card in the following step.

You can do this by either:

1. Attach devices to the SPI bus by calling `spi_bus_add_device()`. This function will by default initialize the GPIO that is used as CS to the idle level: high.
2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
3. Rely on the internal/external pull-up (**not recommended**) to pull up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up. For example, internal pull-down should be enabled.

3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount()`.  
This step will put the SD card into the SPI mode, which **should** be done before all other SPI communications on the same bus. Otherwise, the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.  
If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before the next power cycle, i.e., powered down and powered up again.
4. Now you can talk to other SPI devices freely!

## API Reference

### Header File

- `components/driver/spi/include/driver/sdspi_host.h`
- This header file can be included with:

```
#include "driver/sdspi_host.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

---

**Note:** This function is not thread safe

---

#### Returns

- `ESP_OK` on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` \*dev\_config, `sdspi_dev_handle_t` \*out\_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

---

**Note:** This function is not thread safe

---

---

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

---

---

**Note:** The SDIO over `sdspi` needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

---

#### Parameters

- `dev_config` -- pointer to device configuration structure
- `out_handle` -- Output of the handle to the `sdspi` device.

#### Returns

- `ESP_OK` on success

- ESP\_ERR\_INVALID\_ARG if sdspi\_host\_init\_device has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying spi\_master and gpio drivers

*esp\_err\_t* **sdspi\_host\_remove\_device** (*sdspi\_dev\_handle\_t* handle)

Remove an SD SPI device.

**Parameters** **handle** -- Handle of the SD SPI device

**Returns** Always ESP\_OK

*esp\_err\_t* **sdspi\_host\_do\_transaction** (*sdspi\_dev\_handle\_t* handle, *sdmhc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

---

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi\_host\_do\_transaction as long as other sdspi\_host\_\* functions are not called.

---

#### Parameters

- **handle** -- Handle of the sdspi device
- **cmdinfo** -- pointer to structure describing command and data to transfer

#### Returns

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response

*esp\_err\_t* **sdspi\_host\_set\_card\_clk** (*sdspi\_dev\_handle\_t* host, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**Note:** This function is not thread safe

---

#### Parameters

- **host** -- Handle of the sdspi device
- **freq\_khz** -- card clock frequency, in kHz

#### Returns

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdspi\_host\_get\_real\_freq** (*sdspi\_dev\_handle\_t* handle, int \*real\_freq\_khz)

Calculate working frequency for specific device.

#### Parameters

- **handle** -- SDSPI device handle
- **real\_freq\_khz** -- [out] output parameter to hold the calculated frequency (in kHz)

#### Returns

- ESP\_ERR\_INVALID\_ARG : handle is NULL or invalid or real\_freq\_khz parameter is NULL
- ESP\_OK : Success

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using sdspi\_host\_init.

---

**Note:** This function is not thread safe

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (*sdspi\_dev\_handle\_t* handle)

Enable SDIO interrupt.

**Parameters** `handle` -- Handle of the sdspi device

**Returns**

- ESP\_OK on success

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (*sdspi\_dev\_handle\_t* handle, TickType\_t timeout\_ticks)

Wait for SDIO interrupt until timeout.

**Parameters**

- `handle` -- Handle of the sdspi device
- `timeout_ticks` -- Ticks to wait before timeout.

**Returns**

- ESP\_OK on success

**Structures**

struct **sdspi\_device\_config\_t**

Extra configuration for SD SPI device.

**Public Members**

*spi\_host\_device\_t* **host\_id**

SPI host to use, SPIx\_HOST (see `spi_types.h`).

*gpio\_num\_t* **gpio\_cs**

GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

bool **gpio\_wp\_polarity**

GPIO write protect polarity 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

**Macros**

**SDSPI\_DEFAULT\_HOST**

**SDSPI\_DEFAULT\_DMA****SDSPI\_HOST\_DEFAULT ()**

Default *sdmmc\_host\_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an sdspi device initialized by *sdspi\_host\_init\_device ()*.

**SDSPI\_SLOT\_NO\_CS**

indicates that card select line is not used

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_IO\_ACTIVE\_LOW****SDSPI\_DEVICE\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SD SPI device.

**Type Definitions**

```
typedef int sdspi_dev_handle_t
```

Handle representing an SD SPI device.

## 2.6.18 SDIO Card Slave Driver

**Overview**

The ESP32 SDIO Card host and slave peripherals share two sets of pins, as shown in the table below. The first set is usually occupied by the SPI0 bus, which is responsible for the SPI flash holding the code to run. This means the SDIO slave driver can only run on the second set of pins while the SDIO host is not using it.

The SDIO slave can run under three modes: SPI, 1-bit SD, and 4-bit SD modes. Based on the signals on the interface, the device can determine the current mode and configure itself to adapt to that mode. Later, the slave driver can communicate with the slave device to properly handle commands and data transfers. According to the SDIO specification, the CMD and DAT0-3 signal lines should be pulled up whether in 1-bit SD, 4-bit SD or SPI mode.

**Connections**

Pin Name	Corresponding Pins in SPI Mode	GPIO Number (Slot 1)	GPIO Number (Slot 2)
CLK	SCLK	6	14
CMD	MOSI	11	15
DAT0	MISO	7	2
DAT1	Interrupt	8	4
DAT2	N.C. (pullup)	9	12
DAT3	#CS	10	13

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins, and the ground.
- 4-bit SD mode: Connect all pins, and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins, and the ground.

**Note:** Please check if CMD and DATA lines DAT0-DAT3 of the card are properly pulled up by 10 KOhm - 90 KOhm resistors, which should be ensured even in 1-bit mode or SPI mode. Most official modules do not offer these pullups internally. If you are using official development boards, check [Overview of Compatibility](#) to see whether your development boards have such pullups.

**Note:** Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using an ESP32 module with 3.3 V flash inside, when you are developing on the module for the first time, you will need to perform an eFuse burn-in prior to development. This will adjust the pin configuration of the module to make the module compatible with SDIO functionality. See [Overview of Compatibility](#) for details on how to configure this.

Here is a list of modules/kits with 3.3 V flash:

- Modules: All modules except ESP32-WROVER, ESP32-WROVER-I, ESP32-S3-WROOM-2, and please check [Modules Overview](#) for module list
- Kits: ESP32-PICO-KIT, ESP32-DevKitC (up to v4), ESP32-WROVER-KIT (v4.1 [also known as ESP32-WROVER-KIT-VB], v2, v1 [also known as DevKitJ v1])

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to [SD Pull-up Requirements](#) for more technical details of the pullups.

The host initializes the slave into SD mode by sending the CMD0 command with the DAT3 pin set to a high level. Alternatively, the host initializes the SPI mode by sending CMD0 with CS pin low, which is the same pin as DAT3.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection processes are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol.

The slave driver offers three services over Function 1 access by CMD52 and CMD53:

- (1) sending and receiving FIFO
- (2) 52 R/W registers (8-bit) shared by host and slave
- (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host)

**Terminology** The SDIO slave driver uses the following terms:

- A transfer is initiated by a command token from the host and may consist of a response and multiple data blocks. The core mechanism of the ESP32 SDIO slave driver involves data exchange and communication through transfers.
- Sending: slave to host transfers.
- Receiving: host to slave transfers.

---

**Note:** The register names in [ESP32 Technical Reference Manual > SDIO Slave Controller \[PDF\]](#) are organized from the host's perspective. For instance, RX registers indicate sending, while TX registers denote receiving. In our driver implementation, we've chosen not to utilize the terms TX or RX to prevent any potential ambiguities.

---

- **FIFO:** A designated address within Function 1 that can be accessed using CMD53 commands for reading or writing substantial volumes of data. The address corresponds to the length intended for reading from or writing to the slave in a single transfer: **requested length** = 0x1F800 –address.
- **Ownership:** When the driver assumes ownership of a buffer, it means that the driver has the capability to perform random read/write operations on the buffer (often via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; similarly, if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length:** The length requested in one transfer determined by the FIFO address.
- **Transfer length:** The length requested in one transfer determined by the CMD53 byte/block count field.

---

**Note:** Requested length is different from the transfer length. In the context of ESP32 SDIO slave DMA, the operation is based on the **requested length** rather than the **transfer length**. This means the DMA controller will process the data transfer according to the **requested length**, ensuring that only data within the **requested length** is transferred. The **transfer length** should be no shorter than the **requested length**, and the rest part is filled with 0 during sending or discard during receiving.

---

- **Receiving buffer size:** The buffer size is pre-defined between the host and the slave before communication starts. The slave application has to set the buffer size during initialization by the `recv_buffer_size` parameter in the `sdio_slave_config_t` structure.
- **Interrupts:** The ESP32 SDIO slave supports interrupts in two directions: from host to slave (referred to as slave interrupts) and from slave to host (referred to as host interrupts). For more details, refer to [Interrupts](#).
- **Registers:** Specific addresses in Function 1 accessed by CMD52 or CMD53.

**Communication with ESP SDIO Slave** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of [SDIO Simplified Specification](#)), which is described briefly in [ESP SDIO Slave Initialization](#).

Furthermore, there is an ESP32-specific upper-level communication protocol built upon the foundation of CMD52/CMD53 to Function 1. Within this particular communication protocol, the master and slave engage in data exchange and communication through the utilization of CMD52/CMD53 commands. For more detailed information, please consult the [ESP SDIO Slave Protocol](#) section.

There is also a component [ESP Serial Slave Link](#) designed for ESP32 master to communicate with ESP32 SDIO slave. See example [peripherals/sdio](#) when programming your host.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can trigger an interruption in the slave by writing a single bit to the 0x08D register. As soon as any bit within the register is set, an interrupt is generated, prompting the SDIO slave driver to invoke the callback function specified in the `slave_intr_cb` member of the `sdio_slave_config_t` structure.

---

**Note:** The callback function is called in the ISR. Do not use any delay, loop or blocking function in the callback, e.g., `mutex`.

---

Similar to the previous information, there's an alternative set of functions available. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line at certain time, which is level-sensitive, i.e., the interrupt signal can be triggered by detecting the level change of the interrupt line. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line holds active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general-purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 R/W shared registers (8-bit) to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver allocates memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling `sdio_slave_recv` or `sdio_slave_recv_packet`. If a non-blocking call is needed, set `wait=0`.

The difference between two APIs is that, `sdio_slave_recv_packet` gives more information about packet, which can consist of several buffers.

When `ESP_ERR_NOT_FINISHED` is returned by this API, you should call this API iteratively until the return value is `ESP_OK`. All the continuous buffers returned with `ESP_ERR_NOT_FINISHED`, together with the last buffer returned with `ESP_OK`, belong to one packet from the host.

Call `sdio_slave_recv_get_buf` to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.

If the host never send data longer than the Receiving buffer size, or you do not care about the packet boundary (e.g., the data is only a byte stream), you can call the simpler version `sdio_slave_recv` instead.

4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

---

**Note:** To minimize data copying overhead, the driver itself does not maintain any internal buffer; it is the responsibility of the application to promptly provide new buffers. The DMA system automatically stores received data into these buffers.

---

**Sending FIFO** Each time the slave has data to send, it raises an interrupt, and the host requests the packet length. There are two sending modes:

- Stream Mode: When a buffer is loaded into the driver, the buffer length is included into the packet length requested by host in the incoming communications. This is irrespective of whether previous packets have been sent or not. In other words, the length of the newly loaded buffer is included into the length of the packet requested by the host, even if there are previously unsent packets. This enables the host to receive data from several buffers in a single transfer.
- Packet Mode: The packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

---

**Note:** To avoid overhead from copying data, the driver itself does not have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished, so as to ensure that the data is transferred correctly.

---

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode, several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case, the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`.
  - If non-blocking call is needed, set `wait=0`.
  - If the `wait` is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be kept unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```
typedef struct {
    uint8_t* buffer;
    size_t size;
    int id;
}sdio_transfer_t;

//and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

//and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
sdio_slave_send_get_finished((void*)&arg, portMAX_DELAY);
ESP_LOGI("tag", "(%d) successfully send %d bytes of %p", arg->id, arg->size,
->arg->buffer);
some_post_callback(arg); //do more things
```

3. Work with the receiving part of this driver, and point `arg` to the receive buffer handle of this buffer, so that we can directly use the buffer to receive data when it is sent:

```
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_rcv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

//and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void*)&handle, portMAX_DELAY);
sdio_slave_rcv_load_buf(handle);
```

For more about this, see [peripherals/sdio](#).

## Application Example

Slave/master communication: [peripherals/sdio](#).

## API Reference

### Header File

- [components/hal/include/hal/sdio\\_slave\\_types.h](#)
- This header file can be included with:

```
#include "hal/sdio_slave_types.h"
```

### Enumerations

enum **sdio\_slave\_hostint\_t**

Mask of interrupts sending to the host.

*Values:*

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT0**

General purpose interrupt bit 0.

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT1**

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT2**

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT3**

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT4**

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT5**

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT6**

enumerator **SDIO\_SLAVE\_HOSTINT\_BIT7**

enumerator **SDIO\_SLAVE\_HOSTINT\_SEND\_NEW\_PACKET**

New packet available.

enum **sdio\_slave\_timing\_t**

Timing of SDIO slave.

*Values:*

enumerator **SDIO\_SLAVE\_TIMING\_PSEND\_PSAMPLE**

Send at posedge, and sample at posedge. Default value for HS mode. If `:c:macro:SDIO_SLAVE_FLAG_HIGH_SPEED` is specified in `:cpp:class:sdio_slave_config_t`, this should be selected. Normally there's no problem using this to work in DS mode.

enumerator **SDIO\_SLAVE\_TIMING\_NSEND\_PSAMPLE**

Send at negedge, and sample at posedge. Default value for DS mode and below. If `:c:macro:SDIO_SLAVE_FLAG_DEFAULT_SPEED` is specified in `:cpp:class:sdio_slave_config_t`, this should be selected.

enumerator **SDIO\_SLAVE\_TIMING\_PSEND\_NSAMPLE**

Send at posedge, and sample at negedge.

enumerator **SDIO\_SLAVE\_TIMING\_NSEND\_NSAMPLE**

Send at negedge, and sample at negedge.

enum **sdio\_slave\_sending\_mode\_t**

Configuration of SDIO slave mode.

*Values:*

enumerator **SDIO\_SLAVE\_SEND\_STREAM**

Stream mode, all packets to send will be combined as one if possible.

enumerator **SDIO\_SLAVE\_SEND\_PACKET**

Packet mode, one packets will be sent one after another (only increase `packet_len` if last packet sent).

## Header File

- [components/driver/sdio\\_slave/include/driver/sdio\\_slave.h](#)
- This header file can be included with:

```
#include "driver/sdio_slave.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **sdio\_slave\_initialize** (*sdio\_slave\_config\_t* \*config)

Initialize the sdio slave driver

**Parameters** `config` -- Configuration of the sdio slave driver.

**Returns**

- `ESP_ERR_NOT_FOUND` if no free interrupt found.
- `ESP_ERR_INVALID_STATE` if already initialized.
- `ESP_ERR_NO_MEM` if fail due to memory allocation failed.
- `ESP_OK` if success

void **sdio\_slave\_deinit** (void)

De-initialize the sdio slave driver to release the resources.

*esp\_err\_t* **sdio\_slave\_start** (void)

Start hardware for sending and receiving, as well as set the `IOREADY1` to 1.

---

**Note:** The driver will continue sending from previous data and PKT\_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See `sdio_slave_reset`.

---

**Returns**

- ESP\_ERR\_INVALID\_STATE if already started.
- ESP\_OK otherwise.

void **sdio\_slave\_stop** (void)

Stop hardware from sending and receiving, also set IOREADY1 to 0.

---

**Note:** this will not clear the data already in the driver, and also not reset the PKT\_LEN and TOKEN1 counting. Call `sdio_slave_reset` to do that.

---

*esp\_err\_t* **sdio\_slave\_reset** (void)

Clear the data still in the driver, as well as reset the PKT\_LEN and TOKEN1 counting.

**Returns** always return ESP\_OK.

*sdio\_slave\_buf\_handle\_t* **sdio\_slave\_recv\_register\_buf** (uint8\_t \*start)

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

---

**Note:** The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

---

**Parameters** **start** -- The start address of the buffer.

**Returns** The buffer handle if success, otherwise NULL.

*esp\_err\_t* **sdio\_slave\_recv\_unregister\_buf** (*sdio\_slave\_buf\_handle\_t* handle)

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Parameters** **handle** -- Handle to the buffer to release.

**Returns** ESP\_OK if success, ESP\_ERR\_INVALID\_ARG if the handle is NULL or the buffer is being used.

*esp\_err\_t* **sdio\_slave\_recv\_load\_buf** (*sdio\_slave\_buf\_handle\_t* handle)

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Parameters** **handle** -- Handle to the buffer ready to receive data.

**Returns**

- ESP\_ERR\_INVALID\_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
- ESP\_OK if success

*esp\_err\_t* **sdio\_slave\_recv\_packet** (*sdio\_slave\_buf\_handle\_t* \*handle\_ret, TickType\_t wait)

Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP\_ERR\_NOT\_FINISHED, you should call this API iteratively until the return value is ESP\_OK. All the continuous buffers returned with ESP\_ERR\_NOT\_FINISHED, together with the last buffer returned with ESP\_OK, belong to one packet from the host.

You can call simpler `sdio_slave_recv` instead, if the host never send data longer than the Receiving buffer size, or you don't care about the packet boundary (e.g. the data is only a byte stream).

---

**Note:** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

---

#### Parameters

- **handle\_ret** -- Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
- **wait** -- Time to wait before data received.

#### Returns

- `ESP_ERR_INVALID_ARG` if `handle_ret` is `NULL`
- `ESP_ERR_TIMEOUT` if timeout before receiving new data
- `ESP_ERR_NOT_FINISHED` if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- `ESP_OK` if success

`esp_err_t` **sdio\_slave\_recv** (*sdio\_slave\_buf\_handle\_t* \*handle\_ret, uint8\_t \*\*out\_addr, size\_t \*out\_len, TickType\_t wait)

Get received data if exist. The driver returns the ownership of the buffer to the app.

---

**Note:** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

---

#### Parameters

- **handle\_ret** -- Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- **out\_addr** -- [out] Output of the start address, set to `NULL` if not needed.
- **out\_len** -- [out] Actual length of the data in the buffer, set to `NULL` if not needed.
- **wait** -- Time to wait before data received.

#### Returns

- `ESP_ERR_INVALID_ARG` if `handle_ret` is `NULL`
- `ESP_ERR_TIMEOUT` if timeout before receiving new data
- `ESP_OK` if success

uint8\_t \***sdio\_slave\_recv\_get\_buf** (*sdio\_slave\_buf\_handle\_t* handle, size\_t \*len\_o)

Retrieve the buffer corresponding to a handle.

#### Parameters

- **handle** -- Handle to get the buffer.
- **len\_o** -- Output of buffer length

**Returns** buffer address if success, otherwise `NULL`.

`esp_err_t` **sdio\_slave\_send\_queue** (uint8\_t \*addr, size\_t len, void \*arg, TickType\_t wait)

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

#### Parameters

- **addr** -- Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- **len** -- Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- **arg** -- Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to `NULL` if not needed.
- **wait** -- Time to wait if the buffer is full.

**Returns**

- ESP\_ERR\_INVALID\_ARG if the length is not greater than 0.
- ESP\_ERR\_TIMEOUT if the queue is still full until timeout.
- ESP\_OK if success.

*esp\_err\_t* **sdio\_slave\_send\_get\_finished** (void \*\*out\_arg, TickType\_t wait)

Return the ownership of a finished transaction.

**Parameters**

- **out\_arg** -- Argument of the finished transaction. Set to NULL if unused.
- **wait** -- Time to wait if there's no finished sending transaction.

**Returns** ESP\_ERR\_TIMEOUT if no transaction finished, or ESP\_OK if succeed.

*esp\_err\_t* **sdio\_slave\_transmit** (uint8\_t \*addr, size\_t len)

Start a new sending transfer, and wait for it (blocked) to be finished.

**Parameters**

- **addr** -- Start address of the buffer to send
- **len** -- Length of buffer to send.

**Returns**

- ESP\_ERR\_INVALID\_ARG if the length of descriptor is not greater than 0.
- ESP\_ERR\_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP\_OK if success.

uint8\_t **sdio\_slave\_read\_reg** (int pos)

Read the spi slave register shared with host.

---

**Note:** register 28 to 31 are reserved for interrupt vector.

---

**Parameters** **pos** -- register address, 0-27 or 32-63.

**Returns** value of the register.

*esp\_err\_t* **sdio\_slave\_write\_reg** (int pos, uint8\_t reg)

Write the spi slave register shared with host.

---

**Note:** register 29 and 31 are used for interrupt vector.

---

**Parameters**

- **pos** -- register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- **reg** -- the value to write.

**Returns** ESP\_ERR\_INVALID\_ARG if address wrong, otherwise ESP\_OK.

*sdio\_slave\_hostint\_t* **sdio\_slave\_get\_host\_intena** (void)

Get the interrupt enable for host.

**Returns** the interrupt mask.

void **sdio\_slave\_set\_host\_intena** (*sdio\_slave\_hostint\_t* mask)

Set the interrupt enable for host.

**Parameters** **mask** -- Enable mask for host interrupt.

*esp\_err\_t* **sdio\_slave\_send\_host\_int** (uint8\_t pos)

Interrupt the host by general purpose interrupt.

**Parameters** **pos** -- Interrupt num, 0-7.

**Returns**

- ESP\_ERR\_INVALID\_ARG if interrupt num error

- ESP\_OK otherwise

void **sdio\_slave\_clear\_host\_int** (*sdio\_slave\_hostint\_t* mask)

Clear general purpose interrupt to host.

**Parameters** **mask** -- Interrupt bits to clear, by bit mask.

*esp\_err\_t* **sdio\_slave\_wait\_int** (int pos, TickType\_t wait)

Wait for general purpose interrupt from host.

---

**Note:** this clears the interrupt at the same time.

---

#### Parameters

- **pos** -- Interrupt source number to wait for. is set.
- **wait** -- Time to wait before interrupt triggered.

**Returns** ESP\_OK if success, ESP\_ERR\_TIMEOUT if timeout.

### Structures

struct **sdio\_slave\_config\_t**

Configuration of SDIO slave.

### Public Members

*sdio\_slave\_timing\_t* **timing**

timing of sdio\_slave. see sdio\_slave\_timing\_t.

*sdio\_slave\_sending\_mode\_t* **sending\_mode**

mode of sdio\_slave. SDIO\_SLAVE\_MODE\_STREAM if the data needs to be sent as much as possible; SDIO\_SLAVE\_MODE\_PACKET if the data should be sent in packets.

int **send\_queue\_size**

max buffers that can be queued before sending.

size\_t **recv\_buffer\_size**

If buffer\_size is too small, it costs more CPU time to handle larger number of buffers. If buffer\_size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

*sdio\_event\_cb\_t* **event\_cb**

when the host interrupts slave, this callback will be called with interrupt number (0-7).

uint32\_t **flags**

Features to be enabled for the slave, combinations of SDIO\_SLAVE\_FLAG\_\*.

### Macros

**SDIO\_SLAVE\_RECV\_MAX\_BUFFER**

**SDIO\_SLAVE\_FLAG\_DAT2\_DISABLED**

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

**SDIO\_SLAVE\_FLAG\_HOST\_INTR\_DISABLED**

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don't support 4-bit mode anymore, please do this at your own risk.

**SDIO\_SLAVE\_FLAG\_INTERNAL\_PULLUP**

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

**SDIO\_SLAVE\_FLAG\_DEFAULT\_SPEED**

Disable the highspeed support of the hardware.

**SDIO\_SLAVE\_FLAG\_HIGH\_SPEED**

Enable the highspeed support of the hardware. This is the default option. The host will see highspeed capability, but the mode actually used is determined by the host.

**Type Definitions**

```
typedef void (*sdio_event_cb_t)(uint8_t event)
```

```
typedef void *sdio_slave_buf_handle_t
```

Handle of a receive buffer, register a handle by calling `sdio_slave_recv_register_buf`. Use the handle to load the buffer to the driver, or call `sdio_slave_recv_unregister_buf` if it is no longer used.

## 2.6.19 Sigma-Delta Modulation (SDM)

**Introduction**

ESP32 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.<sup>1</sup>

Delta-sigma modulation converts an analog voltage signal into a pulse frequency, or pulse density, which can be understood as pulse-density modulation (PDM) (refer to [Delta-sigma modulation on Wikipedia](#)).

The main differences comparing to I2S PDM mode and DAC peripheral are:

1. SDM has no clock signal, it is just like the DAC mode of PDM;
2. SDM has no DMA, and it can not change its output density continuously. If you have to, you can update the density in a timer's callback;

---

<sup>1</sup> Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter [GPIO and IOMUX](#) in ESP32 Technical Reference Manual for more details. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `sdm_new_channel()`).

- Based on the former two points, unlike the DAC peripheral, an external active or passive low-pass filter is required additionally to restore the analog wave (See *Convert to an Analog Signal (Optional)*).

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

## Functional Overview

The following sections of this document cover the typical steps to install and operate an SDM channel:

- *Resource Allocation* - covers how to initialize and configure an SDM channel and how to recycle the resources when it finishes working.
- *Enable and Disable Channel* - covers how to enable and disable the channel.
- *Set Pulse Density* - describes how to set the equivalent duty cycle of the PDM pulses.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** In ESP-IDF, the information and attributes of SDM channels are managed and accessed through specific data structures, where the data structure is called `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware-generated signal with the sigma-delta modulation. The driver manages all available channels in a pool so that there is no need to manually assign a fixed channel to a GPIO.

To install an SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel-specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses output from.
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e., all hardware SDM channels have been used up), `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting an SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not been enabled yet by `sdm_channel_enable()`.

## Creating an SDM Channel with a Sample Rate of 1 MHz

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

**Enable and Disable Channel** Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function:

- switches the channel state from **init** to **enable**
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also [Power Management](#) for more information.

On the contrary, calling `sdm_channel_disable()` does the opposite, that is, put the channel back to the **init** state and releases the power management lock.

**Set Pulse Density** For the output PDM signals, the pulse density decides the output analog voltage that is restored by a low-pass filter. The restored analog voltage from the channel is calculated by  $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$ . The range of the quantized `density` input parameter of `sdm_channel_set_pulse_density()` is from -128 to 127 (8-bit signed integer). Depending on the value of the `density` parameter, the duty cycle of the output signal will be changed accordingly. For example, if a zero value is set, then the output signal's duty will be around 50%.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into Light-sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver guarantees that the power management lock is acquired when enabling the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

**IRAM Safe** There is a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly-used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_pulse_density()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread-safe by the driver, which means, the user can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_pulse_density()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread-safe. This means the user should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see [IRAM Safe](#) for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

### Convert to an Analog Signal (Optional)

Typically, if a Sigma-Delta signal is connected to an LED to adjust the brightness, you do not have to add any filter between them, because our eyes have their own low-pass filters for changes in light intensity. However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low-pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

Fig. 26: Sallen-Key Low Pass Filter

### Application Example

- 100 Hz sine wave that is modulated with Sigma-Delta: [peripherals/sigma\\_delta/sdm\\_dac](#).
- LED driven by a GPIO that is modulated with Sigma-Delta: [peripherals/sigma\\_delta/sdm\\_led](#).

### API Reference

#### Header File

- [components/driver/sigma\\_delta/include/driver/sdm.h](#)
- This header file can be included with:

```
#include "driver/sdm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

#### Functions

`esp_err_t sdm_new_channel` (const `sdm_config_t` \*config, `sdm_channel_handle_t` \*ret\_chan)

Create a new Sigma Delta channel.

##### Parameters

- **config** -- [in] SDM configuration
- **ret\_chan** -- [out] Returned SDM channel handle

##### Returns

- ESP\_OK: Create SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Create SDM channel failed because of invalid argument

- ESP\_ERR\_NO\_MEM: Create SDM channel failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP\_FAIL: Create SDM channel failed because of other error

*esp\_err\_t* **sdm\_del\_channel** (*sdm\_channel\_handle\_t* chan)

Delete the Sigma Delta channel.

**Parameters** **chan** -- [in] SDM channel created by `sdm_new_channel`

**Returns**

- ESP\_OK: Delete the SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Delete the SDM channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP\_FAIL: Delete the SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_enable** (*sdm\_channel\_handle\_t* chan)

Enable the Sigma Delta channel.

---

**Note:** This function will transit the channel state from init to enable.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `sdm_config_t`, while `CONFIG_PM_ENABLE` is enabled.

---

**Parameters** **chan** -- [in] SDM channel created by `sdm_new_channel`

**Returns**

- ESP\_OK: Enable SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Enable SDM channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable SDM channel failed because the channel is already enabled
- ESP\_FAIL: Enable SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_disable** (*sdm\_channel\_handle\_t* chan)

Disable the Sigma Delta channel.

---

**Note:** This function will do the opposite work to the `sdm_channel_enable()`

---

**Parameters** **chan** -- [in] SDM channel created by `sdm_new_channel`

**Returns**

- ESP\_OK: Disable SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Disable SDM channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable SDM channel failed because the channel is not enabled yet
- ESP\_FAIL: Disable SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_set\_pulse\_density** (*sdm\_channel\_handle\_t* chan, *int8\_t* density)

Set the pulse density of the PDM output signal.

---

**Note:** The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be  $V_{out} = VDD_{IO} / 256 * density + VDD_{IO} / 2$

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

#### Parameters

- **chan** -- [in] SDM channel created by `sdm_new_channel`
- **density** -- [in] Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

#### Returns

- `ESP_OK`: Set pulse density successfully
- `ESP_ERR_INVALID_ARG`: Set pulse density failed because of invalid argument
- `ESP_FAIL`: Set pulse density failed because of other error

*esp\_err\_t* **sdm\_channel\_set\_duty** (*sdm\_channel\_handle\_t* chan, int8\_t duty)

The alias function of `sdm_channel_set_pulse_density`, it decides the pulse density of the output signal.

---

**Note:** `sdm_channel_set_pulse_density` has a more appropriate name compare this alias function, suggest to turn to `sdm_channel_set_pulse_density` instead

---

#### Parameters

- **chan** -- [in] SDM channel created by `sdm_new_channel`
- **duty** -- [in] Actually it's the quantized pulse density of the PDM output signal

#### Returns

- `ESP_OK`: Set duty cycle successfully
- `ESP_ERR_INVALID_ARG`: Set duty cycle failed because of invalid argument
- `ESP_FAIL`: Set duty cycle failed because of other error

### Structures

struct **sdm\_config\_t**

Sigma Delta channel configuration.

#### Public Members

int **gpio\_num**

GPIO number

*sdm\_clock\_source\_t* **clk\_src**

Clock source

uint32\_t **sample\_rate\_hz**

Over sample rate in Hz, it determines the frequency of the carrier pulses

uint32\_t **invert\_out**

Whether to invert the output signal

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

```
struct sdm_config_t::[anonymous] flags  
    Extra flags
```

### Type Definitions

```
typedef struct sdm_channel_t *sdm_channel_handle_t  
    Type of Sigma Delta channel handle.
```

### Header File

- [components/hal/include/hal/sdm\\_types.h](#)
- This header file can be included with:

```
#include "hal/sdm_types.h"
```

### Type Definitions

```
typedef soc_periph_sdm_clk_src_t sdm_clock_source_t
```

## 2.6.20 SPI Flash API

### Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, and memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the *partition table*, see [Partitions API](#)

---

**Note:** `esp_partition_*` APIs are recommended to be used instead of the lower level `esp_flash_*` API functions when accessing the main SPI flash chip, since they conduct bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. `esp_flash_*` functions can still be used directly when accessing an external (secondary) SPI flash chip.

---

Different from the API before ESP-IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the "main" SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

---

**Note:** Instead of going through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to the limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations is also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

---

---

**Note:** Flash APIs after ESP-IDF v4.0 are no longer **atomic**. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

---

---

**Note:** Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

---

### Support for Features of Flash Chips

**Quad/Dual Mode Chips** Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on the following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

---

**Note:** Only when one flash series listed above is supported by ESP32, this flash series is supported by the chip driver by default. You can use `Component config > SPI Flash driver > Auto-detect flash chips` in `menuconfig` to enable/disable a flash series.

---

### Optional Features

**Optional Features for Flash** Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*
- *32-bit Address Flash Chips*

---

**Note:** When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
  - If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.
- 

**Attention:** This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own bought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

**Auto Suspend & Resume** This feature is only supported on ESP32-S3, ESP32-C2, ESP32-C3, ESP32-C6, ESP32-H2 for now.

The support for ESP32-P4 may be added in the future.

**Flash Unique ID** This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

**High Performance Mode** This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2, ESP32-P4 may be added in the future.

**OPI flash Support** This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

**32-bit Address Flash Chips** This feature is supported on all Espressif chips (with various restrictions to application).

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

---

**Important:** Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please enable the config `IDF_EXPERIMENTAL_FEATURES` and `BOOTLOADER_CACHE_32BIT_ADDR_FLASH` and read the limitations following:

1. This feature is valid only for 4-line flash. Octal flash supports 32-bit-addr by default
  2. This feature needs the MMU on ESP chip to be able to map to  $\geq 16$  MB physical address on the Flash. (Only ESP32S3 supports this up to now)
  3. This option is experimental, which means it can not use on all flash chips stable, for more information, please contact Espressif Business support.
- 

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.

- Flash unique ID - means that flash supports its unique 64-bit ID.

If you want to use these features, please ensure both ESP32 and ALL flash chips in your product support these features. For more details, refer to [Optional Features for Flash](#).

You may also customise your own flash chip driver. See [Overriding Default Chip Drivers](#) for more details.

**Warning:** Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers** During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

### Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g., `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
  - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
  - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
  - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

---

#### Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```

spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}

```

```

const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};

```

- You also can see how to implement this in the example [storage/custom\\_flash\\_driver](#).

4. Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:

```

idf_component_register(SRCS "spi_flash_chip_drivers.c"
                       "spi_flash_chip_mychip.c" # modify as needed
                       REQUIRES hal
                       PRIV_REQUIRES spi_flash
                       LDFRAGMENTS linker.lf)
idf_component_add_link_dependency(FROM spi_flash)

```

- An example of this component `CMakeLists.txt` can be found in [storage/custom\\_flash\\_driver/components/custom\\_chip\\_driver/CMakeLists.txt](#)
5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.
  6. Build your project, and you will see the new flash driver is used.

**Example** See also [storage/custom\\_flash\\_driver](#).

## Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This also detects the chip type, and influence the following operations.

---

**Note:** Multiple flash chips can be attached to the same bus now.

---

## SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash

- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in `menuconfig`

Generally, try to avoid using the raw SPI flash functions to the "main" SPI flash chip in favour of *partition-specific functions*.

### SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

### Concurrency Constraints for Flash on SPI1

#### Concurrency Constraints for Flash on SPI1

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32, these caches must be disabled while reading/writing/erasing.

**When the Caches Are Disabled** Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

The way that these APIs disable the caches suspends all the other tasks. Besides, all non-IRAM-safe interrupts will be disabled. The other core will be polling in a busy loop. These will be restored until the Flash operation completes.

See also *OS Functions* and *SPI Bus Lock*.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g., IRAM, DRAM) and flash cache, please refer to the *application memory layout* documentation.

**IRAM-Safe Interrupt Handlers** For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the *interrupt handler is registered*.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See *How to Place Code in IRAM*.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

---

**Note:** When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both TAG and format string are placed into DRAM in that case.

---

**Non-IRAM-Safe Interrupt Handlers** If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users will not see the corresponding hardware event happening.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) causes significant influence to the whole system. See [Concurrency Constraints for Flash on SPI1](#) for more details.

## SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

## Memory Mapping API

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when [flash encryption](#) is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `spi_flash_mmap.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It adjusts the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

---

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

---

## SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g., lock, delay) in different stages (1st/2nd boot, or the app).

**Host Driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However, due to the speed limitations of ESP32, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS Functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see [SPI Bus Lock](#)) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device does not have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option `CONFIG_ESP_TASK_WDT_PANIC` is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It is pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
  - Increase `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` or decrease `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` in menuconfig.
  - You can also increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.
2. Please be aware of the consequences of enabling the `CONFIG_ESP_TASK_WDT_PANIC` option when doing long-running SPI flash operations which triggers the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.
3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based

on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

### Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation:

- In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation.
- In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

### Related Documents

- [Optional Features for Flash](#)
- [Concurrency Constraints for Flash on SPI](#)

**SPI Flash API ESP-IDF Version vs Chip-ROM Version** There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

### Feature Supported by ESP-IDF but Not in Chip-ROM

- Octal Flash chip support. See [OPI flash Support](#) for details.
- 32-bit-address support for GD25Q256. Note this feature is an optional feature, please do read [32-bit Address Flash Chips](#) for details.
- TH Flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`.
- `CONFIG_SPI_FLASH_VERIFY_WRITE`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option prints the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option checks if you are writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.

- *CONFIG\_SPI\_FLASH\_AUTO\_SUSPEND*, enabling this option to automatically suspend / resume a long Flash operation when short Flash operation happens. Note this feature is an optional feature, please do read [Auto Suspend & Resume](#) for more limitations.

### Bugfixes Introduced in ESP-IDF but Not in Chip-ROM

- Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cfd5cf684567fbdfd6fd9e)

## API Reference - SPI Flash

### Header File

- `components/spi_flash/include/esp_flash_spi_init.h`
- This header file can be included with:

```
#include "esp_flash_spi_init.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

### Functions

*esp\_err\_t* **spi\_bus\_add\_flash\_device** (*esp\_flash\_t* \*\*out\_chip, const *esp\_flash\_spi\_device\_config\_t* \*config)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

#### Parameters

- **out\_chip** -- Pointer to hold the initialized chip.
- **config** -- Configuration of the chips to initialize.

#### Returns

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

*esp\_err\_t* **spi\_bus\_remove\_flash\_device** (*esp\_flash\_t* \*chip)

Remove a SPI Flash device from the SPI bus.

**Parameters** **chip** -- The flash device to remove.

#### Returns

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

### Structures

struct **esp\_flash\_spi\_device\_config\_t**

Configurations for the SPI Flash to init.

### Public Members

*spi\_host\_device\_t* **host\_id**

Bus to use.

int **cs\_io\_num**

GPIO pin to output the CS signal.

*esp\_flash\_io\_mode\_t* **io\_mode**

IO mode to read from the Flash.

enum *esp\_flash\_speed\_s* **speed**

Speed of the Flash clock. Replaced by `freq_mhz`.

int **input\_delay\_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs\_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq\_mhz**

The frequency of flash chip(MHZ)

## Header File

- `components/spi_flash/include/esp_flash.h`
- This header file can be included with:

```
#include "esp_flash.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

## Functions

*esp\_err\_t* **esp\_flash\_init** (*esp\_flash\_t* \*chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

---

**Note:** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or `NULL`.

---

---

**Note:** If the `chip->drv` pointer is `NULL`, `chip` `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

---

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp\_flash\_chip\_driver\_initialized** (const *esp\_flash\_t* \*chip)

Check if appropriate chip driver is set.

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** true if set, otherwise false.

*esp\_err\_t* **esp\_flash\_read\_id** (*esp\_flash\_t* \*chip, uint32\_t \*out\_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_id** -- [out] Pointer to receive ID value.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_size** (*esp\_flash\_t* \*chip, uint32\_t \*out\_size)

Detect flash size based on flash ID.

---

**Note:** 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

- a. The `out_size` returned only stands for The `out_size` stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_size** -- [out] Detected size in bytes, standing for the size in the binary image header.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_physical\_size** (*esp\_flash\_t* \*chip, uint32\_t \*flash\_size)

Detect flash size based on flash ID.

---

**Note:** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash\_size** -- [out] Detected size in bytes.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read\_unique\_chip\_id** (*esp\_flash\_t* \*chip, uint64\_t \*out\_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

---

**Note:** This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out\_id** -- [out] Pointer to receive unique ID value.

**Returns**

- ESP\_OK on success, or a flash error code if operation failed.
- ESP\_ERR\_NOT\_SUPPORTED if the chip doesn't support read id.

*esp\_err\_t* **esp\_flash\_erase\_chip** (*esp\_flash\_t* \*chip)

Erase flash chip contents.

**Parameters** **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if a read-only partition is present.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_erase\_region** (*esp\_flash\_t* \*chip, uint32\_t start, uint32\_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP\_ERR\_INVALID\_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **start** -- Address to start erasing flash. Must be sector aligned.
- **len** -- Length of region to erase. Must also be sector aligned.

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if the address range (`start + len`) overlaps with a read-only partition address space
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool \*write\_protected)

Read if the entire chip is write protected.

---

**Note:** A correct result for this flag depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`

- **write\_protected** -- [out] Pointer to boolean, set to the value of the write protect flag.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool write\_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. If NULL, esp\_flash\_default\_chip is substituted. Must have been successfully initialised via esp\_flash\_init()
- **write\_protect** -- Boolean value for the write protect flag

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protectable\_regions** (const *esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*\*out\_regions, uint32\_t \*out\_num\_regions)

Read the list of individually protectable regions of this SPI flash chip.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **out\_regions** -- [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out\_num\_regions** -- [out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool \*out\_protected)

Detect if a region of the SPI flash chip is protected.

---

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from esp\_flash\_get\_protectable\_regions(...).

- **out\_protected** -- [out] Pointer to a flag which is set based on the protected status for this region.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool protect)

Update the protected status for a region of the SPI flash chip.

---

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from esp\_flash\_get\_protectable\_regions(...).
- **protect** -- Write protection flag to set.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read** (*esp\_flash\_t* \*chip, void \*buffer, uint32\_t address, uint32\_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

---

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

---

#### Parameters

- **chip** -- Pointer to identify flash chip. If NULL, esp\_flash\_default\_chip is substituted. Must have been successfully initialised via esp\_flash\_init()
- **buffer** -- Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** -- Address on flash to read from. Must be less than chip->size field.
- **length** -- Length (in bytes) of data to read.

#### Returns

- ESP\_OK: success
- ESP\_ERR\_NO\_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write** (*esp\_flash\_t* \*chip, const void \*buffer, uint32\_t address, uint32\_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

#### Parameters

- **chip** -- Pointer to identify flash chip. If NULL, esp\_flash\_default\_chip is substituted. Must have been successfully initialised via esp\_flash\_init()

- **address** -- Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** -- Length (in bytes) of data to write.

**Returns**

- ESP\_OK on success
- ESP\_FAIL, bad write, this will be detected only when CONFIG\_SPI\_FLASH\_VERIFY\_WRITE is enabled
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if the address range (address –address + length) overlaps with a read-only partition address space
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, const void \*buffer, uint32\_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

---

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** -- Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write.
- **length** -- Length (in bytes) of data to write. 16 byte aligned.

**Returns**

- ESP\_OK: on success
- ESP\_FAIL: bad write, this will be detected only when CONFIG\_SPI\_FLASH\_VERIFY\_WRITE is enabled
- ESP\_ERR\_NOT\_SUPPORTED: encrypted write not supported for this chip.
- ESP\_ERR\_INVALID\_ARG: Either the address, buffer or length is invalid.
- ESP\_ERR\_NOT\_ALLOWED if the address range (address –address + length) overlaps with a read-only partition address space

*esp\_err\_t* **esp\_flash\_read\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, void \*out\_buffer, uint32\_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Parameters**

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** -- Address on flash to read from.
- **out\_buffer** -- Pointer to a buffer for the data to read to.
- **length** -- Length (in bytes) of data to read.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_NOT\_SUPPORTED: encrypted read not supported for this chip.

static inline bool **esp\_flash\_is\_quad\_mode** (const *esp\_flash\_t* \*chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, esp\_flash\_default\_chip is substituted.

**Returns** true if flash works in quad mode, otherwise false

## Structures

struct **esp\_flash\_region\_t**

Structure for describing a region of flash.

### Public Members

uint32\_t **offset**

Start address of this region.

uint32\_t **size**

Size of the region.

struct **esp\_flash\_os\_functions\_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

*esp\_err\_t* (\***start**)(void \*arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

*esp\_err\_t* (\***end**)(void \*arg)

Called after completing any flash operation.

*esp\_err\_t* (\***region\_protected**)(void \*arg, size\_t start\_addr, size\_t size)

Called before any erase/write operations to check whether the region is limited by the OS

*esp\_err\_t* (\***delay\_us**)(void \*arg, uint32\_t us)

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

void (\***get\_temp\_buffer**)(void \*arg, size\_t request\_size, size\_t \*out\_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (\***release\_temp\_buffer**)(void \*arg, void \*temp\_buf)

Called for release temp buffer.

*esp\_err\_t* (\***check\_yield**)(void \*arg, uint32\_t chip\_status, uint32\_t \*out\_request)

Yield to other tasks. Called during erase operations.

**Return** ESP\_OK means yield needs to be called (got an event to handle), while ESP\_ERR\_TIMEOUT means skip yield.

*esp\_err\_t* (\***yield**)(void \*arg, uint32\_t \*out\_status)

Yield to other tasks. Called during erase operations.

`int64_t (*get_system_time)(void *arg)`

Called for get system time.

`void (*set_flash_op_status)(uint32_t op_status)`

Call to set flash operation status

struct **esp\_flash\_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

`spi_flash_host_inst_t *host`

Pointer to hardware-specific "host\_driver" structure. Must be initialized before used.

const `spi_flash_chip_t *chip_drv`

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const `esp_flash_os_functions_t *os_func`

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void `*os_func_data`

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

`esp_flash_io_mode_t read_mode`

Configured SPI flash read mode. Set before `esp_flash_init` is called.

`uint32_t size`

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

`uint32_t chip_id`

Detected chip id.

`uint32_t busy`

This flag is used to verify chip's status.

`uint32_t hpm_dummy_ena`

This flag is used to verify whether flash works under HPM status.

`uint32_t reserved_flags`

reserved.

## Macros

`SPI_FLASH_YIELD_REQ_YIELD`

`SPI_FLASH_YIELD_REQ_SUSPEND`

`SPI_FLASH_YIELD_STA_RESUME`

`SPI_FLASH_OS_IS_ERASING_STATUS_FLAG`

## Type Definitions

typedef struct *spi\_flash\_chip\_t* **spi\_flash\_chip\_t**

## Header File

- `components/spi_flash/include/spi_flash_mmap.h`
- This header file can be included with:

```
#include "spi_flash_mmap.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

## Functions

*esp\_err\_t* **spi\_flash\_mmap** (size\_t *src\_addr*, size\_t *size*, *spi\_flash\_mmap\_memory\_t* *memory*, const void \*\**out\_ptr*, *spi\_flash\_mmap\_handle\_t* \**out\_handle*)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if `mmap/munmap` are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use `spi_flash_mmap_dump()` function.

### Parameters

- **src\_addr** -- Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (`SPI_FLASH_MMU_PAGE_SIZE`)
- **size** -- Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** -- Address space where the region should be mapped (data or instruction)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region
- **out\_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

**Returns** `ESP_OK` on success, `ESP_ERR_NO_MEM` if pages can not be allocated

*esp\_err\_t* **spi\_flash\_mmap\_pages** (const int \**pages*, size\_t *page\_count*, *spi\_flash\_mmap\_memory\_t* *memory*, const void \*\**out\_ptr*, *spi\_flash\_mmap\_handle\_t* \**out\_handle*)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as `spi_flash_mmap()` but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

### Parameters

- **pages** -- An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page\_count** -- Number of entries in the pages array
- **memory** -- Address space where the region should be mapped (instruction or data)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region
- **out\_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if pages can not be allocated
- ESP\_ERR\_INVALID\_ARG if pagecount is zero or pages array is not in internal memory

void **spi\_flash\_munmap** (*spi\_flash\_mmap\_handle\_t* handle)

Release region previously obtained using `spi_flash_mmap`.

---

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

---

**Parameters** **handle** -- Handle obtained from `spi_flash_mmap`

void **spi\_flash\_mmap\_dump** (void)

Display information about mapped regions.

This function lists handles obtained using `spi_flash_mmap`, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32\_t **spi\_flash\_mmap\_get\_free\_pages** (*spi\_flash\_mmap\_memory\_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual `spi_flash_mmap` (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters** **memory** -- memory type of MMU table free page

**Returns** number of free pages which can be mmaped

size\_t **spi\_flash\_cache2phys** (const void \*cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via `spi_flash_mmap()`, any address in memory mapped flash space can be looked up.

**Parameters** **cached** -- Pointer to flashed cached memory.

**Returns**

- SPI\_FLASH\_CACHE2PHYS\_FAIL If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void \***spi\_flash\_phys2cache** (size\_t phys\_offs, *spi\_flash\_mmap\_memory\_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via `spi_flash_mmap()`, any address in flash can be looked up.

---

**Note:** Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

---

**Note:** This function doesn't impose any alignment constraints, but if memory argument is SPI\_FLASH\_MMAP\_INST and phys\_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

---

#### Parameters

- **phys\_offs** -- Physical offset in flash memory to look up.
- **memory** -- Address space type to look up a flash cache address mapping for (instruction or data)

#### Returns

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys\_offs.

### Macros

#### ESP\_ERR\_FLASH\_OP\_FAIL

This file contains spi\_flash\_mmap\_xx APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

#### ESP\_ERR\_FLASH\_OP\_TIMEOUT

#### SPI\_FLASH\_SEC\_SIZE

SPI Flash sector size

#### SPI\_FLASH\_MMU\_PAGE\_SIZE

Flash cache MMU mapping page size

#### SPI\_FLASH\_CACHE2PHYS\_FAIL

### Type Definitions

```
typedef uint32_t spi_flash_mmap_handle_t
```

Opaque handle for memory region obtained from spi\_flash\_mmap.

### Enumerations

```
enum spi_flash_mmap_memory_t
```

Enumeration which specifies memory space requested in an mmap call.

*Values:*

enumerator **SPI\_FLASH\_MMAP\_DATA**

map to data memory, allows byte-aligned access

enumerator **SPI\_FLASH\_MMAP\_INST**

map to instruction memory, allows only 4-byte-aligned access

### Header File

- [components/hal/include/hal/spi\\_flash\\_types.h](#)
- This header file can be included with:

```
#include "hal/spi_flash_types.h"
```

## Structures

struct **spi\_flash\_trans\_t**

Definition of a common transaction. Also holds the return value.

### Public Members

uint8\_t **reserved**

Reserved, must be 0.

uint8\_t **mosi\_len**

Output data length, in bytes.

uint8\_t **miso\_len**

Input data length, in bytes.

uint8\_t **address\_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32\_t **address**

Address to perform operation on.

const uint8\_t \***mosi\_data**

Output data to save.

uint8\_t \***miso\_data**

[out] Input data from slave, little endian

uint32\_t **flags**

Flags for this transaction. Set to 0 for now.

uint16\_t **command**

Command to send.

uint8\_t **dummy\_bitlen**

Basic dummy bits to use.

uint32\_t **io\_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi\_flash\_sus\_cmd\_conf**

Configuration structure for the flash chip suspend feature.

### Public Members

uint32\_t **sus\_mask**  
SUS/SUS1/SUS2 bit in flash register.

uint32\_t **cmd\_rdsr**  
Read flash status register(2) command.

uint32\_t **sus\_cmd**  
Flash suspend command.

uint32\_t **res\_cmd**  
Flash resume command.

uint32\_t **reserved**  
Reserved, set to 0.

struct **spi\_flash\_encryption\_t**  
Structure for flash encryption operations.

### Public Members

void (**\*flash\_encryption\_enable**)(void)  
Enable the flash encryption.

void (**\*flash\_encryption\_disable**)(void)  
Disable the flash encryption.

void (**\*flash\_encryption\_data\_prepare**)(uint32\_t address, const uint32\_t \*buffer, uint32\_t size)  
Prepare flash encryption before operation.

---

**Note:** address and buffer must be 8-word aligned.

---

**Param address** The destination address in flash for the write operation.

**Param buffer** Data for programming

**Param size** Size to program.

void (**\*flash\_encryption\_done**)(void)  
flash data encryption operation is done.

void (**\*flash\_encryption\_destroy**)(void)  
Destroy encrypted result

bool (**\*flash\_encryption\_check**)(uint32\_t address, uint32\_t length)  
Check if is qualified to encrypt the buffer

**Param address** the address of written flash partition.

**Param length** Buffer size.

struct **spi\_flash\_host\_inst\_t**  
SPI Flash Host driver instance

## Public Members

const struct *spi\_flash\_host\_driver\_s* \***driver**

Pointer to the implementation function table.

struct **spi\_flash\_host\_driver\_s**

Host driver configuration and context structure.

## Public Members

*esp\_err\_t* (\***dev\_config**)(*spi\_flash\_host\_inst\_t* \*host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

*esp\_err\_t* (\***common\_command**)(*spi\_flash\_host\_inst\_t* \*host, *spi\_flash\_trans\_t* \*t)

Send an user-defined spi transaction to the device.

*esp\_err\_t* (\***read\_id**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t \*id)

Read flash ID.

void (\***erase\_chip**)(*spi\_flash\_host\_inst\_t* \*host)

Erase whole flash chip.

void (\***erase\_sector**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific sector by its start address.

void (\***erase\_block**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific block by its start address.

*esp\_err\_t* (\***read\_status**)(*spi\_flash\_host\_inst\_t* \*host, uint8\_t \*out\_sr)

Read the status of the flash chip.

*esp\_err\_t* (\***set\_write\_protect**)(*spi\_flash\_host\_inst\_t* \*host, bool wp)

Disable write protection.

void (\***program\_page**)(*spi\_flash\_host\_inst\_t* \*host, const void \*buffer, uint32\_t address, uint32\_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (\***supports\_direct\_write**)(*spi\_flash\_host\_inst\_t* \*host, const void \*p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (\***write\_data\_slicer**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to write

**Param len** Length request to write

**Param align\_addr** Output of the aligned address to write to

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually written in one `program_page` call

`esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)`

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

`bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)`

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

`int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)`

Slicer for read data. The `read` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to read

**Param len** Length request to read

**Param align\_addr** Output of the aligned address to read

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually read in one `read` call

`uint32_t (*host_status)(spi_flash_host_inst_t *host)`

Check the host status, 0:busy, 1:idle, 2:suspended.

`esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, spi_flash_io_mode_t io_mode)`

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

`void (*poll_cmd_done)(spi_flash_host_inst_t *host)`

Internal use, poll the HW until the last operation is done.

`esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)`

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

`void (*check_suspend)(spi_flash_host_inst_t *host)`

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

`void (*resume)(spi_flash_host_inst_t *host)`

Resume flash from suspend manually

`void (*suspend)(spi_flash_host_inst_t *host)`

Set flash in suspend status manually

`esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)`

Suspend feature setup for setting cmd and status register mask.

## Macros

**SPI\_FLASH\_TRANS\_FLAG\_CMD16**

Send command of 16 bits.

**SPI\_FLASH\_TRANS\_FLAG\_IGNORE\_BASEIO**

Not applying the basic io mode configuration for this transaction.

**SPI\_FLASH\_TRANS\_FLAG\_BYTE\_SWAP**

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

**SPI\_FLASH\_TRANS\_FLAG\_PE\_CMD**

Indicates that this transaction is to erase/program flash chip.

**SPI\_FLASH\_CONFIG\_CONF\_BITS**

OR the `io_mode` with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

**SPI\_FLASH\_OPI\_FLAG**

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

**SPI\_FLASH\_READ\_MODE\_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

**Type Definitions**

```
typedef enum esp_flash_speed_s esp_flash_speed_t
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

```
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

**Enumerations**

```
enum esp_flash_speed_s
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

*Values:*

```
enumerator ESP_FLASH_5MHZ
```

The flash runs under 5MHz.

```
enumerator ESP_FLASH_10MHZ
```

The flash runs under 10MHz.

```
enumerator ESP_FLASH_20MHZ
```

The flash runs under 20MHz.

enumerator **ESP\_FLASH\_26MHZ**

The flash runs under 26MHz.

enumerator **ESP\_FLASH\_40MHZ**

The flash runs under 40MHz.

enumerator **ESP\_FLASH\_80MHZ**

The flash runs under 80MHz.

enumerator **ESP\_FLASH\_120MHZ**

The flash runs under 120MHz, 120MHz can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP\_FLASH\_SPEED\_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp\_flash\_io\_mode\_t**

Mode used for reading from SPI flash.

*Values:*

enumerator **SPI\_FLASH\_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI\_FLASH\_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI\_FLASH\_DOUT**

Data read using dual I/O.

enumerator **SPI\_FLASH\_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI\_FLASH\_QOUT**

Data read using quad I/O.

enumerator **SPI\_FLASH\_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI\_FLASH\_OPI\_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI\_FLASH\_OPI\_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI\_FLASH\_READ\_MODE\_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

### Header File

- `components/hal/include/hal/esp_flash_err.h`
- This header file can be included with:

```
#include "hal/esp_flash_err.h"
```

### Macros

#### **ESP\_ERR\_FLASH\_NOT\_INITIALISED**

`esp_flash_chip_t` structure not correctly initialised by `esp_flash_init()`.

#### **ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST**

Requested operation isn't supported via this host SPI bus (`chip->spi` field).

#### **ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP**

Requested operation isn't supported by this model of SPI flash chip.

#### **ESP\_ERR\_FLASH\_PROTECTED**

Write operation failed due to chip's write protection being enabled.

### Enumerations

enum [anonymous]

*Values:*

enumerator **ESP\_ERR\_FLASH\_SIZE\_NOT\_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP\_ERR\_FLASH\_NO\_RESPONSE**

Chip did not respond to the command, or timed out.

### Header File

- `components/spi_flash/include/esp_spi_flash_counters.h`
- This header file can be included with:

```
#include "esp_spi_flash_counters.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

### Functions

void **esp\_flash\_reset\_counters** (void)

Reset SPI flash operation counters.

void **spi\_flash\_reset\_counters** (void)

void **esp\_flash\_dump\_counters** (FILE \*stream)

Print SPI flash operation counters.

void **spi\_flash\_dump\_counters** (void)

const *esp\_flash\_counters\_t* \***esp\_flash\_get\_counters** (void)

Return current SPI flash operation counters.

**Returns** pointer to the *esp\_flash\_counters\_t* structure holding values of the operation counters

const *spi\_flash\_counters\_t* \***spi\_flash\_get\_counters** (void)

## Structures

struct **esp\_flash\_counter\_t**

Structure holding statistics for one type of operation

### Public Members

uint32\_t **count**

number of times operation was executed

uint32\_t **time**

total time taken, in microseconds

uint32\_t **bytes**

total number of bytes

struct **esp\_flash\_counters\_t**

Structure for counters of flash actions

### Public Members

*esp\_flash\_counter\_t* **read**

counters for read action, like `esp_flash_read`

*esp\_flash\_counter\_t* **write**

counters for write action, like `esp_flash_write`

*esp\_flash\_counter\_t* **erase**

counters for erase action, like `esp_flash_erase`

## Type Definitions

typedef *esp\_flash\_counter\_t* **spi\_flash\_counter\_t**

typedef *esp\_flash\_counters\_t* **spi\_flash\_counters\_t**

## API Reference - Flash Encrypt

### Header File

- `components/bootloader_support/include/esp_flash_encrypt.h`
- This header file can be included with:

```
#include "esp_flash_encrypt.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

```
PRIV_REQUIRES bootloader_support
```

### Functions

bool **esp\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the `FLASH_CRYPT_CNT` efuse has an odd number of bits set.

**Returns** true if flash encryption is enabled.

*esp\_err\_t* **esp\_flash\_encrypt\_check\_and\_update** (void)

bool **esp\_flash\_encrypt\_state** (void)

Returns the Flash Encryption state and prints it.

**Returns** True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp\_flash\_encrypt\_initialized\_once** (void)

Checks if the first initialization was done.

If the first initialization was done then `FLASH_CRYPT_CNT != 0`

**Returns** true - the first initialization was done false - the first initialization was NOT done

*esp\_err\_t* **esp\_flash\_encrypt\_init** (void)

The first initialization of Flash Encryption key and related eFuses.

**Returns** `ESP_OK` if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_contents** (void)

Encrypts flash content.

**Returns** `ESP_OK` if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_enable** (void)

Activates Flash encryption on the chip.

It burns `FLASH_CRYPT_CNT` eFuse based on the `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE` option.

**Returns** `ESP_OK` if all operations succeeded

bool **esp\_flash\_encrypt\_is\_write\_protected** (bool print\_error)

Returns True if the write protection of `FLASH_CRYPT_CNT` is set.

**Parameters** `print_error` -- Print error if it is write protected

**Returns** true - if `FLASH_CRYPT_CNT` is write protected

*esp\_err\_t* **esp\_flash\_encrypt\_region** (uint32\_t src\_addr, size\_t data\_length)

Encrypt-in-place a block of flash sectors.

---

**Note:** This function resets `RTC_WDT` between operations with sectors.

---

#### Parameters

- **src\_addr** -- Source offset in flash. Should be multiple of 4096 bytes.

- **data\_length** -- Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns** ESP\_OK if all operations succeeded, ESP\_ERR\_FLASH\_OP\_FAIL if SPI flash fails, ESP\_ERR\_FLASH\_OP\_TIMEOUT if flash times out.

void **esp\_flash\_write\_protect\_crypt\_cnt** (void)

Write protect FLASH\_CRYPT\_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

---

**Note:** On ESP32 V3 only, write protecting FLASH\_CRYPT\_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp\_efuse\_disable\_rom\_download\_mode() before calling this function.

---

*esp\_flash\_enc\_mode\_t* **esp\_get\_flash\_encryption\_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

**Returns**

void **esp\_flash\_encryption\_init\_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

---

**Note:** This function is called automatically during app startup, it doesn't need to be called from the app.

---

*esp\_err\_t* **esp\_flash\_encryption\_enable\_secure\_features** (void)

Set all secure eFuse features related to flash encryption.

**Returns**

- ESP\_OK - Successfully

bool **esp\_flash\_encryption\_cfg\_verify\_release\_mode** (void)

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

**Returns**

- True - all eFuses are configured correctly
- False - not all eFuses are configured correctly.

void **esp\_flash\_encryption\_set\_release\_mode** (void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- "disable encrypt in dl mode"
- set FLASH\_CRYPT\_CNT efuse to max

## Enumerations

enum `esp_flash_enc_mode_t`

*Values:*

enumerator `ESP_FLASH_ENC_MODE_DISABLED`

enumerator `ESP_FLASH_ENC_MODE_DEVELOPMENT`

enumerator `ESP_FLASH_ENC_MODE_RELEASE`

### 2.6.21 SPI Master Driver

SPI Master driver is a program that controls ESP32's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a master.

---

**Note:** SPI1 is not a GP-SPI. SPI Master driver also supports SPI1 but with quite a few limitations, see [Notes on Using the SPI Master Driver on SPI1 Bus](#).

---

For more hardware information about the GP-SPI peripheral(s), see [ESP32 Technical Reference Manual > SPI Controller \[PDF\]](#).

#### Terminology

The terms used in relation to the SPI Master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32 initiates SPI transmissions over the bus and acts as an SPI Master.
Device	SPI slave Device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in a daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. The oscillating signal generated by a Host keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for the data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for the data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
Assertion	The action of activating a line.
De-assertion	The action of returning the line back to inactive (back to idle) status.
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <b>launches</b> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <b>latches in</b> the signal.

## Driver Features

The SPI Master driver governs the communications between Hosts and Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI Bus Lock*.

**Warning:** The SPI Master driver allows multiple Devices to be connected on a same SPI bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread-safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral-related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Features

### SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock disables the cache before device operations start, and enables it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. There are quite a few limitations when using the SPI Master driver on the SPI1 bus. See *Notes on Using the SPI Master Driver on SPI1 Bus*.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Command	In this phase, a command (0-16 bit) is written to the bus by the Host.
Address	In this phase, an address (0-64 bit) is transmitted over the bus by the Host.
Dummy	This phase is configurable and is used to meet the timing requirements.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, Device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the Read and Write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the Read and Write phases are not simultaneous (one direction at a time). The lengths of the Write and Read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The Command and Address phases are optional, as not every SPI Device requires a command and/or address. This is reflected in the Device's configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no Command or Address phase will occur.

The Read and Write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the Read phase

is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the Write phase is skipped.

The driver supports two types of transactions: interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

**Interrupt Transactions** Interrupt transactions blocks the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver automatically handles them one by one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions are complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1  $\mu$ s to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO Setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	<code>SPI_TRANS_MODE_SHTCOM-</code>	<code>MON_BUSFLAG_DUAL</code>
Dual I/O	1	2	2	<code>SPI_TRANS_MODE_SHTCOM-</code> <code>SPI_TRANS_MULTIMON_BUSFLAG_DUAL</code>	<code>MON_BUSFLAG_DUAL</code>
Quad Output	1	1	4	<code>SPI_TRANS_MODE_SHTCOM-</code>	<code>MON_BUSFLAG_QUAD</code>
Quad I/O	1	4	4	<code>SPI_TRANS_MODE_SHTCOM-</code> <code>SPI_TRANS_MULTIMON_BUSFLAG_QUAD</code>	<code>MON_BUSFLAG_QUAD</code>

**Command and Address Phases** During the Command and Address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the Command and Address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the Command and Address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the Command and Address phase need to have the same number of lines as the data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see [Transaction Line Mode](#).

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device is read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory (`MALLOC_CAP_DMA`), see [DMA-Capable Memory](#).
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data line to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in [Transaction Line Mode](#).

---

**Note:** Half-duplex transactions with both Read and Write phases are not supported when using DMA. For details and workarounds, see [Known Issues](#).

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other Devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

### Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the Device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To remove a certain Device from the bus, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver from the bus, make sure no more devices are attached and call `spi_bus_free()`.

The example code for the SPI Master driver can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the

`spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

**Transactions with Integers Other than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB is first used in rare cases. If a value of fewer than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional "random" bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has a size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transaction (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

---

### Notes on Using the SPI Master Driver on SPI1 Bus

**Note:** Though the *SPI Bus Lock* feature makes it possible to use SPI Master driver on the SPI1 bus, it is still tricky and needs a lot of special treatment. It is a feature for advanced developers.

---

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data should be in the internal memory when the driver is operating on SPI1 bus.  
SPI1 bus is shared among Devices and the cache for data (code) in the flash as well as the PSRAM. The cache should be disabled when other drivers are operating on the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched while the driver acquires the SPI1 bus by:
  - Explicit bus acquiring between `spi_device_acquire_bus()` and `spi_device_release_bus()`.
  - Implicit bus acquiring between `spi_device_polling_start()` and `spi_device_polling_end()` (or inside `spi_device_polling_transmit()`).

During the time above, all other tasks and most ISRs will be disabled (see [IRAM-Safe Interrupt Handlers](#)). Application code and data used by the current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a `Cache disabled but cached memory region accessed` exception. For differences between IRAM, DRAM, and flash cache, please refer to the [application memory layout](#) documentation.

To place functions into the IRAM, you can either:

1. Add `IRAM_ATTR` (include `esp_attr.h`) to the function like:

```
IRAM_ATTR void foo(void) { }
```

Please note that when a function is inlined, it will follow its caller's segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this. Please also note that the compiler may transform some code into a lookup table in the const data, so `noflash_text` is not safe.

2. Use the `noflash` placement in the `linker.lf`. See more in [Linker Script Generation](#). Please note that the compiler may transform some code into a lookup table in the const data, so `noflash_text` is not safe.

Please do take care that the optimization level may affect the compiler behavior of `inline`, or transform some code into a lookup table in the const data, etc.

To place data into the DRAM, you can either:

1. Add `DRAM_ATTR` (include `esp_attr.h`) to the data definition like:

```
DRAM_ATTR int g_foo = 3;
```

2. Use the `noflash` placement in the `linker.lf`. See more in [Linker Script Generation](#).

Please also see the example [peripherals/spi\\_master/hd\\_eeprom](#).

**GPIO Matrix and IO\_MUX** Most of ESP32's peripheral signals have a direct connection to their dedicated `IO_MUX` pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated `IO_MUX` pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if `IO_MUX` pins are used.

---

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

---

The `IO_MUX` pins for SPI buses are given below.

Pin Name	SPI 2 (GPIO Number)	SPI 3 (GPIO Number)
CS0 <sup>1</sup>	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

---

<sup>1</sup> Only the first Device attached to the bus can use the CS0 pin.

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transactions.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2  $\mu$ s per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2  $\mu$ s, but the transaction length is limited to 64 bytes for both write and read.

The typical transaction duration for one byte of data is given below.

- Interrupt Transaction via DMA: 28  $\mu$ s.
- Interrupt Transaction via CPU: 25  $\mu$ s.
- Polling Transaction via DMA: 10  $\mu$ s.
- Polling Transaction via CPU: 8  $\mu$ s.

Note that these data are tested with `CONFIG_SPI_MASTER_ISR_IN_IRAM` enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

**SPI Clock Frequency** The clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to `spi_clock_source_t` to know the supported clock sources.

By default driver sets `spi_device_handle_t::cfg::clock_source` to `SPI_CLK_SRC_DEFAULT`. This usually stands for the highest frequency among GPSPI clock sources. Its value is different among chips.

The actual clock frequency of a Device may not be exactly equal to the number you set, it is re-calculated by the driver to the nearest hardware-compatible number, and not larger than the clock frequency of the clock source. You can call `spi_device_get_actual_freq()` to know the actual frequency computed by the driver.

The theoretical maximum transfer speed of the Write or Read phase can be calculated according to the table below:

Line Width of Write/Read phase	Speed (Bps)
1-Line	$SPI\ Frequency / 8$
2-Line	$SPI\ Frequency / 4$
4-Line	$SPI\ Frequency / 2$

The transfer speed calculation of other phases (Command, Address, Dummy) is similar.

If the clock frequency is too high, the use of some functions might be limited. See *Timing Considerations*.

**Cache Missing** The default config puts only the ISR into the IRAM. Other SPI-related functions, including the driver itself and the callback, might suffer from cache misses and need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache missing.

---

**Note:** SPI driver implementation is based on FreeRTOS APIs, to use `CONFIG_SPI_MASTER_IN_IRAM`, you should not enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`.

---

For an interrupt transaction, the overall cost is  $20+8n/F_{spi}[MHz]$  [ $\mu s$ ] for  $n$  bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/F_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval ( $\mu s$ )	Transaction Length (bytes)	Total Time ( $\mu s$ )	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of the transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations are handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache missing. For more details, see [IRAM-Safe Interrupt Handlers](#).

### Timing Considerations

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is  $< 0$ , which means the setup timing requirement is violated and the reading might be incorrect.

The maximum allowed frequency is dependent on:

- `spi_device_interface_config_t::input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO\_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33 ~ 77% in comparison to the existing **input delay**. To retain a higher frequency, you have to use the IO\_MUX pins or the **dummy bit workaround**. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround:** Dummy clocks, during which the Host does not read data, can be inserted before the Read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the Read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

Frequency Limit (MHz)	Frequency Limit (MHz)	Dummy Bits Used by Driver	Comments
GPIO Matrix	IO_MUX Pins		
26.6	80	No	
40	--	Yes	Half-duplex, no DMA allowed

If the Host only writes data, the **dummy bit workaround** and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80 MHz, even if the GPIO matrix is used.

`spi_device_interface_config_t::flags`

The SPI Master driver still works even if the `spi_device_interface_config_t::input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device's specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table. These data are retrieved when the slave Device is on a different physical chip.

Device	Input Delay (ns)
Ideal Device	0
ESP32 slave using IO_MUX	50
ESP32 slave using GPIO_MATRIX	75

The MISO path delay (valid time) consists of a slave's **input delay** plus the master's **GPIO matrix delay**. The delay determines the above frequency limit for full-duplex transfers. Once exceeding, full-duplex transfers will not work as well as the half-duplex transactions that use dummy bits. The frequency limit is:

$$Freq\ limit\ [MHz] = 80 / (\text{floor}(MISO\ delay[ns]/12.5) + 1)$$

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different **input delay** times are shown in the table below.

When the master is IO\_MUX (0 ns):

Input Delay (ns)	MISO Path Delay (ns)	Freq. Limit (MHz)
0	0	80
50	50	16
75	75	11.43

When the master is GPIO\_MATRIX (25 ns):

Input Delay (ns)	MISO Path Delay (ns)	Freq. Limit (MHz)
0	25	26.67
50	75	11.43
75	100	8.89

### Known Issues

- Half-duplex transactions are not compatible with DMA when both the Write and Read phases are used. If such transactions are required, you have to use one of the alternative solutions:
  - Use full-duplex transactions instead.
  - Disable DMA by setting the bus initialization function's last parameter to 0 as follows:**

```
ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
```

This can prohibit you from transmitting and receiving data longer than 64 bytes.
  - Try using the command and address fields to replace the Write phase.
- Full-duplex transactions are not compatible with the **dummy bit workaround**, hence the frequency is limited. See [dummy bit speed-up workaround](#).
- `dummy_bits` in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI Read and Write phases are both enabled (regardless of full duplex or half duplex mode).

4. `cs_ena_pretrans` is not compatible with the Command and Address phases of full-duplex transactions.

### Application Example

The code example for using the SPI master half duplex mode to read/write an AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi\\_master/hd\\_eeprom](#) directory of ESP-IDF examples.

The code example for using the SPI master full duplex mode to drive a SPI\_LCD (e.g. ST7789V or ILI9341) can be found in the [peripherals/spi\\_master/lcd](#) directory of ESP-IDF examples.

## API Reference - SPI Common

### Header File

- [components/hal/include/hal/spi\\_types.h](#)
- This header file can be included with:

```
#include "hal/spi_types.h"
```

### Structures

struct **spi\_line\_mode\_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

### Public Members

uint8\_t **cmd\_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8\_t **addr\_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8\_t **data\_lines**

The line width of data phase, e.g. 4-line-data-phase.

### Type Definitions

typedef [soc\\_periph\\_spi\\_clk\\_src\\_t](#) **spi\_clock\_source\_t**

Type of SPI clock source.

### Enumerations

enum **spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

*Values:*

enumerator **SPI1\_HOST**

SPI1.

enumerator **SPI2\_HOST**

SPI2.

enumerator **SPI3\_HOST**

SPI3.

enumerator **SPI\_HOST\_MAX**

invalid host value

enum **spi\_event\_t**

SPI Events.

*Values:*

enumerator **SPI\_EV\_BUF\_TX**

The buffer has sent data to master.

enumerator **SPI\_EV\_BUF\_RX**

The buffer has received data from master.

enumerator **SPI\_EV\_SEND\_DMA\_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI\_EV\_RECV\_DMA\_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI\_EV\_CMD9**

Received CMD9 from master.

enumerator **SPI\_EV\_CMDA**

Received CMDA from master.

enumerator **SPI\_EV\_TRANS**

A transaction has done.

enum **spi\_command\_t**

SPI command.

*Values:*

enumerator **SPI\_CMD\_HD\_WRBUF**

enumerator **SPI\_CMD\_HD\_RDBUF**

enumerator **SPI\_CMD\_HD\_WRDMA**

enumerator **SPI\_CMD\_HD\_RDDMA**

enumerator `SPI_CMD_HD_SEG_END`

enumerator `SPI_CMD_HD_EN_QPI`

enumerator `SPI_CMD_HD_WR_END`

enumerator `SPI_CMD_HD_INT0`

enumerator `SPI_CMD_HD_INT1`

enumerator `SPI_CMD_HD_INT2`

### Header File

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t spi_bus_initialize` (`spi_host_device_t` host\_id, const `spi_bus_config_t` \*bus\_config, `spi_dma_chan_t` dma\_chan)

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Parameters

- **host\_id** -- SPI peripheral that controls this bus
- **bus\_config** -- Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

**Returns**

- ESP\_ERR\_INVALID\_ARG if configuration is invalid
- ESP\_ERR\_INVALID\_STATE if host already is in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **spi\_bus\_free** (*spi\_host\_device\_t* host\_id)

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters** *host\_id* -- SPI peripheral to free

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if bus hasn't been initialized before, or not all devices on the bus are freed
- ESP\_OK on success

**Structures**

struct **spi\_bus\_config\_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

---

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi\_bus\_config\_t* referring to these lines will be ignored and can thus safely be left uninitialized.

---

**Public Members**

int **mosi\_io\_num**

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

int **data0\_io\_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso\_io\_num**

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

int **data1\_io\_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk\_io\_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp\_io\_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2\_io\_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd\_io\_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3\_io\_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4\_io\_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5\_io\_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6\_io\_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7\_io\_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max\_transfer\_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32\_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

*esp\_intr\_cpu\_affinity\_t* **isr\_cpu\_id**

Select cpu core to register SPI ISR.

int **intr\_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

## Macros

**SPI\_MAX\_DMA\_LEN**

**SPI\_SWAP\_DATA\_TX** (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

### Parameters

- **DATA** -- Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI\_SWAP\_DATA\_RX** (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

**Parameters**

- **DATA** -- Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON\_BUSFLAG\_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON\_BUSFLAG\_MASTER**

Initialize I/O in master mode.

**SPICOMMON\_BUSFLAG\_IOMUX\_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON\_BUSFLAG\_GPIO\_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_IO4\_IO7**

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON\_BUSFLAG\_OCTAL**

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS**

## Type Definitions

typedef *spi\_common\_dma\_t* **spi\_dma\_chan\_t**

## Enumerations

enum **spi\_common\_dma\_t**

SPI DMA channels.

*Values:*

enumerator **SPI\_DMA\_DISABLED**

Do not enable DMA for SPI.

enumerator **SPI\_DMA\_CH1**

Enable DMA, select DMA Channel 1.

enumerator **SPI\_DMA\_CH2**

Enable DMA, select DMA Channel 2.

enumerator **SPI\_DMA\_CH\_AUTO**

Enable DMA, channel is automatically selected by driver.

## API Reference - SPI Master

### Header File

- [components/driver/spi/include/driver/spi\\_master.h](#)
- This header file can be included with:

```
#include "driver/spi_master.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **spi\_bus\_add\_device** (*spi\_host\_device\_t* host\_id, const *spi\_device\_interface\_config\_t* \*dev\_config, *spi\_device\_handle\_t* \*handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

---

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

---

### Parameters

- **host\_id** -- SPI peripheral to allocate device on

- **dev\_config** -- SPI interface protocol config for the device
- **handle** -- Pointer to variable to hold the device handle

**Returns**

- **ESP\_ERR\_INVALID\_ARG** if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn't set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- **ESP\_ERR\_INVALID\_STATE** if selected clock source is unavailable or spi bus not initialized
- **ESP\_ERR\_NOT\_FOUND** if host doesn't have any free CS slots
- **ESP\_ERR\_NO\_MEM** if out of memory
- **ESP\_OK** on success

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

**Parameters** **handle** -- Device handle to free

**Returns**

- **ESP\_ERR\_INVALID\_ARG** if parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** if device already is freed
- **ESP\_OK** on success

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

**Returns**

- **ESP\_ERR\_INVALID\_ARG** if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- **ESP\_ERR\_TIMEOUT** if there was no room in the queue before `ticks_to_wait` expired
- **ESP\_ERR\_NO\_MEM** if allocating DMA-capable temporary buffer failed
- **ESP\_ERR\_INVALID\_STATE** if previous transactions are not finished
- **ESP\_OK** on success

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.

- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_start** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Immediately start a polling transaction.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_end** (*spi\_device\_handle\_t* handle, TickType\_t ticks\_to\_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions of same device are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_acquire\_bus** (*spi\_device\_handle\_t* device, TickType\_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

---

**Note:** The function will wait until all the existing transactions have been sent.

---

**Parameters**

- **device** -- The device to occupy the bus.
- **wait** -- Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

**Returns**

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters** **dev** -- The device to release the bus.

*esp\_err\_t* **spi\_device\_get\_actual\_freq** (*spi\_device\_handle\_t* handle, int \*freq\_khz)

Calculate working frequency for specific device.

**Parameters**

- **handle** -- SPI device handle
- **freq\_khz** -- [out] output parameter to hold calculated frequency in kHz

**Returns**

- `ESP_ERR_INVALID_ARG` : `handle` or `freq_khz` parameter is NULL
- `ESP_OK` : Success

int **spi\_get\_actual\_clock** (int fapb, int hz, int duty\_cycle)

Calculate the working frequency that is most close to desired frequency.

**Parameters**

- **fapb** -- The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** -- Desired working frequency
- **duty\_cycle** -- Duty cycle of the spi clock

**Returns** Actual working frequency that most fit.

void **spi\_get\_timing** (bool gpio\_is\_used, int input\_delay\_ns, int eff\_clk, int \*dummy\_o, int \*cycles\_remain\_o)

Calculate the timing settings of specified frequency and settings.

---

**Note:** If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

---

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if iomux pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.
- **eff\_clk** -- Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy\_o** -- Address of dummy bits used output. Set to NULL if not needed.
- **cycles\_remain\_o** -- Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool gpio\_is\_used, int input\_delay\_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if native pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

*esp\_err\_t* **spi\_bus\_get\_max\_transaction\_len** (*spi\_host\_device\_t* host\_id, size\_t \*max\_bytes)

Get max length (in bytes) of one transaction.

**Parameters**

- **host\_id** -- SPI peripheral
- **max\_bytes** -- [out] Max length of one transaction, in bytes

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument

## Structures

struct **spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

### Public Members

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

**uint8\_t address\_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

**uint8\_t dummy\_bits**

Amount of dummy bits to insert between address and data phase.

**uint8\_t mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

***spi\_clock\_source\_t* clock\_source**

Select SPI clock source, `SPI_CLK_SRC_DEFAULT` by default.

**uint16\_t duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

**uint16\_t cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

**uint8\_t cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

**int clock\_speed\_hz**

SPI clock speed in Hz. Derived from `clock_source`.

**int input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

**int spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

**uint32\_t flags**

Bitwise OR of `SPI_DEVICE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction\_cb\_t* pre\_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

#### *transaction\_cb\_t* **post\_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

#### struct **spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

### Public Members

#### uint32\_t **flags**

Bitwise OR of `SPI_TRANS_*` flags.

#### uint16\_t **cmd**

Command data, of which the length is set in the `command_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

#### uint64\_t **addr**

Address data, of which the length is set in the `address_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

#### size\_t **length**

Total data length, in bits.

#### size\_t **rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

#### void \***user**

User-defined variable. Can be used to store eg transaction ID.

#### const void \***tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

#### uint8\_t **tx\_data**[4]

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

void **\*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8\_t **rx\_data**[4]

If SPI\_TRANS\_USE\_RXDATA is set, data is received directly to this variable.

struct **spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI\_TRANS\_VARIABLE\_CMD\_ADR to use the bit length here.

### Public Members

struct *spi\_transaction\_t* **base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

uint8\_t **command\_bits**

The command length in this transaction, in bits.

uint8\_t **address\_bits**

The address length in this transaction, in bits.

uint8\_t **dummy\_bits**

The dummy length in this transaction, in bits.

### Macros

**SPI\_MASTER\_FREQ\_8M**

SPI common used frequency (in Hz)

---

**Note:** SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

---

**SPI\_MASTER\_FREQ\_9M**

8.89MHz

**SPI\_MASTER\_FREQ\_10M**

10MHz

**SPI\_MASTER\_FREQ\_11M**

11.43MHz

**SPI\_MASTER\_FREQ\_13M**

13.33MHz

**SPI\_MASTER\_FREQ\_16M**

16MHz

**SPI\_MASTER\_FREQ\_20M**

20MHz

**SPI\_MASTER\_FREQ\_26M**

26.67MHz

**SPI\_MASTER\_FREQ\_40M**

40MHz

**SPI\_MASTER\_FREQ\_80M**

80MHz

**SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK**

**SPI\_DEVICE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use post\_cb to notify instead)

**SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into rx\_data member of *spi\_transaction\_t* instead into memory at rx\_buffer.

**SPI\_TRANS\_USE\_TXDATA**

Transmit tx\_data member of *spi\_transaction\_t* instead of data at tx\_buffer. Do not set tx\_buffer when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by SPI\_MODE\_DIO/SPI\_MODE\_QIO.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the command\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the address\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the dummy\_bits in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_CS\_KEEP\_ACTIVE**

Keep CS active after data transfer.

**SPI\_TRANS\_MULTILINE\_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI\_TRANS\_MODE\_OCT**

Transmit/receive data in 8-bit mode.

**SPI\_TRANS\_MULTILINE\_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

**SPI\_TRANS\_DMA\_BUFFER\_ALIGN\_MANUAL**

By default driver will automatically re-alloc dma buffer if it doesn't meet hardware alignment or dma\_capable requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error ESP\_ERR\_INVALID\_ARG.

**Type Definitions**

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

## 2.6.22 SPI Slave Driver

SPI Slave driver is a program that controls ESP32's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a slave.

For more hardware information about the GP-SPI peripheral(s), see [ESP32 Technical Reference Manual > SPI Controller \[PDF\]](#).

### Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <b>de-assertion</b> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <b>launches</b> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <b>latches in</b> the signal.

### Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the

MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

### Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.

If transactions are expected to be longer than 32 bytes, set the parameter `dma_chan` to 1 or 2 to allow a DMA channel 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

### Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO\_MUX** Most of ESP32's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. If the driver is configured so that all SPI signals are either routed to their dedicated IO\_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO\_MUX pins.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see [Timing Considerations](#).

The IO\_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)	GPIO Number (SPI3)
CS0	15	5
SCLK	14	18
MISO	12	19
MOSI	13	23
QUADWP	2	22
QUADHD	4	21

### Speed and Timing Considerations

**Transaction Interval** The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

/	Output delay of MISO (ns)	Freq. limit (MHz)
IO_MUX	43.75	< 11.4
GPIO matrix	68.75	< 7.2

Note: 1. If the frequency reaches the maximum limitation, random errors may occur. 2. The clock uncertainty between the Host and the Device (12.5 ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.

### Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.

Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

- Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

If DMA is enabled, a Device's launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master's actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

### Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

### API Reference

#### Header File

- [components/driver/spi/include/driver/spi\\_slave.h](#)
- This header file can be included with:

```
#include "driver/spi_slave.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

#### Functions

`esp_err_t spi_slave_initialize` (`spi_host_device_t` host, const `spi_bus_config_t` \*bus\_config, const `spi_slave_interface_config_t` \*slave\_config, `spi_dma_chan_t` dma\_chan)

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- **host** -- SPI peripheral to use as a SPI slave interface
- **bus\_config** -- Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **slave\_config** -- Pointer to a *spi\_slave\_interface\_config\_t* struct specifying the details for the slave interface
- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI\_DMA\_DISABLED limits the size of transactions.
  - Set to SPI\_DMA\_DISABLED if only the SPI flash uses this bus.
  - Set to SPI\_DMA\_CH\_AUTO to let the driver to allocate the DMA channel.

**Returns**

- ESP\_ERR\_INVALID\_ARG if configuration is invalid
- ESP\_ERR\_INVALID\_STATE if host already is in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_free** (*spi\_host\_device\_t* host)

Free a SPI bus claimed as a SPI slave interface.

**Parameters** **host** -- SPI peripheral to free

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if not all devices on the bus are freed
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_queue\_trans** (*spi\_host\_device\_t* host, const *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via *spi\_slave\_initialize*.) This function may block if the queue is full (depending on the *ticks\_to\_wait* parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in *trans\_desc* to the SPI slave driver; the application is not to access this memory until *spi\_slave\_queue\_trans* is called to hand ownership back to the application.

**Parameters**

- **host** -- SPI peripheral that is acting as a slave
- **trans\_desc** -- Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use port-MAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_get\_trans\_result** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with *spi\_slave\_queue\_trans*) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by *spi\_slave\_queue\_trans*.

**Parameters**

- **host** -- SPI peripheral to that is acting as a slave

- **trans\_desc** -- [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_SUPPORTED if flag SPI\_SLAVE\_NO\_RETURN\_RESULT is set
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_transmit** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Do a SPI transaction.

Essentially does the same as spi\_slave\_queue\_trans followed by spi\_slave\_get\_trans\_result. Do not use this when there is still a transaction queued that hasn't been finalized using spi\_slave\_get\_trans\_result.

**Parameters**

- **host** -- SPI peripheral to that is acting as a slave
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Structures**

struct **spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

**Public Members**

int **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of SPI\_SLAVE\_\* flags.

int **queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi\_slave\_queue\_trans but not yet finished using spi\_slave\_get\_trans\_result) at the same time.

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

*slave\_transaction\_cb\_t* **post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

#### *slave\_transaction\_cb\_t* **post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

#### struct **spi\_slave\_transaction\_t**

This structure describes one SPI transaction

#### **Public Members**

##### size\_t **length**

Total data length, in bits.

##### size\_t **trans\_len**

Transaction data length, in bits.

##### const void \***tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

##### void \***rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

##### void \***user**

User-defined variable. Can be used to store eg transaction ID.

#### **Macros**

##### **SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

##### **SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

##### **SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

##### **SPI\_SLAVE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

#### **Type Definitions**

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

### 2.6.23 ESP32-WROOM-32SE (Secure Element)

#### Overview

ESP32-WROOM-32SE integrates Microchip's ATECC608A cryptoauth chip in the module. ATECC608A is a secure element, which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with the use of X.509-based mutual authentication.

The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A.

#### Application Example

Secure Element ECDSA Sign/Verify example: [peripherals/secure\\_element/atecc608\\_ecdsa](#).

#### How to Configure and Provision ESP32-WROOM-32SE for TLS

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit [esp\\_cryptoauth\\_utility](#).

#### How to Use ATECC608A of ESP32-WROOM-32SE for TLS

ATECC608A can be used for TLS connections using ESP-TLS.

To configure ESP-TLS for using a secure element, please refer to **ATECC608A (Secure Element) with ESP-TLS** in [ESP-TLS](#).

### 2.6.24 Touch Sensor

#### Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When the surface is touched, the capacitance variation is used to evaluate if the touch was valid.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see **ESP32 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing** [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in [Touch Sensor Application Note](#).

For more information about testing touch sensors in various configurations, please check the [Guide for ESP32-Sense-Kit](#).

## Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section [API Reference](#). Practical implementation of this API is covered in Section [Application Examples](#).

**Initialization** Before using a touch pad, you need to initialize the touch pad driver by calling the function `touch_pad_init()`. This function sets several `._DEFAULT` driver parameters listed in [API Reference](#) under **Macros**. It also removes the information about which pads have been touched before, if any, and disables interrupts. If the driver is not required anymore, deinitialize it by calling `touch_pad_deinit()`.

**Configuration** Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`. The following 10 capacitive touch pads are supported for ESP32.

Touch Pad	GPIO Pin
T0	GPIO4
T1	GPIO0
T2	GPIO2
T3	MTDO
T4	MTCK
T5	MTDI
T6	MTMS
T7	GPIO27
T8	32K_XN
T9	32K_XP

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

**Touch State Measurements** The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read_raw_data()`
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

---

**Note:** Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section [Filtering of Measurements](#).

---

For the demonstration of how to read the touch pad data, check the application example [peripherals/touch\\_sensor/touch\\_sensor\\_v1/touch\\_pad\\_read](#).

**Method of Measurements** The touch sensor counts the number of charge/discharge cycles over a fixed period of time (specified by `touch_pad_set_measurement_clock_cycles()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor sleeps until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

**Note:** If the specified clock cycles for measurement is too small, the result may be inaccurate, but increasing clock cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

**Optimization of Measurements** A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged/discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_measurement_clock_cycles()`.

The following list summarizes available measurement parameters and corresponding 'set' functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Clock cycles of one measurement: `touch_pad_set_measurement_clock_cycles()`

Relationship between the voltage range (high/low reference voltages), speed (slope), and measurement time is shown in the figure below.

Fig. 27: Touch pad - relationship between measurement parameters

The last chart **Output** represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to **set** a specific parameter and to **get** the current parameter's value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.

You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

**Touch Detection** Touch detection is implemented in ESP32's hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection/provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see [peripherals/touch\\_sensor/touch\\_sensor\\_v1/touch\\_pad\\_interrupt](#).

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in *Touch State Measurements* to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

---

**Note:** Interrupts on touch detection operate on raw/unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see *Filtering of Measurements*) does not affect this process.

---

**Wakeup from Sleep Mode** If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function `touch_pad_set_trigger_source()`.

Configuration of required bit patterns of pads may be managed for each 'SET' with:

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

## Application Examples

- Touch sensor read example: [peripherals/touch\\_sensor/touch\\_sensor\\_v1/touch\\_pad\\_read](#).
- Touch sensor interrupt example: [peripherals/touch\\_sensor/touch\\_sensor\\_v1/touch\\_pad\\_interrupt](#).

## API Reference

### Header File

- [components/driver/touch\\_sensor/esp32/include/driver/touch\\_sensor.h](#)
- This header file can be included with:

```
#include "driver/touch_sensor.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **touch\_pad\_config**(*touch\_pad\_t* touch\_num, uint16\_t threshold)

Configure touch pad interrupt threshold.

---

**Note:** If FSM mode is set to `TOUCH_FSM_MODE_TIMER`, this function will be blocked for one measurement cycle and wait for data to be valid.

---

#### Parameters

- **touch\_num** -- touch pad index
- **threshold** -- interrupt threshold,

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` if argument wrong
- `ESP_FAIL` if touch pad not initialized

*esp\_err\_t* **touch\_pad\_read**(*touch\_pad\_t* touch\_num, uint16\_t \*touch\_value)

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not 'touched', we can get a number of the counter. When the pad is 'touched', the value in counter will get smaller because of the larger equivalent capacitance.

---

**Note:** This API requests hardware measurement once. If IIR filter mode is enabled, please use 'touch\_pad\_read\_raw\_data' interface instead.

---

#### Parameters

- **touch\_num** -- touch pad index
- **touch\_value** -- pointer to accept touch sensor value

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Touch pad parameter error
- `ESP_ERR_INVALID_STATE` This touch pad hardware connection is error, the value of "touch\_value" is 0.
- `ESP_FAIL` Touch pad not initialized

*esp\_err\_t* **touch\_pad\_read\_filtered**(*touch\_pad\_t* touch\_num, uint16\_t \*touch\_value)

get filtered touch sensor counter value by IIR filter.

---

**Note:** `touch_pad_filter_start` has to be called before calling `touch_pad_read_filtered`. This function can be called from ISR

---

**Parameters**

- **touch\_num** -- touch pad index
- **touch\_value** -- pointer to accept touch sensor value

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Touch pad parameter error
- `ESP_ERR_INVALID_STATE` This touch pad hardware connection is error, the value of "touch\_value" is 0.
- `ESP_FAIL` Touch pad not initialized

*esp\_err\_t* **touch\_pad\_read\_raw\_data** (*touch\_pad\_t* touch\_num, uint16\_t \*touch\_value)

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

---

**Note:** `touch_pad_filter_start` has to be called before calling `touch_pad_read_raw_data`. This function can be called from ISR

---

**Parameters**

- **touch\_num** -- touch pad index
- **touch\_value** -- pointer to accept touch sensor value

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Touch pad parameter error
- `ESP_ERR_INVALID_STATE` This touch pad hardware connection is error, the value of "touch\_value" is 0.
- `ESP_FAIL` Touch pad not initialized

*esp\_err\_t* **touch\_pad\_set\_filter\_read\_cb** (*filter\_cb\_t* read\_cb)

Register the callback function that is called after each IIR filter calculation.

---

**Note:** The 'read\_cb' callback is called in timer task in each filtering cycle.

---

**Parameters** **read\_cb** -- Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` set error

*esp\_err\_t* **touch\_pad\_isr\_register** (*intr\_handler\_t* fn, void \*arg)

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** -- Pointer to ISR handler
- **arg** -- Parameter for ISR

**Returns**

- `ESP_OK` Success ;
- `ESP_ERR_INVALID_ARG` GPIO error
- `ESP_ERR_NO_MEM` No memory

*esp\_err\_t* **touch\_pad\_set\_measurement\_clock\_cycles** (uint16\_t clock\_cycle)

Set the clock cycles of each measurement.

---

**Note:** This function will specify the clock cycles of each measurement and the clock is sourced from SOC\_MOD\_CLK\_RTC\_FAST, its default frequency is SOC\_CLK\_RC\_FAST\_FREQ\_APPROX. The touch sensor will record the charge and discharge times during these clock cycles as the final result (raw value).

---

---

**Note:** If clock cycles is too small, it may lead to inaccurate results.

---

**Parameters** **clock\_cycle** -- The clock cycles of each measurement  $measure\_time = clock\_cycle / SOC\_CLK\_RC\_FAST\_FREQ\_APPROX$ , the maximum measure time is  $0xffff / SOC\_CLK\_RC\_FAST\_FREQ\_APPROX$

**Returns**

- ESP\_OK Set the clock cycle success

*esp\_err\_t* **touch\_pad\_get\_measurement\_clock\_cycles** (uint16\_t \*clock\_cycle)

Get the clock cycles of each measurement.

**Parameters** **clock\_cycle** -- The clock cycles of each measurement

**Returns**

- ESP\_OK Get the clock cycle success
- ESP\_ERR\_INVALID\_ARG The input parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_measurement\_interval** (uint16\_t interval\_cycle)

Set the interval between two measurements.

---

**Note:** The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC\_MOD\_CLK\_RTC\_SLOW, its default frequency is SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX.

---

**Parameters** **interval\_cycle** -- The interval between two measurements  $sleep\_time = interval\_cycle / SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX$ . The approximate frequency value of RTC\_SLOW\_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.

**Returns**

- ESP\_OK Set interval cycle success

*esp\_err\_t* **touch\_pad\_get\_measurement\_interval** (uint16\_t \*interval\_cycle)

Get the interval between two measurements.

**Parameters** **interval\_cycle** -- The interval between two measurements

**Returns**

- ESP\_OK Get interval cycle success
- ESP\_ERR\_INVALID\_ARG The input parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_meas\_time** (uint16\_t sleep\_cycle, uint16\_t meas\_cycle)

Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

---

**Note:** The touch sensor will count the number of charge/discharge cycles over a fixed period of time (specified as the second parameter). That means the number of cycles (raw value) will decrease as the capacity of the touch pad is increasing.

---

---

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed.

---

**Parameters**

- **sleep\_cycle** -- The touch sensor will sleep after each measurement. sleep\_cycle decide the interval between each measurement.  $t_{sleep} = sleep\_cycle / SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX$ . The approximate frequency value of RTC\_SLOW\_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.
- **meas\_cycle** -- The duration of the touch sensor measurement.  $t_{meas} = meas\_cycle / SOC\_CLK\_RC\_FAST\_FREQ\_APPROX$ , the maximum measure time is `0xffff / SOC_CLK_RC_FAST_FREQ_APPROX`

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_get\_meas\_time** (uint16\_t \*sleep\_cycle, uint16\_t \*meas\_cycle)

Get touch sensor measurement and sleep time.

**Parameters**

- **sleep\_cycle** -- Pointer to accept sleep cycle number
- **meas\_cycle** -- Pointer to accept measurement cycle count.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG The input parameter is NULL

*esp\_err\_t* **touch\_pad\_sw\_start** (void)

Trigger a touch sensor measurement, only support in SW mode of FSM.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_thresh** (*touch\_pad\_t* touch\_num, uint16\_t threshold)

Set touch sensor interrupt threshold.

**Parameters**

- **touch\_num** -- touch pad index
- **threshold** -- threshold of touchpad count, refer to `touch_pad_set_trigger_mode` to see how to set trigger mode.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_thresh** (*touch\_pad\_t* touch\_num, uint16\_t \*threshold)

Get touch sensor interrupt threshold.

**Parameters**

- **touch\_num** -- touch pad index
- **threshold** -- pointer to accept threshold

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_set\_trigger\_mode** (*touch\_trigger\_mode\_t* mode)

Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

**Parameters** **mode** -- touch sensor interrupt trigger mode

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_trigger\_mode** (*touch\_trigger\_mode\_t* \*mode)

Get touch sensor interrupt trigger mode.

**Parameters** **mode** -- pointer to accept touch sensor interrupt trigger mode

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_trigger\_source** (*touch\_trigger\_src\_t* src)

Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is 'touched'. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

**Parameters** **src** -- touch sensor interrupt trigger source

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_trigger\_source** (*touch\_trigger\_src\_t* \*src)

Get touch sensor interrupt trigger source.

**Parameters** **src** -- pointer to accept touch sensor interrupt trigger source

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_group\_mask** (uint16\_t set1\_mask, uint16\_t set2\_mask, uint16\_t en\_mask)

Set touch sensor group mask. Touch pad module has two sets of signals, 'Touched' signal is triggered only if at least one of touch pad in this group is "touched". This function will set the register bits according to the given bitmask.

**Parameters**

- **set1\_mask** -- bitmask of touch sensor signal group1, it's a 10-bit value
- **set2\_mask** -- bitmask of touch sensor signal group2, it's a 10-bit value
- **en\_mask** -- bitmask of touch sensor work enable, it's a 10-bit value

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_group\_mask** (uint16\_t \*set1\_mask, uint16\_t \*set2\_mask, uint16\_t \*en\_mask)

Get touch sensor group mask.

**Parameters**

- **set1\_mask** -- pointer to accept bitmask of touch sensor signal group1, it's a 10-bit value
- **set2\_mask** -- pointer to accept bitmask of touch sensor signal group2, it's a 10-bit value
- **en\_mask** -- pointer to accept bitmask of touch sensor work enable, it's a 10-bit value

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_clear\_group\_mask** (uint16\_t set1\_mask, uint16\_t set2\_mask, uint16\_t en\_mask)

Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is "touched". This function will clear the register bits according to the given bitmask.

**Parameters**

- **set1\_mask** -- bitmask touch sensor signal group1, it's a 10-bit value
- **set2\_mask** -- bitmask touch sensor signal group2, it's a 10-bit value
- **en\_mask** -- bitmask of touch sensor work enable, it's a 10-bit value

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_intr\_enable** (void)

To enable touch pad interrupt.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_disable** (void)

To disable touch pad interrupt.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_clear** (void)

To clear touch pad interrupt.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_filter\_period** (uint32\_t new\_period\_ms)

set touch pad filter calibration period, in ms. Need to call touch\_pad\_filter\_start before all touch filter APIs

**Parameters** *new\_period\_ms* -- filter period, in ms

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE driver state error
- ESP\_ERR\_INVALID\_ARG parameter error

*esp\_err\_t* **touch\_pad\_get\_filter\_period** (uint32\_t \*p\_period\_ms)

get touch pad filter calibration period, in ms Need to call touch\_pad\_filter\_start before all touch filter APIs

**Parameters** *p\_period\_ms* -- pointer to accept period

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE driver state error
- ESP\_ERR\_INVALID\_ARG parameter error

*esp\_err\_t* **touch\_pad\_filter\_start** (uint32\_t filter\_period\_ms)

start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch\_pad\_filter\_start before all touch filter APIs

---

**Note:** This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

---

**Parameters** *filter\_period\_ms* -- filter calibration period, in ms

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter error
- ESP\_ERR\_NO\_MEM No memory for driver
- ESP\_ERR\_INVALID\_STATE driver state error

*esp\_err\_t* **touch\_pad\_filter\_stop** (void)

stop touch pad filter function Need to call touch\_pad\_filter\_start before all touch filter APIs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE driver state error

*esp\_err\_t* **touch\_pad\_filter\_delete** (void)

delete touch pad filter driver and release the memory Need to call touch\_pad\_filter\_start before all touch filter APIs

**Returns**

- ESP\_OK Success

- ESP\_ERR\_INVALID\_STATE driver state error

### Type Definitions

typedef void (\***filter\_cb\_t**)(uint16\_t \*raw\_value, uint16\_t \*filtered\_value)

Callback function that is called after each IIR filter calculation.

---

**Note:** This callback is called in timer task in each filtering cycle.

---

---

**Note:** This callback should not be blocked.

---

**Param raw\_value** The latest raw data(touch sensor counter value) that points to all channels(raw\_value[0..TOUCH\_PAD\_MAX-1]).

**Param filtered\_value** The latest IIR filtered data(calculated from raw data) that points to all channels(filtered\_value[0..TOUCH\_PAD\_MAX-1]).

### Header File

- [components/driver/touch\\_sensor/include/driver/touch\\_sensor\\_common.h](#)
- This header file can be included with:

```
#include "driver/touch_sensor_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **touch\_pad\_init** (void)

Initialize touch module.

---

**Note:** If default parameter don't match the usage scenario, it can be changed after this function.

---

#### Returns

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM Touch pad init error
- ESP\_ERR\_NOT\_SUPPORTED Touch pad is providing current to external XTAL

*esp\_err\_t* **touch\_pad\_deinit** (void)

Un-install touch pad driver.

---

**Note:** After this function is called, other touch functions are prohibited from being called.

---

#### Returns

- ESP\_OK Success
- ESP\_FAIL Touch pad driver not initialized

*esp\_err\_t touch\_pad\_io\_init* (*touch\_pad\_t* touch\_num)

Initialize touch pad GPIO.

**Parameters** *touch\_num* -- touch pad index

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t touch\_pad\_set\_voltage* (*touch\_high\_volt\_t* refh, *touch\_low\_volt\_t* refl, *touch\_volt\_atten\_t* atten)

Set touch sensor high voltage threshold of charge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**Parameters**

- **refh** -- the value of DREFH
- **refl** -- the value of DREFL
- **atten** -- the attenuation on DREFH

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t touch\_pad\_get\_voltage* (*touch\_high\_volt\_t* \*refh, *touch\_low\_volt\_t* \*refl, *touch\_volt\_atten\_t* \*atten)

Get touch sensor reference voltage,.

**Parameters**

- **refh** -- pointer to accept DREFH value
- **refl** -- pointer to accept DREFL value
- **atten** -- pointer to accept the attenuation on DREFH

**Returns**

- ESP\_OK on success

*esp\_err\_t touch\_pad\_set\_cnt\_mode* (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* slope, *touch\_tie\_opt\_t* opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

---

**Note:** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

---

**Parameters**

- **touch\_num** -- touch pad index
- **slope** -- touch pad charge/discharge speed
- **opt** -- the initial voltage

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t touch\_pad\_get\_cnt\_mode* (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* \*slope, *touch\_tie\_opt\_t* \*opt)

Get touch sensor charge/discharge speed for each pad.

**Parameters**

- **touch\_num** -- touch pad index
- **slope** -- pointer to accept touch pad charge/discharge slope
- **opt** -- pointer to accept the initial voltage

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_isr\_deregister** (void (\*fn)(void\*), void \*arg)

Deregister the handler previously registered using `touch_pad_isr_handler_register`.

**Parameters**

- **fn** -- handler function to call (as passed to `touch_pad_isr_handler_register`)
- **arg** -- argument of the handler (as passed to `touch_pad_isr_handler_register`)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if a handler matching both `fn` and `arg` isn't registered

*esp\_err\_t* **touch\_pad\_get\_wakeup\_status** (*touch\_pad\_t* \*pad\_num)

Get the touch pad which caused wakeup from deep sleep.

**Parameters** `pad_num` -- pointer to touch pad which caused wakeup

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_fsm\_mode** (*touch\_fsm\_mode\_t* mode)

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Parameters** `mode` -- FSM mode

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_fsm\_mode** (*touch\_fsm\_mode\_t* \*mode)

Get touch sensor FSM mode.

**Parameters** `mode` -- pointer to accept FSM mode

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_clear\_status** (void)

To clear the touch sensor channel active status.

---

**Note:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

---

**Returns**

- ESP\_OK on success

*uint32\_t* **touch\_pad\_get\_status** (void)

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Returns**

- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

*bool* **touch\_pad\_meas\_is\_done** (void)

Check touch sensor measurement status.

**Returns**

- True measurement is under way
- False measurement done

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.,

1. TOUCH\_PAD\_NUM5\_GPIO\_NUM is the GPIO number of channel 5 (12);
2. TOUCH\_PAD\_GPIO4\_CHANNEL is the channel number of GPIO 4 (channel 0).

### Header File

- `components/soc/esp32/include/soc/touch_sensor_channel.h`
- This header file can be included with:

```
#include "soc/touch_sensor_channel.h"
```

### Macros

`TOUCH_PAD_GPIO4_CHANNEL`

`TOUCH_PAD_NUM0_GPIO_NUM`

`TOUCH_PAD_GPIO0_CHANNEL`

`TOUCH_PAD_NUM1_GPIO_NUM`

`TOUCH_PAD_GPIO2_CHANNEL`

`TOUCH_PAD_NUM2_GPIO_NUM`

`TOUCH_PAD_GPIO15_CHANNEL`

`TOUCH_PAD_NUM3_GPIO_NUM`

`TOUCH_PAD_GPIO13_CHANNEL`

`TOUCH_PAD_NUM4_GPIO_NUM`

`TOUCH_PAD_GPIO12_CHANNEL`

`TOUCH_PAD_NUM5_GPIO_NUM`

`TOUCH_PAD_GPIO14_CHANNEL`

`TOUCH_PAD_NUM6_GPIO_NUM`

`TOUCH_PAD_GPIO27_CHANNEL`

`TOUCH_PAD_NUM7_GPIO_NUM`

`TOUCH_PAD_GPIO33_CHANNEL`

`TOUCH_PAD_NUM8_GPIO_NUM`

`TOUCH_PAD_GPIO32_CHANNEL`

`TOUCH_PAD_NUM9_GPIO_NUM`

## Header File

- [components/hal/include/hal/touch\\_sensor\\_types.h](#)
- This header file can be included with:

```
#include "hal/touch_sensor_types.h"
```

## Macros

**TOUCH\_PAD\_BIT\_MASK\_ALL**

**TOUCH\_PAD\_SLOPE\_DEFAULT**

**TOUCH\_PAD\_TIE\_OPT\_DEFAULT**

**TOUCH\_PAD\_BIT\_MASK\_MAX**

**TOUCH\_PAD\_HIGH\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_LOW\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_ATTEN\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_IDLE\_CH\_CONNECT\_DEFAULT**

**TOUCH\_PAD\_THRESHOLD\_MAX**

If set touch threshold max value, The touch sensor can't be in touched status

**TOUCH\_PAD\_SLEEP\_CYCLE\_DEFAULT**

The timer frequency is RTC\_SLOW\_CLK (can be 150k or 32k depending on the options), max value is 0xffff

**TOUCH\_PAD\_MEASURE\_CYCLE\_DEFAULT**

The timer frequency is 8Mhz, the max value is 0x7fff

**TOUCH\_FSM\_MODE\_DEFAULT**

The touch FSM may be started by the software or timer

**TOUCH\_TRIGGER\_MODE\_DEFAULT**

Interrupts can be triggered if sensor value gets below or above threshold

**TOUCH\_TRIGGER\_SOURCE\_DEFAULT**

The wakeup trigger source can be SET1 or both SET1 and SET2

## Enumerations

enum **touch\_pad\_t**

Touch pad channel

*Values:*

enumerator **TOUCH\_PAD\_NUM0**

Touch pad channel 0 is GPIO4(ESP32)

enumerator **TOUCH\_PAD\_NUM1**

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM2**

Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM3**

Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM4**

Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM5**

Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM6**

Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM7**

Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM8**

Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM9**

Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator **TOUCH\_PAD\_MAX**

enum **touch\_high\_volt\_t**

Touch sensor high reference voltage

*Values:*

enumerator **TOUCH\_HVOLT\_KEEP**

Touch sensor high reference voltage, no change

enumerator **TOUCH\_HVOLT\_2V4**

Touch sensor high reference voltage, 2.4V

enumerator **TOUCH\_HVOLT\_2V5**

Touch sensor high reference voltage, 2.5V

enumerator **TOUCH\_HVOLT\_2V6**

Touch sensor high reference voltage, 2.6V

enumerator **TOUCH\_HVOLT\_2V7**

Touch sensor high reference voltage, 2.7V

enumerator **TOUCH\_HVOLT\_MAX**

enum **touch\_low\_volt\_t**

Touch sensor low reference voltage

*Values:*

enumerator **TOUCH\_LVOLT\_KEEP**

Touch sensor low reference voltage, no change

enumerator **TOUCH\_LVOLT\_0V5**

Touch sensor low reference voltage, 0.5V

enumerator **TOUCH\_LVOLT\_0V6**

Touch sensor low reference voltage, 0.6V

enumerator **TOUCH\_LVOLT\_0V7**

Touch sensor low reference voltage, 0.7V

enumerator **TOUCH\_LVOLT\_0V8**

Touch sensor low reference voltage, 0.8V

enumerator **TOUCH\_LVOLT\_MAX**

enum **touch\_volt\_atten\_t**

Touch sensor high reference voltage attenuation

*Values:*

enumerator **TOUCH\_HVOLT\_ATTEN\_KEEP**

Touch sensor high reference voltage attenuation, no change

enumerator **TOUCH\_HVOLT\_ATTEN\_1V5**

Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_1V**

Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V5**

Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V**

Touch sensor high reference voltage attenuation, 0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_MAX**

enum **touch\_cnt\_slope\_t**

Touch sensor charge/discharge speed

*Values:*

enumerator **TOUCH\_PAD\_SLOPE\_0**

Touch sensor charge / discharge speed, always zero

enumerator **TOUCH\_PAD\_SLOPE\_1**

Touch sensor charge / discharge speed, slowest

enumerator **TOUCH\_PAD\_SLOPE\_2**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_3**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_4**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_5**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_6**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_7**

Touch sensor charge / discharge speed, fast

enumerator **TOUCH\_PAD\_SLOPE\_MAX**

enum **touch\_tie\_opt\_t**

Touch sensor initial charge level

*Values:*

enumerator **TOUCH\_PAD\_TIE\_OPT\_LOW**

Initial level of charging voltage, low level

enumerator **TOUCH\_PAD\_TIE\_OPT\_HIGH**

Initial level of charging voltage, high level

enumerator **TOUCH\_PAD\_TIE\_OPT\_MAX**

enum **touch\_fsm\_mode\_t**

Touch sensor FSM mode

*Values:*

enumerator **TOUCH\_FSM\_MODE\_TIMER**

To start touch FSM by timer

enumerator `TOUCH_FSM_MODE_SW`

To start touch FSM by software trigger

enumerator `TOUCH_FSM_MODE_MAX`

enum `touch_trigger_mode_t`

*Values:*

enumerator `TOUCH_TRIGGER_BELOW`

Touch interrupt will happen if counter value is less than threshold.

enumerator `TOUCH_TRIGGER_ABOVE`

Touch interrupt will happen if counter value is larger than threshold.

enumerator `TOUCH_TRIGGER_MAX`

enum `touch_trigger_src_t`

*Values:*

enumerator `TOUCH_TRIGGER_SOURCE_BOTH`

wakeup interrupt is generated if both SET1 and SET2 are "touched"

enumerator `TOUCH_TRIGGER_SOURCE_SET1`

wakeup interrupt is generated if SET1 is "touched"

enumerator `TOUCH_TRIGGER_SOURCE_MAX`

## 2.6.25 Two-Wire Automotive Interface (TWAI)

### Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32 contains 1 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

#### Sections

- *Two-Wire Automotive Interface (TWAI)*
  - *Overview*
  - *TWAI Protocol Summary*
  - *Signals Lines and Transceiver*
  - *API Naming Conventions*
  - *Driver Configuration*

- *Driver Operation*
- *Examples*
- *API Reference*

## TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signaling:** Every node constantly monitors the bus. When any node detects an error, it signals the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This results in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as "fault confinement" where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node's **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

## Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g., using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32's GPIO pads.

Fig. 28: Signal lines of the TWAI controller

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0 V), and a recessive bit as a high logic level (3.3 V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0 V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3 V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock.

---

**Note:** An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

---

## API Naming Conventions

---

**Note:** The TWAI driver provides two sets of API. One is handle-free and is widely used in IDF versions earlier than v5.2, but it can only support one TWAI hardware controller. The other set is with handles, and the function name is usually suffixed with "v2", which can support any number of TWAI controllers. These two sets of API can be used at the same time, but it is recommended to use the "v2" version in your new projects.

---

## Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode prevents the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller is still able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

Table 5: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

**Note:** The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI\_ALERT\_ABOVE\_ERR\_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI\_ALERT\_BELOW\_ERR\_WARN is raised when both TEC and REC return back to values below **96**.

**Note:** When enabling alerts, the TWAI\_ALERT\_AND\_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI\_ALERT\_AND\_LOG if the *CONFIG\_TWAI\_ISR\_IN\_IRAM* option is enabled (see *Placing ISR into IRAM*).

**Note:** The TWAI\_ALERT\_ALL and TWAI\_ALERT\_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined

by a pre-scaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock. On the ESP32, the `brp` can be **any even number from 2 to 128**. Alternatively, you can decide the resolution of each quantum, by setting `twai_timing_config_t::quanta_resolution_hz` to a non-zero value. In this way, the driver can calculate the underlying `brp` value for you. It is useful when you set different clock sources but want the bitrate to keep the same.

Supported clock source for a TWAI controller is listed in the `twai_clock_source_t` and can be specified in `twai_timing_config_t::clk_src`.

If the ESP32 is a revision 2 or later chip, the `brp` will **also support any multiple of 4 from 132 to 256**, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

Fig. 29: Bit timing configuration for 500kbit/s given BRP = 8, clock source frequency is 80MHz

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** causes 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

---

**Note:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

---

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS`
- `TWAI_TIMING_CONFIG_800KBITS`
- `TWAI_TIMING_CONFIG_500KBITS`
- `TWAI_TIMING_CONFIG_250KBITS`
- `TWAI_TIMING_CONFIG_125KBITS`
- `TWAI_TIMING_CONFIG_100KBITS`
- `TWAI_TIMING_CONFIG_50KBITS`
- `TWAI_TIMING_CONFIG_25KBITS`

Revision 2 or later of the ESP32 also supports the following bit rates:

- `TWAI_TIMING_CONFIG_20KBITS`
- `TWAI_TIMING_CONFIG_16KBITS`
- `TWAI_TIMING_CONFIG_12_5KBITS`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **does not receive the message, but will still acknowledge it**.

Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode uses the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 30: Bit layout of single filter mode (Right side MSBit)

**Dual Filter Mode** uses the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 31: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This allows applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR continues to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

**ESP32 Errata Workarounds** The ESP32's TWAI controller contains multiple hardware errata (more details about the errata can be found in the [ESP32's ECO document](#)). Some of these errata are critical, and under specific circumstances, can place the TWAI controller into an unrecoverable state (i.e., the controller gets stuck until it is reset by the CPU).

The TWAI driver contains software workarounds for these critical errata. With these workarounds, the ESP32 TWAI driver can operate normally, albeit with degraded performance. The degraded performance will affect users in the following ways depending on what particular errata conditions are encountered:

- The TWAI driver can occasionally drop some received messages.
- The TWAI driver can be unresponsive for a short period of time (i.e., will not transmit or ACK for 11 bit times or longer).
- If `CONFIG_TWAI_ISR_IN_IRAM` is enabled, the workarounds will increase IRAM usage by approximately 1 KB.

The software workarounds are enabled by default and it is recommended that users keep this workarounds enabled.

### Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 32: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled > Stopped	<code>twai_driver_install()</code>
B	Stopped > Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped > Running	<code>twai_start()</code>
D	Running > Stopped	<code>twai_stop()</code>
E	Running > Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off > Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off > Recovering	<code>twai_initiate_recovery()</code>
H	Recovering > Stopped	128 occurrences of 11 consecutive recessive bits.

**Driver States** **Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller is unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore, the TWAI controller is able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller is unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver remains in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags** The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
<code>TWAI_MSG_FLAG_EXTD</code>	Message is in Extended Frame Format (29bit ID)
<code>TWAI_MSG_FLAG_RTR</code>	Message is a Remote Frame (Remote Transmission Request)
<code>TWAI_MSG_FLAG_SS</code>	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
<code>TWAI_MSG_FLAG_SELF</code>	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
<code>TWAI_MSG_FLAG_DLC_NON</code>	Message's Data length code is larger than 8. This will break compliance with TWAI
<code>TWAI_MSG_FLAG_NONE</code>	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
```

(continues on next page)

(continued from previous page)

```

if (twai_start() == ESP_OK) {
    printf("Driver started\n");
} else {
    printf("Failed to start driver\n");
    return;
}

...
}

```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Install Multiple TWAI Instances** The following code snippet demonstrates how to install multiple TWAI instances via the use of the `twai_driver_install_v2()` function.

```

#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    twai_handle_t twai_bus_0;
    twai_handle_t twai_bus_1;
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_0, GPIO_
    ↪NUM_1, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install driver for TWAI bus 0
    g_config.controller_id = 0;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_0) ==_
    ↪ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_0) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Install driver for TWAI bus 1
    g_config.controller_id = 1;
    g_config.tx_io = GPIO_NUM_2;
    g_config.rx_io = GPIO_NUM_3;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_1) ==_
    ↪ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_1) == ESP_OK) {
        printf("Driver started\n");
    }
}

```

(continues on next page)

(continued from previous page)

```

    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Other Driver operations must use version 2 API as well
    ...
}

```

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```

#include "driver/twai.h"

...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {

```

(continues on next page)

(continued from previous page)

```

        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs are accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

**Application Examples** **Network Example:** The TWAI Network example demonstrates communication between two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai\\_self\\_test](#).

## API Reference

### Header File

- `components/hal/include/hal/twai_types.h`
- This header file can be included with:

```
#include "hal/twai_types.h"
```

### Structures

struct **twai\_message\_t**

Structure to store a TWAI message.

---

**Note:** The flags member is deprecated

---

### Public Members

uint32\_t **extd**

Extended Frame Format (29bit ID)

uint32\_t **rtr**

Message is a Remote Frame

uint32\_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32\_t **dlc\_non\_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32\_t **reserved**

Reserved bits

**uint32\_t flags**

Deprecated: Alternate way to set bits using message flags

**uint32\_t identifier**

11 or 29 bit identifier

**uint8\_t data\_length\_code**

Data length code

**uint8\_t data[TWAI\_FRAME\_MAX\_DLC]**

Data bytes (not relevant in RTR frame)

**struct twai\_timing\_config\_t**

Structure for bit timing configuration of the TWAI driver.

---

**Note:** Macro initializers are available for this structure

---

**Public Members***twai\_clock\_source\_t* **clk\_src**

Clock source, set to 0 or TWAI\_CLK\_SRC\_DEFAULT if you want a default clock source

**uint32\_t quanta\_resolution\_hz**

The resolution of one timing quanta, in Hz. Note: the value of `brp` will be reflected by this field if it's non-zero, otherwise, `brp` needs to be set manually

**uint32\_t brp**

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported

**uint8\_t tseg\_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

**uint8\_t tseg\_2**

Timing segment 2 (Number of time quanta, 1 to 8)

**uint8\_t sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

**bool triple\_sampling**

Enables triple sampling when the TWAI controller samples a bit

**struct twai\_filter\_config\_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

---

**Note:** Macro initializers are available for this structure

---

### Public Members

uint32\_t **acceptance\_code**

32-bit acceptance code

uint32\_t **acceptance\_mask**

32-bit acceptance mask

bool **single\_filter**

Use Single Filter Mode (see documentation)

### Macros

**TWAI\_EXTD\_ID\_MASK**

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

**TWAI\_STD\_ID\_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI\_FRAME\_MAX\_DLC**

Max data bytes allowed in TWAI

**TWAI\_FRAME\_EXTD\_ID\_LEN\_BYTES**

EFF ID requires 4 bytes (29bit)

**TWAI\_FRAME\_STD\_ID\_LEN\_BYTES**

SFF ID requires 2 bytes (11bit)

**TWAI\_ERR\_PASS\_THRESH**

Error counter threshold for error passive

### Type Definitions

typedef *soc\_periph\_twai\_clk\_src\_t* **twai\_clock\_source\_t**

RMT group clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

enum **twai\_mode\_t**

TWAI Controller operating modes.

*Values:*

enumerator **TWAI\_MODE\_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI\_MODE\_NO\_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI\_MODE\_LISTEN\_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

### Header File

- [components/driver/twai/include/driver/twai.h](#)
- This header file can be included with:

```
#include "driver/twai.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **twai\_driver\_install** (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

---

**Note:** Macro initializers are available for the configuration structures (see documentation)

---

---

**Note:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

---

#### Parameters

- **g\_config** -- **[in]** General configuration structure
- **t\_config** -- **[in]** Timing configuration structure
- **f\_config** -- **[in]** Filter configuration structure

#### Returns

- **ESP\_OK**: Successfully installed TWAI driver
- **ESP\_ERR\_INVALID\_ARG**: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution
- **ESP\_ERR\_NO\_MEM**: Insufficient memory
- **ESP\_ERR\_INVALID\_STATE**: Driver is already installed

*esp\_err\_t* **twai\_driver\_install\_v2** (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config, *twai\_handle\_t* \*ret\_twai)

Install TWAI driver and return a handle.

---

**Note:** This is an advanced version of `twai_driver_install` that can return a driver handle, so that it allows you to install multiple TWAI drivers. Don't forget to set the proper `controller_id` in the

*twai\_general\_config\_t* Please refer to the documentation of *twai\_driver\_install* for more details.

---

**Parameters**

- **g\_config** -- **[in]** General configuration structure
- **t\_config** -- **[in]** Timing configuration structure
- **f\_config** -- **[in]** Filter configuration structure
- **ret\_twai** -- **[out]** Pointer to a new created TWAI handle

**Returns**

- ESP\_OK: Successfully installed TWAI driver
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution, invalid controller ID
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Driver is already installed

*esp\_err\_t twai\_driver\_uninstall* (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Returns**

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t twai\_driver\_uninstall\_v2* (*twai\_handle\_t* handle)

Uninstall the TWAI driver with a given handle.

---

**Note:** This is an advanced version of *twai\_driver\_uninstall* that can uninstall a TWAI driver with a given handle. Please refer to the documentation of *twai\_driver\_uninstall* for more details.

---

**Parameters** **handle** -- **[in]** TWAI driver handle returned by *twai\_driver\_install\_v2*

**Returns**

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t twai\_start* (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Returns**

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

*esp\_err\_t twai\_start\_v2* (*twai\_handle\_t* handle)

Start the TWAI driver with a given handle.

---

**Note:** This is an advanced version of `twai_start` that can start a TWAI driver with a given handle. Please refer to the documentation of `twai_start` for more details.

---

**Parameters** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- `ESP_OK`: TWAI driver is now running
- `ESP_ERR_INVALID_STATE`: Driver is not in stopped state, or is not installed

*esp\_err\_t* `twai_stop` (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Returns**

- `ESP_OK`: TWAI driver is now Stopped
- `ESP_ERR_INVALID_STATE`: Driver is not in running state, or is not installed

*esp\_err\_t* `twai_stop_v2` (*twai\_handle\_t* handle)

Stop the TWAI driver with a given handle.

---

**Note:** This is an advanced version of `twai_stop` that can stop a TWAI driver with a given handle. Please refer to the documentation of `twai_stop` for more details.

---

**Parameters** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- `ESP_OK`: TWAI driver is now Stopped
- `ESP_ERR_INVALID_STATE`: Driver is not in running state, or is not installed

*esp\_err\_t* `twai_transmit` (const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

---

**Note:** This function does not guarantee that the transmission is successful. The `TX_SUCCESS/TX_FAILED` alert can be enabled to alert the application upon the success/failure of a transmission.

---

---

**Note:** The `TX_IDLE` alert can be used to alert the application when no other messages are awaiting transmission.

---

**Parameters**

- **message** -- [in] Message to transmit
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on the TX queue

**Returns**

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_transmit\_v2* (*twai\_handle\_t* handle, const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message via a given handle.

---

**Note:** This is an advanced version of `twai_transmit` that can transmit a TWAI message with a given handle. Please refer to the documentation of `twai_transmit` for more details.

---

**Parameters**

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- [in] Message to transmit
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on the TX queue

**Returns**

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_receive* (*twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

<p><b>Warning:</b> The flags field of the received message should be checked to determine if the received message contains any data bytes.</p>
--

**Parameters**

- **message** -- [out] Received message
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on RX queue

**Returns**

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_receive\_v2* (*twai\_handle\_t* handle, *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message via a given handle.

---

**Note:** This is an advanced version of `twai_receive` that can receive a TWAI message with a given handle. Please refer to the documentation of `twai_receive` for more details.

---

**Parameters**

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- **[out]** Received message
- **ticks\_to\_wait** -- **[in]** Number of FreeRTOS ticks to block on RX queue

**Returns**

- `ESP_OK`: Message successfully received from RX queue
- `ESP_ERR_TIMEOUT`: Timed out waiting for message
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts* (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

---

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

---

**Parameters**

- **alerts** -- **[out]** Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** -- **[in]** Number of FreeRTOS ticks to block for alert

**Returns**

- `ESP_OK`: Alerts read
- `ESP_ERR_TIMEOUT`: Timed out waiting for alerts
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts\_v2* (*twai\_handle\_t* handle, uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts with a given handle.

---

**Note:** This is an advanced version of `twai_read_alerts` that can read TWAI driver alerts with a given handle. Please refer to the documentation of `twai_read_alerts` for more details.

---

**Parameters**

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **alerts** -- **[out]** Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** -- **[in]** Number of FreeRTOS ticks to block for alert

**Returns**

- `ESP_OK`: Alerts read
- `ESP_ERR_TIMEOUT`: Timed out waiting for alerts
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t twai\_reconfigure\_alerts* (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Parameters**

- **alerts\_enabled** -- **[in]** Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** -- **[out]** Bit field of currently raised alerts. Set to NULL if unused

**Returns**

- `ESP_OK`: Alerts reconfigured
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t* **twai\_reconfigure\_alerts\_v2** (*twai\_handle\_t* handle, uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled, with a given handle.

---

**Note:** This is an advanced version of `twai_reconfigure_alerts` that can reconfigure which alerts are enabled with a given handle. Please refer to the documentation of `twai_reconfigure_alerts` for more details.

---

#### Parameters

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **alerts\_enabled** -- [in] Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** -- [out] Bit field of currently raised alerts. Set to NULL if unused

#### Returns

- ESP\_OK: Alerts reconfigured
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* **twai\_initiate\_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

---

**Note:** The `BUS_RECOVERED` alert can be enabled to alert the application when the bus recovery process completes.

---

#### Returns

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t* **twai\_initiate\_recovery\_v2** (*twai\_handle\_t* handle)

Start the bus recovery process with a given handle.

---

**Note:** This is an advanced version of `twai_initiate_recovery` that can start the bus recovery process with a given handle. Please refer to the documentation of `twai_initiate_recovery` for more details.

---

**Parameters** **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`

#### Returns

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t* **twai\_get\_status\_info** (*twai\_status\_info\_t* \*status\_info)

Get current status information of the TWAI driver.

**Parameters** **status\_info** -- [out] Status information

#### Returns

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_get\_status\_info\_v2* (*twai\_handle\_t* handle, *twai\_status\_info\_t* \*status\_info)

Get current status information of a given TWAI driver handle.

---

**Note:** This is an advanced version of `twai_get_status_info` that can get current status information of a given TWAI driver handle. Please refer to the documentation of `twai_get_status_info` for more details.

---

**Parameters**

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **status\_info** -- [out] Status information

**Returns**

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_clear\_transmit\_queue* (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

---

**Note:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

---

**Returns**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t twai\_clear\_transmit\_queue\_v2* (*twai\_handle\_t* handle)

Clear the transmit queue of a given TWAI driver handle.

---

**Note:** This is an advanced version of `twai_clear_transmit_queue` that can clear the transmit queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_transmit_queue` for more details.

---

**Parameters** **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t twai\_clear\_receive\_queue* (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

---

**Note:** The receive queue is automatically cleared when `twai_start()` is called.

---

**Returns**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* **twai\_clear\_receive\_queue\_v2** (*twai\_handle\_t* handle)

Clear the receive queue of a given TWAI driver handle.

---

**Note:** This is an advanced version of `twai_clear_receive_queue` that can clear the receive queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_receive_queue` for more details.

---

**Parameters** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- `ESP_OK`: Transmit queue cleared
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

## Structures

struct **twai\_general\_config\_t**

Structure for general configuration of the TWAI driver.

---

**Note:** Macro initializers are available for this structure

---

## Public Members

int **controller\_id**

TWAI controller ID, index from 0. If you want to install TWAI driver with a non-zero `controller_id`, please use `twai_driver_install_v2`

*twai\_mode\_t* **mode**

Mode of TWAI controller

gpio\_num\_t **tx\_io**

Transmit GPIO number

gpio\_num\_t **rx\_io**

Receive GPIO number

gpio\_num\_t **clkout\_io**

CLKOUT GPIO number (optional, set to -1 if unused)

gpio\_num\_t **bus\_off\_io**

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32\_t **tx\_queue\_len**

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32\_t **rx\_queue\_len**

Number of messages RX queue can hold

uint32\_t **alerts\_enabled**

Bit field of alerts to enable (see documentation)

uint32\_t **clkout\_divider**

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr\_flags**

Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP\_INTR\_FLAG\_IRAM, the CONFIG\_TWAI\_ISR\_IN\_IRAM option should be enabled first.

struct **twai\_status\_info\_t**

Structure to store status information of TWAI driver.

### Public Members

*twai\_state\_t* **state**

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32\_t **msgs\_to\_tx**

Number of messages queued for transmission or awaiting transmission completion

uint32\_t **msgs\_to\_rx**

Number of messages in RX queue waiting to be read

uint32\_t **tx\_error\_counter**

Current value of Transmit Error Counter

uint32\_t **rx\_error\_counter**

Current value of Receive Error Counter

uint32\_t **tx\_failed\_count**

Number of messages that failed transmissions

uint32\_t **rx\_missed\_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32\_t **rx\_overshoot\_count**

Number of messages that were lost due to a RX FIFO overrun

uint32\_t **arb\_lost\_count**

Number of instances arbitration was lost

uint32\_t **bus\_error\_count**

Number of instances a bus error has occurred

### Macros

**TWAI\_IO\_UNUSED**

Marks GPIO as unused in TWAI configuration

## Type Definitions

typedef struct twai\_obj\_t **\*twai\_handle\_t**  
TWAI controller handle.

## Enumerations

enum **twai\_state\_t**

TWAI driver states.

*Values:*

enumerator **TWAI\_STATE\_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI\_STATE\_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI\_STATE\_BUS\_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI\_STATE\_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

## 2.6.26 Universal Asynchronous Receiver/Transmitter (UART)

### Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has 3 UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit, etc. All the regular UART controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

### Functional Overview

The overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. A typical programming workflow is broken down into the sections provided below:

1. *Set Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Set Communication Pins* - Assigning pins for connection to a device
3. *Install Drivers* - Allocating ESP32's resources for the UART driver
4. *Run UART Communication* - Sending/receiving data
5. *Use Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Set Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart\\_echo](#).

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 6: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Set Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the TX, RX, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro `UART_PIN_NO_CHANGE` should be specified for pins that will not be used.

```
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Install Drivers** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of TX ring buffer
- Size of RX ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function allocates the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Run UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into TX FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into RX FIFO buffer
3. Read the data from RX FIFO buffer

Therefore, an application only writes and reads data from a specific buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM does the rest.

**Transmit Data** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function copies the data to the TX ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the TX FIFO buffer, an interrupt service routine (ISR) moves the data from the TX ring buffer to the TX FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the TX line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the TX FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function does not block until space is available. Instead, it writes all data which can immediately fit into the hardware TX FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the TX FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receive Data** Once the data is received by the UART and saved in the RX FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the RX FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the RX FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver handles the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Use Interrupts** There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in *ESP32 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver's internal interrupt handler to manage the TX and RX ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Install Drivers*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The TX and RX FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string with a specific number of identical characters (the 'pattern') at the end. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Macros** The API also defines several macros. For example, `UART_HW_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

## Overview of RS485 Specific Communication Options

**Note:** The following section uses `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see **ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]**. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the TX FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32's RS485 interface connection.

### Note:

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

### Circuit A: Collision Detection Circuit

(continues on next page)

(continued from previous page)

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

## Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32 pins.
<a href="#">peripherals/uart/nmea0183_parser</a>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

## API Reference

### Header File

- [components/driver/uart/include/driver/uart.h](#)
- This header file can be included with:

```
#include "driver/uart.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

---

**Note:** `Rx_buffer_size` should be greater than `UART_HW_FIFO_LEN(uart_num)`. `Tx_buffer_size` should be either zero or greater than `UART_HW_FIFO_LEN(uart_num)`.

---

### Parameters

- `uart_num` -- UART port number, the max port number is `(UART_NUM_MAX - 1)`.
- `rx_buffer_size` -- UART RX ring buffer size.
- `tx_buffer_size` -- UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size` -- UART event queue size/depth.
- `uart_queue` -- UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to `NULL`, driver will not use an event queue.

- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* uart\_num)

Uninstall UART driver.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

bool **uart\_is\_driver\_installed** (*uart\_port\_t* uart\_num)

Checks whether the driver is installed or not.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- true driver is installed
- false driver is not installed

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* data\_bit)

Set UART data bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- UART data bits

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* \*data\_bit)

Get the UART data bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- Pointer to accept value of UART data bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* stop\_bits)

Set UART stop bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- UART stop bits

**Returns**

- ESP\_OK Success
- ESP\_FAIL Fail

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* \*stop\_bits)

Get the UART stop bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- Pointer to accept value of UART stop bits.

**Returns**

- ESP\_FAIL Parameter error

- ESP\_OK Success, result will be put in (\*stop\_bit)

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* parity\_mode)

Set UART parity mode.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- the enum of uart parity configuration

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* \*parity\_mode)

Get the UART parity mode configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- Pointer to accept value of UART parity mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

*esp\_err\_t* **uart\_get\_sclk\_freq** (*uart\_sclk\_t* sclk, uint32\_t \*out\_freq\_hz)

Get the frequency of a clock source for the HP UART port.

**Parameters**

- **sclk** -- Clock source
- **out\_freq\_hz** -- [out] Output of frequency, in Hz

**Returns**

- ESP\_ERR\_INVALID\_ARG: if the clock source is not supported
- otherwise ESP\_OK

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t baudrate)

Set UART baud rate.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- UART baud rate.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t \*baudrate)

Get the UART baud rate configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- Pointer to accept value of UART baud rate

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*baudrate)

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* uart\_num, uint32\_t inverse\_mask)

Set UART line inverse mode.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **inverse\_mask** -- Choose the wires that need to be inverted. Using the ORred mask of *uart\_signal\_inv\_t*

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* flow\_ctrl, uint8\_t rx\_thresh)

Set hardware flow control.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Hardware flow control mode
- **rx\_thresh** -- Threshold of Hardware RX flow control (0 ~ UART\_HW\_FIFO\_LEN(uart\_num)). Only when UART\_HW\_FLOWCTRL\_RTS is set, will the rx\_thresh value be set.

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* uart\_num, bool enable, uint8\_t rx\_thresh\_xon, uint8\_t rx\_thresh\_xoff)

Set software flow control.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **enable** -- switch on or off
- **rx\_thresh\_xon** -- low water mark
- **rx\_thresh\_xoff** -- high water mark

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* \*flow\_ctrl)

Get the UART hardware flow control configuration.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Option for different flow control mode.

#### Returns

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*flow\_ctrl)

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* uart\_num, uint32\_t clr\_mask)

Clear UART interrupt status.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **clr\_mask** -- Bit mask of the interrupt status to be cleared.

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t enable\_mask)

Set UART interrupt enable.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable\_mask** -- Bit mask of the enable bits.

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t disable\_mask)

Clear UART interrupt enable bits.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

- **disable\_mask** -- Bit mask of the disable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* uart\_num)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* uart\_num)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* uart\_num)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* uart\_num, int enable, int thresh)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable** -- 1: enable; 0: disable
- **thresh** -- Threshold of TX interrupt, 0 ~ UART\_HW\_FIFO\_LEN(uart\_num)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* uart\_num, int tx\_io\_num, int rx\_io\_num, int rts\_io\_num, int cts\_io\_num)

Assign signals of a UART peripheral to GPIO pins.

---

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

---

---

**Note:** It is possible to configure TX and RX to share the same IO (single wire mode), but please be aware of output conflict, which could damage the pad. Apply open-drain and pull-up to the pad ahead of time as a protection, or the upper layer protocol must guarantee no output from two ends at the same time.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **tx\_io\_num** -- UART TX pin GPIO number.
- **rx\_io\_num** -- UART RX pin GPIO number.
- **rts\_io\_num** -- UART RTS pin GPIO number.
- **cts\_io\_num** -- UART CTS pin GPIO number.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* uart\_num, int level)

Manually set the UART RTS pin level.

---

**Note:** UART must be configured with hardware flow control disabled.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: RTS output low (active); 0: RTS output high (block)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* uart\_num, int level)

Manually set the UART DTR pin level.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: DTR output low; 0: DTR output high

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_tx\_idle\_num** (*uart\_port\_t* uart\_num, uint16\_t idle\_num)

Set UART idle interval after tx FIFO is empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **idle\_num** -- idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_param\_config** (*uart\_port\_t* uart\_num, const *uart\_config\_t* \*uart\_config)

Set UART configuration parameters.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **uart\_config** -- UART parameter settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_intr\_config** (*uart\_port\_t* uart\_num, const *uart\_intr\_config\_t* \*intr\_conf)

Configure UART interrupts.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **intr\_conf** -- UART interrupt settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_wait\_tx\_done** (*uart\_port\_t* uart\_num, TickType\_t ticks\_to\_wait)

Wait until UART TX FIFO is empty.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **ticks\_to\_wait** -- Timeout, count in RTOS ticks

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

int **uart\_tx\_chars** (*uart\_port\_t* uart\_num, const char \*buffer, uint32\_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

---

**Note:** This function should only be used when UART TX buffer is not enabled.

---

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buffer** -- data buffer address
- **len** -- data length to send

#### Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes** (*uart\_port\_t* uart\_num, const void \*src, size\_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

#### Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* uart\_num, const void \*src, size\_t size, int brk\_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

- **brk\_len** -- break signal duration(unit: the time it takes to send one bit at current baudrate)

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_read\_bytes** (*uart\_port\_t* uart\_num, void \*buf, uint32\_t length, TickType\_t ticks\_to\_wait)

UART read bytes from UART buffer.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buf** -- pointer to the buffer.
- **length** -- data length
- **ticks\_to\_wait** -- sTimeout, count in RTOS ticks

**Returns**

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* uart\_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

---

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* uart\_num)

Clear input buffer, discard all the data is in the ring-buffer.

---

**Note:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_buffered\_data\_len** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get RX ring buffer cached data length.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept cached data length

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_tx\_buffer\_free\_size** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get TX ring buffer free space size.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept the free space size

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_disable\_pattern\_det\_intr** (*uart\_port\_t* uart\_num)

UART disable pattern detect function. Designed for applications like 'AT commands'. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_pattern\_det\_baud\_intr** (*uart\_port\_t* uart\_num, char pattern\_chr, uint8\_t chr\_num, int chr\_tout, int post\_idle, int pre\_idle)

UART enable pattern detect function. Designed for applications like 'AT commands'. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**

- **uart\_num** -- UART port number.
- **pattern\_chr** -- character of the pattern.
- **chr\_num** -- number of the character, 8bit value.
- **chr\_tout** -- timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at\_cmd char.
- **post\_idle** -- idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at\_cmd char
- **pre\_idle** -- idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at\_cmd char.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

int **uart\_pattern\_pop\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int **uart\_pattern\_get\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos`. It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

*esp\_err\_t* `uart_pattern_queue_reset` (*uart\_port\_t* `uart_num`, int `queue_length`)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).
- `queue_length` -- Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

*esp\_err\_t* `uart_set_mode` (*uart\_port\_t* `uart_num`, *uart\_mode\_t* `mode`)

UART set communication mode.

---

**Note:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

---

**Parameters**

- `uart_num` -- Uart number to configure, the max port number is (`UART_NUM_MAX` -1).
- `mode` -- UART mode to set

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* `uart_set_rx_full_threshold` (*uart\_port\_t* `uart_num`, int `threshold`)

Set uart threshold value for RX fifo full.

---

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

---

**Parameters**

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1)
- `threshold` -- Threshold value above which RX fifo full interrupt is generated

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Driver is not installed

*esp\_err\_t* **uart\_set\_tx\_empty\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold values for TX fifo empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **threshold** -- Threshold value below which TX fifo empty interrupt is generated

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* uart\_num, const uint8\_t tout\_thresh)

UART set threshold timeout for TOUT feature.

**Parameters**

- **uart\_num** -- Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **tout\_thresh** -- This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout\_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If tout\_thresh == 0, the TOUT feature is disabled.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* uart\_num, bool \*collision\_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision\_flag. \*collision\_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart\_write\_bytes()).

**Parameters**

- **uart\_num** -- Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- **collision\_flag** -- Pointer to variable of type bool to return collision flag.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int wakeup\_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set wakeup\_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

---

**Note:** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as function\_1 to wake up UART0, GPIO9 should be configured as function\_5 to wake up UART1), UART2 does

not support light sleep wakeup feature.

---

**Parameters**

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **wakeup\_threshold** -- number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if uart\_num is incorrect or wakeup\_threshold is outside of [3, 0x3ff] range.

*esp\_err\_t* **uart\_get\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int \*out\_wakeup\_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

**Parameters**

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **out\_wakeup\_threshold** -- [**out**] output, set to the current value of wakeup threshold for the given UART.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if out\_wakeup\_threshold is NULL

*esp\_err\_t* **uart\_wait\_tx\_idle\_polling** (*uart\_port\_t* uart\_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters** **uart\_num** -- UART number

*esp\_err\_t* **uart\_set\_loop\_back** (*uart\_port\_t* uart\_num, bool loop\_back\_en)

Configure TX signal loop back to RX module, just for the test usage.

•

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- **uart\_num** -- UART number
- **loop\_back\_en** -- Set true to enable the loop back function, else set it false.

void **uart\_set\_always\_rx\_timeout** (*uart\_port\_t* uart\_num, bool always\_rx\_timeout\_en)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- **uart\_num** -- UART number

- **always\_rx\_timeout\_en** -- Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

## Structures

struct **uart\_config\_t**

UART configuration parameters for `uart_param_config` function.

### Public Members

int **baud\_rate**

UART baud rate

*uart\_word\_length\_t* **data\_bits**

UART byte size

*uart\_parity\_t* **parity**

UART parity mode

*uart\_stop\_bits\_t* **stop\_bits**

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

uint32\_t **backup\_before\_sleep**

If set, the driver will backup/restore the HP UART registers before entering/after exiting sleep mode. By this approach, the system can power off HP UART's power domain. This can save power, but at the expense of more RAM being consumed

struct *uart\_config\_t*::[anonymous] **flags**

Configuration flags

struct **uart\_intr\_config\_t**

UART interrupt configuration parameters for `uart_intr_config` function.

### Public Members

uint32\_t **intr\_enable\_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

`uint8_t rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

`uint8_t txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

`uint8_t rxfifo_full_thresh`

UART RX full interrupt threshold.

struct `uart_event_t`

Event structure used in UART event queue.

### Public Members

`uart_event_type_t` type

UART event type

`size_t` size

UART data size for UART\_DATA event

`bool` timeout\_flag

UART data read timeout flag for UART\_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

### Macros

`UART_PIN_NO_CHANGE`

`UART_FIFO_LEN`

Length of the HP UART HW FIFO.

`UART_HW_FIFO_LEN` (uart\_num)

Length of the UART HW FIFO.

`UART_BITRATE_MAX`

Maximum configurable bitrate.

### Type Definitions

typedef `intr_handle_t` `uart_isr_handle_t`

### Enumerations

enum `uart_event_type_t`

UART event types used in the ring buffer.

*Values:*

enumerator **UART\_DATA**

UART data event

enumerator **UART\_BREAK**

UART break event

enumerator **UART\_BUFFER\_FULL**

UART RX buffer full event

enumerator **UART\_FIFO\_OVF**

UART FIFO overflow event

enumerator **UART\_FRAME\_ERR**

UART RX frame error event

enumerator **UART\_PARITY\_ERR**

UART RX parity event

enumerator **UART\_DATA\_BREAK**

UART TX data and break event

enumerator **UART\_PATTERN\_DET**

UART pattern detected

enumerator **UART\_EVENT\_MAX**

UART event max index

### Header File

- [components/hal/include/hal/uart\\_types.h](#)
- This header file can be included with:

```
#include "hal/uart_types.h"
```

### Structures

struct **uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

### Public Members

uint8\_t **cmd\_char**

UART AT cmd char

uint8\_t **char\_num**

AT cmd char repeat number

uint32\_t **gap\_tout**

gap time(in baud-rate) between AT cmd char

uint32\_t **pre\_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32\_t **post\_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

### Public Members

uint8\_t **xon\_char**

Xon flow control char

uint8\_t **xoff\_char**

Xoff flow control char

uint8\_t **xon\_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

uint8\_t **xoff\_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

### Type Definitions

typedef *soc\_periph\_uart\_clk\_src\_legacy\_t* **uart\_sclk\_t**

UART source clock.

### Enumerations

enum **uart\_port\_t**

UART port number, can be UART\_NUM\_0 ~ (UART\_NUM\_MAX -1).

*Values:*

enumerator **UART\_NUM\_0**

UART port 0

enumerator **UART\_NUM\_1**

UART port 1

enumerator **UART\_NUM\_2**

UART port 2

enumerator **UART\_NUM\_MAX**

UART port max

enum **uart\_mode\_t**

UART mode selection.

*Values:*

enumerator **UART\_MODE\_UART**

mode: regular UART mode

enumerator **UART\_MODE\_RS485\_HALF\_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART\_MODE\_IRDA**

mode: IRDA UART mode

enumerator **UART\_MODE\_RS485\_COLLISION\_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART\_MODE\_RS485\_APP\_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart\_word\_length\_t**

UART word length constants.

*Values:*

enumerator **UART\_DATA\_5\_BITS**

word length: 5bits

enumerator **UART\_DATA\_6\_BITS**

word length: 6bits

enumerator **UART\_DATA\_7\_BITS**

word length: 7bits

enumerator **UART\_DATA\_8\_BITS**

word length: 8bits

enumerator **UART\_DATA\_BITS\_MAX**

enum **uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

enumerator **UART\_STOP\_BITS\_1**

stop bit: 1bit

enumerator **UART\_STOP\_BITS\_1\_5**

stop bit: 1.5bits

enumerator **UART\_STOP\_BITS\_2**

stop bit: 2bits

enumerator **UART\_STOP\_BITS\_MAX**

enum **uart\_parity\_t**

UART parity constants.

*Values:*

enumerator **UART\_PARITY\_DISABLE**

Disable UART parity

enumerator **UART\_PARITY\_EVEN**

Enable UART even parity

enumerator **UART\_PARITY\_ODD**

Enable UART odd parity

enum **uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

enumerator **UART\_HW\_FLOWCTRL\_DISABLE**

disable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_RTS**

enable RX hardware flow control (rts)

enumerator **UART\_HW\_FLOWCTRL\_CTS**

enable TX hardware flow control (cts)

enumerator **UART\_HW\_FLOWCTRL\_CTS\_RTS**

enable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_MAX**

enum **uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

enumerator **UART\_SIGNAL\_INV\_DISABLE**

Disable UART signal inverse

enumerator **UART\_SIGNAL\_IRDA\_TX\_INV**

inverse the UART irda\_tx signal

enumerator **UART\_SIGNAL\_IRDA\_RX\_INV**

inverse the UART irda\_rx signal

enumerator **UART\_SIGNAL\_RXD\_INV**

inverse the UART rxd signal

enumerator **UART\_SIGNAL\_CTS\_INV**

inverse the UART cts signal

enumerator **UART\_SIGNAL\_DSR\_INV**

inverse the UART dsr signal

enumerator **UART\_SIGNAL\_TXD\_INV**

inverse the UART txd signal

enumerator **UART\_SIGNAL\_RTS\_INV**

inverse the UART rts signal

enumerator **UART\_SIGNAL\_DTR\_INV**

inverse the UART dtr signal

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro returns the matching counterpart for you. See some examples below.

---

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is `UART_NUM_0`). It is similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

### Header File

- `components/soc/esp32/include/soc/uart_channel.h`
- This header file can be included with:

```
#include "soc/uart_channel.h"
```

### Macros

**UART\_GPIO1\_DIRECT\_CHANNEL**

**UART\_NUM\_0\_TXD\_DIRECT\_GPIO\_NUM**

UART\_GPIO3\_DIRECT\_CHANNEL

UART\_NUM\_0\_RXD\_DIRECT\_GPIO\_NUM

UART\_GPIO19\_DIRECT\_CHANNEL

UART\_NUM\_0\_CTS\_DIRECT\_GPIO\_NUM

UART\_GPIO22\_DIRECT\_CHANNEL

UART\_NUM\_0\_RTS\_DIRECT\_GPIO\_NUM

UART\_TXD\_GPIO1\_DIRECT\_CHANNEL

UART\_RXD\_GPIO3\_DIRECT\_CHANNEL

UART\_CTS\_GPIO19\_DIRECT\_CHANNEL

UART\_RTS\_GPIO22\_DIRECT\_CHANNEL

UART\_GPIO10\_DIRECT\_CHANNEL

UART\_NUM\_1\_TXD\_DIRECT\_GPIO\_NUM

UART\_GPIO9\_DIRECT\_CHANNEL

UART\_NUM\_1\_RXD\_DIRECT\_GPIO\_NUM

UART\_GPIO6\_DIRECT\_CHANNEL

UART\_NUM\_1\_CTS\_DIRECT\_GPIO\_NUM

UART\_GPIO11\_DIRECT\_CHANNEL

UART\_NUM\_1\_RTS\_DIRECT\_GPIO\_NUM

UART\_TXD\_GPIO10\_DIRECT\_CHANNEL

UART\_RXD\_GPIO9\_DIRECT\_CHANNEL

UART\_CTS\_GPIO6\_DIRECT\_CHANNEL

UART\_RTS\_GPIO11\_DIRECT\_CHANNEL

UART\_GPIO17\_DIRECT\_CHANNEL

`UART_NUM_2_TXD_DIRECT_GPIO_NUM`

`UART_GPIO16_DIRECT_CHANNEL`

`UART_NUM_2_RXD_DIRECT_GPIO_NUM`

`UART_GPIO8_DIRECT_CHANNEL`

`UART_NUM_2_CTS_DIRECT_GPIO_NUM`

`UART_GPIO7_DIRECT_CHANNEL`

`UART_NUM_2_RTS_DIRECT_GPIO_NUM`

`UART_TXD_GPIO17_DIRECT_CHANNEL`

`UART_RXD_GPIO16_DIRECT_CHANNEL`

`UART_CTS_GPIO8_DIRECT_CHANNEL`

`UART_RTS_GPIO7_DIRECT_CHANNEL`

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

## 2.7 Project Configuration

### 2.7.1 Introduction

The `esp-idf-kconfig` package that ESP-IDF uses is based on `kconfiglib`, which is a Python extension to the `Kconfig` system. `Kconfig` provides a compile-time project configuration mechanism and offers configuration options of several types (e.g., integers, strings, and boolens). `Kconfig` files specify dependencies between options, default values of options, the way options are grouped together, etc.

For the full list of available features, please see [Kconfig](#) and [kconfiglib extentions](#).

### 2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved in the `sdkconfig` file under the project root directory. Based on `sdkconfig`, application build targets will generate the `sdkconfig.h` file under the build directory, and will make the `sdkconfig` options available to the project build system and source files.

### 2.7.3 Using `sdkconfig.defaults`

In some cases, for example, when the `sdkconfig` file is under revision control, it may be inconvenient for the build system to change the `sdkconfig` file. The build system offers a solution to prevent it from happening, which is to create the `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It contains all the options which matter to the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configuration, or it can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted or added to the ignore list of the revision control system (e.g., the `.gitignore` file for `git`). Project build targets will automatically create the `sdkconfig` file, populate it with the settings from the `sdkconfig.defaults` file, and configure the rest of the settings to their default values. Note that during the build process, settings from `sdkconfig.defaults` will not override those already in `sdkconfig`. For more information, see [Custom Sdkconfig Defaults](#).

### 2.7.4 Kconfig Format Rules

Format rules for Kconfig files are as follows:

- Option names in any menus should have consistent prefixes. The prefix currently should have at least 3 characters.
- The unit of indentation should be 4 spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 spaces, `config menu` by 4 spaces, `help in config` by 8 spaces, and the text under `help` by 12 spaces.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is 50 characters.
- The maximum length of lines is 120 characters.

---

**Note:** The `help` section of each config in the menu is treated as `reStructuredText` to generate the reference documentation for each option.

---

#### Format Checker

`kconfcheck` tool in [esp-idf-kconfig](#) package is provided for checking Kconfig files against the above format rules. The checker checks all Kconfig and `Kconfig.projbuild` files given as arguments, and generates a new file with suffix `.new` with some suggestions about how to fix issues (if there are any). Please note that the checker cannot correct all format issues and the responsibility of the developer is to final check and make corrections in order to pass the tests. For example, indentations will be corrected if there is not any misleading formatting, but it cannot come up with a common prefix for options inside a menu.

The `esp-idf-kconfig` package is available in ESP-IDF environments, where the checker tool can be invoked by running command `python -m kconfcheck <path_to_kconfig_file>`.

For more information, please refer to [esp-idf-kconfig package documentation](#).

### 2.7.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases, then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `kconfgen` is used by the tool chain to pre-process `sdkconfig` files before anything else. For example, `menuconfig` would read them, so the settings for old options is kept and not ignored.

2. `kconfiggen` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new `Kconfig` option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target-specific rename file `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g., `sdkconfig.rename.esp32s2`.
3. `kconfiggen` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, and `auto.conf`) by adding a list of compatibility statements, i.e., the values of old options are set for new options after modification. If users still use old options in their code, this will prevent it from breaking.
4. *Deprecated options and their replacements* are automatically generated by `kconfiggen`.

## 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from `Kconfig` files. Note that due to dependencies between options, some options listed here may not be visible by default in `menuconfig`.

By convention, all option names are upper-case letters with underscores. When `Kconfig` generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a `Kconfig` file and selected in `menuconfig`, then the `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In the following sections, option names are also prefixed with `CONFIG_`, same as in the source code.

### Build type

Contains:

- `CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS`
- `CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS`
- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

### `CONFIG_APP_BUILD_TYPE`

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when `APP_BUILD_TYPE_RAM` is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A `gdbinit` file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this `gdbinit` file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the `load_ram` in `esptool.py` to load the generated `.bin` file into ram and execute.

**Example:** `esptool.py --chip {chip} -p {port} -b {baud} --no-stub load_ram {app.bin}`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_RAM` is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS= CON-  
FIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y  
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (`CONFIG_APP_BUILD_TYPE_APP_2NDBOOT`)
- Build app runs entirely in RAM (EXPERIMENTAL) (`CONFIG_APP_BUILD_TYPE_RAM`)

### **CONFIG\_APP\_BUILD\_TYPE\_PURE\_RAM\_APP**

Build app without `SPI_FLASH/PSRAM` support (saves ram)

*Found in:* [Build type](#)

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the `spi_flash` component will also be unavailable, such as `app_update`, etc. When this option is enabled, about 26KB of RAM space can be saved.

### **CONFIG\_APP\_REPRODUCIBLE\_BUILD**

Enable reproducible build

*Found in:* [Build type](#)

If enabled, all date, time, and path information would be eliminated. A `.gdbinit` file would be create automatically. (or will be append if you have one already)

**Default value:**

- No (disabled)

### **CONFIG\_APP\_NO\_BLOBS**

No Binary Blobs

*Found in:* [Build type](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**

- No (disabled)

### CONFIG\_APP\_COMPATIBLE\_PRE\_V2\_1\_BOOTLOADERS

App compatible with bootloaders before ESP-IDF v2.1

Found in: *Build type*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app's IRAM usage.

**Default value:**

- No (disabled)

### CONFIG\_APP\_COMPATIBLE\_PRE\_V3\_1\_BOOTLOADERS

App compatible with bootloader and partition table before ESP-IDF v3.1

Found in: *Build type*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *\*before\** ESP-IDF v3.1.

If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

**Default value:**

- No (disabled)

### Bootloader config

Contains:

- *CONFIG\_BOOTLOADER\_LOG\_LEVEL*
- *Bootloader manager*
- *CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION*
- *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*
- *CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE*
- *CONFIG\_BOOTLOADER\_APP\_TEST*
- *CONFIG\_BOOTLOADER\_FACTORY\_RESET*
- *CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO*
- *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*
- *Serial Flash Configurations*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP*
- *CONFIG\_BOOTLOADER\_WDT\_ENABLE*
- *CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST*

**Bootloader manager** Contains:

- *CONFIG\_BOOTLOADER\_PROJECT\_VER*
- *CONFIG\_BOOTLOADER\_COMPILE\_TIME\_DATE*

## CONFIG\_BOOTLOADER\_COMPILE\_TIME\_DATE

Use time/date stamp for bootloader

*Found in: [Bootloader config](#) > [Bootloader manager](#)*

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

## CONFIG\_BOOTLOADER\_PROJECT\_VER

Project version

*Found in: [Bootloader config](#) > [Bootloader manager](#)*

Project version. It is placed in "version" field of the esp\_bootloader\_desc structure. The type of this field is "uint32\_t".

**Range:**

- from 0 to 4294967295

**Default value:**

- 1

## CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION

Bootloader optimization Level

*Found in: [Bootloader config](#)*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default "Size" setting will add the -Os flag to CFLAGS.
- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_SIZE)
- Debug (-Og) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for performance (-O2) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (Deprecated, will be removed in IDF v6.0) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_BOOTLOADER\_LOG\_LEVEL

Bootloader log verbosity

*Found in: [Bootloader config](#)*

Specify how much output to see in bootloader logs.

Available options:

- No output (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

**Serial Flash Configurations** Contains:

- [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#)
- [CONFIG\\_BOOTLOADER\\_SPI\\_WP\\_PIN](#)
- [CONFIG\\_BOOTLOADER\\_FLASH\\_XMC\\_SUPPORT](#)
- [CONFIG\\_BOOTLOADER\\_SPI\\_CUSTOM\\_WP\\_PIN](#)

**CONFIG\_BOOTLOADER\_SPI\_CUSTOM\_WP\_PIN**

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI\_PAD\_CONFIG\_XXX, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin "SD\_DATA\_3" or SPI flash pin "IO2") is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

**Default value:**

- No (disabled) if [CONFIG\\_ESPTOOLPY\\_FLASHMODE\\_QIO](#) || [CONFIG\\_ESPTOOLPY\\_FLASHMODE\\_QOUT](#)

**CONFIG\_BOOTLOADER\_SPI\_WP\_PIN**

Custom SPI Flash WP Pin

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

The option "Use custom SPI Flash WP Pin" must be set or this value is ignored

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

**Range:**

- from 0 to 33 if [CONFIG\\_ESPTOOLPY\\_FLASHMODE\\_QIO](#) || [CONFIG\\_ESPTOOLPY\\_FLASHMODE\\_QOUT](#)

**Default value:**

- 7 if [CONFIG\\_ESPTOOLPY\\_FLASHMODE\\_QIO](#) || [CONFIG\\_ESPTOOLPY\\_FLASHMODE\\_QOUT](#)

**CONFIG\_BOOTLOADER\_FLASH\_DC\_AWARE**

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

**CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT**

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V ([CONFIG\\_BOOTLOADER\\_VDDSDIO\\_BOOST\\_1\\_8V](#))
- 1.9V ([CONFIG\\_BOOTLOADER\\_VDDSDIO\\_BOOST\\_1\\_9V](#))

### CONFIG\_BOOTLOADER\_FACTORY\_RESET

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Range:**

- from 0 to 39 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

**Default value:**

- 4 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LEVEL

Factory reset GPIO level

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low ([CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET\\_PIN\\_LOW](#))

- Reset on GPIO high (CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_HIGH)

### CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_FACTORY\_RESET*

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

### CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_FACTORY\_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy\_init, ...") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

**Default value:**

- "nvs" if *CONFIG\_BOOTLOADER\_FACTORY\_RESET*

### CONFIG\_BOOTLOADER\_APP\_TEST

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

### CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_APP\_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if *CONFIG\_BOOTLOADER\_APP\_TEST*

**Default value:**

- 18 if *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LEVEL

App test GPIO level

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_APP\_TEST*

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low (CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LOW)
- Enter test app on GPIO high (CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_HIGH)

### CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: *Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if *CONFIG\_BOOTLOADER\_FACTORY\_RESET* || *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE

Enable protection for unmapped memory regions

Found in: *Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_ENABLE

Use RTC watchdog in start code

Found in: *Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC\_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow\_clk - and ends calling app\_main. Re-set timeout is needed due to WDT uses a SLOW\_CLK clock source. After changing a frequency slow\_clk a time of WDT needs to re-set for new frequency. slow\_clk depends on RTC\_CLK\_SRC (INTERNAL\_RC or EXTERNAL\_CRYSTAL).

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE

Allows RTC watchdog disable in user code

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc\_wdt in the app's own code. If this option is not set (default), then rtc\_wdt will be disabled by ESP-IDF before calling the app\_main() function.

Use function rtc\_wdt\_feed() for resetting counter of rtc\_wdt. Use function rtc\_wdt\_disable() for disabling rtc\_wdt.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_WDT\_TIME\_MS

Timeout for RTC watchdog (ms)

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC\_WDT will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

### CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE

Enable app rollback support

*Found in:* [Bootloader config](#)

After updating the app, the bootloader runs a new app with the "ESP\_OTA\_IMG\_PENDING\_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK

Enable app anti-rollback support

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)

### CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION

eFuse secure version of app

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see [BOOTLOADER\\_APP\\_SEC\\_VER\\_SIZE\\_EFUSE\\_FIELD](#) option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota\_0 + ota\_1 (without factory).

**Default value:**

- 0 if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD

Size of the efuse secure version field

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**

- from 1 to 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**

- 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE

Emulate operations with efuse secure version(only test)

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

**Default value:**

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP

Skip image validation when exiting deep sleep

*Found in:* `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if "allow insecure options" is enabled, however it's strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE`

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* `Bootloader config`

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it's not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it's

not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: [Bootloader config](#)*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting "Skip image validation from power on reset" instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: [Bootloader config](#)*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through `PRO_CPU`.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_IN\_CRC**

Include custom memory in the CRC calculation

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)*

This option allows the customer to use the legacy bootloader behavior when the RTC FAST memory CRC calculation takes place. When this option is enabled, the allocated user custom data will be taken into account in the CRC calculation. This means that any change to the custom data would need a CRC update to prevent the bootloader from marking this data as corrupted. If this option is disabled, the custom data will not be taken into account when calculating the RTC FAST memory CRC. The user custom data can be changed freely, without the need to update the CRC. THIS OPTION MUST BE THE SAME FOR BOTH THE BOOTLOADER AND THE APPLICATION BUILDS.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

## CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE

Size in bytes for custom purposes

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (*rtc\_retain\_mem\_t*) is reserved and has access from the bootloader and an application.

**Default value:**

- 0 if *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*

## Security features

Contains:

- *CONFIG\_SECURE\_BOOT\_INSECURE*
- *CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME*
- *CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT*

- *CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT*

## CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT

Require signed app images

Found in: *Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

## CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME

App Signing Scheme

Found in: *Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

### 1. Secure boot V1

- Legacy custom secure boot scheme. Supported in ESP32 SoC.

## 2. Secure boot V2

- RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
- ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_SCHEME)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (CONFIG\_SECURE\_SIGNED\_APPS\_RSA\_SCHEME)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_V2\_SCHEME)  
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

### CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_192\_BITS)
- Using ECC curve NISTP256 (Recommended) (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_256\_BITS)

### CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME`

### CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

## CONFIG\_SECURE\_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: [Security features](#)*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**

- No (disabled)

## CONFIG\_SECURE\_BOOT\_VERSION

Select secure boot version

*Found in: [Security features](#) > `CONFIG_SECURE_BOOT`*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (`CONFIG_SECURE_BOOT_V1_ENABLED`)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (`CONFIG_SECURE_BOOT_V2_ENABLED`)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOTLOADER\_MODE

Secure bootloader mode

*Found in: [Security features](#)*

Available options:

- One-time flash (`CONFIG_SECURE_BOOTLOADER_ONE_TIME_FLASH`)  
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.  
Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (`CONFIG_SECURE_BOOTLOADER_REFLASHABLE`)  
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.  
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.  
This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

### **CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES**

Sign binaries during build

*Found in: [Security features](#)*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

### **CONFIG\_SECURE\_BOOT\_SIGNING\_KEY**

Secure boot private signing key

*Found in: [Security features](#) > [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

#### **Default value:**

- "secure\_boot\_signing\_key.pem" if [CONFIG\\_SECURE\\_BOOT\\_BUILD\\_SIGNED\\_BINARIES](#)

### **CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY**

Secure boot public signature verification key

*Found in: [Security features](#)*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT` && `SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY`

## CONFIG\_SECURE\_BOOT\_FLASH\_BOOTLOADER\_DEFAULT

Flash bootloader along with other artifacts when using the default flash command

*Found in: Security features*

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be separately flashed using the command `idf.py bootloader flash`, whereas, the application and partition table can be flashed using the command `idf.py flash` itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command `idf.py flash`.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_V2_ENABLED` && `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

## CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

### CONFIG\_SECURE\_BOOT\_INSECURE

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

**Default value:**

- No (disabled) if *CONFIG\_SECURE\_BOOT*

### CONFIG\_SECURE\_FLASH\_ENC\_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**

- No (disabled)

### CONFIG\_SECURE\_FLASH\_ENCRYPTION\_KEYSIZE

Size of generated XTS-AES key

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (*CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES128\_DERIVED*)
- AES-128 (256-bit key) (*CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES128*)
- AES-256 (512-bit key) (*CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES256*)

### CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE

Enable usage mode

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When EFUSE\_VIRTUAL is enabled, SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE is not available. For CI tests we use IDF\_CI\_BUILD to bypass it ("export IDF\_CI\_BUILD=1"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT)
- Release (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE)

### Potentially insecure options Contains:

- [CONFIG\\_SECURE\\_BOOT\\_V2\\_ALLOW\\_EFUSE\\_RD\\_DIS](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_SHORT\\_APP\\_PARTITION](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_JTAG](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_ROM\\_BASIC](#)
- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_DEC](#)
- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_ENC](#)
- [CONFIG\\_SECURE\\_FLASH\\_UART\\_BOOTLOADER\\_ALLOW\\_CACHE](#)
- [CONFIG\\_SECURE\\_BOOT\\_ALLOW\\_UNUSED\\_DIGEST\\_SLOTS](#)
- [CONFIG\\_SECURE\\_FLASH\\_REQUIRE\\_ALREADY\\_ENABLED](#)
- [CONFIG\\_SECURE\\_FLASH\\_SKIP\\_WRITE\\_PROTECTION\\_CACHE](#)

### CONFIG\_SECURE\_BOOT\_ALLOW\_ROM\_BASIC

Leave ROM BASIC Interpreter available on reset

*Found in: Security features > Potentially insecure options*

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

#### Default value:

- No (disabled) if [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#) || [CONFIG\\_SECURE\\_FLASH\\_ENCRYPTION\\_MODE\\_DEVELOPMENT](#)

### CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

#### Default value:

- No (disabled) if [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#) || [CONFIG\\_SECURE\\_FLASH\\_ENCRYPTION\\_MODE\\_DEVELOPMENT](#)

### CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

### CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR\_DIS\_RD\_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE\_RD\_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK\_KEY0-BLOCK\_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If "UART ROM download mode (Permanently disabled (recommended))" or "UART ROM download mode (Permanently switch to Secure mode (recommended))" is set, then it is **\_\_NOT\_\_** possible to read/write efuses using espefuse.py utility. However, efuse can be read/written from the application

### CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` &&  
`SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS`

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_DEC**

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_FLASH\_SKIP\_WRITE\_PROTECTION\_CACHE**

Skip write-protection of DIS\_CACHE (DIS\_ICACHE, DIS\_DCACHE)

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS\_CACHE(for ESP32) or DIS\_ICACHE/DIS\_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these `SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`, `SECURE_BOOT_ALLOW_JTAG` or `SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE` options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: `MAC`, `MAC_CRC`, `DISABLE_APP_CPU`, `DISABLE_BT`, `DIS_CACHE`, `VOL_LEVEL_HP_INV`.

ESP32-C3: DIS\_ICACHE, DIS\_USB\_JTAG, DIS\_DOWNLOAD\_ICACHE, DIS\_USB\_SERIAL\_JTAG, DIS\_FORCE\_DOWNLOAD, DIS\_TWAI, JTAG\_SEL\_ENABLE, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-C6: SWAP\_UART\_SDIO\_EN, DIS\_ICACHE, DIS\_USB\_JTAG, DIS\_DOWNLOAD\_ICACHE, DIS\_USB\_SERIAL\_JTAG, DIS\_FORCE\_DOWNLOAD, DIS\_TWAI, JTAG\_SEL\_ENABLE, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-H2: DIS\_ICACHE, DIS\_USB\_JTAG, POWERGLITCH\_EN, DIS\_FORCE\_DOWNLOAD, SPI\_DOWNLOAD\_MSPI\_DIS, DIS\_TWAI, JTAG\_SEL\_ENABLE, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-S2: DIS\_ICACHE, DIS\_DCACHE, DIS\_DOWNLOAD\_ICACHE, DIS\_DOWNLOAD\_DCACHE, DIS\_FORCE\_DOWNLOAD, DIS\_USB, DIS\_TWAI, DIS\_BOOT\_REMAP, SOFT\_DIS\_JTAG, HARD\_DIS\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-S3: DIS\_ICACHE, DIS\_DCACHE, DIS\_DOWNLOAD\_ICACHE, DIS\_DOWNLOAD\_DCACHE, DIS\_FORCE\_DOWNLOAD, DIS\_USB\_OTG, DIS\_TWAI, DIS\_APP\_CPU, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT, DIS\_USB\_JTAG, DIS\_USB\_SERIAL\_JTAG, STRAP\_JTAG\_SEL, USB\_PHY\_SEL.

### CONFIG\_SECURE\_FLASH\_ENCRYPT\_ONLY\_IMAGE\_LEN\_IN\_APP\_PART

Encrypt only the app image that is present in the partition of type app

*Found in: Security features*

If set, optimise encryption time for the partition of type APP, by only encrypting the app image that is present in the partition, instead of the whole partition. The image length used for encryption is derived from the image metadata, which includes the size of the app image, checksum, hash and also the signature sector when secure boot is enabled.

If not set (default), the whole partition of type APP would be encrypted, which increases the encryption time but might be useful if there is any custom data appended to the firmware image.

### CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

#### Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

### CONFIG\_SECURE\_FLASH\_PSEUDO\_ROUND\_FUNC

Permanently enable XTS-AES's pseudo rounds function

*Found in: Security features*

If set (default), the bootloader will permanently enable the XTS-AES peripheral's pseudo rounds function. Note: Enabling this config would burn an efuse.

#### Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE` && `SOC_FLASH_ENCRYPTION_XTS_AES_SUPPORT_PSEUDO_ROUND`

## CONFIG\_SECURE\_FLASH\_PSEUDO\_ROUND\_FUNC\_STRENGTH

Strength of the pseudo rounds function

Found in: *Security features* > *CONFIG\_SECURE\_FLASH\_PSEUDO\_ROUND\_FUNC*

The strength of the pseudo rounds functions can be configured to low, medium and high, each denoting the values that would be stored in the efuses field. By default the value to set to low. You can configure the strength of the pseudo rounds functions according to your use cases, for example, increasing the strength would provide higher security but would slow down the flash encryption/decryption operations. For more info regarding the performance impact, please checkout the pseudo round function section of the security guide documentation.

Available options:

- Low (CONFIG\_SECURE\_FLASH\_PSEUDO\_ROUND\_FUNC\_STRENGTH\_LOW)
- Medium (CONFIG\_SECURE\_FLASH\_PSEUDO\_ROUND\_FUNC\_STRENGTH\_MEDIUM)
- High (CONFIG\_SECURE\_FLASH\_PSEUDO\_ROUND\_FUNC\_STRENGTH\_HIGH)

## CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

Found in: *Security features*

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (CONFIG\_SECURE\_DISABLE\_ROM\_DL\_MODE)  
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools.  
Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.  
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.  
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (CONFIG\_SECURE\_ENABLE\_SECURE\_ROM\_DL\_MODE)  
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.  
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).  
Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.  
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential "attack surface" for an attacker to try and bypass them with a successful physical attack.  
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`  
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (CONFIG\_SECURE\_INSECURE\_ALLOW\_DL\_MODE)

This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

### Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

#### **CONFIG\_APP\_COMPILE\_TIME\_DATE**

Use time/date stamp for app

*Found in:* [Application manager](#)

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

#### **CONFIG\_APP\_EXCLUDE\_PROJECT\_VER\_VAR**

Exclude PROJECT\_VER from firmware image

*Found in:* [Application manager](#)

The PROJECT\_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

#### **CONFIG\_APP\_EXCLUDE\_PROJECT\_NAME\_VAR**

Exclude PROJECT\_NAME from firmware image

*Found in:* [Application manager](#)

The PROJECT\_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

#### **CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG**

Get the project version from Kconfig

*Found in:* [Application manager](#)

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

### CONFIG\_APP\_PROJECT\_VER

Project version

Found in: *Application manager* > *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

Project version

**Default value:**

- 1 if *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

### CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA

The length of APP ELF SHA is stored in RAM(chars)

Found in: *Application manager*

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is *APP\_RETRIEVE\_LEN\_ELF\_SHA* plus the null terminator. Changing this value will change the size of this buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 9

### Serial flasher config

Contains:

- *CONFIG\_ESPTOOLPY\_AFTER*
- *CONFIG\_ESPTOOLPY\_BEFORE*
- *CONFIG\_ESPTOOLPY\_HEADER\_FLASHSIZE\_UPDATE*
- *CONFIG\_ESPTOOLPY\_NO\_STUB*
- *CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE*
- *CONFIG\_ESPTOOLPY\_FLASHSIZE*
- *CONFIG\_ESPTOOLPY\_FLASHMODE*
- *CONFIG\_ESPTOOLPY\_FLASHFREQ*

### CONFIG\_ESPTOOLPY\_NO\_STUB

Disable download stub

Found in: *Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

### CONFIG\_ESPTOOLPY\_FLASHMODE

Flash SPI mode

Found in: *Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (*CONFIG\_ESPTOOLPY\_FLASHMODE\_QIO*)
- QOUT (*CONFIG\_ESPTOOLPY\_FLASHMODE\_QOUT*)
- DIO (*CONFIG\_ESPTOOLPY\_FLASHMODE\_DIO*)

- DOUT (CONFIG\_ESPTOOLPY\_FLASHMODE\_DOUT)
- OPI (CONFIG\_ESPTOOLPY\_FLASHMODE\_OPI)

### CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE

Flash Sampling Mode

*Found in: Serial flasher config*

Available options:

- STR Mode (CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_STR)
- DTR Mode (CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_DTR)

### CONFIG\_ESPTOOLPY\_FLASHFREQ

Flash SPI speed

*Found in: Serial flasher config*

Available options:

- 120 MHz (READ DOCS FIRST) (CONFIG\_ESPTOOLPY\_FLASHFREQ\_120M)
  - Optional feature for QSPI Flash. Read docs and enable *CONFIG\_SPI\_FLASH\_HPM\_ENA* first!
  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.
    - Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
- 80 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_80M)
- 64 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_64M)
- 60 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_60M)
- 48 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_48M)
- 40 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_40M)
- 32 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_32M)
- 30 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_30M)
- 26 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_26M)
- 24 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_24M)
- 20 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_20M)
- 16 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_16M)
- 15 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_15M)

### CONFIG\_ESPTOOLPY\_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

Available options:

- 1 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_1MB)
- 2 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_2MB)
- 4 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_4MB)
- 8 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_8MB)

- 16 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_16MB)
- 32 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_32MB)
- 64 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_64MB)
- 128 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_128MB)

### CONFIG\_ESPTOOLPY\_HEADER\_FLASHSIZE\_UPDATE

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

### CONFIG\_ESPTOOLPY\_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG\_ESPTOOLPY\_BEFORE\_RESET)
- No reset (CONFIG\_ESPTOOLPY\_BEFORE\_NORESET)

### CONFIG\_ESPTOOLPY\_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG\_ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (CONFIG\_ESPTOOLPY\_AFTER\_NORESET)

### Partition Table

Contains:

- *CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME*
- *CONFIG\_PARTITION\_TABLE\_MD5*
- *CONFIG\_PARTITION\_TABLE\_OFFSET*
- *CONFIG\_PARTITION\_TABLE\_TYPE*

## CONFIG\_PARTITION\_TABLE\_TYPE

Partition Table

Found in: [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. These are mostly intended for example and development use, it's expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP)  
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE)  
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (CONFIG\_PARTITION\_TABLE\_TWO\_OTA)  
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota.csv
- Custom partition table CSV (CONFIG\_PARTITION\_TABLE\_CUSTOM)  
Specify the path to the partition table CSV to use for your project.  
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)  
This is a variation of the default "Single factory app, no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_encr\_nvs.csv
- Single factory app (large), no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE\_ENC\_NVS)  
This is a variation of the "Single factory app (large), no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large\_encr\_nvs.csv
- Factory app, two OTA definitions, encrypted NVS (CONFIG\_PARTITION\_TABLE\_TWO\_OTA\_ENCRYPTED\_NVS)  
This is a variation of the "Factory app, two OTA definitions" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota\_encr\_nvs.csv

### CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME

Custom partition CSV file

*Found in:* [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "partitions.csv"

### CONFIG\_PARTITION\_TABLE\_OFFSET

Offset of partition table

*Found in:* [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION\_TABLE\_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- "0x8000"

### CONFIG\_PARTITION\_TABLE\_MD5

Generate an MD5 checksum for the partition table

*Found in:* [Partition Table](#)

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

### Compiler options

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_RT_LIB`
- `CONFIG_COMPILER_NO_MERGE_CONSTANTS`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC12_WARNINGS`
- `CONFIG_COMPILER_DISABLE_GCC13_WARNINGS`
- `CONFIG_COMPILER_DUMP_RTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_ORPHAN_SECTIONS`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

## CONFIG\_COMPILER\_OPTIMIZATION

Optimization Level

*Found in: [Compiler options](#)*

This option sets compiler optimization level (gcc -O argument) for the app.

- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Size" setting will add the -Os flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

The "Size" setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The "Performance" setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

"None" with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER\_COMPILER\_OPTIMIZATION setting.

Available options:

- Debug (-Og) (CONFIG\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for size (-Os) (CONFIG\_COMPILER\_OPTIMIZATION\_SIZE)
- Optimize for performance (-O2) (CONFIG\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (CONFIG\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in: [Compiler options](#)*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to "silent" to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_ENABLE)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_SILENT)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_DISABLE)  
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

## CONFIG\_COMPILER\_FLOAT\_LIB\_FROM

Compiler float lib source

*Found in: [Compiler options](#)*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is "fast", but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_GCCLIB)
- librvfp (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_RVFPLIB)

### CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT

Disable messages in ESP\_RETURN\_ON\_\* and ESP\_EXIT\_ON\_\* macros

*Found in: [Compiler options](#)*

If enabled, the error messages will be discarded in following check macros: -  
ESP\_RETURN\_ON\_ERROR - ESP\_EXIT\_ON\_ERROR - ESP\_RETURN\_ON\_FALSE -  
ESP\_EXIT\_ON\_FALSE

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS

Replace ESP-IDF and project paths in binaries

*Found in: [Compiler options](#)*

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string "IDF", and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-fmacro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom `-fmacro-prefix-map` or `-file-prefix-map` arguments.

**Default value:**

- Yes (enabled)

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS

Enable C++ exceptions

*Found in: [Compiler options](#)*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#)

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE

Emergency Pool Size

Found in: *Compiler options* > *CONFIG\_COMPILER\_CXX\_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if *CONFIG\_COMPILER\_CXX\_EXCEPTIONS*

### CONFIG\_COMPILER\_CXX\_RTTI

Enable C++ run-time type info (RTTI)

Found in: *Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_STACK\_CHECK\_MODE

Stack smashing protection mode

Found in: *Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected -- those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NONE*)
- Normal (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NORM*)
- Strong (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_STRONG*)
- Overall (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_ALL*)

### CONFIG\_COMPILER\_NO\_MERGE\_CONSTANTS

Disable merging const sections

Found in: *Compiler options*

Disable merging identical constants (string/floating-point) across compilation units. This helps in better size analysis of the application binary as the rodata section distribution is more uniform across libraries. On downside, it may increase the binary size and hence should be used during development phase only.

### CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable -Wwrite-strings warning flag

*Found in: [Compiler options](#)*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DISABLE\_GCC12\_WARNINGS

Disable new warnings introduced in GCC 12

*Found in: [Compiler options](#)*

Enable this option if use GCC 12 or newer, and want to disable warnings which don't appear with GCC 11.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DISABLE\_GCC13\_WARNINGS

Disable new warnings introduced in GCC 13

*Found in: [Compiler options](#)*

Enable this option if use GCC 13 or newer, and want to disable warnings which don't appear with GCC 12.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

*Found in: [Compiler options](#)*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

### CONFIG\_COMPILER\_RT\_LIB

Compiler runtime library

*Found in: [Compiler options](#)*

Select runtime library to be used by compiler. - GCC toolchain supports `libgcc` only. - Clang allows to choose between `libgcc` or `libclang_rt`. - For host builds ("linux" target), uses the default library.

Available options:

- `libgcc` (CONFIG\_COMPILER\_RT\_LIB\_GCCLIB)
- `libclang_rt` (CONFIG\_COMPILER\_RT\_LIB\_CLANGRT)
- Host (CONFIG\_COMPILER\_RT\_LIB\_HOST)

## CONFIG\_COMPILER\_ORPHAN\_SECTIONS

Orphan sections handling

*Found in: [Compiler options](#)*

If the linker finds orphan sections, it attempts to place orphan sections after sections of the same attribute such as code vs data, loadable vs non-loadable, etc. That means that orphan sections could be placed between sections defined in IDF linker scripts. This could lead to corruption of the binary image. Configure the linker action here.

Available options:

- Place with warning (CONFIG\_COMPILER\_ORPHAN\_SECTIONS\_WARNING)  
Places orphan sections with a warning message.
- Place silently (CONFIG\_COMPILER\_ORPHAN\_SECTIONS\_PLACE)  
Places orphan sections without a warning/error message.

- *CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE*
- *CONFIG\_APPTRACE\_UART\_TX\_GPIO*
- *CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE*

**CONFIG\_APPTRACE\_DESTINATION1**

Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (CONFIG\_APPTRACE\_DEST\_JTAG)
- None (CONFIG\_APPTRACE\_DEST\_NONE)

**CONFIG\_APPTRACE\_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (CONFIG\_APPTRACE\_DEST\_UART0)
- UART1 (CONFIG\_APPTRACE\_DEST\_UART1)
- UART2 (CONFIG\_APPTRACE\_DEST\_UART2)
- USB\_CDC (CONFIG\_APPTRACE\_DEST\_USB\_CDC)
- None (CONFIG\_APPTRACE\_DEST\_UART\_NONE)

### **CONFIG\_APPTRACE\_UART\_TX\_GPIO**

UART TX on GPIO#

*Found in: [Component config](#) > [Application Level Tracing](#)*

This GPIO is used for UART TX pin.

### **CONFIG\_APPTRACE\_UART\_RX\_GPIO**

UART RX on GPIO#

*Found in: [Component config](#) > [Application Level Tracing](#)*

This GPIO is used for UART RX pin.

### **CONFIG\_APPTRACE\_UART\_BAUDRATE**

UART baud rate

*Found in: [Component config](#) > [Application Level Tracing](#)*

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

### **CONFIG\_APPTRACE\_UART\_RX\_BUFF\_SIZE**

UART RX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

### **CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE**

UART TX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

### **CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE**

UART TX message size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Maximum size of the single message to transfer.

### CONFIG\_APPTRACE\_UART\_TASK\_PRIO

UART Task Priority

*Found in: Component config > Application Level Tracing*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX\_PRIORITIES-1).

**Range:**

- from 1 to 32

**Default value:**

- 1

### CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

### CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

### CONFIG\_APPTRACE\_BUF\_SIZE

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

### CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

### FreeRTOS SystemView Tracing Contains:

- *CONFIG\_APPTRACE\_SV\_CPU*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_MAX\_TASKS*
- *CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE*

- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_TERMINATE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_ENTER\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_EXIT\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_TS\\_SOURCE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_OVERFLOW\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_BUF\\_WAIT\\_TMO](#)

### **CONFIG\_APPTRACE\_SV\_ENABLE**

SystemView Tracing Enable

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables support for SEGGER SystemView tracing functionality.

### **CONFIG\_APPTRACE\_SV\_DEST**

SystemView destination

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

SystemView will transfer data through defined interface.

Available options:

- Data destination JTAG ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_JTAG](#))  
Send SEGGER SystemView events through JTAG interface.
- Data destination UART ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_UART](#))  
Send SEGGER SystemView events through UART interface.

### **CONFIG\_APPTRACE\_SV\_CPU**

CPU to trace

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Define the CPU to trace by SystemView.

Available options:

- CPU0 ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_CPU\\_0](#))  
Send SEGGER SystemView events for Pro CPU.
- CPU1 ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_CPU\\_1](#))  
Send SEGGER SystemView events for App CPU.

### **CONFIG\_APPTRACE\_SV\_TS\_SOURCE**

Timer to use as timestamp source

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) ([CONFIG\\_APPTRACE\\_SV\\_TS\\_SOURCE\\_CCOUNT](#))
- General Purpose Timer (Timer Group) ([CONFIG\\_APPTRACE\\_SV\\_TS\\_SOURCE\\_GPTIMER](#))

- esp\_timer high resolution timer (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

### **CONFIG\_APPTRACE\_SV\_MAX\_TASKS**

Maximum supported tasks

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures maximum supported tasks in sysview debug

### **CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO**

Trace buffer wait timeout

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

### **CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE**

Trace Buffer Overflow Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Trace Buffer Overflow" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE**

ISR Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR Exit" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR to Scheduler" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Task Start Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Stop Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Start Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Stop Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Create" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Terminate" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE**

System Idle Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "System Idle" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE**

Timer Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Timer Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE**

Timer Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Timer Exit" event.

### **CONFIG\_APPTRACE\_GCOV\_ENABLE**

GCOV to Host Enable

*Found in: [Component config](#) > [Application Level Tracing](#)*

Enables support for GCOV data transfer to host.

### **CONFIG\_APPTRACE\_GCOV\_DUMP\_TASK\_STACK\_SIZE**

Gcov dump task stack size

*Found in: [Component config](#) > [Application Level Tracing](#) > [CONFIG\\_APPTRACE\\_GCOV\\_ENABLE](#)*

Configures stack size of Gcov dump task

**Default value:**

- 2048 if [CONFIG\\_APPTRACE\\_GCOV\\_ENABLE](#)

**Bluetooth** Contains:

- [Bluedroid Options](#)
- [CONFIG\\_BT\\_ENABLED](#)
- [Common Options](#)
- [Controller Options](#)
- [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)
- [NimBLE Options](#)
- [CONFIG\\_BT\\_RELEASE\\_IRAM](#)

### **CONFIG\_BT\_ENABLED**

Bluetooth

*Found in: [Component config](#) > [Bluetooth](#)*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

### **CONFIG\_BT\_HOST**

Host

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#)*

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode** ([CONFIG\\_BT\\_BLUEDROID\\_ENABLED](#))  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only** ([CONFIG\\_BT\\_NIMBLE\\_ENABLED](#))  
This option is recommended for BLE only usecases to save on memory
- **Disabled** ([CONFIG\\_BT\\_CONTROLLER\\_ONLY](#))  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

## CONFIG\_BT\_CONTROLLER

Controller

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth controller stack

Available options:

- Enabled (CONFIG\_BT\_CONTROLLER\_ENABLED)  
This option is recommended for Bluetooth controller usecases
- Disabled (CONFIG\_BT\_CONTROLLER\_DISABLED)  
This option is recommended for Bluetooth Host only usecases

**Bluedroid Options** Contains:

- *CONFIG\_BT\_ABORT\_WHEN\_ALLOCATION\_FAILS*
- *CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK*
- *CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG*
- *CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BLE\_ENABLED*
- *BT\_DEBUG\_LOG\_LEVEL*
- *CONFIG\_BT\_ACL\_CONNECTIONS*
- *CONFIG\_BT\_SMP\_MAX\_BONDS*
- *CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST*
- *CONFIG\_BT\_CLASSIC\_ENABLED*
- *CONFIG\_BT\_HID\_ENABLED*
- *CONFIG\_BT\_STACK\_NO\_LOG*
- *CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL*
- *CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE*

- *CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH*
- *CONFIG\_BT\_BLUEDROID\_ESP\_COEX\_VSC*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH*
- *CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN*
- *CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN*
- *CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE*
- *CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT*
- *CONFIG\_BT\_BLE\_RPA\_TIMEOUT*
- *CONFIG\_BT\_BLE\_RPA\_SUPPORTED*
- *CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY*
- *CONFIG\_BT\_HFP\_WBS\_ENABLE*

## CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE

Bluetooth event (callback to application) task stack size

Found in: *Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**Default value:**

- 3072 if *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_1)

### CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**

- 4352 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLUEDROID\_ESP\_COEX\_VSC

Enable Espressif Vendor-specific HCI commands for coexist status configuration

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_CLASSIC\_ENABLED

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs "SMP\_ENABLE" to be set to yes

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` || `CONFIG_BT_CONTROLLER_DISABLED`) && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_CLASSIC\_BQB\_ENABLED

Host Qualification support for Classic Bluetooth

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_A2DP\_ENABLE

A2DP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

Advanced Audio Distribution Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_SPP\_ENABLED

SPP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables the Serial Port Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_L2CAP\_ENABLED

BT L2CAP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_HFP\_ENABLE

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

Contains:

- `CONFIG_BT_HFP_AG_ENABLE`
- `CONFIG_BT_HFP_AUDIO_DATA_PATH`
- `CONFIG_BT_HFP_CLIENT_ENABLE`

### CONFIG\_BT\_HFP\_CLIENT\_ENABLE

Hands Free Unit

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_HFP\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_HFP\_AG\_ENABLE

Audio Gateway

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_HFP\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API "esp\_bredr\_sco\_datapath\_set" in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

Available options:

- PCM (*CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH\_PCM*)
- HCI (*CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH\_HCI*)

### CONFIG\_BT\_HFP\_WBS\_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH\_HCI* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_HID\_ENABLED

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**

- No (disabled) if *CONFIG\_BT\_CLASSIC\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

Contains:

- *CONFIG\_BT\_HID\_DEVICE\_ENABLED*
- *CONFIG\_BT\_HID\_HOST\_ENABLED*

### CONFIG\_BT\_HID\_HOST\_ENABLED

Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Host

**Default value:**

- No (disabled) if *CONFIG\_BT\_HID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_HID\_DEVICE\_ENABLED

Classic BT HID Device

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Device

### CONFIG\_BT\_BLE\_ENABLED

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTS\_ENABLE

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This enables "Peripheral Preferred Connection Parameters" characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES**

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 8 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE**

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)  
Let Bluedroid handle the service change indication internally

### **CONFIG\_BT\_GATTS\_ROBUST\_CACHING\_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option enables the GATT robust caching feature on the server. If turned on, the Client Supported Features characteristic, Database Hash characteristic, and Server Supported Features characteristic will be included in the GAP SERVICE.

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_DEVICE\_NAME\_WRITABLE**

Allow to write device name by GATT clients

*Found in:* [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTS\\_ENABLE](#)

Enabling this option allows remote GATT clients to write device name

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_APPEARANCE\_WRITABLE**

Allow to write appearance by GATT clients

*Found in:* [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTS\\_ENABLE](#)

Enabling this option allows remote GATT clients to write appearance

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTC\_ENABLE**

Include GATT client module(GATTC)

*Found in:* [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#)

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR**

Max gattc cache characteristic for discover

*Found in:* [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTC\\_ENABLE](#)

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 40 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTC\_NOTIF\_REG\_MAX**

Max gattc notify(indication) register number

*Found in:* [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTC\\_ENABLE](#)

Maximum GATTC notify(indication) register number

**Range:**

- from 1 to 64 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 5 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH**

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 255 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 3 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_SMP\_ENABLE**

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_SMP\_ID\_RESET\_ENABLE**

Reset device identity when all bonding records are deleted

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

There are tracking risks associated with using a fixed or static IRK. If enabled this option, Bluetooth will assign a new randomly-generated IRK when all pairing and bonding records are deleted. This would decrease the ability of a previously paired peer to be used to determine whether a device with which it previously shared an IRK is within range.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_SMP\_BOND\_NVS\_FLASH**

Save SMP bonding keys to nvs flash

*Found in: Component config > Bluetooth > Bluetooth Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

This select can save SMP bonding keys to nvs flash

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_STACK\_NO\_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluetooth Options*

This select can save the rodata code size

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**BT DEBUG LOG LEVEL** Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

### **CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL**

HCI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HCI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL**

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL**

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL**

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL**

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL**

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL**

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

Available options:

- NONE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

Available options:

- NONE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)

- DEBUG (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL**

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL**

AVRC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL**

MCA layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for MCA layer

Available options:

- NONE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL**

HID layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HID layer

Available options:

- NONE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL**

APPL layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for APPL layer

Available options:

- NONE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL**

GATT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GATT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL**

SMP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL**

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL**

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL**

OSI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for OSI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Blueroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_ACL\_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: Component config > Bluetooth > Blueroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if `CONFIG_BT_BLUEROID_ENABLED` && `CONFIG_BT_BLUEROID_ENABLED`

**Default value:**

- 4 if `CONFIG_BT_BLUEROID_ENABLED` && `CONFIG_BT_BLUEROID_ENABLED`

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Blueroid Options*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEROID_ENABLED`

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Blueroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluebird Options*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluebird Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_SMP\_MAX BONDS**

BT/BLE maximum bond device count

*Found in: Component config > Bluetooth > Bluebird Options*

The number of security records for peer devices.

**CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluebird Options*

Originally, when doing BLE active scan, Bluebird will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluebird will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, `ESP_GATTC_OPEN_EVT` or `ESP_GATTS_OPEN_EVT` is triggered.

**Range:**

- from 1 to 60 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 32 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**

- No (disabled) if `CONFIG_BT_CONTROLLER_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` || `CONFIG_BT_CONTROLLER_DISABLED`) && `CONFIG_BT_BLUEDROID_ENABLED`
- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` || `CONFIG_BT_CONTROLLER_DISABLED`) && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_TIMEOUT

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

**Range:**

- from 1 to 3600 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED

Enable BLE 5.0 features(please disable BLE 4.2 if enable BLE 5.0)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enabling this option activates BLE 5.0 features. This option is universally supported in chips that support BLE, except for ESP32. BLE 4.2 and BLE 5.0 cannot be used simultaneously.

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_50_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED

Enable BLE 4.2 features(please disable BLE 5.0 if enable BLE 4.2)

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features. This option is universally supported by all ESP chips with BLE capabilities. BLE 4.2 and BLE 5.0 cannot be used simultaneously.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_50_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH

Enable create sync enhancements(reporting disable and duplicate filtering enable support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the create sync enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_ABORT\_WHEN\_ALLOCATION\_FAILS

Abort when memory allocation fails in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables abort when memory allocation fails

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### NimBLE Options

 Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- *BLE Services*
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_DYNAMIC_SERVICE`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_SUBRATE`
- `CONFIG_BT_NIMBLE_VS_SUPPORT`
- `CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN`
- `CONFIG_BT_NIMBLE_ENC_ADV_DATA`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- *GAP Service*
- *Host-controller Transport*
- `CONFIG_BT_NIMBLE_L2CAP_ENHANCED_COC`
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX BONDS`
- `CONFIG_BT_NIMBLE_MAX CCCDS`
- `CONFIG_BT_NIMBLE_MAX CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_EATT_CHAN_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`

- [CONFIG\\_BT\\_NIMBLE\\_MEM\\_ALLOC\\_MODE](#)
- [Memory Settings](#)
- [CONFIG\\_BT\\_NIMBLE\\_LOG\\_LEVEL](#)
- [CONFIG\\_BT\\_NIMBLE\\_HOST\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_CRYPTO\\_STACK\\_MBEDTLS](#)
- [CONFIG\\_BT\\_NIMBLE\\_NVS\\_PERSIST](#)
- [CONFIG\\_BT\\_NIMBLE\\_ATT\\_PREFERRED\\_MTU](#)

- [CONFIG\\_BT\\_NIMBLE\\_PINNED\\_TO\\_CORE\\_CHOICE](#)
- [CONFIG\\_BT\\_NIMBLE\\_TEST\\_THROUGHPUT\\_TEST](#)

## CONFIG\_BT\_NIMBLE\_MEM\_ALLOC\_MODE

Memory allocation strategy

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory ([CONFIG\\_BT\\_NIMBLE\\_MEM\\_ALLOC\\_MODE\\_INTERNAL](#))
- External SPIRAM ([CONFIG\\_BT\\_NIMBLE\\_MEM\\_ALLOC\\_MODE\\_EXTERNAL](#))
- Default alloc mode ([CONFIG\\_BT\\_NIMBLE\\_MEM\\_ALLOC\\_MODE\\_DEFAULT](#))
- Internal IRAM ([CONFIG\\_BT\\_NIMBLE\\_MEM\\_ALLOC\\_MODE\\_IRAM\\_8BIT](#))  
Allows to use IRAM memory region as 8bit accessible region.  
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

## CONFIG\_BT\_NIMBLE\_LOG\_LEVEL

NimBLE Host log verbosity

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in "Component config --> Log output --> Default log verbosity".

Available options:

- No logs ([CONFIG\\_BT\\_NIMBLE\\_LOG\\_LEVEL\\_NONE](#))
- Error logs ([CONFIG\\_BT\\_NIMBLE\\_LOG\\_LEVEL\\_ERROR](#))
- Warning logs ([CONFIG\\_BT\\_NIMBLE\\_LOG\\_LEVEL\\_WARNING](#))
- Info logs ([CONFIG\\_BT\\_NIMBLE\\_LOG\\_LEVEL\\_INFO](#))
- Debug logs ([CONFIG\\_BT\\_NIMBLE\\_LOG\\_LEVEL\\_DEBUG](#))

## CONFIG\_BT\_NIMBLE\_MAX\_CONNECTIONS

Maximum number of concurrent connections

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

**Range:**

- from 1 to 9 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 3 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MAX BONDS

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MAX CCCDS

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_L2CAP\_COC\_MAX\_NUM

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_L2CAP\_ENHANCED\_COC

L2CAP Enhanced Connection Oriented Channel

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Enhanced Credit Based Flow Control Mode

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`  $\geq$  1 && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_CHOICE

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:

- Core 0 (PRO CPU) (CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_1)

### CONFIG\_BT\_NIMBLE\_HOST\_TASK\_STACK\_SIZE

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 4096 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_CENTRAL

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_PERIPHERAL

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_BROADCASTER

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_OBSERVER

Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables observer role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_NVS\_PERSIST

Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SMP\_ID\_RESET

Reset device identity when all bonding records are deleted

*Found in: Component config > Bluetooth > NimBLE Options*

There are tracking risks associated with using a fixed or static IRK. If enabled this option, NimBLE will assign a new randomly-generated IRK when all pairing and bonding records are deleted. This would decrease the ability of a previously paired peer to be used to determine whether a device with which it previously shared an IRK is within range.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE

Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE sm feature

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_NIMBLE_SM_SC_ONLY`
- `CONFIG_BT_NIMBLE_SM_SC_LVL`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`

### CONFIG\_BT\_NIMBLE\_SM\_LEGACY

Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC

Security manager secure connections (4.2)

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options` > `CONFIG_BT_NIMBLE_SECURITY_ENABLE`

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC\_DEBUG\_KEYS

Use predefined public-private key pair

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options` > `CONFIG_BT_NIMBLE_SECURITY_ENABLE` > `CONFIG_BT_NIMBLE_SM_SC`

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_SM_SC` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_ENCRYPTION

Enable LE encryption

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options` > `CONFIG_BT_NIMBLE_SECURITY_ENABLE`

Enable encryption connection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC\_LVL

Security level

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options` > `CONFIG_BT_NIMBLE_SECURITY_ENABLE`

LE Security Mode 1 Levels: 1. No Security 2. Unauthenticated pairing with encryption 3. Authenticated pairing with encryption 4. Authenticated LE Secure Connections pairing with encryption using a 128-bit strength encryption key.

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC\_ONLY

Enable Secure Connections Only Mode

*Found in:* `Component config` > `Bluetooth` > `NimBLE Options` > `CONFIG_BT_NIMBLE_SECURITY_ENABLE`

Enable Secure Connections Only Mode

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_DEBUG**

Enable extra runtime asserts and host debugging

*Found in: Component config > Bluetooth > NimBLE Options*

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_DYNAMIC\_SERVICE**

Enable dynamic services

*Found in: Component config > Bluetooth > NimBLE Options*

This enables user to add/remove Gatt services at runtime

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_DEVICE\_NAME**

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- "nimble" if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_GAP\_DEVICE\_NAME\_MAX\_LEN**

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ATT\_PREFERRED\_MTU**

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEARANCE

External appearance of the device

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### Memory Settings Contains:

- [CONFIG\\_BT\\_NIMBLE\\_TRANSPORT\\_ACL\\_FROM\\_LL\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_TRANSPORT\\_EVT\\_DISCARD\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_BUF\\_FROM\\_HEAP](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_1\\_BLOCK\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_1\\_BLOCK\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_2\\_BLOCK\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_MSYS\\_2\\_BLOCK\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_TRANSPORT\\_ACL\\_SIZE](#)
- [CONFIG\\_BT\\_NIMBLE\\_TRANSPORT\\_EVT\\_COUNT](#)
- [CONFIG\\_BT\\_NIMBLE\\_TRANSPORT\\_EVT\\_SIZE](#)

## CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT

MSYS\_1 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 24 if [SOC\\_ESP\\_NIMBLE\\_CONTROLLER](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_SIZE

MSYS\_1 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory size of block 1

**Default value:**

- 128 if [SOC\\_ESP\\_NIMBLE\\_CONTROLLER](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

## CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_COUNT

MSYS\_2 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory count

**Default value:**

- 24 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_SIZE

MSYS\_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**

- 320 if `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MSYS\_BUF\_FROM\_HEAP

Get Msys Mbuf from heap

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This option sets the source of the shared msys mbuf memory between the Host and the Controller. Allocate the memory from the heap if this option is sets, from the mempool otherwise.

**Default value:**

- Yes (enabled) if `BT_LE_MSYS_INIT_IN_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_FROM\_LL\_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers allocated for host.

**Default value:**

- 24 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_SIZE

Transport ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_SIZE

Transport Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 70 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_COUNT

Transport Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**

- 30 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_DISCARD\_COUNT

Discardable Transport Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**

- 8 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_MAX\_PROCS

Maximum number of GATT client procedures

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Maximum number of GATT client procedures that can be executed.

**Default value:**

- 4 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL

Enable Host Flow control

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable Host Flow control

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_ITVL

Host Flow control interval

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Host flow control interval in msec

**Default value:**

- 1000 if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if *CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_TX\_ON\_DISCONNECT**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_RPA\_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change.

**Range:**

- from 1 to 41400 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Default value:**

- 900 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_MESH**

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./doc/./esp32/api-guides/esp-ble-mesh/ble-mesh-index``

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

Contains:

- *CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER*
- *CONFIG\_BT\_NIMBLE\_MESH\_PROV*
- *CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY*
- *CONFIG\_BT\_NIMBLE\_MESH\_FRIEND*
- *CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER*
- *CONFIG\_BT\_NIMBLE\_MESH\_PROXY*
- *CONFIG\_BT\_NIMBLE\_MESH\_RELAY*
- *CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME*
- *CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT*

### CONFIG\_BT\_NIMBLE\_MESH\_PROXY

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable proxy. This is automatically set whenever NIMBLE\_MESH\_PB\_GATT or NIMBLE\_MESH\_GATT\_PROXY is set

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_PROV

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_ADV

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH > CONFIG\_BT\_NIMBLE\_MESH\_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_MESH\_PROV* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_GATT

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH > CONFIG\_BT\_NIMBLE\_MESH\_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_MESH\_PROV* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_RELAY

Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Support for acting as a Mesh Relay Node

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_FRIEND

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

- "nimble-mesh-node" if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Defines mesh node count.

**Default value:**

- 1 if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioner.

**Default value:**

- 0 if *CONFIG\_BT\_NIMBLE\_MESH* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_CRYPTO\_STACK\_MBEDTLS

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HS\_STOP\_TIMEOUT\_MS

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

- 2000 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HOST\_BASED\_PRIVACY

Enable host based privacy for random address.

*Found in: Component config > Bluetooth > NimBLE Options*

Use this option to do host based Random Private Address resolution. If this option is disabled then controller based privacy is used.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT

Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**

- Yes (enabled) if `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- No (disabled) if `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`

### CONFIG\_BT\_NIMBLE\_MAX\_CONN\_REATTEMPT

Maximum number connection reattempts

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT*

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 255 if `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`

**Default value:**

- 3 if `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`

## CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT

Enable BLE 5 feature

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE 5 feature

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `SOC_BLE_50_SUPPORTED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_2M\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_CODED\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)
- [CONFIG\\_BT\\_NIMBLE\\_EXT\\_SCAN](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)
- [CONFIG\\_BT\\_NIMBLE\\_BLE\\_POWER\\_CONTROL](#)

## CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_2M\_PHY

Enable 2M Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable 2M-PHY

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_CODED\_PHY

Enable coded Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable coded-PHY

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

## CONFIG\_BT\_NIMBLE\_EXT\_ADV

Enable extended advertising

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES**

Maximum number of extended advertising instances.

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV`

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**

- from 0 to 4 if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_EXT\_ADV\_MAX\_SIZE**

Maximum length of the advertising data.

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV`

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**

- from 0 to 1650 if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 1650 if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV**

Enable periodic advertisement.

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV`

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_ENH**

Periodic adv enhancements(adi support)

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV`

Enable the periodic advertising enhancements

**CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable Transfer Sync Events

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#)

This enables controller transfer periodic sync events to host

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_WITH\_RESPONSES**

Enable Periodic Advertisement with Response (EXPERIMENTAL)

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#)

This enables controller PAwR (Periodic Advertisement with Response).

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_EXT\_SCAN**

Enable extended scanning

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended scanning.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ROLE\\_OBSERVER](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_SYNC**

Enable periodic sync

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_SCAN](#)

Enable this option to receive periodic advertisement.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_SCAN](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_SYNCS**

Maximum number of periodic advertising syncs

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_SCAN](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_SYNC](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**

- from 0 to 8 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_SYNC` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_SYNC` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_SYNC` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_ADVERTISER\_LIST**

Maximum number of periodic advertiser list

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_SCAN > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_SYNC`

Set this option to set the upper limit for number of periodic advertiser list.

**Range:**

- from 1 to 5 if `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_SYNC` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 5 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_SYNC` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_BLE\_POWER\_CONTROL**

Enable support for BLE Power Control

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`

Set this option to enable the Power Control feature

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `SOC_BLE_POWER_CONTROL_SUPPORTED` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_GATT\_CACHING**

Enable GATT caching

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`

Enable GATT caching

Contains:

- `CONFIG_BT_NIMBLE_GATT_CACHING_DISABLE_AUTO`
- `CONFIG_BT_NIMBLE_GATT_CACHING_MAX_CONNS`
- `CONFIG_BT_NIMBLE_GATT_CACHING_MAX_CHRS`
- `CONFIG_BT_NIMBLE_GATT_CACHING_MAX_DSCS`
- `CONFIG_BT_NIMBLE_GATT_CACHING_MAX_SVCS`

**CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CONNS**

Maximum connections to be cached

*Found in:* [Component config > Bluetooth > NimBLE Options > CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT > CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of connections to be cached.

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_SVCS**

Maximum number of services per connection

*Found in:* [Component config > Bluetooth > NimBLE Options > CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT > CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of services per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CHRS**

Maximum number of characteristics per connection

*Found in:* [Component config > Bluetooth > NimBLE Options > CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT > CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of characteristics per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_DSCS**

Maximum number of descriptors per connection

*Found in:* [Component config > Bluetooth > NimBLE Options > CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT > CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of descriptors per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_DISABLE\_AUTO**

Do not start discovery procedure automatically upon receiving Out of Sync

*Found in:* [Component config > Bluetooth > NimBLE Options > CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT > CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

When client receives ATT out-of-sync error message, it will not automatically start the discovery procedure to correct the invalid cache.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_WHITELIST\_SIZE**

BLE white list size

*Found in: Component config > Bluetooth > NimBLE Options*

BLE list size

**Range:**

- from 1 to 15 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Default value:**

- 12 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_TEST\_THROUGHPUT\_TEST**

Throughput Test Mode enable

*Found in: Component config > Bluetooth > NimBLE Options*

Enable the throughput test mode

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_BLUFI\_ENABLE**

Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to enable blufi functionality.

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_USE\_ESP\_TIMER**

Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_BLE\_GATT\_BLOB\_TRANSFER**

Blob transfer

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT needs to be increased according to the need.

**GAP Service** Contains:

- *GAP Appearance write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION*
- *GAP device name write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_GATT\_SECURITY\_LEVEL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO*

**GAP Appearance write permissions** Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE**

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_ENC**

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHEN**

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION**

GAP Characteristic - Central Address Resolution

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Whether or not Central Address Resolution characteristic is supported on the device, and if supported, whether or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported

- Central Address Resolution not supported
- Central Address Resolution supported

Available options:

- Characteristic not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_CHAR\_NOT\_SUPP)
- Central Address Resolution not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_NOT\_SUPP)
- Central Address Resolution supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_SUPP)

**GAP device name write permissions** Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE**

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_ENC**

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHEN**

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL**

PPCP Connection Interval Max (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL**

PPCP Connection Interval Min (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY**

PPCP Slave Latency

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Slave Latency

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO**

PPCP Supervision Timeout (Unit: 10 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value \* 10 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_SVC\_GAP\_GATT\_SECURITY\_LEVEL**

LE GATT Security Level Characteristic

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Enable the LE GATT Security Level Characteristic

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`

### **BLE Services** Contains:

- `CONFIG_BT_NIMBLE_SVC_BAS_BATTERY_LEVEL_NOTIFY`
- *Device Information Service*
- `CONFIG_BT_NIMBLE_HID_SERVICE`

### CONFIG\_BT\_NIMBLE\_HID\_SERVICE

HID service

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services*

Enable HID service support

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_RPTS*
- *CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_INSTANCES*

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_INSTANCES

Maximum HID service instances

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of HID service instances

**Default value:**

- 2 if *CONFIG\_BT\_NIMBLE\_HID\_SERVICE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_RPTS

Maximum HID Report characteristics per service instance

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of report characteristics per service instance

**Default value:**

- 3 if *CONFIG\_BT\_NIMBLE\_HID\_SERVICE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_SVC\_BAS\_BATTERY\_LEVEL\_NOTIFY

BAS Battery Level NOTIFY permission

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services*

Enable/Disable notifications on BAS Battery Level Characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Device Information Service** Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_INCLUDED*
- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_FIRMWARE\_REVISION*
- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_HARDWARE\_REVISION*
- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_MANUFACTURER\_NAME*
- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_PNP\_ID*
- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_SERIAL\_NUMBER*
- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_SOFTWARE\_REVISION*
- *CONFIG\_BT\_NIMBLE\_SVC\_DIS\_SYSTEM\_ID*

### **CONFIG\_BT\_NIMBLE\_SVC\_DIS\_MANUFACTURER\_NAME**

Manufacturer Name

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Enable the DIS characteristic Manufacturer Name String characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### **CONFIG\_BT\_NIMBLE\_SVC\_DIS\_SERIAL\_NUMBER**

Serial Number

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Enable the DIS Serial Number characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### **CONFIG\_BT\_NIMBLE\_SVC\_DIS\_HARDWARE\_REVISION**

Hardware Revision

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Enable the DIS Hardware Revision characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### **CONFIG\_BT\_NIMBLE\_SVC\_DIS\_FIRMWARE\_REVISION**

Firmware Revision

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Enable the DIS Firmware Revision characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### **CONFIG\_BT\_NIMBLE\_SVC\_DIS\_SOFTWARE\_REVISION**

Software Revision

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Enable the DIS Software Revision characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### **CONFIG\_BT\_NIMBLE\_SVC\_DIS\_SYSTEM\_ID**

System ID

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Enable the DIS System ID characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_SVC\_DIS\_PNP\_ID

PnP ID

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Enable the DIS PnP ID characteristic

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_SVC\_DIS\_INCLUDED

DIS as an Included Service

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > Device Information Service*

Use DIS as an included service

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_VS\_SUPPORT

Enable support for VSC and VSE

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

### CONFIG\_BT\_NIMBLE\_OPTIMIZE\_MULTI\_CONN

Enable the optimization of multi-connection

*Found in: Component config > Bluetooth > NimBLE Options*

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

**Default value:**

- No (disabled) if *SOC\_BLE\_MULTI\_CONN\_OPTIMIZATION* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA

Encrypted Advertising Data

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable encrypted advertising data.

### CONFIG\_BT\_NIMBLE\_MAX\_EADS

Maximum number of EAD devices to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA*

Defines maximum number of encrypted advertising data key material to save

**Default value:**

- 10 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HIGH\_DUTY\_ADV\_ITVL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > NimBLE Options*

This enable BLE high duty advertising interval feature

**CONFIG\_BT\_NIMBLE\_HOST\_QUEUE\_CONG\_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > NimBLE Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Host-controller Transport** Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_UART`
- `CONFIG_BT_NIMBLE_HCI_UART_CTS_PIN`
- `CONFIG_BT_NIMBLE_USE_HCI_UART_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_HCI_UART_RTS_PIN`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART**

Enable Uart Transport

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Use UART transport

**Default value:**

- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART\_PORT**

Uart port

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart port

**Default value:**

- 1 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HCI\_USE\_UART\_BAUDRATE**

Uart Hci Baud Rate

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart Baud Rate

Available options:

- 115200 (CONFIG\_UART\_BAUDRATE\_115200)
- 230400 (CONFIG\_UART\_BAUDRATE\_230400)
- 460800 (CONFIG\_UART\_BAUDRATE\_460800)
- 921600 (CONFIG\_UART\_BAUDRATE\_921600)

### CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_PARITY

Uart PARITY

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart Parity

Available options:

- None (CONFIG\_UART\_PARITY\_NONE)
- Odd (CONFIG\_UART\_PARITY\_ODD)
- Even (CONFIG\_UART\_PARITY\_EVEN)

### CONFIG\_BT\_NIMBLE\_UART\_RX\_PIN

UART Rx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Rx pin for Nimble Transport

**Default value:**

- 5 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_UART\_TX\_PIN

UART Tx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Tx pin for Nimble Transport

**Default value:**

- 4 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_FLOW\_CTRL

Uart Flow Control

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Uart Flow Control

Available options:

- Disable (CONFIG\_UART\_HW\_FLOWCTRL\_DISABLE)
- Enable hardware flow control (CONFIG\_UART\_HW\_FLOWCTRL\_CTS\_RTS)

**CONFIG\_BT\_NIMBLE\_HCI\_UART\_RTS\_PIN**

UART Rts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI RTS pin

**Default value:**

- 19 if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HCI\_UART\_CTS\_PIN**

UART Cts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI CTS pin

**Default value:**

- 23 if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_EATT\_CHAN\_NUM**

Maximum number of EATT channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines the number of channels EATT bearers can use

**Default value:**

- 0 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SUBRATE**

Enable Subrate Change

*Found in: Component config > Bluetooth > NimBLE Options*

Enable connection subrate change feature

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Controller Options** Contains:

- *CONFIG\_BTDM\_CTRL\_AUTO\_LATENCY*
- *CONFIG\_BTDM\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*
- *BLE disconnect when instant passed*
- *CONFIG\_BTDM\_CTRL\_FULL\_SCAN\_SUPPORTED*
- *CONFIG\_BTDM\_CTRL\_BLE\_MAX\_CONN*
- *CONFIG\_BTDM\_BLE\_SCAN\_DUPL*
- *CONFIG\_BTDM\_BLE\_SLEEP\_CLOCK\_ACCURACY*
- *CONFIG\_BTDM\_BLE\_VS\_QA\_SUPPORT*
- *CONFIG\_BTDM\_CTRL\_MODE*
- *CONFIG\_BTDM\_CTRL\_BR\_EDR\_MAX\_ACL\_CONN*
- *CONFIG\_BTDM\_CTRL\_BR\_EDR\_SCO\_DATA\_PATH*
- *CONFIG\_BTDM\_CTRL\_BR\_EDR\_MAX\_SYNC\_CONN*
- *CONFIG\_BTDM\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX*
- *CONFIG\_BTDM\_BLE\_CHAN\_ASS\_EN*
- *CONFIG\_BTDM\_CTRL\_CHECK\_CONNECT\_IND\_ACCESS\_ADDRESS*
- *CONFIG\_BTDM\_BLE\_PING\_EN*
- *CONFIG\_BTDM\_CTRL\_HCI\_MODE\_CHOICE*
- *HCI UART(H4) Options*

- [CONFIG\\_BTDM\\_CTRL\\_HLI](#)
- [CONFIG\\_BTDM\\_CTRL\\_LEGACY\\_AUTH\\_VENDOR\\_EVT](#)
- [MODEM\\_SLEEP Options](#)
- [CONFIG\\_BTDM\\_CTRL\\_PCM\\_ROLE\\_EDGE\\_CONFIG](#)
- [CONFIG\\_BTDM\\_CTRL\\_PINNED\\_TO\\_CORE\\_CHOICE](#)

### CONFIG\_BTDM\_CTRL\_MODE

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > Controller Options*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

Available options:

- BLE Only ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BLE\\_ONLY](#))
- BR/EDR Only ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BR\\_EDR\\_ONLY](#))
- Bluetooth Dual Mode ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#))

### CONFIG\_BTDM\_CTRL\_BLE\_MAX\_CONN

BLE Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BLE maximum connections of bluetooth controller. Each connection uses 1KB static DRAM whenever the BT controller is enabled.

**Range:**

- from 1 to 9 if ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BLE\\_ONLY](#) || [CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#)) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**Default value:**

- 3 if ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BLE\\_ONLY](#) || [CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#)) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BTDM\_CTRL\_BR\_EDR\_MAX\_ACL\_CONN

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

**Range:**

- from 1 to 7 if ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BR\\_EDR\\_ONLY](#) || [CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#)) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**Default value:**

- 2 if ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BR\\_EDR\\_ONLY](#) || [CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#)) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BTDM\_CTRL\_BR\_EDR\_MAX\_SYNC\_CONN

BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.

**Range:**

- from 0 to 3 if (`CONFIG_BTDM_CTRL_MODE_BR_EDR_ONLY` || `CONFIG_BTDM_CTRL_MODE_BTDM`) && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 0 if (`CONFIG_BTDM_CTRL_MODE_BR_EDR_ONLY` || `CONFIG_BTDM_CTRL_MODE_BTDM`) && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BTDM\_CTRL\_BR\_EDR\_SCO\_DATA\_PATH**

BR/EDR Sync(SCO/eSCO) default data path

*Found in: Component config > Bluetooth > Controller Options*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be "matrixed" to GPIOs. The default data path can also be set using API "esp\_bredr\_sco\_datapath\_set"

Available options:

- HCI (`CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI`)
- PCM (`CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM`)

**CONFIG\_BTDM\_CTRL\_PCM\_ROLE\_EDGE\_CONFIG**

PCM Signal Config (Role and Polar)

*Found in: Component config > Bluetooth > Controller Options*

**Default value:**

- Yes (enabled) if `CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM` && `CONFIG_BT_CONTROLLER_ENABLED`

Contains:

- `CONFIG_BTDM_CTRL_PCM_POLAR`
- `CONFIG_BTDM_CTRL_PCM_ROLE`

**CONFIG\_BTDM\_CTRL\_PCM\_ROLE**

PCM Role

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BTDM\_CTRL\_PCM\_ROLE\_EDGE\_CONFIG*

PCM role can be configured as PCM master or PCM slave

Available options:

- PCM Master (`CONFIG_BTDM_CTRL_PCM_ROLE_MASTER`)
- PCM Slave (`CONFIG_BTDM_CTRL_PCM_ROLE_SLAVE`)

**CONFIG\_BTDM\_CTRL\_PCM\_POLAR**

PCM Polar

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BTDM\_CTRL\_PCM\_ROLE\_EDGE\_CONFIG*

PCM polarity can be configured as Falling Edge or Rising Edge

Available options:

- Falling Edge (CONFIG\_BTDM\_CTRL\_PCM\_POLAR\_FALLING\_EDGE)
- Rising Edge (CONFIG\_BTDM\_CTRL\_PCM\_POLAR\_RISING\_EDGE)

### CONFIG\_BTDM\_CTRL\_AUTO\_LATENCY

Auto latency

*Found in: Component config > Bluetooth > Controller Options*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

**Default value:**

- No (disabled) if `CONFIG_BTDM_CTRL_MODE_BTDM` && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BTDM\_CTRL\_LEGACY\_AUTH\_VENDOR\_EVT

Legacy Authentication Vendor Specific Event Enable

*Found in: Component config > Bluetooth > Controller Options*

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

**Default value:**

- Yes (enabled) if `(CONFIG_BTDM_CTRL_MODE_BR_EDR_ONLY || CONFIG_BTDM_CTRL_MODE_BTDM)` && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BTDM\_CTRL\_PINNED\_TO\_CORE\_CHOICE

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Controller Options*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (CONFIG\_BTDM\_CTRL\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (CONFIG\_BTDM\_CTRL\_PINNED\_TO\_CORE\_1)

### CONFIG\_BTDM\_CTRL\_HCI\_MODE\_CHOICE

HCI mode

*Found in: Component config > Bluetooth > Controller Options*

Specify HCI mode as VHCI or UART(H4)

Available options:

- VHCI (CONFIG\_BTDM\_CTRL\_HCI\_MODE\_VHCI)  
Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
- UART(H4) (CONFIG\_BTDM\_CTRL\_HCI\_MODE\_UART\_H4)  
If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**HCI UART(H4) Options** Contains:

- [CONFIG\\_BTDM\\_CTRL\\_HCI\\_UART\\_FLOW\\_CTRL\\_EN](#)
- [CONFIG\\_BTDM\\_CTRL\\_HCI\\_UART\\_BAUDRATE](#)
- [CONFIG\\_BTDM\\_CTRL\\_HCI\\_UART\\_NO](#)

**CONFIG\_BTDM\_CTRL\_HCI\_UART\_NO**

UART Number for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.

**Range:**

- from 1 to 2 if [CONFIG\\_BTDM\\_CTRL\\_HCI\\_MODE\\_UART\\_H4](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BTDM\\_CTRL\\_HCI\\_MODE\\_UART\\_H4](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**CONFIG\_BTDM\_CTRL\_HCI\_UART\_BAUDRATE**

UART Baudrate for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

UART Baudrate for HCI. Please use standard baudrate.

**Range:**

- from 115200 to 921600 if [CONFIG\\_BTDM\\_CTRL\\_HCI\\_MODE\\_UART\\_H4](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**Default value:**

- 921600 if [CONFIG\\_BTDM\\_CTRL\\_HCI\\_MODE\\_UART\\_H4](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**CONFIG\_BTDM\_CTRL\_HCI\_UART\_FLOW\_CTRL\_EN**

Enable UART flow control

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

**Default value:**

- Yes (enabled) if [CONFIG\\_BTDM\\_CTRL\\_HCI\\_MODE\\_UART\\_H4](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**MODEM SLEEP Options** Contains:

- [CONFIG\\_BTDM\\_CTRL\\_LOW\\_POWER\\_CLOCK](#)
- [CONFIG\\_BTDM\\_CTRL\\_MODEM\\_SLEEP](#)

**CONFIG\_BTDM\_CTRL\_MODEM\_SLEEP**

Bluetooth modem sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

## CONFIG\_BTDM\_CTRL\_MODEM\_SLEEP\_MODE

Bluetooth Modem sleep mode

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [MODEM SLEEP Options](#) > [CONFIG\\_BTDM\\_CTRL\\_MODEM\\_SLEEP](#)

To select which strategy to use for modem sleep

Available options:

- ORIG Mode(sleep with low power clock) (CONFIG\_BTDM\_CTRL\_MODEM\_SLEEP\_MODE\_ORIG)  
ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode, bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain bluetooth reference clock.
- EVED Mode(For internal test only) (CONFIG\_BTDM\_CTRL\_MODEM\_SLEEP\_MODE\_EVED)  
EVED mode is for BLE only and is only for internal test. Do not use it for production. this mode is not compatible with DFS nor light sleep

## CONFIG\_BTDM\_CTRL\_LOW\_POWER\_CLOCK

Bluetooth low power clock

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [MODEM SLEEP Options](#)

Select the low power clock source for bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- "Main crystal" option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- "External 32kHz crystal" option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

Available options:

- Main crystal (CONFIG\_BTDM\_CTRL\_LPCLK\_SEL\_MAIN\_XTAL)  
Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the bluetooth low power clock source.
- External 32kHz crystal/oscillator (CONFIG\_BTDM\_CTRL\_LPCLK\_SEL\_EXT\_32K\_XTAL)  
External 32kHz crystal/oscillator has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

## CONFIG\_BTDM\_BLE\_SLEEP\_CLOCK\_ACCURACY

BLE Sleep Clock Accuracy

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#)

BLE Sleep Clock Accuracy(SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy(e.g. 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator(LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- "151ppm to 250ppm" option is the default value for Bluetooth Dual mode
- **"251ppm to 500ppm" option can be used in BLE only mode when using external 32kHz crystal as low power clock.** This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

Available options:

- 251ppm to 500ppm (CONFIG\_BTDM\_BLE\_DEFAULT\_SCA\_500PPM)
- 151ppm to 250ppm (CONFIG\_BTDM\_BLE\_DEFAULT\_SCA\_250PPM)

### CONFIG\_BTDM\_BLE\_SCAN\_DUPL

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Controller Options*

This select enables parameters setting of BLE scan duplicate.

**Default value:**

- Yes (enabled) if (`CONFIG_BTDM_CTRL_MODE_BTDM` || `CONFIG_BTDM_CTRL_MODE_BLE_ONLY`) && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BTDM\_SCAN\_DUPL\_TYPE

Scan Duplicate Type

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BTDM\_BLE\_SCAN\_DUPL*

Scan duplicate have three ways. one is "Scan Duplicate By Device Address", This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is "Scan Duplicate By Device Address And Advertising Data". This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is "Scan Duplicate By Advertising Data". This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (CONFIG\_BTDM\_SCAN\_DUPL\_TYPE\_DEVICE)  
This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (CONFIG\_BTDM\_SCAN\_DUPL\_TYPE\_DATA)  
This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (CONFIG\_BTDM\_SCAN\_DUPL\_TYPE\_DATA\_DEVICE)  
This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

### CONFIG\_BTDM\_SCAN\_DUPL\_CACHE\_SIZE

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BTDM\_BLE\_SCAN\_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the oldest device will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 100 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BTDM\_SCAN\_DUPL\_CACHE\_REFRESH\_PERIOD**

Duplicate scan list refresh period (seconds)

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BTDM\_BLE\_SCAN\_DUPL*

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

**Range:**

- from 0 to 1000 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 0 if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BTDM\_BLE\_MESH\_SCAN\_DUPL\_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BTDM\_BLE\_SCAN\_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**

- No (disabled) if `CONFIG_BTDM_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BTDM\_MESH\_DUPL\_SCAN\_CACHE\_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BTDM\_BLE\_SCAN\_DUPL > CONFIG\_BTDM\_BLE\_MESH\_SCAN\_DUPL\_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 100 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BTDM\_CTRL\_FULL\_SCAN\_SUPPORTED**

BLE full scan feature supported

*Found in: Component config > Bluetooth > Controller Options*

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

**Default value:**

- Yes (enabled) if `(CONFIG_BTDM_CTRL_MODE_BLE_ONLY || CONFIG_BTDM_CTRL_MODE_BTDM)` && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BTDM\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX

Disable active scan backoff

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

Disable active scan backoff. The bluetooth spec requires that scanners should run a backoff procedure to minimize collision of scan request PDUs from multiple scanners. If scan backoff is disabled, in active scanning, scan request PDU will be sent every time when HW receives scannable ADV PDU.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BTDM\_CTRL\_CHECK\_CONNECT\_IND\_ACCESS\_ADDRESS

Enable enhanced Access Address check in CONNECT\_IND

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

Enabling this option will add stricter verification of the Access Address in the CONNECT\_IND PDU. This improves security by ensuring that only connection requests with valid Access Addresses are accepted. If disabled, only basic checks are applied, improving compatibility.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BTDM\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP

BLE adv report flow control supported

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**

- Yes (enabled) if [\(CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM || CONFIG\\_BTDM\\_CTRL\\_MODE\\_BLE\\_ONLY\) && CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BTDM\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM

BLE adv report flow control number

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#)*

The number of unprocessed advertising report that Blueroid can save. If you set [BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_NUM](#) to a small value, this may cause adv packets lost. If you set [BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_NUM](#) to a large value, Blueroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 \* 50 bytes. Please set [BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_NUM](#) according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**

- from 50 to 1000 if [CONFIG\\_BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP && CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**Default value:**

- 100 if [CONFIG\\_BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP && CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

## CONFIG\_BTDM\_BLE\_ADV\_REPORT\_DISCARD\_THRSHOLD

BLE adv lost event threshold value

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#)

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set *BTDM\_BLE\_ADV\_REPORT\_DISCARD\_THRSHOLD* to a small value or printf every adv lost event, it may cause adv packets lost more.

### Range:

- from 1 to 1000 if [CONFIG\\_BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### Default value:

- 20 if [CONFIG\\_BTDM\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**BLE disconnect when instant passed** Contains:

- [CONFIG\\_BTDM\\_BLE\\_LLCP\\_CHAN\\_MAP\\_UPDATE](#)
- [CONFIG\\_BTDM\\_BLE\\_LLCP\\_CONN\\_UPDATE](#)

## CONFIG\_BTDM\_BLE\_LLCP\_CONN\_UPDATE

BLE ACL connection update procedure

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [BLE disconnect when instant passed](#)

If this option is enabled, Controller will terminate the connection when instant passed during connection update procedure.

### Default value:

- No (disabled) if ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BLE\\_ONLY](#) || [CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#)) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

## CONFIG\_BTDM\_BLE\_LLCP\_CHAN\_MAP\_UPDATE

BLE ACL channel map update procedure

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [BLE disconnect when instant passed](#)

If this option is enabled, Controller will terminate the connection when instant passed in channel map update procedure.

### Default value:

- No (disabled) if ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BLE\\_ONLY](#) || [CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#)) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

## CONFIG\_BTDM\_BLE\_CHAN\_ASS\_EN

Enable channel assessment

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#)

If this option is enabled, The Controller will records the communication quality for each channel and then start a timer to check and update the channel map every 4 seconds.

### Default value:

- Yes (enabled) if ([CONFIG\\_BTDM\\_CTRL\\_MODE\\_BLE\\_ONLY](#) || [CONFIG\\_BTDM\\_CTRL\\_MODE\\_BTDM](#)) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BTDM\_BLE\_PING\_EN

Enable LE Ping procedure

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

If this option is disabled, The Controller will not start the LE authenticated payload timer. This option is used for some compatibility problems related to LE ping procedure.

**Default value:**

- Yes (enabled) if `(CONFIG_BTDM_CTRL_MODE_BTDM || CONFIG_BTDM_CTRL_MODE_BLE_ONLY) && CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BTDM\_BLE\_VS\_QA\_SUPPORT

BLE vendor HCI QA support

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

This enables BLE vendor HCI command and event for QA.

**Default value:**

- No (disabled) if `(CONFIG_BTDM_CTRL_MODE_BTDM || CONFIG_BTDM_CTRL_MODE_BLE_ONLY) && CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BTDM\_CTRL\_HLI

High level interrupt

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

Using Level 4 interrupt for Bluetooth.

**Default value:**

- Yes (enabled) if `CONFIG_BT_ENABLED && CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_RELEASE\_IRAM

Release Bluetooth text (READ DOCS FIRST)

*Found in: [Component config](#) > [Bluetooth](#)*

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when `esp_bt_mem_release` is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (`ESP_SYSTEM_PMP_IDRAM_SPLIT`)

**Default value:**

- No (disabled) if `CONFIG_BT_ENABLED && BT_LE_RELEASE_IRAM_SUPPORTED`

### CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN

Enable Bluetooth HCI debug mode

*Found in: [Component config](#) > [Bluetooth](#)*

This option is used to enable bluetooth debug mode, which saves the hci layer data stream.

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED || CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_HCI\_LOG\_DATA\_BUFFER\_SIZE

Size of the cache used for HCI data in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)*

This option is to configure the buffer size of the hci data steam cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Default value:**

- 5 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

### CONFIG\_BT\_HCI\_LOG\_ADV\_BUFFER\_SIZE

Size of the cache used for adv report in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)*

This option is to configure the buffer size of the hci adv report cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Default value:**

- 8 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Common Options** Contains:

- [CONFIG\\_BT\\_ALARM\\_MAX\\_NUM](#)

### CONFIG\_BT\_ALARM\_MAX\_NUM

Maximum number of Bluetooth alarms

*Found in: [Component config](#) > [Bluetooth](#) > [Common Options](#)*

This option decides the maximum number of alarms which could be used by Bluetooth host.

**Default value:**

- 50

### CONFIG\_BLE\_MESH

ESP BLE Mesh Support

*Found in: [Component config](#)*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- [BLE Mesh and BLE coexistence support](#)
- [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_CLIENT](#)
- [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_SERVER](#)
- [BLE Mesh NET BUF DEBUG LOG LEVEL](#)
- [CONFIG\\_BLE\\_MESH\\_PROV](#)
- [CONFIG\\_BLE\\_MESH\\_PROXY](#)
- [BLE Mesh specific test option](#)
- [BLE Mesh STACK DEBUG LOG LEVEL](#)
- [CONFIG\\_BLE\\_MESH\\_NO\\_LOG](#)

- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`
- `CONFIG_BLE_MESH_EXPERIMENTAL`
- `CONFIG_BLE_MESH_CRPL`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
- `CONFIG_BLE_MESH_MODEL_KEY_COUNT`
- `CONFIG_BLE_MESH_APP_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_GROUP_COUNT`
- `CONFIG_BLE_MESH_LABEL_COUNT`
- `CONFIG_BLE_MESH_SUBNET_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MAX`
- `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_MEM_ALLOC_MODE`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`
- `CONFIG_BLE_MESH_NOT_RELAY_REPLAY_MSG`
- `CONFIG_BLE_MESH_ADV_BUF_COUNT`
- `CONFIG_BLE_MESH_PB_GATT`
- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_IVU_RECOVERY_IVI`
- `CONFIG_BLE_MESH_RELAY`
- `CONFIG_BLE_MESH_SAR_ENHANCEMENT`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_ACTIVE_SCAN`
- `CONFIG_BLE_MESH_DEINIT`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- `CONFIG_BLE_MESH_V11_SUPPORT`
- Support for BLE Mesh Client/Server models
- Support for BLE Mesh Foundation models
- `CONFIG_BLE_MESH_NODE`
- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_RANDOM_ADV_INTERVAL`
- `CONFIG_BLE_MESH_IV_UPDATE_TEST`
- `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`

### **CONFIG\_BLE\_MESH\_HCI\_5\_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG\_BLE\_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_V11\_SUPPORT**

Support ESP BLE Mesh v1.1 features (Preview)

*Found in: Component config > CONFIG\_BLE\_MESH*

Support BLE Mesh v1.1 features

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_RANDOM\_ADV\_INTERVAL

Support using random adv interval for mesh packets

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow using random advertising interval for mesh packets. And this could help avoid collision of advertising packets.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN

Support Duplicate Scan in BLE Mesh

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is "Scan Duplicate By Device Address and Advertising Data".

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_ACTIVE\_SCAN

Support Active Scan in BLE Mesh

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow using BLE Active Scan for BLE Mesh.

### CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE

Memory allocation strategy

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_INTERNAL)
- External SPIRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_EXTERNAL)
- Default alloc mode (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_DEFAULT)  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.

- Internal IRAM (`CONFIG_BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT`)  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC**

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if (`CONFIG_SPIRAM` || `CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY`) && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_MODE**

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (`CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL`)  
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when `SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` is enabled. See the SPIRAM options for more details.
- Internal IRAM (`CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT`)  
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

### **CONFIG\_BLE\_MESH\_DEINIT**

Support de-initialize BLE Mesh stack

Found in: *Component config* > *CONFIG\_BLE\_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**BLE Mesh and BLE coexistence support** Contains:

- `CONFIG_BLE_MESH_SUPPORT_BLE_SCAN`
- `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BLE\_ADV\_BUF\_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support > CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FAST\_PROV

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NODE

Support for BLE Mesh Node

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

## CONFIG\_BLE\_MESH\_PROVISIONER

Support for BLE Mesh Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

## CONFIG\_BLE\_MESH\_WAIT\_FOR\_PROV\_MAX\_DEV\_NUM

Maximum number of unprovisioned devices that can be added to device queue

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**

- from 1 to 100 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME

Maximum number of PB-ADV running at the same time by Provisioner

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**

- from 1 to 10 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBG\_SAME\_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**

- from 1 to 5 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB

Support receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB\_FILTER\_SIZE

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER > CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_PROV

BLE Mesh Provisioning support

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_PROV\_EPA

BLE Mesh enhanced provisioning authentication

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_PROV`

Enable this option to support BLE Mesh enhanced provisioning authentication functionality. This option can increase the security level of provisioning. It is recommended to enable this option.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_CERT\_BASED\_PROV

Support Certificate-based provisioning

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_PROV`

Enable this option to support BLE Mesh Certificate-Based Provisioning.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_RECORD\_FRAG\_MAX\_SIZE

Maximum size of the provisioning record fragment that Provisioner can receive

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_PROV` > `CONFIG_BLE_MESH_CERT_BASED_PROV`

This option sets the maximum size of the provisioning record fragment that the Provisioner can receive. The range depends on provisioning bearer.

**Range:**

- from 1 to 57 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

**Default value:**

- 56 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PB\_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_UNPROVISIONED\_BEACON\_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#)

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE\_MESH\_FAST\_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 5 if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)
- 3 if [CONFIG\\_BLE\\_MESH\\_FAST\\_PROV](#) && [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PB\_GATT

Provisioning support using GATT (PB-GATT)

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

### CONFIG\_BLE\_MESH\_PROXY

BLE Mesh Proxy protocol support

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER

BLE Mesh GATT Proxy Server

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_NODE\_ID\_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROXY\_FILTER\_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

- from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROXY\_PRIVACY**

Support Proxy Privacy

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

The Proxy Privacy parameter controls the privacy of the Proxy Server over the connection. The value of the Proxy Privacy parameter is controlled by the type of proxy connection, which is dependent on the bearer used by the proxy connection.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_PRB_SRV` && `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX**

Support receiving Proxy Solicitation PDU

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

Enable this option to support receiving Proxy Solicitation PDU.

### CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_RX\_CRPL

Maximum capacity of solicitation replay protection list

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER > CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX*

This option specifies the maximum capacity of the solicitation replay protection list. The solicitation replay protection list is used to reject Solicitation PDUs that were already processed by a node, which will store the solicitation src and solicitation sequence number of the received Solicitation PDU message.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX

Support sending Proxy Solicitation PDU

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT*

Enable this option to support sending Proxy Solicitation PDU.

### CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_TX\_SRC\_COUNT

Maximum number of SSRC that can be used by Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT > CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX*

This option specifies the maximum number of Solicitation Source (SSRC) that can be used by Proxy Client for sending a Solicitation PDU. A Proxy Client may use the primary address or any of the secondary addresses as the SSRC for a Solicitation PDU. So for a Proxy Client, it's better to choose the value based on its own element count.

**Range:**

- from 1 to 16 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SETTINGS

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG\_BLE\_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_STORE\_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SEQ\_STORE\_RATE**

How often the sequence number gets updated in storage

*Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_RPL\_STORE\_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SETTINGS\_BACKWARD\_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of "mesh/role" in nvs. In the new version mesh stack, key of "mesh/role" is added in nvs, recovering node information needs to check "mesh/role" key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of "mesh/role" because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PARTITION\_NAME

Name of the NVS partition for BLE Mesh

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_SPECIFIC_PARTITION`

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- "ble\_mesh" if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE

Support using multiple NVS namespaces by Provisioner

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_MAX\_NVS\_NAMESPACE

Maximum number of NVS namespaces

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_SETTINGS* > *CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE*

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE* && *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE* && *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SUBNET\_COUNT

Maximum number of mesh subnets per network

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT

Maximum number of application keys per network

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT

Maximum number of application keys per model

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT

Maximum number of group address subscriptions per model

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LABEL\_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: `Component config > CONFIG_BLE_MESH`*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_CRPL**

Maximum capacity of the replay protection list

*Found in: `Component config > CONFIG_BLE_MESH`*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**

- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG**

Not relay replayed messages in a mesh network

*Found in: `Component config > CONFIG_BLE_MESH`*

There may be many expired messages in a complex mesh network that would be considered replayed messages. Enable this option will refuse to relay such messages, which could help to reduce invalid packets in the mesh network. However, it should be noted that enabling this option may result in packet loss in certain environments. Therefore, users need to decide whether to enable this option according to the actual usage situation.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_EXPERIMENTAL` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE**

Network message cache size

*Found in: `Component config > CONFIG_BLE_MESH`*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**

- from 2 to 65535 if *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT

Number of advertising buffers

*Found in: Component config > CONFIG\_BLE\_MESH*

Number of advertising buffers available. The transport layer reserves ADV\_BUF\_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**

- from 6 to 256 if *CONFIG\_BLE\_MESH*

**Default value:**

- 60 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_IVU\_DIVIDER

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG\_BLE\_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**

- from 2 to 96 if *CONFIG\_BLE\_MESH*

**Default value:**

- 4 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: Component config > CONFIG\_BLE\_MESH*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SAR\_ENHANCEMENT

Segmentation and reassembly enhancement

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to use the enhanced segmentation and reassembly mechanism introduced in Bluetooth Mesh Protocol 1.1.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG\_BLE\_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to if *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG\_BLE\_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_RX\_SDU\_MAX

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG\_BLE\_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**

- from 36 to 384 if *CONFIG\_BLE\_MESH*

**Default value:**

- 384 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TX\_SEG\_MAX

Maximum number of segments in outgoing messages

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers ([BLE\\_MESH\\_ADV\\_BUF\\_COUNT](#)) as there are outgoing segments.

**Range:**

- from 2 to 32 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 32 if [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY**

Relay support

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF**

Use separate advertising buffers for relay packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#)*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF\_COUNT**

Number of advertising buffers for relay packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#) > [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#)*

Number of advertising buffers for relay packets available.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LOW\_POWER

Support for Low Power features

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

## CONFIG\_BLE\_MESH\_LPN\_ESTABLISHMENT

Perform Friendship establishment using low power

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_AUTO\_TIMEOUT

Time from last received message before going to LPN mode

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) > [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#)

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**

- from 0 to 3600 if [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#) && [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 15 if [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#) && [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_RETRY\_TIMEOUT

Retry timeout for Friend requests

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RSSI\_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RECV\_WIN\_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_MIN\_QUEUE\_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The MinQueueSizeLog field is defined as  $\log_2(N)$ , where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**

- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RECV\_DELAY

Receive delay requested by the local node

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**

- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_POLL\_TIMEOUT

The value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**

- from 10 to 244735 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 300 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_INIT\_POLL\_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**

- from 10 to if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SCAN\_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**

- from 0 to 50 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**

- from 0 to 16384 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 8 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SUB\_ALL\_NODES\_ADDR

Automatically subscribe all nodes address

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND**

Support for Friend feature

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to be able to act as a Friend Node.

### **CONFIG\_BLE\_MESH\_FRIEND\_RECV\_WIN**

Friend Receive Window

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND\_QUEUE\_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**

- from 2 to 65536 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND\_SUB\_LIST\_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**

- from 0 to 1023 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_LPN\_COUNT

Number of supported LPN nodes

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SEG\_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NO\_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG\_BLE\_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH* && *CONFIG\_BLE\_MESH*

### BLE Mesh STACK DEBUG LOG LEVEL Contains:

- *CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL*

### CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL

BLE\_MESH\_STACK

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_WARNING)
- INFO (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_INFO)
- DEBUG (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL** Contains:

- [CONFIG\\_BLE\\_MESH\\_NET\\_BUF\\_TRACE\\_LEVEL](#)

**CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL**

BLE\_MESH\_NET\_BUF

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_WARNING)
- INFO (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_INFO)
- DEBUG (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_VERBOSE)

**CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT**

Timeout(ms) for client message response

*Found in: Component config > CONFIG\_BLE\_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**

- from 100 to 1200000 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 4000 if [CONFIG\\_BLE\\_MESH](#)

**Support for BLE Mesh Foundation models** Contains:

- [CONFIG\\_BLE\\_MESH\\_BRC\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_BRC\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_CFG\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_DF\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_DF\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_HEALTH\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_HEALTH\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_LCD\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_LCD\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_PRB\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_PRB\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_ODP\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_ODP\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_AGG\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_AGG\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_RPR\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_RPR\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_SAR\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_SAR\\_SRV](#)
- [CONFIG\\_BLE\\_MESH\\_SRPL\\_CLI](#)
- [CONFIG\\_BLE\\_MESH\\_SRPL\\_SRV](#)

- [CONFIG\\_BLE\\_MESH\\_COMP\\_DATA\\_1](#)
- [CONFIG\\_BLE\\_MESH\\_COMP\\_DATA\\_128](#)
- [CONFIG\\_BLE\\_MESH\\_MODELS\\_METADATA\\_0](#)

### **CONFIG\_BLE\_MESH\_CFG\_CLI**

Configuration Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Configuration Client model.

### **CONFIG\_BLE\_MESH\_HEALTH\_CLI**

Health Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Health Client model.

### **CONFIG\_BLE\_MESH\_HEALTH\_SRV**

Health Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Health Server model.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_BRC\_CLI**

Bridge Configuration Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Bridge Configuration Client model.

### **CONFIG\_BLE\_MESH\_BRC\_SRV**

Bridge Configuration Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Bridge Configuration Server model.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_V11\\_SUPPORT](#) && [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_MAX\_BRIDGING\_TABLE\_ENTRY\_COUNT**

Maximum number of Bridging Table entries

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_BRC\\_SRV](#)*

Maximum number of Bridging Table entries that the Bridge Configuration Server can support.

**Range:**

- from 16 to 65535 if [CONFIG\\_BLE\\_MESH\\_BRC\\_SRV](#) && [CONFIG\\_BLE\\_MESH\\_V11\\_SUPPORT](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 16 if [CONFIG\\_BLE\\_MESH\\_BRC\\_SRV](#) && [CONFIG\\_BLE\\_MESH\\_V11\\_SUPPORT](#) && [CONFIG\\_BLE\\_MESH](#)

**CONFIG\_BLE\_MESH\_BRIDGE\_CRPL**

Maximum capacity of bridge replay protection list

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_BRC\_SRV*

This option specifies the maximum capacity of the bridge replay protection list. The bridge replay protection list is used to prevent a bridged subnet from replay attack, which will store the source address and sequence number of the received bridge messages.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

**Default value:**

- 5 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_PRB\_CLI**

Mesh Private Beacon Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Client model.

**CONFIG\_BLE\_MESH\_PRB\_SRV**

Mesh Private Beacon Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Server model.

**CONFIG\_BLE\_MESH\_ODP\_CLI**

On-Demand Private Proxy Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for On-Demand Private Proxy Client model.

**CONFIG\_BLE\_MESH\_ODP\_SRV**

On-Demand Private Proxy Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for On-Demand Private Proxy Server model.

**CONFIG\_BLE\_MESH\_SRPL\_CLI**

Solicitation PDU RPL Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Solicitation PDU RPL Configuration Client model.

### **CONFIG\_BLE\_MESH\_SRPL\_SRV**

Solicitation PDU RPL Configuration Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Solicitation PDU RPL Configuration Server model. Note: This option depends on the functionality of receiving Solicitation PDU. If the device doesn't support receiving Solicitation PDU, then there is no need to enable this server model.

### **CONFIG\_BLE\_MESH\_AGG\_CLI**

Opcodes Aggregator Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Opcodes Aggregator Client model.

### **CONFIG\_BLE\_MESH\_AGG\_SRV**

Opcodes Aggregator Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Opcodes Aggregator Server model.

### **CONFIG\_BLE\_MESH\_SAR\_CLI**

SAR Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for SAR Configuration Client model.

### **CONFIG\_BLE\_MESH\_SAR\_SRV**

SAR Configuration Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for SAR Configuration Server model.

### **CONFIG\_BLE\_MESH\_COMP\_DATA\_1**

Support Composition Data Page 1

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 1 contains information about the relationships among models. Each model either can be a root model or can extend other models.

### **CONFIG\_BLE\_MESH\_COMP\_DATA\_128**

Support Composition Data Page 128

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 128 is used to indicate the structure of elements, features, and models of a node after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Composition Data Page 128 shall be present if the node supports the Remote Provisioning Server model; otherwise it is optional.

### CONFIG\_BLE\_MESH\_MODELS\_METADATA\_0

Support Models Metadata Page 0

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

The Models Metadata state contains metadata of a node's models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 0 shall be present if the node supports the Large Composition Data Server model.

### CONFIG\_BLE\_MESH\_MODELS\_METADATA\_128

Support Models Metadata Page 128

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_MODELS\\_METADATA\\_0](#)*

The Models Metadata state contains metadata of a node's models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 128 contains metadata for the node's models after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Models Metadata Page 128 shall be present if the node supports the Remote Provisioning Server model and the node supports the Large Composition Data Server model.

### CONFIG\_BLE\_MESH\_LCD\_CLI

Large Composition Data Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Large Composition Data Client model.

### CONFIG\_BLE\_MESH\_LCD\_SRV

Large Composition Data Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Large Composition Data Server model.

### CONFIG\_BLE\_MESH\_RPR\_CLI

Remote Provisioning Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Remote Provisioning Client model

### CONFIG\_BLE\_MESH\_RPR\_CLI\_PROV\_SAME\_TIME

Maximum number of PB-Remote running at the same time by Provisioner

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_RPR\\_CLI](#)*

This option specifies how many devices can be provisioned at the same time using PB-REMOTE. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-REMOTE at the same time.

**Range:**

- from 1 to 5 if [CONFIG\\_BLE\\_MESH\\_RPR\\_CLI](#) && [CONFIG\\_BLE\\_MESH\\_V11\\_SUPPORT](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 2 if `CONFIG_BLE_MESH_RPR_CLI` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RPR\_SRV**

Remote Provisioning Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Server model

### **CONFIG\_BLE\_MESH\_RPR\_SRV\_MAX\_SCANNED\_ITEMS**

Maximum number of device information can be scanned

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_SRV*

This option specifies how many device information can a Remote Provisioning Server store each time while scanning.

**Range:**

- from 4 to 255 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RPR\_SRV\_ACTIVE\_SCAN**

Support Active Scan for remote provisioning

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_SRV*

Enable this option to support Active Scan for remote provisioning.

### **CONFIG\_BLE\_MESH\_RPR\_SRV\_MAX\_EXT\_SCAN**

Maximum number of extended scan procedures

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_SRV*

This option specifies how many extended scan procedures can be started by the Remote Provisioning Server.

**Range:**

- from 1 to 10 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_RPR_SRV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_DF\_CLI**

Directed Forwarding Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Directed Forwarding Configuration Client model.

### CONFIG\_BLE\_MESH\_DF\_SRV

Directed Forwarding Configuration Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Directed Forwarding Configuration Server model.

### CONFIG\_BLE\_MESH\_MAX\_DISC\_TABLE\_ENTRY\_COUNT

Maximum number of discovery table entries in a given subnet

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Maximum number of Discovery Table entries supported by the node in a given subnet.

**Range:**

- from 2 to 255 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_FORWARD\_TABLE\_ENTRY\_COUNT

Maximum number of forward table entries in a given subnet

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Maximum number of Forward Table entries supported by the node in a given subnet.

**Range:**

- from 2 to 64 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_DEPS\_NODES\_PER\_PATH

Maximum number of dependent nodes per path

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Maximum size of dependent nodes list supported by each forward table entry.

**Range:**

- from 2 to 64 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_DF\_SRV* && *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PATH\_MONITOR\_TEST

Enable Path Monitoring test mode

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

The option only removes the Path Use timer; all other behavior of the device is not changed. If Path Monitoring test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_SUPPORT\_DIRECTED\_PROXY**

Enable Directed Proxy functionality

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Support Directed Proxy functionality.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

### **Support for BLE Mesh Client/Server models** Contains:

- `CONFIG_BLE_MESH_MBT_CLI`
- `CONFIG_BLE_MESH_MBT_SRV`
- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`
- `CONFIG_BLE_MESH_SCENE_CLI`
- `CONFIG_BLE_MESH_SCHEDULER_CLI`
- `CONFIG_BLE_MESH_SENSOR_CLI`
- `CONFIG_BLE_MESH_SENSOR_SERVER`
- `CONFIG_BLE_MESH_TIME_SCENE_SERVER`
- `CONFIG_BLE_MESH_TIME_CLI`

### **CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI**

Generic Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI**

Generic Location Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Location Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI**

Generic Property Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Property Client model.

#### **CONFIG\_BLE\_MESH\_SENSOR\_CLI**

Sensor Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor Client model.

#### **CONFIG\_BLE\_MESH\_TIME\_CLI**

Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time Client model.

### **CONFIG\_BLE\_MESH\_SCENE\_CLI**

Scene Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scene Client model.

### **CONFIG\_BLE\_MESH\_SCHEDULER\_CLI**

Scheduler Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI**

Light Lightness Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light Lightness Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI**

Light CTL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light CTL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI**

Light HSL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light HSL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI**

Light XYL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light XYL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI**

Light LC Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_SERVER**

Generic server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SENSOR\_SERVER

Sensor server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER

Time and Scenes server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LIGHTING\_SERVER

Lighting server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MBT\_CLI

BLOB Transfer Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Client model.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_V11\_SUPPORT* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_BLOB\_RECEIVERS

Maximum number of simultaneous blob receivers

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models > CONFIG\_BLE\_MESH\_MBT\_CLI*

Maximum number of BLOB Transfer Server models that can participating in the BLOB transfer with a BLOB Transfer Client model.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_MBT\_CLI* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_MBT\_CLI* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MBT\_SRV

BLOB Transfer Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Server model.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_V11_SUPPORT` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG\_BLE\_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option** Contains:

- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_BQB_TEST`
- `CONFIG_BLE_MESH_SELF_TEST`
- `CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK`
- `CONFIG_BLE_MESH_TEST_USE_WHITE_LIST`

**CONFIG\_BLE\_MESH\_SELF\_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_BQB\_TEST**

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_SELF\_TEST* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SHELL

Enable BLE Mesh shell

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_DEBUG

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_DEBUG\_NET

Network layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_TRANS

Transport layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_BEACON

Beacon debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_CRYPTO**

Crypto debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable cryptographic debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROV**

Provisioning debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Provisioning debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ACCESS**

Access layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Access layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_MODEL**

Foundation model debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Foundation Models debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ADV**

Advertising debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable advertising debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_LOW\_POWER**

Low Power debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Low Power debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_FRIEND**

Friend debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Friend debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_PROXY

Proxy debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Proxy protocol debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_EXPERIMENTAL

Make BLE Mesh experimental features visible

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Make BLE Mesh Experimental features visible. Experimental features list: - CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

**Driver Configurations** Contains:

- [Analog Comparator Configuration](#)
- [DAC Configuration](#)
- [GPIO Configuration](#)
- [GPTimer Configuration](#)
- [I2C Configuration](#)
- [I2S Configuration](#)
- [LEDC Configuration](#)
- [Legacy ADC Configuration](#)
- [MCPWM Configuration](#)
- [Parallel IO Configuration](#)
- [PCNT Configuration](#)
- [RMT Configuration](#)
- [Sigma Delta Modulator Configuration](#)
- [SPI Configuration](#)
- [Temperature sensor Configuration](#)
- [TWAI Configuration](#)
- [UART Configuration](#)
- [USB Serial/JTAG Configuration](#)

**Legacy ADC Configuration** Contains:

- [CONFIG\\_ADC\\_DISABLE\\_DAC](#)
- [Legacy ADC Calibration Configuration](#)
- [CONFIG\\_ADC\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_ADC\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_ADC\_DISABLE\_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in:* [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled)

### CONFIG\_ADC\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_ADC\_SKIP\_LEGACY\_CONFLICT\_CHECK

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

### Legacy ADC Calibration Configuration

 Contains:

- [CONFIG\\_ADC\\_CALI\\_SUPPRESS\\_DEPRECATED\\_WARN](#)
- [CONFIG\\_ADC\\_CAL\\_EFUSE\\_VREF\\_ENABLE](#)
- [CONFIG\\_ADC\\_CAL\\_LUT\\_ENABLE](#)
- [CONFIG\\_ADC\\_CAL\\_EFUSE\\_TP\\_ENABLE](#)

### CONFIG\_ADC\_CAL\_EFUSE\_TP\_ENABLE

Use Two Point Values

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#) > [Legacy ADC Calibration Configuration](#)*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**

- Yes (enabled)

### CONFIG\_ADC\_CAL\_EFUSE\_VREF\_ENABLE

Use eFuse Vref

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#) > [Legacy ADC Calibration Configuration](#)*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**

- Yes (enabled)

### CONFIG\_ADC\_CAL\_LUT\_ENABLE

Use Lookup Tables

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#) > [Legacy ADC Calibration Configuration](#)*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**

- Yes (enabled)

### CONFIG\_ADC\_CALI\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#) > [Legacy ADC Calibration Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (`esp_adc_cal.h`). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**SPI Configuration** Contains:

- [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_IN\\_IRAM](#)

### CONFIG\_SPI\_MASTER\_IN\_IRAM

Place transmitting functions of SPI master into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won't be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.

During unit test, this is enabled to measure the ideal case of api.

### CONFIG\_SPI\_MASTER\_ISR\_IN\_IRAM

Place SPI master ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

### **CONFIG\_SPI\_SLAVE\_IN\_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

### **CONFIG\_SPI\_SLAVE\_ISR\_IN\_IRAM**

Place SPI slave ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

### **TWAI Configuration** Contains:

- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_RX\\_FRAME\\_INVALID](#)
- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_LISTEN\\_ONLY\\_DOM](#)
- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_BUS\\_OFF\\_REC](#)
- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_RX\\_FIFO\\_CORRUPT](#)
- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_TX\\_INTR\\_LOST](#)
- [CONFIG\\_TWAI\\_ISR\\_IN\\_IRAM](#)

### **CONFIG\_TWAI\_ISR\_IN\_IRAM**

Place TWAI ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the `ESP_INTR_FLAG_IRAM` in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the `TWAI_ALERT_AND_LOG` flag) will have no effect.

**Default value:**

- No (disabled)

### **CONFIG\_TWAI\_ERRATA\_FIX\_BUS\_OFF\_REC**

Add SW workaround for REC change during bus-off

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver's ISR. However on the ESP32, there is an edge case where the REC will increase before the driver's ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.

**Default value:**

- Yes (enabled)

**CONFIG\_TWAI\_ERRATA\_FIX\_TX\_INTR\_LOST**

Add SW workaround for TX interrupt lost errata

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

**Default value:**

- Yes (enabled)

**CONFIG\_TWAI\_ERRATA\_FIX\_RX\_FRAME\_INVALID**

Add SW workaround for invalid RX frame errata

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be received by the peripheral sent on the bus during the reset, the message will be lost.

**Default value:**

- Yes (enabled)

**CONFIG\_TWAI\_ERRATA\_FIX\_RX\_FIFO\_CORRUPT**

Add SW workaround for RX FIFO corruption errata

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

**Default value:**

- Yes (enabled)

**CONFIG\_TWAI\_ERRATA\_FIX\_LISTEN\_ONLY\_DOM**

Add SW workaround for listen only transmits dominant bit errata

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**

- Yes (enabled)

**Temperature sensor Configuration** Contains:

- [CONFIG\\_TEMP\\_SENSOR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_TEMP\\_SENSOR\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_TEMP\\_SENSOR\\_SUPPRESS\\_DEPRECATED\\_WARN](#)
- [CONFIG\\_TEMP\\_SENSOR\\_ISR\\_IRAM\\_SAFE](#)

**CONFIG\_TEMP\_SENSOR\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp\_sensor.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_TEMP\_SENSOR\_SUPPORTED

**CONFIG\_TEMP\_SENSOR\_SKIP\_LEGACY\_CONFLICT\_CHECK**

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled) if SOC\_TEMP\_SENSOR\_SUPPORTED

**CONFIG\_TEMP\_SENSOR\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_TEMP\_SENSOR\_SUPPORTED

**CONFIG\_TEMP\_SENSOR\_ISR\_IRAM\_SAFE**

Temperature sensor ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_TEMPERATURE\_SENSOR\_INTR\_SUPPORT && SOC\_TEMP\_SENSOR\_SUPPORTED

**UART Configuration** Contains:

- [CONFIG\\_UART\\_ISR\\_IN\\_IRAM](#)

### CONFIG\_UART\_ISR\_IN\_IRAM

Place UART ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [UART Configuration](#)*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

### GPIO Configuration

 Contains:

- [CONFIG\\_GPIO\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_GPIO\\_ESP32\\_SUPPORT\\_SWITCH\\_SLP\\_PULL](#)

### CONFIG\_GPIO\_ESP32\_SUPPORT\_SWITCH\_SLP\_PULL

Support light sleep GPIO pullup/pulldown configuration for ESP32

*Found in: [Component config](#) > [Driver Configurations](#) > [GPIO Configuration](#)*

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.

### CONFIG\_GPIO\_CTRL\_FUNC\_IN\_IRAM

Place GPIO control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPIO Configuration](#)*

Place GPIO control functions (like `intr_disable/set_level`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

### Sigma Delta Modulator Configuration

 Contains:

- [CONFIG\\_SDM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_SDM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_SDM\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_SDM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_SDM\_CTRL\_FUNC\_IN\_IRAM

Place SDM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Place SDM control functions (like `set_duty`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_SDM\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### **CONFIG\_SDM\_SKIP\_LEGACY\_CONFLICT\_CHECK**

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

### **CONFIG\_SDM\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### **Analog Comparator Configuration** Contains:

- [CONFIG\\_ANA\\_CMPR\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_ANA\\_CMPR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_ANA\\_CMPR\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### **CONFIG\_ANA\_CMPR\_ISR\_IRAM\_SAFE**

Analog comparator ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

### **CONFIG\_ANA\_CMPR\_CTRL\_FUNC\_IN\_IRAM**

Place Analog Comparator control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Place Analog Comparator control functions (like `ana_cmpr_set_internal_reference`) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

### CONFIG\_ANA\_CMPR\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Whether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

### GPTimer Configuration

 Contains:

- [CONFIG\\_GPTIMER\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_GPTIMER\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GPTIMER\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_ISR\\_HANDLER\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_GPTIMER\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_GPTIMER\_ISR\_HANDLER\_IN\_IRAM

Place GPTimer ISR handler into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

**Default value:**

- Yes (enabled)

### CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM

Place GPTimer control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE

GPTimer ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_GPTIMER\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to suppress the deprecation warnings when using legacy timer group driver (`driver/timer.h`). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### **CONFIG\_GPTIMER\_SKIP\_LEGACY\_CONFLICT\_CHECK**

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

### **CONFIG\_GPTIMER\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### **PCNT Configuration** Contains:

- [CONFIG\\_PCNT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PCNT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_PCNT\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_PCNT\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_PCNT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_PCNT\_CTRL\_FUNC\_IN\_IRAM**

Place PCNT control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### **CONFIG\_PCNT\_ISR\_IRAM\_SAFE**

PCNT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_PCNT\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_PCNT\_SKIP\_LEGACY\_CONFLICT\_CHECK

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

### CONFIG\_PCNT\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### RMT Configuration

 Contains:

- [CONFIG\\_RMT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_RMT\\_RECV\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_RMT\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_RMT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_RMT\_ISR\_IRAM\_SAFE

RMT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_RMT\_RECV\_FUNC\_IN\_IRAM

Place RMT receive function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Place RMT receive function into IRAM, so that the receive function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**CONFIG\_RMT\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**CONFIG\_RMT\_SKIP\_LEGACY\_CONFLICT\_CHECK**

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

**CONFIG\_RMT\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**MCPWM Configuration** Contains:

- [CONFIG\\_MCPWM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_MCPWM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_MCPWM\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_MCPWM\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_MCPWM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_MCPWM\_ISR\_IRAM\_SAFE**

Place MCPWM ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**

- No (disabled)

### CONFIG\_MCPWM\_CTRL\_FUNC\_IN\_IRAM

Place MCPWM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Place MCPWM control functions (like `set_compare_value`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_MCPWM\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (`driver/mcpwm.h`). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_MCPWM\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_MCPWM\_SKIP\_LEGACY\_CONFLICT\_CHECK

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

**I2S Configuration** Contains:

- [CONFIG\\_I2S\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2S\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_I2S\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_I2S\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_I2S\_ISR\_IRAM\_SAFE

I2S ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG\_I2S\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**

- No (disabled)

**CONFIG\_I2S\_SKIP\_LEGACY\_CONFLICT\_CHECK**

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

**CONFIG\_I2S\_ENABLE\_DEBUG\_LOG**

Enable I2S debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**

- No (disabled)

**DAC Configuration** Contains:

- [CONFIG\\_DAC\\_DMA\\_AUTO\\_16BIT\\_ALIGN](#)
- [CONFIG\\_DAC\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_DAC\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_DAC\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_DAC\\_SKIP\\_LEGACY\\_CONFLICT\\_CHECK](#)
- [CONFIG\\_DAC\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_DAC\_CTRL\_FUNC\_IN\_IRAM**

Place DAC control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Place DAC control functions (e.g. 'dac\_one\_shot\_output\_voltage') into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_DAC\_ISR\_IRAM\_SAFE

DAC ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_DAC\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_DAC\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_DAC\_DMA\_AUTO\_16BIT\_ALIGN

Align the continuous data to 16 bit automatically

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to left shift the continuous data to align every bytes to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

**Default value:**

- Yes (enabled)

### CONFIG\_DAC\_SKIP\_LEGACY\_CONFLICT\_CHECK

Skip legacy conflict check

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

This configuration option allows the user to bypass the conflict check mechanism with legacy code.

**Default value:**

- No (disabled)

**USB Serial/JTAG Configuration** Contains:

- [CONFIG\\_USJ\\_NO\\_AUTO\\_LS\\_ON\\_CONNECTION](#)

**CONFIG\_USJ\_NO\_AUTO\_LS\_ON\_CONNECTION**

Don't enter the automatic light sleep when USB Serial/JTAG port is connected

*Found in: [Component config](#) > [Driver Configurations](#) > [USB Serial/JTAG Configuration](#)*

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP\_PM\_NO\_LIGHT\_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If `esp_light_sleep_start()` is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

**Parallel IO Configuration** Contains:

- [CONFIG\\_PARLIO\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PARLIO\\_ISR\\_IRAM\\_SAFE](#)

**CONFIG\_PARLIO\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Whether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_PARLIO\_SUPPORTED

**CONFIG\_PARLIO\_ISR\_IRAM\_SAFE**

Parallel IO ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_PARLIO\_SUPPORTED

**LEDC Configuration** Contains:

- [CONFIG\\_LEDC\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

**CONFIG\_LEDC\_CTRL\_FUNC\_IN\_IRAM**

Place LEDC control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [LEDC Configuration](#)*

Place LEDC control functions (`ledc_update_duty` and `ledc_stop`) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**I2C Configuration** Contains:

- [CONFIG\\_I2C\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2C\\_ISR\\_IRAM\\_SAFE](#)

### **CONFIG\_I2C\_ISR\_IRAM\_SAFE**

I2C ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2C Configuration*

Ensure the I2C interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). note: This cannot be used in the I2C legacy driver.

**Default value:**

- No (disabled)

### **CONFIG\_I2C\_ENABLE\_DEBUG\_LOG**

Enable I2C debug log

*Found in: Component config > Driver Configurations > I2C Configuration*

Whether to enable the debug log message for I2C driver. Note that this option only controls the I2C driver log, will not affect other drivers.

note: This cannot be used in the I2C legacy driver.

**Default value:**

- No (disabled)

**eFuse Bit Manager** Contains:

- [CONFIG\\_EFUSE\\_CODE\\_SCHEME\\_SELECTOR](#)
- [CONFIG\\_EFUSE\\_VIRTUAL](#)
- [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### **CONFIG\_EFUSE\_CUSTOM\_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**

- No (disabled)

### **CONFIG\_EFUSE\_CUSTOM\_TABLE\_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_CUSTOM\_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "main/esp\_efuse\_custom\_table.csv" if [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

## CONFIG\_EFUSE\_VIRTUAL

Simulate eFuse operations in RAM

*Found in: [Component config](#) > [eFuse Bit Manager](#)*

If "n" - No virtual mode. All eFuse operations are real and use eFuse registers. If "y" - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is "y", then SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE cannot be used. Because the EFUSE VIRT mode is for testing only.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

### Default value:

- No (disabled)

## CONFIG\_EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH

Keep eFuses in flash

*Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG\\_EFUSE\\_VIRTUAL](#)*

In addition to the "Simulate eFuse operations in RAM" option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition\_table should have the *efuse* partition. partition.csv: "efuse\_em, data, efuse, , 0x2000,"

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure\_boot and flash\_encryption).

## CONFIG\_EFUSE\_VIRTUAL\_LOG\_ALL\_WRITES

Log all virtual writes

*Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG\\_EFUSE\\_VIRTUAL](#)*

If enabled, log efuse burns. This shows changes that would be made.

## CONFIG\_EFUSE\_CODE\_SCHEME\_SELECTOR

Coding Scheme Compatibility

*Found in: [Component config](#) > [eFuse Bit Manager](#)*

Selector eFuse code scheme.

Available options:

- None Only (CONFIG\_EFUSE\_CODE\_SCHEME\_COMPAT\_NONE)
- 3/4 and None (CONFIG\_EFUSE\_CODE\_SCHEME\_COMPAT\_3\_4)
- Repeat, 3/4 and None (common table does not support it) (CONFIG\_EFUSE\_CODE\_SCHEME\_COMPAT\_REPEAT)

**ESP-TLS** Contains:

- [CONFIG\\_ESP\\_TLS\\_INSECURE](#)
- [CONFIG\\_ESP\\_TLS\\_LIBRARY\\_CHOOSE](#)
- [CONFIG\\_ESP\\_TLS\\_CLIENT\\_SESSION\\_TICKETS](#)
- [CONFIG\\_ESP\\_DEBUG\\_WOLFSSL](#)
- [CONFIG\\_ESP\\_TLS\\_SERVER](#)

- [CONFIG\\_ESP\\_TLS\\_PSK\\_VERIFICATION](#)
- [CONFIG\\_ESP\\_WOLFSSL\\_SMALL\\_CERT\\_VERIFY](#)
- [CONFIG\\_ESP\\_TLS\\_USE\\_DS\\_PERIPHERAL](#)
- [CONFIG\\_ESP\\_TLS\\_USE\\_SECURE\\_ELEMENT](#)

### CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: [Component config](#) > [ESP-TLS](#)*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS (CONFIG\_ESP\_TLS\_USING\_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (CONFIG\_ESP\_TLS\_USING\_WOLFSSL)

### CONFIG\_ESP\_TLS\_USE\_SECURE\_ELEMENT

Use Secure Element (ATECC608A) with ESP-TLS

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESPWROOM32SE, which can be used for TLS connection.

### CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**

- Yes (enabled) if `CONFIG_ESP_TLS_USING_MBEDTLS` &&  
SOC\_DIG\_SIGN\_SUPPORTED

### CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS

Enable client session tickets

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable session ticket support as specified in RFC5077.

### CONFIG\_ESP\_TLS\_SERVER

Enable ESP-TLS Server

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKETS

Enable server session tickets

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

Enable session ticket support as specified in RFC5077

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKET\_TIMEOUT

Server session ticket timeout in seconds

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#) > [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

Sets the session ticket timeout used in the tls server.

**Default value:**

- 86400 if [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

### CONFIG\_ESP\_TLS\_SERVER\_CERT\_SELECT\_HOOK

Certificate selection hook

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

### CONFIG\_ESP\_TLS\_SERVER\_MIN\_AUTH\_MODE\_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbdtdtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

### CONFIG\_ESP\_TLS\_PSK\_VERIFICATION

Enable PSK verification

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_INSECURE

Allow potentially insecure options

*Found in:* [Component config](#) > [ESP-TLS](#)

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

### CONFIG\_ESP\_TLS\_SKIP\_SERVER\_CERT\_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP-TLS > CONFIG\_ESP\_TLS\_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `crt_bundle_attach`, `use_global_ca_store` etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

### CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY

Enable SMALL\_CERT\_VERIFY

Found in: *Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_TLS\_USING\_WOLFSSL*

### CONFIG\_ESP\_DEBUG\_WOLFSSL

Enable debug logs for wolfSSL

Found in: *Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

### ADC and ADC Calibration Contains:

- *ADC Calibration Configurations*
- *CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE*
- *CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT*
- *CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM*

### CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM

Place ISR version ADC oneshot mode read function into IRAM

Found in: *Component config > ADC and ADC Calibration*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**

- No (disabled)

### CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE

ADC continuous mode driver ISR IRAM-Safe

Found in: *Component config > ADC and ADC Calibration*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**

- No (disabled)

**ADC Calibration Configurations** Contains:

- [CONFIG\\_ADC\\_CALI\\_EFUSE\\_VREF\\_ENABLE](#)
- [CONFIG\\_ADC\\_CALI\\_LUT\\_ENABLE](#)
- [CONFIG\\_ADC\\_CALI\\_EFUSE\\_TP\\_ENABLE](#)

### **CONFIG\_ADC\_CALI\_EFUSE\_TP\_ENABLE**

Use Two Point Values

*Found in: [Component config](#) > [ADC and ADC Calibration](#) > [ADC Calibration Configurations](#)*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**

- Yes (enabled)

### **CONFIG\_ADC\_CALI\_EFUSE\_VREF\_ENABLE**

Use eFuse Vref

*Found in: [Component config](#) > [ADC and ADC Calibration](#) > [ADC Calibration Configurations](#)*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**

- Yes (enabled)

### **CONFIG\_ADC\_CALI\_LUT\_ENABLE**

Use Lookup Tables

*Found in: [Component config](#) > [ADC and ADC Calibration](#) > [ADC Calibration Configurations](#)*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**

- Yes (enabled)

### **CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT**

Disable DAC when ADC2 is in use

*Found in: [Component config](#) > [ADC and ADC Calibration](#)*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**

- Yes (enabled)

**Wireless Coexistence** Contains:

- [CONFIG\\_ESP\\_COEX\\_GPIO\\_DEBUG](#)
- [CONFIG\\_ESP\\_COEX\\_SW\\_COEXIST\\_ENABLE](#)
- [CONFIG\\_ESP\\_COEX\\_POWER\\_MANAGEMENT](#)

### **CONFIG\_ESP\_COEX\_SW\_COEXIST\_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in:* [Component config](#) > [Wireless Coexistence](#)

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_ENABLED](#) || [CONFIG\\_IEEE802154\\_ENABLED](#) || ([CONFIG\\_IEEE802154\\_ENABLED](#) && [CONFIG\\_BT\\_ENABLED](#))

### **CONFIG\_ESP\_COEX\_POWER\_MANAGEMENT**

Support power management under coexistence

*Found in:* [Component config](#) > [Wireless Coexistence](#)

If enabled, coexist power management will be enabled.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_COEX\\_SW\\_COEXIST\\_ENABLE](#)

### **CONFIG\_ESP\_COEX\_GPIO\_DEBUG**

GPIO debugging for coexistence

*Found in:* [Component config](#) > [Wireless Coexistence](#)

Support coexistence GPIO debugging

### **CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_DIAG**

Debugging Diagram

*Found in:* [Component config](#) > [Wireless Coexistence](#) > [CONFIG\\_ESP\\_COEX\\_GPIO\\_DEBUG](#)

Select type of debugging diagram

Available options:

- General ([CONFIG\\_ESP\\_COEX\\_GPIO\\_DEBUG\\_DIAG\\_GENERAL](#))
- Wi-Fi ([CONFIG\\_ESP\\_COEX\\_GPIO\\_DEBUG\\_DIAG\\_WIFI](#))

### **CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_COUNT**

Max number of debugging GPIOs

*Found in:* [Component config](#) > [Wireless Coexistence](#) > [CONFIG\\_ESP\\_COEX\\_GPIO\\_DEBUG](#)

**Range:**

- from 0 to 12 if [CONFIG\\_ESP\\_COEX\\_GPIO\\_DEBUG](#)

**Default value:**

- 12 if [CONFIG\\_ESP\\_COEX\\_GPIO\\_DEBUG](#)

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX0**

Actual IO num for Debug IO ID0

*Found in: Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 0` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 15 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 0` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 2 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 0` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 4 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 0` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 1 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 0` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX1**

Actual IO num for Debug IO ID1

*Found in: Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 1` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 2 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 1` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 3 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 1` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 5 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 1` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 2 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 1` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX2**

Actual IO num for Debug IO ID2

*Found in: Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 2` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 0 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 2` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 4 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 2` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 6 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 2` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 3 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 2` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX3**

Actual IO num for Debug IO ID3

*Found in: Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 3` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 4 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 3` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 5 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 3` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 7 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 3` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 4 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 3` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX4**

Actual IO num for Debug IO ID4

Found in: *Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 4` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 5 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 4` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 27 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 4` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 0 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 4` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 5 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 4` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX5**

Actual IO num for Debug IO ID5

Found in: *Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 5` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 18 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 5` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 6 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 5` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 1 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 5` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 6 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 5` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX6**

Actual IO num for Debug IO ID6

Found in: *Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 6` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 19 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 6` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 7 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 6` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 8 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 6` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 7 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 6` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX7**

Actual IO num for Debug IO ID7

Found in: *Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 7` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 22 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 7` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 26 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 7` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 2 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 7` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 8 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 7` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX8**

Actual IO num for Debug IO ID8

Found in: *Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 8` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 13 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 8` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 24 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 8` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 3 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 8` && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 9 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 8` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX9**

Actual IO num for Debug IO ID9

Found in: *Component config > Wireless Coexistence > CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

**Range:**

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 9` && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Default value:**

- 12 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT > 9` && `CONFIG_ESP_COEX_GPIO_DEBUG`

- 23 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 9 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 9 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 9 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 10 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 9 && `CONFIG_ESP_COEX_GPIO_DEBUG`

### CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX10

Actual IO num for Debug IO ID10

*Found in:* *Component config* > *Wireless Coexistence* > *CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

#### Range:

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 10 && `CONFIG_ESP_COEX_GPIO_DEBUG`

#### Default value:

- 14 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 10 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 10 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 10 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 13 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 10 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 11 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 10 && `CONFIG_ESP_COEX_GPIO_DEBUG`

### CONFIG\_ESP\_COEX\_GPIO\_DEBUG\_IO\_IDX11

Actual IO num for Debug IO ID11

*Found in:* *Component config* > *Wireless Coexistence* > *CONFIG\_ESP\_COEX\_GPIO\_DEBUG*

#### Range:

- from 0 to 33 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 11 && `CONFIG_ESP_COEX_GPIO_DEBUG`

#### Default value:

- 27 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 11 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 9 if `IDF_TARGET_ESP32C5` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 11 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 12 if `IDF_TARGET_ESP32C61` && `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 11 && `CONFIG_ESP_COEX_GPIO_DEBUG`
- 12 if `CONFIG_ESP_COEX_GPIO_DEBUG_IO_COUNT` > 11 && `CONFIG_ESP_COEX_GPIO_DEBUG`

**Common ESP-related** Contains:

- `CONFIG_ESP_ERR_TO_NAME_LOOKUP`

### CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP

Enable lookup of error code strings

*Found in:* *Component config* > *Common ESP-related*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

#### Default value:

- Yes (enabled)

**Ethernet** Contains:

- [CONFIG\\_ETH\\_TRANSMIT\\_MUTEX](#)
- [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)
- [CONFIG\\_ETH\\_USE\\_OPENETH](#)
- [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)

### CONFIG\_ETH\_USE\_ESP32\_EMAC

Support ESP32 internal EMAC controller

Found in: [Component config](#) > [Ethernet](#)

ESP32 integrates a 10/100M Ethernet MAC controller.

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_ETH\\_DMA\\_RX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ETH\\_DMA\\_TX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ETH\\_IRAM\\_OPTIMIZATION](#)
- [CONFIG\\_ETH\\_SOFT\\_FLOW\\_CONTROL](#)
- [CONFIG\\_ETH\\_DMA\\_BUFFER\\_SIZE](#)
- [CONFIG\\_ETH\\_RMII\\_CLK\\_OUTPUT\\_GPIO0](#)
- [CONFIG\\_ETH\\_PHY\\_INTERFACE](#)
- [CONFIG\\_ETH\\_RMII\\_CLK\\_OUT\\_GPIO](#)
- [CONFIG\\_ETH\\_RMII\\_CLK\\_MODE](#)

### CONFIG\_ETH\_PHY\_INTERFACE

PHY interface

Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)

Select the communication interface between MAC and PHY chip.

Available options:

- Reduced Media Independent Interface (RMII) ([CONFIG\\_ETH\\_PHY\\_INTERFACE\\_RMII](#))

### CONFIG\_ETH\_RMII\_CLK\_MODE

RMII clock mode

Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)

Select external or internal RMII clock.

Available options:

- Input RMII clock from external ([CONFIG\\_ETH\\_RMII\\_CLK\\_INPUT](#))  
MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
- Output RMII clock from internal ([CONFIG\\_ETH\\_RMII\\_CLK\\_OUTPUT](#))  
ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

### CONFIG\_ETH\_RMII\_CLK\_OUTPUT\_GPIO0

Output RMII clock from GPIO0 (Experimental!)

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)*

GPIO0 can be set to output a pre-divided PLL clock. Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock may not work well with your PHY chip. WARNING: If you want the Ethernet to work with WiFi, don't select ESP32 as RMII CLK output as it would result in clock instability!

**Default value:**

- No (disabled) if `CONFIG_ETH_RMII_CLK_OUTPUT` && `CONFIG_ETH_USE_ESP32_EMAC`

### CONFIG\_ETH\_RMII\_CLK\_OUT\_GPIO

RMII clock GPIO number

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)*

Set the GPIO number to output RMII Clock. WARNING: If you want the Ethernet to work with WiFi, don't select ESP32 as RMII CLK output as it would result in clock instability!

### CONFIG\_ETH\_DMA\_BUFFER\_SIZE

Ethernet DMA buffer size (Byte)

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)*

Set the size of each buffer used by Ethernet MAC DMA.

**Range:**

- from 256 to 1600

**Default value:**

- 512

### CONFIG\_ETH\_DMA\_RX\_BUFFER\_NUM

Amount of Ethernet DMA Rx buffers

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)*

Number of DMA receive buffers. Each buffer's size is ETH\_DMA\_BUFFER\_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**

- from 3 to 30

**Default value:**

- 10

### CONFIG\_ETH\_DMA\_TX\_BUFFER\_NUM

Amount of Ethernet DMA Tx buffers

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)*

Number of DMA transmit buffers. Each buffer's size is ETH\_DMA\_BUFFER\_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**

- from 3 to 30

**Default value:**

- 10

## CONFIG\_ETH\_SOFT\_FLOW\_CONTROL

Enable software flow control

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)*

Ethernet MAC engine on ESP32 doesn't feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

**Default value:**

- No (disabled) if [CONFIG\\_ETH\\_DMA\\_RX\\_BUFFER\\_NUM](#) > 15 && [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)

## CONFIG\_ETH\_IRAM\_OPTIMIZATION

Enable IRAM optimization

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_ESP32\\_EMAC](#)*

If enabled, functions related to RX/TX are placed into IRAM. It can improve Ethernet throughput. If disabled, all functions are placed into FLASH.

**Default value:**

- No (disabled)

## CONFIG\_ETH\_USE\_SPI\_ETHERNET

Support SPI to Ethernet Module

*Found in: [Component config](#) > [Ethernet](#)*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_DM9051](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_KSZ8851SNL](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_W5500](#)

## CONFIG\_ETH\_SPI\_ETHERNET\_DM9051

Use DM9051

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

## CONFIG\_ETH\_SPI\_ETHERNET\_W5500

Use W5500 (MAC RAW)

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_KSZ8851SNL

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

### CONFIG\_ETH\_USE\_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_RX\\_BUFFER\\_NUM](#)
- [CONFIG\\_ETH\\_OPENETH\\_DMA\\_TX\\_BUFFER\\_NUM](#)

### CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 4 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

### CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

**Default value:**

- 1 if [CONFIG\\_ETH\\_USE\\_OPENETH](#)

### CONFIG\_ETH\_TRANSMIT\_MUTEX

Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**

- No (disabled)

**Event Loop Library** Contains:

- [CONFIG\\_ESP\\_EVENT\\_LOOP\\_PROFILING](#)
- [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

### **CONFIG\_ESP\_EVENT\_LOOP\_PROFILING**

Enable event loop profiling

*Found in: [Component config](#) > [Event Loop Library](#)*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR**

Support posting events from ISRs

*Found in: [Component config](#) > [Event Loop Library](#)*

Enable posting events from interrupt handlers.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR**

Support posting events from ISRs placed in IRAM

*Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**Default value:**

- Yes (enabled)

**GDB Stub** Contains:

- [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)
- [CONFIG\\_ESP\\_SYSTEM\\_GDBSTUB\\_RUNTIME](#)

### **CONFIG\_ESP\_SYSTEM\_GDBSTUB\_RUNTIME**

GDBStub at runtime

*Found in: [Component config](#) > [GDB Stub](#)*

Enable builtin GDBStub. This allows to debug the target device using serial port: - Run 'idf.py monitor'. - Wait for the device to initialize. - Press Ctrl+C to interrupt the execution and enter GDB attached to your device for debugging. NOTE: all UART input will be handled by GDBStub.

### **CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS**

Enable listing FreeRTOS tasks through GDB Stub

*Found in: [Component config](#) > [GDB Stub](#)*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_GDBSTUB\_MAX\_TASKS**

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS*

Set the number of tasks which GDB Stub will support.

**Default value:**

- 32

**ESP HTTP client** Contains:

- *CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH*
- *CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_DIGEST\_AUTH*
- *CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS*

**CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS**

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH**

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

**CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_DIGEST\_AUTH**

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

**HTTP Server** Contains:

- `CONFIG_HTTPD_QUEUE_WORK_BLOCKING`
- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

**CONFIG\_HTTPD\_MAX\_REQ\_HDR\_LEN**

Max HTTP Request Header Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512

**CONFIG\_HTTPD\_MAX\_URI\_LEN**

Max HTTP URI Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**

- 512

**CONFIG\_HTTPD\_ERR\_RESP\_NO\_DELAY**

Use TCP\_NODELAY socket option when sending HTTP error responses

*Found in: [Component config](#) > [HTTP Server](#)*

Using TCP\_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**

- Yes (enabled)

**CONFIG\_HTTPD\_PURGE\_BUF\_LEN**

Length of temporary buffer for purging data

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**

- 32

### CONFIG\_HTTPD\_LOG\_PURGE\_DATA

Log purged content data at Debug level

*Found in: [Component config](#) > [HTTP Server](#)*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_WS\_SUPPORT

WebSocket server support

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the WebSocket server support.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_QUEUE\_WORK\_BLOCKING

httpd\_queue\_work as blocking API

*Found in: [Component config](#) > [HTTP Server](#)*

This makes httpd\_queue\_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to `LWIP_UDP_RECVMBOX_SIZE` to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

### ESP HTTPS OTA Contains:

- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_ALLOW\\_HTTP](#)
- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_DECRYPT\\_CB](#)

### CONFIG\_ESP\_HTTPS\_OTA\_DECRYPT\_CB

Provide decryption callback

*Found in: [Component config](#) > [ESP HTTPS OTA](#)*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_HTTPS\_OTA\_ALLOW\_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: [Component config](#) > [ESP HTTPS OTA](#)*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**

- No (disabled)

**ESP HTTPS server** Contains:

- [CONFIG\\_ESP\\_HTTPS\\_SERVER\\_ENABLE](#)

### **CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE**

Enable ESP\_HTTPS\_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

**Hardware Settings** Contains:

- [Chip revision](#)
- [Crypto DPA Protection](#)
- [ETM Configuration](#)
- [CONFIG\\_ESP\\_CRYPTOFORCE\\_ECC\\_CONSTANT\\_TIME\\_POINT\\_MUL](#)
- [GDMA Configuration](#)
- [MAC Config](#)
- [Main XTAL Config](#)
- [Peripheral Control](#)
- [RTC Clock Config](#)
- [Sleep Config](#)

**Chip revision** Contains:

- [CONFIG\\_ESP\\_REV\\_NEW\\_CHIP\\_TEST](#)
- [CONFIG\\_ESP\\_EFUSE\\_BLOCK\\_REV\\_MIN\\_FULL](#)
- [CONFIG\\_ESP32\\_REV\\_MIN](#)

### **CONFIG\_ESP32\_REV\_MIN**

Minimum Supported ESP32 Revision

*Found in: Component config > Hardware Settings > Chip revision*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

Available options:

- Rev v0.0 (ECO0) ([CONFIG\\_ESP32\\_REV\\_MIN\\_0](#))
- Rev v1.0 (ECO1) ([CONFIG\\_ESP32\\_REV\\_MIN\\_1](#))
- Rev v1.1 (ECO1.1) ([CONFIG\\_ESP32\\_REV\\_MIN\\_1\\_1](#))
- Rev v2.0 (ECO2) ([CONFIG\\_ESP32\\_REV\\_MIN\\_2](#))
- Rev v3.0 (ECO3) ([CONFIG\\_ESP32\\_REV\\_MIN\\_3](#))
- Rev v3.1 (ECO4) ([CONFIG\\_ESP32\\_REV\\_MIN\\_3\\_1](#))

### **CONFIG\_ESP\_EFUSE\_BLOCK\_REV\_MIN\_FULL**

Minimum Supported ESP32 eFuse Block Revision

*Found in: Component config > Hardware Settings > Chip revision*

Required minimum eFuse Block revision. ESP-IDF will check it at the 2nd bootloader stage whether the current image can work correctly for this eFuse Block revision. So that to avoid running an incompatible image on a SoC that contains breaking change in the eFuse Block. If you want to update this value to

run the image that not compatible with the current eFuse Block revision, please contact to Espressif's business team for details: <https://www.espressif.com.cn/en/contact-us/sales-questions>

**Default value:**

- 0

### CONFIG\_ESP\_REV\_NEW\_CHIP\_TEST

Internal test mode

*Found in: Component config > Hardware Settings > Chip revision*

For internal chip testing, a small number of new versions chips didn't update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

**Default value:**

- No (disabled)

### MAC Config

 Contains:

- [CONFIG\\_ESP\\_MAC\\_USE\\_CUSTOM\\_MAC\\_AS\\_BASE\\_MAC](#)
- [CONFIG\\_ESP\\_MAC\\_IGNORE\\_MAC\\_CRC\\_ERROR](#)
- [CONFIG\\_ESP32\\_UNIVERSAL\\_MAC\\_ADDRESSES](#)

### CONFIG\_ESP32\_UNIVERSAL\_MAC\_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Available options:

- Two ([CONFIG\\_ESP32\\_UNIVERSAL\\_MAC\\_ADDRESSES\\_TWO](#))
- Four ([CONFIG\\_ESP32\\_UNIVERSAL\\_MAC\\_ADDRESSES\\_FOUR](#))

### CONFIG\_ESP\_MAC\_IGNORE\_MAC\_CRC\_ERROR

Ignore MAC CRC error (not recommended)

*Found in: Component config > Hardware Settings > MAC Config*

If you have an invalid MAC CRC ([ESP\\_ERR\\_INVALID\\_CRC](#)) problem and you still want to use this chip, you can enable this option to bypass such an error. This applies to both [MAC\\_FACTORY](#) and [CUSTOM\\_MAC](#) efuses.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_MAC\_USE\_CUSTOM\_MAC\_AS\_BASE\_MAC

Enable using custom mac as base mac

*Found in: [Component config](#) > [Hardware Settings](#) > [MAC Config](#)*

When this configuration is enabled, the user can invoke `esp_read_mac` to obtain the desired type of MAC using a custom MAC as the base MAC.

**Default value:**

- No (disabled)

**Sleep Config** Contains:

- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_ENABLE\\_INTERNAL\\_RESISTORS](#)
- [CONFIG\\_ESP\\_SLEEP\\_CACHE\\_SAFE\\_ASSERTION](#)
- [CONFIG\\_ESP\\_SLEEP\\_EVENT\\_CALLBACKS](#)
- [CONFIG\\_ESP\\_SLEEP\\_DEBUG](#)
- [CONFIG\\_ESP\\_SLEEP\\_WAIT\\_FLASH\\_READY\\_EXTRA\\_DELAY](#)

- [CONFIG\\_ESP\\_SLEEP\\_FLASH\\_LEAKAGE\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_PSRAM\\_LEAKAGE\\_WORKAROUND](#)

### CONFIG\_ESP\_SLEEP\_POWER\_DOWN\_FLASH

Power down flash in light sleep when there is no SPIRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set `ESP_PD_DOMAIN_VDDSDIO` to `ESP_PD_OPTION_OFF`. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

### CONFIG\_ESP\_SLEEP\_FLASH\_LEAKAGE\_WORKAROUND

Pull-up Flash CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external SPI Flash CS pin pullups.)

### CONFIG\_ESP\_SLEEP\_PSRAM\_LEAKAGE\_WORKAROUND

Pull-up PSRAM CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state,

there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external PSRAM CS pin pullups.)

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM`

**CONFIG\_ESP\_SLEEP\_MSPI\_NEED\_ALL\_IO\_PU**

Pull-up all SPI pins in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

**CONFIG\_ESP\_SLEEP\_GPIO\_RESET\_WORKAROUND**

light sleep GPIO reset workaround

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

esp32c2, esp32c3, esp32s3, esp32c6 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**CONFIG\_ESP\_SLEEP\_WAIT\_FLASH\_READY\_EXTRA\_DELAY**

Extra delay (in us) after flash powerdown sleep wakeup to wait flash ready

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When the chip exits sleep, the CPU and the flash chip are powered on at the same time. CPU will run rom code (deepsleep) or ram code (lightsleep) first, and then load or execute code from flash.

Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

(!!! Please adjust this value according to the Data Sheet of SPI Flash used in your project.) In Flash Data Sheet, the parameters that define the Flash ready timing after power-up (minimum time from Vcc(min) to CS active) usually named tVSL in ELECTRICAL CHARACTERISTICS chapter, and the configuration value here should be: `ESP_SLEEP_WAIT_FLASH_READY_EXTRA_DELAY = tVSL - 900`

For esp32 and esp32s3, the default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing "flash read err, 1000" message printed to the console after deep sleep reset on esp32, or triggered RTC\_WDT/LP\_WDT after lightsleep wakeup, try increasing this value. (For esp32, the delay will be executed in both deep sleep and light sleep wake up flow. For chips after esp32, the delay

will be executed only in light sleep flow, the delay controlled by the EFUSE\_FLASH\_TPUW in ROM will be executed in deepsleep wake up flow.)

**Range:**

- from 0 to 5000

**Default value:**

- 2000
- 0

### CONFIG\_ESP\_SLEEP\_CACHE\_SAFE\_ASSERTION

Check the cache safety of the sleep wakeup code in sleep process

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM\_SLP\_IRAM\_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_SLEEP\_DEBUG

esp sleep debug

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enable esp sleep debug.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_SLEEP\_GPIO\_ENABLE\_INTERNAL\_RESISTORS

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SLEEP\_EVENT\_CALLBACKS

Enable registration of sleep event callbacks

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM\_LIGHT\_SLEEP\_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**RTC Clock Config** Contains:

- [CONFIG\\_RTC\\_EXT\\_CRYST\\_ADDIT\\_CURRENT\\_METHOD](#)
- [CONFIG\\_RTC\\_XTAL\\_CAL\\_RETRY](#)
- [CONFIG\\_RTC\\_CLK\\_CAL\\_CYCLES](#)
- [CONFIG\\_RTC\\_CLK\\_SRC](#)

## CONFIG\_RTC\_CLK\_SRC

RTC clock source

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

Choose which clock is used as RTC clock source.

- **"Internal 150kHz oscillator" option provides lowest deep sleep current** consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- **"External 32kHz crystal" provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.**
- **"External 32kHz oscillator" allows using 32kHz clock generated by an** external circuit. In this case, external clock signal must be connected to 32K\_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be  $0.1 < V_{cm} < 0.5V_{amp}$ , where  $V_{amp}$  is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K\_XP pin and ground. 32K\_XP pin can not be used as a GPIO in this case.
- **"Internal 8.5MHz oscillator divided by 256" option results in higher** deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

Available options:

- Internal 150 kHz RC oscillator (CONFIG\_RTC\_CLK\_SRC\_INT\_RC)
- External 32kHz crystal (CONFIG\_RTC\_CLK\_SRC\_EXT\_CRYS)
- External 32kHz oscillator at 32K\_XN pin (CONFIG\_RTC\_CLK\_SRC\_EXT\_OSC)
- Internal 8.5MHz oscillator, divided by 256 (~33kHz) (CONFIG\_RTC\_CLK\_SRC\_INT\_8MD256)

## CONFIG\_RTC\_EXT\_CRYST\_ADDIT\_CURRENT\_METHOD

Additional current for external 32kHz crystal

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the external 32kHz crystal. Note that the deep sleep current is slightly high (4-5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2.

This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option, allow all wakeup sources, and save some code size.

- "None" option will not provide additional current to external crystal
- **"Method 1" option can't ensure 100% to solve the external 32k crystal start failed** issue, but the touchpad can work in this method.
- **"Method 2" option can solve the external 32k issue, but the touchpad can't work** in this method.

Available options:

- None (CONFIG\_RTC\_EXT\_CRYST\_ADDIT\_CURRENT\_NONE)
- Method 1 (CONFIG\_RTC\_EXT\_CRYST\_ADDIT\_CURRENT)
- Method 2 (CONFIG\_RTC\_EXT\_CRYST\_ADDIT\_CURRENT\_V2)

### CONFIG\_RTC\_CLK\_CAL\_CYCLES

Number of cycles for RTC\_SLOW\_CLK calibration

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

When the startup code initializes RTC\_SLOW\_CLK, it can perform calibration by comparing the RTC\_SLOW\_CLK frequency with main XTAL frequency. This option sets the number of RTC\_SLOW\_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 27000 if `CONFIG_RTC_CLK_SRC_EXT_CRYST` || `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- from 0 to 32766

**Default value:**

- 3000 if `CONFIG_RTC_CLK_SRC_EXT_CRYST` || `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- 1024

### CONFIG\_RTC\_XTAL\_CAL\_RETRY

Number of attempts to repeat 32k XTAL calibration

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

**Default value:**

- 1 if `CONFIG_RTC_CLK_SRC_EXT_CRYST`

**Peripheral Control** Contains:

- `CONFIG_PERIPH_CTRL_FUNC_IN_IRAM`

### CONFIG\_PERIPH\_CTRL\_FUNC\_IN\_IRAM

Place peripheral control functions into IRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [Peripheral Control](#)*

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**ETM Configuration** Contains:

- [CONFIG\\_ETM\\_ENABLE\\_DEBUG\\_LOG](#)

### **CONFIG\_ETM\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Hardware Settings](#) > [ETM Configuration](#)*

Whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_ETM\_SUPPORTED

**GDMA Configuration** Contains:

- [CONFIG\\_GDMA\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_GDMA\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GDMA\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### **CONFIG\_GDMA\_CTRL\_FUNC\_IN\_IRAM**

Place GDMA control functions into IRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_GDMA\_SUPPORTED

### **CONFIG\_GDMA\_ISR\_IRAM\_SAFE**

GDMA ISR IRAM-Safe

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_GDMA\_SUPPORTED

### **CONFIG\_GDMA\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

Whether to enable the debug log message for GDMA driver. Note that, this option only controls the GDMA driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_GDMA\_SUPPORTED

**Main XTAL Config** Contains:

- [CONFIG\\_XTAL\\_FREQ\\_SEL](#)

## CONFIG\_XTAL\_FREQ\_SEL

Main XTAL frequency

*Found in: [Component config](#) > [Hardware Settings](#) > [Main XTAL Config](#)*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value **MUST** reflect the frequency of the given hardware.

Note: The XTAL\_FREQ\_AUTO option allows the ESP target to automatically estimating XTAL clock's operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator's frequency being temperature dependent, usage of the XTAL\_FREQ\_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

Available options:

- 24 MHz (CONFIG\_XTAL\_FREQ\_24)
- 26 MHz (CONFIG\_XTAL\_FREQ\_26)
- 32 MHz (CONFIG\_XTAL\_FREQ\_32)
- 40 MHz (CONFIG\_XTAL\_FREQ\_40)
- Autodetect (CONFIG\_XTAL\_FREQ\_AUTO)

**Crypto DPA Protection** Contains:

- [CONFIG\\_ESP\\_CRYPTODPA\\_PROTECTION\\_AT\\_STARTUP](#)

## CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_AT\_STARTUP

Enable crypto DPA protection at startup

*Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#)*

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

**Default value:**

- Yes (enabled) if SOC\_CRYPTODPA\_PROTECTION\_SUPPORTED

## CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL

DPA protection level

*Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#) > [CONFIG\\_ESP\\_CRYPTODPA\\_PROTECTION\\_AT\\_STARTUP](#)*

Configure the DPA protection security level

Available options:

- Security level low (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_LOW)
- Security level medium (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_MEDIUM)
- Security level high (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_HIGH)

## CONFIG\_ESP\_CRYPTO\_FORCE\_ECC\_CONSTANT\_TIME\_POINT\_MUL

Forcefully enable ECC constant time point multiplication operations

*Found in: [Component config](#) > [Hardware Settings](#)*

If enabled, the app startup code will burn the ECC\_FORCE\_CONST\_TIME efuse bit to force the ECC peripheral to always perform constant time point multiplication operations, irrespective of the ECC\_MULT\_SECURITY\_MODE status bit that is present in the ECC\_MULT\_CONF\_REG register. By default, ESP-IDF configures the ECC peripheral to perform constant time point multiplication operations, so enabling this config would provide security enhancement only in the cases when trusted boot is not enabled and the attacker tries carrying out non-constant time point multiplication operations by changing the default ESP-IDF configurations. Performing constant time operations protect the ECC multiplication operations from timing attacks.

**Default value:**

- No (disabled) if SOC\_ECC\_CONSTANT\_TIME\_POINT\_MUL

## LCD and Touch Panel

 Contains:

- [LCD Peripheral Configuration](#)

## LCD Peripheral Configuration

 Contains:

- [CONFIG\\_LCD\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_LCD\\_PANEL\\_IO\\_FORMAT\\_BUF\\_SIZE](#)
- [CONFIG\\_LCD\\_RGB\\_RESTART\\_IN\\_VSYNC](#)
- [CONFIG\\_LCD\\_RGB\\_ISR\\_IRAM\\_SAFE](#)

## CONFIG\_LCD\_PANEL\_IO\_FORMAT\_BUF\_SIZE

LCD panel io format buffer size

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**

- 32

## CONFIG\_LCD\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won't affect other drivers.

**Default value:**

- No (disabled)

## CONFIG\_LCD\_RGB\_ISR\_IRAM\_SAFE

RGB LCD ISR IRAM-Safe

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### CONFIG\_LCD\_RGB\_RESTART\_IN\_VSYNC

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can't deliver data as fast as the LCD consumes it.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### ESP NETIF Adapter Contains:

- *CONFIG\_ESP\_NETIF\_SET\_DNS\_PER\_DEFAULT\_NETIF*
- *CONFIG\_ESP\_NETIF\_BRIDGE\_EN*
- *CONFIG\_ESP\_NETIF\_L2\_TAP*
- *CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL*
- *CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB*
- *CONFIG\_ESP\_NETIF\_RECEIVE\_REPORT\_ERRORS*

### CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM\_EVENT\_STA\_LOST\_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

### CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

Available options:

- LwIP (CONFIG\_ESP\_NETIF\_TCPIP\_LWIP)  
lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (CONFIG\_ESP\_NETIF\_LOOPBACK)  
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

### CONFIG\_ESP\_NETIF\_RECEIVE\_REPORT\_ERRORS

Use `esp_err_t` to report errors from `esp_netif_receive`

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Enable if `esp_netif_receive()` should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_NETIF\_L2\_TAP

Enable netif L2 TAP support

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

### CONFIG\_ESP\_NETIF\_L2\_TAP\_MAX\_FDS

Maximum number of opened L2 TAP File descriptors

*Found in: [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)*

Maximum number of opened File descriptors (FD's) associated with ESP TAP device. ESP TAP FD's take up a certain amount of memory, and allowing fewer FD's to be opened at the same time conserves memory.

**Range:**

- from 1 to 10 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

**Default value:**

- 5 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

### CONFIG\_ESP\_NETIF\_L2\_TAP\_RX\_QUEUE\_SIZE

Size of L2 TAP Rx queue

*Found in: [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)*

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**Range:**

- from 1 to 100 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

**Default value:**

- 20 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

### CONFIG\_ESP\_NETIF\_BRIDGE\_EN

Enable LwIP IEEE 802.1D bridge

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that "Number of clients store data in netif" (`LWIP_NUM_NETIF_CLIENT_DATA`) option needs to be properly configured to be LwIP bridge available!

**Default value:**

- No (disabled)

## CONFIG\_ESP\_NETIF\_SET\_DNS\_PER\_DEFAULT\_NETIF

Enable DNS server per interface

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Enable this option to use the DNS server which belongs to the selected default network interface. This feature collects DNS server and netif information from LWIP core modules. Whenever a new default netif is selected, global DNS servers in LWIP are updated with the netif related servers.

**Default value:**

- No (disabled)

## Partition API Configuration

**PHY** Contains:

- [CONFIG\\_ESP\\_PHY\\_CALIBRATION\\_MODE](#)
- [CONFIG\\_ESP\\_PHY\\_PLL\\_TRACK\\_DEBUG](#)
- [CONFIG\\_ESP\\_PHY\\_ENABLE\\_CERT\\_TEST](#)
- [CONFIG\\_ESP\\_PHY\\_IMPROVE\\_RX\\_11B](#)
- [CONFIG\\_ESP\\_PHY\\_ENABLE\\_USB](#)
- [CONFIG\\_ESP\\_PHY\\_MAX\\_WIFI\\_TX\\_POWER](#)
- [CONFIG\\_ESP\\_PHY\\_MAC\\_BB\\_PD](#)
- [CONFIG\\_ESP\\_PHY\\_REDUCE\\_TX\\_POWER](#)
- [CONFIG\\_ESP\\_PHY\\_CALIBRATION\\_AND\\_DATA\\_STORAGE](#)
- [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

## CONFIG\_ESP\_PHY\_CALIBRATION\_AND\_DATA\_STORAGE

Store phy calibration data in NVS

*Found in: [Component config](#) > [PHY](#)*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it's easy that your board calibrate bad data, choose 'n'. Two cases for example, you should choose 'n': 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose 'y'.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION

Use a partition to store PHY init data

*Found in: [Component config](#) > [PHY](#)*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: 'data', subtype: 'phy'). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose 'n'.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ESP\\_PHY\\_RECORD\\_USED\\_TIME](#)
- [CONFIG\\_ESP\\_PHY\\_DEFAULT\\_INIT\\_IF\\_INVALID](#)
- [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

### **CONFIG\_ESP\_PHY\_DEFAULT\_INIT\_IF\_INVALID**

Reset default PHY init data if invalid

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose 'n'.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### **CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN**

Support multiple PHY init data bin

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China's PHY init data bin is used by default. Can be modified by country information in API `esp_wifi_set_country()`. The priority of switching the PHY init data type is: 1. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_MANUAL`. 2. Country notified by the connected AP. 3. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_AUTO`.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) && [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

### **CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN\_EMBED**

Support embedded multiple phy init data bin to app bin

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

If enabled, multiple phy init data bin will embedded into app bin If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### **CONFIG\_ESP\_PHY\_INIT\_DATA\_ERROR**

Terminate operation when PHY init data error

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_RECORD\_USED\_TIME

Record PHY used time

Found in: *Component config* > *PHY* > *CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

Select to support record and query phy used time.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION*

### CONFIG\_ESP\_PHY\_MAX\_WIFI\_TX\_POWER

Max WiFi TX power (dBm)

Found in: *Component config* > *PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**

- from 10 to 20

**Default value:**

- 20

### CONFIG\_ESP\_PHY\_MAC\_BB\_PD

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

Found in: *Component config* > *PHY*

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

**Default value:**

- No (disabled) if *SOC\_PM\_SUPPORT\_MAC\_BB\_PD* && *CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE*

### CONFIG\_ESP\_PHY\_REDUCE\_TX\_POWER

Reduce PHY TX power when brownout reset

Found in: *Component config* > *PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_PHY\_ENABLE\_USB

Keep the USB PHY enabled when initializing WiFi

Found in: *Component config* > *PHY*

On some ESP targets, the USB PHY can interfere with WiFi thus lowering WiFi performance. As a result, on those affected ESP targets, the ESP PHY library's initialization will automatically disable the USB PHY to get best WiFi performance. This option controls whether or not the ESP PHY library will keep the USB PHY enabled on initialization.

Note: This option can be disabled to increase WiFi performance. However, disabling this option will also mean that the USB PHY cannot be used while WiFi is enabled.

**Default value:**

- Yes (enabled) if `(CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG || CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG) && SOC_WIFI_PHY_NEEDS_USB_WORKAROUND`
- No (disabled) if `SOC_WIFI_PHY_NEEDS_USB_WORKAROUND`

### CONFIG\_ESP\_PHY\_ENABLE\_CERT\_TEST

Enable RF certification test functions

*Found in: [Component config > PHY](#)*

If enabled, you can use RF certification test APIs.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_PHY\_CALIBRATION\_MODE

Calibration mode

*Found in: [Component config > PHY](#)*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

Available options:

- Calibration partial (`CONFIG_ESP_PHY_RF_CAL_PARTIAL`)
- Calibration none (`CONFIG_ESP_PHY_RF_CAL_NONE`)
- Calibration full (`CONFIG_ESP_PHY_RF_CAL_FULL`)

### CONFIG\_ESP\_PHY\_IMPROVE\_RX\_11B

Improve Wi-Fi receive 11b pkts

*Found in: [Component config > PHY](#)*

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

**Default value:**

- No (disabled) if `SOC_PHY_IMPROVE_RX_11B`

### CONFIG\_ESP\_PHY\_PLL\_TRACK\_DEBUG

Enable pll track logging

*Found in: [Component config > PHY](#)*

If enabled, there will be some logs while pll tracking

**Default value:**

- No (disabled)

**Power Management** Contains:

- [CONFIG\\_PM\\_LIGHTSLEEP\\_RTC\\_OSC\\_CAL\\_INTERVAL](#)
- [CONFIG\\_PM\\_SLP\\_DISABLE\\_GPIO](#)
- [CONFIG\\_PM\\_LIGHT\\_SLEEP\\_CALLBACKS](#)
- [CONFIG\\_PM\\_POWER\\_DOWN\\_CPU\\_IN\\_LIGHT\\_SLEEP](#)
- [CONFIG\\_PM\\_POWER\\_DOWN\\_PERIPHERAL\\_IN\\_LIGHT\\_SLEEP](#)
- [CONFIG\\_PM\\_SLP\\_IRAM\\_OPT](#)
- [CONFIG\\_PM\\_RTOS\\_IDLE\\_OPT](#)
- [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_ENABLE

Support for power management

*Found in: [Component config](#) > [Power Management](#)*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**

- No (disabled) if `__DOXYGEN__`

### CONFIG\_PM\_DFS\_INIT\_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to `DEFAULT_CPU_FREQ_MHZ` setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using `esp_pm_configure` function.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_PROFILING

Enable profiling counters for PM locks

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, `esp_pm_*` functions will keep track of the amount of time each of the power management locks has been held, and `esp_pm_dump_locks` function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_TRACE

Enable debug tracing of PM using GPIOs

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to `pm_trace.c` file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**

- No (disabled) if `CONFIG_PM_ENABLE`

### CONFIG\_PM\_SLP\_IRAM\_OPT

Put lightsleep related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 2.1KB of lightsleep related source code would be in IRAM and chip would sleep longer for 310us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

**Default value:**

- No (disabled)

### CONFIG\_PM\_RTOS\_IDLE\_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 180Bytes of RTOS\_IDLE related source code would be in IRAM and chip would sleep longer for 20us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

### CONFIG\_PM\_SLP\_DISABLE\_GPIO

Disable all GPIO when chip at sleep

*Found in: [Component config](#) > [Power Management](#)*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio\_sleep\_sel\_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio\_sleep\_set\_direction' and 'gpio\_sleep\_set\_pull\_mode' to have a different GPIO configuration at sleep. **Warning:** If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

### CONFIG\_PM\_LIGHTSLEEP\_RTC\_OSC\_CAL\_INTERVAL

Calibrate the RTC\_FAST/SLOW clock every N times of light sleep

*Found in: [Component config](#) > [Power Management](#)*

The value of this option determines the calibration interval of the RTC\_FAST/SLOW clock during sleep when power management is enabled. When it is configured as N, the RTC\_FAST/SLOW clock will be calibrated every N times of lightsleep. Decreasing this value will increase the time the chip is in the active state, thereby increasing the average power consumption of the chip. Increasing this value can reduce the average power consumption, but when the external environment changes drastically and the chip RTC\_FAST/SLOW oscillator frequency drifts, it may cause system instability.

**Range:**

- from 1 to 128 if `CONFIG_PM_ENABLE`

**Default value:**

- 1 if `CONFIG_PM_ENABLE`

### CONFIG\_PM\_POWER\_DOWN\_CPU\_IN\_LIGHT\_SLEEP

Power down CPU in light sleep

*Found in: [Component config](#) > [Power Management](#)*

If enabled, the CPU will be powered down in light sleep, ESP chips supports saving and restoring CPU's running context before and after light sleep, the feature provides applications with seamless CPU power-downed lightsleep without user awareness. But this will takes up some internal memory. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**

- Yes (enabled) if SOC\_PM\_SUPPORT\_CPU\_PD

### CONFIG\_PM\_POWER\_DOWN\_PERIPHERAL\_IN\_LIGHT\_SLEEP

Power down Digital Peripheral in light sleep (EXPERIMENTAL)

*Found in: [Component config](#) > [Power Management](#)*

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

Note1: Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in power\_management.rst

Note2: When this option is enabled simultaneously with FREERTOS\_USE\_TICKLESS\_IDLE, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP threshold in menuconfig.

**Default value:**

- No (disabled) if SOC\_PAU\_SUPPORTED

### CONFIG\_PM\_LIGHT\_SLEEP\_CALLBACKS

Enable registration of pm light sleep callbacks

*Found in: [Component config](#) > [Power Management](#)*

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**ESP PSRAM** Contains:

- [CONFIG\\_SPIRAM](#)

### **CONFIG\_SPIRAM**

Support for external, SPI-connected RAM

*Found in:* [Component config](#) > [ESP PSRAM](#)

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**SPI RAM config** Contains:

- [CONFIG\\_SPIRAM\\_ALLOW\\_BSS\\_SEG\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_ALLOW\\_NOINIT\\_SEG\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_ALLOW\\_STACK\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_SPIWP\\_SD3\\_PIN](#)
- [CONFIG\\_SPIRAM\\_BANKSWITCH\\_ENABLE](#)
- [CONFIG\\_SPIRAM\\_2T\\_MODE](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_WORKAROUND](#)
- [CONFIG\\_SPIRAM\\_BOOT\\_INIT](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_ALWAYSINTERNAL](#)
- [PSRAM clock and cs IO for ESP32-D2WD](#)
- [PSRAM clock and cs IO for ESP32-D0WD](#)
- [PSRAM clock and cs IO for ESP32-PICO-D4](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_RESERVE\\_INTERNAL](#)
- [CONFIG\\_SPIRAM\\_MEMTEST](#)
- [CONFIG\\_SPIRAM\\_SPEED](#)
- [CONFIG\\_SPIRAM\\_OCCUPY\\_SPI\\_HOST](#)
- [CONFIG\\_SPIRAM\\_USE](#)
- [SPIRAM cache workaround debugging](#)
- [SPIRAM workaround libraries placement](#)
- [CONFIG\\_SPIRAM\\_TRY\\_ALLOCATE\\_WIFI\\_LWIP](#)
- [CONFIG\\_SPIRAM\\_TYPE](#)
- [CONFIG\\_SPIRAM\\_CUSTOM\\_SPIWP\\_SD3\\_PIN](#)

### **CONFIG\_SPIRAM\_TYPE**

Type of SPI RAM chip in use

*Found in:* [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)

Available options:

- Auto-detect ([CONFIG\\_SPIRAM\\_TYPE\\_AUTO](#))
- ESP-PSRAM16 or APS1604 ([CONFIG\\_SPIRAM\\_TYPE\\_ESPPSRAM16](#))
- ESP-PSRAM32 ([CONFIG\\_SPIRAM\\_TYPE\\_ESPPSRAM32](#))
- ESP-PSRAM64 or LY68L6400 ([CONFIG\\_SPIRAM\\_TYPE\\_ESPPSRAM64](#))

### **CONFIG\_SPIRAM\_SPEED**

Set RAM clock speed

*Found in:* [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz

2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode(80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM\_OCCUPY\_SPI\_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP-TOOLPY\_FLASHFREQ\_80M is true)

Available options:

- 40MHz clock speed (CONFIG\_SPIRAM\_SPEED\_40M)
- 80MHz clock speed (CONFIG\_SPIRAM\_SPEED\_80M)

### CONFIG\_SPIRAM\_BOOT\_INIT

Initialize SPI RAM during startup

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you'll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

### CONFIG\_SPIRAM\_IGNORE\_NOTFOUND

Ignore PSRAM when not found

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [CONFIG\\_SPIRAM\\_BOOT\\_INIT](#)*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available. In particular, it is important to note that when SPIRAM\_IGNORE\_NOTFOUND is enabled, some WIFI related configs will be set to the default value used when SPIRAM is disabled. It can be assumed that by enabling this config, WIFI and LWIP will assume that the current chip does not have SPIRAM. SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP will not work, buffers in WIFI and LWIP will be set to smaller ranges and default values. WIFI\_CACHE\_TX\_BUFFER\_NUM and ESP\_WIFI\_AMSDU\_TX\_ENABLED will be disabled, ESP\_WIFI\_TX\_BUFFER will be set to ESP\_WIFI\_DYNAMIC\_TX\_BUFFER.

### CONFIG\_SPIRAM\_USE

SPI RAM access method

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU's memory map, by integrating it in the heap as 'special' memory needing heap\_caps\_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

Available options:

- Integrate RAM into memory map (CONFIG\_SPIRAM\_USE\_MEMMAP)
- Make RAM allocatable using heap\_caps\_malloc(..., MALLOC\_CAP\_SPIRAM) (CONFIG\_SPIRAM\_USE\_CAPS\_ALLOC)
- Make RAM allocatable using malloc() as well (CONFIG\_SPIRAM\_USE\_MALLOC)

### CONFIG\_SPIRAM\_MEMTEST

Run memory test on SPI RAM initialization

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

### CONFIG\_SPIRAM\_MALLOC\_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

### CONFIG\_SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

### CONFIG\_SPIRAM\_MALLOC\_RESERVE\_INTERNAL

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that's also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

### CONFIG\_SPIRAM\_ALLOW\_BSS\_SEG\_EXTERNAL\_MEMORY

Allow .bss segment placed in external memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

If enabled, variables with EXT\_RAM\_BSS\_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of *lwip*, *net80211*, *pp*, *bt* libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme *extram\_bss*.

Note that the variables placed in SPIRAM using EXT\_RAM\_BSS\_ATTR will be zero initialized.

## CONFIG\_SPIRAM\_ALLOW\_NOINIT\_SEG\_EXTERNAL\_MEMORY

Allow .noinit segment placed in external memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

If enabled, noinit variables can be placed in PSRAM using EXT\_RAM\_NOINIT\_ATTR.

Note the values placed into this section will not be initialized at startup and should keep its value after software restart.

## CONFIG\_SPIRAM\_CACHE\_WORKAROUND

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

### **SPIRAM cache workaround debugging** Contains:

- [CONFIG\\_SPIRAM\\_CACHE\\_WORKAROUND\\_STRATEGY](#)

## CONFIG\_SPIRAM\_CACHE\_WORKAROUND\_STRATEGY

Workaround strategy

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM cache workaround debugging](#)*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it's suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. 'Insert nops' is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

Available options:

- Insert memw after vulnerable instructions (default) (CONFIG\_SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (CONFIG\_SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (CONFIG\_SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_NOP)

### **SPIRAM workaround libraries placement** Contains:

- [CONFIG\\_SPIRAM\\_CACHE\\_LIBCHAR\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBENV\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBFILE\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBIO\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBJMP\\_IN\\_IRAM](#)

- [CONFIG\\_SPIRAM\\_CACHE\\_LIBMATH\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBMEM\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBMISC\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBNUMPARSER\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBRAND\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBSTR\\_IN\\_IRAM](#)
- [CONFIG\\_SPIRAM\\_CACHE\\_LIBTIME\\_IN\\_IRAM](#)

### **CONFIG\_SPIRAM\_CACHE\_LIBJMP\_IN\_IRAM**

Put libc's jump related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: longjmp and setjmp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBMATH\_IN\_IRAM**

Put libc's math related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: abs, div, labs, ldiv, quorem, fpclassify, and nan. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBNUMPARSER\_IN\_IRAM**

Put libc's number parsing related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: utoa, itoa, atoi, atol, strtol, and strtoul. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBIO\_IN\_IRAM**

Put libc's I/O related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: wctomb, fvwrite, wbuf, wsetup, fputc, wctomb\_r, ungetc, makebuf, fflush, refill, and sccl. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBTIME\_IN\_IRAM**

Put libc's time related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: asctime, asctime\_r, ctime, ctime\_r, localtime, localtime\_r, gmtime, gmtime\_r, strftime, mktime, tzset\_r, tzset, time, gettzinfo, systimes, month\_lengths, timelocal, tzvars,

tzlock, tzcalc\_limits, and strptime. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBCHAR\_IN\_IRAM**

Put libc's characters related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: ctype\_, toupper, tolower, toascii,strupr, bzero, isalnum, isalpha, isascii, isblank, iscntrl, isdigit, isgraph, islower, isprint, ispunct, isspace, and isupper. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBMEM\_IN\_IRAM**

Put libc's memory related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: memccpy, memchr, memmove, and memrchr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBSTR\_IN\_IRAM**

Put libc's string related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: strcasecmp, strcasestr, strchr, strcoll, strcpy, strcspn, strdup, strdup\_r, strlcat, strlcpy, strlen, strlwr, strncasecmp, strncat, strncmp, strncpy, strndup, strndup\_r, strchr, strsep, strspn, strstr, strtok\_r, andstrupr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBRAND\_IN\_IRAM**

Put libc's random related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: srand, rand, and rand\_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### **CONFIG\_SPIRAM\_CACHE\_LIBENV\_IN\_IRAM**

Put libc's environment related functions in IRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [SPIRAM workaround libraries placement](#)*

The functions affected by this option are: environ, envlock, and getenv\_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### CONFIG\_SPIRAM\_CACHE\_LIBFILE\_IN\_IRAM

Put libc's file related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: lock, isatty, fclose, open, close, creat, read, rshift, sbrk, stdio, sysbrk, sysclose, sysopen, creat, sysread, syswrite, impure, fwalk, and findfp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### CONFIG\_SPIRAM\_CACHE\_LIBMISC\_IN\_IRAM

Put libc's miscellaneous functions in IRAM, see help

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: raise and system Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

### CONFIG\_SPIRAM\_BANKSWITCH\_ENABLE

Enable bank switching for >4MiB external RAM

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp\_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp\_psram\_extram\_writeback\_cache needs some kind of mapping of #some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

### CONFIG\_SPIRAM\_BANKSWITCH\_RESERVE

Amount of 32K pages to reserve for bank switching

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config > CONFIG\_SPIRAM\_BANKSWITCH\_ENABLE*

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp\_heap\_alloc\_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp\_heap\_alloc\_caps.

### CONFIG\_SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate (and related task creation functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large

amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause `xTaskCreateStatic` to allow tasks stack in external memory.

### **CONFIG\_SPIRAM\_OCCUPY\_SPI\_HOST**

SPI host to use for 32MBit PSRAM

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

Available options:

- HSPI host (SPI2) (`CONFIG_SPIRAM_OCCUPY_HSPI_HOST`)
- VSPI host (SPI3) (`CONFIG_SPIRAM_OCCUPY_VSPI_HOST`)
- Will not try to use any host, will abort if not able to use the PSRAM (`CONFIG_SPIRAM_OCCUPY_NO_HOST`)

### **PSRAM clock and cs IO for ESP32-D0WD** Contains:

- [CONFIG\\_D0WD\\_PSRAM\\_CLK\\_IO](#)
- [CONFIG\\_D0WD\\_PSRAM\\_CS\\_IO](#)

### **CONFIG\_D0WD\_PSRAM\_CLK\_IO**

PSRAM CLK IO number

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [PSRAM clock and cs IO for ESP32-D0WD](#)*

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

If configured to the same pin as Flash, PSRAM shouldn't be rev0. Contact Espressif for more information.

### **CONFIG\_D0WD\_PSRAM\_CS\_IO**

PSRAM CS IO number

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [PSRAM clock and cs IO for ESP32-D0WD](#)*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

### **PSRAM clock and cs IO for ESP32-D2WD** Contains:

- [CONFIG\\_D2WD\\_PSRAM\\_CLK\\_IO](#)
- [CONFIG\\_D2WD\\_PSRAM\\_CS\\_IO](#)

### **CONFIG\_D2WD\_PSRAM\_CLK\_IO**

PSRAM CLK IO number

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#) > [PSRAM clock and cs IO for ESP32-D2WD](#)*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

If configured to the same pin (GPIO6) as Flash, PSRAM shouldn't be rev0. Contact Espressif for more information.

### **CONFIG\_D2WD\_PSRAM\_CS\_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**PSRAM clock and cs IO for ESP32-PICO-D4** Contains:

- *CONFIG\_PICO\_PSRAM\_CS\_IO*

### **CONFIG\_PICO\_PSRAM\_CS\_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO-D4*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.

For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to [https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4\\_datasheet\\_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf)

### **CONFIG\_SPIRAM\_CUSTOM\_SPIWP\_SD3\_PIN**

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI\_PAD\_CONFIG\_XXX, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin "SD\_DATA\_3" or SPI flash pin "IO2") is not specified in eFuse. The psram only has QPI mode, so a WP pin setting is necessary.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash WP pin configured in the bootloader.

### **CONFIG\_SPIRAM\_SPIWP\_SD3\_PIN**

Custom SPI PSRAM WP(SD3) Pin

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > SPI RAM config*

The option "Use custom SPI PSRAM WP(SD3) pin" must be set or this value is ignored

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this value to the GPIO number of the SPIRAM WP pin.

### CONFIG\_SPIRAM\_2T\_MODE

Enable SPI PSRAM 2T mode

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [SPI RAM config](#)*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp\_himem APIs, which are not supported in 2T mode.

### ESP Ringbuf Contains:

- [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)

### CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place non-ISR ringbuf functions into flash

*Found in: [Component config](#) > [ESP Ringbuf](#)*

Place non-ISR ringbuf functions (like xRingbufferCreate/xRingbufferSend) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

#### Default value:

- No (disabled)

### CONFIG\_RINGBUF\_PLACE\_ISR\_FUNCTIONS\_INTO\_FLASH

Place ISR ringbuf functions into flash

*Found in: [Component config](#) > [ESP Ringbuf](#) > [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)*

Place ISR ringbuf functions (like xRingbufferSendFromISR/xRingbufferReceiveFromISR) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. CONFIG\_UART\_ISR\_IN\_IRAM.

#### Default value:

- No (disabled) if [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)

### ESP System Settings Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_RTC\\_EXT\\_XTAL\\_BOOTSTRAP\\_CYCLES](#)
- [Brownout Detector](#)
- [CONFIG\\_ESP\\_CONSOLE\\_UART](#)
- [CONFIG\\_ESP\\_CONSOLE\\_SECONDARY](#)

- [CONFIG\\_ESP\\_MAIN\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_DEBUG\\_OCDAWARE](#)

- *Memory*
- *Memory protection*
- *CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE*
- *CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE*
- *CONFIG\_ESP\_SYSTEM\_PANIC*
- *CONFIG\_ESP\_SYSTEM\_PANIC\_REBOOT\_DELAY\_SECONDS*
- *CONFIG\_ESP32\_DISABLE\_BASIC\_ROM\_CONSOLE*
- *CONFIG\_ESP\_PANIC\_HANDLER\_IRAM*
- *CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE*
- *Trace memory*
- *CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE*
- *CONFIG\_ESP\_CONSOLE\_UART\_NUM*
- *CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO*
- *CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO*

### **CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

Available options:

- 40 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_40)
- 80 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_80)
- 160 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_160)
- 240 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_240)

**Memory** Contains:

- *CONFIG\_ESP32\_IRAM\_AS\_8BIT\_ACCESSIBLE\_MEMORY*
- *Non-backward compatible options*
- *CONFIG\_ESP32\_RTCDATA\_IN\_FAST\_MEM*
- *CONFIG\_ESP32\_USE\_FIXED\_STATIC\_RAM\_SIZE*

### **CONFIG\_ESP32\_RTCDATA\_IN\_FAST\_MEM**

Place RTC\_DATA\_ATTR and RTC\_RODATA\_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP System Settings > Memory*

This option allows to place .rtc\_data and .rtc\_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG\_FREERTOS\_UNICORE option because RTC fast memory can be accessed only by PRO\_CPU core.

**Default value:**

- No (disabled) if *CONFIG\_FREERTOS\_UNICORE*

### **CONFIG\_ESP32\_USE\_FIXED\_STATIC\_RAM\_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP System Settings > Memory*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0\_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0\_0 region, where its length is set with `ESP32_FIXED_STATIC_RAM_SIZE`

**Default value:**

- No (disabled)

### **CONFIG\_ESP32\_FIXED\_STATIC\_RAM\_SIZE**

Fixed Static RAM size

*Found in:* [Component config](#) > [ESP System Settings](#) > [Memory](#) > [CONFIG\\_ESP32\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by `BTDM_RESERVE_DRAM` if Bluetooth controller is enabled.

**Range:**

- from 0 to 0x2c200 if [CONFIG\\_ESP32\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)

**Default value:**

- "0x1E000" if [CONFIG\\_ESP32\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)

### **CONFIG\_ESP32\_IRAM\_AS\_8BIT\_ACCESSIBLE\_MEMORY**

Enable IRAM as 8 bit accessible memory

*Found in:* [Component config](#) > [ESP System Settings](#) > [Memory](#)

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions `LoadStoreError (3)` and `LoadStoreAlignmentError (9)` Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

#### **Non-backward compatible options** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_ESP32\\_SRAM1\\_REGION\\_AS\\_IRAM](#)

### **CONFIG\_ESP\_SYSTEM\_ESP32\_SRAM1\_REGION\_AS\_IRAM**

Reserve parts of SRAM1 for app IRAM (WARNING, read help before enabling)

*Found in:* [Component config](#) > [ESP System Settings](#) > [Memory](#) > [Non-backward compatible options](#)

Reserve parts of SRAM1 for app IRAM which was previously reserved for bootloader DRAM. If booting an app on an older bootloader from before this option was introduced, the app will fail to boot due to not recognizing the new IRAM memory area.

If this is the case please test carefully before pushing out any OTA updates.

#### **Trace memory** Contains:

- [CONFIG\\_ESP32\\_TRAX](#)

### **CONFIG\_ESP32\_TRAX**

Use TRAX tracing feature

*Found in:* [Component config](#) > [ESP System Settings](#) > [Trace memory](#)

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can't be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**

- No (disabled)

**CONFIG\_ESP32\_TRAX\_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in: [Component config](#) > [ESP System Settings](#) > [Trace memory](#) > [CONFIG\\_ESP32\\_TRAX](#)*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can't be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reserve for trace, used in linker script

**CONFIG\_ESP\_SYSTEM\_PANIC**

Panic handler behaviour

*Found in: [Component config](#) > [ESP System Settings](#)*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

Available options:

- Print registers and halt (CONFIG\_ESP\_SYSTEM\_PANIC\_PRINT\_HALT)  
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (CONFIG\_ESP\_SYSTEM\_PANIC\_PRINT\_REBOOT)  
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (CONFIG\_ESP\_SYSTEM\_PANIC\_SILENT\_REBOOT)  
Just resets the processor without outputting anything
- GDBStub on panic (CONFIG\_ESP\_SYSTEM\_PANIC\_GDBSTUB)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

**CONFIG\_ESP\_SYSTEM\_PANIC\_REBOOT\_DELAY\_SECONDS**

Panic reboot delay (Seconds)

*Found in: [Component config](#) > [ESP System Settings](#)*

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

**Range:**

- from 0 to 99

**Default value:**

- 0

**CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: [Component config](#) > [ESP System Settings](#)*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger "Number of cycles for RTC\_SLOW\_CLK calibration" (about 3000).

### **CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Memory protection** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_PMP\\_IDRAM\\_SPLIT](#)
- [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### **CONFIG\_ESP\_SYSTEM\_PMP\_IDRAM\_SPLIT**

Enable IRAM/DRAM split protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if `SOC_CPU_IDRAM_SPLIT_USING_PMP`

### **CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE**

Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if `SOC_MEMPROT_SUPPORTED`

### **CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE\_LOCK**

Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE

System event queue size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event queue size in different application.

**Default value:**

- 32

### CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE

Event loop task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event task stack size in different application.

**Default value:**

- 2304

### CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE

Main task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**

- 3584

### CONFIG\_ESP\_MAIN\_TASK\_AFFINITY

Main task core affinity

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

Available options:

- CPU0 (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_NO\_AFFINITY)

### CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE

Minimal allowed size for shared stack

*Found in: [Component config](#) > [ESP System Settings](#)*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**

- 2048

## CONFIG\_ESP\_CONSOLE\_UART

Channel for console output

*Found in: [Component config](#) > [ESP System Settings](#)*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If "Custom" is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If "None" is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, "USB CDC" option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:

- Default: UART0 (CONFIG\_ESP\_CONSOLE\_UART\_DEFAULT)
- USB CDC (CONFIG\_ESP\_CONSOLE\_USB\_CDC)
- USB Serial/JTAG Controller (CONFIG\_ESP\_CONSOLE\_USB\_SERIAL\_JTAG)
- Custom UART (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM)
- None (CONFIG\_ESP\_CONSOLE\_NONE)

## CONFIG\_ESP\_CONSOLE\_SECONDARY

Channel for console secondary output

*Found in: [Component config](#) > [ESP System Settings](#)*

This secondary option supports output through other specific port like USB\_SERIAL\_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

Available options:

- No secondary console (CONFIG\_ESP\_CONSOLE\_SECONDARY\_NONE)
- USB\_SERIAL\_JTAG PORT (CONFIG\_ESP\_CONSOLE\_SECONDARY\_USB\_SERIAL\_JTAG)  
This option supports output through USB\_SERIAL\_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB\_SERIAL\_JTAG port, please change the primary config to ESP\_CONSOLE\_USB\_SERIAL\_JTAG above.

## CONFIG\_ESP\_CONSOLE\_UART\_NUM

UART peripheral to use for console output (0-1)

*Found in: [Component config](#) > [ESP System Settings](#)*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

Available options:

- UART0 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_0)
- UART1 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_1)

### CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 33 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

**Default value:**

- 1 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*
- 43 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

### CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 39 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

**Default value:**

- 3 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*
- 44 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

### CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 1200 to 1000000 if *CONFIG\_PM\_ENABLE*

**Default value:**

- 115200

### CONFIG\_ESP\_INT\_WDT

Interrupt watchdog

*Found in: [Component config](#) > [ESP System Settings](#)*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS

Interrupt watchdog timeout (ms)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 800 if [CONFIG\\_SPIRAM](#) && [CONFIG\\_ESP\\_INT\\_WDT](#)

### CONFIG\_ESP\_INT\_WDT\_CHECK\_CPU1

Also watch CPU1 tick interrupt

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

Also detect if interrupts on CPU 1 are disabled for too long.

### CONFIG\_ESP\_TASK\_WDT\_EN

Enable Task Watchdog Timer

*Found in: [Component config](#) > [ESP System Settings](#)*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_INIT

Initialize Task Watchdog Timer on startup

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#)*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_PANIC

Invoke panic handler on Task Watchdog timeout

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)

**CONFIG\_ESP\_TASK\_WDT\_TIMEOUT\_S**

Task Watchdog timeout period (seconds)

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**

- from 1 to 60

**Default value:**

- 5

**CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU0**

Watch CPU0 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU1**

Watch CPU1 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**CONFIG\_ESP\_XT\_WDT**

Initialize XTAL32K watchdog timer on startup

*Found in:* [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect oscillation failure of the XTAL32K\_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K\_CLK and generate an interrupt.

**CONFIG\_ESP\_XT\_WDT\_TIMEOUT**

XTAL32K watchdog timeout period

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_XT\\_WDT](#)

Timeout period configuration for the XTAL32K watchdog timer based on RTC\_CLK.

**Range:**

- from 1 to 255 if *CONFIG\_ESP\_XT\_WDT*

**Default value:**

- 200 if *CONFIG\_ESP\_XT\_WDT*

**CONFIG\_ESP\_XT\_WDT\_BACKUP\_CLK\_ENABLE**

Automatically switch to BACKUP32K\_CLK when timer expires

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_XT\_WDT*

Enable this to automatically switch to BACKUP32K\_CLK as the source of RTC\_SLOW\_CLK when the watchdog timer expires.

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_XT\_WDT*

**CONFIG\_ESP\_PANIC\_HANDLER\_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE**

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**CONFIG\_ESP\_DEBUG\_OCDAWARE**

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL**

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog, IPC\_ISR and other system checks.

Available options:

- Level 5 interrupt (CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL\_5)  
Using level 5 interrupt for Interrupt Watchdog, IPC\_ISR and other system checks.
- Level 4 interrupt (CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL\_4)  
Using level 4 interrupt for Interrupt Watchdog, IPC\_ISR and other system checks.

**Brownout Detector** Contains:

- *CONFIG\_ESP\_BROWNOUT\_DET*

### CONFIG\_ESP\_BROWNOUT\_DET

Hardware brownout detect & reset

*Found in: Component config > ESP System Settings > Brownout Detector*

The ESP has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL

Brownout voltage level

*Found in: Component config > ESP System Settings > Brownout Detector > CONFIG\_ESP\_BROWNOUT\_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

Available options:

- 2.43V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_0)
- 2.48V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_1)
- 2.58V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_2)
- 2.62V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_3)
- 2.67V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_4)
- 2.70V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_5)
- 2.77V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_6)
- 2.80V +/- 0.05 (CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL\_7)

### CONFIG\_ESP32\_DISABLE\_BASIC\_ROM\_CONSOLE

Permanently disable BASIC ROM Console

*Found in: Component config > ESP System Settings*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**Default value:**

- No (disabled)

## CONFIG\_ESP\_SYSTEM\_HW\_STACK\_GUARD

Hardware stack guard

*Found in: Component config > ESP System Settings*

This config allows to trigger a panic interrupt when Stack Pointer register goes out of allocated stack memory bounds.

**Default value:**

- Yes (enabled) if SOC\_ASSIST\_DEBUG\_SUPPORTED

## IPC (Inter-Processor Call) Contains:

- [CONFIG\\_ESP\\_IPC\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_IPC\\_USES\\_CALLERS\\_PRIORITY](#)

## CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**

- from 512 to 65536

**Default value:**

- 1024

## CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY

IPC runs at caller's priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX\_PRIORITIES - 1) priority.

## High resolution timer (esp\_timer) Contains:

- [CONFIG\\_ESP\\_TIMER\\_PROFILING](#)
- [CONFIG\\_ESP\\_TIMER\\_TASK\\_AFFINITY](#)
- [CONFIG\\_ESP\\_TIMER\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_TIMER\\_INTERRUPT\\_LEVEL](#)
- [CONFIG\\_ESP\\_TIMER\\_SHOW\\_EXPERIMENTAL](#)
- [CONFIG\\_ESP\\_TIMER\\_SUPPORTS\\_ISR\\_DISPATCH\\_METHOD](#)
- [CONFIG\\_ESP\\_TIMER\\_ISR\\_AFFINITY](#)

## CONFIG\_ESP\_TIMER\_PROFILING

Enable esp\_timer profiling features

*Found in: Component config > High resolution timer (esp\_timer)*

If enabled, esp\_timer\_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE**

High-resolution timer task stack size

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

Configure the stack size of "timer\_task" task. This task is used to dispatch callbacks of timers created using ets\_timer and esp\_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see "FreeRTOS timer task stack size" option in "FreeRTOS".

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

**CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL**

Interrupt level

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

It sets the interrupt level for esp\_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp\_timer latency.

**Range:**

- from 1 to 3

**Default value:**

- 1

**CONFIG\_ESP\_TIMER\_SHOW\_EXPERIMENTAL**

show esp\_timer's experimental features

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

This shows some hidden features of esp\_timer. Note that they may break other features, use them with care.

**CONFIG\_ESP\_TIMER\_TASK\_AFFINITY**

esp\_timer task core affinity

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) esp\_timer task is processed by CPU0. - "CPU1": esp\_timer task is processed by CPU1. - "No affinity": esp\_timer task can be processed by any CPU.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_NO\_AFFINITY)

## CONFIG\_ESP\_TIMER\_ISR\_AFFINITY

timer interrupt core affinity

*Found in: Component config > High resolution timer (esp\_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) timer interrupt is processed by CPU0. - "CPU1": timer interrupt is processed by CPU1. - "No affinity": timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_NO\_AFFINITY)

## CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp\_timer)*

Allows using ESP\_TIMER\_ISR dispatch method (ESP\_TIMER\_TASK dispatch method is also available). - ESP\_TIMER\_TASK - Timer callbacks are dispatched from a high-priority esp\_timer task. - ESP\_TIMER\_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**

- No (disabled)

**Wi-Fi** Contains:

- *CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS*
- *CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR*
- *CONFIG\_ESP\_WIFI\_11KV\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_11R\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_DPP\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT*

- `CONFIG_ESP_WIFI_SOFTAP_SUPPORT`
- `CONFIG_ESP_WIFI_TASK_CORE_ID`
- *WPS Configuration Options*

### **CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 128 if `SOC_WIFI_HE_SUPPORT`

**Default value:**

- 10

### **CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**

- from 0 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_TX\_BUFFER

Type of WiFi TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi TX buffers:

If "Static" is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If "Dynamic" is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, "Static" should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, "Dynamic" should be selected to improve the utilization of RAM.

Available options:

- Static ([CONFIG\\_ESP\\_WIFI\\_STATIC\\_TX\\_BUFFER](#))
- Dynamic ([CONFIG\\_ESP\\_WIFI\\_DYNAMIC\\_TX\\_BUFFER](#))

### CONFIG\_ESP\_WIFI\_STATIC\_TX\_BUFFER\_NUM

Max number of WiFi static TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 64 if [CONFIG\\_ESP\\_WIFI\\_STATIC\\_TX\\_BUFFER](#)

**Default value:**

- 16 if [CONFIG\\_ESP\\_WIFI\\_STATIC\\_TX\\_BUFFER](#)

### CONFIG\_ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM

Max number of WiFi cache TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

### CONFIG\_ESP\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM

Max number of WiFi dynamic TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 128

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_MGMT\_RX\_BUFFER

Type of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi RX MGMT buffers:

If "Static" is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If "Dynamic" is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:

- Static (CONFIG\_ESP\_WIFI\_STATIC\_RX\_MGMT\_BUFFER)
- Dynamic (CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_MGMT\_BUFFER)

### CONFIG\_ESP\_WIFI\_RX\_MGMT\_BUF\_NUM\_DEF

Max number of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi RX\_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**

- from 1 to 10

**Default value:**

- 5

### CONFIG\_ESP\_WIFI\_CSI\_ENABLED

WiFi CSI(Channel State Information)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED

WiFi AMPDU TX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_TX\_BA\_WIN

WiFi AMPDU TX BA window size

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 64 if `SOC_WIFI_HE_SUPPORT` && [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)

**Default value:**

- 6

### CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

WiFi AMPDU RX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_RX\_BA\_WIN

WiFi AMPDU RX BA window size

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 64 if `SOC_WIFI_HE_SUPPORT` && [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)

**Default value:**

- 6

**CONFIG\_ESP\_WIFI\_AMSDU\_TX\_ENABLED**

WiFi AMSDU TX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMSDU TX feature

**Default value:**

- No (disabled) if `CONFIG_ESP_WIFI_CACHE_TX_BUFFER_NUM`  $\geq 2$

**CONFIG\_ESP\_WIFI\_NVS\_ENABLED**

WiFi NVS flash

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi NVS flash

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_TASK\_CORE\_ID**

WiFi Task Core ID

*Found in: [Component config](#) > [Wi-Fi](#)*

Pinned WiFi task to core 0 or core 1.

Available options:

- Core 0 (`CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_0`)
- Core 1 (`CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_1`)

**CONFIG\_ESP\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN**

Max length of WiFi SoftAP Beacon

*Found in: [Component config](#) > [Wi-Fi](#)*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 ( $752+36*5$ ).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

- from 752 to 1256

**Default value:**

- 752

### CONFIG\_ESP\_WIFI\_MGMT\_SBUF\_NUM

WiFi mgmt short buffer number

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the maximum number of Wi-Fi management short buffers. These buffers are dynamically allocated, with their size determined by the length of the management packet to be sent. When a management packet is less than 64 bytes, the Wi-Fi driver classifies it as a short management packet and assigns it to one of these buffers.

**Range:**

- from 6 to 32

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_IRAM\_OPT

WiFi IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_ENABLED](#) && [CONFIG\\_SPIRAM](#)
- Yes (enabled)

### CONFIG\_ESP\_WIFI\_EXTRA\_IRAM\_OPT

WiFi EXTRA IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_RX\_IRAM\_OPT

WiFi RX IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_ENABLED](#) && [CONFIG\\_SPIRAM](#)
- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_SAE

Enable WPA3-Personal

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_ENABLE\_SAE\_PK**

Enable SAE-PK

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)*

Select this option to enable SAE-PK

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_SOFTAP\_SAE\_SUPPORT**

Enable WPA3 Personal(SAE) SoftAP

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)*

Select this option to enable SAE support in softAP mode.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_OWE\_STA**

Enable OWE STA

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish OWE connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT**

WiFi SLP IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP\_WIFI\_IRAM\_OPT and ESP\_WIFI\_RX\_IRAM\_OPT, or this one. If already enabled ESP\_WIFI\_IRAM\_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP\_WIFI\_RX\_IRAM\_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME**

Minimum active time

*Found in: [Component config](#) > [Wi-Fi](#)*

Only for station in WIFI\_PS\_MIN\_MODEM or WIFI\_PS\_MAX\_MODEM. When the station enters the active state, it will work for at least ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME. If a data packet is received or sent during this period, the time will be refreshed. If the time is up, but the station still has packets to receive or send, the time will also be refreshed. unit: milliseconds.

**Range:**

- from 8 to 60

**Default value:**

- 50

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME**

Maximum keep alive time

*Found in: [Component config](#) > [Wi-Fi](#)*

Only for station in WIFI\_PS\_MIN\_MODEM or WIFI\_PS\_MAX\_MODEM. If no packet has been sent within ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME, a null data packet will be sent to maintain the connection with the AP. unit: seconds.

**Range:**

- from 10 to 60

**Default value:**

- 10

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_WAIT\_BROADCAST\_DATA\_TIME**

Minimum wait broadcast data time

*Found in: [Component config](#) > [Wi-Fi](#)*

Only for station in WIFI\_PS\_MIN\_MODEM or WIFI\_PS\_MAX\_MODEM. When the station knows through the beacon that AP will send broadcast packet, it will wait for ESP\_WIFI\_SLP\_DEFAULT\_WAIT\_BROADCAST\_DATA\_TIME before entering the sleep process. If a broadcast packet is received with more data bits, the time will refreshed. unit: milliseconds.

**Range:**

- from 10 to 30

**Default value:**

- 15

**CONFIG\_ESP\_WIFI\_FTM\_ENABLE**

WiFi FTM

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**

- No (disabled) if SOC\_WIFI\_FTM\_SUPPORT

**CONFIG\_ESP\_WIFI\_FTM\_INITIATOR\_SUPPORT**

FTM Initiator support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**CONFIG\_ESP\_WIFI\_FTM\_RESPONDER\_SUPPORT**

FTM Responder support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

### CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE

Power Management for station at disconnected

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable power\_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT

WiFi GCMP Support(GCMP128 and GCMP256)

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**

- No (disabled) if SOC\_WIFI\_GCMP\_SUPPORT

### CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT

WiFi SoftAP Support

Found in: [Component config](#) > [Wi-Fi](#)

WiFi module can be compiled without SoftAP to save code size.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENHANCED\_LIGHT\_SLEEP

WiFi modem automatically receives the beacon

Found in: [Component config](#) > [Wi-Fi](#)

The wifi modem automatically receives the beacon frame during light sleep.

**Default value:**

- No (disabled) if `CONFIG_ESP_PHY_MAC_BB_PD` &&  
SOC\_PM\_SUPPORT\_BEACON\_WAKEUP

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT

Wifi sleep optimize when beacon lost

Found in: [Component config](#) > [Wi-Fi](#)

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_TIMEOUT

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**

- from 5 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 10 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_THRESHOLD

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 3 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_ON\_DELTA\_EARLY\_TIME

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**

- from 0 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_OFF\_DELTA\_TIMEOUT\_TIME

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM

Maximum espnow encrypt peers number

*Found in: Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum

number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

**Range:**

- from 0 to 17

**Default value:**

- 7

**CONFIG\_ESP\_WIFI\_NAN\_ENABLE**

WiFi Aware

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable WiFi Aware (NAN) feature.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_TX\_STATS**

Enable Wi-Fi transmission statistics

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.

**Default value:**

- Yes (enabled) if SOC\_WIFI\_HE\_SUPPORT

**CONFIG\_ESP\_WIFI\_MBEDTLS\_CRYPTO**

Use MbedTLS crypto APIs

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_MBEDTLS\_TLS\_CLIENT**

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_MBEDTLS\\_CRYPTO](#)*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. In case your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_WAPI\_PSK

Enable WAPI PSK support

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_SUITE\_B\_192

Enable NSA suite B support with 192 bit key

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**

- No (disabled) if SOC\_WIFI\_GCMP\_SUPPORT

### CONFIG\_ESP\_WIFI\_11KV\_SUPPORT

Enable 802.11k, 802.11v APIs Support

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_SCAN\_CACHE

Keep scan results in cache

*Found in:* [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)

### CONFIG\_ESP\_WIFI\_MBO\_SUPPORT

Enable Multi Band Operation Certification Support

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable WiFi Multiband operation certification support.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_WIFI\_DPP\_SUPPORT**

Enable DPP support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi Easy Connect Support.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_WIFI\_11R\_SUPPORT**

Enable 802.11R (Fast Transition) Support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi Fast Transition Support.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR**

Add WPS Registrar support in SoftAP mode

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WPS registrar support in softAP mode.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_STATS**

Enable Wi-Fi reception statistics

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

**Default value:**

- Yes (enabled) if `SOC_WIFI_HE_SUPPORT`

### **CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_MU\_STATS**

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)*

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)

**WPS Configuration Options** Contains:

- [CONFIG\\_ESP\\_WIFI\\_WPS\\_PASSPHRASE](#)
- [CONFIG\\_ESP\\_WIFI\\_WPS\\_STRICT](#)

### CONFIG\_ESP\_WIFI\_WPS\_STRICT

Strictly validate all WPS attributes

*Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_WPS\_PASSPHRASE

Get WPA2 passphrase in WPS config

*Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)*

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_DEBUG\_PRINT

Print debug messages from WPA Supplicant

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS

Add DPP testing code

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT

Enable enterprise option

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable/disable enterprise connection support.

disabling this will reduce binary size. disabling this will disable the use of any esp\_wifi\_sta\_wpa2\_ent\_\* (as APIs will be meaningless)

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_WIFI\_ENT\_FREE\_DYNAMIC\_BUFFER

Free dynamic buffers during WiFi enterprise connection

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENTERPRISE\\_SUPPORT](#)*

Select this configuration to free dynamic buffers during WiFi enterprise connection. This will enable chip to reduce heap consumption during WiFi enterprise connection.

### Default value:

- No (disabled)

### Core dump Contains:

- [CONFIG\\_ESP\\_COREDUMP\\_CHECK\\_BOOT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_CHECKSUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_TO\\_FLASH\\_OR\\_UART](#)
- [CONFIG\\_ESP\\_COREDUMP\\_UART\\_DELAY](#)
- [CONFIG\\_ESP\\_COREDUMP\\_LOGS](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DECODE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_MAX\\_TASKS\\_NUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_STACK\\_SIZE](#)

## CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART

Data destination

*Found in: [Component config](#) > [Core dump](#)*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the [components/partition\\_table](#) directory.

Available options:

- Flash ([CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_FLASH](#))
- UART ([CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_UART](#))
- None ([CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_NONE](#))

## CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT

Core dump data format

*Found in: [Component config](#) > [Core dump](#)*

Select the data format for core dump.

Available options:

- Binary format ([CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_BIN](#))
- ELF format ([CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#))

### CONFIG\_ESP\_COREDUMP\_CHECKSUM

Core dump data integrity check

*Found in:* [Component config](#) > [Core dump](#)

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (`CONFIG_ESP_COREDUMP_CHECKSUM_CRC32`)
- Use SHA256 for integrity verification (`CONFIG_ESP_COREDUMP_CHECKSUM_SHA256`)

### CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT

Check core dump data integrity on boot

*Found in:* [Component config](#) > [Core dump](#)

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

### CONFIG\_ESP\_COREDUMP\_LOGS

Enable coredump logs for debugging

*Found in:* [Component config](#) > [Core dump](#)

Enable/disable coredump logs. Logs strings from `espcoredump` component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

### CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM

Maximum number of tasks

*Found in:* [Component config](#) > [Core dump](#)

Maximum number of tasks snapshots in core dump.

### CONFIG\_ESP\_COREDUMP\_UART\_DELAY

Delay before print to UART

*Found in:* [Component config](#) > [Core dump](#)

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**

- 0 if `CONFIG_ESP_COREDUMP_ENABLE_TO_UART`

### CONFIG\_ESP\_COREDUMP\_STACK\_SIZE

Reserved stack size

*Found in:* [Component config](#) > [Core dump](#)

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

## CONFIG\_ESP\_COREDUMP\_DECODE

Handling of UART core dumps in IDF Monitor

*Found in: [Component config](#) > [Core dump](#)*

Available options:

- Decode and show summary (info\_corefile) (CONFIG\_ESP\_COREDUMP\_DECODE\_INFO)
- Don't decode (CONFIG\_ESP\_COREDUMP\_DECODE\_DISABLE)

## FAT Filesystem support

 Contains:

- [CONFIG\\_FATFS\\_API\\_ENCODING](#)
- [CONFIG\\_FATFS\\_VFS\\_FSTAT\\_BLKSIZE](#)
- [CONFIG\\_FATFS\\_IMMEDIATE\\_FSYNC](#)
- [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)
- [CONFIG\\_FATFS\\_LONG\\_FILENAMES](#)
- [CONFIG\\_FATFS\\_MAX\\_LFN](#)
- [CONFIG\\_FATFS\\_FS\\_LOCK](#)
- [CONFIG\\_FATFS\\_VOLUME\\_COUNT](#)
- [CONFIG\\_FATFS\\_CHOOSE\\_CODEPAGE](#)
- [CONFIG\\_FATFS\\_ALLOC\\_PREFER\\_EXTRAM](#)
- [CONFIG\\_FATFS\\_SECTOR\\_SIZE](#)
- [CONFIG\\_FATFS\\_TIMEOUT\\_MS](#)
- [CONFIG\\_FATFS\\_PER\\_FILE\\_CACHE](#)

## CONFIG\_FATFS\_VOLUME\_COUNT

Number of volumes

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Number of volumes (logical drives) to use.

**Range:**

- from 1 to 10

**Default value:**

- 2

## CONFIG\_FATFS\_LONG\_FILENAMES

Long filename support

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (CONFIG\_FATFS\_LFN\_NONE)
- Long filename buffer in heap (CONFIG\_FATFS\_LFN\_HEAP)
- Long filename buffer on stack (CONFIG\_FATFS\_LFN\_STACK)

### CONFIG\_FATFS\_SECTOR\_SIZE

Sector size

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Specify the size of the sector in bytes for FATFS partition generator.

Available options:

- 512 (CONFIG\_FATFS\_SECTOR\_512)
- 4096 (CONFIG\_FATFS\_SECTOR\_4096)

### CONFIG\_FATFS\_CHOOSE\_CODEPAGE

OEM Code Page

*Found in: [Component config](#) > [FAT Filesystem support](#)*

OEM code page used for file name encodings.

If "Dynamic" is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (CONFIG\_FATFS\_CODEPAGE\_DYNAMIC)
- US (CP437) (CONFIG\_FATFS\_CODEPAGE\_437)
- Arabic (CP720) (CONFIG\_FATFS\_CODEPAGE\_720)
- Greek (CP737) (CONFIG\_FATFS\_CODEPAGE\_737)
- KBL (CP771) (CONFIG\_FATFS\_CODEPAGE\_771)
- Baltic (CP775) (CONFIG\_FATFS\_CODEPAGE\_775)
- Latin 1 (CP850) (CONFIG\_FATFS\_CODEPAGE\_850)
- Latin 2 (CP852) (CONFIG\_FATFS\_CODEPAGE\_852)
- Cyrillic (CP855) (CONFIG\_FATFS\_CODEPAGE\_855)
- Turkish (CP857) (CONFIG\_FATFS\_CODEPAGE\_857)
- Portugese (CP860) (CONFIG\_FATFS\_CODEPAGE\_860)
- Icelandic (CP861) (CONFIG\_FATFS\_CODEPAGE\_861)
- Hebrew (CP862) (CONFIG\_FATFS\_CODEPAGE\_862)
- Canadian French (CP863) (CONFIG\_FATFS\_CODEPAGE\_863)
- Arabic (CP864) (CONFIG\_FATFS\_CODEPAGE\_864)
- Nordic (CP865) (CONFIG\_FATFS\_CODEPAGE\_865)
- Russian (CP866) (CONFIG\_FATFS\_CODEPAGE\_866)
- Greek 2 (CP869) (CONFIG\_FATFS\_CODEPAGE\_869)
- Japanese (DBCS) (CP932) (CONFIG\_FATFS\_CODEPAGE\_932)
- Simplified Chinese (DBCS) (CP936) (CONFIG\_FATFS\_CODEPAGE\_936)
- Korean (DBCS) (CP949) (CONFIG\_FATFS\_CODEPAGE\_949)
- Traditional Chinese (DBCS) (CP950) (CONFIG\_FATFS\_CODEPAGE\_950)

### CONFIG\_FATFS\_MAX\_LFN

Max long filename length

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Maximum long filename length. Can be reduced to save RAM.

## CONFIG\_FATFS\_API\_ENCODING

API character encoding

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

- API uses ANSI/OEM encoding (CONFIG\_FATFS\_API\_ENCODING\_ANSI\_OEM)
- API uses UTF-8 encoding (CONFIG\_FATFS\_API\_ENCODING\_UTF\_8)

## CONFIG\_FATFS\_FS\_LOCK

Number of simultaneously open files protected by lock function

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

\* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

\* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

## CONFIG\_FATFS\_TIMEOUT\_MS

Timeout for acquiring a file lock, ms

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**

- 10000

## CONFIG\_FATFS\_PER\_FILE\_CACHE

Use separate cache for each file

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)

**CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM**

Prefer external RAM when allocating FATFS buffers

*Found in: [Component config > FAT Filesystem support](#)*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM_USE_CAPS_ALLOC` || `CONFIG_SPIRAM_USE_MALLOC`

**CONFIG\_FATFS\_USE\_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: [Component config > FAT Filesystem support](#)*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**

- No (disabled)

**CONFIG\_FATFS\_FAST\_SEEK\_BUFFER\_SIZE**

Fast seek CLMT buffer size

*Found in: [Component config > FAT Filesystem support > CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if `CONFIG_FATFS_USE_FASTSEEK`

**CONFIG\_FATFS\_VFS\_FSTAT\_BLKSIZE**

Default block size

*Found in: [Component config > FAT Filesystem support](#)*

If set to 0, the 'newlib' library's default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

NOTE: The block size value is shared by all the filesystem functions accessing target media for given file descriptor! See 'Improving I/O performance' section of 'Maximizing Execution Speed' documentation page for more details.

**Default value:**

- 0

## CONFIG\_FATFS\_IMMEDIATE\_FSYNC

Enable automatic `f_sync`

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Enables automatic calling of `f_sync()` to flush recent file changes after each call of `vfs_fat_write()`, `vfs_fat_pwrite()`, `vfs_fat_link()`, `vfs_fat_truncate()` and `vfs_fat_ftruncate()` functions. This feature improves file-consistency and size reporting accuracy for the FatFS, at a price on decreased performance due to frequent disk operations

**Default value:**

- No (disabled)

**FreeRTOS** Contains:

- [Kernel](#)
- [Port](#)

**Kernel** Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_STACKOVERFLOW](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_BACKWARD\\_COMPATIBILITY](#)
- [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)
- [CONFIG\\_FREERTOS\\_MAX\\_TASK\\_NAME\\_LEN](#)
- [CONFIG\\_FREERTOS\\_IDLE\\_TASK\\_STACKSIZE](#)

- [CONFIG\\_FREERTOS\\_USE\\_MINIMAL\\_IDLE\\_HOOK](#)

## CONFIG\_FREERTOS\_SMP

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: <https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp>

IDF has added an experimental port of this SMP kernel located in `components/freertos/FreeRTOS-Kernel-SMP`. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: `components/freertos/FreeRTOS-Kernel`. Both kernel versions are SMP capable, but differ in their implementation and features.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_UNICORE

Run FreeRTOS only on first core

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

### CONFIG\_FREERTOS\_HZ

configTICK\_RATE\_HZ

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK\_RATE\_HZ documentation for more details).

**Range:**

- from 1 to 1000

**Default value:**

- 100

### CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER

configUSE\_PORT\_OPTIMISED\_TASK\_SELECTION

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see configUSE\_PORT\_OPTIMISED\_TASK\_SELECTION documentation for more details).

### CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW

configCHECK\_FOR\_STACK\_OVERFLOW

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables FreeRTOS to check for stack overflows (see configCHECK\_FOR\_STACK\_OVERFLOW documentation for more details).

**Note:** If users do not provide their own `vApplicationStackOverflowHook()` function, a default function will be provided by ESP-IDF.

Available options:

- No checking (CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW\_NONE)  
Do not check for stack overflows (configCHECK\_FOR\_STACK\_OVERFLOW = 0)
- Check by stack pointer value (Method 1) (CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW\_PTRVAL)  
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK\_FOR\_STACK\_OVERFLOW = 1)
- Check using canary bytes (Method 2) (CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW\_CANARY)  
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK\_FOR\_STACK\_OVERFLOW = 2)

## CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS

configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the number of thread local storage pointers in each task (see configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**

- from 1 to 256

**Default value:**

- 1

## CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE

configMINIMAL\_STACK\_SIZE (Idle task stack size)

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the idle task stack size in bytes (see configMINIMAL\_STACK\_SIZE documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.
- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
- Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

**Range:**

- from 768 to 32768

**Default value:**

- 1536

## CONFIG\_FREERTOS\_USE\_IDLE\_HOOK

configUSE\_IDLE\_HOOK

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

Note:

- The application must provide the hook function `void vApplicationIdleHook( void ) ;`
- `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_USE\_MINIMAL\_IDLE\_HOOK

Use FreeRTOS minimal idle hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the minimal idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

Note:

- The application must provide the hook function `void vApplicationMinimalIdleHook ( void );`
- `vApplicationMinimalIdleHook ()` is called from FreeRTOS minimal idle task(s)

**Default value:**

- No (disabled) if `CONFIG_FREERTOS_SMP`

## CONFIG\_FREERTOS\_USE\_TICK\_HOOK

`configUSE_TICK_HOOK`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the tick hook (see `configUSE_TICK_HOOK` documentation for more details).

Note:

- The application must provide the hook function `void vApplicationTickHook ( void );`
- `vApplicationTickHook ()` is called from FreeRTOS's tick handling function `xTaskIncrementTick ()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN

`configMAX_TASK_NAME_LEN`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the maximum number of characters for task names (see `configMAX_TASK_NAME_LEN` documentation for more details).

Note: For most uses, the default of 16 characters is sufficient.

**Range:**

- from 1 to 256

**Default value:**

- 16

## CONFIG\_FREERTOS\_ENABLE\_BACKWARD\_COMPATIBILITY

`configENABLE_BACKWARD_COMPATIBILITY`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see `configENABLE_BACKWARD_COMPATIBILITY` documentation for more details).

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_USE\_TIMERS

`configUSE_TIMERS`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enable FreeRTOS Software Timers. Normally the timer task will only get pulled into the build and created if any software timer related functions are used. This is achieved through IDF defining a weak

empty function for `xTimerCreateTimerTask`, which should take effect if `timers.c` is not pulled into the build.

In certain special cases (if you use `configUSE_TRACE_FACILITY=y` and event groups) the linker will still pull in the `xTimerCreateTimerTask` from `timers.c` even if the function that utilized it gets discarded due to not being used.

In these cases you can use this option to force the timer task to be disabled.

**Default value:**

- Yes (enabled)

### **CONFIG\_FREERTOS\_TIMER\_SERVICE\_TASK\_NAME**

`configTIMER_SERVICE_TASK_NAME`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TIMERS](#)*

Sets the timer task's name (see `configTIMER_SERVICE_TASK_NAME` documentation for more details).

**Default value:**

- "Tmr Svc"

### **CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY**

`configTIMER_TASK_PRIORITY`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TIMERS](#)*

Sets the timer task's priority (see `configTIMER_TASK_PRIORITY` documentation for more details).

**Range:**

- from 1 to 25

**Default value:**

- 1

### **CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH**

`configTIMER_TASK_STACK_DEPTH`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TIMERS](#)*

Set the timer task's stack size (see `configTIMER_TASK_STACK_DEPTH` documentation for more details).

**Range:**

- from 1536 to 32768

**Default value:**

- 2048

### **CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH**

`configTIMER_QUEUE_LENGTH`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TIMERS](#)*

Set the timer task's command queue length (see `configTIMER_QUEUE_LENGTH` documentation for more details).

**Range:**

- from 5 to 20

**Default value:**

- 10

### CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE

configQUEUE\_REGISTRY\_SIZE

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the size of the queue registry (see configQUEUE\_REGISTRY\_SIZE documentation for more details).

Note: A value of 0 will disable queue registry functionality

**Range:**

- from 0 to 20

**Default value:**

- 0

### CONFIG\_FREERTOS\_TASK\_NOTIFICATION\_ARRAY\_ENTRIES

configTASK\_NOTIFICATION\_ARRAY\_ENTRIES

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more light weight compared to alternatives such as semaphores.

**Range:**

- from 1 to 32

**Default value:**

- 1

### CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY

configUSE\_TRACE\_FACILITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE\_TRACE\_FACILITY documentation for more details).

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS

configUSE\_STATS\_FORMATTING\_FUNCTIONS

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)*

Set configUSE\_TRACE\_FACILITY and configUSE\_STATS\_FORMATTING\_FUNCTIONS to 1 to include the vTaskList() and vTaskGetRunTimeStats() functions in the build (see configUSE\_STATS\_FORMATTING\_FUNCTIONS documentation for more details).

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)

### CONFIG\_FREERTOS\_VTASKLIST\_INCLUDE\_COREID

Enable display of xCoreID in vTaskList

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#) > [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

## CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS

configGENERATE\_RUN\_TIME\_STATS

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables collection of run time statistics for each task (see configGENERATE\_RUN\_TIME\_STATS documentation for more details).

Note: The clock used for run time statistics can be configured in FREERTOS\_RUN\_TIME\_STATS\_CLK.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE

configRUN\_TIME\_COUNTER\_TYPE

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)

Sets the data type used for the FreeRTOS run time stats. A larger data type can be used to reduce the frequency of the counter overflowing.

Available options:

- uint32\_t (CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE\_U32)  
configRUN\_TIME\_COUNTER\_TYPE is set to uint32\_t
- uint64\_t (CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE\_U64)  
configRUN\_TIME\_COUNTER\_TYPE is set to uint64\_t

## CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE

configUSE\_TICKLESS\_IDLE

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP option. This feature is also known as "automatic light sleep".

Note that timers created using esp\_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the "skip\_unhandled\_events" option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP

configEXPECTED\_IDLE\_TIME\_BEFORE\_SLEEP

Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable PM\_PROFILING feature in esp\_pm components and dump the sleep status with esp\_pm\_dump\_locks, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency

**Range:**

- from 2 to 4294967295 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Default value:**

- 3 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

## CONFIG\_FREERTOS\_USE\_APPLICATION\_TASK\_TAG

configUSE\_APPLICATION\_TASK\_TAG

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables task tagging functionality and its associated API (see configUSE\_APPLICATION\_TASK\_TAG documentation for more details).

**Default value:**

- No (disabled)

**Port** Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_MUTEX\\_GIVEN\\_BY\\_OWNER](#)
- [CONFIG\\_FREERTOS\\_RUN\\_TIME\\_STATS\\_CLK](#)
- [CONFIG\\_FREERTOS\\_INTERRUPT\\_BACKTRACE](#)
- [CONFIG\\_FREERTOS\\_WATCHPOINT\\_END\\_OF\\_STACK](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_STATIC\\_TASK\\_CLEAN\\_UP](#)
- [CONFIG\\_FREERTOS\\_TASK\\_PRE\\_DELETION\\_HOOK](#)
- [CONFIG\\_FREERTOS\\_TLSP\\_DELETION\\_CALLBACKS](#)
- [CONFIG\\_FREERTOS\\_ISR\\_STACKSIZE](#)
- [CONFIG\\_FREERTOS\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)
- [CONFIG\\_FREERTOS\\_CHECK\\_PORT\\_CRITICAL\\_COMPLIANCE](#)
- [CONFIG\\_FREERTOS\\_CORETIMER](#)
- [CONFIG\\_FREERTOS\\_FPU\\_IN\\_ISR](#)
- [CONFIG\\_FREERTOS\\_TASK\\_FUNCTION\\_WRAPPER](#)

## CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER

Wrap task functions

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**

- Yes (enabled)

## CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK

Enable stack overflow debug watchpoint

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS\_CHECK\_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic'ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_TLSP\_DELETION\_CALLBACKS

Enable thread local storage pointers deletion callbacks

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_TASK\_PRE\_DELETION\_HOOK

Enable task pre-deletion hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Enable this option to make FreeRTOS call a user provided hook function right before it deletes a task (i.e., frees/releases a dynamically/statically allocated task's memory). This is useful if users want to know when a task is actually deleted (in case the task's deletion is delegated to the IDLE task).

If this config option is enabled, users must define a `void vTaskPreDeletionHook( void \* pxtCB )` hook function in their application.

### CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP

Enable static task clean up hook (DEPRECATED)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

THIS OPTION IS DEPRECATED. Use FREERTOS\_TASK\_PRE\_DELETION\_HOOK instead.

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void \*pxTCB )` callback

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER

Check that mutex semaphore is given by owner task

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

### CONFIG\_FREERTOS\_ISR\_STACKSIZE

ISR stack size

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**

- from 2096 to 32768 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- from 1536 to 32768

**Default value:**

- 2096 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- 1536

## CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE

Enable backtrace from interrupt to task context

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**

- Yes (enabled)

## CONFIG\_FREERTOS\_FPU\_IN\_ISR

Use float in Level 1 ISR

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled, the usage of float type is allowed inside Level 1 ISRs. Note that usage of float types in higher level interrupts is still not permitted.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_CORETIMER

Tick timer source (Xtensa Only)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

Available options:

- Timer 0 (int 6, level 1) (`CONFIG_FREERTOS_CORETIMER_0`)  
Select this to use timer 0
- Timer 1 (int 15, level 3) (`CONFIG_FREERTOS_CORETIMER_1`)  
Select this to use timer 1
- SYSTIMER 0 (level 1) (`CONFIG_FREERTOS_CORETIMER_SYSTIMER_LVL1`)  
Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (`CONFIG_FREERTOS_CORETIMER_SYSTIMER_LVL3`)  
Select this to use systimer with the 3 interrupt priority.

## CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK

Choose the clock source for run time stats

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

Available options:

- Use ESP TIMER for run time stats (CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_USING\_ESP\_TIMER) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_USING\_CPU\_CLK) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP\_DEFAULT\_CPU\_FREQ\_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

## CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place FreeRTOS functions into Flash

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port\*\_CRITICAL calls

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, context of port\*\_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port\*\_CRITICAL from ISR context would cause assert failure

**Default value:**

- No (disabled)

**Hardware Abstraction Layer (HAL) and Low Level (LL)** Contains:

- [CONFIG\\_HAL\\_DEFAULT\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_HAL\\_LOG\\_LEVEL](#)
- [CONFIG\\_HAL\\_SYSTIMER\\_USE\\_ROM\\_IMPL](#)
- [CONFIG\\_HAL\\_WDT\\_USE\\_ROM\\_IMPL](#)

### CONFIG\_HAL\_DEFAULT\_ASSERTION\_LEVEL

Default HAL assertion level

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can't exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can't be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

Available options:

- Same as system assertion level (CONFIG\_HAL\_ASSERTION\_EQUALS\_SYSTEM)
- Disabled (CONFIG\_HAL\_ASSERTION\_DISABLE)
- Silent (CONFIG\_HAL\_ASSERTION\_SILENT)
- Enabled (CONFIG\_HAL\_ASSERTION\_ENABLE)

### CONFIG\_HAL\_LOG\_LEVEL

HAL layer log verbosity

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Specify how much output to see in HAL logs.

Available options:

- No output (CONFIG\_HAL\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_HAL\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_HAL\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_HAL\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_HAL\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_HAL\_LOG\_LEVEL\_VERBOSE)

### CONFIG\_HAL\_SYSTIMER\_USE\_ROM\_IMPL

Use ROM implementation of SysTimer HAL driver

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HAL\_SYSTIMER

### CONFIG\_HAL\_WDT\_USE\_ROM\_IMPL

Use ROM implementation of WDT HAL driver

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HAL\_WDT

**Heap memory debugging** Contains:

- [CONFIG\\_HEAP\\_ABORT\\_WHEN\\_ALLOCATION\\_FAILS](#)
- [CONFIG\\_HEAP\\_TASK\\_TRACKING](#)
- [CONFIG\\_HEAP\\_PLACE\\_FUNCTION\\_INTO\\_FLASH](#)
- [CONFIG\\_HEAP\\_CORRUPTION\\_DETECTION](#)
- [CONFIG\\_HEAP\\_TRACING\\_DEST](#)
- [CONFIG\\_HEAP\\_TRACING\\_STACK\\_DEPTH](#)
- [CONFIG\\_HEAP\\_USE\\_HOOKS](#)
- [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)
- [CONFIG\\_HEAP\\_TLSF\\_USE\\_ROM\\_IMPL](#)

### **CONFIG\_HEAP\_CORRUPTION\_DETECTION**

Heap corruption detection

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the "Heap Memory Debugging" page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) ([CONFIG\\_HEAP\\_POISONING\\_DISABLED](#))
- Light impact ([CONFIG\\_HEAP\\_POISONING\\_LIGHT](#))
- Comprehensive ([CONFIG\\_HEAP\\_POISONING\\_COMPREHENSIVE](#))

### **CONFIG\_HEAP\_TRACING\_DEST**

Heap tracing

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables the heap tracing API defined in `esp_heap_trace.h`.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it's best to keep it disabled unless tracing is being used.

Available options:

- Disabled ([CONFIG\\_HEAP\\_TRACING\\_OFF](#))
- Standalone ([CONFIG\\_HEAP\\_TRACING\\_STANDALONE](#))
- Host-based ([CONFIG\\_HEAP\\_TRACING\\_TOHOST](#))

### **CONFIG\_HEAP\_TRACING\_STACK\_DEPTH**

Heap tracing stack depth

*Found in: [Component config](#) > [Heap memory debugging](#)*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

### CONFIG\_HEAP\_USE\_HOOKS

Use allocation and free hooks

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable the user to implement function hooks triggered for each successful allocation and free.

### CONFIG\_HEAP\_TASK\_TRACKING

Enable heap task tracking

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

### CONFIG\_HEAP\_TRACE\_HASH\_MAP

Use hash map mechanism to access heap trace records

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use a hash map to increase performance in handling heap trace records.

Heap trace standalone supports storing records as a list, or a list + hash map.

Using only a list takes less memory, but calls to 'free' will get slower as the list grows. This is particularly affected when using HEAP\_TRACE\_ALL mode.

By using a list + hash map, calls to 'free' remain fast, at the cost of additional memory to store the hash map.

**Default value:**

- No (disabled) if [CONFIG\\_HEAP\\_TRACING\\_STANDALONE](#)

### CONFIG\_HEAP\_TRACE\_HASH\_MAP\_IN\_EXT\_RAM

Place hash map in external RAM

*Found in: [Component config](#) > [Heap memory debugging](#) > [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)*

When enabled this configuration forces the hash map to be placed in external RAM.

**Default value:**

- No (disabled) if [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)

### CONFIG\_HEAP\_TRACE\_HASH\_MAP\_SIZE

The number of entries in the hash map

*Found in: [Component config](#) > [Heap memory debugging](#) > [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)*

Defines the number of entries in the heap trace hashmap. Each entry takes 8 bytes. The bigger this number is, the better the performance. Recommended range: 200 - 2000.

**Default value:**

- 512 if [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)

### CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS

Abort if memory allocation fails

*Found in: [Component config](#) > [Heap memory debugging](#)*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

### CONFIG\_HEAP\_TLSF\_USE\_ROM\_IMPL

Use ROM implementation of heap tlsf library

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HEAP\_TLSF

### CONFIG\_HEAP\_PLACE\_FUNCTION\_INTO\_FLASH

Force the entire heap component to be placed in flash memory

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to save up RAM space by placing the heap component in the flash memory

Note that it is only safe to enable this configuration if no functions from `esp_heap_caps.h` or `esp_heap_trace.h` are called from ISR.

### IEEE 802.15.4 Contains:

- [CONFIG\\_IEEE802154\\_ENABLED](#)

### CONFIG\_IEEE802154\_ENABLED

IEEE802154 Enable

*Found in: [Component config](#) > [IEEE 802.15.4](#)*

**Default value:**

- Yes (enabled) if SOC\_IEEE802154\_SUPPORTED

### CONFIG\_IEEE802154\_RX\_BUFFER\_SIZE

The number of 802.15.4 receive buffers

*Found in: [Component config](#) > [IEEE 802.15.4](#) > [CONFIG\\_IEEE802154\\_ENABLED](#)*

The number of 802.15.4 receive buffers

**Range:**

- from 2 to 100 if [CONFIG\\_IEEE802154\\_ENABLED](#)

**Default value:**

- 20 if [CONFIG\\_IEEE802154\\_ENABLED](#)

### CONFIG\_IEEE802154\_CCA\_MODE

Clear Channel Assessment (CCA) mode

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

configure the CCA mode

Available options:

- Carrier sense only (CONFIG\_IEEE802154\_CCA\_CARRIER)  
configure the CCA mode to Carrier sense only
- Energy above threshold (CONFIG\_IEEE802154\_CCA\_ED)  
configure the CCA mode to Energy above threshold
- Carrier sense OR energy above threshold (CONFIG\_IEEE802154\_CCA\_CARRIER\_OR\_ED)  
configure the CCA mode to Carrier sense OR energy above threshold
- Carrier sense AND energy above threshold (CONFIG\_IEEE802154\_CCA\_CARRIER\_AND\_ED)  
configure the CCA mode to Carrier sense AND energy above threshold

### CONFIG\_IEEE802154\_CCA\_THRESHOLD

CCA detection threshold

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

set the CCA threshold, in dB

**Range:**

- from -120 to 0 if *CONFIG\_IEEE802154\_ENABLED*

**Default value:**

- "-60" if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_PENDING\_TABLE\_SIZE

Pending table size

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

set the pending table size

**Range:**

- from 1 to 100 if *CONFIG\_IEEE802154\_ENABLED*

**Default value:**

- 20 if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_MULTI\_PAN\_ENABLE

Enable multi-pan feature for frame filter

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

Enable IEEE802154 multi-pan

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_TIMING\_OPTIMIZATION

Enable throughput optimization

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option increases throughput by ~5% at the expense of ~2.1k IRAM code size increase.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_SLEEP\_ENABLE

Enable IEEE802154 light sleep

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows the IEEE802.15.4 module to be powered down during automatic light sleep, which reduces current consumption.

**Default value:**

- No (disabled) if *CONFIG\_PM\_ENABLE* && *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_DEBUG

Enable IEEE802154 Debug

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows different kinds of IEEE802154 debug output. All IEEE802154 debug features increase the size of the final binary.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

Contains:

- *CONFIG\_IEEE802154\_TXRX\_STATISTIC*
- *CONFIG\_IEEE802154\_ASSERT*
- *CONFIG\_IEEE802154\_RECORD*
- *CONFIG\_IEEE802154\_RX\_BUFFER\_STATISTIC*

### CONFIG\_IEEE802154\_RX\_BUFFER\_STATISTIC

Rx buffer statistic

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED > CONFIG\_IEEE802154\_DEBUG*

Enabling this option to count IEEE802154 rx buffer when allocating or freeing.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_DEBUG*

### CONFIG\_IEEE802154\_ASSERT

Enrich the assert information

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED > CONFIG\_IEEE802154\_DEBUG*

Enabling this option to print more information when assert.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_DEBUG*

### CONFIG\_IEEE802154\_RECORD

Record the information with IEEE802154 state and event

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to add some probe codes in the driver, and record these information.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### CONFIG\_IEEE802154\_RECORD\_EVENT

Enable record event information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD`

Enabling this option to record event, when assert, the recorded event will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_RECORD`

### CONFIG\_IEEE802154\_RECORD\_EVENT\_SIZE

Record event table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD > CONFIG_IEEE802154_RECORD_EVENT`

set the record event table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_EVENT`

**Default value:**

- 30 if `CONFIG_IEEE802154_RECORD_EVENT`

### CONFIG\_IEEE802154\_RECORD\_STATE

Enable record state information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD`

Enabling this option to record state, when assert, the recorded state will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_RECORD`

### CONFIG\_IEEE802154\_RECORD\_STATE\_SIZE

Record state table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD > CONFIG_IEEE802154_RECORD_STATE`

set the record state table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_STATE`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_STATE`

### CONFIG\_IEEE802154\_RECORD\_CMD

Enable record command information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD`

Enabling this option to record the command, when assert, the recorded command will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_RECORD`

### CONFIG\_IEEE802154\_RECORD\_CMD\_SIZE

Record command table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD > CONFIG_IEEE802154_RECORD_CMD`

set the record command table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_CMD`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_CMD`

### CONFIG\_IEEE802154\_RECORD\_ABORT

Enable record abort information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD`

Enabling this option to record the abort, when assert, the recorded abort will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_RECORD`

### CONFIG\_IEEE802154\_RECORD\_ABORT\_SIZE

Record abort table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD > CONFIG_IEEE802154_RECORD_ABORT`

set the record abort table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_ABORT`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_ABORT`

### CONFIG\_IEEE802154\_TXRX\_STATISTIC

Enable record tx/rx packets information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the tx and rx

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**Log output** Contains:

- [CONFIG\\_LOG\\_DEFAULT\\_LEVEL](#)
- [CONFIG\\_LOG\\_MASTER\\_LEVEL](#)
- [CONFIG\\_LOG\\_TIMESTAMP\\_SOURCE](#)
- [CONFIG\\_LOG\\_MAXIMUM\\_LEVEL](#)
- [CONFIG\\_LOG\\_COLORS](#)

### **CONFIG\_LOG\_DEFAULT\_LEVEL**

Default log verbosity

*Found in: [Component config](#) > [Log output](#)*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting "Warning" would mean that changing log level to "Debug" at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

Available options:

- No output (`CONFIG_LOG_DEFAULT_LEVEL_NONE`)
- Error (`CONFIG_LOG_DEFAULT_LEVEL_ERROR`)
- Warning (`CONFIG_LOG_DEFAULT_LEVEL_WARN`)
- Info (`CONFIG_LOG_DEFAULT_LEVEL_INFO`)
- Debug (`CONFIG_LOG_DEFAULT_LEVEL_DEBUG`)
- Verbose (`CONFIG_LOG_DEFAULT_LEVEL_VERBOSE`)

### **CONFIG\_LOG\_MAXIMUM\_LEVEL**

Maximum log verbosity

*Found in: [Component config](#) > [Log output](#)*

This config option sets the highest log verbosity that it's possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate "Bootloader log verbosity" setting.

Available options:

- Same as default (`CONFIG_LOG_MAXIMUM_EQUALS_DEFAULT`)
- Error (`CONFIG_LOG_MAXIMUM_LEVEL_ERROR`)
- Warning (`CONFIG_LOG_MAXIMUM_LEVEL_WARN`)
- Info (`CONFIG_LOG_MAXIMUM_LEVEL_INFO`)
- Debug (`CONFIG_LOG_MAXIMUM_LEVEL_DEBUG`)
- Verbose (`CONFIG_LOG_MAXIMUM_LEVEL_VERBOSE`)

### CONFIG\_LOG\_MASTER\_LEVEL

Enable global master log level

*Found in: [Component config](#) > [Log output](#)*

Enables an additional global "master" log level check that occurs before a log tag cache lookup. This is useful if you want to compile in a lot of logs that are selectable at runtime, but avoid the performance hit during periods where you don't want log output. Examples include remote log forwarding, or disabling logs during a time-critical or CPU-intensive section and re-enabling them later. Results in larger program size depending on number of logs compiled in.

If enabled, defaults to LOG\_DEFAULT\_LEVEL and can be set using esp\_log\_set\_level\_master(). This check takes precedence over ESP\_LOG\_LEVEL\_LOCAL.

**Default value:**

- No (disabled)

### CONFIG\_LOG\_COLORS

Use ANSI terminal colors in log output

*Found in: [Component config](#) > [Log output](#)*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

### CONFIG\_LOG\_TIMESTAMP\_SOURCE

Log Timestamps

*Found in: [Component config](#) > [Log output](#)*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip's RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

Available options:

- Milliseconds Since Boot (CONFIG\_LOG\_TIMESTAMP\_SOURCE\_RTOS)
- System Time (CONFIG\_LOG\_TIMESTAMP\_SOURCE\_SYSTEM)

**LWIP** Contains:

- [CONFIG\\_LWIP\\_CHECK\\_THREAD\\_SAFETY](#)
- [Checksums](#)
- [CONFIG\\_LWIP\\_DHCP\\_COARSE\\_TIMER\\_SECS](#)
- [DHCP server](#)
- [CONFIG\\_LWIP\\_DHCP\\_OPTIONS\\_LEN](#)

- [CONFIG\\_LWIP\\_USE\\_EXTERNAL\\_MBEDTLS](#)

### CONFIG\_LWIP\_ENABLE

Enable LwIP stack

*Found in: [Component config](#) > [LWIP](#)*

Builds normally if selected. Excludes LwIP from build if unselected, even if it is a dependency of a component or application. Some applications can switch their IP stacks, e.g., when switching between chip and Linux targets (LwIP stack vs. Linux IP stack). Since the LwIP dependency cannot easily be excluded based on a Kconfig option, it has to be a dependency in all cases. This switch allows the LwIP stack to be built selectively, even if it is a dependency.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_LOCAL\_HOSTNAME

Local netif hostname

*Found in: [Component config](#) > [LWIP](#)*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

- "espressif"

### CONFIG\_LWIP\_NETIF\_API

Enable usage of standard POSIX APIs in LWIP

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as `esp_netif_get_netif_impl_name()`)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_PRIO

LWIP TCP/IP Task Priority

*Found in: [Component config](#) > [LWIP](#)*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (`config-MAX_PRIORITIES-1`).

**Range:**

- from 1 to 24

**Default value:**

- 18

### CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING

Enable tcpip core locking

*Found in: [Component config](#) > [LWIP](#)*

If Enable tcpip core locking, Creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK\_TCPIP\_CORE() and UNLOCK\_TCPIP\_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING\_INPUT

Enable tcpip core locking input

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)*

when LWIP\_TCPIP\_CORE\_LOCKING is enabled, this lets tcpip\_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip\_thread.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)

### CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY

Checks that lwip API runs in expected context

*Found in: [Component config](#) > [LWIP](#)*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES

Enable mDNS queries in resolving host name

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_L2\_TO\_L3\_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_IRAM\_OPTIMIZATION**

Enable LWIP IRAM optimization

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_EXTRA\_IRAM\_OPTIMIZATION**

Enable LWIP IRAM optimization for TCP part

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some tcp part functions relating to RX/TX in LWIP will be put into IRAM, it can improve TCP throughput. On the other hand, it needs about 17KB IRAM for these optimizations.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_TIMERS\_ONDEMAND**

Enable LWIP Timers on demand

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_ND6**

LWIP NDP6 Enable/Disable

*Found in: [Component config](#) > [LWIP](#)*

This option is used to disable the Network Discovery Protocol (NDP) if it is not required. Please use this option with caution, as the NDP is essential for IPv6 functionality within a local network.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_FORCE\_ROUTER\_FORWARDING**

LWIP Force Router Forwarding Enable/Disable

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ND6](#)*

This option is used to set the the router flag for the NA packets. When enabled, the router flag in NA packet will always set to 1, otherwise, never set router flag for NA packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_MAX\_SOCKETS

Max number of open sockets

*Found in: [Component config](#) > [LWIP](#)*

The practical maximum limit is determined by available heap memory at runtime.

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 253. If using value above 61, update CMakeLists defining FD\_SETSIZE to the number of sockets used plus the expected open files (minimum of +3 for stdout, stderr and stdin).

**Range:**

- from 1 to 253

**Default value:**

- 10

### CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: [Component config](#) > [LWIP](#)*

This option is deprecated. Do not use this option, use VFS\_SUPPORT\_SELECT instead.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_LINGER

Enable SO\_LINGER processing

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows SO\_LINGER processing. l\_onoff = 1,l\_linger can set the timeout.

If l\_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l\_linger!=0,Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_REUSE

Enable SO\_REUSEADDR option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows binding to a port which remains in TIME\_WAIT.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_REUSE\_RXTOALL

SO\_REUSEADDR copies broadcast/multicast to all matches

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SO\\_REUSE](#)*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO\_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_RCVBUF

Enable SO\_RCVBUF option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETBUF\_RECVINFO

Enable IP\_PKTINFO option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_DEFAULT\_TTL

The value for Time-To-Live used by transport layers

*Found in: [Component config](#) > [LWIP](#)*

Set value for Time-To-Live used by transport layers.

**Range:**

- from 1 to 255

**Default value:**

- 64

### CONFIG\_LWIP\_IP4\_FRAG

Enable fragment outgoing IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP6\_FRAG

Enable fragment outgoing IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP4\_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP6\_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_REASS\_MAX\_PBUFS

The maximum amount of pbufs waiting to be reassembled

*Found in: [Component config](#) > [LWIP](#)*

Set the maximum amount of pbufs waiting to be reassembled.

**Range:**

- from 10 to 100

**Default value:**

- 10

### CONFIG\_LWIP\_IP\_FORWARD

Enable IP forwarding

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV4\_NAPT

Enable NAT (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#)*

Enabling this option allows Network Address and Port Translation.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IP\\_FORWARD](#)

### CONFIG\_LWIP\_IPV4\_NAPT\_PORTMAP

Enable NAT Port Mapping (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#) > [CONFIG\\_LWIP\\_IPV4\\_NAPT](#)*

Enabling this option allows Port Forwarding or Port mapping.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_IPV4\\_NAPT](#)

### CONFIG\_LWIP\_STATS

Enable LWIP statistics

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows LWIP statistics

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP

Send gratuitous ARP periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_GARP\_TMR\_INTERVAL

GARP timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_GRATUITOUS\\_ARP](#)*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

### CONFIG\_LWIP\_ESP\_MLDV6\_REPORT

Send mldv6 report periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MLDV6\_TMR\_INTERVAL

mldv6 report timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_MLDV6\\_REPORT](#)*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**

- 40

### CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE

TCPIP task receive mail box size

*Found in: [Component config](#) > [LWIP](#)*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 32

### CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK

DHCP: Perform ARP check on any offered address

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID

DHCP: Disable Use of HW address as client identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to "y" in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID

DHCP: Disable Use of vendor class identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client vendor class identification. Set this option to "y" in order to exclude option 60 from DHCP packets.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP

DHCP: Restore last IP obtained from DHCP server

Found in: *Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN

DHCP total option length

Found in: *Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP\_ASSERT due to option value is too long. Please increase the LWIP\_DHCP\_OPTIONS\_LEN value.

**Range:**

- from 68 to 255

**Default value:**

- 68

### CONFIG\_LWIP\_NUM\_NETIF\_CLIENT\_DATA

Number of clients store data in netif

Found in: *Component config > LWIP*

Number of clients that may store data in client\_data member array of struct netif.

**Range:**

- from 0 to 256

**Default value:**

- 0

### CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS

DHCP coarse timer interval(s)

Found in: *Component config > LWIP*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**

- from 1 to 10

**Default value:**

- 1

**DHCP server** Contains:

- *CONFIG\_LWIP\_DHCPS*

### CONFIG\_LWIP\_DHCPS

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#)*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCPS\_LEASE\_UNIT

Multiplier for lease time, in seconds

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

### CONFIG\_LWIP\_DHCPS\_MAX\_STATION\_NUM

Maximum number of stations

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it's address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

### CONFIG\_LWIP\_DHCPS\_STATIC\_ENTRIES

Enable ARP static entries

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

Enabling this option allows DHCP server to support temporary static ARP entries for DHCP Client. This will help the DHCP server to send the DHCP OFFER and DHCP ACK using IP unicast.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_AUTOIP\\_TRIES](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_MAX\\_CONFLICTS](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_RATE\\_LIMIT\\_INTERVAL](#)

### CONFIG\_LWIP\_AUTOIP\_TRIES

DHCP Probes before self-assigning IPv4 LL address

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: "This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP." (In the case of ESP-IDF, this means multiple SYSTEM\_EVENT\_STA\_GOT\_IP events.)

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 2 if [CONFIG\\_LWIP\\_AUTOIP](#)

### CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS

Max IP conflicts before rate limiting

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 9 if [CONFIG\\_LWIP\\_AUTOIP](#)

### CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL

Rate limited interval (seconds)

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)

If rate limiting self-assignment requests, wait this long between each request.

**Range:**

- from 5 to 120 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 20 if [CONFIG\\_LWIP\\_AUTOIP](#)

### CONFIG\_LWIP\_IPV4

Enable IPv4

*Found in:* [Component config](#) > [LWIP](#)

Enable IPv4 stack. If you want to use IPv6 only TCP/IP stack, disable this.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IPV6

Enable IPv6

*Found in: [Component config](#) > [LWIP](#)*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP\_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IPV6\_AUTOCONFIG

Enable IPV6 stateless address autoconfiguration (SLAAC)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_NUM\_ADDRESSES

Number of IPv6 addresses on each network interface

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_FORWARD

Enable IPv6 forwarding between interfaces

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_RDNSS\_MAX\_DNS\_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: [Component config](#) > [LWIP](#)*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**

- 0 if [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#)

### CONFIG\_LWIP\_IPV6\_DHCP6

Enable DHCPv6 stateless address autoconfiguration

Found in: *Component config > LWIP*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_IPV6\_AUTOCONFIG*

### CONFIG\_LWIP\_NETIF\_STATUS\_CALLBACK

Enable status callback for network interfaces

Found in: *Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETIF\_LOOPBACK

Support per-interface loopback

Found in: *Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will "loop back" and be received by this interface. Disabling this option disables support of loopback interface in lwIP

**Default value:**

- Yes (enabled)

Contains:

- *CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS*

### CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS

Max queued loopback packets per interface

Found in: *Component config > LWIP > CONFIG\_LWIP\_NETIF\_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

- from 0 to 16

**Default value:**

- 8

**TCP** Contains:

- *CONFIG\_LWIP\_TCP\_WND\_DEFAULT*
- *CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT*
- *CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE*
- *CONFIG\_LWIP\_TCP\_RTO\_TIME*
- *CONFIG\_LWIP\_MAX\_ACTIVE\_TCP*
- *CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT*
- *CONFIG\_LWIP\_MAX\_LISTENING\_TCP*

- [CONFIG\\_LWIP\\_TCP\\_MAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_SYNMAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_MSL](#)
- [CONFIG\\_LWIP\\_TCP\\_MSS](#)
- [CONFIG\\_LWIP\\_TCP\\_OVERSIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)
- [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- [CONFIG\\_LWIP\\_TCP\\_HIGH\\_SPEED\\_RETRANSMISSION](#)
- [CONFIG\\_LWIP\\_TCP\\_TMR\\_INTERVAL](#)

### **CONFIG\_LWIP\_MAX\_ACTIVE\_TCP**

Maximum active TCP Connections

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### **CONFIG\_LWIP\_MAX\_LISTENING\_TCP**

Maximum listening TCP Connections

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### **CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION**

TCP high speed retransmissions

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_TCP\_MAXRTX**

Maximum number of retransmissions of data segments

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Set maximum number of retransmissions of data segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

**CONFIG\_LWIP\_TCP\_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of SYN segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

**CONFIG\_LWIP\_TCP\_MSS**

Maximum Segment Size (MSS)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP\_MSS Range: 576 <= TCP\_MSS <= 1460 IPv6 TCP\_MSS Range: 1220<= TCP\_MSS <= 1440

**Range:**

- from 536 to 1460

**Default value:**

- 1440

**CONFIG\_LWIP\_TCP\_TMR\_INTERVAL**

TCP timer interval(ms)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

- 250

**CONFIG\_LWIP\_TCP\_MSL**

Maximum segment lifetime (MSL)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

**CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT**

Maximum FIN segment lifetime

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 20000

**CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT**

Default send buffer size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

**CONFIG\_LWIP\_TCP\_WND\_DEFAULT**

Default receive window size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

**CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE**

Default TCP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is:  $LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2$ , e.g. if  $LWIP\_TCP\_WND\_DEFAULT=14360$ ,  $TCP\_MSS=1436$ , then the recommended receive mail box size is  $(14360/1436 + 2) = 12$ .

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum `LWIP_TCP_RECVMBOX_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is `LWIP_TCP_RECVMBOX_SIZE` multiplies the maximum TCP socket number. In other words, the bigger `LWIP_TCP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 1024 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ

Queue incoming out-of-order segments

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_OOSEQ\_TIMEOUT

Timeout for each pbuf queued in TCP OOSEQ, in RTOs.

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)

The timeout value is TCP\_OOSEQ\_TIMEOUT \* RTO.

**Range:**

- from 1 to 30

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_OOSEQ\_MAX\_PBUFS

The maximum number of pbufs queued on OOSEQ per pcb

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)

If LWIP\_TCP\_OOSEQ\_MAX\_PBUFS = 0, TCP will not control the number of OOSEQ pbufs.

In a poor network environment, many out-of-order tcp pbufs will be received. These out-of-order pbufs will be cached in the TCP out-of-order queue which will cause Wi-Fi/Ethernet fail to release RX buffer in time. It is possible that all RX buffers for MAC layer are used by OOSEQ.

Control the number of out-of-order pbufs to ensure that the MAC layer has enough RX buffer to receive packets.

In the Wi-Fi scenario, recommended OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

In the Ethernet scenario, recommended Ethernet OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ETH\_DMA\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

Within the recommended value range, the larger the value, the better the performance.

MAX\_TCP\_NUMBER represent Maximum number of TCP connections in Wi-Fi(STA+SoftAP) and Ethernet scenario.

**Range:**

- from 0 to 12

**Default value:**

- 4

### CONFIG\_LWIP\_TCP\_SACK\_OUT

Support sending selective acknowledgements

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCP\_OVERSIZE

Pre-allocate transmit PBUF size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Allows enabling "oversize" allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle's algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

Available options:

- MSS (CONFIG\_LWIP\_TCP\_OVERSIZE\_MSS)
- 25% MSS (CONFIG\_LWIP\_TCP\_OVERSIZE\_QUARTER\_MSS)
- Disabled (CONFIG\_LWIP\_TCP\_OVERSIZE\_DISABLE)

### CONFIG\_LWIP\_WND\_SCALE

Support TCP window scale

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Enable this feature to support TCP window scaling.

### CONFIG\_LWIP\_TCP\_RCV\_SCALE

Set TCP receiving window scaling factor

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_WND\\_SCALE](#)*

Enable this feature to support TCP window scaling.

**Range:**

- from 0 to 14 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 0 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

### CONFIG\_LWIP\_TCP\_RTO\_TIME

Default TCP rto time

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**

- 1500

**UDP** Contains:

- [CONFIG\\_LWIP\\_UDP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_MAX\\_UDP\\_PCBS](#)

### **CONFIG\_LWIP\_MAX\_UDP\_PCBS**

Maximum active UDP control blocks

*Found in:* [Component config](#) > [LWIP](#) > [UDP](#)

The maximum number of active UDP "connections" (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### **CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE**

Default UDP receive mail box size

*Found in:* [Component config](#) > [LWIP](#) > [UDP](#)

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum UDP\_RECVMBOX\_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP\_RECVMBOX\_SIZE multiplies the maximum UDP socket number. In other words, the bigger UDP\_RECVMBOX\_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64

**Default value:**

- 6

**Checksums** Contains:

- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_ICMP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_IP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_UDP](#)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_IP**

Enable LWIP IP checksums

*Found in:* [Component config](#) > [LWIP](#) > [Checksums](#)

Enable checksum checking for received IP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_UDP

Enable LWIP UDP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received UDP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_ICMP

Enable LWIP ICMP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received ICMP messages

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_STACK\_SIZE

TCP/IP Task Stack Size

*Found in: [Component config](#) > [LWIP](#)*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**

- from 2048 to 65536

**Default value:**

- 3072

### CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY

TCP/IP task affinity

*Found in: [Component config](#) > [LWIP](#)*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to "TCP/IP" task and "Ping" task.

Available options:

- No affinity (CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY\_CPU1)

### CONFIG\_LWIP\_IPV6\_ND6\_NUM\_PREFIXES

Max number of entries in IPv6 on-link prefixes cache

*Found in: [Component config](#) > [LWIP](#)*

Maximum number of entries in IPv6 on-link prefixes cache

**Default value:**

- 5

### CONFIG\_LWIP\_IPV6\_ND6\_NUM\_ROUTERS

Max number of entries in IPv6 default routers cache

*Found in: [Component config](#) > [LWIP](#)*

Maximum number of entries in IPv6 default routers cache

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_ND6\_NUM\_DESTINATIONS

Max number of entries in IPv6 destinations cache

*Found in: [Component config](#) > [LWIP](#)*

Maximum number of entries in IPv6 destinations cache

**Default value:**

- 10

### CONFIG\_LWIP\_PPP\_SUPPORT

Enable PPP support

*Found in: [Component config](#) > [LWIP](#)*

Enable PPP stack. Now only PPP over serial is possible.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_PPP\\_ENABLE\\_IPV6](#)

### CONFIG\_LWIP\_PPP\_ENABLE\_IPV6

Enable IPV6 support for PPP connections (IPV6CP)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)*

Enable IPV6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPV6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPV6 support.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#) && [CONFIG\\_LWIP\\_IPV6](#)

### CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE

Max number of IPv6 packets to queue during MAC resolution

*Found in: [Component config](#) > [LWIP](#)*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

### **CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS**

Max number of entries in IPv6 neighbor cache

*Found in: [Component config](#) > [LWIP](#)*

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

### **CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT**

Enable Notify Phase Callback

*Found in: [Component config](#) > [LWIP](#)*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_PAP\_SUPPORT**

Enable PAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Password Authentication Protocol (PAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT**

Enable CHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT**

Enable MSCHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT**

Enable MPPE support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_SERVER\_SUPPORT

Enable PPP server support

*Found in: Component config > LWIP*

Enable to use PPP server

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_PPP\_VJ\_HEADER\_COMPRESSION

Enable VJ IP Header compression

*Found in: Component config > LWIP*

Enable support for VJ header compression. Please disable this if you're using NAPT on PPP interface, since the compressed IP header might not be correctly interpreted in NAT causing the compressed packet to be dropped.

**Default value:**

- Yes (enabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_ENABLE\_LCP\_ECHO

Enable LCP ECHO

*Found in: Component config > LWIP*

Enable LCP echo keepalive requests

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_LCP\_ECHOINTERVAL

Echo interval (s)

*Found in: Component config > LWIP > CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**

- from 0 to 1000000 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

**Default value:**

- 3 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

### CONFIG\_LWIP\_LCP\_MAXECHOFAILS

Maximum echo failures

*Found in: Component config > LWIP > CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**

- from 0 to 100000 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

**Default value:**

- 3 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

### CONFIG\_LWIP\_PPP\_DEBUG\_ON

Enable PPP debug log output

*Found in: [Component config > LWIP](#)*

Enable PPP debug log output

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_USE\_EXTERNAL\_MBEDTLS

Use mbedTLS instead of internal polarSSL

*Found in: [Component config > LWIP](#)*

This option uses mbedTLS crypto functions (instead of internal PolarSSL implementation) for PPP authentication modes (PAP, CHAP, etc.). You can use this option to address symbol duplication issues, since the internal functions are not namespaced (e.g. md5\_init()).

### CONFIG\_LWIP\_SLIP\_SUPPORT

Enable SLIP support (new/experimental)

*Found in: [Component config > LWIP](#)*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_SLIP\\_DEBUG\\_ON](#)

### CONFIG\_LWIP\_SLIP\_DEBUG\_ON

Enable SLIP debug log output

*Found in: [Component config > LWIP > CONFIG\\_LWIP\\_SLIP\\_SUPPORT](#)*

Enable SLIP debug log output

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_SLIP\\_SUPPORT](#)

**ICMP** Contains:

- [CONFIG\\_LWIP\\_ICMP](#)
- [CONFIG\\_LWIP\\_BROADCAST\\_PING](#)
- [CONFIG\\_LWIP\\_MULTICAST\\_PING](#)

### CONFIG\_LWIP\_ICMP

ICMP: Enable ICMP

*Found in: [Component config > LWIP > ICMP](#)*

Enable ICMP module for check network stability

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MULTICAST\_PING

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_BROADCAST\_PING

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### LWIP RAW API

 Contains:

- [CONFIG\\_LWIP\\_MAX\\_RAW\\_PCBS](#)

### CONFIG\_LWIP\_MAX\_RAW\_PCBS

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### SNTP

 Contains:

- [CONFIG\\_LWIP\\_SNTP\\_MAX\\_SERVERS](#)
- [CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY](#)
- [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_MAX\_SERVERS

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

**Range:**

- from 1 to 16

**Default value:**

- 1

### CONFIG\_LWIP\_DHCP\_GET\_NTP\_SRV

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add 'NTP' to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_MAX\_NTP\_SERVERS

Maximum number of NTP servers acquired via DHCP

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#) > [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to "Maximum number of NTP servers", any extra servers would be just ignored.

**Range:**

- from 1 to 16 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

**Default value:**

- 1 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY

Request interval to update time (ms)

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#)*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**

- from 15000 to 4294967295

**Default value:**

- 3600000

### DNS

 Contains:

- [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)
- [CONFIG\\_LWIP\\_DNS\\_SETSERVER\\_WITH\\_NETIF](#)
- [CONFIG\\_LWIP\\_DNS\\_MAX\\_SERVERS](#)
- [CONFIG\\_LWIP\\_DNS\\_MAX\\_HOST\\_IP](#)

### CONFIG\_LWIP\_DNS\_MAX\_HOST\_IP

Maximum number of IP addresses per host

*Found in: [Component config](#) > [LWIP](#) > [DNS](#)*

Maximum number of IP addresses that can be returned by DNS queries for a single host.

**Default value:**

- 1

### CONFIG\_LWIP\_DNS\_MAX\_SERVERS

Maximum number of DNS servers

*Found in: [Component config](#) > [LWIP](#) > [DNS](#)*

Set maximum number of DNS servers. If fallback DNS servers are supported, the number of DNS servers needs to be greater than or equal to 3.

**Range:**

- from 1 to 4

**Default value:**

- 3

**CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT**

Enable DNS fallback server support

*Found in: [Component config](#) > [LWIP](#) > [DNS](#)*

Enable this feature to support DNS fallback server.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_ADDRESS**

DNS fallback server address

*Found in: [Component config](#) > [LWIP](#) > [DNS](#) > [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)*

This option allows you to config dns fallback server address.

**Default value:**

- "114.114.114.114" if [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)

**CONFIG\_LWIP\_DNS\_SETSERVER\_WITH\_NETIF**

Enable DNS server settings with netif

*Found in: [Component config](#) > [LWIP](#) > [DNS](#)*

This option allows collecting DNS server settings per netif using configurable callback function. It's typically used with [CONFIG\\_ESP\\_NETIF\\_SET\\_DNS\\_PER\\_DEFAULT\\_NETIF](#) which configures a callback to collect the DNS info on esp\_netif layer.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_BRIDGEIF\_MAX\_PORTS**

Maximum number of bridge ports

*Found in: [Component config](#) > [LWIP](#)*

Set maximum number of ports a bridge can consists of.

**Range:**

- from 1 to 63

**Default value:**

- 7

**CONFIG\_LWIP\_ESP\_LWIP\_ASSERT**

Enable LWIP ASSERT checks

*Found in: [Component config](#) > [LWIP](#)*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Hooks** Contains:

- [CONFIG\\_LWIP\\_HOOK\\_DNS\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_ND6\\_GET\\_GW](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_INPUT](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_ROUTE](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_SELECT\\_SRC\\_ADDR](#)
- [CONFIG\\_LWIP\\_HOOK\\_NETCONN\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_TCP\\_ISN](#)

### **CONFIG\_LWIP\_HOOK\_TCP\_ISN**

TCP ISN Hook

*Found in:* [Component config](#) > [LWIP](#) > [Hooks](#)

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (*tcp\_next\_iss*) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`CONFIG_LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_TCP_ISN_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_IP6\_ROUTE**

IPv6 route Hook

*Found in:* [Component config](#) > [LWIP](#) > [Hooks](#)

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW**

IPv6 get gateway Hook

*Found in:* [Component config](#) > [LWIP](#) > [Hooks](#)

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_ND6_GET_GW_NONE`)

- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW\_CUSTOM)

### CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR

IPv6 source address selection Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 source address selection. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_CUSTOM)

### CONFIG\_LWIP\_HOOK\_NETCONN\_EXTERNAL\_RESOLVE

Netconn external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook (without callback). Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_CUSTOM)

### CONFIG\_LWIP\_HOOK\_DNS\_EXTERNAL\_RESOLVE

DNS external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook (with callback). Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_DNS\_EXT\_RESOLVE\_NONE)
- Custom implementation (CONFIG\_LWIP\_HOOK\_DNS\_EXT\_RESOLVE\_CUSTOM)

### CONFIG\_LWIP\_HOOK\_IP6\_INPUT

IPv6 packet input

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 packet input. Setting this to "default" provides weak IDF implementation, which drops all incoming IPv6 traffic if the interface has no link local address. (this default implementation is "weak" and could be still overwritten in the application if some additional IPv6 input packet filtering is needed) Setting this to "none" removes this default filter and conforms to the lwIP implementation (which

accepts multicasts even if the interface has no link local address) Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_CUSTOM)

## CONFIG\_LWIP\_DEBUG

Enable LWIP Debug

*Found in:* *Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_LWIP\_API\_LIB\_DEBUG*
- *CONFIG\_LWIP\_BRIDGEIF\_FDB\_DEBUG*
- *CONFIG\_LWIP\_BRIDGEIF\_FW\_DEBUG*
- *CONFIG\_LWIP\_BRIDGEIF\_DEBUG*
- *CONFIG\_LWIP\_DHCP\_DEBUG*
- *CONFIG\_LWIP\_DHCP\_STATE\_DEBUG*
- *CONFIG\_LWIP\_DNS\_DEBUG*
- *CONFIG\_LWIP\_ETHARP\_DEBUG*
- *CONFIG\_LWIP\_ICMP\_DEBUG*
- *CONFIG\_LWIP\_ICMP6\_DEBUG*
- *CONFIG\_LWIP\_IP\_DEBUG*
- *CONFIG\_LWIP\_IP6\_DEBUG*
- *CONFIG\_LWIP\_NAPT\_DEBUG*
- *CONFIG\_LWIP\_NETIF\_DEBUG*
- *CONFIG\_LWIP\_PBUF\_DEBUG*
- *CONFIG\_LWIP\_SNTP\_DEBUG*
- *CONFIG\_LWIP\_SOCKETS\_DEBUG*
- *CONFIG\_LWIP\_TCP\_DEBUG*
- *CONFIG\_LWIP\_UDP\_DEBUG*
- *CONFIG\_LWIP\_DEBUG\_ESP\_LOG*

## CONFIG\_LWIP\_DEBUG\_ESP\_LOG

Route LWIP debugs through ESP\_LOG interface

*Found in:* *Component config > LWIP > CONFIG\_LWIP\_DEBUG*

Enabling this option routes all enabled LWIP debugs through ESP\_LOGD.

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

## CONFIG\_LWIP\_NETIF\_DEBUG

Enable netif debug messages

*Found in:* *Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_PBUF\_DEBUG**

Enable pbuf debug messages

*Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_ETHARP\_DEBUG**

Enable etharp debug messages

*Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_API\_LIB\_DEBUG**

Enable api lib debug messages

*Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_SOCKETS\_DEBUG**

Enable socket debug messages

*Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_IP\_DEBUG**

Enable IP debug messages

*Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_ICMP\_DEBUG**

Enable ICMP debug messages

*Found in: `Component config` > `LWIP` > `CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG` && `CONFIG_LWIP_ICMP`

### **CONFIG\_LWIP\_DHCP\_STATE\_DEBUG**

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DHCP\_DEBUG**

Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP6\_DEBUG**

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP6\_DEBUG**

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_TCP\_DEBUG**

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_UDP\_DEBUG**

Enable UDP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_SNTP\_DEBUG**

Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_DNS\_DEBUG**

Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_NAPT\_DEBUG**

Enable NAPT debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_IPV4\_NAPT*

**CONFIG\_LWIP\_BRIDGEIF\_DEBUG**

Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FDB\_DEBUG**

Enable bridge FDB debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FW\_DEBUG**

Enable bridge forwarding debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**mbedTLS** Contains:

- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

### **CONFIG\_MBEDTLS\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF

- Custom allocation mode, by overwriting `calloc()/free()` using `MBEDTLS_PLATFORM_SET_CALLOC_FREE()` function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal memory (`CONFIG_MBEDTLS_INTERNAL_MEM_ALLOC`)
- External SPIRAM (`CONFIG_MBEDTLS_EXTERNAL_MEM_ALLOC`)
- Default alloc mode (`CONFIG_MBEDTLS_DEFAULT_MEM_ALLOC`)
- Custom alloc mode (`CONFIG_MBEDTLS_CUSTOM_MEM_ALLOC`)
- Internal IRAM (`CONFIG_MBEDTLS_IRAM_8BIT_MEM_ALLOC`)

Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_MBEDTLS\_SSL\_MAX\_CONTENT\_LEN**

TLS maximum message content length

*Found in: [Component config > mbedTLS](#)*

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (`max_fragment_length`, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of `MBEDTLS_ERR_SSL_INVALID_RECORD` (-0x7200).

### **CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN**

Asymmetric in/out fragment length

*Found in: [Component config > mbedTLS](#)*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SSL\_IN\_CONTENT\_LEN**

TLS maximum incoming fragment length

*Found in: [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum incoming fragment length, overriding default maximum content length (`MBEDTLS_SSL_MAX_CONTENT_LEN`).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

**CONFIG\_MBEDTLS\_SSL\_OUT\_CONTENT\_LEN**

TLS maximum outgoing fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

**CONFIG\_MBEDTLS\_DYNAMIC\_BUFFER**

Using dynamic TX/RX buffer

*Found in: [Component config](#) > [mbedtls](#)*

Using dynamic TX/RX buffer. After enabling this option, mbedtls will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedtls also allocate TX and RX buffer with the default value of "MBEDTLS\_SSL\_OUT\_CONTENT\_LEN" or "MBEDTLS\_SSL\_IN\_CONTENT\_LEN", so to save more heap, users can set the options to be an appropriate value.

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CONFIG\_DATA**

Free private key and DHM data after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CA\_CERT**

Free SSL CA certificate after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)

## CONFIG\_MBEDTLS\_DEBUG

Enable mbedTLS debugging

*Found in: [Component config](#) > [mbedTLS](#)*

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include "mbedtls/esp\_debug.h" and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

### Default value:

- No (disabled)

## CONFIG\_MBEDTLS\_DEBUG\_LEVEL

Set mbedTLS debugging level

*Found in: [Component config](#) > [mbedTLS](#) > [CONFIG\\_MBEDTLS\\_DEBUG](#)*

Set mbedTLS debugging level

Available options:

- Warning (`CONFIG_MBEDTLS_DEBUG_LEVEL_WARN`)
- Info (`CONFIG_MBEDTLS_DEBUG_LEVEL_INFO`)
- Debug (`CONFIG_MBEDTLS_DEBUG_LEVEL_DEBUG`)
- Verbose (`CONFIG_MBEDTLS_DEBUG_LEVEL_VERBOSE`)

### **mbedTLS v3.x related** Contains:

- *DTLS-based configurations*
- `CONFIG_MBEDTLS_PKCS7_C`
- `CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION`
- `CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK`
- `CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE`
- `CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`
- `CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT`
- `CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH`

## CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3

Support TLS 1.3 protocol

*Found in: [Component config](#) > [mbedTLS](#) > [mbedTLS v3.x related](#)*

### **TLS 1.3 related configurations** Contains:

- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL`
- `CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE`
- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL`
- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK`

## CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_COMPATIBILITY\_MODE

TLS 1.3 middlebox compatibility mode

*Found in: [Component config](#) > [mbedTLS](#) > [mbedTLS v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)*

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

**CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK**

TLS 1.3 PSK key exchange mode

*Found in:* [Component config > mbedTLS > mbedTLS v3.x related > CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3 > TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

**CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_EPHEMERAL**

TLS 1.3 ephemeral key exchange mode

*Found in:* [Component config > mbedTLS > mbedTLS v3.x related > CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3 > TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

**CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK\_EPHEMERAL**

TLS 1.3 PSK ephemeral key exchange mode

*Found in:* [Component config > mbedTLS > mbedTLS v3.x related > CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3 > TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

**CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH**

Variable SSL buffer length

*Found in:* [Component config > mbedTLS > mbedTLS v3.x related](#)

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT**

Use a backward compatible ECDH context (Experimental)

*Found in:* [Component config > mbedTLS > mbedTLS v3.x related](#)

Use the legacy ECDH context format. Define this option only if you enable `MBEDTLS_ECP_RESTARTABLE` or if you want to access ECDH context fields directly.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

### CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK

Enable trusted certificate callbacks

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION

Enable serialization of the TLS context structures

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE

Keep peer certificate after handshake completion

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PKCS7\_C

Enable PKCS #7

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY

Record plaintext padding

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**

- 16 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**DTLS-based configurations** Contains:

- `CONFIG_MBEDTLS_SSL_DTLS_SRTP`
- `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_CID\_IN\_LEN\_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_CID\_OUT\_LEN\_MAX**

Maximum length of CIDs used for outgoing DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_DTLS\_SRTP**

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use\_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

**Certificate Bundle** Contains:

- [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE**

Enable trusted root certificate bundle

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#)

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DEFAULT\_CERTIFICATE\_BUNDLE**

Default certificate bundle options

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

Available options:

- Use the full default certificate bundle ([CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE\\_DEFAULT\\_FULL](#))
- Use only the most common certificates from the default bundles ([CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE\\_DEFAULT\\_CMN](#))  
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle ([CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE\\_DEFAULT\\_NONE](#))

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE**

Add custom certificates to the default bundle

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE\_PATH**

Custom certificate bundle path

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#) > [CONFIG\\_MBEDTLS\\_CUSTOM\\_CERTIFICATE\\_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

### CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_MAX\_CERTS

Maximum no of certificates allowed in certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- 200

### CONFIG\_MBEDTLS\_ECP\_RESTARTABLE

Enable mbedtls ecp restartable

*Found in:* [Component config](#) > [mbedtls](#)

Enable "non-blocking" ECC operations that can return early and be resumed.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CMAC\_C

Enable CMAC mode for block ciphers

*Found in:* [Component config](#) > [mbedtls](#)

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HARDWARE\_AES

Enable hardware AES acceleration

*Found in:* [Component config](#) > [mbedtls](#)

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

### CONFIG\_MBEDTLS\_AES\_USE\_PSEUDO\_ROUND\_FUNC

Enable AES hardware's pseudo round function

*Found in:* [Component config](#) > [mbedtls](#)

Enables the pseudo round function of the AES peripheral. Enabling this would impact the performance of the AES operations. For more info regarding the performance impact, please checkout the pseudo round function section of the security guide.

**Default value:**

- No (disabled) if SOC\_AES\_SUPPORT\_PSEUDO\_ROUND\_FUNCTION

### CONFIG\_MBEDTLS\_AES\_USE\_PSEUDO\_ROUND\_FUNC\_STRENGTH

Strength of the pseudo rounds function

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_AES\\_USE\\_PSEUDO\\_ROUND\\_FUNC](#)

The strength of the pseudo rounds functions can be configured to low, medium and high. You can configure the strength of the pseudo rounds functions according to your use cases, for example, increasing the strength would provide higher security but would slow down the hardware AES encryption/decryption operations.

Available options:

- Low (CONFIG\_MBEDTLS\_AES\_USE\_PSEUDO\_ROUND\_FUNC\_STRENGTH\_LOW)
- Medium (CONFIG\_MBEDTLS\_AES\_USE\_PSEUDO\_ROUND\_FUNC\_STRENGTH\_MEDIUM)
- High (CONFIG\_MBEDTLS\_AES\_USE\_PSEUDO\_ROUND\_FUNC\_STRENGTH\_HIGH)

### CONFIG\_MBEDTLS\_HARDWARE\_GCM

Enable partially hardware accelerated GCM

*Found in: [Component config](#) > [mbedtls](#)*

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS\_HARDWARE\_GCM is disabled and MBEDTLS\_HARDWARE\_AES is enabled then mbedtls will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**

- Yes (enabled) if SOC\_AES\_SUPPORT\_GCM && [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

### CONFIG\_MBEDTLS\_GCM\_SUPPORT\_NON\_AES\_CIPHER

Enable support for non-AES ciphers in GCM operation

*Found in: [Component config](#) > [mbedtls](#)*

Enable this config to support fallback to software definitions for a non-AES cipher GCM operation as we support hardware acceleration only for AES cipher. Some of the non-AES ciphers used in a GCM operation are DES, ARIA, CAMELLIA, CHACHA20, BLOWFISH.

If this config is disabled, performing a non-AES cipher GCM operation with the config MBEDTLS\_HARDWARE\_AES enabled will result in calculation of an AES-GCM operation instead for the given input values and thus could lead to failure in certificate validation which would ultimately lead to a SSL handshake failure.

This config being by-default enabled leads to an increase in binary size footprint of ~2.5KB. In case you are sure that your use case (for example, client and server configurations in case of a TLS handshake) would not involve any GCM operations using a non-AES cipher, you can safely disable this config, leading to reduction in binary size footprint.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HARDWARE\_MPI

Enable hardware MPI (bignum) acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC\_RSA\_MAX\_BIT\_LEN bit results.

These operations are used by RSA.

### CONFIG\_MBEDTLS\_LARGE\_KEY\_SOFTWARE\_MPI

Fallback to software implementation for larger MPI values

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)*

Fallback to software implementation for RSA key lengths larger than SOC\_RSA\_MAX\_BIT\_LEN. If this is not active then the ESP will be unable to process keys greater than SOC\_RSA\_MAX\_BIT\_LEN.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_HARDWARE\_SHA**

Enable hardware SHA acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**CONFIG\_MBEDTLS\_HARDWARE\_ECC**

Enable hardware ECC acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedtls

**Default value:**

- Yes (enabled) if SOC\_ECC\_SUPPORTED

**CONFIG\_MBEDTLS\_ECC\_OTHER\_CURVES\_SOFT\_FALLBACK**

Fallback to software implementation for curves not supported in hardware

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)

**CONFIG\_MBEDTLS\_ROM\_MD5**

Use MD5 implementation in ROM

*Found in: [Component config](#) > [mbedtls](#)*

Use ROM MD5 in mbedtls.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_SIGN**

Enable ECDSA signing using on-chip ECDSA peripheral

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedtls.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA\_KEY. If no key is burnt, it will report an error

The key should be burnt in little endian format. `espefuse.py` utility handles it internally but care needs to be taken while burning using `esp_efuse` APIs

**Default value:**

- No (disabled) if `SOC_ECDSA_SUPPORTED`

### Enable Software Countermeasure for ECDSA signing using on-chip ECDSA peripheral

#### **CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_VERIFY**

Enable ECDSA signature verification using on-chip ECDSA peripheral

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedtls.

**Default value:**

- Yes (enabled) if `SOC_ECDSA_SUPPORTED`

#### **CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

#### **CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY**

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

#### **CONFIG\_MBEDTLS\_HAVE\_TIME**

Enable mbedtls time support

*Found in: [Component config](#) > [mbedtls](#)*

Enable use of `time.h` functions (`time()` and `gmtime()`) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PLATFORM\_TIME\_ALT

Enable mbedtls time support: platform-specific

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enabling this config will provide users with a function "mbedtls\_platform\_set\_time()" that allows to set an alternative time function pointer.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME\_DATE

Enable mbedtls certificate expiry check

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS\_X509\_BADCERT\_FUTURE or MBEDTLS\_X509\_BADCERT\_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC

Enable deterministic ECDSA

*Found in: [Component config](#) > [mbedtls](#)*

Standard ECDSA is "fragile" in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SHA512\_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: [Component config](#) > [mbedtls](#)*

Enable MBEDTLS\_SHA512\_C adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SHA3\_C

Enable the SHA3 cryptographic hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enabling MBEDTLS\_SHA3\_C adds support for SHA3. Enabling this configuration option increases the flash footprint by almost 4KB.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_TLS\_MODE

TLS Protocol Role

*Found in: [Component config](#) > [mbedtls](#)*

mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (CONFIG\_MBEDTLS\_TLS\_SERVER\_AND\_CLIENT)
- Server (CONFIG\_MBEDTLS\_TLS\_SERVER\_ONLY)
- Client (CONFIG\_MBEDTLS\_TLS\_CLIENT\_ONLY)
- None (CONFIG\_MBEDTLS\_TLS\_DISABLED)

### TLS Key Exchange Methods

 Contains:

- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_DHE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ECJPAKE](#)
- [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

### CONFIG\_MBEDTLS\_PSK\_MODES

Enable pre-shared-key ciphersuites

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_PSK

Enable PSK based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_PSK

Enable DHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA\_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA

Enable RSA-only based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA

Enable DHE-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE

Support Elliptic Curve based ciphersuites

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_RSA**

Enable ECDHE-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_ECDSA**

Enable ECDHE-ECDSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA**

Enable ECDH-ECDSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA**

Enable ECDH-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE**

Enable ECJPAKE based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP256R1\\_ENABLED](#)

### CONFIG\_MBEDTLS\_SSL\_RENEGOTIATION

Support TLS renegotiation

*Found in: [Component config](#) > [mbedtls](#)*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_2

Support TLS 1.2 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_GMTSSL1\_1

Support GM/T SSL 1.1 protocol

*Found in: [Component config](#) > [mbedtls](#)*

Provisions for GM/T SSL 1.1 support

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_DTLS

Support DTLS protocol (all versions)

*Found in: [Component config](#) > [mbedtls](#)*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_ALPN

Support ALPN (Application Layer Protocol Negotiation)

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this option will save some code size if it is not needed.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CLIENT\_SSL\_SESSION\_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

## CONFIG\_MBEDTLS\_SERVER\_SSL\_SESSION\_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

## Symmetric Ciphers Contains:

- [CONFIG\\_MBEDTLS\\_AES\\_C](#)
- [CONFIG\\_MBEDTLS\\_BLOWFISH\\_C](#)
- [CONFIG\\_MBEDTLS\\_CAMELLIA\\_C](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_DES\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_NIST\\_KW\\_C](#)
- [CONFIG\\_MBEDTLS\\_XTEA\\_C](#)

## CONFIG\_MBEDTLS\_AES\_C

AES block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- Yes (enabled)

## CONFIG\_MBEDTLS\_CAMELLIA\_C

Camellia block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_DES\_C

DES block cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_BLOWFISH\_C

Blowfish block cipher (read help)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_XTEA\_C**

XTEA block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_CCM\_C**

CCM (Counter with CBC-MAC) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_GCM\_C**

GCM (Galois/Counter) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_NIST\_KW\_C**

NIST key wrapping (KW) and KW padding (KWP)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_RIPEMD160\_C**

Enable RIPEMD-160 hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

- No (disabled)

**Certificates** Contains:

- [CONFIG\\_MBEDTLS\\_PEM\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_PEM\\_WRITE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CRL\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CSR\\_PARSE\\_C](#)

### **CONFIG\_MBEDTLS\_PEM\_PARSE\_C**

Read & Parse PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_PEM\_WRITE\_C**

Write PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C**

X.509 CRL parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Revocation Lists.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C**

X.509 CSR parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Signing Requests

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECP\_C**

Elliptic Curve Ciphers

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DHM\_C**

Diffie-Hellman-Merkle key exchange (DHM)

*Found in: [Component config](#) > [mbedtls](#)*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file *mbedtls/dhm.h* file.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECDH\_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECDSA\_C**

Elliptic Curve DSA

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECJPAKE\_C**

Elliptic curve J-PAKE

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP192R1\_ENABLED**

Enable SECP192R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192R1 Elliptic Curve.

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP224R1\_ENABLED**

Enable SECP224R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256R1\_ENABLED**

Enable SECP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP384R1\_ENABLED**

Enable SECP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP384R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP521R1\_ENABLED**

Enable SECP521R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP521R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192K1\_ENABLED**

Enable SECP192K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224K1\_ENABLED**

Enable SECP224K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED

Enable BP512R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED

Enable CURVE25519 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for CURVE25519 Elliptic Curve.

### CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM

NIST 'modulo p' optimisations

*Found in: [Component config](#) > [mbedtls](#)*

NIST 'modulo p' optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ECP\_FIXED\_POINT\_OPTIM

Enable fixed-point multiplication optimisations

*Found in: [Component config](#) > [mbedtls](#)*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Enabling this configuration option increases the flash footprint (about 29KB if all Elliptic Curve selected) in the application binary.

# end of Elliptic Curve options

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_POLY1305\_C

Poly1305 MAC algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for Poly1305 MAC algorithm.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CHACHA20\_C

Chacha20 stream cipher

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for Chacha20 stream cipher.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CHACHAPOLY\_C

ChaCha20-Poly1305 AEAD algorithm

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#)

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#) && [CONFIG\\_MBEDTLS\\_POLY1305\\_C](#)

### CONFIG\_MBEDTLS\_HKDF\_C

HKDF algorithm (RFC 5869)

*Found in:* [Component config](#) > [mbedtls](#)

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_C

Enable the threading abstraction layer

*Found in:* [Component config](#) > [mbedtls](#)

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_ALT

Enable threading alternate implementation

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

Enable threading alt to allow your own alternate threading implementation.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

### CONFIG\_MBEDTLS\_THREADING\_PTHREAD

Enable threading pthread implementation

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

Enable the pthread wrapper layer for the threading layer.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

### CONFIG\_MBEDTLS\_ERROR\_STRINGS

Enable error code to error string conversion

*Found in:* [Component config](#) > [mbedtls](#)

Enables `mbedtls_strerror()` for converting error codes to error strings. Disabling this config can save some code/rodata size as the error string conversion implementation is replaced with an empty stub.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_USE\_CRYPTO\_ROM\_IMPL**

Use ROM implementation of the crypto algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable this flag to use mbedtls crypto algorithm from ROM instead of ESP-IDF.

This configuration option saves flash footprint in the application binary. Note that the version of mbedtls crypto algorithm library in ROM(ECO1~ECO3) is v2.16.12, and the version of mbedtls crypto algorithm library in ROM(ECO4) is v3.6.0. We have done the security analysis of the mbedtls revision in ROM (ECO1~ECO4) and ensured that affected symbols have been patched (removed). If in the future mbedtls revisions there are security issues that also affects the version in ROM (ECO1~ECO4) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

**Default value:**

- No (disabled) if ESP\_ROM\_HAS\_MBEDTLS\_CRYPTOLIB

**CONFIG\_MBEDTLS\_FS\_IO**

Enable functions that use the filesystem

*Found in: [Component config](#) > [mbedtls](#)*

This option enables functions in mbedtls that use the filesystem. It uses the default filesystem support for the target, which is added through vfs component for ESP32 based targets or by the host system when the target is Linux.

**Default value:**

- Yes (enabled)

**ESP-MQTT Configurations** Contains:

- [CONFIG\\_MQTT\\_CUSTOM\\_OUTBOX](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_311](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_5](#)
- [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)
- [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_EXPIRED\\_TIMEOUT\\_MS](#)
- [CONFIG\\_MQTT\\_REPORT\\_DELETED\\_MESSAGES](#)
- [CONFIG\\_MQTT\\_SKIP\\_PUBLISH\\_IF\\_DISCONNECTED](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_DATA\\_ON\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_MQTT\\_MSG\\_ID\\_INCREMENTAL](#)

**CONFIG\_MQTT\_PROTOCOL\_311**

Enable MQTT protocol 3.1.1

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_PROTOCOL\_5

Enable MQTT protocol 5.0

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will not support MQTT 5.0

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TRANSPORT\_SSL

Enable MQTT over SSL

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET

Enable MQTT over Websocket

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE

Enable MQTT over Websocket Secure

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET\\_SECURE](#)*

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_MSG\_ID\_INCREMENTAL

Use Incremental Message Id

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED

Skip publish if disconnected

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The

MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_REPORT\_DELETED\_MESSAGES

Report deleted messages

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG

MQTT Using custom configurations

*Found in: Component config > ESP-MQTT Configurations*

Custom MQTT configurations.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TCP\_DEFAULT\_PORT

Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over TCP port

**Default value:**

- 1883 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_SSL\_DEFAULT\_PORT

Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over SSL port

**Default value:**

- 8883 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG* && *CONFIG\_MQTT\_TRANSPORT\_SSL*

### CONFIG\_MQTT\_WS\_DEFAULT\_PORT

Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over Websocket port

**Default value:**

- 80 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG* && *CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET*

### CONFIG\_MQTT\_WSS\_DEFAULT\_PORT

Default MQTT over Websocket Secure port

Found in: *Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over Websocket Secure port

**Default value:**

- 443 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG* && *CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET* && *CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE*

### CONFIG\_MQTT\_BUFFER\_SIZE

Default MQTT Buffer Size

Found in: *Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

This buffer size using for both transmit and receive

**Default value:**

- 1024 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_TASK\_STACK\_SIZE

MQTT task stack size

Found in: *Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task stack size

**Default value:**

- 6144 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_DISABLE\_API\_LOCKS

Disable API locks

Found in: *Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_TASK\_PRIORITY

MQTT task priority

Found in: *Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_POLL\_READ\_TIMEOUT\_MS

MQTT transport poll read timeout

Found in: *Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Timeout when polling underlying transport for read.

**Default value:**

- 1000 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE

Number of queued events.

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

A value higher than 1 enables multiple queued events.

**Default value:**

- 1 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED

Enable MQTT task core selection

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

This will enable core selection

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION

Core to use ?

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)*

Available options:

- Core 0 ([CONFIG\\_MQTT\\_USE\\_CORE\\_0](#))
- Core 1 ([CONFIG\\_MQTT\\_USE\\_CORE\\_1](#))

### CONFIG\_MQTT\_OUTBOX\_DATA\_ON\_EXTERNAL\_MEMORY

Use external memory for outbox data

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set to true to use external memory for outbox data.

**Default value:**

- No (disabled) if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_CUSTOM\_OUTBOX

Enable custom outbox implementation

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources: `idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)`

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_OUTBOX\_EXPIRED\_TIMEOUT\_MS

Outbox message expired timeout[ms]

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib** Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_TIME_SYSCALL`

**CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING**

Line ending for UART output

*Found in:* [Component config](#) > [Newlib](#)

This option allows configuring the desired line endings sent to UART when a newline ('n', LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (`drivers/uart.h`).

Available options:

- CRLF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_CRLF`)
- LF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_LF`)
- CR (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_CR`)

**CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING**

Line ending for UART input

*Found in:* [Component config](#) > [Newlib](#)

This option allows configuring which input sequence on UART produces a newline ('n', LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (`drivers/uart.h`).

Available options:

- CRLF (`CONFIG_NEWLIB_STDIN_LINE_ENDING_CRLF`)
- LF (`CONFIG_NEWLIB_STDIN_LINE_ENDING_LF`)
- CR (`CONFIG_NEWLIB_STDIN_LINE_ENDING_CR`)

**CONFIG\_NEWLIB\_NANO\_FORMAT**

Enable 'nano' formatting options for printf/scanf family

*Found in:* [Component config](#) > [Newlib](#)

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for '--enable-newlib-nano-formatted-io': <https://sourceware.org/newlib/README>

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP\_ROM\_HAS\_NEWLIB\_NANO\_FORMAT and ESP\_ROM\_HAS\_NEWLIB\_NORMAL\_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

## CONFIG\_NEWLIB\_TIME\_SYSCALL

Timers used for gettimeofday function

*Found in: [Component config > Newlib](#)*

This setting defines which hardware timers are used to implement 'gettimeofday' and 'time' functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used,** timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC\_STORE registers are** used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC\_HRT)
- RTC (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC)
- High-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_HRT)
- None (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_NONE)

**NVS** Contains:

- [CONFIG\\_NVS\\_LEGACY\\_DUP\\_KEYS\\_COMPATIBILITY](#)
- [CONFIG\\_NVS\\_ENCRYPTION](#)
- [CONFIG\\_NVS\\_COMPATIBLE\\_PRE\\_V4\\_3\\_ENCRYPTION\\_FLAG](#)
- [CONFIG\\_NVS\\_ASSERT\\_ERROR\\_CHECK](#)

## CONFIG\_NVS\_ENCRYPTION

Enable NVS encryption

*Found in: [Component config > NVS](#)*

This option enables encryption for NVS. When enabled, XTS-AES is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition (enabling flash encryption is mandatory here) or to be derived from an HMAC key burnt in eFuse.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED` && (`CONFIG_SECURE_FLASH_ENC_ENABLED` || `SOC_HMAC_SUPPORTED`)

**CONFIG\_NVS\_COMPATIBLE\_PRE\_V4\_3\_ENCRYPTION\_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in:* `Component config > NVS`

Enabling this will ignore "encrypted" flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have "encrypted" flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**CONFIG\_NVS\_ASSERT\_ERROR\_CHECK**

Use assertions for error checking

*Found in:* `Component config > NVS`

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**

- No (disabled)

**CONFIG\_NVS\_LEGACY\_DUP\_KEYS\_COMPATIBILITY**

Enable legacy `nvs_set` function behavior when same key is reused with different data types

*Found in:* `Component config > NVS`

Enabling this option will switch the `nvs_set()` family of functions to the legacy mode: when called repeatedly with the same key but different data type, the existing value in the NVS remains active and the new value is just stored, actually not accessible through corresponding `nvs_get()` call for the key given. Use this option only when your application relies on such NVS API behaviour.

**Default value:**

- No (disabled)

**NVS Security Provider** Contains:

- `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`
- `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME`

**CONFIG\_NVS\_SEC\_KEY\_PROTECTION\_SCHEME**

NVS Encryption: Key Protection Scheme

*Found in:* `Component config > NVS Security Provider`

This choice defines the default NVS encryption keys protection scheme; which will be used for the default NVS partition. Users can use the corresponding scheme registration APIs to register other schemes for the default as well as other NVS partitions.

Available options:

- Using Flash Encryption (`CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC`)  
Protect the NVS Encryption Keys using Flash Encryption Requires a separate 'nvs\_keys' partition (which will be encrypted by flash encryption) for storing the NVS encryption keys
- Using HMAC peripheral (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`)  
Derive and protect the NVS Encryption Keys using the HMAC peripheral Requires the specified eFuse block (`NVS_SEC_HMAC_EFUSE_KEY_ID` or the v2 API argument) to be empty or pre-written with a key with the purpose `ESP_EFUSE_KEY_PURPOSE_HMAC_UP`

### **CONFIG\_NVS\_SEC\_HMAC\_EFUSE\_KEY\_ID**

eFuse key ID storing the HMAC key

*Found in: [Component config](#) > [NVS Security Provider](#)*

eFuse block key ID storing the HMAC key for deriving the NVS encryption keys

Note: The eFuse block key ID required by the HMAC scheme (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`) is set using this config when the default NVS partition is initialized with `nvs_flash_init()`. The eFuse block key ID can also be set at runtime by passing the appropriate value to the NVS security scheme registration APIs.

**Range:**

- from 0 to 6 if [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#)

**Default value:**

- 6 if [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#)

**OpenThread** Contains:

- [CONFIG\\_OPENTHREAD\\_ENABLED](#)
- [OpenThread Spinel](#)

### **CONFIG\_OPENTHREAD\_ENABLED**

OpenThread

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**

- No (disabled)

**Thread Version Message** Contains:

- [CONFIG\\_OPENTHREAD\\_PACKAGE\\_NAME](#)
- [CONFIG\\_OPENTHREAD\\_PLATFORM\\_INFO](#)

### **CONFIG\_OPENTHREAD\_PACKAGE\_NAME**

OpenThread package name

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Version Message](#)*

The OpenThread package name.

**Default value:**

- "openthread-esp32" if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

## CONFIG\_OPENTHREAD\_PLATFORM\_INFO

platform information

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Version Message*

The OpenThread platform information.

**Default value:**

- "esp32" if *CONFIG\_OPENTHREAD\_ENABLED*

**Thread Console** Contains:

- *CONFIG\_OPENTHREAD\_CLI*
- *CONFIG\_OPENTHREAD\_CONSOLE\_TYPE*

## CONFIG\_OPENTHREAD\_CONSOLE\_TYPE

OpenThread console type

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Console*

Select OpenThread console type

Available options:

- OpenThread console type UART (*CONFIG\_OPENTHREAD\_CONSOLE\_TYPE\_UART*)
- OpenThread console type USB Serial/JTAG Controller (*CONFIG\_OPENTHREAD\_CONSOLE\_TYPE\_USB\_SERIAL\_JTAG*)

## CONFIG\_OPENTHREAD\_CLI

Enable Openthread Command-Line Interface

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Console*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**Thread Core Features** Contains:

- *CONFIG\_OPENTHREAD\_BORDER\_ROUTER*
- *CONFIG\_OPENTHREAD\_COMMISSIONER*
- *CONFIG\_OPENTHREAD\_CSL\_ENABLE*
- *CONFIG\_OPENTHREAD\_DIAG*
- *CONFIG\_OPENTHREAD\_DNS\_CLIENT*
- *CONFIG\_OPENTHREAD\_DNS64\_CLIENT*
- *CONFIG\_OPENTHREAD\_JOINER*
- *CONFIG\_OPENTHREAD\_LINK\_METRICS*
- *CONFIG\_OPENTHREAD\_MACFILTER\_ENABLE*
- *CONFIG\_OPENTHREAD\_RX\_ON\_WHEN\_IDLE*
- *CONFIG\_OPENTHREAD\_RADIO\_STATS\_ENABLE*
- *CONFIG\_OPENTHREAD\_SRP\_CLIENT*
- *CONFIG\_OPENTHREAD\_TIME\_SYNC*
- *OpenThread Stack Parameters*
- *Thread 15.4 Radio Link*
- *CONFIG\_OPENTHREAD\_DEVICE\_TYPE*
- *Thread Memory Allocation*

- [Thread Operational Dataset](#)
- [Thread Radio Co-Processor Feature](#)
- [Thread Trel Radio Link](#)

**Thread Operational Dataset** Contains:

- [CONFIG\\_OPENTHREAD\\_NETWORK\\_EXTPANID](#)
- [CONFIG\\_OPENTHREAD\\_MESH\\_LOCAL\\_PREFIX](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_CHANNEL](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_MASTERKEY](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_NAME](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_PANID](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_PSKC](#)

### **CONFIG\_OPENTHREAD\_NETWORK\_NAME**

OpenThread network name

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Operational Dataset*

**Default value:**

- "OpenThread-ESP" if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_MESH\_LOCAL\_PREFIX**

OpenThread mesh local prefix, format <address>/<plen>

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Operational Dataset*

A string in the format "<address>/<plen>", where <address> is an IPv6 address and <plen> is a prefix length. For example "fd00:db8:a0:0::/64"

**Default value:**

- "fd00:db8:a0:0::/64" if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_NETWORK\_CHANNEL**

OpenThread network channel

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Operational Dataset*

**Range:**

- from 11 to 26 if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**Default value:**

- 15 if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_NETWORK\_PANID**

OpenThread network pan id

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Operational Dataset*

**Range:**

- from 0 to 0xFFFFE if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**Default value:**

- "0x1234" if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_NETWORK\_EXTPANID

OpenThread extended pan id

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#) > [Thread Operational Dataset](#)*

The OpenThread network extended pan id in hex string format

**Default value:**

- dead00beef00cafe if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_NETWORK\_MASTERKEY

OpenThread network key

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#) > [Thread Operational Dataset](#)*

The OpenThread network network key in hex string format

**Default value:**

- 00112233445566778899aabbccddeeff if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_NETWORK\_PSKC

OpenThread pre-shared commissioner key

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#) > [Thread Operational Dataset](#)*

The OpenThread pre-shared commissioner key in hex string format

**Default value:**

- 104810e2315100afd6bc9215a6bfac53 if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_DEVICE\_TYPE

Thread device type

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#)*

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (CONFIG\_OPENTHREAD\_FTD)  
Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (CONFIG\_OPENTHREAD\_MTD)  
Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (CONFIG\_OPENTHREAD\_RADIO)  
Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

**Thread Trel Radio Link** Contains:

- [CONFIG\\_OPENTHREAD\\_RADIO\\_TREL](#)

### CONFIG\_OPENTHREAD\_RADIO\_TREL

Enable Thread Radio Encapsulation Link (TREL)

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Trel Radio Link*

Select this option to enable Thread Radio Encapsulation Link.

**Default value:**

- No (disabled) if (EXAMPLE\_CONNECT\_WIFI || EXAMPLE\_CONNECT\_ETHERNET) && CONFIG\_OPENTHREAD\_ENABLED

### CONFIG\_OPENTHREAD\_TREL\_PORT

The port of openthread trel service

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Trel Radio Link > CONFIG\_OPENTHREAD\_RADIO\_TREL*

Configure the port number of TREL service.

**Default value:**

- 12390 if CONFIG\_OPENTHREAD\_RADIO\_TREL && (EXAMPLE\_CONNECT\_WIFI || EXAMPLE\_CONNECT\_ETHERNET) && CONFIG\_OPENTHREAD\_ENABLED

**Thread 15.4 Radio Link** Contains:

- CONFIG\_OPENTHREAD\_RADIO\_TYPE

### CONFIG\_OPENTHREAD\_RADIO\_TYPE

Config the Thread radio type with 15.4 link

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread 15.4 Radio Link*

Configure how OpenThread connects to the 15.4 radio

Available options:

- Native 15.4 radio (CONFIG\_OPENTHREAD\_RADIO\_NATIVE)  
Select this to use the native 15.4 radio.
- Connect via UART (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_UART)  
Select this to connect to a Radio Co-Processor via UART.
- Connect via SPI (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_SPI)  
Select this to connect to a Radio Co-Processor via SPI.
- Disable the Thread radio based on 15.4 link (CONFIG\_OPENTHREAD\_RADIO\_154\_NONE)  
Select this to disable the Thread radio based on 15.4 link.

**Thread Radio Co-Processor Feature** Contains:

- CONFIG\_OPENTHREAD\_NCP\_VENDOR\_HOOK
- CONFIG\_OPENTHREAD\_RCP\_TRANSPORT

## CONFIG\_OPENTHREAD\_RCP\_TRANSPORT

The RCP transport type

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Radio Co-Processor Feature*

Available options:

- UART RCP (CONFIG\_OPENTHREAD\_RCP\_UART)  
Select this to enable UART connection to host.
- SPI RCP (CONFIG\_OPENTHREAD\_RCP\_SPI)  
Select this to enable SPI connection to host.

## CONFIG\_OPENTHREAD\_NCP\_VENDOR\_HOOK

Enable vendor command for RCP

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Radio Co-Processor Feature*

Select this to enable OpenThread NCP vendor commands.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_RADIO* && *CONFIG\_OPENTHREAD\_ENABLED*

## CONFIG\_OPENTHREAD\_BORDER\_ROUTER

Enable Border Router

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable border router features in OpenThread.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_FTD* && *CONFIG\_OPENTHREAD\_ENABLED*

## CONFIG\_OPENTHREAD\_COMMISSIONER

Enable Commissioner

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**Commissioner Configurations** Contains:

- *CONFIG\_OPENTHREAD\_COMM\_MAX\_JOINER\_ENTRIES*

## CONFIG\_OPENTHREAD\_COMM\_MAX\_JOINER\_ENTRIES

The size of max commissioning joiner entries

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > CONFIG\_OPENTHREAD\_COMMISSIONER > Commissioner Configurations*

**Default value:**

- 2 if *CONFIG\_OPENTHREAD\_COMMISSIONER* && *CONFIG\_OPENTHREAD\_ENABLED*

## CONFIG\_OPENTHREAD\_JOINER

Enable Joiner

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

## CONFIG\_OPENTHREAD\_SRP\_CLIENT

Enable SRP Client

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

## SRP Client Configurations

 Contains:

- *CONFIG\_OPENTHREAD\_SRP\_CLIENT\_MAX\_SERVICES*

## CONFIG\_OPENTHREAD\_SRP\_CLIENT\_MAX\_SERVICES

Specifies number of service entries in the SRP client service pool

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > CONFIG\_OPENTHREAD\_SRP\_CLIENT > SRP Client Configurations*

Set the max buffer size of service entries in the SRP client service pool.

**Default value:**

- 5 if *CONFIG\_OPENTHREAD\_SRP\_CLIENT* && *CONFIG\_OPENTHREAD\_ENABLED*

## CONFIG\_OPENTHREAD\_DNS\_CLIENT

Enable DNS Client

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable DNS Client in OpenThread.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_DNS64\_CLIENT

Enable DNS64 Client

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to acquire NAT64 address from dns servers.

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_IPV4* && *CONFIG\_OPENTHREAD\_ENABLED*

**DNS64 Client Configurations** Contains:

- *CONFIG\_OPENTHREAD\_DNS\_SERVER\_ADDR*

### CONFIG\_OPENTHREAD\_DNS\_SERVER\_ADDR

DNS server address (IPv4)

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > CONFIG\_OPENTHREAD\_DNS64\_CLIENT > DNS64 Client Configurations*

Set the DNS server IPv4 address.

**Default value:**

- "8.8.8.8" if *CONFIG\_OPENTHREAD\_DNS64\_CLIENT* && *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_LINK\_METRICS

Enable link metrics feature

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable link metrics feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_MACFILTER\_ENABLE

Enable mac filter feature

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable mac filter feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_CSL\_ENABLE

Enable CSL feature

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable CSL feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CSL Configurations** Contains:

- [CONFIG\\_OPENTHREAD\\_CSL\\_DEBUG\\_ENABLE](#)
- [CONFIG\\_OPENTHREAD\\_CSL\\_UNCERTAIN](#)
- [CONFIG\\_OPENTHREAD\\_CSL\\_ACCURACY](#)

### **CONFIG\_OPENTHREAD\_CSL\_ACCURACY**

The current CSL rx/tx scheduling drift, in units of  $\pm$  ppm

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#) > [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#) > [CSL Configurations](#)*

The current accuracy of the clock used for scheduling CSL operations

**Default value:**

- 1 if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#) && [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_CSL\_UNCERTAIN**

The CSL Uncertainty in units of 10 us.

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#) > [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#) > [CSL Configurations](#)*

The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.

**Default value:**

- 1 if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#) && [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_CSL\_DEBUG\_ENABLE**

Enable CSL debug

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#) > [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#) > [CSL Configurations](#)*

Select this option to set rx on when sleep in CSL feature, only for debug

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#) && [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_TIME\_SYNC**

Enable the time synchronization service feature

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#)*

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_RADIO\_STATS\_ENABLE**

Enable Radio Statistics feature

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#)*

Select this option to enable the radio statistics feature, you can use radio command to print some radio Statistics information.

**Default value:**

- No (disabled) if `(CONFIG_OPENTHREAD_FTD || CONFIG_OPENTHREAD_MTD) && CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_RX\_ON\_WHEN\_IDLE**

Enable OpenThread radio capability rx on when idle

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable OpenThread radio capability rx on when idle. Do not support this feature when SW coexistence is enabled.

**Default value:**

- No (disabled) if `CONFIG_ESP_COEX_SW_COEXIST_ENABLE && CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_DIAG**

Enable diag

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

**Thread Memory Allocation** Contains:

- `CONFIG_OPENTHREAD_PLATFORM_MALLOC_CAP_SPIRAM`
- `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT`

**CONFIG\_OPENTHREAD\_PLATFORM\_MALLOC\_CAP\_SPIRAM**

Allocate memory from PSRAM

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Memory Allocation*

Select this option to allocate buffer from PSRAM for Thread

**Default value:**

- Yes (enabled) if `(CONFIG_SPIRAM_USE_CAPS_ALLOC || CONFIG_SPIRAM_USE_MALLOC) && CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_PLATFORM\_MSGPOOL\_MANAGEMENT**

Allocate message pool buffer from PSRAM

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > Thread Memory Allocation*

If enabled, the message pool is managed by platform defined logic.

**Default value:**

- No (disabled) if `(CONFIG_SPIRAM_USE_CAPS_ALLOC || CONFIG_SPIRAM_USE_MALLOC) && CONFIG_OPENTHREAD_ENABLED`

**OpenThread Stack Parameters** Contains:

- `CONFIG_OPENTHREAD_MAC_MAX_CSMA_BACKOFFS_DIRECT`
- `CONFIG_OPENTHREAD_PREFERRED_CHANNEL_MASK`
- `CONFIG_OPENTHREAD_SUPPORTED_CHANNEL_MASK`
- `CONFIG_OPENTHREAD_XTAL_ACCURACY`
- `CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS`
- `CONFIG_OPENTHREAD_MLE_MAX_CHILDREN`
- `CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES`
- `CONFIG_OPENTHREAD_UART_BUFFER_SIZE`
- *Thread Address Query Config*

**Thread Address Query Config** Contains:

- `CONFIG_OPENTHREAD_ADDRESS_QUERY_RETRY_DELAY`
- `CONFIG_OPENTHREAD_ADDRESS_QUERY_MAX_RETRY_DELAY`
- `CONFIG_OPENTHREAD_ADDRESS_QUERY_TIMEOUT`

**CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_TIMEOUT**

Timeout (in seconds) for a address notification response after sending an address query.

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters > Thread Address Query Config*

**Default value:**

- 3 if (`CONFIG_OPENTHREAD_FTD` || `CONFIG_OPENTHREAD_MTD`) && `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_RETRY\_DELAY**

Initial retry delay for address query (in seconds).

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters > Thread Address Query Config*

**Default value:**

- 15 if (`CONFIG_OPENTHREAD_FTD` || `CONFIG_OPENTHREAD_MTD`) && `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_MAX\_RETRY\_DELAY**

Maximum retry delay for address query (in seconds).

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters > Thread Address Query Config*

**Default value:**

- 120 if (`CONFIG_OPENTHREAD_FTD` || `CONFIG_OPENTHREAD_MTD`) && `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_PREFERRED\_CHANNEL\_MASK**

Preferred channel mask

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters*

**Default value:**

- "0x7fff800" if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_SUPPORTED\_CHANNEL\_MASK

Supported channel mask

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters*

**Default value:**

- "0x7fff800" if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_NUM\_MESSAGE\_BUFFERS

The number of openthread message buffers

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters*

**Default value:**

- 65 if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_XTAL\_ACCURACY

The accuracy of the XTAL

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters*

The device's XTAL accuracy, in ppm.

**Default value:**

- 130 if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_MLE\_MAX\_CHILDREN

The size of max MLE children entries

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters*

**Default value:**

- 10 if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_TMF\_ADDR\_CACHE\_ENTRIES

The size of max TMF address cache entries

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters*

**Default value:**

- 20 if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_UART\_BUFFER\_SIZE

The uart received buffer size of openthread

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Core Features > OpenThread Stack Parameters*

Set the OpenThread UART buffer size.

**Default value:**

- 2048 if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_MAC\_MAX\_CSMA\_BACKOFFS\_DIRECT

Maximum backoffs times before declaring a channel access failure.

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Core Features](#) > [OpenThread Stack Parameters](#)*

The maximum number of backoffs the CSMA-CA algorithm will attempt before declaring a channel access failure.

**Default value:**

- 4 if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**Thread Log** Contains:

- [CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_DYNAMIC](#)
- [CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL](#)

### CONFIG\_OPENTHREAD\_LOG\_LEVEL\_DYNAMIC

Enable dynamic log level control

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Log](#)*

Select this option to enable dynamic log level control for OpenThread

**Default value:**

- Yes (enabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_LOG\_LEVEL

OpenThread log verbosity

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Log](#)*

Select OpenThread log level.

Available options:

- No logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_NONE](#))
- Error logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_CRIT](#))
- Warning logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_WARN](#))
- Notice logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_NOTE](#))
- Info logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_INFO](#))
- Debug logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_DEBG](#))

**Thread Extended Features** Contains:

- [CONFIG\\_OPENTHREAD\\_HEADER\\_CUSTOM](#)

### CONFIG\_OPENTHREAD\_HEADER\_CUSTOM

Use a header file defined by customer

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#) > [Thread Extended Features](#)*

This option allows users to tailor the values of openthread macros according to their requirements. The openthread submodule contains numerous macros, each with a default value set. In the Kconfig of ESP openthread, users can set specific openthread parameters, which will be applied for certain openthread macros in the openthread-core-esp32x-xxx-config.h file. During compilation, the values specified in openthread-core-esp32x-xxx-config.h will replace the default settings in the openthread submodule.

However, Kconfig does not cover all openthread macros, particularly those typically using default values. For such macros, users can enable the `OPENTHREAD_HEADER_CUSTOM` option in the Kconfig and provide a custom header file. Macros defined in the custom header file will have the highest priority.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**OpenThread Custom Header Config** Contains:

- `CONFIG_OPENTHREAD_CUSTOM_HEADER_FILE_NAME`
- `CONFIG_OPENTHREAD_CUSTOM_HEADER_PATH`

**CONFIG\_OPENTHREAD\_CUSTOM\_HEADER\_PATH**

Path of custom header file

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Extended Features > CONFIG\_OPENTHREAD\_HEADER\_CUSTOM > OpenThread Custom Header Config*

Please use relative paths with respect to the project folder.

**Default value:**

- if `CONFIG_OPENTHREAD_HEADER_CUSTOM` && `CONFIG_OPENTHREAD_HEADER_CUSTOM` && `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_CUSTOM\_HEADER\_FILE\_NAME**

Name of custom header file

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED > Thread Extended Features > CONFIG\_OPENTHREAD\_HEADER\_CUSTOM > OpenThread Custom Header Config*

Name of custom header file.

**Default value:**

- "esp\_ot\_custom\_config.h" if `CONFIG_OPENTHREAD_HEADER_CUSTOM` && `CONFIG_OPENTHREAD_HEADER_CUSTOM` && `CONFIG_OPENTHREAD_ENABLED`

**OpenThread Spinel** Contains:

- `CONFIG_OPENTHREAD_SPINEL_ONLY`
- `CONFIG_OPENTHREAD_SPINEL_MAC_MAX_CSMA_BACKOFFS_DIRECT`
- `CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE`

**CONFIG\_OPENTHREAD\_SPINEL\_ONLY**

Enable OpenThread External Radio Spinel feature

*Found in: Component config > OpenThread > OpenThread Spinel*

Select this option to enable the OpenThread Radio Spinel for external protocol stack, such as Zigbee.

**Default value:**

- No (disabled)

**CONFIG\_OPENTHREAD\_SPINEL\_RX\_FRAME\_BUFFER\_SIZE**

The size of openthread spinel rx frame buffer

*Found in: Component config > OpenThread > OpenThread Spinel*

**Default value:**

- 1024 if (`CONFIG_OPENTHREAD_MTD` || `CONFIG_OPENTHREAD_RADIO`) && (`CONFIG_OPENTHREAD_ENABLED` || `CONFIG_OPENTHREAD_SPINEL_ONLY`)
- 2048 if (`CONFIG_OPENTHREAD_FTD` || `CONFIG_OPENTHREAD_SPINEL_ONLY`) && (`CONFIG_OPENTHREAD_ENABLED` || `CONFIG_OPENTHREAD_SPINEL_ONLY`)

### **CONFIG\_OPENTHREAD\_SPINEL\_MAC\_MAX\_CSMA\_BACKOFFS\_DIRECT**

Maximum backoffs times before declaring a channel access failure.

*Found in:* [Component config](#) > [OpenThread](#) > [OpenThread Spinel](#)

The maximum number of backoffs the CSMA-CA algorithm will attempt before declaring a channel access failure.

**Default value:**

- 4 if `CONFIG_OPENTHREAD_SPINEL_ONLY`

**Protocomm** Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`

### **CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_0**

Support protocomm security version 0 (no security)

*Found in:* [Component config](#) > [Protocomm](#)

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_1**

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

*Found in:* [Component config](#) > [Protocomm](#)

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_2**

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

*Found in:* [Component config](#) > [Protocomm](#)

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

**PThreads** Contains:

- [CONFIG\\_PTHREAD\\_TASK\\_NAME\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_CORE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_PRIO\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_STACK\\_SIZE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_STACK\\_MIN](#)

### **CONFIG\_PTHREAD\_TASK\_PRIO\_DEFAULT**

Default task priority

*Found in:* [Component config](#) > [PThreads](#)

Priority used to create new tasks with default pthread parameters.

**Range:**

- from 0 to 255

**Default value:**

- 5

### **CONFIG\_PTHREAD\_TASK\_STACK\_SIZE\_DEFAULT**

Default task stack size

*Found in:* [Component config](#) > [PThreads](#)

Stack size used to create new tasks with default pthread parameters.

**Default value:**

- 3072

### **CONFIG\_PTHREAD\_STACK\_MIN**

Minimum allowed pthread stack size

*Found in:* [Component config](#) > [PThreads](#)

Minimum allowed pthread stack size set in attributes passed to pthread\_create

**Default value:**

- 768

### **CONFIG\_PTHREAD\_TASK\_CORE\_DEFAULT**

Default pthread core affinity

*Found in:* [Component config](#) > [PThreads](#)

The default core to which pthreads are pinned.

Available options:

- No affinity ([CONFIG\\_PTHREAD\\_DEFAULT\\_CORE\\_NO\\_AFFINITY](#))
- Core 0 ([CONFIG\\_PTHREAD\\_DEFAULT\\_CORE\\_0](#))
- Core 1 ([CONFIG\\_PTHREAD\\_DEFAULT\\_CORE\\_1](#))

## CONFIG\_PTHREAD\_TASK\_NAME\_DEFAULT

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

### Default value:

- "pthread"

**SoC Settings** Contains:

- *MMU Config*

## MMU Config

**Main Flash configuration** Contains:

- *Optional and Experimental Features (READ DOCS FIRST)*
- *SPI Flash behavior when brownout*

**SPI Flash behavior when brownout** Contains:

- *CONFIG\_SPI\_FLASH\_BROWNOUT\_RESET\_XMC*

## CONFIG\_SPI\_FLASH\_BROWNOUT\_RESET\_XMC

Enable sending reset when brownout for XMC flash chips

*Found in: Component config > Main Flash configuration > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.

**Optional and Experimental Features (READ DOCS FIRST)** Contains:

- *CONFIG\_SPI\_FLASH\_AUTO\_SUSPEND*
- *CONFIG\_SPI\_FLASH\_FORCE\_ENABLE\_XMC\_C\_SUSPEND*
- *CONFIG\_SPI\_FLASH\_HPM\_DC*

## CONFIG\_SPI\_FLASH\_HPM\_DC

Support HPM using DC (READ DOCS FIRST)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

This feature needs your bootloader to be compiled DC-aware (BOOT-LOADER\_FLASH\_DC\_AWARE=y). Otherwise the chip will not be able to boot after a reset.

Available options:

- Auto (Enable when bootloader support enabled (BOOT-LOADER\_FLASH\_DC\_AWARE=y)) (CONFIG\_SPI\_FLASH\_HPM\_DC\_AUTO)
- Disable (READ DOCS FIRST) (CONFIG\_SPI\_FLASH\_HPM\_DC\_DISABLE)

### CONFIG\_SPI\_FLASH\_AUTO\_SUSPEND

Auto suspend long erase/write operations (READ DOCS FIRST)

*Found in: [Component config](#) > [Main Flash configuration](#) > [Optional and Experimental Features \(READ DOCS FIRST\)](#)*

This option is disabled by default because it is supported only for specific flash chips and for specific Espressif chips. To evaluate if you can use this feature refer to *Optional Features for Flash > Auto Suspend & Resume* of the *ESP-IDF Programming Guide*.

CAUTION: If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

If you are using an official Espressif module, please contact Espressif Business support to check if the module has the flash that support this feature installed. Also refer to *Concurrency Constraints for Flash on SPI1 > Flash Auto Suspend Feature* before enabling this option.

### CONFIG\_SPI\_FLASH\_FORCE\_ENABLE\_XMC\_C\_SUSPEND

Enable XMC-C series flash chip suspend feature anyway

*Found in: [Component config](#) > [Main Flash configuration](#) > [Optional and Experimental Features \(READ DOCS FIRST\)](#)*

XMC-C series is regarded as not qualified for the Suspend feature, since its specification has a tRS >= 1ms restriction. We strongly do not suggest using it for the Suspend feature. However, if your product in field has enabled this feature, you may still enable this config option to keep the legacy behavior.

For new users, DO NOT enable this config.

**SPI Flash driver** Contains:

- *Auto-detect flash chips*
- *CONFIG\_SPI\_FLASH\_BYPASS\_BLOCK\_ERASE*
- *CONFIG\_SPI\_FLASH\_ENABLE\_ENCRYPTED\_READ\_WRITE*
- *CONFIG\_SPI\_FLASH\_ENABLE\_COUNTERS*
- *CONFIG\_SPI\_FLASH\_ROM\_DRIVER\_PATCH*
- *CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE*
- *CONFIG\_SPI\_FLASH\_CHECK\_ERASE\_TIMEOUT\_DISABLED*
- *CONFIG\_SPI\_FLASH\_WRITE\_CHUNK\_SIZE*
- *CONFIG\_SPI\_FLASH\_OVERRIDE\_CHIP\_DRIVER\_LIST*
- *CONFIG\_SPI\_FLASH\_SIZE\_OVERRIDE*
- *CONFIG\_SPI\_FLASH\_SHARE\_SPI1\_BUS*
- *CONFIG\_SPI\_FLASH\_ROM\_IMPL*
- *CONFIG\_SPI\_FLASH\_VERIFY\_WRITE*
- *CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE*

### CONFIG\_SPI\_FLASH\_VERIFY\_WRITE

Verify SPI flash writes

*Found in: [Component config](#) > [SPI Flash driver](#)*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

### CONFIG\_SPI\_FLASH\_LOG\_FAILED\_WRITE

Log errors if verification fails

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

### **CONFIG\_SPI\_FLASH\_WARN\_SETTING\_ZERO\_TO\_ONE**

Log warning if writing zero bits to ones

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

### **CONFIG\_SPI\_FLASH\_ENABLE\_COUNTERS**

Enable operation counters

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option enables the following APIs:

- `esp_flash_reset_counters`
- `esp_flash_dump_counters`
- `esp_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

### **CONFIG\_SPI\_FLASH\_ROM\_DRIVER\_PATCH**

Enable SPI flash ROM driver patched functions

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

### **CONFIG\_SPI\_FLASH\_ROM\_IMPL**

Use `esp_flash` implementation in ROM

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as "y" in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- `SPI_FLASH_AUTO_SUSPEND` (C3, S3)

## CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE

Writing to dangerous flash regions

*Found in: [Component config](#) > [SPI Flash driver](#)*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the `esp_rom_XXX` SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

- Aborts (`CONFIG_SPI_FLASH_DANGEROUS_WRITE_ABORTS`)
- Fails (`CONFIG_SPI_FLASH_DANGEROUS_WRITE_FAILS`)
- Allowed (`CONFIG_SPI_FLASH_DANGEROUS_WRITE_ALLOWED`)

## CONFIG\_SPI\_FLASH\_SHARE\_SPI1\_BUS

Support other devices attached to SPI1 bus

*Found in: [Component config](#) > [SPI Flash driver](#)*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of `esp_flash` driver access to the main flash chip.

If you only need to use `esp_flash` driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

## CONFIG\_SPI\_FLASH\_BYPASS\_BLOCK\_ERASE

Bypass a block erase and always do sector erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

Some flash chips can have very high "max" erase times, especially for block erase (32KB or 64KB). This option allows to bypass "block erase" and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

## CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE

Enables yield operation during flash erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with `SPI_FLASH_ERASE_YIELD_DURATION_MS` and `SPI_FLASH_ERASE_YIELD_TICKS` after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check *SPI Flash API* reference documentation under section *OS Function*.

## CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS

Duration of erasing to yield CPUs (ms)

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

### CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_TICKS

CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE*

Defines how many ticks will be before returning to continue a erasing.

### CONFIG\_SPI\_FLASH\_WRITE\_CHUNK\_SIZE

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

### CONFIG\_SPI\_FLASH\_SIZE\_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY\_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY\_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

### CONFIG\_SPI\_FLASH\_CHECK\_ERASE\_TIMEOUT\_DISABLED

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

### CONFIG\_SPI\_FLASH\_OVERRIDE\_CHIP\_DRIVER\_LIST

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the *default\_registered\_chips* structure must be provided by the user.

See example: `custom_chip_driver` under `examples/storage` for more details.

**Auto-detect flash chips** Contains:

- `CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_GD_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_TH_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP`

### CONFIG\_SPI\_FLASH\_SUPPORT\_ISSI\_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_MXIC\_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_GD\_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip\_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

### CONFIG\_SPI\_FLASH\_SUPPORT\_WINBOND\_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_BOYA\_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_TH\_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

## CONFIG\_SPI\_FLASH\_ENABLE\_ENCRYPTED\_READ\_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

### SPIFFS Configuration Contains:

- *Debug Configuration*
- *CONFIG\_SPIFFS\_USE\_MAGIC*
- *CONFIG\_SPIFFS\_GC\_STATS*
- *CONFIG\_SPIFFS\_PAGE\_CHECK*
- *CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS*
- *CONFIG\_SPIFFS\_MAX\_PARTITIONS*
- *CONFIG\_SPIFFS\_USE\_MTIME*
- *CONFIG\_SPIFFS\_GC\_MAX\_RUNS*
- *CONFIG\_SPIFFS\_OBJ\_NAME\_LEN*
- *CONFIG\_SPIFFS\_META\_LENGTH*
- *SPIFFS Cache Configuration*
- *CONFIG\_SPIFFS\_PAGE\_SIZE*
- *CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS*

## CONFIG\_SPIFFS\_MAX\_PARTITIONS

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

### SPIFFS Cache Configuration Contains:

- *CONFIG\_SPIFFS\_CACHE*

## CONFIG\_SPIFFS\_CACHE

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**

- Yes (enabled)

## CONFIG\_SPIFFS\_CACHE\_WR

Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG\_SPIFFS\_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**

- Yes (enabled)

### **CONFIG\_SPIFFS\_CACHE\_STATS**

Enable SPIFFS Cache Statistics

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)*

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_PAGE\_CHECK**

Enable SPIFFS Page Check

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**

- Yes (enabled)

### **CONFIG\_SPIFFS\_GC\_MAX\_RUNS**

Set Maximum GC Runs

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**

- from 1 to 10000

**Default value:**

- 10

### **CONFIG\_SPIFFS\_GC\_STATS**

Enable SPIFFS GC Statistics

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_PAGE\_SIZE**

SPIFFS logical page size

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**

- from 256 to 1024

**Default value:**

- 256

### CONFIG\_SPIFFS\_OBJ\_NAME\_LEN

Set SPIFFS Maximum Name Length

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS\_OBJ\_NAME\_LEN - 1.

SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH should not exceed SPIFFS\_PAGE\_SIZE - 64.

**Range:**

- from 1 to 256

**Default value:**

- 32

### CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS

Enable symbolic links for image creation

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_USE\_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_USE\_MAGIC\_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [CONFIG\\_SPIFFS\\_USE\\_MAGIC](#)*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_META\_LENGTH

Size of per-file metadata field

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH should not exceed SPIFFS\_PAGE\_SIZE - 64.

**Default value:**

- 4

**CONFIG\_SPIFFS\_USE\_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**

- Yes (enabled)

**CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS**

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS\_META\_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time\_t support.

**Default value:**

- No (disabled) if *CONFIG\_SPIFFS\_META\_LENGTH*  $\geq$  8

**Debug Configuration** Contains:

- *CONFIG\_SPIFFS\_DBG*
- *CONFIG\_SPIFFS\_API\_DBG*
- *CONFIG\_SPIFFS\_CACHE\_DBG*
- *CONFIG\_SPIFFS\_CHECK\_DBG*
- *CONFIG\_SPIFFS\_TEST\_VISUALISATION*
- *CONFIG\_SPIFFS\_GC\_DBG*

**CONFIG\_SPIFFS\_DBG**

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**Default value:**

- No (disabled)

**CONFIG\_SPIFFS\_API\_DBG**

Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_GC\_DBG**

Enable SPIFFS Garbage Cleaner debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print GC debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CACHE\_DBG**

Enable SPIFFS Cache debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print cache debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CHECK\_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_TEST\_VISUALISATION**

Enable SPIFFS Filesystem Visualization

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enable this option to enable SPIFFS\_vis function in the API.

**Default value:**

- No (disabled)

**TCP Transport** Contains:

- [Websocket](#)

**Websocket** Contains:

- [CONFIG\\_WS\\_TRANSPORT](#)

### **CONFIG\_WS\_TRANSPORT**

Enable Websocket Transport

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#)*

Enable support for creating websocket transport.

**Default value:**

- Yes (enabled)

### CONFIG\_WS\_BUFFER\_SIZE

WebSocket transport buffer size

*Found in: [Component config](#) > [TCP Transport](#) > [WebSocket](#) > [CONFIG\\_WS\\_TRANSPORT](#)*

Size of the buffer used for constructing the HTTP Upgrade request during connect

**Default value:**

- 1024

### CONFIG\_WS\_DYNAMIC\_BUFFER

Using dynamic websocket transport buffer

*Found in: [Component config](#) > [TCP Transport](#) > [WebSocket](#) > [CONFIG\\_WS\\_TRANSPORT](#)*

If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

**Default value:**

- No (disabled)

**Ultra Low Power (ULP) Co-processor** Contains:

- [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)
- [ULP RISC-V Settings](#)

### CONFIG\_ULP\_COPROC\_ENABLED

Enable Ultra Low Power (ULP) Co-processor

*Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#)*

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

**Default value:**

- No (disabled)

### CONFIG\_ULP\_COPROC\_TYPE

ULP Co-processor type

*Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)*

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V.

Available options:

- ULP FSM (Finite State Machine) ([CONFIG\\_ULP\\_COPROC\\_TYPE\\_FSM](#))
- ULP RISC-V ([CONFIG\\_ULP\\_COPROC\\_TYPE\\_RISCV](#))
- LP core RISC-V ([CONFIG\\_ULP\\_COPROC\\_TYPE\\_LP\\_CORE](#))

### CONFIG\_ULP\_COPROC\_RESERVE\_MEM

RTC slow memory reserved for coprocessor

*Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)*

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

**Range:**

- from 32 to 8176 if `CONFIG_ULP_COPROC_ENABLED`

**Default value:**

- 512 if `CONFIG_ULP_COPROC_ENABLED`

**ULP RISC-V Settings** Contains:

- `CONFIG_ULP_RISCV_UART_BAUDRATE`
- `CONFIG_ULP_RISCV_I2C_RW_TIMEOUT`

**CONFIG\_ULP\_RISCV\_UART\_BAUDRATE**

Baudrate used by the bitbanged ULP RISC-V UART driver

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)

The accuracy of the bitbanged UART driver is limited, it is not recommend to increase the value above 19200.

**Default value:**

- 9600 if `CONFIG_ULP_COPROC_TYPE_RISCV`

**CONFIG\_ULP\_RISCV\_I2C\_RW\_TIMEOUT**

Set timeout for ULP RISC-V I2C transaction timeout in ticks.

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)

Set the ULP RISC-V I2C read/write timeout. Set this value to -1 if the ULP RISC-V I2C read and write APIs should wait forever. Please note that the tick rate of the ULP co-processor would be different than the OS tick rate of the main core and therefore can have different timeout value depending on which core the API is invoked on.

**Range:**

- from -1 to 4294967295 if `CONFIG_ULP_COPROC_TYPE_RISCV`

**Default value:**

- 500 if `CONFIG_ULP_COPROC_TYPE_RISCV`

**Unity unit testing library** Contains:

- `CONFIG_UNITY_ENABLE_COLOR`
- `CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER`
- `CONFIG_UNITY_ENABLE_FIXTURE`
- `CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIG_UNITY_ENABLE_64BIT`
- `CONFIG_UNITY_ENABLE_DOUBLE`
- `CONFIG_UNITY_ENABLE_FLOAT`

**CONFIG\_UNITY\_ENABLE\_FLOAT**

Support for float type

*Found in:* [Component config](#) > [Unity unit testing library](#)

If not set, assertions on float arguments will not be available.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_DOUBLE

Support for double type

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on double arguments will not be available.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_64BIT

Support for 64-bit integer types

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY\_ASSERT\_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_COLOR

Colorize test output

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, Unity will colorize test results using console escape sequences.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_IDF\_TEST\_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, then the following features will be available:

- TEST\_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: `unity_run_all_tests`, `unity_run_tests_with_filter`, `unity_run_single_test_by_name`.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via `unity_run_menu` function.

Disable if a different test registration mechanism is used.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_FIXTURE

Include Unity test fixture

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, `unity_fixture.h` header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_BACKTRACE\_ON\_FAIL

Print a backtrace when a unit test fails

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST\_ASSERT, TEST\_FAIL etc.

**Default value:**

- No (disabled)

### USB-OTG Contains:

- [CONFIG\\_USB\\_HOST\\_ENABLE\\_ENUM\\_FILTER\\_CALLBACK](#)
- [CONFIG\\_USB\\_HOST\\_HW\\_BUFFER\\_BIAS](#)
- [Hub Driver Configuration](#)
- [CONFIG\\_USB\\_HOST\\_CONTROL\\_TRANSFER\\_MAX\\_SIZE](#)

### CONFIG\_USB\_HOST\_CONTROL\_TRANSFER\_MAX\_SIZE

Largest size (in bytes) of transfers to/from default endpoints

*Found in: [Component config](#) > [USB-OTG](#)*

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device's control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device's with configuration descriptors larger than this limit cannot be supported

**Default value:**

- 256 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS

Hardware FIFO size biasing

*Found in: [Component config](#) > [USB-OTG](#)*

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

Available options:

- Balanced (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_BALANCED)
- Bias IN (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_IN)
- Periodic OUT (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_PERIODIC\_OUT)

**Hub Driver Configuration** Contains:

- *Root Port configuration*
- *CONFIG\_USB\_HOST\_HUBS\_SUPPORTED*

**Root Port configuration** Contains:

- *CONFIG\_USB\_HOST\_DEBOUNCE\_DELAY\_MS*
- *CONFIG\_USB\_HOST\_RESET\_HOLD\_MS*
- *CONFIG\_USB\_HOST\_RESET\_RECOVERY\_MS*
- *CONFIG\_USB\_HOST\_SET\_ADDR\_RECOVERY\_MS*

**CONFIG\_USB\_HOST\_DEBOUNCE\_DELAY\_MS**

Debounce delay in ms

*Found in: Component config > USB-OTG > Hub Driver Configuration > Root Port configuration*

On connection of a USB device, the USB 2.0 specification requires a "debounce interval with a minimum duration of 100ms" to allow the connection to stabilize (see USB 2.0 chapter 7.1.7.3 for more details). During the debounce interval, no new connection/disconnection events are registered.

The default value is set to 250 ms to be safe.

**Default value:**

- 250 if SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_RESET\_HOLD\_MS**

Reset hold in ms

*Found in: Component config > USB-OTG > Hub Driver Configuration > Root Port configuration*

The reset signaling can be generated on any Hub or Host Controller port by request from the USB System Software. The USB 2.0 specification requires that "the reset signaling must be driven for a minimum of 10ms" (see USB 2.0 chapter 7.1.7.5 for more details). After the reset, the hub port will transition to the Enabled state (refer to Section 11.5).

The default value is set to 30 ms to be safe.

**Default value:**

- 30 if SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_RESET\_RECOVERY\_MS**

Reset recovery delay in ms

*Found in: Component config > USB-OTG > Hub Driver Configuration > Root Port configuration*

After a port stops driving the reset signal, the USB 2.0 specification requires that the "USB System Software guarantees a minimum of 10 ms for reset recovery" before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

**Default value:**

- 30 if SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_SET\_ADDR\_RECOVERY\_MS**

SetAddress() recovery time in ms

*Found in: Component config > USB-OTG > Hub Driver Configuration > Root Port configuration*

"After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms. At the end of this interval, the device must be able to accept Setup packets addressed to the new address. Also, at the end of the recovery interval, the device must not respond to tokens sent to the old address (unless, of course, the old and new address is the same)." See USB 2.0 chapter 9.2.6.3 for more details.

The default value is set to 10 ms to be safe.

**Default value:**

- 10 if SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_HUBS\_SUPPORTED**

Support Hubs

*Found in: Component config > USB-OTG > Hub Driver Configuration*

Enables support of external Hubs.

**Default value:**

- No (disabled) if SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_HUB\_MULTI\_LEVEL**

Support multiple Hubs

*Found in: Component config > USB-OTG > Hub Driver Configuration > CONFIG\_USB\_HOST\_HUBS\_SUPPORTED*

Enables support for connecting multiple Hubs simultaneously.

**Default value:**

- Yes (enabled) if *CONFIG\_USB\_HOST\_HUBS\_SUPPORTED* && SOC\_USB\_OTG\_SUPPORTED

**Downstream Port configuration** Contains:

- *CONFIG\_USB\_HOST\_EXT\_PORT\_CUSTOM\_POWER\_ON\_DELAY\_ENABLE*
- *CONFIG\_USB\_HOST\_EXT\_PORT\_RESET\_RECOVERY\_DELAY\_MS*
- *CONFIG\_USB\_HOST\_EXT\_PORT\_SUPPORT\_LS*

**CONFIG\_USB\_HOST\_EXT\_PORT\_SUPPORT\_LS**

Support LS

*Found in: Component config > USB-OTG > Hub Driver Configuration > CONFIG\_USB\_HOST\_HUBS\_SUPPORTED > Downstream Port configuration*

Enables support of Low-speed devices, connected through the external Hub.

**Default value:**

- No (disabled) if *CONFIG\_IDF\_EXPERIMENTAL\_FEATURES* && *CONFIG\_USB\_HOST\_HUBS\_SUPPORTED* && SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_EXT\_PORT\_RESET\_RECOVERY\_DELAY\_MS**

Reset recovery delay in ms

*Found in:* [Component config](#) > [USB-OTG](#) > [Hub Driver Configuration](#) > [CONFIG\\_USB\\_HOST\\_HUBS\\_SUPPORTED](#) > [Downstream Port configuration](#)

After a port stops driving the reset signal, the USB 2.0 specification requires that the "USB System Software guarantees a minimum of 10 ms for reset recovery" before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

**Default value:**

- 30 if [CONFIG\\_USB\\_HOST\\_HUBS\\_SUPPORTED](#) && [SOC\\_USB\\_OTG\\_SUPPORTED](#)

**CONFIG\_USB\_HOST\_EXT\_PORT\_CUSTOM\_POWER\_ON\_DELAY\_ENABLE**

Custom bPwrOn2PwrGood value

*Found in:* [Component config](#) > [USB-OTG](#) > [Hub Driver Configuration](#) > [CONFIG\\_USB\\_HOST\\_HUBS\\_SUPPORTED](#) > [Downstream Port configuration](#)

Enables the possibility to configure custom time for the power-on sequence on a port until power is good on that port.

When enabled, applies the custom PwrOn2PwrGood delay. When disabled, applies the PwrOn2PwrGood value from the Hub Descriptor.

**Default value:**

- No (disabled) if [CONFIG\\_USB\\_HOST\\_HUBS\\_SUPPORTED](#) && [SOC\\_USB\\_OTG\\_SUPPORTED](#)

**CONFIG\_USB\_HOST\_EXT\_PORT\_CUSTOM\_POWER\_ON\_DELAY\_MS**

PwrOn2PwrGood delay in ms

*Found in:* [Component config](#) > [USB-OTG](#) > [Hub Driver Configuration](#) > [CONFIG\\_USB\\_HOST\\_HUBS\\_SUPPORTED](#) > [Downstream Port configuration](#) > [CONFIG\\_USB\\_HOST\\_EXT\\_PORT\\_CUSTOM\\_POWER\\_ON\\_DELAY\\_ENABLE](#)

Custom value of delay from the time the power-on sequence begins on a port until power is good on that port. Value 0 is used for a hub with no power switches.

The default value is 100 ms.

**Range:**

- from 0 to 5000 if [CONFIG\\_USB\\_HOST\\_EXT\\_PORT\\_CUSTOM\\_POWER\\_ON\\_DELAY\\_ENABLE](#) && [CONFIG\\_USB\\_HOST\\_HUBS\\_SUPPORTED](#) && [SOC\\_USB\\_OTG\\_SUPPORTED](#)

**Default value:**

- 100 if [CONFIG\\_USB\\_HOST\\_EXT\\_PORT\\_CUSTOM\\_POWER\\_ON\\_DELAY\\_ENABLE](#) && [CONFIG\\_USB\\_HOST\\_HUBS\\_SUPPORTED](#) && [SOC\\_USB\\_OTG\\_SUPPORTED](#)

**CONFIG\_USB\_HOST\_ENABLE\_ENUM\_FILTER\_CALLBACK**

Enable enumeration filter callback

*Found in:* [Component config](#) > [USB-OTG](#)

The enumeration filter callback is called before enumeration of each newly attached device. This callback allows users to control whether a device should be enumerated, and what configuration number to use when enumerating a device.

If enabled, the enumeration filter callback can be set via 'usb\_host\_config\_t' when calling 'usb\_host\_install()'.

**Default value:**

- No (disabled) if SOC\_USB\_OTG\_SUPPORTED

**Virtual file system** Contains:

- [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

**CONFIG\_VFS\_SUPPORT\_IO**

Provide basic I/O functions

*Found in: [Component config](#) > [Virtual file system](#)*

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

**Default value:**

- Yes (enabled)

**CONFIG\_VFS\_SUPPORT\_DIR**

Provide directory related functions

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir\_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**

- Yes (enabled)

**CONFIG\_VFS\_SUPPORT\_SELECT**

Provide select function

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for "select" on UART file descriptors is not required.

**CONFIG\_VFS\_SUPPRESS\_SELECT\_DEBUG\_OUTPUT**

Suppress select() related debug outputs

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#) > [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#)*

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**

- Yes (enabled)

**CONFIG\_VFS\_SELECT\_IN\_RAM**

Make VFS driver select() callbacks IRAM-safe

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > CONFIG\_VFS\_SUPPORT\_SELECT*

If enabled, VFS driver select() callback function will be placed in IRAM.

**Default value:**

- No (disabled)

**CONFIG\_VFS\_SUPPORT\_TERMIOS**

Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**

- Yes (enabled)

**CONFIG\_VFS\_MAX\_COUNT**

Maximum Number of Virtual Filesystems

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO*

Define maximum number of virtual filesystems that can be registered.

**Range:**

- from 1 to 20

**Default value:**

- 8

**Host File System I/O (Semihosting)** Contains:

- *CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS*

**CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS**

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

**Wear Levelling** Contains:

- *CONFIG\_WL\_SECTOR\_MODE*
- *CONFIG\_WL\_SECTOR\_SIZE*

## CONFIG\_WL\_SECTOR\_SIZE

Wear Levelling library sector size

*Found in: [Component config](#) > [Wear Levelling](#)*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

Available options:

- 512 (CONFIG\_WL\_SECTOR\_SIZE\_512)
- 4096 (CONFIG\_WL\_SECTOR\_SIZE\_4096)

## CONFIG\_WL\_SECTOR\_MODE

Sector store mode

*Found in: [Component config](#) > [Wear Levelling](#)*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:

- Performance (CONFIG\_WL\_SECTOR\_MODE\_PERF)
- Safety (CONFIG\_WL\_SECTOR\_MODE\_SAFE)

**Wi-Fi Provisioning Manager** Contains:

- [CONFIG\\_WIFI\\_PROV\\_BLE\\_NOTIFY](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_BONDING](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_SEC\\_CONN](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_FORCE\\_ENCRYPTION](#)
- [CONFIG\\_WIFI\\_PROV\\_KEEP\\_BLE\\_ON\\_AFTER\\_PROV](#)
- [CONFIG\\_WIFI\\_PROV\\_SCAN\\_MAX\\_ENTRIES](#)
- [CONFIG\\_WIFI\\_PROV\\_AUTOSTOP\\_TIMEOUT](#)
- [CONFIG\\_WIFI\\_PROV\\_STA\\_SCAN\\_METHOD](#)

## CONFIG\_WIFI\_PROV\_SCAN\_MAX\_ENTRIES

Max Wi-Fi Scan Result Entries

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**

- from 1 to 255

**Default value:**

- 16

**CONFIG\_WIFI\_PROV\_AUTOSTOP\_TIMEOUT**

Provisioning auto-stop timeout

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**

- from 5 to 600

**Default value:**

- 30

**CONFIG\_WIFI\_PROV\_BLE\_BONDING**

Enable BLE bonding

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

This option is applicable only when provisioning transport is BLE.

**CONFIG\_WIFI\_PROV\_BLE\_SEC\_CONN**

Enable BLE Secure connection flag

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_WIFI\_PROV\_BLE\_FORCE\_ENCRYPTION**

Force Link Encryption during characteristic Read / Write

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Used to enforce link encryption when attempting to read / write characteristic

**CONFIG\_WIFI\_PROV\_BLE\_NOTIFY**

Add support for Notification for provisioning BLE descriptors

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Used to enable support Notification in BLE descriptors of prov\* characteristics

**CONFIG\_WIFI\_PROV\_KEEP\_BLE\_ON\_AFTER\_PROV**

Keep BT on after provisioning is done

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

## CONFIG\_WIFI\_PROV\_DISCONNECT\_AFTER\_PROV

Terminate connection after provisioning is done

*Found in:* `Component config > Wi-Fi Provisioning Manager > CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`

### Default value:

- Yes (enabled) if `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`

## CONFIG\_WIFI\_PROV\_STA\_SCAN\_METHOD

Wifi Provisioning Scan Method

*Found in:* `Component config > Wi-Fi Provisioning Manager`

Available options:

- All Channel Scan (`CONFIG_WIFI_PROV_STA_ALL_CHANNEL_SCAN`)  
Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
- Fast Scan (`CONFIG_WIFI_PROV_STA_FAST_SCAN`)  
Scan will end after an AP matching with the SSID has been detected.

## CONFIG\_IDF\_EXPERIMENTAL\_FEATURES

Make experimental features visible

*Found in:*

By enabling this option, ESP-IDF experimental feature options will be visible.

Note you should still enable a certain experimental feature option to use it, and you should read the corresponding risk warning and known issue list carefully.

Current experimental feature list:

- `CONFIG_ESPTOOLPY_FLASHFREQ_120M` && `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR`
- `CONFIG_SPIRAM_SPEED_120M` && `CONFIG_SPIRAM_MODE_OCT`
- `CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH`
- `CONFIG_USB_HOST_EXT_PORT_SUPPORT_LS`
- `CONFIG_USB_HOST_EXT_PORT_RESET_ATTEMPTS`

### Default value:

- No (disabled)

## Deprecated options and their replacements

- `CONFIG_A2DP_ENABLE` (`CONFIG_BT_A2DP_ENABLE`)
- `CONFIG_A2D_INITIAL_TRACE_LEVEL` (`CONFIG_BT_LOG_A2D_TRACE_LEVEL`)

## 2.8 Provisioning API

### 2.8.1 Protocol Communication

#### Overview

The Protocol Communication (protocomm) component manages secure sessions and provides the framework for multiple transports. The application can also use the protocomm layer directly to have application-specific extensions for the provisioning or non-provisioning use cases.

Following features are available for provisioning:

- Communication security at the application level
  - `protocomm_security0` (no security)
  - `protocomm_security1` (Curve25519 key exchange + AES-CTR encryption/decryption)
  - `protocomm_security2` (SRP6a-based key exchange + AES-GCM encryption/decryption)
- Proof-of-possession (support with `protocomm_security1` only)
- Salt and Verifier (support with `protocomm_security2` only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Users can choose to implement their own security (even without using protobuf). Protocomm can also be used without any security layer.

Protocomm provides the framework for various transports:

- Bluetooth LE
- Wi-Fi (SoftAP + HTTPD)
- Console, in which case the handler invocation is automatically taken care of on the device side. See Transport Examples below for code snippets.

Note that for `protocomm_security1` and `protocomm_security2`, the client still needs to establish sessions by performing the two-way handshake. See *Unified Provisioning* for more details about the secure handshake logic.

## Enabling Protocomm Security Version

The protocomm component provides a project configuration menu to enable/disable support of respective security versions. The respective configuration options are as follows:

- Support `protocomm_security0`, with no security: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`, this option is enabled by default.
- Support `protocomm_security1` with Curve25519 key exchange + AES-CTR encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`, this option is enabled by default.
- Support `protocomm_security2` with SRP6a-based key exchange + AES-GCM encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`.

**Note:** Enabling multiple security versions at once offers the ability to control them dynamically but also increases the firmware size.

## SoftAP + HTTP Transport Example with Security 2

For sample usage, see `wifi_provisioning/src/scheme_softap.c`.

```

/* The endpoint handler to be registered with protocomm. This simply echoes back
↳the received data. */

        .service_uuid = {
            /* LSB <-----
            * -----> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of Bluetooth LE. */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can be kept_
↳NULL. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0, NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
    return pc;
}

/* The example function for stopping a protocomm instance. */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop the Bluetooth LE protocomm service. */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

## API Reference

### Header File

- [components/protocomm/include/common/protocomm.h](#)
- This header file can be included with:

```
#include "protocomm.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

PRIV\_REQUIRES protocomm

## Functions

*protocomm\_t* \***protocomm\_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the *protocomm\_t* structure initialized to NULL.

### Returns

- *protocomm\_t*\* : On success
- NULL : No memory for allocating new instance

void **protocomm\_delete** (*protocomm\_t* \*pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

**Parameters** *pc* -- [in] Pointer to the protocomm instance to be deleted

*esp\_err\_t* **protocomm\_add\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name, *protocomm\_req\_handler\_t* h, void \*priv\_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

---

### Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
  - This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the *protocomm\_t* instance structure.
- 

### Parameters

- *pc* -- [in] Pointer to the protocomm instance
- *ep\_name* -- [in] Endpoint identifier(name) string
- *h* -- [in] Endpoint handler function
- *priv\_data* -- [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

### Returns

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_remove\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

---

### Note:

- This function internally calls the registered `remove_endpoint()` function which is a member of the *protocomm\_t* instance structure.
- 

### Parameters

- *pc* -- [in] Pointer to the protocomm instance
- *ep\_name* -- [in] Endpoint identifier(name) string

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_open\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Allocates internal resources for new transport session.

---

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- 

**Parameters**

- **pc** -- [in] Pointer to the protocomm instance
- **session\_id** -- [in] Unique ID for a communication session

**Returns**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_close\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Frees internal resources used by a transport session.

---

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- 

**Parameters**

- **pc** -- [in] Pointer to the protocomm instance
- **session\_id** -- [in] Unique ID for a communication session

**Returns**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_req\_handle** (*protocomm\_t* \*pc, const char \*ep\_name, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

---

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
  - Resulting output buffer must be deallocated by the caller.
- 

**Parameters**

- **pc** -- [in] Pointer to the protocomm instance
- **ep\_name** -- [in] Endpoint identifier(name) string
- **session\_id** -- [in] Unique ID for a communication session
- **inbuf** -- [in] Input buffer contains input request data which is to be processed by the registered handler
- **inlen** -- [in] Length of the input buffer
- **outbuf** -- [out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** -- [out] Buffer length of the allocated output buffer

**Returns**

- `ESP_OK` : Request handled successfully
- `ESP_FAIL` : Internal error in execution of registered handler
- `ESP_ERR_NO_MEM` : Error allocating internal resource
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

*esp\_err\_t* **protocomm\_set\_security** (*protocomm\_t* \*pc, const char \*ep\_name, const *protocomm\_security\_t* \*sec, const void \*sec\_params)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

---

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
  - The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.
- 

**Parameters**

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string
- **sec** -- **[in]** Pointer to endpoint security instance
- **sec\_params** -- **[in]** Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 `sec_params` should contain pointer to struct of type `protocomm_security1_params_t` and `protocomm_security2_params_t` respectively. The contents of this pointer must be valid till the security session has been running and is not closed.

**Returns**

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_unset\_security** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Parameters**

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string

**Returns**

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn't exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

*esp\_err\_t* **protocomm\_set\_version** (*protocomm\_t* \*pc, const char \*ep\_name, const char \*version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

---

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Parameters**

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string
- **version** -- **[in]** Version identifier(name) string

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Version endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_unset\_version** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

**Parameters**

- **pc** -- **[in]** Pointer to the protocomm instance
- **ep\_name** -- **[in]** Endpoint identifier(name) string

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

**Type Definitions**

typedef *esp\_err\_t* (**protocomm\_req\_handler\_t**)(uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm **protocomm\_t**

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

---

**Note:** Structure of the protocomm object is kept private

---

**Header File**

- `components/protocomm/include/security/protocomm_security.h`
- This header file can be included with:

```
#include "protocomm_security.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

**Structures**

struct **protocomm\_security1\_params**

Protocomm Security 1 parameters: Proof Of Possession.

**Public Members**

const uint8\_t \***data**

Pointer to buffer containing the proof of possession data

uint16\_t **len**

Length (in bytes) of the proof of possession data

struct **protocomm\_security2\_params**

Protocomm Security 2 parameters: Salt and Verifier.

**Public Members**

const char \***salt**

Pointer to the buffer containing the salt

uint16\_t **salt\_len**

Length (in bytes) of the salt

const char \***verifier**

Pointer to the buffer containing the verifier

uint16\_t **verifier\_len**

Length (in bytes) of the verifier

struct **protocomm\_security**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**Note:** This structure should not have any dynamic members to allow re-entrancy

---

**Public Members**

int **ver**

Unique version number of security implementation

*esp\_err\_t* (\***init**)(*protocomm\_security\_handle\_t* \*handle)

Function for initializing/allocating security infrastructure

*esp\_err\_t* (\***cleanup**)(*protocomm\_security\_handle\_t* handle)

Function for deallocating security infrastructure

*esp\_err\_t* (\***new\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Starts new secure transport session with specified ID

*esp\_err\_t* (\***close\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Closes a secure transport session with specified ID

*esp\_err\_t* (\***security\_req\_handler**)(*protocomm\_security\_handle\_t* handle, const void \*sec\_params, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Handler function for authenticating connection request and establishing secure session

*esp\_err\_t* (\***encrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Function which implements the encryption algorithm

*esp\_err\_t* (\***decrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Function which implements the decryption algorithm

## Type Definitions

typedef struct *protocomm\_security1\_params* **protocomm\_security1\_params\_t**

Protocomm Security 1 parameters: Proof Of Possession.

typedef *protocomm\_security1\_params\_t* **protocomm\_security\_pop\_t**

typedef struct *protocomm\_security2\_params* **protocomm\_security2\_params\_t**

Protocomm Security 2 parameters: Salt and Verifier.

typedef void \***protocomm\_security\_handle\_t**

typedef struct *protocomm\_security* **protocomm\_security\_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**Note:** This structure should not have any dynamic members to allow re-entrancy

---

## Enumerations

enum **protocomm\_security\_session\_event\_t**

Events generated by the protocomm security layer.

These events are generated while establishing secured session.

*Values:*

enumerator **PROTOCOLM\_SECURITY\_SESSION\_SETUP\_OK**

Secured session established successfully

enumerator **PROTOCOLM\_SECURITY\_SESSION\_INVALID\_SECURITY\_PARAMS**

Received invalid (NULL) security parameters (username / client public-key)

enumerator **PROTOCOLM\_SECURITY\_SESSION\_CREDENTIALS\_MISMATCH**

Received incorrect credentials (username / PoP)

PRIV_REQUIRES protocomm
```

**Functions**

*esp\_srp\_handle\_t* \***esp\_srp\_init** (*esp\_ng\_type\_t* ng)

Initialize srp context for given NG type.

---

**Note:** the handle gets freed with *esp\_srp\_free*

---

**Parameters** **ng** -- NG type given by *esp\_ng\_type\_t*

**Returns** *esp\_srp\_handle\_t*\* srp handle

void **esp\_srp\_free** (*esp\_srp\_handle\_t* \*hd)

free *esp\_srp\_context*

**Parameters** **hd** -- handle to be free

*esp\_err\_t* **esp\_srp\_srv\_pubkey** (*esp\_srp\_handle\_t* \*hd, const char \*username, int username\_len, const char \*pass, int pass\_len, int salt\_len, char \*\*bytes\_B, int \*len\_B, char \*\*bytes\_salt)

Returns B (pub key) and salt. [Step2.b].

---

**Note:** \*bytes\_B MUST NOT BE FREED BY THE CALLER

---

---

**Note:** \*bytes\_salt MUST NOT BE FREE BY THE CALLER

---

**Parameters**

- **hd** -- *esp\_srp* handle
- **username** -- Username not expected NULL terminated
- **username\_len** -- Username length
- **pass** -- Password not expected to be NULL terminated
- **pass\_len** -- Password length
- **salt\_len** -- Salt length
- **bytes\_B** -- Public Key returned
- **len\_B** -- Length of the public key
- **bytes\_salt** -- Salt bytes generated

**Returns** *esp\_err\_t* ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_gen\_salt\_verifier** (const char \*username, int username\_len, const char \*pass, int pass\_len, char \*\*bytes\_salt, int salt\_len, char \*\*verifier, int \*verifier\_len)

Generate salt-verifier pair, given username, password and salt length.

---

**Note:** if API has returned ESP\_OK, salt and verifier generated need to be freed by caller

---

---

**Note:** Usually, username and password are not saved on the device. Rather salt and verifier are generated outside the device and are embedded. this convenience API can be used to generate salt and verifier on the fly for development use case. OR for devices which intentionally want to generate different password each time and can send it to the client securely. e.g., a device has a display and it shows the pin

---

**Parameters**

- **username** -- [in] username
- **username\_len** -- [in] length of the username
- **pass** -- [in] password

- **pass\_len** -- [in] length of the password
- **bytes\_salt** -- [out] generated salt on successful generation, or NULL
- **salt\_len** -- [in] salt length
- **verifier** -- [out] generated verifier on successful generation, or NULL
- **verifier\_len** -- [out] length of the generated verifier

**Returns** esp\_err\_t ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_set\_salt\_verifier** (*esp\_srp\_handle\_t* \*hd, const char \*salt, int salt\_len, const char \*verifier, int verifier\_len)

Set the Salt and Verifier pre-generated for a given password. This should be used only if the actual password is not available. The public key can then be generated using *esp\_srp\_srv\_pubkey\_from\_salt\_verifier()* and not *esp\_srp\_srv\_pubkey()*

#### Parameters

- **hd** -- esp\_srp\_handle
- **salt** -- pre-generated salt bytes
- **salt\_len** -- length of the salt bytes
- **verifier** -- pre-generated verifier
- **verifier\_len** -- length of the verifier bytes

**Returns** esp\_err\_t ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_srv\_pubkey\_from\_salt\_verifier** (*esp\_srp\_handle\_t* \*hd, char \*\*bytes\_B, int \*len\_B)

Returns B (pub key)[Step2.b] when the salt and verifier are set using *esp\_srp\_set\_salt\_verifier()*

---

**Note:** \*bytes\_B MUST NOT BE FREED BY THE CALLER

---

#### Parameters

- **hd** -- esp\_srp handle
- **bytes\_B** -- Key returned to the called
- **len\_B** -- Length of the key returned

**Returns** esp\_err\_t ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_get\_session\_key** (*esp\_srp\_handle\_t* \*hd, char \*bytes\_A, int len\_A, char \*\*bytes\_key, uint16\_t \*len\_key)

Get session key in \*bytes\_key given by len in \*len\_key. [Step2.c].

This calculated session key is used for further communication given the proofs are exchanged/authenticated with *esp\_srp\_exchange\_proofs*

---

**Note:** \*bytes\_key MUST NOT BE FREED BY THE CALLER

---

#### Parameters

- **hd** -- esp\_srp handle
- **bytes\_A** -- Private Key
- **len\_A** -- Private Key length
- **bytes\_key** -- Key returned to the caller
- **len\_key** -- length of the key in \*bytes\_key

**Returns** esp\_err\_t ESP\_OK on success, appropriate error otherwise

*esp\_err\_t* **esp\_srp\_exchange\_proofs** (*esp\_srp\_handle\_t* \*hd, char \*username, uint16\_t username\_len, char \*bytes\_user\_proof, char \*bytes\_host\_proof)

Complete the authentication. If this step fails, the session\_key exchanged should not be used.

This is the final authentication step in SRP algorithm [Step4.1, Step4.b, Step4.c]

### Parameters

- **hd** -- esp\_srp handle
- **username** -- Username not expected NULL terminated
- **username\_len** -- Username length
- **bytes\_user\_proof** -- param in
- **bytes\_host\_proof** -- parameter out (should be SHA512\_DIGEST\_LENGTH) bytes in size

**Returns** esp\_err\_t ESP\_OK if user's proof is ok and subsequently bytes\_host\_proof is populated with our own proof.

### Type Definitions

typedef struct esp\_srp\_handle **esp\_srp\_handle\_t**

esp\_srp handle as the result of esp\_srp\_init

The handle is returned by esp\_srp\_init on successful init. It is then passed for subsequent API calls as an argument. esp\_srp\_free can be used to clean up the handle. After esp\_srp\_free the handle becomes invalid.

### Enumerations

enum **esp\_ng\_type\_t**

Large prime+generator to be used for the algorithm.

*Values:*

enumerator **ESP\_NG\_3072**

### Header File

- [components/protocomm/include/transport/protocomm\\_httpd.h](#)
- This header file can be included with:

```
#include "protocomm_httpd.h"
```

- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

### Functions

**esp\_err\_t protocomm\_httpd\_start** (*protocomm\_t* \*pc, const *protocomm\_httpd\_config\_t* \*config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

---

**Note:** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

---

### Parameters

- **pc** -- [in] Protocomm instance pointer obtained from protocomm\_new()

- **config** -- **[in]** Pointer to config structure for initializing HTTP server

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_SUPPORTED : Transport layer bound to another protocomm instance
- ESP\_ERR\_INVALID\_STATE : Transport layer already bound to this protocomm instance
- ESP\_ERR\_NO\_MEM : Memory allocation for server resource failed
- ESP\_ERR\_HTTPD\_\* : HTTP server error on start

*esp\_err\_t* **protocomm\_httpd\_stop** (*protocomm\_t* \*pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Parameters** **pc** -- **[in]** Same protocomm instance that was passed to `protocomm_httpd_start()`

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : Null / incorrect protocomm instance pointer

## Unions

union **protocomm\_httpd\_config\_data\_t**

*#include <protocomm\_httpd.h>* Protocomm HTTPD Configuration Data

### Public Members

void \***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

*protocomm\_http\_server\_config\_t* **config**

HTTP Server Configuration, if a server is not already active

## Structures

struct **protocomm\_http\_server\_config\_t**

Config parameters for protocomm HTTP server.

### Public Members

uint16\_t **port**

Port on which the HTTP server will listen

size\_t **stack\_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task\_priority**

Priority of server task

struct **protocomm\_httpd\_config\_t**

Config parameters for protocomm HTTP server.

## Public Members

bool **ext\_handle\_provided**

Flag to indicate if an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.

*protocomm\_httpd\_config\_data\_t* **data**

Protocomm HTTPD Configuration Data

## Macros

**PROTOCOLM\_HTTPD\_DEFAULT\_CONFIG** ()

## Header File

- `components/protocomm/include/transport/protocomm_ble.h`
- This header file can be included with:

```
#include "protocomm_ble.h"
```

- This header file is a part of the API provided by the `protocomm` component. To declare that your component depends on `protocomm`, add the following to your `CMakeLists.txt`:

```
REQUIRES protocomm
```

or

```
PRIV_REQUIRES protocomm
```

## Functions

*esp\_err\_t* **protocomm\_ble\_start** (*protocomm\_t* \*pc, const *protocomm\_ble\_config\_t* \*config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

### Parameters

- **pc** -- **[in]** Protocomm instance pointer obtained from `protocomm_new()`
- **config** -- **[in]** Pointer to config structure for initializing BLE

### Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE start error
- `ESP_ERR_NO_MEM` : Error allocating memory for internal resources
- `ESP_ERR_INVALID_STATE` : Error in ble config
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **protocomm\_ble\_stop** (*protocomm\_t* \*pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

---

**Note:** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

---

**Parameters** **pc** -- **[in]** Same protocomm instance that was passed to `protocomm_ble_start()`

### Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Simple BLE stop error

- `ESP_ERR_INVALID_ARG` : Null / incorrect protocomm instance

## Structures

struct **name\_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

### Public Members

const char \***name**

Name of the handler, which is passed to protocomm layer

uint16\_t **uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct **protocomm\_ble\_event\_t**

Structure for BLE events in Protocomm.

### Public Members

uint16\_t **evt\_type**

This field indicates the type of BLE event that occurred.

uint16\_t **conn\_handle**

The handle of the relevant connection.

uint16\_t **conn\_status**

The status of the connection attempt; 0: the connection was successfully established. 0 BLE host error code: the connection attempt failed for the specified reason.

uint16\_t **disconnect\_reason**

Return code indicating the reason for the disconnect.

struct **protocomm\_ble\_config**

Config parameters for protocomm BLE service.

### Public Members

char **device\_name**[MAX\_BLE\_DEVNAME\_LEN + 1]

BLE device name being broadcast at the time of provisioning

uint8\_t **service\_uuid**[BLE\_UUID128\_VAL\_LENGTH]

128 bit UUID of the provisioning service

uint8\_t \***manufacturer\_data**

BLE device manufacturer data pointer in advertisement

ssize\_t **manufacturer\_data\_len**  
BLE device manufacturer data length in advertisement

ssize\_t **nu\_lookup\_count**  
Number of entries in the Name-UUID lookup table

*protocomm\_ble\_name\_uuid\_t* \***nu\_lookup**  
Pointer to the Name-UUID lookup table

unsigned **ble\_bonding**  
BLE bonding

unsigned **ble\_sm\_sc**  
BLE security flag

unsigned **ble\_link\_encryption**  
BLE security flag

uint8\_t \***ble\_addr**  
BLE address

unsigned **ble\_notify**  
BLE characteristic notify flag

## Macros

### **MAX\_BLE\_DEVNAME\_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

### **BLE\_UUID128\_VAL\_LENGTH**

### **MAX\_BLE\_MANUFACTURER\_DATA\_LEN**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

### **BLE\_ADDR\_LEN**

## Type Definitions

typedef struct *name\_uuid* **protocomm\_ble\_name\_uuid\_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct *protocomm\_ble\_config* **protocomm\_ble\_config\_t**

Config parameters for protocomm BLE service.

## Enumerations

enum `protocomm_transport_ble_event_t`

Events generated by BLE transport.

These events are generated when the BLE transport is paired and disconnected.

*Values:*

enumerator `PROTOCOMM_TRANSPORT_BLE_CONNECTED`

enumerator `PROTOCOMM_TRANSPORT_BLE_DISCONNECTED`

## 2.8.2 Unified Provisioning

### Overview

The unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use case, it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. The developers can choose to extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. The followings are the important features of this implementation:

#### 1. Extensible Protocol

The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation is also left to the application to decide.

#### 2. Transport Flexibility

The protocol can work on Wi-Fi (SoftAP + HTTP server) or on Bluetooth LE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behavior can be supported on the transport.

#### 3. Security Scheme Flexibility

It is understood that each use case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that is WPA2 protected or Bluetooth LE with the "just-works" security. Or the applications may consider the transport to be insecure and may want application-level security. The unified provisioning framework allows the application to choose the security as deemed suitable.

#### 4. Compact Data Representation

The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application-specific data and the developers may choose the representation of their choice.

### Typical Provisioning Process

#### Deciding on Transport

The unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and Bluetooth LE (GATT based) transport schemes. The following points need to be considered while selecting the best possible transport for provisioning:

1. The Bluetooth LE-based transport has the advantage of maintaining an intact communication channel between the device and the client during the provisioning, which ensures reliable provisioning feedback.

Fig. 33: Typical Provisioning Process

2. The Bluetooth LE-based provisioning implementation makes the user experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring the user to go out of the phone app.
3. However, the Bluetooth LE transport consumes about 110 KB memory at runtime. If the product does not use the Bluetooth LE or Bluetooth functionality after provisioning is done, almost all the memory can be reclaimed and added into the heap.
4. The SoftAP-based transport is highly interoperable. However, there are a few considerations:
  - The device uses the same radio to host the SoftAP and also to connect to the configured AP. Since these could potentially be on different channels, it may cause connection status updates not to be reliably received by the phone
  - The phone (client) has to disconnect from its current AP in order to connect to the SoftAP. The original network will get restored only when the provisioning process is complete, and the softAP is taken down.
5. The SoftAP transport does not require much additional memory for the Wi-Fi use cases.
6. The SoftAP-based provisioning requires the phone-app user to go to `System Settings` to connect to the Wi-Fi network hosted by the device in the iOS system. The discovery (scanning) as well as connection APIs are not available for the iOS applications.

## Deciding on Security

Depending on the transport and other constraints, the security scheme needs to be selected by the application developers. The following considerations need to be given from the provisioning-security perspective:

1. The configuration data sent from the client to the device and the response have to be secured.
2. The client should authenticate the device that it is connected to.
3. The device manufacturer may choose proof-of-possession (PoP), a unique per-device secret to be entered on the provisioning client as a security measure to make sure that only the user can provision the device in their possession.

There are two levels of security schemes, of which the developer may select one or a combination, depending on requirements.

### 1. Transport Security

For SoftAP provisioning, developers may choose WPA2-protected security with unique per-device passphrase. Unique per-device passphrase can also act as a proof-of-possession. For Bluetooth LE, the "just-works" security can be used as a transport-level security after assessing its provided level of security.

### 2. Application Security

The unified provisioning subsystem provides the application-level security (*Security 1 Scheme*) that provides data protection and authentication through PoP, if the application does not use the transport-level security, or if the transport-level security is not sufficient for the use case.

## Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device-firmware application can choose appropriate method for advertisement and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the Bluetooth LE transport, device name or primary service included in the advertisement or a combination of both can be used for discovery.

## Architecture

The below diagram shows the architecture of unified provisioning:

It relies on the base layer called *Protocol Communication* (protocomm) which provides a framework for security schemes and transport mechanisms. The Wi-Fi Provisioning layer uses protocomm to provide simple callbacks to the

Fig. 34: Unified Provisioning Architecture

application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition, the application can directly use protocomm to register custom handlers.

The application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an "end-point" which corresponds to the logical channel for communication for specific type of information. For example, security handshake happens on a different endpoint from the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of the SoftAP+HTTP transport, the end-point corresponds to URI, whereas in case of Bluetooth LE, the end-point corresponds to the GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

### Security Schemes

At present, the unified provisioning supports the following security schemes:

1. Security 0

No security (No encryption).

2. Security 1

Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key.
- b. No Auth (Null PoP) - Shared key derived through key exchange only.

3. Security 2

SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

---

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to [Enabling Protocomm Security Version](#) for more details.

---

### Security 1 Scheme

The Security 1 scheme details are shown in the below sequence diagram:

### Security 2 Scheme

The Security 2 scheme is based on the Secure Remote Password (SRP6a) protocol, see [RFC 5054](#).

The protocol requires the Salt and Verifier to be generated beforehand with the help of the identifying username  $I$  and the plaintext password  $p$ . The Salt and Verifier are then stored on ESP32.

- The password  $p$  and the username  $I$  are to be provided to the Phone App (Provisioning entity) by suitable means, e.g., QR code sticker.

Details about the Security 2 scheme are shown in the below sequence diagram:

### Sample Code

Please refer to [Protocol Communication](#) and [Wi-Fi Provisioning](#) for API guides and code snippets on example usage.

Application implementation can be found as an example under [provisioning](#).

### Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [Bluetooth LE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [Bluetooth LE Provisioning app on App Store](#).
  - [SoftAP Provisioning app on App Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/macOS/Windows: [tools/esp\\_prov](#), a Python-based command line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

## 2.8.3 Wi-Fi Provisioning

### Overview

This component provides APIs that control the Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or Bluetooth LE transport via secure [Protocol Communication](#) sessions. The set of `wifi_prov_mgr_` APIs help quickly implement a provisioning service that has necessary features with minimal amount of code and sufficient flexibility.

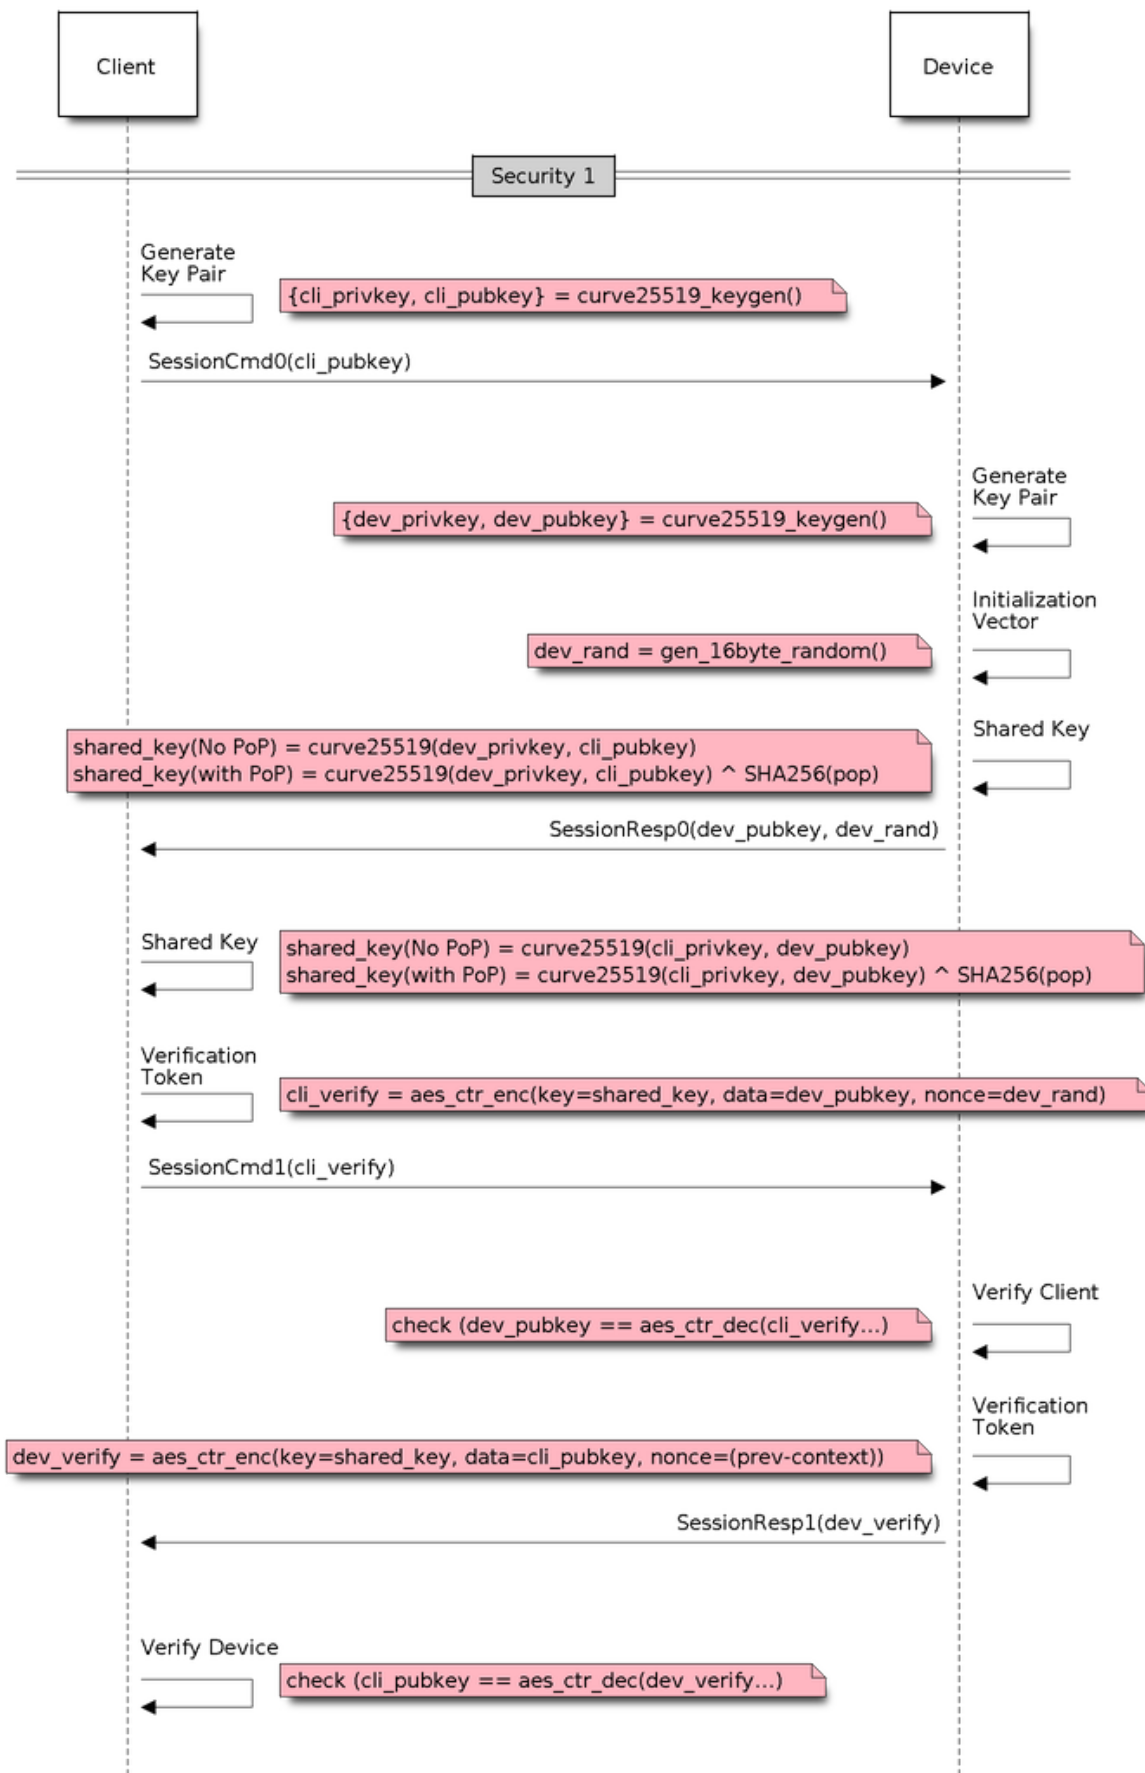

Fig. 35: Security 1

Fig. 36: Security 2

**Initialization** `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager, and thus must be called prior to invoking any other `wifi_prov_mgr_*` APIs. Note that the manager relies on other components of ESP-IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi, and optionally mDNS, hence these components must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the desired behavior of the manager:

- `wifi_prov_mgr_config_t::scheme` - This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, support the following options:
  - `wifi_prov_scheme_ble` - Bluetooth LE transport and GATT Server for handling the provisioning commands.
  - `wifi_prov_scheme_softap` - Wi-Fi SoftAP transport and HTTP Server for handling the provisioning commands.
  - `wifi_prov_scheme_console` - Serial transport and console for handling the provisioning commands.
- `wifi_prov_mgr_config_t::scheme_event_handler`: An event handler defined along with the scheme. Choosing the appropriate scheme-specific event handler allows the manager to take care of certain matters automatically. Presently, this option is not used for either the SoftAP or Console-based provisioning, but is very convenient for Bluetooth LE. To understand how, we must recall that Bluetooth requires a substantial amount of memory to function, and once the provisioning is finished, the main application may want to reclaim back this memory (or part of it) if it needs to use either Bluetooth LE or classic Bluetooth. Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme-specific handlers have been defined, and depending upon the chosen handler, the Bluetooth LE/classic Bluetooth/BTDM memory is freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic Bluetooth and Bluetooth LE/BTDM memory. Used when the main application does not require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only Bluetooth LE memory. Used when main application requires classic Bluetooth.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic Bluetooth. Used when main application requires Bluetooth LE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Do not use any scheme specific handler. Used when the provisioning scheme is not Bluetooth LE, i.e., using SoftAP or Console, or when main application wants to handle the memory reclaiming on its own, or needs both Bluetooth LE and classic Bluetooth to function.
- `wifi_prov_mgr_config_t::app_event_handler` (Deprecated) - It is now recommended to catch `WIFI_PROV_EVENT` that is emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
```

(continues on next page)

(continued from previous page)

```

        ESP_LOGI(TAG, "Provisioning started");
        break;
    case WIFI_PROV_CRED_RECV: {
        wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t
→*)event_data;
        ESP_LOGI(TAG, "Received Wi-Fi credentials"
                "\n\tSSID      : %s\n\tPassword : %s",
                (const char *) wifi_sta_cfg->ssid,
                (const char *) wifi_sta_cfg->password);
        break;
    }
    case WIFI_PROV_CRED_FAIL: {
        wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
→reason_t *)event_data;
        ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
                "\n\tPlease reset to factory and retry.
→provisioning",
                (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                "Wi-Fi station authentication failed" : "Wi-Fi
→access-point not found");
        break;
    }
    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;
    case WIFI_PROV_END:
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
        break;
    default:
        break;
    }
}
}
}

```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check the Provisioning State** Whether the device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently the manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If the provisioning state needs to be reset, any of the following approaches may be taken:

- The associated part of NVS partition has to be erased manually
- The main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- The main application must implement some logic to force start the provisioning irrespective of the provisioning state

```

bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

**Start the Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key, that is to say:

- A Wi-Fi SoftAP SSID and a passphrase, respectively, when the scheme is `wifi_prov_scheme_softap`.
- Bluetooth LE device name with the service key ignored when the scheme is `wifi_prov_scheme_ble`.

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession `pop`, followed by AES-CTR for encryption or decryption of subsequent messages.
- Security 0 is simply plain text communication. In this case the `pop` is simply ignored.

See *Unified Provisioning* for details about the security features.

```
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↳name, service_key) );
```

The provisioning service automatically finishes only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP with IP obtained. Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

---

**Note:** If the device fails to connect with the provided credentials, it does not accept new credentials anymore, but the provisioning service keeps on running, only to convey failure to the client, until the device is restarted. Upon restart, the provisioning state turns out to be true this time, as credentials are found in NVS, but the device does fail again to connect with those same credentials, unless an AP with the matching credentials somehow does become available. This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in *Check the Provisioning State*.

---

**Waiting for Completion** Typically, the main application waits for the provisioning to finish, then de-initializes the manager to free up resources, and finally starts executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↳name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT` and call `wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize the manager once the provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name, which, depending upon the selected transport, is either the Bluetooth LE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case, the host name set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using Bluetooth LE transport, a custom 128-bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID is to be included in the Bluetooth LE advertisement and corresponds to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic is formed using the primary service UUID as the base, with different auto-assigned 12th and 13th bytes, presumably counting from the 0th byte. Since an endpoint characteristic UUID is auto-assigned, it should not be used to identify the endpoint. Instead, client-side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic is assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning-related protocomm endpoints can be identified as follows:

Table 7: Endpoints Provided by the Provisioning Service

Endpoint Name i.e., Bluetooth LE + GATT Server	URI, i.e., SoftAP + HTTP Server + mDNS	Description
prov-session	<a href="http://&lt;mdns-hostname&gt;.local/prov-session">http://&lt;mdns-hostname&gt;.local/prov-session</a>	Security endpoint used for session establishment
prov-scan	<a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a>	the endpoint used for starting Wi-Fi scan and receiving scan results
prov-ctrl	<a href="http://wifi-prov.local/prov-ctrl">http://wifi-prov.local/prov-ctrl</a>	the endpoint used for controlling Wi-Fi provisioning state
prov-config	<a href="http://&lt;mdns-hostname&gt;.local/prov-config">http://&lt;mdns-hostname&gt;.local/prov-config</a>	the endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://&lt;mdns-hostname&gt;.local/proto-ver">http://&lt;mdns-hostname&gt;.local/proto-ver</a>	the endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version/capabilities information from the `proto-ver` endpoint. All communications to this endpoint are unencrypted, hence necessary information, which may be relevant for deciding compatibility, can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`. Here label `prov` provides provisioning service version `ver` and capabilities `cap`. For now, only the `no_pop` capability is supported, which indicates that the service does not require proof of possession for authentication. Any application-related version or capabilities are given by other labels, e.g., `my_app` in this example. These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use, which is not needed when the manager is configured to use protocomm security 0.

See [Unified Provisioning](#) for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages with the corresponding `.proto` files that can be found under `wifi_provisioning/proto`:

- `get_status` - For querying the Wi-Fi connection status. The device responds with a status which is one of connecting, connected or disconnected. If the status is disconnected, a disconnection reason is also to be included in the status response.
- `set_config` - For setting the Wi-Fi connection credentials.

- `apply_config` - For applying the credentials saved during `set_config` and starting the Wi-Fi station.

After session establishment, the client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands :

- `scan_start` - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished.
  - `passive` (input) - If true, the scan is started in passive mode, which may be slower, instead of active mode.
  - `group_channels` (input) - This specifies whether to scan all channels in one go when zero, or perform scanning of channels in groups, with 120 ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager waits for at least 120 ms after completing the scan on a group of channels, and thus allows the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 3 creates 5 groups, with each group having 3 channels, except the last one which has  $14 \% 3 = 2$  channels. So, when the scan is started, the first 3 channels will be scanned, followed by a 120 ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only a few channels in a group may increase the overall scan time, while having too many may again cause disconnection. Usually, a value of 4 should work for most cases. Note that for any other mode of transport, e.g., Bluetooth LE, this can be safely set to 0, and hence achieve the shortest overall scanning time.
  - `period_ms` (input) - The scan parameter specifying how long to wait on each channel.
- `scan_status` - It gives the status of scanning process:
  - `scan_finished` (output) - When the scan has finished, this returns true.
  - `result_count` (output) - This gives the total number of results obtained till now. If the scan is yet happening, this number keeps on updating.
- `scan_result` - For fetching the scan results. This can be called even if the scan is still on going.
  - `start_index` (input) - Where the index starts from to fetch the entries from the results list.
  - `count` (input) - The number of entries to fetch from the starting index.
  - `entries` (output) - The list of entries returned. Each entry consists of `ssid`, `channel` and `rss` information.

The client can also control the provisioning state of the device using `wifi_ctrl` endpoint. The `wifi_ctrl` endpoint supports the following protobuf commands:

- `ctrl_reset` - Resets internal state machine of the device and clears provisioned credentials only in case of provisioning failures.
- `ctrl_reprov` - Resets internal state machine of the device and clears provisioned credentials only in case the device is to be provisioned again for new credentials after a previous successful provisioning.

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [Protocol Communication](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init (config);
wifi_prov_mgr_endpoint_create ("custom-endpoint");
wifi_prov_mgr_start_provisioning (security, pop, service_name, service_
↳key);
wifi_prov_mgr_endpoint_register ("custom-endpoint", custom_ep_handler, ↳
↳custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When/How to Stop the Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service stops, and Bluetooth LE or SoftAP turns off, automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service stops after a 30 s timeout.

On the other hand, if device is not able to connect using the provided Wi-Fi credentials, due to incorrect SSID or passphrase, the service keeps running, and `get_status` keeps responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, are to be rejected. These credentials are preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service stops only after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and `WIFI_PROV_END` event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange these credentials over a custom protocomm endpoint, then after successfully doing so, stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

## Application Examples

For complete example implementation see [provisioning/wifi\\_prov\\_mgr](#).

## Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [Bluetooth LE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [Bluetooth LE Provisioning app on App Store](#).
  - [SoftAP Provisioning app on App Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows: [tools/esp\\_prov](#), a Python-based command-line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

## API Reference

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/manager.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/manager.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

## Functions

*esp\_err\_t* **wifi\_prov\_mgr\_init** (*wifi\_prov\_mgr\_config\_t* config)

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI\_PROV\_INIT is emitted right after initialization is complete

**Parameters** **config** -- [in] Configuration structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Fail

void **wifi\_prov\_mgr\_deinit** (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI\_PROV\_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI\_PROV\_END, and then performs the de-initialization

*esp\_err\_t* **wifi\_prov\_mgr\_is\_provisioned** (bool \*provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp\_wifi component

If one were to call esp\_wifi\_set\_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

---

**Note:** Calling wifi\_prov\_mgr\_start\_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

---

**Parameters** **provisioned** -- [out] True if provisioned, else false

**Returns**

- ESP\_OK : Retrieved provision state successfully
- ESP\_FAIL : Wi-Fi not initialized
- ESP\_ERR\_INVALID\_ARG : Null argument supplied

*esp\_err\_t* **wifi\_prov\_mgr\_start\_provisioning** (*wifi\_prov\_security\_t* security, const void \*wifi\_prov\_sec\_params, const char \*service\_name, const char \*service\_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- wifi\_prov\_scheme\_ble : This starts protocomm\_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi\_prov\_scheme\_softap : This activates SoftAP mode of Wi-Fi and starts protocomm\_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type \_esp\_wifi\_prov.\_tcp)

Event `WIFI_PROV_START` is emitted right after provisioning starts without failure

---

**Note:** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

---

### Parameters

- **security** -- **[in]** Specify which protocomm security scheme to use :
  - `WIFI_PROV_SECURITY_0` : For no security
  - `WIFI_PROV_SECURITY_1` : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - `WIFI_PROV_SECURITY_2`: SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi\_prov\_sec\_params** -- **[in]** Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type `wifi_prov_security1_params_t` for protocomm security 1 and `wifi_prov_security2_params_t` for protocomm security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-inited.
- **service\_name** -- **[in]** Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service\_key** -- **[in]** Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

### Returns

- `ESP_OK` : Provisioning started successfully
- `ESP_FAIL` : Failed to start provisioning service
- `ESP_ERR_INVALID_STATE` : Provisioning manager not initialized or already started

void **wifi\_prov\_mgr\_stop\_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi\_prov\_mgr\_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

*esp\_err\_t* **wifi\_prov\_mgr\_disable\_auto\_stop** (uint32\_t cleanup\_delay)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

---

**Note:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**Parameters** **cleanup\_delay** -- **[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

**Returns**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

*esp\_err\_t* **wifi\_prov\_mgr\_set\_app\_info** (const char \*label, const char \*version, const char \*\*capabilities, size\_t total\_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label "prov", containing only provisioning service version and capabilities. Application services should use a label other than "prov" so as not to overwrite this.

---

**Note:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**Parameters**

- **label** -- **[in]** String indicating the application name.
- **version** -- **[in]** String indicating the application version. There is no constraint on format.
- **capabilities** -- **[in]** Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total\_capabilities** -- **[in]** Size of capabilities array

**Returns**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM` : Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG` : Null argument

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_create** (const char \*ep\_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

---

**Note:** This API can only be called BEFORE provisioning is started

---

---

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**Parameters** **ep\_name** -- **[in]** unique name of the endpoint

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_register** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

---

**Note:** This API can only be called AFTER provisioning has started

---

---

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**Parameters**

- **ep\_name** -- **[in]** Name of the endpoint
- **handler** -- **[in]** Endpoint handler function
- **user\_ctx** -- **[in]** User data

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

void **wifi\_prov\_mgr\_endpoint\_unregister** (const char \*ep\_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**Parameters** **ep\_name** -- **[in]** Name of the endpoint

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_state** (*wifi\_prov\_sta\_state\_t* \*state)

Get state of Wi-Fi Station during provisioning.

**Parameters** `state` -- **[out]** Pointer to `wifi_prov_sta_state_t` variable to be filled

**Returns**

- `ESP_OK` : Successfully retrieved Wi-Fi state
- `ESP_FAIL` : Provisioning app not running

*esp\_err\_t* `wifi_prov_mgr_get_wifi_disconnect_reason` (`wifi_prov_sta_fail_reason_t` \*reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

**Parameters** `reason` -- **[out]** Pointer to `wifi_prov_sta_fail_reason_t` variable to be filled

**Returns**

- `ESP_OK` : Successfully retrieved Wi-Fi disconnect reason
- `ESP_FAIL` : Provisioning app not running

*esp\_err\_t* `wifi_prov_mgr_configure_sta` (`wifi_config_t` \*wifi\_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event `WIFI_PROV_CRED_RECV` is emitted after credentials have been applied and Wi-Fi station started

**Parameters** `wifi_cfg` -- **[in]** Pointer to Wi-Fi configuration structure

**Returns**

- `ESP_OK` : Wi-Fi configured and started successfully
- `ESP_FAIL` : Failed to set configuration

*esp\_err\_t* `wifi_prov_mgr_reset_provisioning` (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**Returns**

- `ESP_OK` : Reset provisioning config successfully
- `ESP_FAIL` : Failed to reset provisioning config

*esp\_err\_t* `wifi_prov_mgr_reset_sm_state_on_failure` (void)

Reset internal state machine and clear provisioned credentials.

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

**Returns**

- `ESP_OK` : Reset provisioning state machine successfully
- `ESP_FAIL` : Failed to reset provisioning state machine
- `ESP_ERR_INVALID_STATE` : Manager not initialized

*esp\_err\_t* `wifi_prov_mgr_reset_sm_state_for_reprovision` (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

---

**Note:** This API can be used only if provisioning auto-stop has been disabled using `wifi_prov_mgr_disable_auto_stop()`

---

**Returns**

- `ESP_OK` : Reset provisioning state machine successfully
- `ESP_FAIL` : Failed to reset provisioning state machine
- `ESP_ERR_INVALID_STATE` : Manager not initialized

## Structures

struct **wifi\_prov\_event\_handler\_t**

Event handler that is used by the manager while provisioning service is active.

## Public Members

*wifi\_prov\_cb\_func\_t* **event\_cb**

Callback function to be executed on provisioning events

void **\*user\_data**

User context data to pass as parameter to callback function

struct **wifi\_prov\_scheme**

Structure for specifying the provisioning scheme to be followed by the manager.

---

**Note:** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
  - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
  - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
- 

## Public Members

*esp\_err\_t* (**\*prov\_start**)(*protocomm\_t* \*pc, void \*config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

*esp\_err\_t* (**\*prov\_stop**)(*protocomm\_t* \*pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void (**\*new\_config**)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov\_start()*

void (**\*delete\_config**)(void \*config)

Function which is to be called by the manager to delete a configuration generated using *new\_config()*

*esp\_err\_t* (**\*set\_config\_service**)(void \*config, const char \*service\_name, const char \*service\_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

*esp\_err\_t* (**\*set\_config\_endpoint**)(void \*config, const char \*endpoint\_name, uint16\_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

*wifi\_mode\_t* **wifi\_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- `WIFI_MODE_APSTA` for SoftAP transport
- `WIFI_MODE_STA` for BLE transport

struct `wifi_prov_mgr_config_t`

Structure for specifying the manager configuration.

### Public Members

`wifi_prov_scheme_t` **scheme**

Provisioning scheme to use. Following schemes are already available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)

`wifi_prov_event_handler_t` **scheme\_event\_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used. When using scheme `wifi_prov_scheme_ble`, the following options are available:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

`wifi_prov_event_handler_t` **app\_event\_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use `WIFI_PROV_EVENT_HANDLER_NONE` when not used.

### Macros

`WIFI_PROV_EVENT_HANDLER_NONE`

Event handler can be set to none if not used.

### Type Definitions

typedef void (\*`wifi_prov_cb_func_t`)(void \*user\_data, `wifi_prov_cb_event_t` event, void \*event\_data)

typedef struct `wifi_prov_scheme` `wifi_prov_scheme_t`

Structure for specifying the provisioning scheme to be followed by the manager.

---

**Note:** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
  - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
  - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
- 

typedef enum `wifi_prov_security` `wifi_prov_security_t`

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

typedef *protocomm\_security2\_params\_t* **wifi\_prov\_security2\_params\_t**

Security 2 params structure This needs to be passed when using `WIFI_PROV_SECURITY_2`.

### Enumerations

enum **wifi\_prov\_cb\_event\_t**

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

*Values:*

enumerator **WIFI\_PROV\_INIT**

Emitted when the manager is initialized

enumerator **WIFI\_PROV\_START**

Indicates that provisioning has started

enumerator **WIFI\_PROV\_CRED\_RECV**

Emitted when Wi-Fi AP credentials are received via `protocomm` endpoint `wifi_config`. The event data in this case is a pointer to the corresponding *wifi\_sta\_config\_t* structure

enumerator **WIFI\_PROV\_CRED\_FAIL**

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

enumerator **WIFI\_PROV\_CRED\_SUCCESS**

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

enumerator **WIFI\_PROV\_END**

Signals that provisioning service has stopped

enumerator **WIFI\_PROV\_DEINIT**

Signals that manager has been de-initialized

enum **wifi\_prov\_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by `protocomm`

*Values:*

enumerator **WIFI\_PROV\_SECURITY\_0**

No security (plain-text communication)

enumerator **WIFI\_PROV\_SECURITY\_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

enumerator **WIFI\_PROV\_SECURITY\_2**

This secure communication mode consists of SRP6a based authentication and key exchange

- AES-GCM encryption/decryption

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_ble.h](#)
- This header file can be included with:

```
#include "wifi_provisioning/scheme_ble.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your CMakeLists.txt:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

### Functions

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_bt***dm* (void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_ble** (void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_bt** (void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

*esp\_err\_t* **wifi\_prov\_scheme\_ble\_set\_service\_uuid** (uint8\_t \*uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

---

**Note:** The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

---

**Parameters** `uuid128` -- [in] A custom 128 bit UUID

#### Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

*esp\_err\_t* **wifi\_prov\_scheme\_ble\_set\_mfg\_data** (uint8\_t \*mfg\_data, ssize\_t mfg\_data\_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

---

**Note:** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data

size limits i.e.  $(mfg\_data\_len + 2) < 31 - (device\_name\_length + 2)$ . If the `mfg_data` length exceeds this limit, the length will be truncated.

---

#### Parameters

- `mfg_data` -- [in] Custom manufacturer data
- `mfg_data_len` -- [in] Manufacturer data length

#### Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

`esp_err_t wifi_prov_scheme_ble_set_random_addr` (const uint8\_t \*rand\_addr)

Set Bluetooth Random address.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

This API can be used in cases where a new identity address is to be used during provisioning. This will result in this device being treated as a new device by remote devices.

This API is only to be called to set random address. Re-invoking this API after provisioning is started will have no effect.

---

**Note:** This API will change the existing BD address for the device. The address once set will remain unchanged until BLE stack tear down happens when `wifi_prov_mgr_deinit` is invoked.

---

**Parameters** `rand_addr` -- [in] The static random address to be set of length 6 bytes.

#### Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null argument

### Macros

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

### Header File

- `components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h`
- This header file can be included with:

```
#include "wifi_provisioning/scheme_softap.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

## Functions

void **wifi\_prov\_scheme\_softap\_set\_httpd\_handle** (void \*handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

---

**Note:** This API should be called before `wifi_prov_mgr_start_provisioning()`

---

**Parameters** `handle` -- [in] Handle to HTTPD server instance

## Header File

- `components/wifi_provisioning/include/wifi_provisioning/scheme_console.h`
- This header file can be included with:

```
#include "wifi_provisioning/scheme_console.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

## Header File

- This header file can be included with:

```
#include "wifi_provisioning/wifi_config.h"
```

- This header file is a part of the API provided by the `wifi_provisioning` component. To declare that your component depends on `wifi_provisioning`, add the following to your `CMakeLists.txt`:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

## Functions

*esp\_err\_t* **wifi\_prov\_config\_data\_handler** (uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm proto-comm\_req\_handler\_t) using `protocomm_add_endpoint()`

## Structures

struct **wifi\_prov\_sta\_conn\_info\_t**

WiFi STA connected status information.

**Public Members**

char **ip\_addr**[IP4ADDR\_STRLEN\_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was established

char **ssid**[33]

SSID of the to which connection was established

uint8\_t **channel**

Channel of the AP

uint8\_t **auth\_mode**

Authorization mode of the AP

struct **wifi\_prov\_config\_get\_data\_t**

WiFi status data to be sent in response to `get_status` request from master.

**Public Members**

*wifi\_prov\_sta\_state\_t* **wifi\_state**

WiFi state of the station

*wifi\_prov\_sta\_fail\_reason\_t* **fail\_reason**

Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

*wifi\_prov\_sta\_conn\_info\_t* **conn\_info**

Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

struct **wifi\_prov\_config\_set\_data\_t**

WiFi config data received by slave during `set_config` request from master.

**Public Members**

char **ssid**[33]

SSID of the AP to which the slave is to be connected

char **password**[64]

Password of the AP

char **bssid**[6]

BSSID of the AP

uint8\_t **channel**

Channel of the AP

struct **wifi\_prov\_config\_handlers**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Public Members

*esp\_err\_t* (\***get\_status\_handler**)(*wifi\_prov\_config\_get\_data\_t* \*resp\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

*esp\_err\_t* (\***set\_config\_handler**)(const *wifi\_prov\_config\_set\_data\_t* \*req\_data, *wifi\_prov\_ctx\_t* \*\*ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

*esp\_err\_t* (\***apply\_config\_handler**)(*wifi\_prov\_ctx\_t* \*\*ctx)

Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

*wifi\_prov\_ctx\_t* \***ctx**

Context pointer to be passed to above handler functions upon invocation

### Type Definitions

typedef struct *wifi\_prov\_ctx* **wifi\_prov\_ctx\_t**

Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct *wifi\_prov\_config\_handlers* **wifi\_prov\_config\_handlers\_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Enumerations

enum **wifi\_prov\_sta\_state\_t**

WiFi STA status for conveying back to the provisioning master.

*Values:*

enumerator **WIFI\_PROV\_STA\_CONNECTING**

enumerator **WIFI\_PROV\_STA\_CONNECTED**

enumerator **WIFI\_PROV\_STA\_DISCONNECTED**

enum `wifi_prov_sta_fail_reason_t`

WiFi STA connection fail reason.

*Values:*

enumerator `WIFI_PROV_STA_AUTH_ERROR`

enumerator `WIFI_PROV_STA_AP_NOT_FOUND`

Code examples for above API are provided in the [provisioning](#) directory of ESP-IDF examples.

Code example for above API is provided in [wifi/smart\\_config](#).

Code example for above API is provided in [wifi/wifi\\_easy\\_connect/dpp-enrollee](#).

## 2.9 Storage API

This section contains reference of the high-level storage APIs. They are based on low-level drivers such as SPI flash, SD/MMC.

- *Partitions API* allow block based access to SPI flash according to the *Partition Tables*.
- *Non-Volatile Storage library (NVS)* implements a fault-tolerant wear-levelled key-value storage in SPI NOR flash.
- *Virtual File System (VFS)* library provides an interface for registration of file system drivers. SPIFFS, FAT and various other file system libraries are based on the VFS.
- *SPIFFS* is a wear-levelled file system optimized for SPI NOR flash, well suited for small partition sizes and low throughput
- *FAT* is a standard file system which can be used in SPI flash or on SD/MMC cards
- *Wear Levelling* library implements a flash translation layer (FTL) suitable for SPI NOR flash. It is used as a container for FAT partitions in flash.

---

**Note:** It is suggested to use high-level APIs (`esp_partition` or file system) instead of low-level driver APIs to access the SPI NOR flash.

Due to the restriction of NOR flash and ESP hardware, accessing the main flash will affect the performance of the whole system. See *SPI Flash API* to learn more about the limitations.

---

### 2.9.1 FAT Filesystem Support

ESP-IDF uses the `FatFs` library to work with FAT filesystems. `FatFs` resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS using the C standard library and POSIX API functions.

Additionally, `FatFs` has been modified to support the runtime pluggable disk I/O layer. This allows mapping of `FatFs` drives to physical disks at runtime.

#### Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting `FatFs` and VFS.

The function `esp_vfs_fat_register()` allocates a `FATFS` structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to `FatFs` APIs.

The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. Call `esp_vfs_fat_register()` to specify:
  - Path prefix where to mount the filesystem (e.g., `"/sdcard"`, `"/spiflash"`)
  - FatFs drive number
  - A variable which receives the pointer to the FATFS structure
2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function `f_mount()`, and optionally `f_fdisk()`, `f_mkfs()`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see [FatFs documentation](#).
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_fat_register()` (for example, `"/sdcard/hello.txt"`). The filesystem uses [8.3 filenames](#) format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available [here](#).
5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, you can use the POSIX `lseek` function to perform it faster. The fast seek does not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, by enabling the option `CONFIG_FATFS_IMMEDIATE_FSYNC`, you can enable automatic calling of `f_sync()` to flush recent file changes after each call of `vfs_fat_write()`, `vfs_fat_pwrite()`, `vfs_fat_link()`, `vfs_fat_truncate()` and `vfs_fat_ftruncate()` functions. This feature improves file-consistency and size reporting accuracy for the FatFs, at a price on decreased performance due to frequent disk operations.
7. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix, for example, `"/hello.txt"`.
8. Close all open files.
9. Call the FatFs function `f_mount()` for the same drive number with `NULL` `FATFS*` argument to unmount the filesystem.
10. Call the FatFs function `ff_diskio_register()` with `NULL` `ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
11. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcard_unmount()` wrap the steps described above and also handle SD card initialization. These functions are described in the next section.

### Using FatFs with VFS and SD Cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcard_unmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

### Using FatFs with VFS in Read-Only Mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_spiflash_mount_ro()` and `esp_vfs_fat_spiflash_unmount_ro()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning, which will not be changed by production application throughout the lifetime of the hardware.

## FatFS Disk IO Layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

These APIs provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmhc()`.

void **ff\_diskio\_register** (BYTE pdrv, const `ff_diskio_impl_t` \*discio\_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of `disk_XXX` functions for driver number pdrv, corresponding function in `discio_impl` for given pdrv will be called.

### Parameters

- **pdrv** -- drive number
- **discio\_impl** -- pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff\_diskio\_impl\_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

## Public Members

DSTATUS (\***init**)(unsigned char pdrv)

disk initialization function

DSTATUS (\***status**)(unsigned char pdrv)

disk status check function

DRESULT (\***read**)(unsigned char pdrv, unsigned char \*buff, uint32\_t sector, unsigned count)

sector read function

DRESULT (\***write**)(unsigned char pdrv, const unsigned char \*buff, uint32\_t sector, unsigned count)

sector write function

DRESULT (\***ioctl**)(unsigned char pdrv, unsigned char cmd, void \*buff)

function to get info about disk and do some misc operations

void **ff\_diskio\_register\_sdmhc** (unsigned char pdrv, `sdmmc_card_t` \*card)

Register SD/MMC diskio driver

### Parameters

- **pdrv** -- drive number
- **card** -- pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling `f_mount`.

`esp_err_t` **ff\_diskio\_register\_wl\_partition** (unsigned char pdrv, `wl_handle_t` flash\_handle)

Register spi flash partition

### Parameters

- **pdrv** -- drive number
- **flash\_handle** -- handle of the wear levelling partition.

`esp_err_t ff_diskio_register_raw_partition` (unsigned char pdrv, const `esp_partition_t` \*part\_handle)

Register spi flash partition

#### Parameters

- **pdrv** -- drive number
- **part\_handle** -- pointer to raw flash partition.

## FatFs Partition Generator

We provide a partition generator for FatFs ([wl\\_fatfsген.py](#)) which is integrated into the build system and could be easily used in the user project.

The tool is used to create filesystem images on a host and populate it with content of the specified host folder.

The script is based on the partition generator ([fatfsген.py](#)). Apart from generating partition, it can also initialize wear levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to 255 characters and can contain multiple periods (.) characters within the filename and additional characters +, -, ;, =, [ and ].

An in-depth description of the FatFs partition generator and analyzer can be found at [Generating and parsing FAT partition on host](#).

**Build System Integration with FatFs Partition Generator** It is possible to invoke FatFs generator directly from the CMake build system by calling `fatfs_create_spiflash_image`:

```
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

If you prefer generating partition without wear levelling support, you can use `fatfs_create_rawflash_image`:

```
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` respectively `fatfs_create_rawflash_image` must be called from project's CMakeLists.txt.

If you decide for any reason to use `fatfs_create_rawflash_image` (without wear levelling support), beware that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. `partition` - the name of the partition as defined in the partition table (e.g., [storage/fatfsген/partitions\\_example.csv](#)).
2. `base_dir` - the directory that will be encoded to FatFs partition and optionally flashed into the device. Beware that you have to specify the suitable size of the partition in the partition table.
3. flag `FLASH_IN_PROJECT` - optionally, users can have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash -p <PORT>` by specifying `FLASH_IN_PROJECT`.
4. flag `PRESERVE_TIME` - optionally, users can force preserving the timestamps from the source folder to the target image. Without preserving the time, every timestamp will be set to the FATFS default initial time (1st January 1980).

For example:

```
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py` or a custom build system target.

For an example, see [storage/fatfsген](#).

## FatFs Partition Analyzer

([fatfsparse.py](#)) is a partition analyzing tool for FatFs.

It is a reverse tool of ([fatfsgen.py](#)), i.e., it can generate the folder structure on the host based on the FatFs image.

Usage:

```
./fatfsparse.py [-h] [--wl-layer {detect,enabled,disabled}] fatfs_image.img
```

## High-level API Reference

### Header File

- [components/fatfs/vfs/esp\\_vfs\\_fat.h](#)
- This header file can be included with:

```
#include "esp_vfs_fat.h"
```

- This header file is a part of the API provided by the `fatfs` component. To declare that your component depends on `fatfs`, add the following to your `CMakeLists.txt`:

```
REQUIRES fatfs
```

or

```
PRIV_REQUIRES fatfs
```

### Functions

[esp\\_err\\_t esp\\_vfs\\_fat\\_register](#) (const char \*base\_path, const char \*fat\_drive, size\_t max\_files, FATFS \*\*out\_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

---

**Note:** This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

---

#### Parameters

- **base\_path** -- path prefix where FATFS should be registered
- **fat\_drive** -- FATFS drive specification; if only one drive is used, can be an empty string
- **max\_files** -- maximum number of files which can be open at the same time
- **out\_fs** -- [out] pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

[esp\\_err\\_t esp\\_vfs\\_fat\\_unregister\\_path](#) (const char \*base\_path)

Un-register FATFS from VFS.

---

**Note:** FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_ctx`. Difference between this function and the one

above is that this one will release the correct drive, while the one above will release the last registered one

---

**Parameters** **base\_path** -- path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if FATFS is not registered in VFS

*esp\_err\_t* **esp\_vfs\_fat\_sdmmc\_mount** (const char \*base\_path, const *sdmmc\_host\_t* \*host\_config, const void \*slot\_config, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config, *sdmmc\_card\_t* \*\*out\_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host\_config
- initializes SD card with configuration in slot\_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount\_config
- registers FATFS library with VFS, with prefix given by base\_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

---

**Note:** Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

---

**Parameters**

- **base\_path** -- path where partition should be registered (e.g. "/sdcard")
- **host\_config** -- Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot\_config** -- Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to *sdmmc\_slot\_config\_t* structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`.
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS
- **out\_card** -- [out] if not NULL, pointer to the card information structure will be returned via this argument

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

*esp\_err\_t* **esp\_vfs\_fat\_sdspi\_mount** (const char \*base\_path, const *sdmmc\_host\_t* \*host\_config\_input, const *sdspi\_device\_config\_t* \*slot\_config, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config, *sdmmc\_card\_t* \*\*out\_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot\_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host\_config\_input

- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

---

**Note:** This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

---

#### Parameters

- **base\_path** -- path where partition should be registered (e.g. `"/sdcard"`)
- **host\_config\_input** -- Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot\_config** -- Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS
- **out\_card** -- [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it's not suggested to use more than one card at the same time and unmount one of them in your application.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

`esp_err_t esp_vfs_fat_sdmmc_unmount` (void)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount`.

*Deprecated:*

Use `esp_vfs_fat_sdcard_unmount()` instead.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` hasn't been called

`esp_err_t esp_vfs_fat_sdcard_unmount` (const char \*base\_path, `sdmmc_card_t` \*card)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the card argument is unregistered
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` hasn't been called

`esp_err_t esp_vfs_fat_sdcard_format` (const char \*base\_path, `sdmmc_card_t` \*card)

Format FAT filesystem.

---

**Note:** This API should be only called when the FAT is already mounted.

---

#### Parameters

- **base\_path** -- Path where partition should be registered (e.g. `"/sdcard"`)

- **card** -- Pointer to the card handle, which should be initialised by calling `esp_vfs_fat_sdspi_mount` first

**Returns**

- `ESP_OK`
- `ESP_ERR_INVALID_STATE`: FAT partition isn't mounted, call `esp_vfs_fat_sdmmc_mount` or `esp_vfs_fat_sdspi_mount` first
- `ESP_ERR_NO_MEM`: if memory can not be allocated
- `ESP_FAIL`: fail to format it, or fail to mount back

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_mount\_rw\_wl** (const char \*base\_path, const char \*partition\_label, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config, *wl\_handle\_t* \*wl\_handle)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base\_prefix variable

This function is intended to make example code more compact.

**Parameters**

- **base\_path** -- path where FATFS partition should be mounted (e.g. "/spiflash")
- **partition\_label** -- label of the partition which should be used
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS
- **wl\_handle** -- [out] wear levelling driver handle

**Returns**

- `ESP_OK` on success
- `ESP_ERR_NOT_FOUND` if the partition table does not contain FATFS partition with given label
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_spiflash_mount_rw_wl` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_unmount\_rw\_wl** (const char \*base\_path, *wl\_handle\_t* wl\_handle)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount_rw_wl`.

**Parameters**

- **base\_path** -- path where partition should be registered (e.g. "/spiflash")
- **wl\_handle** -- wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount_rw_wl`

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_spiflash_mount_rw_wl` hasn't been called

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_format\_rw\_wl** (const char \*base\_path, const char \*partition\_label)

Format FAT filesystem.

---

**Note:** This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn't mounted (by calling `esp_vfs_fat_spiflash_mount_rw_wl`), this API will first mount the FAT then format it, then restore back to the original state.

---

**Parameters**

- **base\_path** -- Path where partition should be registered (e.g. "/spiflash")
- **partition\_label** -- Label of the partition which should be used

**Returns**

- ESP\_OK
- ESP\_ERR\_NO\_MEM: if memory can not be allocated
- Other errors from esp\_vfs\_fat\_spiflash\_mount\_rw\_wl

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_mount\_ro** (const char \*base\_path, const char \*partition\_label, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base\_prefix variable

---

**Note:** Wear levelling is not used when FAT is mounted in read-only mode using this function.

---

**Parameters**

- **base\_path** -- path where FATFS partition should be mounted (e.g. "/spiflash")
- **partition\_label** -- label of the partition which should be used
- **mount\_config** -- pointer to structure with extra parameters for mounting FATFS

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_spiflash\_mount\_ro was already called for the same partition
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

*esp\_err\_t* **esp\_vfs\_fat\_spiflash\_unmount\_ro** (const char \*base\_path, const char \*partition\_label)

Unmount FAT filesystem and release resources acquired using esp\_vfs\_fat\_spiflash\_mount\_ro.

**Parameters**

- **base\_path** -- path where partition should be registered (e.g. "/spiflash")
- **partition\_label** -- label of partition to be unmounted

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_spiflash\_mount\_ro hasn't been called

*esp\_err\_t* **esp\_vfs\_fat\_info** (const char \*base\_path, uint64\_t \*out\_total\_bytes, uint64\_t \*out\_free\_bytes)

Get information for FATFS partition.

**Parameters**

- **base\_path** -- Base path of the partition examined (e.g. "/spiflash")
- **out\_total\_bytes** -- [out] Size of the file system
- **out\_free\_bytes** -- [out] Free bytes available in the file system

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if partition not found
- ESP\_FAIL if another FRESULT error (saved in errno)

**Structures**

struct **esp\_vfs\_fat\_mount\_config\_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount_rw_wl` functions.

### Public Members

bool **format\_if\_mount\_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max\_files**

Max number of open files.

size\_t **allocation\_unit\_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and  $128 * \text{sector size}$ . For SD cards, sector size is always 512 bytes. For wear\_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool **disk\_status\_check\_enable**

Enables real `ff_disk_status` function implementation for SD cards (`ff_sdmmc_status`). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn't do anything for other memory storage media.

### Type Definitions

typedef *esp\_vfs\_fat\_mount\_config\_t* **esp\_vfs\_fat\_sdmmc\_mount\_config\_t**

## 2.9.2 Manufacturing Utility

### Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- [esptool.py](#)
- **Flash Download tool (available on Windows only)**
  - Download and unzip it, and follow the instructions inside the *doc* folder.
- Direct flash programming using custom production tools.

## Prerequisites

This utility is dependent on ESP-IDF's NVS Partition Generator Utility.

- **Operating System requirements:**
  - Linux / MacOS / Windows (standard distributions)
- **The following packages are needed to use this utility:**
  - [Python](#)

---

### Note:

**Before using this utility, please make sure that:**

- The path to Python is added to the PATH environment variable.
  - You have installed the packages from *requirement.txt*, the file in the root of the ESP-IDF directory.
- 

## Workflow

## CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace,    <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

---

**Note:** The first line in this file should always be the `namespace` entry.

---

Each line should have three parameters: `key`, `type`, `encoding`, separated by a comma. If the `REPEAT` tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator Utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

---

### Note:

**Make sure there are no spaces:**

- before and after ','
- at the end of each line in a CSV file

### Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1, key2, key3, .....  
value1, value2, value3, .....
```

---

**Note:** The first line in the file should always contain the `key` names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

---

Each line should contain the `value` of the corresponding keys, separated by a comma. If the key has the `REPEAT` tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id, firmware_key, serial_no, device_no  
1, 1a2b3c4d5e6faabb, A1, 101  
2, 1a2b3c4d5e6fccdd, , 102  
3, 1a2b3c4d5e6feeff, , 103
```

---

**Note:** If the `'REPEAT'` tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the `'REPEAT'` tag.

---

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key, type, encoding, value  
key, namespace, ,  
key1, type1, encoding1, value1  
key2, type2, encoding2, value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

### Running the utility

**Usage:**

```
python mfg_gen.py [-h] {generate, generate-key} ...
```

**Optional Arguments:**

No.	Parameter	Description
1	-h / --help	Show the help message and exit

**Commands:**

Run `mfg_gen.py {command} -h` for additional help

No.	Parameter	Description
1	<code>generate</code>	Generate NVS partition
2	<code>generate-key</code>	Generate keys for encryption

**To generate factory images for each device (Default):****Usage:**

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                          [--inputkey INPUTKEY] [--outdir OUTDIR]
                          [--key_protect_hmac] [--kp_hmac_keygen]
                          [--kp_hmac_keyfile KP_HMAC_KEYFILE] [--kp_hmac_
↳inputkey KP_HMAC_INPUTKEY]
                          conf values prefix size
```

**Positional Arguments:**

Parameter	Description
<code>conf</code>	Path to configuration csv file to parse
<code>values</code>	Path to values csv file to parse
<code>prefix</code>	Unique name for each output filename prefix
<code>size</code>	Size of NVS partition in bytes (must be multiple of 4096)

**Optional Arguments:**

Parameter	Description
<code>-h / --help</code>	Show the help message and exit
<code>--fileid FILEID</code>	Unique file identifier (any key in values file) for each filename suffix (Default: numeric value(1,2,3...))
<code>--version {1,2}</code>	Set multipage blob version. (Default: Version 2) Version 1 - Multipage blob support disabled. Version 2 - Multipage blob support enabled.
<code>--keygen</code>	Generates key for encrypting NVS partition
<code>--inputkey INPUTKEY</code>	File having key for encrypting NVS partition
<code>--outdir OUTDIR</code>	Output directory to store files created (Default: current directory)
<code>--key_protect_hmac</code>	If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used
<code>--kp_hmac_keygen</code>	Generate the HMAC key for HMAC-based encryption scheme
<code>--kp_hmac_keyfile KP_HMAC_KEYFILE</code>	Path to output HMAC key file
<code>--kp_hmac_inputkey KP_HMAC_INPUTKEY</code>	File having the HMAC key for generating the NVS encryption keys

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↳singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

**To generate encrypted factory images for each device:**

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format <outdir>/keys/keys-<prefix>-<fileid>.bin is created. This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to *NVS Key Partition* for more details.

- To generate an encrypted image using the HMAC-based scheme, the above command can be used along with some additional parameters.
  - Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

```
python mfg_gen.py generate samples/sample_config.csv samples/
↪sample_values_singlepage_blob.csv Sample 0x3000 --keygen --key_
↪protect_hmac --kp_hmac_keygen
```

**Note:** Encryption key of the format <outdir>/keys/keys-<timestamp>.bin and HMAC key of the format <outdir>/keys/hmac-keys-<timestamp>.bin are created.

- Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --keygen --key_protect_hmac --kp_hmac_
↪inputkey testdata/sample_hmac_key.bin
```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↪singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

### To generate only encryption keys:

**Usage::** python mfg\_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]

#### Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--keyfile KEYFILE	Path to output encryption keys file
--outdir OUTDIR	Output directory to store files created. (Default: current directory)
--key_protect_hmac	If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used
--kp_hmac_keygen	Generate the HMAC key for HMAC-based encryption scheme
--kp_hmac_keyfile KP_HMAC_KEYFILE	Path to output HMAC key file
--kp_hmac_inputkey KP_HMAC_INPUTKEY	File having the HMAC key for generating the NVS encryption keys

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`. To provide custom target filename use the `--keyfile` argument.

---

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:

```
python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
```

---

**Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

---

- Generate the NVS encryption keys, given the HMAC-key:

```
python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey testdata/  
↪sample_hmac_key.bin
```

---

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

---

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

## 2.9.3 Non-Volatile Storage Library

### Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying Storage** Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

---

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.

---

---

**Note:** NVS works best for storing many small values, rather than a few large values of the type 'string' and 'blob'. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

---

**Keys and Values** NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

---

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

---

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key replaces the old value and data type with the value and data type specified by a write operation.

A data type check is performed when reading a value. An error is returned if the data type expected by read operation does not match the data type of entry found for the key provided.

**Namespaces** To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

**NVS Iterators** Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` creates an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` advances an iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

In general, all iterators obtained via `nvs_entry_find()` have to be released using `nvs_release_iterator()`, which also tolerates NULL iterators.

`nvs_entry_find()` and `nvs_entry_next()` set the given iterator to NULL or a valid iterator in all cases except a parameter error occurred (i.e., return `ESP_ERR_NVS_NOT_FOUND`). In case of a parameter error, the given iterator will not be modified. Hence, it is best practice to initialize the iterator to NULL before calling `nvs_entry_find()` to avoid complicated error checking before releasing the iterator.

**Security, Tampering, and Robustness** NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized

as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

## NVS Encryption

Please refer to the [NVS Encryption](#) guide for more details.

## NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to [NVS Partition Generator Utility](#).

Instead of calling the `nvs_partition_gen.py` tool manually, the creation of the partition binary files can also be done directly from CMake using the function `nvs_create_partition_image`:

```
nvs_create_partition_image(<partition> <csv> [FLASH_IN_PROJECT] [DEPENDS dep dep_
↪dep ...])
```

### Positional Arguments:

Parameter	Description
<code>partition</code>	Name of the NVS partition
<code>csv</code>	Path to CSV file to parse

### Optional Arguments:

Parameter	Description
<code>FLASH_IN_PROJECT</code>	Name of the NVS partition
<code>DEPENDS</code>	Specify files on which the command depends

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `idf.py <partition>-flash` (e.g., if your partition name is `nvs`, then use `idf.py nvs-flash`).

`nvs_create_partition_image` must be called from one of the component `CMakeLists.txt` files. Currently, only non-encrypted partitions are supported.

## Application Example

You can find code examples in the [storage](#) directory of ESP-IDF examples:

[storage/nvs\\_rw\\_value](#)

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32 module restarts. The value's function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read/write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

[storage/nvs\\_rw\\_blob](#)

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

- `value` - tracks the number of the ESP32 module soft and hard restarts.
- `blob` - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read/write operation was successful.

#### [storage/nvs\\_rw\\_value\\_cxx](#)

This example does exactly the same as [storage/nvs\\_rw\\_value](#), except that it uses the C++ NVS handle class.

## Internals

**Log of Key-Value Pairs** NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

**Pages and Entries** NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

**Empty/uninitialized** Flash storage for the page is empty (all bytes are `0xff`). Page is not used to store any data at this point and does not have a sequence number.

**Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

**Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

**Erasing** Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

**Corrupted** Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in **uninitialized** state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

**Structure of a Page** For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via

menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and Entry State Bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 \* 126) are not used.

**Empty (2'b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2'b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

**Erased (2'b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of Entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called "blob index". Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

(continues on next page)

(continued from previous page)

Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For "blob index" entry, these 8 bytes hold the following information about data-chunks:

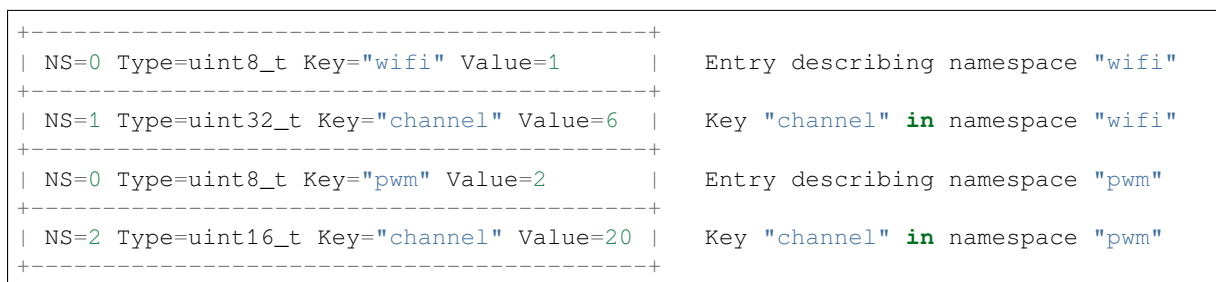

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have chunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The `Span` field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

**Item Hash List** To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, *Page::findItem* first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item is found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

## API Reference

### Header File

- [components/nvs\\_flash/include/nvs\\_flash.h](#)
- This header file can be included with:

```
#include "nvs_flash.h"
```

- This header file is a part of the API provided by the `nvs_flash` component. To declare that your component depends on `nvs_flash`, add the following to your CMakeLists.txt:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

### Functions

*esp\_err\_t* **nvs\_flash\_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

When "NVS\_ENCRYPTION" is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

- a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any "data" type partition which has the subtype value set to "nvs\_keys")
- b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
- c. Internally call "nvs\_flash\_secure\_init()" with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

#### Returns

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label "nvs" is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from `nvs_flash_read_security_cfg` API (when "NVS\_ENCRYPTION" is enabled).
- error codes from `nvs_flash_generate_keys` API (when "NVS\_ENCRYPTION" is enabled).

- error codes from `nvs_flash_secure_init_partition` API (when "NVS\_ENCRYPTION" is enabled) .

*esp\_err\_t* **nvs\_flash\_init\_partition** (const char \*partition\_label)

Initialize NVS flash storage for the specified partition.

**Parameters** `partition_label` -- [in] Label of the partition. Must be no longer than 16 characters.

**Returns**

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_init\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Initialize NVS flash storage for the partition specified by partition pointer.

**Parameters** `partition` -- [in] pointer to a partition obtained by the ESP partition API.

**Returns**

- ESP\_OK if storage was successfully initialized
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with "nvs" label in the partition table.

**Returns**

- ESP\_OK on success (storage was deinitialized)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage was not initialized prior to this call

*esp\_err\_t* **nvs\_flash\_deinit\_partition** (const char \*partition\_label)

Deinitialize NVS storage for the given NVS partition.

**Parameters** `partition_label` -- [in] Label of the partition

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage for given partition was not initialized prior to this call

*esp\_err\_t* **nvs\_flash\_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label "nvs").

---

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition labeled "nvs" in the partition table
- different error in case de-initialization fails (shouldn't happen)

*esp\_err\_t* **nvs\_flash\_erase\_partition** (const char \*part\_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

---

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**Parameters** **part\_name** -- **[in]** Name (label) of the partition which should be erased

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn't happen)

*esp\_err\_t* **nvs\_flash\_erase\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Erase custom partition.

Erase all content of specified custom partition.

---

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**Parameters** **partition** -- **[in]** pointer to a partition obtained by the ESP partition API.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no partition with the specified parameters in the partition table
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_secure\_init** (*nvs\_sec\_cfg\_t* \*cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

**Parameters** **cfg** -- **[in]** Security configuration (keys) to be used for NVS encryption/decryption. If **cfg** is NULL, no encryption is used.

**Returns**

- ESP\_OK if storage has been initialized successfully.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label "nvs" is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_secure\_init\_partition** (const char \*partition\_label, *nvs\_sec\_cfg\_t* \*cfg)

Initialize NVS flash storage for the specified partition.

**Parameters**

- **partition\_label** -- **[in]** Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** -- **[in]** Security configuration (keys) to be used for NVS encryption/decryption. If **cfg** is null, no encryption/decryption is used.

**Returns**

- ESP\_OK if storage has been initialized successfully.

- `ESP_ERR_NVS_NO_FREE_PAGES` if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- `ESP_ERR_NOT_FOUND` if specified partition is not found in the partition table
- `ESP_ERR_NO_MEM` in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_generate_keys` (const `esp_partition_t` \*partition, `nvs_sec_cfg_t` \*cfg)

Generate and store NVS keys in the provided esp partition.

#### Parameters

- **partition** -- [in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

#### Returns

- `ESP_OK`, if cfg was read successfully;
- `ESP_ERR_INVALID_ARG`, if partition or cfg is NULL;
- or error codes from `esp_partition_write/erase` APIs.

`esp_err_t nvs_flash_read_security_cfg` (const `esp_partition_t` \*partition, `nvs_sec_cfg_t` \*cfg)

Read NVS security configuration from a partition.

---

**Note:** Provided partition is assumed to be marked 'encrypted'.

---

#### Parameters

- **partition** -- [in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** -- [out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

#### Returns

- `ESP_OK`, if cfg was read successfully;
- `ESP_ERR_INVALID_ARG`, if partition or cfg is NULL
- `ESP_ERR_NVS_KEYS_NOT_INITIALIZED`, if the partition is not yet written with keys.
- `ESP_ERR_NVS_CORRUPT_KEY_PART`, if the partition containing keys is found to be corrupt
- or error codes from `esp_partition_read` API.

`esp_err_t nvs_flash_register_security_scheme` (`nvs_sec_scheme_t` \*scheme\_cfg)

Registers the given security scheme for NVS encryption The scheme registered with `sec_scheme_id` by this API be used as the default security scheme for the "nvs" partition. Users will have to call this API explicitly in their application.

**Parameters** **scheme\_cfg** -- [in] Pointer to the security scheme configuration structure that the user (or the `nvs_key_provider`) wants to register.

#### Returns

- `ESP_OK`, if security scheme registration succeeds;
- `ESP_ERR_INVALID_ARG`, if `scheme_cfg` is NULL;
- `ESP_FAIL`, if security scheme registration fails

`nvs_sec_scheme_t` \*`nvs_flash_get_default_security_scheme` (void)

Fetch the configuration structure for the default active security scheme for NVS encryption.

**Returns** Pointer to the default active security scheme configuration (NULL if no scheme is registered yet i.e. active)

`esp_err_t nvs_flash_generate_keys_v2` (`nvs_sec_scheme_t` \*scheme\_cfg, `nvs_sec_cfg_t` \*cfg)

Generate (and store) the NVS keys using the specified key-protection scheme.

#### Parameters

- **scheme\_cfg** -- **[in]** Security scheme specific configuration
- **cfg** -- **[out]** Security configuration (encryption keys)

**Returns**

- ESP\_OK, if cfg was populated successfully with generated encryption keys;
- ESP\_ERR\_INVALID\_ARG, if scheme\_cfg or cfg is NULL;
- ESP\_FAIL, if the key generation process fails

*esp\_err\_t* **nvs\_flash\_read\_security\_cfg\_v2** (*nvs\_sec\_scheme\_t* \*scheme\_cfg, *nvs\_sec\_cfg\_t* \*cfg)

Read NVS security configuration set by the specified security scheme.

**Parameters**

- **scheme\_cfg** -- **[in]** Security scheme specific configuration
- **cfg** -- **[out]** Security configuration (encryption keys)

**Returns**

- ESP\_OK, if cfg was read successfully;
- ESP\_ERR\_INVALID\_ARG, if scheme\_cfg or cfg is NULL;
- ESP\_FAIL, if the key reading process fails

**Structures**

struct **nvs\_sec\_cfg\_t**

Key for encryption and decryption.

**Public Members**

uint8\_t **eky**[NVS\_KEY\_SIZE]

XTS encryption and decryption key

uint8\_t **tky**[NVS\_KEY\_SIZE]

XTS tweak key

struct **nvs\_sec\_scheme\_t**

NVS encryption: Security scheme configuration structure.

**Public Members**

int **scheme\_id**

Security Scheme ID (E.g. HMAC)

void \***scheme\_data**

Scheme-specific data (E.g. eFuse block for HMAC-based key generation)

*nvs\_flash\_generate\_keys\_t* **nvs\_flash\_key\_gen**

Callback for the nvs\_flash\_key\_gen implementation

*nvs\_flash\_read\_cfg\_t* **nvs\_flash\_read\_cfg**

Callback for the nvs\_flash\_read\_keys implementation

**Macros**

**NVS\_KEY\_SIZE**

## Type Definitions

typedef *esp\_err\_t* (\***nvs\_flash\_generate\_keys\_t**)(const void \*scheme\_data, *nvs\_sec\_cfg\_t* \*cfg)

Callback function prototype for generating the NVS encryption keys.

typedef *esp\_err\_t* (\***nvs\_flash\_read\_cfg\_t**)(const void \*scheme\_data, *nvs\_sec\_cfg\_t* \*cfg)

Callback function prototype for reading the NVS encryption keys.

## Header File

- `components/nvs_flash/include/nvs.h`
- This header file can be included with:

```
#include "nvs.h"
```

- This header file is a part of the API provided by the `nvs_flash` component. To declare that your component depends on `nvs_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES nvs_flash
```

or

```
PRIV_REQUIRES nvs_flash
```

## Functions

*esp\_err\_t* **nvs\_set\_i8** (*nvs\_handle\_t* handle, const char \*key, int8\_t value)

set int8\_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called. Regardless whether key-value pair is created or updated, function always requires at least one `nvs` available entry. See `nvs_get_stats`. After create type of operation, the number of available entries is decreased by one. After update type of operation, the number of available entries remains the same.

### Parameters

- **handle** -- [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- [in] Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- [in] The value to set.

### Returns

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.

*esp\_err\_t* **nvs\_set\_u8** (*nvs\_handle\_t* handle, const char \*key, uint8\_t value)

set uint8\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_i16** (*nvs\_handle\_t* handle, const char \*key, int16\_t value)

set int16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_u16** (*nvs\_handle\_t* handle, const char \*key, uint16\_t value)

set uint16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_i32** (*nvs\_handle\_t* handle, const char \*key, int32\_t value)

set int32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_u32** (*nvs\_handle\_t* handle, const char \*key, uint32\_t value)

set uint32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_i64** (*nvs\_handle\_t* handle, const char \*key, int64\_t value)

set int64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_u64** (*nvs\_handle\_t* handle, const char \*key, uint64\_t value)

set uint64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp\_err\_t* **nvs\_set\_str** (*nvs\_handle\_t* handle, const char \*key, const char \*value)

set string for given key

Sets string value for the key. Function requires whole space for new data to be available as contiguous entries in same nvs page. Operation consumes 1 overhead entry and 1 entry per each 32 characters of new string including zero character to be set. In case of value update for existing key, entries occupied by the previous value and overhead entry are returned to the pool of available entries. Note that storage of long string values can fail due to fragmentation of nvs pages even if `available_entries` returned by `nvs_get_stats` suggests enough overall space available. Note that the underlying storage will not be updated until `nvs_commit` is called.

#### Parameters

- **handle** -- [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** -- [in] Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** -- [in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

#### Returns

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

*esp\_err\_t* **nvs\_get\_i8** (*nvs\_handle\_t* handle, const char \*key, int8\_t \*out\_value)

get int8\_t value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

### Parameters

- **handle** -- [in] Handle obtained from `nvs_open` function.
- **key** -- [in] Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out\_value** -- Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in `length` argument.

### Returns

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`  
get uint8\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`  
get int16\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`  
get uint16\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`  
get int32\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`  
get uint32\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64(nvs_handle_t handle, const char *key, int64_t *out_value)`  
get int64\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u64(nvs_handle_t handle, const char *key, uint64_t *out_value)`  
get uint64\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_str(nvs_handle_t handle, const char *key, char *out_value, size_t *length)`  
get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
↳dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

### Parameters

- **handle** -- **[in]** Handle obtained from `nvs_open` function.
- **key** -- **[in]** Key name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out\_value** -- **[out]** Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- **length** -- **[inout]** A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

### Returns

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if `length` is not sufficient to store data

`esp_err_t nvs_get_blob(nvs_handle_t handle, const char *key, void *out_value, size_t *length)`

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

`esp_err_t nvs_open(const char *namespace_name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)`

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled "nvs" in the partition table.

### Parameters

- **namespace\_name** -- **[in]** Namespace name. Maximum length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **open\_mode** -- **[in]** `NVS_READWRITE` or `NVS_READONLY`. If `NVS_READONLY`, will open a handle for reading only. All write requests will be rejected for this handle.
- **out\_handle** -- **[out]** If successful (return code is zero), handle will be returned in this argument.

### Returns

- ESP\_OK if storage handle was opened successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label "nvs" is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP\_ERR\_NOT\_ALLOWED if the NVS partition is read-only and mode is NVS\_READWRITE
- ESP\_ERR\_INVALID\_ARG if out\_handle is equal to NULL
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_open\_from\_partition** (const char \*part\_name, const char \*namespace\_name, *nvs\_open\_mode\_t* open\_mode, *nvs\_handle\_t* \*out\_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

#### Parameters

- **part\_name** -- [in] Label (name) of the partition of interest for object read/write/erase
- **namespace\_name** -- [in] Namespace name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **open\_mode** -- [in] NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out\_handle** -- [out] If successful (return code is zero), handle will be returned in this argument.

#### Returns

- ESP\_OK if storage handle was opened successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with specified name is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP\_ERR\_NOT\_ALLOWED if the NVS partition is read-only and mode is NVS\_READWRITE
- ESP\_ERR\_INVALID\_ARG if out\_handle is equal to NULL
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_set\_blob** (*nvs\_handle\_t* handle, const char \*key, const void \*value, size\_t length)

set variable length binary value for given key

Sets variable length binary value for the key. Function uses 2 overhead and 1 entry per each 32 bytes of new data from the pool of available entries. See `nvs_get_stats`. In case of value update for existing key, space occupied by the existing value and 2 overhead entries are returned to the pool of available entries. Note that the underlying storage will not be updated until `nvs_commit` is called.

#### Parameters

- **handle** -- [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.

- **key** -- **[in]** Key name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **value** -- **[in]** The value to set.
- **length** -- **[in]** length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

**Returns**

- ESP\_OK if value was set successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if storage handle was opened as read only
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn't satisfy constraints
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is not enough space in the underlying storage to save the value
- ESP\_ERR\_NVS\_REMOVE\_FAILED if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.
- ESP\_ERR\_NVS\_VALUE\_TOO\_LONG if the value is too long

*esp\_err\_t* **nvs\_find\_key** (*nvs\_handle\_t* handle, const char \*key, *nvs\_type\_t* \*out\_type)

Lookup key-value pair with given key name.

Note that function may indicate both existence of the key as well as the data type of NVS entry if it is found.

**Parameters**

- **handle** -- **[in]** Storage handle obtained with `nvs_open`.
- **key** -- **[in]** Key name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **out\_type** -- **[out]** Pointer to the output variable populated with data type of NVS entry in case key was found. May be NULL, respective data type is then not provided.

**Returns**

- ESP\_OK if NVS entry for key provided was found
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn't exist
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_erase\_key** (*nvs\_handle\_t* handle, const char \*key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Parameters**

- **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- **key** -- **[in]** Key name. Maximum length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.

**Returns**

- ESP\_OK if erase operation was successful
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if handle was opened as read only
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn't exist
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_erase\_all** (*nvs\_handle\_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Parameters** **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**Returns**

- `ESP_OK` if erase operation was successful
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- other error codes from the underlying storage driver

`esp_err_t nvs_commit (nvs_handle_t handle)`

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Parameters** **handle** -- **[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**Returns**

- `ESP_OK` if the changes have been written successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- other error codes from the underlying storage driver

`void nvs_close (nvs_handle_t handle)`

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

**Parameters** **handle** -- **[in]** Storage handle to close

`esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)`

Fill structure `nvs_stats_t`. It provides info about memory used by NVS.

This function calculates the number of used entries, free entries, available entries, total entries and number of namespaces in partition.

```
// Example of nvs_get_stats() to get overview of actual statistics of data_
→entries :
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%lu), FreeEntries = (%lu), AvailableEntries = (
→%lu), AllEntries = (%lu)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.available_
→entries, nvs_stats.total_entries);
```

**Parameters**

- **part\_name** -- **[in]** Partition name NVS in the partition table. If pass a `NULL` than will use `NVS_DEFAULT_PART_NAME` ("nvs").
- **nvs\_stats** -- **[out]** Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

**Returns**

- `ESP_OK` if the changes have been written successfully. Return param `nvs_stats` will be filled.
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label "name" is not found. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `nvs_stats` is equal to `NULL`.

- `ESP_ERR_INVALID_STATE` if there is page with the status of `INVALID`. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first `INVALID` page.

`esp_err_t nvs_get_used_entry_count` (`nvs_handle_t` handle, `size_t *used_entries`)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if `err` is equal to `ESP_OK`). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs_
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
// the total number of entries occupied by the namespace
total_entries_namespace = used_entries + 1;
}
```

#### Parameters

- **handle** -- **[in]** Handle obtained from `nvs_open` function.
- **used\_entries** -- **[out]** Returns amount of used entries from a namespace.

#### Returns

- `ESP_OK` if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`. Return param `used_entries` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `used_entries` is equal to `NULL`.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

`esp_err_t nvs_entry_find` (`const char *part_name`, `const char *namespace_name`, `nvs_type_t` type, `nvs_iterator_t *output_iterator`)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified_
↳partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↳ANY, &it);
while(res == ESP_OK) {
nvs_entry_info_t info;
nvs_entry_info(it, &info); // Can omit error check if parameters are_
↳guaranteed to be non-NULL
printf("key '%s', type '%d' \n", info.key, info.type);
res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

#### Parameters

- **part\_name** -- **[in]** Partition name
- **namespace\_name** -- **[in]** Set this value if looking for entries with a specific namespace. Pass `NULL` otherwise.

- **type** -- **[in]** One of `nvs_type_t` values.
- **output\_iterator** -- **[out]** Set to a valid iterator to enumerate all the entries found. Set to `NULL` if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is `NULL`, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

#### Returns

- `ESP_OK` if no internal error or programming error occurred.
- `ESP_ERR_NVS_NOT_FOUND` if no element of specified criteria has been found.
- `ESP_ERR_NO_MEM` if memory has been exhausted during allocation of internal structures.
- `ESP_ERR_INVALID_ARG` if any of the parameters is `NULL`. Note: don't release `output_iterator` in case `ESP_ERR_INVALID_ARG` has been returned

`esp_err_t nvs_entry_find_in_handle` (`nvs_handle_t` handle, `nvs_type_t` type, `nvs_iterator_t` \*output\_iterator)

Create an iterator to enumerate NVS entries based on a handle and type.

```
// Example of listing all the key-value pairs of any type under specified_
↳handle (which defines a partition and namespace)
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find_in_handle(<nvs_handle>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are_
↳guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

#### Parameters

- **handle** -- **[in]** Handle obtained from `nvs_open` function.
- **type** -- **[in]** One of `nvs_type_t` values.
- **output\_iterator** -- **[out]** Set to a valid iterator to enumerate all the entries found. Set to `NULL` if no entry for specified criteria was found. If any other error except `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is `NULL`, too. If `ESP_ERR_INVALID_ARG` occurs, `output_iterator` is not changed. If a valid iterator is obtained through this function, it has to be released using `nvs_release_iterator` when not used any more, unless `ESP_ERR_INVALID_ARG` is returned.

#### Returns

- `ESP_OK` if no internal error or programming error occurred.
- `ESP_ERR_NVS_NOT_FOUND` if no element of specified criteria has been found.
- `ESP_ERR_NO_MEM` if memory has been exhausted during allocation of internal structures.
- `ESP_ERR_NVS_INVALID_HANDLE` if unknown handle was specified.
- `ESP_ERR_INVALID_ARG` if `output_iterator` parameter is `NULL`. Note: don't release `output_iterator` in case `ESP_ERR_INVALID_ARG` has been returned

`esp_err_t nvs_entry_next` (`nvs_iterator_t` \*iterator)

Advances the iterator to next item matching the iterator criteria.

Note that any copies of the iterator will be invalid after this call.

**Parameters** **iterator** -- **[inout]** Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-`NULL`. If any error ex-

cept `ESP_ERR_INVALID_ARG` occurs, `iterator` is set to `NULL`. If `ESP_ERR_INVALID_ARG` occurs, `iterator` is not changed.

**Returns**

- `ESP_OK` if no internal error or programming error occurred.
- `ESP_ERR_NVS_NOT_FOUND` if no next element matching the iterator criteria.
- `ESP_ERR_INVALID_ARG` if `iterator` is `NULL`.
- Possibly other errors in the future for internal programming or flash errors.

*esp\_err\_t* **nvs\_entry\_info** (const *nvs\_iterator\_t* iterator, *nvs\_entry\_info\_t* \*out\_info)

Fills *nvs\_entry\_info\_t* structure with information about entry pointed to by the iterator.

**Parameters**

- **iterator** -- [in] Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-`NULL`.
- **out\_info** -- [out] Structure to which entry information is copied.

**Returns**

- `ESP_OK` if all parameters are valid; current iterator data has been written to `out_info`
- `ESP_ERR_INVALID_ARG` if one of the parameters is `NULL`.

void **nvs\_release\_iterator** (*nvs\_iterator\_t* iterator)

Release iterator.

**Parameters** **iterator** -- [in] Release iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` or `nvs_entry_next` function. `NULL` argument is allowed.

**Structures**

struct **nvs\_entry\_info\_t**

information about entry obtained from `nvs_entry_info` function

**Public Members**

char **namespace\_name**[`NVS_NS_NAME_MAX_SIZE`]

Namespace to which key-value belong

char **key**[`NVS_KEY_NAME_MAX_SIZE`]

Key of stored key-value pair

*nvs\_type\_t* **type**

Type of stored key-value pair

struct **nvs\_stats\_t**

---

**Note:** Info about storage space NVS.

---

**Public Members**

size\_t **used\_entries**

Number of used entries.

size\_t **free\_entries**

Number of free entries. It includes also reserved entries.

size\_t **available\_entries**

Number of entries available for data storage.

size\_t **total\_entries**

Number of all entries.

size\_t **namespace\_count**

Number of namespaces.

## Macros

**ESP\_ERR\_NVS\_BASE**

Starting number of error codes

**ESP\_ERR\_NVS\_NOT\_INITIALIZED**

The storage driver is not initialized

**ESP\_ERR\_NVS\_NOT\_FOUND**

A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS\_READONLY

**ESP\_ERR\_NVS\_TYPE\_MISMATCH**

The type of set or get operation doesn't match the type of value stored in NVS

**ESP\_ERR\_NVS\_READ\_ONLY**

Storage handle was opened as read only

**ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE**

There is not enough space in the underlying storage to save the value

**ESP\_ERR\_NVS\_INVALID\_NAME**

Namespace name doesn't satisfy constraints

**ESP\_ERR\_NVS\_INVALID\_HANDLE**

Handle has been closed or is NULL

**ESP\_ERR\_NVS\_REMOVE\_FAILED**

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

**ESP\_ERR\_NVS\_KEY\_TOO\_LONG**

Key name is too long

**ESP\_ERR\_NVS\_PAGE\_FULL**

Internal error; never returned by nvs API functions

**ESP\_ERR\_NVS\_INVALID\_STATE**

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

**ESP\_ERR\_NVS\_INVALID\_LENGTH**

String or blob length is not sufficient to store data

**ESP\_ERR\_NVS\_NO\_FREE\_PAGES**

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

**ESP\_ERR\_NVS\_VALUE\_TOO\_LONG**

Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

**ESP\_ERR\_NVS\_PART\_NOT\_FOUND**

Partition with specified name is not found in the partition table

**ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND**

NVS partition contains data in new format and cannot be recognized by this version of code

**ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED**

XTS encryption failed while writing NVS entry

**ESP\_ERR\_NVS\_XTS\_DECR\_FAILED**

XTS decryption failed while reading NVS entry

**ESP\_ERR\_NVS\_XTS\_CFG\_FAILED**

XTS configuration setting failed

**ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND**

XTS configuration not found

**ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED**

NVS encryption is not supported in this version

**ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED**

NVS key partition is uninitialized

**ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART**

NVS key partition is corrupt

**ESP\_ERR\_NVS\_WRONG\_ENCRYPTION**

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP\_ERR\_NVS\_CONTENT\_DIFFERS**

Internal error; never returned by `nvs` API functions. NVS key is different in comparison

**NVS\_DEFAULT\_PART\_NAME**

Default partition name of the NVS partition in the partition table

**NVS\_PART\_NAME\_MAX\_SIZE**

maximum length of partition name (excluding null terminator)

**NVS\_KEY\_NAME\_MAX\_SIZE**

Maximum length of NVS key name (including null terminator)

**NVS\_NS\_NAME\_MAX\_SIZE**

Maximum length of NVS namespace name (including null terminator)

**Type Definitions**

```
typedef uint32_t nvs_handle_t
```

Opaque pointer type representing non-volatile storage handle

```
typedef nvs_handle_t nvs_handle
```

```
typedef nvs_open_mode_t nvs_open_mode
```

```
typedef struct nvs_opaque_iterator_t *nvs_iterator_t
```

Opaque pointer type representing iterator to nvs entries

**Enumerations**

```
enum nvs_open_mode_t
```

Mode of opening the non-volatile storage.

*Values:*

```
enumerator NVS_READONLY
```

Read only

```
enumerator NVS_READWRITE
```

Read and write

```
enum nvs_type_t
```

Types of variables.

*Values:*

```
enumerator NVS_TYPE_U8
```

Type uint8\_t

```
enumerator NVS_TYPE_I8
```

Type int8\_t

```
enumerator NVS_TYPE_U16
```

Type uint16\_t

```
enumerator NVS_TYPE_I16
```

Type int16\_t

```
enumerator NVS_TYPE_U32
```

Type uint32\_t

```
enumerator NVS_TYPE_I32
```

Type int32\_t

enumerator **NVS\_TYPE\_U64**

Type `uint64_t`

enumerator **NVS\_TYPE\_I64**

Type `int64_t`

enumerator **NVS\_TYPE\_STR**

Type `string`

enumerator **NVS\_TYPE\_BLOB**

Type `blob`

enumerator **NVS\_TYPE\_ANY**

Must be last

## 2.9.4 NVS Encryption

### Overview

This guide provides an overview of the NVS encryption feature. NVS encryption helps to achieve secure storage on the device flash memory.

Data stored in NVS partitions can be encrypted using XTS-AES in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one `sector` and relative address of the entry (w.r.t., `partition-start`) is fed to the encryption algorithm as `sector-number`.

### NVS Encryption: Flash Encryption-Based Scheme

In this scheme, the keys required for NVS encryption are stored in yet another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* becomes a prerequisite for NVS encryption here.

NVS encryption is enabled by default when *Flash Encryption* is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform-level encryption is already enabled.

For using NVS encryption using this scheme, the partition table must contain the *NVS Key Partition*. Two partition tables containing the *NVS Key Partition* are provided for NVS encryption under the partition table option (`menuconfig`>`Partition Table`). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example [security/flash\\_encryption](#) for how to configure and use the NVS encryption feature.

**NVS Key Partition** An application requiring NVS encryption support (using the Flash Encryption-based scheme) needs to be compiled with a key-partition of the type `data` and subtype `nvs_keys`. This partition should be marked as `encrypted` and its size should be the minimum partition size (4 KB). Refer to *Partition Tables* for more details. Two additional partition tables which contain the *NVS Key Partition* are provided under the partition table option (`menuconfig`>`Partition Table`). They can be directly used for NVS encryption. The structure of these partitions is depicted below:

```
+-----+-----+-----+-----+
|              XTS encryption key (32)              |
+-----+-----+-----+-----+
|              XTS tweak key (32)                    |
+-----+-----+-----+-----+
```

(continues on next page)

+-----+   CRC32 (4)   +-----+
-------------------------------------

The XTS encryption keys in the *NVS Key Partition* can be generated in one of the following two ways.

### Generate the keys on ESP32 chip itself

- When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first *NVS Key Partition*.
- Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.
- The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function then writes those keys onto the key-partition in encrypted form.

**Note:** Please note that `nvs_keys` partition must be completely erased before you start the application in this approach. Otherwise the application may generate the `ESP_ERR_NVS_CORRUPT_KEY_PART` error code assuming that `nvs_keys` partition is not empty and contains malformed data. You can use the following command for this:

```
parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --
↪partition-table-offset PARTITION_TABLE_OFFSET erase_partition --
↪partition-type=data --partition-subtype=nvs_keys
```

### Use a pre-generated NVS key partition

This option will be required by the user when keys in the *NVS Key Partition* are not generated by the application. The *NVS Key Partition* containing the XTS encryption keys can be generated with the help of *NVS Partition Generator Utility*. Then the user can store the pre-generated key partition on the flash with help of the following two commands:

1. Build and flash the partition table

```
idf.py partition-table partition-table-flash
```

2. Store the keys in the *NVS Key Partition* (on the flash) with the help of `parttool.py` (see Partition Tool section in *partition-tables* for more details)

```
parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET_
↪write_partition --partition-name="name of nvs_key partition" --input_
↪NVS_KEY_PARTITION_FILE
```

**Note:** If the device is encrypted in flash encryption development mode and you want to renew the NVS key partition, you need to tell `parttool.py` to encrypt the NVS key partition and you also need to give it a pointer to the unencrypted partition table in your build directory (`build/partition_table`) since the partition table on the device is encrypted, too. You can use the following command:

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table-
↪file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_
↪OFFSET write_partition --partition-name="name of nvs_key partition"
↪input NVS_KEY_PARTITION_FILE
```

---

Since the key partition is marked as `encrypted` and *Flash Encryption* is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide the correct key-partition and keys for encryption or decryption.

### Encrypted Read/Write

The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted NVS partition as well.

#### Encrypt the default NVS partition

- To enable encryption for the default NVS partition, no additional step is necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps to enable encryption for the default NVS partition depending on the scheme being used (set by `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME`).
- For the flash encryption-based scheme, the first *NVS Key Partition* found is used to generate the encryption keys while for the HMAC one, keys are generated using the HMAC key burnt in eFuse at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` (refer to the API documentation for more details).

Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

#### Encrypt a custom NVS partition

- To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.
- When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled:
  1. Populate the NVS security configuration structure `nvs_sec_cfg_t`
    - For the Flash Encryption-based scheme
      - \* Find key partition and NVS data partition using `esp_partition_find*` API functions.
      - \* Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
  2. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
  3. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
  4. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
  5. Deinitialise an NVS partition using `nvs_flash_deinit()`.

### NVS Security Provider

The component `nvs_sec_provider` stores all the implementation-specific code for the NVS encryption schemes and would also accommodate any future schemes. This component acts as an interface to the `nvs_flash` component for the handling of encryption keys. `nvs_sec_provider` has a configuration menu of its own, based on which the selected security scheme and the corresponding settings are registered for the `nvs_flash` component.

### API Reference

#### Header File

- `components/nvs_sec_provider/include/nvs_sec_provider.h`

- This header file can be included with:

```
#include "nvs_sec_provider.h"
```

- This header file is a part of the API provided by the `nvs_sec_provider` component. To declare that your component depends on `nvs_sec_provider`, add the following to your `CMakeLists.txt`:

```
REQUIRES nvs_sec_provider
```

or

```
PRIV_REQUIRES nvs_sec_provider
```

## Functions

`esp_err_t nvs_sec_provider_register_flash_enc` (const `nvs_sec_config_flash_enc_t` `sec_scheme_cfg`, `nvs_sec_scheme_t` `sec_scheme_handle_out`)

Register the Flash-Encryption based scheme for NVS Encryption.

### Parameters

- `sec_scheme_cfg` -- [in] Security scheme specific configuration data
- `sec_scheme_handle_out` -- [out] Security scheme specific configuration handle

### Returns

- `ESP_OK`, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_cfg_hmac` is `NULL`;
- `ESP_ERR_NO_MEM`, No memory for the scheme-specific handle `sec_scheme_handle_out`
- `ESP_ERR_NOT_FOUND`, if no `nvs_keys` partition is found

`esp_err_t nvs_sec_provider_deregister` (`nvs_sec_scheme_t` `sec_scheme_handle`)

Deregister the NVS encryption scheme registered with the given handle.

**Parameters** `sec_scheme_handle` -- [in] Security scheme specific configuration handle

### Returns

- `ESP_OK`, if the scheme registered with `sec_scheme_handle` was deregistered successfully
- `ESP_ERR_INVALID_ARG`, if `sec_scheme_handle` is `NULL`;

## Structures

struct `nvs_sec_config_flash_enc_t`

Flash encryption-based scheme specific configuration data.

### Public Members

const `esp_partition_t` `nvs_keys_part`

Partition of subtype `nvs_keys` holding the NVS encryption keys

## Macros

`ESP_ERR_NVS_SEC_BASE`

Starting number of error codes

`ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND`

HMAC Key required to generate the NVS encryption keys not found

**ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_BLK\_ALREADY\_USED**

Provided eFuse block for HMAC key generation is already in use

**ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_GENERATION\_FAILED**

Failed to generate/write the HMAC key to eFuse

**ESP\_ERR\_NVS\_SEC\_HMAC\_XTS\_KEYS\_DERIV\_FAILED**

Failed to derive the NVS encryption keys based on the HMAC-based scheme

**NVS\_SEC\_PROVIDER\_CFG\_FLASH\_ENC\_DEFAULT ()**

Helper for populating the Flash encryption-based scheme specific configuration data.

### Enumerations

enum **nvs\_sec\_scheme\_id\_t**

NVS Encryption Keys Protection Scheme.

*Values:*

enumerator **NVS\_SEC\_SCHEME\_FLASH\_ENC**

Protect NVS encryption keys using Flash Encryption

enumerator **NVS\_SEC\_SCHEME\_HMAC**

Protect NVS encryption keys using HMAC peripheral

enumerator **NVS\_SEC\_SCHEME\_MAX**

## 2.9.5 NVS Partition Generator Utility

### Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file, compatible with the NVS architecture defined in *Non-Volatile Storage Library*, based on the key-value pairs provided in a CSV file.

This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

### Prerequisites

**To use this utility in encryption mode, install the following packages:**

- `cryptography`

All the required packages are included in *requirements.txt* in the root of the ESP-IDF directory.

**CSV File Format** Each line of a CSV file should contain 4 parameters, separated by a comma. The table below describes each of these parameters.

No.	Parameter	Description	Notes
1	Key	Key of the data. The data can be accessed later from an application using this key.	
2	Type	Supported values are <code>file</code> , <code>data</code> , and <code>namespace</code> .	
3	Encoding	Supported values are: <code>u8</code> , <code>i8</code> , <code>u16</code> , <code>i16</code> , <code>u32</code> , <code>i32</code> , <code>u64</code> , <code>i64</code> , <code>string</code> , <code>hex2bin</code> , <code>base64</code> , and <code>binary</code> . This specifies how actual data values are encoded in the resulting binary file. The difference between the <code>string</code> and <code>binary</code> encoding is that <code>string</code> data is terminated with a NULL character, whereas <code>binary</code> data is not.	As of now, for the <code>file</code> type, only <code>hex2bin</code> , <code>base64</code> , <code>string</code> , and <code>binary</code> encoding is supported.
4	Value	Data value	Encoding and Value cells for the <code>namespace</code> field type should be empty. Encoding and Value of <code>namespace</code> are fixed and are not configurable. Any values in these cells are ignored.

---

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

---

Below is an example dump of such a CSV file:

```
key,type,encoding,value      <-- column header
namespace_name,namespace,,  <-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

---

**Note:**

**Make sure there are no spaces:**

- before and after `'`
  - at the end of each line in a CSV file
- 

### NVS Entry and Namespace Association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

---

**Note:** First entry in a CSV file should always be a namespace entry.

---

## Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section *Structure of Entry*. If you intend to use the older format, the utility provides an option to disable this feature.

## Encryption-Decryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file and decrypt an encrypted one. The utility uses the XTS-AES encryption. Please refer to *NVS Encryption* for more details.

## Running the Utility

### Usage:

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

### Optional Arguments:

No.	Parameter	Description
1	-h / --help	Show the help message and exit

### Commands:

Run `nvs_partition_gen.py {command} -h` for additional help

No.	Parameter	Description
1	generate	Generate NVS partition
2	generate-key	Generate keys for encryption
3	encrypt	Generate NVS encrypted partition
4	decrypt	Decrypt NVS encrypted partition

### Generate NVS Partition (Default) Usage:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]
↪input output size
```

### Positional Arguments:

Parameter	Description
input	Path to CSV file to parse
output	Path to output NVS binary file
size	Size of NVS partition in bytes (must be multiple of 4096)

### Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--version {1,2}	Set multipage blob version (Default: Version 2) Version 1 - Multipage blob support disabled Version 2 - Multipage blob support enabled
--outdir OUTDIR	Output directory to store file created (Default: current directory)

You can run the utility to generate NVS partition using the command below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

### Generate Encryption Keys Partition Usage:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

#### Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--keyfile KEYFILE	Path to output encryption keys file
--outdir OUTDIR	Output directory to store files created. (Default: current directory)

You can run the utility to generate only the encryption key partition using the command below:

```
python nvs_partition_gen.py generate-key
```

### Generate Encrypted NVS Partition Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                   [--keyfile KEYFILE] [--inputkey INPUTKEY] [--
↳outdir OUTDIR]
                                   input output size
```

#### Positional Arguments:

Parameter	Description
input	Path to CSV file to parse
output	Path to output NVS binary file
size	Size of NVS partition in bytes (must be multiple of 4096)

#### Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--version {1,2}	Set multipage blob version (Default: Version 2) Version 1 - Multipage blob support disabled Version 2 - Multipage blob support enabled
--keygen	Generates key for encrypting NVS partition
--keyfile KEYFILE	Path to output encryption keys file
--inputkey INPUTKEY	File having key for encrypting NVS partition
--outdir OUTDIR	Output directory to store file created (Default: current directory)

You can run the utility to encrypt NVS partition using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↳0x3000 --keygen
```

---

**Note:** Encryption key of the format <outdir>/keys/keys-<timestamp>.bin is created.

---

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --keygen --keyfile sample_keys.bin
```

---

**Note:**

- Encryption key of the format <outdir>/keys/sample\_keys.bin is created.
  - This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to [NVS Key Partition](#) for more details.
- 

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin_
↪0x3000 --inputkey sample_keys.bin
```

### Decrypt Encrypted NVS Partition Usage:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

#### Positional Arguments:

Parameter	Description
input	Path to encrypted NVS partition file to parse
key	Path to file having keys for decryption
output	Path to output decrypted binary file

#### Optional Arguments:

Parameter	Description
-h / --help	Show the help message and exit
--outdir OUTDIR	Output directory to store files created. (Default: current directory)

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

#### You can also provide the format version number:

- Multipage blob support disabled (Version 1)
- Multipage blob support enabled (Version 2)

**Multipage Blob Support Disabled (Version 1)** You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file for the same is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 -
↪-version 1
```

**Multipage Blob Support Enabled (Version 2)** You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file for the same is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --  
↪version 2
```

---

**Note:**

- Minimum NVS Partition Size needed is 0x3000 bytes.
  - When flashing the binary onto the device, make sure it is consistent with the application's sdkconfig.
- 

**Caveats**

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

## 2.9.6 NVS Partition Parser Utility

**Introduction**

The utility `nvs_flash/nvs_partition_tool/nvs_tool.py` loads and parses an NVS storage partition for easier debugging and data extraction. The utility also features integrity check which scans the partition for potential errors. Data blobs are encoded in *base64* format.

**Encrypted Partitions**

This utility does not support decryption. To decrypt the NVS partition, please use the *NVS Partition Generator Utility* which does support NVS partition encryption and decryption.

**Usage**

**There are two output format styles available with the `-f` or `--format` option:**

- *json* - All of the output is printed as a JSON.
- *text* - The output is printed as a human-readable text with different selectable output styles mentioned below.

**For the *text* output format, the utility provides six different output styles with the `-d` or `--dump` option:**

- *all* (default) - Prints all entries with metadata.
- *written* - Prints only written entries with metadata.
- *minimal* - Prints written *namespace:key = value* pairs.
- *namespaces* - Prints all written namespaces
- *blobs* - Prints all blobs and strings (reconstructs them if they are chunked).
- *storage\_info* - Prints entry states count for every page.

---

**Note:** There is also a *none* option which will not print anything. This can be used with the integrity check option if the NVS partition contents are irrelevant.

---

The utility also provides an integrity check feature via the `-i` or `--integrity-check` option (available only with the *text* format as it would invalidate the *json* output). This feature scans through the entire partition and prints potential errors. It can be used with the `-d none` option which will print only the potential errors.

## 2.9.7 SD/SDIO/MMC Driver

### Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/sdmmc/include/driver/sdmmc\\_host.h](#) and [driver/spi/include/driver/sdspi\\_host.h](#)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see [SDMMC Host API](#)
- SD SPI host, see [SD SPI Host API](#)

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the `sdmmc_host_t` structure. This structure contains pointers to various functions of the host.

### Pin Configurations

SDMMC pins are dedicated, you don't have to configure the pins.

### Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the [storage/sd\\_card](#) directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

**Combo (Memory + IO) Cards** The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread Safety** Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

### Protocol Layer API

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

### Using API with SD Memory Cards

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

**Using API with eMMC Chips** From the protocol layer's perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

**Using API with SDIO Cards** Initialization and the probing process are the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the field is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

Action	Read Function	Write Function
Read and write a single byte using IO_RW_DIRECT (CMD52)	<code>sdmmc_io_read_byte()</code>	<code>sdmmc_io_write_byte()</code>
Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode	<code>sdmmc_io_read_bytes()</code>	<code>sdmmc_io_write_bytes()</code>
Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode	<code>sdmmc_io_read_blocks()</code>	<code>sdmmc_io_write_blocks()</code>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See [ESP Serial Slave Link](#) and example [peripherals/sdio/host](#).

## API Reference

### Header File

- `components/sdmmc/include/sdmmc_cmd.h`
- This header file can be included with:

```
#include "sdmmc_cmd.h"
```

- This header file is a part of the API provided by the `sdmmc` component. To declare that your component depends on `sdmmc`, add the following to your `CMakeLists.txt`:

```
REQUIRES sdmmc
```

or

```
PRIV_REQUIRES sdmmc
```

## Functions

*esp\_err\_t* **sdmmc\_card\_init** (const *sdmmc\_host\_t* \*host, *sdmmc\_card\_t* \*out\_card)

Probe and initialize SD/MMC card using given host

---

**Note:** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

---

### Parameters

- **host** -- pointer to structure defining host controller
- **out\_card** -- pointer to structure which will receive information about the card when the function completes

### Returns

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

void **sdmmc\_card\_print\_info** (FILE \*stream, const *sdmmc\_card\_t* \*card)

Print information about the card to a stream.

### Parameters

- **stream** -- stream obtained using `fopen` or `fdopen`
- **card** -- card information structure initialized using `sdmmc_card_init`

*esp\_err\_t* **sdmmc\_get\_status** (*sdmmc\_card\_t* \*card)

Get status of SD/MMC card

**Parameters** **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

### Returns

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_write\_sectors** (*sdmmc\_card\_t* \*card, const void \*src, size\_t start\_sector, size\_t sector\_count)

Write given number of sectors to SD/MMC card

### Parameters

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **src** -- pointer to data buffer to read data from; data size must be equal to `sector_count * card->csd.sector_size`
- **start\_sector** -- sector where to start writing
- **sector\_count** -- number of sectors to write

### Returns

- `ESP_OK` on success or `sector_count` equal to 0
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_read\_sectors** (*sdmmc\_card\_t* \*card, void \*dst, size\_t start\_sector, size\_t sector\_count)

Read given number of sectors from the SD/MMC card

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **dst** -- pointer to data buffer to write into; buffer size must be at least `sector_count * card->csd.sector_size`
- **start\_sector** -- sector where to start reading
- **sector\_count** -- number of sectors to read

**Returns**

- ESP\_OK on success or `sector_count` equal to 0
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_erase\_sectors** (*sdmmc\_card\_t* \*card, size\_t start\_sector, size\_t sector\_count, *sdmmc\_erase\_arg\_t* arg)

Erase given number of sectors from the SD/MMC card

---

**Note:** When `sdmmc_erase_sectors` used with cards in SDSPI mode, it was observed that card requires re-init after erase operation.

---

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **start\_sector** -- sector where to start erase
- **sector\_count** -- number of sectors to erase
- **arg** -- erase command (CMD38) argument

**Returns**

- ESP\_OK on success or `sector_count` equal to 0
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_can\_discard** (*sdmmc\_card\_t* \*card)

Check if SD/MMC card supports discard

**Parameters** **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**

- ESP\_OK if supported by the card/device
- ESP\_FAIL if not supported by the card/device

*esp\_err\_t* **sdmmc\_can\_trim** (*sdmmc\_card\_t* \*card)

Check if SD/MMC card supports trim

**Parameters** **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**

- ESP\_OK if supported by the card/device
- ESP\_FAIL if not supported by the card/device

*esp\_err\_t* **sdmmc\_mmc\_can\_sanitize** (*sdmmc\_card\_t* \*card)

Check if SD/MMC card supports sanitize

**Parameters** **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**

- ESP\_OK if supported by the card/device
- ESP\_FAIL if not supported by the card/device

*esp\_err\_t* **sdmmc\_mmc\_sanitize** (*sdmmc\_card\_t* \*card, uint32\_t timeout\_ms)

Sanitize the data that was unmapped by a Discard command

**Note:** Discard command has to precede sanitize operation. To discard, use `MMC_DICARD_ARG` with `sdmmc_erase_sectors` argument

---

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout\_ms** -- timeout value in milliseconds required to sanitize the selected range of sectors.

**Returns**

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_full\_erase** (*sdmmc\_card\_t* \*card)

Erase complete SD/MMC card

**Parameters** **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_byte** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t reg, uint8\_t \*out\_byte)

Read one byte from an SDIO card using `IO_RW_DIRECT` (CMD52)

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **out\_byte** -- **[out]** output, receives the value read from the card

**Returns**

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_byte** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t reg, uint8\_t in\_byte, uint8\_t \*out\_byte)

Write one byte to an SDIO card using `IO_RW_DIRECT` (CMD52)

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **reg** -- byte address within IO function
- **in\_byte** -- value to be written
- **out\_byte** -- **[out]** if not NULL, receives new byte value read from the card (read-after-write).

**Returns**

- `ESP_OK` on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_bytes** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, void \*dst, size\_t size)

Read multiple bytes from an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs read operation using `CMD53` in byte mode. For block mode, see `sdmmc_io_read_blocks`.

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where reading starts
- **dst** -- buffer which receives the data read from card
- **size** -- number of bytes to read

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if `size` exceeds 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_bytes** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write multiple bytes to an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs write operation using `CMD53` in byte mode. For block mode, see `sdmmc_io_write_blocks`.

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **src** -- data to be written
- **size** -- number of bytes to write

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if `size` exceeds 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_blocks** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, void \*dst, size\_t size)

Read blocks of data from an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs read operation using `CMD53` in block mode. For byte mode, see `sdmmc_io_read_bytes`.

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **dst** -- buffer which receives the data read from card
- **size** -- number of bytes to read, must be divisible by the card block size.

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_SIZE` if `size` is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_blocks** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write blocks of data to an SDIO card using `IO_RW_EXTENDED` (CMD53)

This function performs write operation using `CMD53` in block mode. For byte mode, see `sdmmc_io_write_bytes`.

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** -- IO function number
- **addr** -- byte address within IO function where writing starts
- **src** -- data to be written

- **size** -- number of bytes to read, must be divisible by the card block size.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_enable\_int** (*sdmmc\_card\_t* \*card)

Enable SDIO interrupt in the SDMMC host

**Parameters** **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts

*esp\_err\_t* **sdmmc\_io\_wait\_int** (*sdmmc\_card\_t* \*card, TickType\_t timeout\_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout\_ticks** -- time to wait for the interrupt, in RTOS ticks

**Returns**

- ESP\_OK if the interrupt is received
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts
- ESP\_ERR\_TIMEOUT if the interrupt does not happen in `timeout_ticks`

*esp\_err\_t* **sdmmc\_io\_get\_cis\_data** (*sdmmc\_card\_t* \*card, uint8\_t \*out\_buffer, size\_t buffer\_size, size\_t \*inout\_cis\_size)

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Parameters**

- **card** -- pointer to card information structure previously initialized using `sdmmc_card_init`
- **out\_buffer** -- Output buffer of the CIS data
- **buffer\_size** -- Size of the buffer.
- **inout\_cis\_size** -- Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_RESPONSE: if the card does not (correctly) support CIS.
- ESP\_ERR\_INVALID\_SIZE: `CIS_CODE_END` found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- ESP\_ERR\_NOT\_FOUND: if the `CIS_CODE_END` not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

*esp\_err\_t* **sdmmc\_io\_print\_cis\_info** (uint8\_t \*buffer, size\_t buffer\_size, FILE \*fp)

Parse and print the CIS information of an SDIO card.

---

**Note:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

**Parameters**

- **buffer** -- Buffer to parse
- **buffer\_size** -- Size of the buffer.
- **fp** -- File pointer to print to, set to NULL to print to stdout.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_NOT\_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP\_ERR\_INVALID\_SIZE: if the CIS size fields are not correct.

**Header File**

- `components/driver/sdmmc/include/driver/sdmmc_types.h`
- This header file can be included with:

```
#include "driver/sdmmc_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

PRIV_REQUIRES driver
```

**Structures**

struct **sdmmc\_csd\_t**

Decoded values from SD card Card Specific Data register

**Public Members**

int **csd\_ver**

CSD structure format

int **mmc\_ver**

MMC version (for CID format)

int **capacity**

total number of sectors

int **sector\_size**

sector size in bytes

int **read\_block\_len**

block length for reads

int **card\_command\_class**

Card Command Class for SD

int **tr\_speed**  
Max transfer speed

struct **sdmmc\_cid\_t**  
Decoded values from SD card Card IDentification register

### Public Members

int **mfg\_id**  
manufacturer identification number

int **oem\_id**  
OEM/product identification number

char **name**[8]  
product name (MMC v1 has the longest)

int **revision**  
product revision

int **serial**  
product serial number

int **date**  
manufacturing date

struct **sdmmc\_scr\_t**  
Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly

### Public Members

uint32\_t **sd\_spec**  
SD Physical layer specification version, reported by card

uint32\_t **erase\_mem\_state**  
data state on card after erase whether 0 or 1 (card vendor dependent)

uint32\_t **bus\_width**  
bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

uint32\_t **reserved**  
reserved for future expansion

uint32\_t **rsvd\_mnf**  
reserved for manufacturer usage

struct **sdmmc\_ssr\_t**  
Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly

**Public Members****uint32\_t alloc\_unit\_kb**

Allocation unit of the card, in multiples of kB (1024 bytes)

**uint32\_t erase\_size\_au**

Erase size for the purpose of timeout calculation, in multiples of allocation unit

**uint32\_t cur\_bus\_width**

SD current bus width

**uint32\_t discard\_support**

SD discard feature support

**uint32\_t fule\_support**

SD FULE (Full User Area Logical Erase) feature support

**uint32\_t erase\_timeout**

Timeout (in seconds) for erase of a single allocation unit

**uint32\_t erase\_offset**

Constant timeout offset (in seconds) for any erase operation

**uint32\_t reserved**

reserved for future expansion

struct **sdmmc\_ext\_csd\_t**

Decoded values of Extended Card Specific Data

**Public Members****uint8\_t rev**

Extended CSD Revision

**uint8\_t power\_class**

Power class used by the card

**uint8\_t erase\_mem\_state**

data state on card after erase whether 0 or 1 (card vendor dependent)

**uint8\_t sec\_feature**

secure data management features supported by the card

struct **sdmmc\_switch\_func\_rsp\_t**

SD SWITCH\_FUNC response buffer

**Public Members**

uint32\_t **data**[512 / 8 / sizeof(uint32\_t)]  
response data

struct **sdmmc\_command\_t**  
SD/MMC command information

**Public Members**

uint32\_t **opcode**  
SD or MMC command index

uint32\_t **arg**  
SD/MMC command argument

*sdmmc\_response\_t* **response**  
response buffer

void \***data**  
buffer to send or read into

size\_t **datalen**  
length of data in the buffer

size\_t **buflen**  
length of the buffer

size\_t **blklen**  
block length

int **flags**  
see below

*esp\_err\_t* **error**  
error returned from transfer

uint32\_t **timeout\_ms**  
response timeout, in milliseconds

struct **sdmmc\_host\_t**  
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

**Public Members**

**uint32\_t flags**

flags defining host properties

**int slot**

slot number, to be passed to host functions

**int max\_freq\_khz**

max frequency supported by the host

**float io\_voltage**

I/O voltage used by the controller (voltage switching is not supported)

*esp\_err\_t* (\***init**)(void)

Host function to initialize the driver

*esp\_err\_t* (\***set\_bus\_width**)(int slot, size\_t width)

host function to set bus width

size\_t (\***get\_bus\_width**)(int slot)

host function to get bus width

*esp\_err\_t* (\***set\_bus\_ddr\_mode**)(int slot, bool ddr\_enable)

host function to set DDR mode

*esp\_err\_t* (\***set\_card\_clk**)(int slot, uint32\_t freq\_khz)

host function to set card clock frequency

*esp\_err\_t* (\***set\_cclk\_always\_on**)(int slot, bool cclk\_always\_on)

host function to set whether the clock is always enabled

*esp\_err\_t* (\***do\_transaction**)(int slot, *sdmmc\_command\_t* \*cmdinfo)

host function to do a transaction

*esp\_err\_t* (\***deinit**)(void)

host function to deinitialize the driver

*esp\_err\_t* (\***deinit\_p**)(int slot)

host function to deinitialize the driver, called with the `slot`

*esp\_err\_t* (\***io\_int\_enable**)(int slot)

Host function to enable SDIO interrupt line

*esp\_err\_t* (\***io\_int\_wait**)(int slot, TickType\_t timeout\_ticks)

Host function to wait for SDIO interrupt line to be active

**int command\_timeout\_ms**

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

*esp\_err\_t* (\***get\_real\_freq**)(int slot, int \*real\_freq)

Host function to provide real working freq, based on SDMMC controller setup

*sdmmc\_delay\_phase\_t* **input\_delay\_phase**

input delay phase, this will only take into effect when the host works in SDMMC\_FREQ\_HIGHSPEED or SDMMC\_FREQ\_52M. Driver will print out how long the delay is

*esp\_err\_t* (\***set\_input\_delay**)(int slot, *sdmmc\_delay\_phase\_t* delay\_phase)

set input delay phase

struct **sdmmc\_card\_t**

SD/MMC card information structure

### Public Members

*sdmmc\_host\_t* **host**

Host with which the card is associated

uint32\_t **ocr**

OCR (Operation Conditions Register) value

*sdmmc\_cid\_t* **cid**

decoded CID (Card Identification) register value

*sdmmc\_response\_t* **raw\_cid**

raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

*sdmmc\_csd\_t* **csd**

decoded CSD (Card-Specific Data) register value

*sdmmc\_scr\_t* **scr**

decoded SCR (SD card Configuration Register) value

*sdmmc\_ssr\_t* **ssr**

decoded SSR (SD Status Register) value

*sdmmc\_ext\_csd\_t* **ext\_csd**

decoded EXT\_CSD (Extended Card Specific Data) register value

uint16\_t **rca**

RCA (Relative Card Address)

uint16\_t **max\_freq\_khz**

Maximum frequency, in kHz, supported by the card

int **real\_freq\_khz**

Real working frequency, in kHz, configured on the host controller

uint32\_t **is\_mem**

Bit indicates if the card is a memory card

uint32\_t **is\_sdio**

Bit indicates if the card is an IO card

uint32\_t **is\_mmc**

Bit indicates if the card is MMC

uint32\_t **num\_io\_functions**

If `is_sdio` is 1, contains the number of IO functions on the card

uint32\_t **log\_bus\_width**

$\log_2$ (bus width supported by card)

uint32\_t **is\_ddr**

Card supports DDR mode

uint32\_t **reserved**

Reserved for future expansion

## Macros

**SDMMC\_HOST\_FLAG\_1BIT**

host supports 1-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_4BIT**

host supports 4-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_8BIT**

host supports 8-line MMC protocol

**SDMMC\_HOST\_FLAG\_SPI**

host supports SPI protocol

**SDMMC\_HOST\_FLAG\_DDR**

host supports DDR mode for SD/MMC

**SDMMC\_HOST\_FLAG\_DEINIT\_ARG**

host `deinit` function called with the slot argument

**SDMMC\_FREQ\_DEFAULT**

SD/MMC Default speed (limited by clock divider)

**SDMMC\_FREQ\_HIGHSPEED**

SD High speed (limited by clock divider)

**SDMMC\_FREQ\_PROBING**

SD/MMC probing speed

**SDMMC\_FREQ\_52M**

MMC 52MHz speed

**SDMMC\_FREQ\_26M**

MMC 26MHz speed

**Type Definitions**typedef uint32\_t **sdmmc\_response\_t**[4]

SD/MMC command response buffer

**Enumerations**enum **sdmmc\_delay\_phase\_t**

SD/MMC Host clock timing delay phases

This will only take effect when the host works in SDMMC\_FREQ\_HIGHSPEED or SDMMC\_FREQ\_52M. Driver will print out how long the delay is, in picosecond (ps).

*Values:*enumerator **SDMMC\_DELAY\_PHASE\_0**

Delay phase 0

enumerator **SDMMC\_DELAY\_PHASE\_1**

Delay phase 1

enumerator **SDMMC\_DELAY\_PHASE\_2**

Delay phase 2

enumerator **SDMMC\_DELAY\_PHASE\_3**

Delay phase 3

enum **sdmmc\_erase\_arg\_t**

SD/MMC erase command(38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.

DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the previously written data may be partially or fully read by the host depending on card implementation.

MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.

DISCARD: The Discard function allows the host to identify data that is no longer required so that the device can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group. After discard operation, the original data may be remained partially or fully accessible to the host dependent on device.

*Values:*enumerator **SDMMC\_ERASE\_ARG**

Erase operation on SD, Trim operation on MMC

enumerator **SDMMC\_DISCARD\_ARG**

Discard operation for SD/MMC

## 2.9.8 Partitions API

### Overview

The `esp_partition` component has higher-level API functions which work with partitions defined in the [Partition Tables](#). These APIs are based on lower level API provided by [SPI Flash API](#).

### Partition Table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in [Partition Tables](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find()`.
- `esp_partition_find_first()` is a convenience function which returns the structure describing the first partition found by `esp_partition_find()`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `esp_flash_read()`, `esp_flash_write()`, `esp_flash_erase_region()`, but operate within partition boundaries.

### See Also

- [Partition Tables](#)
- [Over The Air Updates \(OTA\)](#) provides high-level API for updating applications stored in flash.
- [Non-Volatile Storage Library](#) provides a structured API for storing small pieces of data in SPI flash.

### API Reference - Partition Table

#### Header File

- `components/esp_partition/include/esp_partition.h`
- This header file can be included with:

```
#include "esp_partition.h"
```

- This header file is a part of the API provided by the `esp_partition` component. To declare that your component depends on `esp_partition`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_partition
```

or

```
PRIV_REQUIRES esp_partition
```

#### Functions

`esp_partition_iterator_t` **esp\_partition\_find** (`esp_partition_type_t` type, `esp_partition_subtype_t` subtype, `const char *label`)

Find partition based on one or more parameters.

#### Parameters

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

**Returns** iterator which can be used to enumerate all the partitions found, or `NULL` if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

```
const esp_partition_t *esp_partition_find_first (esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
```

Find first partition based on one or more parameters.

#### Parameters

- **type** -- Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** -- Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** -- (optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

**Returns** pointer to `esp_partition_t` structure, or `NULL` if no partition is found. This pointer is valid for the lifetime of the application.

```
const esp_partition_t *esp_partition_get (esp_partition_iterator_t iterator)
```

Get `esp_partition_t` structure for given partition.

**Parameters** **iterator** -- Iterator obtained using `esp_partition_find`. Must be non-`NULL`.

**Returns** pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

```
esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)
```

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Parameters** **iterator** -- Iterator obtained using `esp_partition_find`. Must be non-`NULL`.

**Returns** `NULL` if no partition was found, valid `esp_partition_iterator_t` otherwise.

```
void esp_partition_iterator_release (esp_partition_iterator_t iterator)
```

Release partition iterator.

**Parameters** **iterator** -- Iterator obtained using `esp_partition_find`. The iterator is allowed to be `NULL`, so it is not necessary to check its value before calling this function.

```
const esp_partition_t *esp_partition_verify (const esp_partition_t *partition)
```

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

**Parameters** **partition** -- Pointer to partition data to verify. Must be non-`NULL`. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

#### Returns

- If partition not found, returns `NULL`.
- If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.

*esp\_err\_t* **esp\_partition\_read** (const *esp\_partition\_t* \*partition, size\_t src\_offset, void \*dst, size\_t size)

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

#### Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src\_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

**Returns** ESP\_OK, if data was read successfully; ESP\_ERR\_INVALID\_ARG, if `src_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_write** (const *esp\_partition\_t* \*partition, size\_t dst\_offset, const void \*src, size\_t size)

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `esp_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `esp_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

---

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

---

#### Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst\_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

**Returns** ESP\_OK, if data was written successfully; ESP\_ERR\_INVALID\_ARG, if `dst_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition; ESP\_ERR\_NOT\_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_read\_raw** (const *esp\_partition\_t* \*partition, size\_t src\_offset, void \*dst, size\_t size)

Read data from the partition without any transformation/decryption.

---

**Note:** This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

---

#### Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** -- Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **src\_offset** -- Address of the data to be read, relative to the beginning of the partition.
- **size** -- Size of data to be read, in bytes.

**Returns** ESP\_OK, if data was read successfully; ESP\_ERR\_INVALID\_ARG, if `src_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_write\_raw** (const *esp\_partition\_t* \*partition, size\_t dst\_offset, const void \*src, size\_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

---

**Note:** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

---

---

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

---

#### Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst\_offset** -- Address where the data should be written, relative to the beginning of the partition.
- **src** -- Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least 'size' bytes long.
- **size** -- Size of data to be written, in bytes.

**Returns** ESP\_OK, if data was written successfully; ESP\_ERR\_INVALID\_ARG, if `dst_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition; ESP\_ERR\_NOT\_ALLOWED, if partition is read-only; or one of the error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_erase\_range** (const *esp\_partition\_t* \*partition, size\_t offset, size\_t size)

Erase part of the partition.

#### Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** -- Offset from the beginning of partition where erase operation should start. Must be aligned to `partition->erase_size`.
- **size** -- Size of the range which should be erased, in bytes. Must be divisible by `partition->erase_size`.

**Returns** ESP\_OK, if the range was erased successfully; ESP\_ERR\_INVALID\_ARG, if iterator or `dst` are NULL; ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition; ESP\_ERR\_NOT\_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_mmap** (const *esp\_partition\_t* \*partition, size\_t offset, size\_t size, *esp\_partition\_mmap\_memory\_t* memory, const void \*\*out\_ptr, *esp\_partition\_mmap\_handle\_t* \*out\_handle)

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of `mmap-ed` region).

To release mapped memory, pass handle returned via `out_handle` argument to `esp_partition_munmap` function.

#### Parameters

- **partition** -- Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** -- Offset from the beginning of partition where mapping should start.
- **size** -- Size of the area to be mapped.
- **memory** -- Memory space where the region should be mapped
- **out\_ptr** -- Output, pointer to the mapped memory region
- **out\_handle** -- Output, handle which should be used for `esp_partition_munmap` call

**Returns** `ESP_OK`, if successful

void **esp\_partition\_munmap** (*esp\_partition\_mmap\_handle\_t* handle)

Release region previously obtained using `esp_partition_mmap`.

---

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

---

**Parameters** **handle** -- Handle obtained from `spi_flash_mmap`

*esp\_err\_t* **esp\_partition\_get\_sha256** (const *esp\_partition\_t* \*partition, uint8\_t \*sha\_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns `ESP_ERR_IMAGE_INVALID`. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

#### Parameters

- **partition** -- [**in**] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha\_256** -- [**out**] Returned SHA-256 digest for a given partition.

#### Returns

- `ESP_OK`: In case of successful operation.
- `ESP_ERR_INVALID_ARG`: The size was 0 or the `sha_256` was NULL.
- `ESP_ERR_NO_MEM`: Cannot allocate memory for sha256 operation.
- `ESP_ERR_IMAGE_INVALID`: App partition doesn't contain a valid app image.
- `ESP_FAIL`: An allocation error occurred.

bool **esp\_partition\_check\_identity** (const *esp\_partition\_t* \*partition\_1, const *esp\_partition\_t* \*partition\_2)

Check for the identity of two partitions by SHA-256 digest.

#### Parameters

- **partition\_1** -- [**in**] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition\_2** -- [**in**] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

#### Returns

- True: In case of the two firmware is equal.
- False: Otherwise

*esp\_err\_t* **esp\_partition\_register\_external** (*esp\_flash\_t* \*flash\_chip, size\_t offset, size\_t size, const char \*label, *esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, const *esp\_partition\_t* \*\*out\_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp\_flash\_t* structure) as partitions. This allows using them with components which access SPI flash through the *esp\_partition* API.

#### Parameters

- **flash\_chip** -- Pointer to the structure identifying the flash chip
- **offset** -- Address in bytes, where the partition starts
- **size** -- Size of the partition in bytes
- **label** -- Partition name
- **type** -- One of the partition types (ESP\_PARTITION\_TYPE\_\*), or an integer. Note that applications can not be booted from external flash chips, so using ESP\_PARTITION\_TYPE\_APP is not supported.
- **subtype** -- One of the partition subtypes (ESP\_PARTITION\_SUBTYPE\_\*), or an integer.
- **out\_partition** -- [out] Output, if non-NULL, receives the pointer to the resulting *esp\_partition\_t* structure

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if memory allocation has failed
- ESP\_ERR\_INVALID\_ARG if the new partition overlaps another partition on the same flash chip
- ESP\_ERR\_INVALID\_SIZE if the partition doesn't fit into the flash chip size

*esp\_err\_t* **esp\_partition\_deregister\_external** (const *esp\_partition\_t* \*partition)

Deregister the partition previously registered using *esp\_partition\_register\_external*.

**Parameters** *partition* -- pointer to the partition structure obtained from *esp\_partition\_register\_external*,

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition pointer is not found
- ESP\_ERR\_INVALID\_ARG if the partition comes from the partition table
- ESP\_ERR\_INVALID\_ARG if the partition was not registered using *esp\_partition\_register\_external* function.

void **esp\_partition\_unload\_all** (void)

Unload partitions and free space allocated by them.

## Structures

struct **esp\_partition\_t**

partition information structure

This is not the format in flash, that format is *esp\_partition\_info\_t*.

However, this is the format used by this API.

## Public Members

*esp\_flash\_t* \***flash\_chip**

SPI flash chip on which the partition resides

*esp\_partition\_type\_t* **type**

partition type (app/data)

*esp\_partition\_subtype\_t* **subtype**

partition subtype

uint32\_t **address**

starting address of the partition in flash

uint32\_t **size**

size of the partition, in bytes

uint32\_t **erase\_size**

size the erase operation should be aligned to

char **label**[17]

partition label, zero-terminated ASCII string

bool **encrypted**

flag is set to true if partition is encrypted

bool **readonly**

flag is set to true if partition is read-only

### Macros

**ESP\_PARTITION\_SUBTYPE\_OTA** (i)

Convenience macro to get esp\_partition\_subtype\_t value for the i-th OTA partition.

### Type Definitions

typedef uint32\_t **esp\_partition\_mmap\_handle\_t**

Opaque handle for memory region obtained from esp\_partition\_mmap.

typedef struct esp\_partition\_iterator\_opaque\_ **\*esp\_partition\_iterator\_t**

Opaque partition iterator type.

### Enumerations

enum **esp\_partition\_mmap\_memory\_t**

Enumeration which specifies memory space requested in an mmap call.

*Values:*

enumerator **ESP\_PARTITION\_MMAP\_DATA**

map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

enumerator **ESP\_PARTITION\_MMAP\_INST**

map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

enum **esp\_partition\_type\_t**

Partition type.

---

**Note:** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

---

*Values:*

enumerator **ESP\_PARTITION\_TYPE\_APP**

Application partition type.

enumerator **ESP\_PARTITION\_TYPE\_DATA**

Data partition type.

enumerator **ESP\_PARTITION\_TYPE\_ANY**

Used to search for partitions with any type.

enum **esp\_partition\_subtype\_t**

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

---

**Note:** These ESP-IDF-defined partition subtypes apply to partitions of type `ESP_PARTITION_TYPE_APP` and `ESP_PARTITION_TYPE_DATA`.

---

*Values:*

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_FACTORY**

Factory application partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN**

Base for OTA partition subtypes.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_0**

OTA partition 0.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_1**

OTA partition 1.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_2**

OTA partition 2.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_3**

OTA partition 3.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_4**

OTA partition 4.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_5**

OTA partition 5.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_6**

OTA partition 6.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_7**

OTA partition 7.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_8**

OTA partition 8.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_9**

OTA partition 9.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_10**

OTA partition 10.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_11**

OTA partition 11.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_12**

OTA partition 12.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_13**

OTA partition 13.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_14**

OTA partition 14.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_15**

OTA partition 15.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MAX**

Max subtype of OTA partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_TEST**

Test application partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_OTA**

OTA selection partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_PHY**

PHY init data partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_NVS**

NVS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_COREDUMP**

COREDUMP partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_NVS\_KEYS**

Partition for NVS keys.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_EFUSE\_EM**

Partition for emulate eFuse bits.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_UNDEFINED**

Undefined (or unspecified) data partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_ESPHTTPD**

ESPHTTPD partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_FAT**

FAT partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_SPIFFS**

SPIFFS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_LITTLEFS**

LITTLEFS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_ANY**

Used to search for partitions with any subtype.

## 2.9.9 SPIFFS Filesystem

### Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

### Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under `/spiffs`, then creating a file with the path `/spiffs/tmp/myfile.txt` will create a file called `/tmp/myfile.txt` in SPIFFS, instead of `myfile.txt` in the directory `/spiffs/tmp`.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
- When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g., [here](#)) and in the official [SPIFFS github repository](#). The issue can be partially mitigated by the [SPIFFS configuration](#).
- Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
- When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via `esp_spiffs_check` function. More details in the official [SPIFFS FAQ](#).

### Tools

**spiffsgen.py** `spiffsgen.py` is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use `spiffsgen.py`, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image\_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base\_dir**: directory for which the SPIFFS image needs to be created.
- **output\_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool's help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_  
→dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the **image\_size** is required for the standalone invocation, only the **partition** name is required when using `spiffs_create_partition_image --` the image size is automatically obtained from the project's partition table.

`spiffs_create_partition_image` must be called from one of the component `CMakeLists.txt` files.

Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` by specifying `FLASH_IN_PROJECT`. For example:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image:

```
add_custom_target(dep COMMAND ...)  
  
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see [storage/spiffsgen](#).

**mkspiffs** Another tool for creating SPIFFS partition images is `mkspiffs`. Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000_↵  
↵spiffs.bin
```

---

**Note:** You can configure the `write_flash` command of `esptool.py` to [write the spiffs data to an external SPI flash chip](#) using the `--spi-connection <CLK>, <Q>, <D>, <HD>, <CS>` option. Just specify the GPIO pins assigned to the external flash, e.g. `python esptool.py write_flash --spi-connection 6, 7, 8, 9, 11 -z 0x110000 spiffs.bin`.

---

**Notes on Which SPIFFS Tool to Use** The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases:

1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

## See Also

- [Partition Table documentation](#)

## Application Example

An example of using SPIFFS is provided in the [storage/spiffs](#) directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the `README.md` file in the example directory for more information.

## High-level API Reference

### Header File

- [components/spiffs/include/esp\\_spiffs.h](#)
- This header file can be included with:

```
#include "esp_spiffs.h"
```

- This header file is a part of the API provided by the `spiffs` component. To declare that your component depends on `spiffs`, add the following to your `CMakeLists.txt`:

```
REQUIRES spiffs
```

or

```
PRIV_REQUIRES spiffs
```

## Functions

*esp\_err\_t* **esp\_vfs\_spiffs\_register** (const *esp\_vfs\_spiffs\_conf\_t* \*conf)

Register and mount SPIFFS to VFS with given path prefix.

**Parameters** **conf** -- Pointer to *esp\_vfs\_spiffs\_conf\_t* configuration structure

**Returns**

- ESP\_OK if success
- ESP\_ERR\_NO\_MEM if objects could not be allocated
- ESP\_ERR\_INVALID\_STATE if already mounted or partition is encrypted
- ESP\_ERR\_NOT\_FOUND if partition for SPIFFS was not found
- ESP\_FAIL if mount or format fails

*esp\_err\_t* **esp\_vfs\_spiffs\_unregister** (const char \*partition\_label)

Unregister and unmount SPIFFS from VFS

**Parameters** **partition\_label** -- Same label as passed to *esp\_vfs\_spiffs\_register*.

**Returns**

- ESP\_OK if successful
- ESP\_ERR\_INVALID\_STATE already unregistered

bool **esp\_spiffs\_mounted** (const char \*partition\_label)

Check if SPIFFS is mounted

**Parameters** **partition\_label** -- Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

**Returns**

- true if mounted
- false if not mounted

*esp\_err\_t* **esp\_spiffs\_format** (const char \*partition\_label)

Format the SPIFFS partition

**Parameters** **partition\_label** -- Same label as passed to *esp\_vfs\_spiffs\_register*.

**Returns**

- ESP\_OK if successful
- ESP\_FAIL on error

*esp\_err\_t* **esp\_spiffs\_info** (const char \*partition\_label, size\_t \*total\_bytes, size\_t \*used\_bytes)

Get information for SPIFFS

**Parameters**

- **partition\_label** -- Same label as passed to *esp\_vfs\_spiffs\_register*
- **total\_bytes** -- [out] Size of the file system
- **used\_bytes** -- [out] Current used bytes in the file system

**Returns**

- ESP\_OK if success
- ESP\_ERR\_INVALID\_STATE if not mounted

*esp\_err\_t* **esp\_spiffs\_check** (const char \*partition\_label)

Check integrity of SPIFFS

**Parameters** **partition\_label** -- Same label as passed to *esp\_vfs\_spiffs\_register*

**Returns**

- ESP\_OK if successful
- ESP\_ERR\_INVALID\_STATE if not mounted
- ESP\_FAIL on error

*esp\_err\_t* **esp\_spiffs\_gc** (const char \*partition\_label, size\_t size\_to\_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP\_ERR\_NOT\_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested

space after `CONFIG_SPIFFS_GC_MAX_RUNS` number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of `CONFIG_SPIFFS_GC_MAX_RUNS` should be set at least to the maximum expected `size_to_gc`, divided by 4096. For example, if the application expects to make room for a 1MB file and calls `esp_spiffs_gc(label, 1024 * 1024)`, `CONFIG_SPIFFS_GC_MAX_RUNS` should be set to at least 256. On the other hand, increasing `CONFIG_SPIFFS_GC_MAX_RUNS` value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

#### Parameters

- **partition\_label** -- Label of the partition to be garbage-collected. The partition must be already mounted.
- **size\_to\_gc** -- The number of bytes that the GC process should attempt to make available.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_FINISHED` if GC fails to reclaim the size given by `size_to_gc`
- `ESP_ERR_INVALID_STATE` if the partition is not mounted
- `ESP_FAIL` on all other errors

### Structures

struct **esp\_vfs\_spiffs\_conf\_t**

Configuration structure for `esp_vfs_spiffs_register`.

#### Public Members

const char \***base\_path**

File path prefix associated with the filesystem.

const char \***partition\_label**

Optional, label of SPIFFS partition to use. If set to `NULL`, first partition with subtype=`spiffs` will be used.

size\_t **max\_files**

Maximum files that could be open at the same time.

bool **format\_if\_mount\_failed**

If true, it will format the file system if it fails to mount.

## 2.9.10 Virtual Filesystem Component

### Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as `fopen` and `fprintf`, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call `fopen("/fat/file.txt", "w")`. Then the VFS component calls the function `open` of the FAT driver and pass the argument `/file.txt` to

it together with appropriate mode flags. All subsequent calls to C library functions for the returned `FILE*` stream will also be forwarded to the FAT driver.

## FS Registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

**Synchronous Input/Output Multiplexing** Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()`, described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.

4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

**Non-Socket VFS Drivers** If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```
// In definition of esp_vfs_t:  
    .start_select = &uart_start_select,  
    .end_select = &uart_end_select,  
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

---

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case (i.e., should not crash but return an error instead).

---

Please refer to the reference implementation for the UART peripheral in [vfs/vfs\\_uart.c](#) and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- [peripherals/uart/uart\\_select](#)
- [system/select](#)

**Socket VFS Drivers** A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```
// In definition of esp_vfs_t:  
    .socket_select = &lwip_select,  
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,  
    .stop_socket_select = &lwip_stop_socket_select,  
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,  
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which is used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used from ISR.

Please see [lwip/port/esp32xx/vfs\\_lwip.c](#) for a reference socket driver implementation using LWIP.

**Note:** If you use `select()` for socket file descriptors only then you can disable the `CONFIG_VFS_SUPPORT_SELECT` option to reduce the code size and improve performance. You should not change the socket driver during an active `select()` call or you might experience some undefined behavior.

---

## Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a "mount point" of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called `/data/log.txt`
- FS 2 will be used when opening a file called `/data/static/index.html`
- Even if `/index.html` does not exist in FS 2, FS 1 will **not** be searched for `/static/index.html`.

As a general rule, mount point names must start with the path separator (`/`) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a "fallback" filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (`.`) in path names in any special way. VFS does not treat `..` as a reference to the parent directory. In the above example, using a path `/data/static/./log.txt` will not result in a call to FS 1 to open `/log.txt`. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with `/data` as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the `/config.json` file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

## File Descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in `sys/select.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

## Standard IO Streams (`stdin`, `stdout`, `stderr`)

If the `menuconfig` option `UART` for console output is not set to `None`, then `stdin`, `stdout`, and `stderr` are configured to read from, and write to, a UART. It is possible to use `UART0` or `UART1` for standard IO. By default, `UART0` is used with 115200 baud rate; TX pin is `GPIO1`; RX pin is `GPIO3`. These parameters can be changed in `menuconfig`.

Writing to `stdout` or `stderr` sends characters to the UART transmit FIFO. Reading from `stdin` retrieves characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `fscanf("%d\n", &var);`, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver's interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF ("`\n`") character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via `menuconfig`, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

**Standard Streams and FreeRTOS Tasks** FILE objects for `stdin`, `stdout`, and `stderr` are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task `struct _reent`.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n");` by the preprocessor:

```
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to `struct _reent` in `newlib` libc. This structure is allocated on the TCB of each task. When a task is initialized, `_stdin`, `_stdout`, and `_stderr` members of `struct _reent` are set to the values of `_stdin`, `_stdout`, and `_stderr` of `_GLOBAL_REENT` (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set `stdin`, `stdout`, and `stderr` for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r");`
- Closing default `stdin`, `stdout`, or `stderr` using `fclose` closes the FILE stream object, which will affect all other tasks.
- To change the default `stdin`, `stdout`, `stderr` streams for new tasks, modify `_GLOBAL_REENT->_stdin(_stdout,_stderr)` before creating the task.

## eventfd()

`eventfd()` call is a powerful tool to notify a `select()` based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in [man\(2\) eventfd](#) except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options `EFD_CLOEXEC`, `EFD_NONBLOCK` and `EFD_SEMAPHORE` are not supported in flags.
- Option `EFD_SUPPORT_ISR` has been added in flags. This flag is required to read and write the `eventfd` in an interrupt handler.

Note that creating an `eventfd` with `EFD_SUPPORT_ISR` will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

## API Reference

### Header File

- [components/vfs/include/esp\\_vfs.h](#)
- This header file can be included with:

```
#include "esp_vfs.h"
```

- This header file is a part of the API provided by the `vfs` component. To declare that your component depends on `vfs`, add the following to your `CMakeLists.txt`:

REQUIRES `vfs`

or

PRIV\_REQUIRES `vfs`

## Functions

`ssize_t esp_vfs_write` (struct `_reent` \*r, int fd, const void \*data, `size_t` size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek` (struct `_reent` \*r, int fd, `off_t` size, int mode)

`ssize_t esp_vfs_read` (struct `_reent` \*r, int fd, void \*dst, `size_t` size)

int `esp_vfs_open` (struct `_reent` \*r, const char \*path, int flags, int mode)

int `esp_vfs_close` (struct `_reent` \*r, int fd)

int `esp_vfs_fstat` (struct `_reent` \*r, int fd, struct stat \*st)

int `esp_vfs_stat` (struct `_reent` \*r, const char \*path, struct stat \*st)

int `esp_vfs_link` (struct `_reent` \*r, const char \*n1, const char \*n2)

int `esp_vfs_unlink` (struct `_reent` \*r, const char \*path)

int `esp_vfs_rename` (struct `_reent` \*r, const char \*src, const char \*dst)

int `esp_vfs_utime` (const char \*path, const struct utimbuf \*times)

*esp\_err\_t* `esp_vfs_register` (const char \*base\_path, const *esp\_vfs\_t* \*vfs, void \*ctx)

Register a virtual filesystem for given path prefix.

### Parameters

- **base\_path** -- file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to `ESP_VFS_PATH_MAX` characters long, and at least 2 characters long. Name must start with a "/" and must not end with "/". For example, "/data" or "/dev/spi" are valid. These VFSes would then be called to handle file paths such as "/data/myfile.txt" or "/dev/spi/0". In the special case of an empty `base_path`, a "fallback" VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** -- Pointer to *esp\_vfs\_t*, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.
- **ctx** -- If `vfs->flags` has `ESP_VFS_FLAG_CONTEXT_PTR` set, a pointer which should be passed to VFS functions. Otherwise, NULL.

**Returns** `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered.

*esp\_err\_t* `esp_vfs_register_fd_range` (const *esp\_vfs\_t* \*vfs, void \*ctx, int min\_fd, int max\_fd)
