This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S, ESP32-C, ESP32-H and ESP32-P Series SoCs.

This document describes using ESP-IDF with the ESP32-C6 SoC.
Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C6 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C6 board.

Note: This is documentation for stable version v5.2.2 of ESP-IDF. Other ESP-IDF Versions are also available.

1.1 Introduction

ESP32-C6 is a system on a chip that integrates the following features:

- Wi-Fi 6 (2.4 GHz band)
- Bluetooth Low Energy
- 802.15.4 Thread/Zigbee
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Built-in security hardware

Powered by 40 nm technology, ESP32-C6 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C6 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32-C6 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!
If you have one of ESP32-C6 official development boards listed below, you can click on the link to learn more about the hardware.

### 1.2.2 Software

To start using ESP-IDF on **ESP32-C6**, install the following software:

- **Toolchain** to compile code for ESP32-C6
- **Build tools** - CMake and Ninja to build a full Application for ESP32-C6
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-C6 and scripts to operate the **Toolchain**

### 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

#### 1.3.1 IDE

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

- Eclipse Plugin
- VSCode Extension
1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

Standard Setup of Toolchain for Windows

Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we are going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse Plugin or another graphical IDE with CMake support instead.

Note: Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via Control Panel > Change date, time, or number formats > Administrative tab > Change system locale > check the option Beta: Use Unicode UTF-8 for worldwide language support > Ok > reboot the computer.

ESP-IDF Tools Installer

The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers.

Windows Installer Download

What Is the Use case for Online and Offline Installer

Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer downloads only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory $userprofile%\.
espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the Installation

The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF
Chapter 1. Get Started

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment**  At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer launches ESP-IDF environment in selected prompt.

**Run ESP-IDF PowerShell Environment:**

![Completing the ESP-IDF Tools Setup Wizard]

Fig. 1: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

**Run ESP-IDF Command Prompt (cmd.exe):**

**Using the Command Prompt**  For the remaining Getting Started steps, we are going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

Checking if Python packages are up to date...
Python requirements from C:Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:Users\test\esp\esp-idf>
First Steps on ESP-IDF  Now since all requirements are met, the next topic guides you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C6 and build, flash, and monitor the device output.

Note: If you have not yet installed ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

Start a Project  Now you are ready to prepare your application for ESP32-C6. You can start with get-started/hello_world project from examples directory in ESP-IDF.

Important: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project get-started/hello_world to ~/esp directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

Note: There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

Connect Your Device  Now connect your ESP32-C6 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to Establish Serial Connection with ESP32-C6 for full details.

Note: Keep the port name handy as it is needed in the next steps.

Configure Your Project  Navigate to your hello_world directory, set ESP32-C6 as the target, and run the project configuration utility menuconfig.

Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32c6
idf.py menuconfig
```

After opening a new project, you should first set the target with idf.py set-target esp32c6. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See Select the Target Chip: set-target for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”, since this example runs with default configuration.
Chapter 1. Get Started

![Project configuration - Home window](image)

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project**  
Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device**  
To flash the binaries that you just built for the ESP32-C6 in the previous step, you need to run the following command:
idf.py \-p PORT flash

Replace \texttt{PORT} with your ESP32-C6 board's USB port name. If the \texttt{PORT} is not defined, the \texttt{idf.py} will try to connect automatically using the available USB ports.

For more information on \texttt{idf.py} arguments, see \texttt{idf.py}.

\textbf{Note:} The option \texttt{flash} automatically builds and flashes the project, so running \texttt{idf.py build} is not necessary.

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to Flashing Troubleshooting page or Establish Serial Connection with ESP32-C6 for more detailed information.

\textbf{Normal Operation} When flashing, you will see the output log similar to the following:

... esptool esp32c6 \-p /dev/ttyUSB0 \-b 460800 \-before=default_reset \-after=hard_ \-\-reset \-\-no-stub write_flash \-\-flash_mode dio \-\-flash_freq 80m \-\-flash_size 2MB_ \-\-partition-table.bin
esptool.py v4.3 Serial port /dev/ttyUSB0 Connecting.... Chip is ESP32-C6 (revision v0.0) Features: WiFi 6, BT 5 Crystal is 40MHz MAC: 60:55:f9:f6:01:38 Changing baud rate to 460800 Changed. Enabling default SPI flash mode... Configuring flash size... Flash will be erased from 0x00000000 to 0x00004fff... Flash will be erased from 0x00010000 to 0x00028fff... (continues on next page)
Chapter 1. Get Started

Leaving...
Hard resetting via RTS pin...

If there are no issues by the end of the flash process, the board will reboot and start up the "hello_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running idf.py, check out Eclipse Plugin, VS Code Extension.

Monitor the Output  To check if "hello_world" is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
...  
Hello world!
  Restarting in 10 seconds...
   This is esp32c6 chip with 1 CPU core(s), WiFi/BLE, 802.15.4 (Zigbee/Thread),...  
---silicon revision v0.0, 2 MB external flash  
Minimum free heap size: 473816 bytes
  Restarting in 9 seconds...  
  Restarting in 8 seconds...  
  Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

That is all that you need to get started with ESP32-C6!

Now you are ready to try some other examples, or go straight to developing your own applications.

Important: Some of examples do not support ESP32-C6 because required hardware is not included in ESP32-C6 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C6 target, or the table does not exist at all, the example will work on ESP32-C6.
Chapter 1. Get Started

Additional Tips

Permission Denied Issue With some Linux distributions, you may get the error message similar to 

```
Could not open port <PORT>: Permission denied: '<PORT>'
```

when flashing the ESP32-C6. This can be solved by adding the current user to the specific group, such as dialout or uucp group.

Python Compatibility ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Flash Erase Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

Related Documents For advanced users who want to customize the install process:

- Updating ESP-IDF Tools on Windows
- Establish Serial Connection with ESP32-C6
- Eclipse Plugin
- VSCode Extension
- IDF Monitor

Updating ESP-IDF Tools on Windows

Install ESP-IDF Tools Using a Script From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This downloads and installs the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C:\Users\username\.espressif.

Add ESP-IDF Tools to PATH Using an Export Script ESP-IDF tools installer creates a Start menu shortcut for "ESP-IDF Command Prompt". This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which was not started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute export.bat:

```
cd %userprofile%\esp\esp-idf
export.bat
```
Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

**Establish Serial Connection with ESP32-C6**

Establishing a serial connection with the ESP32-C6 target device could be done using USB-to-UART bridge or USB peripheral supported in ESP32-C6.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

**Supported USB Peripheral**  The ESP32-C6 supports the USB peripheral. In this case, the USB-to-UART bridge is not needed and the device can be flashed directly.

![SoC with Supported USB](fig6.png)

Fig. 6: SoC with Supported USB

Apart from the USB peripheral, some development boards also include the USB-to-UART bridge.

**USB-to-UART Bridge on Development Board**  For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32-C6 is UART.

**External USB-to-UART Bridge**  Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.

**Flash Using USB**  For the ESP32-C6, the USB peripheral is available, allowing you to flash the binaries without the need for an external USB-to-UART bridge.

The USB on the ESP32-C6 uses the **GPIO13** for \( D^+ \) and **GPIO12** for \( D^- \).  

**Note:** The ESP32-C6 supports only **USB CDC and JTAG**.

If you are flashing for the first time, you need to get the ESP32-C6 into the download mode manually. To do so, press and hold the **BOOT** button and then press the **RESET** button once. After that release the **BOOT** button.
Chapter 1. Get Started

Fig. 7: Development Board with USB-to-UART Bridge

This section provides guidance on how to establish a serial connection between ESP32-C6 and PC using USB-to-UART Bridge, either installed on the development board or external.

Connect ESP32-C6 to PC  Connect the ESP32-C6 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32-C6 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-C6 boards produced by Espressif together with links to the drivers:

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

You can change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the **BOOT** button and then press the **RESET** button once. After that release the **BOOT** button.
Check Port on Windows  
Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C6 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

Fig. 9: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Check Port on Linux and macOS  
To check the device name for the serial port of your ESP32-C6 board (or external converter dongle), run this command two times, first with the board/dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

Note: macOS users: if you do not see the serial port then check you have the USB/serial drivers installed. See Section Connect ESP32-C6 to PC for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer..." where the developer name is Silicon Labs or FTDI.

Adding User to dialout or uucp on Linux  
The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:
Chapter 1. Get Started

Fig. 10: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

```bash
sudo usermod -a -G dialout $USER
```
on Arch Linux this is done by adding the user to uucp group with the following command:

```bash
sudo usermod -a -G uucp $USER
```
Make sure you re-login to enable read and write permissions for the serial port.

**Verify Serial Connection**  
Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C6.

The default console baud rate on ESP32-C6 is 115200.

**Windows and Linux**  
In this example, we use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![PuTTY Configuration](image)

**Fig. 11:** Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32-C6. The log contents depend on application loaded to ESP32-C6, see **Example Output**. Reset the board if no log has been printed out.

**Note:**  
Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.
Fig. 12: Setting Serial Communication in PuTTY on Linux
Note: If there is no log output, check

- if the required power is supplied to ESP32-C6
- if the board was reset after starting the terminal program
- if the selected serial port is the correct one by using the method stated in Check Port on Windows and Check Port on Linux and macOS
- if the serial port is not being used by another program
- if the identified port has been selected in serial terminal programs you are using, as stated in Windows and Linux
- if settings of the serial port in serial terminal programs are applicable to corresponding applications
- if the correct USB connector (UART) is used on the development board
- if your application is expected to output some log
- if the log output has not been disabled (use hello world application to test)

macOS To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in Check port on Linux and macOS, run:

```bash
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port  /dev/cu.SLAB_USBtoUART  /dev/cu.SLAB_USBtoUART
```

- The output varies depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change “115200” to the default baud rate of the chip in use):

```bash
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`

- What you are looking for is some log displayed by the `screen`. The log contents depend on application loaded to ESP32-C6, see Example Output. To exit the current `screen` session, type Ctrl-A + K.

**Note:** Do not forget to exit the current screen session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464

I (44) boot: ESP-IDF v2.0-rc2-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32-C6.
Chapter 1. Get Started

Note: For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C6 booting and producing serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

If you got here from Step 5. First Steps on ESP-IDF when installing s/w for ESP32-C6 development, then you can continue with Step 5. First Steps on ESP-IDF.

Flashing Troubleshooting

Failed to Connect   If you run the given command and see errors such as "Failed to connect", there might be several reasons for this. One of the reasons might be issues encountered by esptool.py, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the esptool troubleshooting page.

esptool.py resets ESP32-C6 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32-C6). The DTR and RTS control lines are in turn connected to GPIO9 and CHIP_PU (EN) pins of ESP32-C6, thus changes in the voltage levels of DTR and RTS will boot ESP32-C6 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, esptool.py is not able to reset your hardware automatically in the following cases:

   • Your hardware does not have the DTR and RTS lines connected to GPIO9 and CHIP_PU.
   • The DTR and RTS lines are configured differently.
   • There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C6 board into Firmware Download mode (reset).

   • For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO9) and press the EN button (CHIP_PU).
   • For other types of hardware, try pulling GPIO9 down.

IDF Monitor

IDF Monitor uses the esp-idf-monitor package as a serial terminal program which relays serial data to and from the target device's serial port. It also provides some ESP-IDF-specific features.

IDF Monitor can be launched from an ESP-IDF project by running idf.py monitor.

Keyboard Shortcuts   For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table. These keyboard shortcuts can be customized, for more details see Configuration File section.
## Keyboard Shortcut

<table>
<thead>
<tr>
<th>Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl + J</td>
<td>Exit the program</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>Ctrl + T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl + T</td>
<td>Send the menu character itself to remote</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl + J</td>
<td>Send the exit character itself to remote</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl + P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl + R</td>
<td>Reset target board via RTS</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl + A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl + Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl + L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl + I (or I)</td>
<td>Stop/resume printing timestamps</td>
<td>IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.</td>
</tr>
<tr>
<td>• Ctrl + H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl + X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl + C</td>
<td>Interrupt running application</td>
<td>Pauses IDF Monitor and runs GDB project debugger to debug the application at runtime. This requires CONFig_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.</td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-} and Ctrl-T, will be sent through the serial port.

### ESP-IDF-specific Features

**Automatic Address Decoding**  Whenever the chip outputs a hexadecimal address that points to executable code, IDF monitor looks up the location in the source code (file name and line number) and prints the location on the next line in yellow.

If an ESP-IDF app crashes and panics, a register dump and backtrace are produced, such as the following:

```
abort() was called at PC 0x42067cd5 on core 0
```

(continues on next page)
Stack dump detected
Core 0 register dump:

To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

If an address is not matched in the app source code, IDF monitor also checks the ROM code. Instead of printing the source file name and line number, only the function name followed by in ROM is displayed:

```
abort() was called at PC 0x400481c1 on core 0
0x400481c1: ets_rsa_pss_verify in ROM
```

(continues on next page)
The ROM ELF file is automatically loaded from a location based on the IDF_PATH and ESP_ROM_ELF_DIR environment variables. This can be overridden by calling esp_idf_monitor and providing a path to a specific ROM ELF file: python -m esp_idf_monitor --rom-elf-file [path to ROM ELF file].

**Note:** Set environment variable ESP_MONITOR_DECODE to 0 or call esp_idf_monitor with specific command line option: python -m esp_idf_monitor --disable-address-decoding to disable address decoding.

### Target Reset on Connection
By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the `--no-reset` option (e.g., idf.py monitor --no-reset).

**Note:** The `--no-reset` option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., idf.py monitor --no-reset -p [PORT]).

### Launching GDB with GDBStub
GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME`. GDBStub will run in the background until a Ctrl+C message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the Ctrl+C message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board’s Reset button).

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex...
```

### Output Filtering
IDF monitor can be invoked as idf.py monitor --print-filter="xyz", where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed. Filtering can also be configured using the ESP_IDF_MONITOR_PRINT_FILTER environment variable.

**Note:** When using both the environment variable ESP_IDF_MONITOR_PRINT_FILTER and the argument `--print-filter`, the setting from the CLI argument will take precedence.
Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, `--print_filter="tag1:W"` matches and prints only the outputs written with ESP_LOGW("tag1", ...) or at lower verbosity level, i.e., ESP_LOGE("tag1", ...). Not specifying a `<log_level>` or using `*` defaults to a Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with the IDF monitor is a secondary solution that can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples of Filtering Rules:

- `*` can be used to match any tags. However, the string `--print_filter="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules "tag1:V", "tag1:v", "tag1:", "tag1:*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1:I tag2:W" only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

#### A More Complex Filtering Example

The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID:
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `--print_filter="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `--print_filter="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:
### Configuration File

esp-idf-monitor is using C0 control codes to interact with the console. Characters from the config file are converted to their C0 control codes. Available characters include the English alphabet (A-Z) and special symbols: [.,\]^._.

**Warning:** Please note that some characters may not work on all platforms or can be already reserved as a shortcut for something else. Use this feature with caution!

### File Location

The default name for a configuration file is esp-idf-monitor.cfg. First, the same directory esp-idf-monitor is being run if is inspected.

If a configuration file is not found here, the current user’s OS configuration directory is inspected next:

- **Linux:** /home/<user>/.config/esp-idf-monitor/
- **MacOS** /Users/<user>/.config/esp-idf-monitor/
- **Windows:** `c:\Users\<user>\AppData\Local\esp-idf-monitor`

If a configuration file is still not found, the last inspected location is the home directory:

- **Linux:** /home/<user>/
- **MacOS** /Users/<user>/
- **Windows:** `c:\Users\<user>\`

On Windows, the home directory can be set with the `HOME` or `USERPROFILE` environment variables. Therefore, the Windows configuration directory location also depends on these.

A different location for the configuration file can be specified with the `ESP_IDF_MONITOR_CFGFILE` environment variable, e.g., `ESP_IDF_MONITOR_CFGFILE = ~/custom_config.cfg`. This overrides the search priorities described above.

esp-idf-monitor will read settings from other usual configuration files if no other configuration file is used. It automatically reads from `setup.cfg` or `tox.ini` if they exist.

### Configuration Options

Below is a table listing the available configuration options:

<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>menu_key</td>
<td>Key to access the main menu.</td>
<td>T</td>
</tr>
<tr>
<td>exit_key</td>
<td>Key to exit the monitor.</td>
<td>J</td>
</tr>
<tr>
<td>chip_reset_key</td>
<td>Key to initiate a chip reset.</td>
<td>R</td>
</tr>
<tr>
<td>recompile_upload_key</td>
<td>Key to recompile and upload.</td>
<td>F</td>
</tr>
<tr>
<td>recompile_upload_app_key</td>
<td>Key to recompile and upload just the application.</td>
<td>A</td>
</tr>
<tr>
<td>toggle_output_key</td>
<td>Key to toggle the output display.</td>
<td>Y</td>
</tr>
<tr>
<td>toggle_log_key</td>
<td>Key to toggle the logging feature.</td>
<td>L</td>
</tr>
<tr>
<td>toggle_timestamp_key</td>
<td>Key to toggle timestamp display.</td>
<td>I</td>
</tr>
<tr>
<td>chip_reset_bootloader_key</td>
<td>Key to reset the chip to bootloader mode.</td>
<td>P</td>
</tr>
<tr>
<td>exit_menu_key</td>
<td>Key to exit the monitor from the menu.</td>
<td>X</td>
</tr>
<tr>
<td>skip_menu_key</td>
<td>Pressing the menu key can be skipped for menu commands.</td>
<td>False</td>
</tr>
</tbody>
</table>

### Syntax

The configuration file is in .ini file format: it must be introduced by an `[esp-idf-monitor]` header to be recognized as valid. This section then contains name = value entries. Lines beginning with # or ; are ignored as comments.
# esp-idf-monitor.cfg file to configure internal settings of esp-idf-monitor

[esp-idf-monitor]
menu_key = T
exit_key = ]
chip_reset_key = R
recompile_upload_key = F
recompile_upload_app_key = A
toggle_output_key = Y
toggle_log_key = L
toggle_timestamp_key = I
chip_reset_bootloader_key = P
exit_menu_key = X
skip_menu_key = False

Known Issues with IDF Monitor

Issues Observed on Windows

• Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
• Occasionally, when "idf.py" exits, it might stall for up to 30 seconds before IDF Monitor resumes.
• When "gdb" is run, it might stall for a short time before it begins communicating with the GDBStub.

Standard Toolchain Setup for Linux and macOS

Installation Step by Step  This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment  These are the steps for setting up the ESP-IDF for your ESP32-C6.

• Step 1. Install Prerequisites
• Step 2. Get ESP-IDF
• Step 3. Set up the Tools
• Step 4. Set up the Environment Variables
• Step 5. First Steps on ESP-IDF

Step 1. Install Prerequisites  In order to use ESP-IDF with the ESP32-C6, you need to install some software packages based on your Operating System. This setup guide helps you on getting everything installed on Linux and macOS based systems.

For Linux Users  To compile using ESP-IDF, you need to get the following packages. The command to run depends on which distribution of Linux you are using:

• Ubuntu and Debian:

```bash
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-
--venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

• CentOS 7 & 8:

```bash
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake-
--ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

• Arch:
Chapter 1. Get Started

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja
   --ccache dfu-util libusb
```

Note:
- CMake version 3.16 or newer is required for use with ESP-IDF. Run "tools/idf_tools.py install cmake" to install a suitable version if your OS versions does not have one.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users  ESP-IDF uses the version of Python installed by default on macOS.
- Install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    ```
brew install cmake ninja dfu-util
```
  - If you have MacPorts, you can run:
    ```
sudo port install cmake ninja dfu-util
```
  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.
- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note:  If an error like this is shown during any step:
```
```
Then you need to install the XCode command line tools to continue. You can install these by running xcode-select --install.

Apple M1 Users  If you use Apple M1 platform and see an error like this:
```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.
```

or:
```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```
Then you need to install Apple Rosetta 2 by running
```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

Installing Python 3  Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 is not included by default in future versions of macOS. Check what Python you currently have:
```
python --version
```
If the output is like Python 2.7.17, your default interpreter is Python 2.7. If so, also check if Python 3 is not already installed on your computer:
Chapter 1. Get Started

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with HomeBrew can be done as follows:
  ```
brew install python3
  ```
- If you have MacPorts, you can run:
  ```
sudo port install python38
  ```

**Step 2. Get ESP-IDF**  To build applications for the ESP32-C6, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v5.2.2 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF is downloaded into `~/esp/esp-idf`.

Consult **ESP-IDF Versions** for information about which ESP-IDF version to use in a given situation.

**Step 3. Setup the Tools**  Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-C6.

```
cd ~/esp/esp-idf
./install.sh esp32c6
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32c6
```

The above commands install tools for ESP32-C6 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```
Note: For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable...
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see Download Error While Installing ESP-IDF Tools.

### Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it does not change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Note:** For users in China, we recommend using our download server located in China for faster download speed.

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.cn/github_assets"
./install.sh
```

### Customizing the Tools Installation Path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

### Step 4. Set up the Environment Variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)
Chapter 1. Get Started

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF**

Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C6 and build, flash, and monitor the device output.

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

**Start a Project**

Now you are ready to prepare your application for ESP32-C6. You can start with `get-started/hello_world` project from `examples` directory in ESP-IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

**Connect Your Device**

Now connect your ESP32-C6 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux**: starting with `/dev/tty`
- **macOS**: starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C6](#) for full details.

**Note:** Keep the port name handy as it is needed in the next steps.

**Configure Your Project**

Navigate to your `hello_world` directory, set ESP32-C6 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32c6
idf.py menuconfig
```
After opening a new project, you should first set the target with `idf.py set-target esp32c6`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See Select the Target Chip: set-target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for "hello_world", since this example runs with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

### Build the Project

Build the project by running:

```
$ idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
```

(continues on next page)
Chapter 1. Get Started

(continued from previous page)

```bash
# To flash the firmware binary.bin files.

idf.py -p PORT flash
```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device**  To flash the binaries that you just built for the ESP32-C6 in the previous step, you need to run the following command:

```bash
idf.py -p PORT flash
```

Replace PORT with your ESP32-C6 board's USB port name. If the PORT is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to Flashing Troubleshooting page or Establish Serial Connection with ESP32-C6 for more detailed information.

**Normal Operation**  When flashing, you will see the output log similar to the following:

```
...  
esptool esp32c6 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
    --reset --no-stub write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB_
    --0x0 bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
    --partition-table.bin
    esptool.py v4.3 Serial port /dev/ttyUSB0 Connecting.... Chip is ESP32-C6 (revision v0.0) Features: WiFi 6, BT 5 Crystal is 40MHz MAC: 60:55:f9:f6:01:38 Changing baud rate to 460800 Changed. Enabling default SPI flash mode... Configuring flash size... Flash will be erased from 0x00000000 to 0x000004fff... Flash will be erased from 0x00010000 to 0x00028fff... If there are no issues by the end of the flash process, the board will reboot and start up the "hello_world" application. If you would like to use the Eclipse or VS Code IDE instead of running idf.py, check out Eclipse Plugin, VSCode Extension.

Monitor the Output  To check if "hello_world" is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+T | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57...
```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
Hello world!
Restarting in 10 seconds...
This is esp32c6 chip with 1 CPU core(s), WiFi/BLE, 802.15.4 (Zigbee/Thread), silicon revision v0.0, 2 MB external flash
Minimum free heap size: 473816 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+T].

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:
- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.
Chapter 1. Get Started

That is all that you need to get started with ESP32-C6!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-C6 because required hardware is not included in ESP32-C6 so it cannot be supported.

If building an example, please check the README file for the **Supported Targets** table. If this is present including ESP32-C6 target, or the table does not exist at all, the example will work on ESP32-C6.

Additional Tips

**Permission Denied Issue** With some Linux distributions, you may get the error message similar to *Could not open port <PORT>: Permission denied: '<PORT>'* when flashing the ESP32-C6. *This can be solved by adding the current user to the specific group*, such as *dialout* or *uucp* group.

**Python Compatibility** ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from *sources* or the use of a Python version management system such as *pyenv*.

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see ESP-IDF Versions.

The simplest way to do the update is to delete the existing *esp-idf* folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the `Install` script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the Tools.

Once the new tools are installed, update the environment using the `Export` script. See instructions at Step 4. Set up the Environment Variables.

1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the Start a Project on Windows or Start a Project on Linux and macOS.

1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow Uninstall ESP-IDF.
Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures, and types.
- Build system functions, predefined variables, and options. These are documented in the ESP-IDF CMake Build System API.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of the ESP-IDF interfaces.

ESP-IDF is made up of multiple components where these components either contain code specifically written for ESP chips, or contain a third-party library (i.e., a third-party component). In some cases, third-party components contain an "ESP-IDF specific" wrapper in order to provide an interface that is either simpler or better integrated with the rest of ESP-IDF's features. In other cases, third-party components present the original API of the underlying library directly.

The following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error Handling

Most ESP-IDF APIs return error codes defined with the esp_err_t type. See Error Handling section for more information about error handling approaches. Error Codes Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration Structures

Important: Correct initialization of configuration structures is an important part of making the application compatible with future versions of ESP-IDF.
Most initialization, configuration, and installation functions in ESP-IDF (typically named \_init(), \_config(), and \_install()) take a configuration structure pointer as an argument. For example:

```c
const esp_timer_create_args_t my_timer_args = {
  .callback = &my_timer_callback,
  .arg = callback_arg,
  .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

These functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack. The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
  .callback = &my_timer_callback,
  /* Correct, fields .arg and .name are zero-initialized */
};
```

The C++ language supports designated initializer syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```cpp
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero-
  initialized */
const esp_timer_create_args_t my_timer_args = {
  .callback = &my_timer_callback,
  /* Correct, fields .arg and .name are zero-initialized */
};
```

For more information on designated initializers, see Designated Initializers. Note that C++ language versions older than C++20, which are not the default in the current version of ESP-IDF, do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```cpp
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

### Default Initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. Now all fields are-
  set to the default values, and any field can still be modified: */
config.server_port = 8081;
```
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code rather than by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in Example Projects

ESP-IDF examples contain a variety of projects demonstrating the usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Before using, take time to read the code and understand if it is applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses Semantic Versioning as explained in the Versioning Scheme.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source-level Compatibility

ESP-IDF guarantees source-level compatibility of C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Source-level compatibility implies that the application source code can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source-level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however, this is not mandatory. Deprecated functions and files can be removed from major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system’s backward compatibility ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files, and source code.
Chapter 2. API Reference

Lack of Binary Compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source-level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See Configuration Structures for tips that help ensure compatibility.
- Replacing an \texttt{extern} function with a \texttt{static inline} one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other Exceptions from Compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issuing reports about any unintended breaking changes that do not fall into the categories below.

- Private APIs.
- Components in Example Projects.
- Features clearly marked as "beta", "preview", or "experimental".
- Changes made to mitigate security issues or to replace insecure default behaviors with secure ones.
- Features that were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features that depend on non-functional chip hardware features.
- Unexpected or undefined behavior that is not documented explicitly may be fixed/changed, such as due to missing validation of argument ranges.
- Location of \texttt{Kconfig} options in menuconfig.
- Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO Port

ASIO is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component ASIO has been moved from ESP-IDF since version v5.0 to a separate repository:

- ASIO component on GitHub

To add ASIO component in your project, please run \texttt{idf.py add-dependency espressif/asio}.

Hosted Documentation

The documentation can be found on the link below:

- ASIO documentation (English)
2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, and Ethernet interfaces. Since ESP-IDF version v5.0, the component freemodbus has been moved from ESP-IDF to a separate repository:

- ESP-Modbus component on GitHub

Hosted Documentation

The documentation can be found through the link below:

- ESP-Modbus documentation (English)

Application Example

The examples below demonstrate the ESP-Modbus library of serial and TCP ports for both slave and master implementations respectively.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the README.md documents of each specific example for details.

Protocol References

- For the detailed protocol specifications, see The Modbus Organization.

2.2.3 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client, which is a lightweight publish/subscribe messaging protocol. Now ESP-MQTT supports MQTT v5.0.

Features

- Support MQTT over TCP, SSL with Mbed TLS, MQTT over WebSocket, and MQTT over WebSocket Secure
- Easy to setup with URI
- Multiple instances (multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings, and all 3 Quality of Service (QoS) levels (it should be a fully functional client)

Application Examples

- protocols/mqtt/tcp: MQTT over TCP, default port 1883
- protocols/mqtt/ssl: MQTT over TLS, default port 8883
- protocols/mqtt/ssl_ds: MQTT over TLS using digital signature peripheral for authentication, default port 8883
- protocols/mqtt/ssl Mutual auth: MQTT over TLS using certificates for authentication, default port 8883
• protocols/mqtt/ssl_psk: MQTT over TLS using pre-shared keys for authentication, default port 8883
• protocols/mqtt/ws: MQTT over WebSocket, default port 80
• protocols/mqtt/wss: MQTT over WebSocket Secure, default port 443
• protocols/mqtt5: Uses ESP-MQTT library to connect to broker with MQTT v5.0

MQTT Message Retransmission

A new MQTT message is created by calling esp_mqtt_client_publish or its non blocking counterpart esp_mqtt_client_enqueue.

Messages with QoS 0 is sent only once. QoS 1 and 2 have different behaviors since the protocol requires extra steps to complete the process.

The ESP-MQTT library opts to always retransmit unacknowledged QoS 1 and 2 publish messages to avoid losses in faulty connections, even though the MQTT specification requires the re-transmission only on reconnect with Clean Session flag been set to 0 (set disable_clean_session to true for this behavior).

QoS 1 and 2 messages that may need retransmission are always enqueued, but first transmission try occurs immediately if esp_mqtt_client_publish is used. A transmission retry for unacknowledged messages will occur after message_retransmit_timeout. After CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS messages will expire and be deleted. If CONFIG_MQTT_REPORT_DELETED_MESSAGES is set, an event will be sent to notify the user.

Configuration

The configuration is made by setting fields in esp_mqtt_client_config_t struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

• esp_mqtt_client_config_t::broker_t - Allow to set address and security verification.
• esp_mqtt_client_config_t::credentials_t - Client credentials for authentication.
• esp_mqtt_client_config_t::session_t - Configuration for MQTT session aspects.
• esp_mqtt_client_config_t::network_t - Networking related configuration.
• esp_mqtt_client_config_t::task_t - Allow to configure FreeRTOS task.
• esp_mqtt_client_config_t::buffer_t - Buffer size for input and output.

In the following sections, the most common aspects are detailed.

Broker

Address  Broker address can be set by usage of address struct. The configuration can be made by usage of uri field or the combination of hostname, transport and port. Optionally, path could be set, this field is useful in WebSocket connections.

The uri field is used in the format scheme://hostname:port/path.

• Currently support mqtt, mqtts, ws, wss schemes
• MQTT over TCP samples:
  – mqtt://mqtt.eclipseprojects.io: MQTT over TCP, default port 1883
  – mqtt://mqtt.eclipseprojects.io:1884: MQTT over TCP, port 1884
  – mqtt://username:password@mqtt.eclipseprojects.io:1884: MQTT over TCP, port 1884, with username and password
• MQTT over SSL samples:
  – mqtts://mqtt.eclipseprojects.io: MQTT over SSL, port 8883
  – mqtts://mqtt.eclipseprojects.io:8884: MQTT over SSL, port 8884
• MQTT over WebSocket samples:
  – ws://mqtt.eclipseprojects.io:80/mqtt
• MQTT over WebSocket Secure samples:
  – wss://mqtt.eclipseprojects.io:443/mqtt
• Minimal configurations:
```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
    client);
esp_mqtt_client_start(client);
```

**Note:** By default MQTT client uses event loop library to post related MQTT events (connected, subscribed, published, etc.).

**Verification** For secure connections with TLS used, and to guarantee Broker's identity, the `verification` struct must be set. The broker certificate may be set in PEM or DER format. To select DER, the equivalent `certificate_len` field must be set. Otherwise, a null-terminated string in PEM format should be provided to `certificate` field.

- Get certificate from server, example: `mqtt.eclipseprojects.io`

```bash
openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
```

- Check the sample application: `protocols/mqtt/ssl`
- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char*)mqtt_eclipse_org_pem_start,
    },
};
```

For details about other fields, please check the *API Reference* and *TLS Server Verification*.

**Client Credentials** All client related credentials are under the `credentials` field.

- `username`: pointer to the username used for connecting to the broker, can also be set by URI
- `client_id`: pointer to the client ID, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format

**Authentication** It is possible to set authentication parameters through the `authentication` field. The client supports the following authentication methods:

- `password`: use a password by setting
- `certificate` and `key`: mutual authentication with TLS, and both can be provided in PEM or DER format
- `use_secure_element`: use secure element available in ESP32-WROOM-32SE
- `ds_data`: use Digital Signature Peripheral available in some Espressif devices

**Session** For MQTT session related configurations, `session` fields should be used.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `last_will` struct.

- `topic`: pointer to the LWT message topic
- `msg`: pointer to the LWT message
- `msg_len`: length of the LWT message, required if `msg` is not null-terminated
• **qos**: quality of service for the LWT message
• **retain**: specifies the retain flag of the LWT message

**Change Settings in Project Configuration Menu**  The settings for MQTT can be found using `idf.py menu-config`, under Component config > ESP-MQTT Configuration.

The following settings are available:

- **CONFIG_MQTT_PROTOCOL_311**: enable 3.1.1 version of MQTT protocol
- **CONFIG_MQTT_TRANSPORT_SSL** and **CONFIG_MQTT_TRANSPORT_WEBSOCKET**: enable specific MQTT transport layer, such as SSL, WEBSOCKET, and WEBSOCKET_SECURE
- **CONFIG_MQTT_CUSTOM_OUTBOX**: disable default implementation of mqtt_outbox, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:

- **MQTT_EVENT_BEFORE_CONNECT**: The client is initialized and about to start connecting to the broker.
- **MQTT_EVENT_CONNECTED**: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- **MQTT_EVENT_DISCONNECTED**: The client has aborted the connection due to being unable to read or write data, e.g., because the server is unavailable.
- **MQTT_EVENT_SUBSCRIBED**: The broker has acknowledged the client's subscribe request. The event data contains the message ID of the subscribe message.
- **MQTT_EVENT_UNSUBSCRIBED**: The broker has acknowledged the client's unsubscribe request. The event data contains the message ID of the unsubscribe message.
- **MQTT_EVENT_PUBLISHED**: The broker has acknowledged the client's publish message. This is only posted for QoS level 1 and 2, as level 0 does not use acknowledgements. The event data contains the message ID of the publish message.
- **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer, multiple MQTT_EVENT_DATA events are posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- **MQTT_EVENT_ERROR**: The client has encountered an error. The field `error_handle` in the event data contains `error_type` that can be used to identify the error. The type of error determines which parts of the `error_handle` struct is filled.

**API Reference**

**Header File**

- **components/mqtt/esp-mqtt/include/mqtt_client.h**
- This header file can be included with:

```
#include "mqtt_client.h"
```

- This header file is a part of the API provided by the `mqtt` component. To declare that your component depends on `mqtt`, add the following to your CMakeLists.txt:

```
REQUIRES mqtt
```

or

```
PRIV_REQUIRES mqtt
```

**Functions**
**esp_mqtt_client_init**

`esp_mqtt_client_init(const esp_mqtt_client_config_t *config)`

Creates MQTT client handle based on the configuration.

**Parameters**
- `config` -- MQTT configuration structure

**Returns**
- `mqqt_client_handle` if successfully created, `NULL` on error

**esp_mqtt_client_set_uri**

`esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)`

Sets MQTT connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

**Parameters**
- `client` -- MQTT client handle
- `uri` --

**Returns**
- `ESP_FAIL` if URI parse error, `ESP_OK` on success

**esp_mqtt_client_start**

`esp_mqtt_client_start(esp_mqtt_client_handle_t client)`

Starts MQTT client with already created client handle.

**Parameters**
- `client` -- MQTT client handle

**Returns**
- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` on wrong initialization
- `ESP_FAIL` if other error

**esp_mqtt_client_reconnect**

`esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)`

This api is typically used to force reconnection upon a specific event.

**Parameters**
- `client` -- MQTT client handle

**Returns**
- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` on wrong initialization
- `ESP_FAIL` if client is in invalid state

**esp_mqtt_client_disconnect**

`esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)`

This api is typically used to force disconnection from the broker.

**Parameters**
- `client` -- MQTT client handle

**Returns**
- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` on wrong initialization

**esp_mqtt_client_stop**

`esp_mqtt_client_stop(esp_mqtt_client_handle_t client)`

Stops MQTT client tasks.

**Notes:**
- Cannot be called from the MQTT event handler

**Parameters**
- `client` -- MQTT client handle

**Returns**
- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` on wrong initialization
- `ESP_FAIL` if client is in invalid state

**esp_mqtt_client_subscribe_single**

`esp_mqtt_client_subscribe_single(esp_mqtt_client_handle_t client, const char *topic, int qos)`

Subscribe the client to defined topic with defined qos.

**Notes:**
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

**Parameters**
- `client` -- MQTT client handle
- `topic` -- topic filter to subscribe
- `qos` -- Max qos level of the subscription

**Returns**
- `message_id` of the subscribe message on success
- `-1` on failure
- `-2` in case of full outbox.
int esp_mqtt_client_subscribe_multiple (esp_mqtt_client_handle_t client, const esp_mqtt_topic_t *topic_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:
• Client must be connected to send subscribe message
• This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task
  (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
• esp_mqtt_client_subscribe could be used to call this function.

Parameters
  • client -- MQTT client handle
  • topic_list -- List of topics to subscribe
  • size -- size of topic_list

Returns message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int esp_mqtt_client_unsubscribe (esp_mqtt_client_handle_t client, const char *topic)

Unsubscribe the client from defined topic.

Notes:
• Client must be connected to send unsubscribe message
• It is thread safe, please refer to esp_mqtt_client_subscribe_single for details

Parameters
  • client -- MQTT client handle
  • topic --

Returns message_id of the subscribe message on success -1 on failure

int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:
• This API might block for several seconds, either due to network timeout (10s) or if publishing payloads
  longer than internal buffer (due to message fragmentation)
• Client doesn’t have to be connected for this API to work, enqueueing the messages with qos>1 (returning
  -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is
  enabled, this API will not attempt to publish when the client is not connected and will always return -1.
• It is thread safe, please refer to esp_mqtt_client_subscribe for details

Parameters
  • client -- MQTT client handle
  • topic -- topic string
  • data -- payload string (set to NULL, sending empty payload message)
  • len -- data length, if set to 0, length is calculated from payload string
  • qos -- QoS of publish message
  • retain -- retain flag

Returns message_id of the publish message (for QoS 0 message_id will always be zero) on success.
  -1 on failure, -2 in case of full outbox.

int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also
used for qos=0 messages if store=true.
This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

**Parameters**
- `client` -- MQTT client handle
- `topic` -- topic string
- `data` -- payload string (set to NULL, sending empty payload message)
- `len` -- data length, if set to 0, length is calculated from payload string
- `qos` -- QoS of publish message
- `retain` -- retain flag
- `store` -- if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message_id if queued successfully, -1 on failure, -2 in case of full outbox.

```c
esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)
```

Destroys the client handle.

**Notes:**
- Cannot be called from the MQTT event handler

**Parameters**
- `client` -- MQTT client handle

**Returns** ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

```c
esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)
```

Set configuration structure, typically used when updating the config (i.e. on "before_connect" event).

**Notes:**
- When calling this function make sure to have all the intendend configurations set, otherwise default values are set.

**Parameters**
- `client` -- MQTT client handle
- `config` -- MQTT configuration structure

**Returns** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

```c
esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
```

Registers MQTT event.

**Parameters**
- `client` -- MQTT client handle
- `event` -- event type
- `event_handler` -- handler callback
- `event_handler_arg` -- handlers context

**Returns** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

```c
esp_err_t esp_mqtt_client_unregister_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler)
```

Unregisters mqtt event.

**Parameters**
- `client` -- mqtt client handle
- `event` -- event ID
- `event_handler` -- handler to unregister
Chapter 2. API Reference

Returns
ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on invalid event ID ESP_OK on success

int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)
Get outbox size.

Parameters
client -- MQTT client handle

Returns
outbox size 0 on wrong initialization

esp_err_t esp_mqtt_dispatch_custom_event(esp_mqtt_client_handle_t client, esp_mqtt_event_t *event)
Dispatch user event to the mqtt internal event loop.

Parameters
• client -- MQTT client handle
• event -- MQTT event handle structure

Returns
ESP_OK on success ESP_ERR_TIMEOUT if the event couldn't be queued (ref also
CONFIG_MQTT_EVENT_QUEUE_SIZE)

Structures

struct esp_mqtt_error_codes
MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends esp_tls_last_error error structure and is backward compatible with
it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update
applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source
of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from
tcp_transport/esp-tls |
| MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

Public Members

esp_err_t esp_tls_last_err
last esp_err code reported from esp-tls component

int esp_tls_stack_err
tls specific error code reported from underlying tls stack

int esp_tls_cert_verify_flags
tls flags reported from underlying tls stack during certificate verification

esp_mqtt_error_type_t error_type
type referring to the source of the error

esp_mqtt_connect_return_code_t connect_return_code
connection refused error code reported from MQTT* broker on connection

int esp_transport_sock_errno
errno from the underlying socket

struct esp_mqtt_event_t
MQTT event configuration structure
**Public Members**

- `esp_mqtt_event_id_t event_id`
  
  MQTT event type

- `esp_mqtt_client_handle_t client`
  
  MQTT client handle for this event

- `char *data`
  
  Data associated with this event

- `int data_len`
  
  Length of the data for this event

- `int total_data_len`
  
  Total length of the data (longer data are supplied with multiple events)

- `int current_data_offset`
  
  Actual offset for the data associated with this event

- `char *topic`
  
  Topic associated with this event

- `int topic_len`
  
  Length of the topic for this event associated with this event

- `int msg_id`
  
  MQTT message id of message

- `int session_present`
  
  MQTT session_present flag for connection event

- `esp_mqtt_error_codes_t *error_handle`
  
  esp-mqtt error handle including esp-tls errors as well as internal MQTT errors

- `bool retain`
  
  Retained flag of the message associated with this event

- `int qos`
  
  QoS of the messages associated with this event

- `bool dup`
  
  dup flag of the message associated with this event

- `esp_mqtt_protocol_ver_t protocol_ver`
  
  MQTT protocol version used for connection, defaults to value from menuconfig
struct esp_mqtt_client_config_t
MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Public Members

struct esp_mqtt_client_config_t::broker_t broker
Broker address and security verification

struct esp_mqtt_client_config_t::credentials_t credentials
User credentials for broker

struct esp_mqtt_client_config_t::session_t session
MQTT session configuration.

struct esp_mqtt_client_config_t::network_t network
Network configuration

struct esp_mqtt_client_config_t::task_t task
FreeRTOS task configuration.

struct esp_mqtt_client_config_t::buffer_t buffer
Buffer size configuration.

struct esp_mqtt_client_config_t::outbox_config_t outbox
Outbox configuration.

struct broker_t
Broker related configuration

Public Members

struct esp_mqtt_client_config_t::broker_t::address_t address
Broker address configuration

struct esp_mqtt_client_config_t::broker_t::verification_t verification
Security verification of the broker

struct address_t
Broker address

- uri have precedence over other fields
- If uri isn’t set at least hostname, transport and port should.
Public Members

const char *uri
   Complete MQTT broker URI

const char *hostname
   Hostname, to set ipv4 pass it as string

esp_mqtt_transport_t transport
   Selects transport

const char *path
   Path in the URI

uint32_t port
   MQTT server port

struct verification_t
   Broker identity verification
   If fields are not set broker's identity isn't verified. It's recommended to set the options in this struct for security reasons.

Public Members

bool use_global_ca_store
   Use a global ca_store, look esp-tls documentation for details.

esp_err_t (*crt_bundle_attach)(void *conf)
   Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.
   Client only attach the bundle, the cleanup must be done by the user.

const char *certificate
   Certificate data, default is NULL. It's not copied nor freed by the client, user needs to clean up.

size_t certificate_len
   Length of the buffer pointed to by certificate.

const struct psk_key_hint *psk_hint_key
   Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker. It's not copied nor freed by the client, user needs to clean up.

bool skip_cert_common_name_check
   Skip any validation of server certificate CN field, this reduces the security of TLS and makes MQTT client susceptible to MITM attacks

const char **alpn_protos
   NULL-terminated list of supported application protocols to be used for ALPN.
const char *\texttt{common}\texttt{\_name}  
Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname. This is ignored if skip_cert_common_name_check=true. It's not copied nor freed by the client, user needs to clean up.

\textbf{struct buffer\_t}  
Client buffer size configuration  
Client have two buffers for input and output respectively.

\textbf{Public Members}  

\textbf{int size}  
\textit{MQTT} send/receive buffer

\textbf{int out\_size}  
\textit{MQTT} output buffer. If not defined, defaults to the size defined by buffer\_size

\textbf{struct credentials\_t}  
Client related credentials for authentication.

\textbf{Public Members}  

\textbf{const char *username}  
\textit{MQTT} username

\textbf{const char *client\_id}  
Set \textit{MQTT} client identifier. Ignored if set\_null\_client\_id == true If NULL set the default client id. Default client id is ESP32\_CHIPID\% where CHIPID\% are last 3 bytes of MAC address in hex format

\textbf{bool set\_null\_client\_id}  
Selects a NULL client id

\textbf{struct esp\_mqtt\_client\_config\_t::credentials\_t::authentication\_t authentication}  
Client authentication

\textbf{struct authentication\_t}  
Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

\textbf{Public Members}
const char *password
MQTT password

const char *certificate
Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with key. It's not copied nor freed by the client, user needs to clean up.

size_t certificate_len
Length of the buffer pointed to by certificate.

const char *key
Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also certificate has to be provided. It's not copied nor freed by the client, user needs to clean up.

size_t key_len
Length of the buffer pointed to by key.

const char *key_password
Client key decryption password, not PEM nor DER, if provided key_password_len must be correctly set.

int key_password_len
Length of the password pointed to by key_password

bool use_secure_element
Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void *ds_data
Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices. It's not copied nor freed by the client, user needs to clean up.

struct network_t
Network related configuration

Public Members

int reconnect_timeout_ms
Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int refresh_connection_after_ms
Refresh connection after this value (in milliseconds)
bool disable_auto_reconnect
Client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

esp_transport_handle_t transport
Custom transport handle to use. Warning: The transport should be valid during the client lifetime and is destroyed when esp_mqtt_client_destroy is called.

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

struct outbox_config_t
Client outbox configuration options.

Public Members

uint64_t limit
Size limit for the outbox in bytes.

struct session_t
MQTT Session related configuration

Public Members

struct esp_mqtt_client_config_t::session_t::last_will_t last_will
Last will configuration

bool disable_clean_session
MQTT clean session, default clean_session is true

int keepalive
MQTT keepalive, default is 120 seconds When configuring this value, keep in mind that the client attempts to communicate with the broker at half the interval that is actually set. This conservative approach allows for more attempts before the broker's timeout occurs

bool disable_keepalive
Set disable_keepalive=true to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value keepalive to 0 doesn't disable keepalive feature, but uses a default keepalive period

esp_mqtt_protocol_ver_t protocol_ver
MQTT protocol version used for connection.

int message_retransmit_timeout
timeout for retransmitting of failed packet

struct last_will_t
Last Will and Testament message configuration.
Chapter 2. API Reference

Public Members

const char *topic
   LWT (Last Will and Testament) message topic

const char *msg
   LWT message, may be NULL terminated

int msg_len
   LWT message length, if msg isn't NULL terminated must have the correct length

int qos
   LWT message QoS

int retain
   LWT retained message flag

struct task_t
   Client task configuration

Public Members

int priority
   MQTT task priority

int stack_size
   MQTT task stack size

struct topic_t
   Topic definition struct

Public Members

const char *filter
   Topic filter to subscribe

int qos
   Max QoS level of the subscription

Macros

MQTT_ERROR_TYPE_ESP_TLS
   MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility
Chapter 2. API Reference

esp_mqtt_client_subscribe (client_handle, topic_type, qos_or_size)

Convenience macro to select subscribe function to use.

Notes:

• Usage of esp_mqtt_client_subscribe_single is the same as previous esp_mqtt_client_subscribe, refer to it for details.

Parameters

• client_handle -- MQTT client handle
• topic_type -- Needs to be char* for single subscription or esp_mqtt_topic_t for multiple topics
• qos_or_size -- It’s either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.

Returns message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

Type Definitions

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t

MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

• client - MQTT client handle
• various other data depending on event type

typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t

MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t

MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_transport_t esp_mqtt_transport_t

typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t

MQTT protocol version used for connection

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

typedef struct esp_mqtt_event_t esp_mqtt_event_t

MQTT event configuration structure
typedef \textit{esp\_mqtt\_event\_t} *\textit{esp\_mqtt\_event\_handle\_t}

typedef struct \textit{esp\_mqtt\_client\_config\_t} \textit{esp\_mqtt\_client\_config\_t}

\emph{MQTT} client configuration structure

\begin{itemize}
  \item Default values can be set via menuconfig
  \item All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.
\end{itemize}

typedef struct \textit{topic\_t} \textit{esp\_mqtt\_topic\_t}

Topic definition struct

\textbf{Enumerations}

\textbf{enum } \textit{esp\_mqtt\_event\_id\_t}

\emph{MQTT} event types.

User event handler receives context data in \textit{esp\_mqtt\_event\_t} structure with

\begin{itemize}
  \item client - \emph{MQTT} client handle
  \item various other data depending on event type
\end{itemize}

\textit{Values:}

\begin{itemize}
  \item \textbf{MQTT\_EVENT\_ANY}
  \item \textbf{MQTT\_EVENT\_ERROR}
    on error event, additional context: connection return code, error handle from esp\_tls (if supported)
  \item \textbf{MQTT\_EVENT\_CONNECTED}
    connected event, additional context: session\_present flag
  \item \textbf{MQTT\_EVENT\_DISCONNECTED}
    disconnected event
  \item \textbf{MQTT\_EVENT\_SUBSCRIBED}
    subscribed event, additional context:
    \begin{itemize}
      \item msg\_id message id
      \item error\_handle error\_type in case subscribing failed
      \item data pointer to broker response, check for errors.
      \item data\_len length of the data for this event
    \end{itemize}
  \item \textbf{MQTT\_EVENT\_UNSUBSCRIBED}
    unsubscribed event, additional context: msg\_id
  \item \textbf{MQTT\_EVENT\_PUBLISHED}
    published event, additional context: msg\_id
  \item \textbf{MQTT\_EVENT\_DATA}
    data event, additional context:
\end{itemize}
Chapter 2. API Reference

- msg_id message id
- topic pointer to the received topic
- topic_len length of the topic
- data pointer to the received data
- data_len length of the data for this event
- current_data_offset offset of the current data for this event
- total_data_len total length of the data received
- retain retain flag of the message
- qos QoS level of the message
- dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**
The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**
Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
- Additional context: msg_id (id of the deleted message).

enumerator **MQTT_USER_EVENT**
Custom event used to queue tasks into mqtt event handler. All fields from the esp_mqtt_event_t type could be used to pass an additional context data to the handler.

enum **esp_mqtt_connect_return_code_t**
MQTT connection error codes propagated via ERROR event

- enumerator **MQTT_CONNECTION_ACCEPTED**
  Connection accepted

- enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**
  MQTT connection refused reason: Wrong protocol

- enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**
  MQTT connection refused reason: ID rejected

- enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**
  MQTT connection refused reason: Server unavailable

- enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**
  MQTT connection refused reason: Wrong user

- enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**
  MQTT connection refused reason: Wrong username or password

enum **esp_mqtt_error_type_t**
MQTT connection error codes propagated via ERROR event

- Values:
Chapter 2. API Reference

enumerator MQTT_TRANSPORT_OVER_WSS
  MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t

Values:

enumerator MQTT_PROTOCOL_UNDEFINED
enumerator MQTT_PROTOCOL_V_3_1
enumerator MQTT_PROTOCOL_V_3_1_1
enumerator MQTT_PROTOCOL_V_5

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functions. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, and non-blocking connection among others. All the configurations can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:
Chapter 2. API Reference

- `esp_tls_init()` for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()` for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()` for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()` for reading from the connection.
- `esp_tls_conn_write()` for writing into the connection.
- `esp_tls_conn_destroy()` for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2, etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](#).

Tree Structure for ESP-TLS Component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contains the public API headers for the component. Internally, the ESP-TLS component operates using either MbedTLS or WolfSSL, which are SSL/TLS libraries. APIs specific to MbedTLS are present in `esp-tls/private_include/esp_tls_mbedtls.h` and APIs specific to WolfSSL are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

TLS Server Verification

ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected, the client will return a fatal error by default during the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS uses the CA certificate present in the buffer to verify the server. The following variables in the `esp_tls_cfg_t` structure must be set.
  - `cacert_buf` - pointer to the buffer which contains the CA certification.
  - `cacert_bytes` - the size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See the API Reference section below for information regarding different APIs used for initializing and setting up the `global_ca_store`.
- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at ESP x509 Certificate Bundle.
- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to the PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purposes. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option
is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure.

**Warning:** Enabling this option comes with a potential risk of establishing a TLS connection with a server that has a fake identity, provided that the server certificate is not provided either through API or other mechanisms like ca_store etc.

### ESP-TLS Server Cert Selection Hook

The ESP-TLS component provides an option to set the server certification selection hook when using the MbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake. The callback helps to select a certificate to present to the client based on the TLS extensions supplied in the client hello message, such as ALPN and SNI. To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig.

The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```c
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}
esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

### Underlying SSL/TLS Library Options

The ESP-TLS component offers the option to use MbedTLS or WolfSSL as its underlying SSL/TLS library. By default, only MbedTLS is available and used, WolfSSL SSL/TLS library is also available publicly at [https://github.com/espressif/esp-wolfssl](https://github.com/espressif/esp-wolfssl). The repository provides the WolfSSL component in binary format, and it also provides a few examples that are useful for understanding the API. Please refer to the repository README.md for information on licensing and other options. Please see the below section for instructions on how to use WolfSSL in your project.

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

### How to Use WolfSSL with ESP-IDF

There are two ways to use WolfSSL in your project:

1) Directly add WolfSSL as a component in your project with the following three commands:

```bash
(First, change the directory (cd) to your project directory)
mkdir components
cd components
git clone --recursive https://github.com/espressif/esp-wolfssl.git
```

2) Add WolfSSL as an extra component in your project.

   • Download WolfSSL with:

   ```bash
git clone --recursive https://github.com/espressif/esp-wolfssl.git
```

   • Include ESP-WolfSSL in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in `CMakeLists.txt` of your project as done in `wolfssl/examples`. For reference see Optional Project Variables in `build-system`.
After the above steps, you will have the option to choose WolfSSL as the underlying SSL/TLS library in the configuration menu of your project as follows:

```
idf.py menuconfig > ESP-TLS > SSL/TLS Library > Mbedtls/Wolfssl
```

### Comparison Between MbedTLS and WolfSSL

The following table shows a typical comparison between WolfSSL and MbedTLS when the protocols/https_request example (which includes server authentication) is running with both SSL/TLS libraries and with all respective configurations set to default. For MbedTLS, the IN_CONTENT length and OUT_CONTENT length are set to 16384 bytes and 4096 bytes respectively.

<table>
<thead>
<tr>
<th>Property</th>
<th>WolfSSL</th>
<th>MbedTLS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 KB</td>
<td>~37 KB</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 KB</td>
<td>~3.6 KB</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 KB</td>
<td>~736 KB</td>
</tr>
</tbody>
</table>

**Note:** These values can vary based on configuration options and version of respective libraries.

### Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C6. Use of the DS for TLS is supported only when ESP-TLS is used with MbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature (DS)](DigitalSignature.pdf). The technical details of Digital Signature such as how to calculate private key parameters can be found in [ESP32-C6 Technical Reference Manual > Digital Signature (DS)](ESP32-C6_TechnicalReferenceManual.pdf). The DS peripheral must be configured before it can be used to perform Digital Signature, see [Configure the DS peripheral for a TLS connection](Configure_DS_for_TLS_connection). The DS peripheral must be initialized with the required encrypted private key parameters, which are obtained when the DS peripheral is configured. ESP-TLS internally initializes the DS peripheral when provided with the required DS context, i.e., DS parameters. Please see the below code snippet for passing the DS context to the ESP-TLS context. The DS context passed to the ESP-TLS context should not be freed till the TLS connection is deleted.

```c
#include "esp_tls.h"

esp_ds_data_ctx_t *ds_ctx;

/* initialize ds_ctx with encrypted private key parameters, which can be read from nvs or provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client certification */,
    .clientcert_bytes = /* length of the client certification */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client certification (`clientcert_buf`) and the DS params (`ds_data`) are required and the client key (`clientkey_buf`) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at `ssl mutual auth` which internally uses (ESP-TLS) for the TLS connection.
Chapter 2. API Reference

TLS Ciphersuites

ESP-TLS provides the ability to set a ciphersuites list in client mode. The TLS ciphersuites list informs the server about the supported ciphersuites for the specific TLS connection regardless of the TLS stack configuration. If the server supports any ciphersuite from this list, then the TLS connection will succeed; otherwise, it will fail.

You can set ciphersuites_list in the `esp_tls_cfg_t` structure during client connection as follows:

```c
/* ciphersuites_list must end with 0 and must be available in the memory scope active during the entire TLS connection */
static const int ciphersuites_list[] = {MBEDTLS_TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384, MBEDTLS_TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384, 0};

esp_tls_cfg_t cfg = {
    .ciphersuites_list = ciphersuites_list,
};
```

ESP-TLS will not check the validity of ciphersuites_list that was set, you should call `esp_tls_get_ciphersuites_list()` to get ciphersuites list supported in the TLS stack and cross-check it against the supplied list.

Note: This feature is supported only in the MbedTLS stack.

API Reference

Header File

- `components/esp-tls/esp_tls.h`
- This header file can be included with:

```c
#include "esp_tls.h"
```
- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp-tls
```

Functions

`esp_tls_t *esp_tls_init (void)`

Create TLS connection.

- **Returns** tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

`esp_tls_t *esp_tls_conn_http_new (const char *url, const esp_tls_cfg_t *cfg)`

Create a new blocking TLS/SSL connection with a given "HTTP" url.

- **Note:** This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

- **Parameters**

  - `cfg` -- [in] TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.

- **Returns** pointer to esp_tls_t, or NULL if connection couldn’t be opened.
int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)

Create a new blocking TLS/SSL connection.
This function establishes a TLS/SSL connection with the specified host in blocking manner.

Parameters
- **hostname** -- [in] Hostname of the host.
- **hostlen** -- [in] Length of hostname.
- **port** -- [in] Port number of the host.
- **cfg** -- [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- **tls** -- [in] Pointer to esp-tls as esp-tls handle.

Returns
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int esp_tls_conn_http_new_sync (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
Create a new blocking TLS/SSL connection with a given "HTTP" url.
The behaviour is same as esp_tls_conn_new_sync() API. However this API accepts host’s url.

Parameters
- **url** -- [in] url of host.
- **cfg** -- [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.
- **tls** -- [in] Pointer to esp-tls as esp-tls handle.

Returns
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
Create a new non-blocking TLS/SSL connection.
This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Parameters
- **hostname** -- [in] Hostname of the host.
- **hostlen** -- [in] Length of hostname.
- **port** -- [in] Port number of the host.
- **cfg** -- [in] TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- **tls** -- [in] pointer to esp-tls as esp-tls handle.

Returns
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int esp_tls_conn_http_new_async (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
Create a new non-blocking TLS/SSL connection with a given "HTTP" url.
The behaviour is same as esp_tls_conn_new_async() API. However this API accepts host’s url.

Parameters
- **url** -- [in] url of host.
- **cfg** -- [in] TLS configuration as esp_tls_cfg_t.
- **tls** -- [in] pointer to esp-tls as esp-tls handle.
Chapter 2. API Reference

Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize_t esp_tls_conn_write (esp_tls_t *tls, const void *data, size_t datalen)
Write from buffer ‘data’ into specified tls connection.

Parameters

- tls -- [in] pointer to esp-tls as esp-tls handle.
- data -- [in] Buffer from which data will be written.
- datalen -- [in] Length of data buffer.

Returns

- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize_t esp_tls_conn_read (esp_tls_t *tls, void *data, size_t datalen)
Read from specified tls connection into the buffer ‘data’.

Parameters

- tls -- [in] pointer to esp-tls as esp-tls handle.
- data -- [in] Buffer to hold read data.
- datalen -- [in] Length of data buffer.

Returns

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

int esp_tls_conn_destroy (esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new_sync() (or esp_tls_conn_http_new_sync()) and esp_tls_conn_new_async() (or esp_tls_conn_http_new_async()) APIs.

Parameters tls -- [in] pointer to esp-tls as esp-tls handle.

Returns
- 0 on success
- -1 if socket error or an invalid argument

ssize_t esp_tls_get_bytes_avail (esp_tls_t *tls)
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtlss’s mbedtls_ssl_get_bytes_avail() API.

Parameters tls -- [in] pointer to esp-tls as esp-tls handle.

Returns
- -1 in case of invalid arg
- bytes available in the application data record read buffer

esp_err_t esp_tls_get_conn_sockfd (esp_tls_t *tls, int *sockfd)
Returns the connection socket file descriptor from esp_tls session.

Parameters

- tls -- [in] handle to esp_tls context
- sockfd -- [out] int pointer to sockfd value.

Returns
- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection.
• ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

`esp_err_t esp_tls_set_conn_sockfd(esp_tls_t *tls, int sockfd)`

Sets the connection socket file descriptor for the esp_tls session.

**Parameters**
- `tls` -- [in] handle to esp_tls context

**Returns**
- ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd < 0)

`esp_err_t esp_tls_get_conn_state(esp_tls_t *tls, esp_tls_conn_state_t *conn_state)`

Gets the connection state for the esp_tls session.

**Parameters**
- `tls` -- [in] handle to esp_tls context
- `conn_state` -- [out] pointer to the connection state value.

**Returns**
- ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG (Invalid arguments)

`esp_err_t esp_tls_set_conn_state(esp_tls_t *tls, esp_tls_conn_state_t conn_state)`

Sets the connection state for the esp_tls session.

**Parameters**
- `tls` -- [in] handle to esp_tls context
- `conn_state` -- [in] connection state value to set.

**Returns**
- ESP_OK on success and value of sockfd for the tls connection shall updated withthe provided value
- ESP_ERR_INVALID_ARG (Invalid arguments)

`void *esp_tls_get_ssl_context(esp_tls_t *tls)`

Returns the ssl context.

**Parameters**
- `tls` -- [in] handle to esp_tls context

**Returns**
- ssl_ctx pointer to ssl context of underlying TLS layer on success
- NULL in case of error

`esp_err_t esp_tls_init_global_ca_store(void)`

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

**Returns**
- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occured when allocating the mbedTLS resources.

`esp_err_t esp_tls_set_global_ca_store(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)`

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

**Parameters**
- `cacert_pem_buf` -- [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- `cacert_pem_bytes` -- [in] Length of the buffer.

**Returns**
Chapter 2. API Reference

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void esp_tls_free_global_ca_store (void)
Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application

esp_err_t esp_tls_get_and_clear_last_error (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally
upon return.

Parameters
- h -- [in] esp-tls error handle.
- esp_tls_code -- [out] last error code returned from mbedtls api (set to zero if none) This
  pointer could be NULL if caller does not care about esp_tls_code
- esp_tls_flags -- [out] last certification verification flags (set to zero if none) This
  pointer could be NULL if caller does not care about esp_tls_code

Returns
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

esp_err_t esp_tls_get_and_clear_error_type (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)
Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

Parameters
- h -- [in] esp-tls error handle.
- err_type -- [in] specific error type
- error_code -- [out] last error code returned from mbedtls api (set to zero if none) This
  pointer could be NULL if caller does not care about esp_tls_code

Returns
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

esp_err_t esp_tls_get_error_handle (esp_tls_t *tls, esp_tls_error_handle_t *error_handle)
Returns the ESP-TLS error handle.

Parameters
- tls -- [in] handle to esp_tls context
- error_handle -- [out] pointer to the error handle.

Returns
- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

mbedtls_x509_crt *esp_tls_get_global_ca_store (void)
Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the
application for APIs other than esp_tls.

Note: Modifying the pointer might cause a failure in verifying the certificates.

Returns
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.
Chapter 2. API Reference

const int *esp_tls_get_ciphersuites_list (void)
Get supported TLS ciphersuites list.
See https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4 for the list of ciphersuites

Returns Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites.

esp_err_t esp_tls_plain_tcp_connect (const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg,
esp_tls_error_handle_t error_handle, int *sockfd)
Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Parameters
• host -- [in] Hostname of the host.
• hostlen -- [in] Length of hostname.
• port -- [in] Port number of the host.
• cfg -- [in] ESP-TLS configuration as esp_tls_cfg_t.
• error_handle -- [out] ESP-TLS error handle holding potential errors occurred during connection
• sockfd -- [out] Socket descriptor if successfully connected on TCP layer

Returns ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Structures

struct psk_key_hint
ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the key

const char *hint
hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
esp-tls client session ticket ctx
Keep alive parameters structure

Public Members

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time (second)
int keep_alive_interval
   Keep-alive interval time (second)

int keep_alive_count
   Keep-alive packet retry send count

struct esp_tls_cfg
   ESP-TLS configuration parameters.

**Note**: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *._pem_buf and *._pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

### Public Members

const char **alpn_protos
   Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };
   • where 'h2' is the protocol name

const unsigned char *cacert_buf
   Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
   CA certificate buffer legacy name

unsigned int cacert_bytes
   Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
   Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
   Client certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support. This buffer should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
   Client certificate legacy name
unsigned int \texttt{clientcert\_bytes} \\
Size of client certificate pointed to by \texttt{clientcert\_pem\_buf} (including NULL-terminator in case of PEM format)

unsigned int \texttt{clientcert\_pem\_bytes} \\
Size of client certificate legacy name

const unsigned char *\texttt{clientkey\_buf} \\
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *\texttt{clientkey\_pem\_buf} \\
Client key legacy name

unsigned int \texttt{clientkey\_bytes} \\
Size of client key pointed to by \texttt{clientkey\_pem\_buf} (including NULL-terminator in case of PEM format)

unsigned int \texttt{clientkey\_pem\_bytes} \\
Size of client key legacy name

const unsigned char *\texttt{clientkey\_password} \\
Client key decryption password string

unsigned int \texttt{clientkey\_password\_len} \\
String length of the password pointed to by \texttt{clientkey\_password}

bool \texttt{use\_ecdsa\_peripheral} \\
Use the ECDSA peripheral for the private key operations

uint8_t \texttt{ecdsa\_key\_efuse\_blk} \\
The efuse block where the ECDSA key is stored

bool \texttt{non\_block} \\
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool \texttt{use\_secure\_element} \\
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int \texttt{timeout\_ms} \\
Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32\_MAX

bool \texttt{use\_global\_ca\_store} \\
Use a global ca_store for all the connections in which this bool is set.

const char *\texttt{common\_name} \\
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.
bool **skip_common_name**
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t **keep_alive_cfg**
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t **psk_hint_key**
Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (**crt_bundle_attach**) (void **conf**)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void **ds_data**
Pointer for digital signature peripheral context

bool **is_plain_tcp**
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq **if_name**
The name of interface for data to go through. Use the default interface without setting

esp_tls_addr_family_t **addr_family**
The address family to use when connecting to a host.

const int **ciphersuites_list**
Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites. Please check the list validity by esp_tls_get_ciphersuites_list() API

esp_tls_proto_ver_t **tls_version**
TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

**Type Definitions**

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
esp-tls client session ticket ctx
Keep alive parameters structure
typedef enum esp_tls_addr_family esp_tls_addr_family_t

typedef struct esp_tls_cfg esp_tls_cfg_t

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_.pem_buf and *_.pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

---

typedef struct esp_tls esp_tls_t

**Enumerations**

enum esp_tls_conn_state

ESP-TLS Connection State.

Values:

- enumerator ESP_TLS_INIT
- enumerator ESP_TLS_CONNECTING
- enumerator ESP_TLS_HANDSHAKE
- enumerator ESP_TLS_FAIL
- enumerator ESP_TLS_DONE

enum esp_tls_role

Values:

- enumerator ESP_TLS_CLIENT
- enumerator ESP_TLS_SERVER

enum esp_tls_addr_family

Values:

- enumerator ESP_TLS_AF_UNSPEC
  Unspecified address family.
enumerator ESP_TLS_AF_INET
    IPv4 address family.

enumerator ESP_TLS_AF_INET6
    IPv6 address family.

enum esp_tls_proto_ver_t

Values:

enumerator ESP_TLS_VER_ANY

enumerator ESP_TLS_VER_TLS_1_2

enumerator ESP_TLS_VER_TLS_1_3

enumerator ESP_TLS_VER_TLS_MAX

Header File

- components/esp-tls/esp_tls_errors.h
- This header file can be included with:

```c
#include "esp_tls_errors.h"
```

- This header file is a part of the API provided by the esp-tls component. To declare that your component depends on esp-tls, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp-tls
```

or

```cmake
PRIV_REQUIRES esp-tls
```

Structures

struct esp_tls_last_error

Error structure containing relevant errors in case tls error occurred.

Public Members

`esp_err_t last_error`

error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

`int esp_tls_error_code`

esp_tls error code from last esp_tls failed api

`int esp_tls_flags`

last certification verification flags
Macros

**ESP_ERR_ESP_TLS_BASE**
Starting number of ESP-TLS error codes

**ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME**
Error if hostname couldn’t be resolved upon tls connection

**ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET**
Failed to create socket

**ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY**
Unsupported protocol family

**ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST**
Failed to connect to host

**ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED**
failed to set/get socket option

**ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT**
new connection in esp_tls_low_level_conn connection timeouted

**ESP_ERR_ESP_TLS_SE_FAILED**

**ESP_ERR_ESP_TLS_TCP_CLOSED_FIN**

**ESP_ERR_MBEDTLS_CERT_PARTLY_OK**
mbedtls parse certificates was partly successful

**ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED**
mbedtls api returned error

**ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED**
mbedtls api returned error

**ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED**
mbedtls api returned error

**ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED**
mbedtls api returned error

**ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED**
mbedtls api returned error

**ESP_ERR_MBEDTLS_SSL_CONF_OWN_CERT_FAILED**
mbedtls api returned error

**ESP_ERR_MBEDTLS_SSL_SETUP_FAILED**
mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_WRITE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_TICKET_SETUP_FAILED
mbedtls api returned failed

ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED
wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_CTX_SETUP_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED
wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED
wolfSSL api returned failed

ESP_TLS_ERR_SSL_WANT_READ
Definition of errors reported from IO API (potentially non-blocking) in case of error:
  • esp_tls_conn_read()
  • esp_tls_conn_write()

ESP_TLS_ERR_SSL_WANT_WRITE

ESP_TLS_ERR_SSL_TIMEOUT
Type Definitions

typedef struct esp_tls_last_error *esp_tls_error_handle_t

typedef struct esp_tls_last_error esp_tls_last_error_t

Error structure containing relevant errors in case tls error occurred.

Enumerations

enum esp_tls_error_type_t

Definition of different types/sources of error codes reported from different components

2.2.5 ESP HTTP Client

Overview

esp_http_client component provides a set of APIs for making HTTP/S requests from ESP-IDF applications. The steps to use these APIs are as follows:

- esp_http_client_init(): Creates an esp_http_client_handle_t instance, i.e., an HTTP client handle based on the given esp_http_client_config_t configuration. This function must be the first to be called; default values are assumed for the configuration values that are not explicitly defined by the user.
Chapter 2. API Reference

- \texttt{esp\_http\_client\_perform()}: Performs all operations of the \texttt{esp\_http\_client} - opening the connection, exchanging data, and closing the connection (as required), while blocking the current task before its completion. All related events are invoked through the event handler (as specified in \texttt{esp\_http\_client\_config\_t}).
- \texttt{esp\_http\_client\_cleanup()}: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests can be found at \texttt{protocols/esp\_http\_client}.

Basic HTTP Request

Check out the example functions \texttt{http\_rest\_with\_url} and \texttt{http\_rest\_with\_hostname\_path} in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the \texttt{Connection: close} header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance. Check out the example functions \texttt{http\_rest\_with\_url} and \texttt{http\_rest\_with\_hostname\_path} in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

HTTPS Request

ESP HTTP client supports SSL connections using \texttt{mbedtls}, with the \texttt{url} configuration starting with \texttt{https} scheme or \texttt{transport\_type} set to \texttt{HTTP\_TRANSPORT\_OVER\_SSL}. HTTPS support can be configured via \texttt{CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS} (enabled by default).

Note: While making HTTPS requests, if server verification is needed, an additional root certificate (in PEM format) needs to be provided to the \texttt{cert\_pem} member in the \texttt{esp\_http\_client\_config\_t} configuration. Users can also use the ESP X509 Certificate Bundle for server verification using the \texttt{crt\_bundle\_attach} member of the \texttt{esp\_http\_client\_config\_t} configuration.

Check out the example functions \texttt{https\_with\_url} and \texttt{https\_with\_hostname\_path} in the application example for implementation details of the above note.

HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- \texttt{esp\_http\_client\_init()}: Create a HTTP client handle.
- \texttt{esp\_http\_client\_set\_\_*} or \texttt{esp\_http\_client\_delete\_\_*}: Modify the HTTP connection parameters (optional).
- \texttt{esp\_http\_client\_open()}: Open the HTTP connection with \texttt{write\_len} parameter (content length that needs to be written to server), set \texttt{write\_len=0} for read-only connection.
- \texttt{esp\_http\_client\_write()}: Write data to server with a maximum length equal to \texttt{write\_len} of \texttt{esp\_http\_client\_open()}; no need to call this function for \texttt{write\_len=0}.
Chapter 2. API Reference

- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream.
- `esp_http_client_close()`: Close the connection.
- `esp_http_client_cleanup()`: Release allocated resources.

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

HTTP Authentication

**ESP HTTP client supports both Basic and Digest Authentication.**

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only one perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes two perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

**Examples of Authentication Configuration**

- Authentication with URI
  ```c
  esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

- Authentication with username and password entry
  ```c
  esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
  };
  ```

Event Handling

ESP HTTP Client supports event handling by triggering an event handler corresponding to the event which takes place. `esp_http_client_event_id_t` contains all the events which could occur while performing an HTTP request using the ESP HTTP Client.

To enable event handling, you just need to set a callback function using the `esp_http_client_config_t::event_handler` member.

ESP HTTP Client Diagnostic Information

Diagnostic information could be helpful to gain insights into a problem. In the case of ESP HTTP Client, the diagnostic information can be collected by registering an event handler with the `Event Loop library`. This feature has been added by keeping in mind the ESP Insights framework which collects the diagnostic information. However, this
feature can also be used without any dependency on the ESP Insights framework for the diagnostic purpose. Event handler can be registered to the event loop using the \texttt{esp_event_handler_register()} function.

Expected data types for different HTTP Client events in the event loop are as follows:

- \texttt{HTTP\_EVENT\_ERROR: esp\_http\_client\_handle\_t}
- \texttt{HTTP\_EVENT\_ON\_CONNECTED: esp\_http\_client\_handle\_t}
- \texttt{HTTP\_EVENT\_HEADERS\_SENT: esp\_http\_client\_handle\_t}
- \texttt{HTTP\_EVENT\_ON\_HEADER: esp\_http\_client\_handle\_t}
- \texttt{HTTP\_EVENT\_ON\_DATA: esp\_http\_client\_on\_data\_t}
- \texttt{HTTP\_EVENT\_ON\_FINISH: esp\_http\_client\_handle\_t}
- \texttt{HTTP\_EVENT\_DISCONNECTED: esp\_http\_client\_handle\_t}
- \texttt{HTTP\_EVENT\_REDIRECT: esp\_http\_client\_redirect\_event\_data\_t}

The \texttt{esp\_http\_client\_handle\_t} received along with the event data will be valid until \texttt{HTTP\_EVENT\_DISCONNECTED} is not received. This handle has been sent primarily to differentiate between different client connections and must not be used for any other purpose, as it may change based on client connection state.

API Reference

Header File

- \texttt{components/esp\_http\_client/include/esp\_http\_client.h}
- This header file can be included with:

  ```
  #include "esp\_http\_client.h"
  ```

- This header file is a part of the API provided by the \texttt{esp\_http\_client} component. To declare that your component depends on \texttt{esp\_http\_client}, add the following to your \texttt{CMakeLists.txt}:

  ```
  REQUIRES esp\_http\_client
  ```
  or

  ```
  PRIV\_REQUIRES esp\_http\_client
  ```

Functions

\texttt{esp\_http\_client\_handle\_t esp\_http\_client\_init \( \text{(const esp\_http\_client\_config\_t \*config) } \)}}

Start a HTTP session. This function must be the first function to call, and it returns a \texttt{esp\_http\_client\_handle\_t} that you must use as input to other functions in the interface. This call MUST have a corresponding call to \texttt{esp\_http\_client\_cleanup} when the operation is complete.

Parameters \texttt{config} -- [in] The configurations, see \texttt{http\_client\_config\_t}

Returns

- \texttt{esp\_http\_client\_handle\_t}
- NULL if any errors

\texttt{esp\_err\_t esp\_http\_client\_perform \( \text{\texttt{esp\_http\_client\_handle\_t \text{client} })} \)}}

Invoke this function after \texttt{esp\_http\_client\_init} and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same \texttt{esp\_http\_client\_handle\_t} as input as the \texttt{esp\_http\_client\_init} call returned. \texttt{esp\_http\_client\_perform} performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking \texttt{esp\_http\_client\_perform()}, \texttt{is\_async} member of \texttt{esp\_http\_client\_config\_t} must be set while making a call to \texttt{esp\_http\_client\_init()} API. You can do any amount of calls to \texttt{esp\_http\_client\_perform} while using the same \texttt{esp\_http\_client\_handle\_t}. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. \texttt{esp\_http\_client} will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources.
Just note that you will have to use esp_http_client_set_** between the invokes to set options for the following esp_http_client_perform.

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several esp_http_client_handle_t. This function include esp_http_client_open -> esp_http_client_write -> esp_http_client_fetch_headers -> esp_http_client_read (and option) esp_http_client_close.

**Parameters**
- client -- The esp_http_client handle

**Returns**
- ESP_OK on successful
- ESP_FAIL on error

```c
esp_err_t esp_http_client_cancel_request (esp_http_client_handle_t client)
```

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same esp_http_client context.

**Parameters**
- client -- The esp_http_client handle

**Returns**
- ESP_OK on successful
- ESP_FAIL on error
- ESP_ERR_INVALID_ARG
- ESP_ERR_INVALID_STATE

```c
esp_err_t esp_http_client_set_url (esp_http_client_handle_t client, const char* url)
```

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Parameters**
- client -- [in] The esp_http_client handle
- url -- [in] The url

**Returns**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_http_client_set_post_field (esp_http_client_handle_t client, const char *data, int len)
```

Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**
- client -- [in] The esp_http_client handle
- data -- [in] post data pointer
- len -- [in] post length

**Returns**
- ESP_OK
- ESP_FAIL

```c
int esp_http_client_get_post_field (esp_http_client_handle_t client, char **data)
```

Get current post field information.

**Parameters**
- client -- [in] The client
- data -- [out] Point to post data pointer

**Returns** Size of post data

```c
esp_err_t esp_http_client_set_header (esp_http_client_handle_t client, const char *key, const char *value)
```

Set http request header, this function must be called after esp_http_client_init and before any perform function.

**Parameters**
Chapter 2. API Reference

- **client** -- [in] The esp_http_client handle
- **key** -- [in] The header key
- **value** -- [in] The header value

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_get_header (esp_http_client_handle_t client, const char* key, char** value)**

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **key** -- [in] The header key
- **value** -- [out] The header value

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_get_username (esp_http_client_handle_t client, char** value)**

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **value** -- [out] The username value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_username (esp_http_client_handle_t client, const char* username)**

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **username** -- [in] The username value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_get_password (esp_http_client_handle_t client, char** value)**

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **value** -- [out] The password value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_password (esp_http_client_handle_t client, const char* password)**

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **password** -- [in] The password value

**Returns**
- ESP_OK
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_authtype(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)
```
Set http request auth_type.

**Parameters**
- `client` -- [in] The esp_http_client handle
- `auth_type` -- [in] The esp_http_client auth type

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_get_user_data(esp_http_client_handle_t client, void** data)
```
Get http request user_data. The value stored from the `esp_http_client_config_t` will be written to the address passed into data.

**Parameters**
- `client` -- [in] The esp_http_client handle
- `data` -- [out] A pointer to the pointer that will be set to user_data.

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_user_data(esp_http_client_handle_t client, void* data)
```
Set http request user_data. The value passed in `+data+` will be available during event callbacks. No memory management will be performed on the user’s behalf.

**Parameters**
- `client` -- [in] The esp_http_client handle
- `data` -- [in] The pointer to the user data

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

```c
int esp_http_client_get_errno(esp_http_client_handle_t client)
```
Get HTTP client session errno.

**Parameters**
- `client` -- [in] The esp_http_client handle

**Returns**
- (-1) if invalid argument
- `errno`

```c
esp_err_t esp_http_client_set_method(esp_http_client_handle_t client, esp_http_client_method_t method)
```
Set http request method.

**Parameters**
- `client` -- [in] The esp_http_client handle
- `method` -- [in] The method

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

```c
esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)
```
Set http request timeout.

**Parameters**
- `client` -- [in] The esp_http_client handle
- `timeout_ms` -- [in] The timeout value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG
**esp_err_t esp_http_client_delete_header (esp_http_client_handle_t client, const char *key)**

Delete http request header.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **key** -- [in] The key

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_open (esp_http_client_handle_t client, int write_len)**

This function will be open the connection, write all header strings and return.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **write_len** -- [in] HTTP Content length need to write to the server

**Returns**
- ESP_OK
- ESP_FAIL

**int esp_http_client_write (esp_http_client_handle_t client, const char *buffer, int len)**

This function will write data to the HTTP connection previously opened by esp_http_client_open()

**Parameters**
- **client** -- [in] The esp_http_client handle
- **buffer** -- The buffer
- **len** -- [in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

**Returns**
- (-1) if any errors
- Length of data written

**int64_t esp_http_client_fetch_headers (esp_http_client_handle_t client)**

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**Parameters**
- **client** -- [in] The esp_http_client handle

**Returns**
- (0) if stream doesn't contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

**bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)**

Check response data is chunked.

**Parameters**
- **client** -- [in] The esp_http_client handle

**Returns**
- true or false

**int esp_http_client_read (esp_http_client_handle_t client, char *buffer, int len)**

Read data from http stream.

**Note:** (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

**Parameters**
- **client** -- [in] The esp_http_client handle
- **buffer** -- The buffer
- **len** -- [in] The length

**Returns**
- (-1) if any errors
Chapter 2. API Reference

- Length of data was read

```c
int esp_http_client_get_status_code(esp_http_client_handle_t client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

Parameters client -- [in] The esp_http_client handle

Returns Status code
```

```c
int64_t esp_http_client_get_content_length(esp_http_client_handle_t client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Parameters client -- [in] The esp_http_client handle

Returns
- (-1) Chunked transfer
- Content-Length value as bytes
```

```c
esp_err_t esp_http_client_close(esp_http_client_handle_t client)

Close http connection, still kept all http request resources.

Parameters client -- [in] The esp_http_client handle

Returns
- ESP_OK
- ESP_FAIL
```

```c
esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Parameters client -- [in] The esp_http_client handle

Returns
- ESP_OK
- ESP_FAIL
```

```c
esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)

Get transport type.

Parameters client -- [in] The esp_http_client handle

Returns
- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL
```

```c
esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When disable_auto_redirect is set, the client will not call this function but the event HTTP_EVENT_REDIRECT will be dispatched giving the user control over the redirection event.

Parameters client -- [in] The esp_http_client handle

Returns
- ESP_OK
- ESP_FAIL
```

```c
esp_err_t esp_http_client_set_auth_data(esp_http_client_handle_t client, const char* auth_data, int len)

On receiving a custom authentication header, this API can be invoked to set the authentication information from the header. This API can be called from the event handler.

Parameters
- client -- [in] The esp_http_client handle
```
Chapter 2. API Reference

- **auth_data** -- [in] The authentication data received in the header
- **len** -- [in] length of auth_data.

**Returns**
- ESP_ERR_INVALID_ARG
- ESP_OK

**void esp_http_client_add_auth (esp_http_client_handle_t client)**

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**
- **client** -- [in] The esp_http_client handle

**bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)**

Checks if entire data in the response has been read without any error.

**Parameters**
- **client** -- [in] The esp_http_client handle

**Returns**
- true
- false

**int esp_http_client_read_response (esp_http_client_handle_t client, char*buffer, int len)**

Helper API to read larger data chunks This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **buffer** -- The buffer
- **len** -- [in] The buffer length

**Returns**
- Length of data was read

**esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int*len)**

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferrable to esp_http_client_read_response in situations where the content of the response may be ignored.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **len** -- Length of data discarded

**Returns**
- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

**esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)**

Get URL from client.

**Parameters**
- **client** -- [in] The esp_http_client handle
- **url** -- [inout] The buffer to store URL
- **len** -- [in] The buffer length

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)**

Get Chunk-Length from client.
Parameters

- **client** -- [in] The esp_http_client handle
- **len** -- [out] Variable to store length

Returns

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

```c
struct esp_http_client_event
    HTTP Client events data.
```

Public Members

```c
esp_http_client_event_id_t event_id
    event_id, to know the cause of the event

esp_http_client_handle_t client
    esp_http_client_handle_t context

void *data
    data of the event

int data_len
    data length of data

void *user_data
    user_data context, from esp_http_client_config_t user_data

cchar *header_key
    For HTTP_EVENT_ON_HEADER event_id, it's store current http header key

cchar *header_value
    For HTTP_EVENT_ON_HEADER event_id, it's store current http header value
```

```c
struct esp_http_client_on_data
    Argument structure for HTTP_EVENT_ON_DATA event.
```

Public Members

```c
esp_http_client_handle_t client
    Client handle

int64_t data_process
    Total data processed
```

```c
struct esp_http_client_redirect_event_data
    Argument structure for HTTP_EVENT_REDIRECT event.
```
Public Members

*esp_http_client_handle_t* client
Client handle

*int* status_code
Status Code

*struct esp_http_client_config_t* HTTP configuration.

Public Members

const char *url
HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
Domain or IP as string

*int* port
Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
Using for Http authentication

const char *password
Using for Http authentication

*esp_http_client_auth_type_t* auth_type
Http authentication type, see esp_http_client_auth_type_t

const char *path
HTTP Path, if not set, default is /

const char *query
HTTP query

const char *cert_pem
SSL server certification, PEM format as string, if the client requires to verify server

*size_t* cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
SSL client certification, PEM format as string, if the server requires to verify client

*size_t* client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem
const char *client_key_pem
SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
Client key decryption password string

size_t client_key_password_len
String length of the password pointed to by client_key_password

esp_http_client_proto_ver_t tls_version
TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

const char *user_agent
The User Agent string to send with HTTP requests

esp_http_client_method_t method
HTTP Method

int timeout_ms
Network timeout in milliseconds

bool disable_auto_redirect
Disable HTTP automatic redirects

int max_redirection_count
Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
HTTP Event Handle

esp_http_client_transport_t transport_type
HTTP transport type, see esp_http_client_transport_t

int buffer_size
HTTP receive buffer size

int buffer_size_tx
HTTP transmit buffer size

void *user_data
HTTP user_data context
bool is_async
Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

const char* common_name
Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)

int keep_alive_count
Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

void *ds_data
Pointer for digital signature peripheral context, see ESP-TLS Documentation for more details

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE
Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
Error write HTTP data
ESP_ERR_HTTP_FETCH_HEADER
    Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
    There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
    HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN
    Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
    Read FIN from peer and the connection closed

**Type Definitions**

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
    HTTP Client events data.

typedef struct esp_http_client_on_data esp_http_client_on_data_t
    Argument structure for HTTP_EVENT_ON_DATA event.

typedef struct esp_http_client_redirect_event_data esp_http_client_redirect_event_data_t
    Argument structure for HTTP_EVENT_REDIRECT event.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

**Enumerations**

enum esp_http_client_event_id_t
    HTTP Client events id.
    
    Values:

    enumerator HTTP_EVENT_ERROR
        This event occurs when there are any errors during execution

    enumerator HTTP_EVENT_ON_CONNECTED
        Once the HTTP has been connected to the server, no data exchange has been performed

    enumerator HTTP_EVENT_HEADERS_SENT
        After sending all the headers to the server

    enumerator HTTP_EVENT_HEADER_SENT
        This header has been kept for backward compatibility and will be deprecated in future versions esp-idf
Chapter 2. API Reference

enumerator **HTTP_EVENT_ON_HEADER**
Occurs when receiving each header sent from the server

enumerator **HTTP_EVENT_ON_DATA**
Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP_EVENT_ON_FINISH**
Occurs when finish a HTTP session

enumerator **HTTP_EVENT_DISCONNECTED**
The connection has been disconnected

enumerator **HTTP_EVENT_REDIRECT**
Intercepting HTTP redirects to handle them manually

enum **esp_http_client_transport_t**
HTTP Client transport.

Values:

enumerator **HTTP_TRANSPORT_UNKNOWN**
Unknown

enumerator **HTTP_TRANSPORT_OVER_TCP**
Transport over tcp

enumerator **HTTP_TRANSPORT_OVER_SSL**
Transport over ssl

enum **esp_http_client_proto_ver_t**
Values:

enumerator **ESP_HTTP_CLIENT_TLS_VER_ANY**

enumerator **ESP_HTTP_CLIENT_TLS_VER_TLS_1_2**

enumerator **ESP_HTTP_CLIENT_TLS_VER_TLS_1_3**

enumerator **ESP_HTTP_CLIENT_TLS_VER_MAX**

enum **esp_http_client_method_t**
HTTP method.

Values:

enumerator **HTTP_METHOD_GET**
HTTP GET Method

enumerator **HTTP_METHOD_POST**
HTTP POST Method
enumerator HTTP_METHOD_PUT
    HTTP PUT Method

enumerator HTTP_METHOD_PATCH
    HTTP PATCH Method

enumerator HTTP_METHOD_DELETE
    HTTP DELETE Method

enumerator HTTP_METHOD_HEAD
    HTTP HEAD Method

enumerator HTTP_METHOD_NOTIFY
    HTTP NOTIFY Method

enumerator HTTP_METHOD_SUBSCRIBE
    HTTP SUBSCRIBE Method

enumerator HTTP_METHOD_UNSUBSCRIBE
    HTTP UNSUBSCRIBE Method

enumerator HTTP_METHOD_OPTIONS
    HTTP OPTIONS Method

enumerator HTTP_METHOD_COPY
    HTTP COPY Method

enumerator HTTP_METHODMOVE
    HTTP MOVE Method

enumerator HTTP_METHODLOCK
    HTTP LOCK Method

enumerator HTTP_METHOD_UNLOCK
    HTTP UNLOCK Method

enumerator HTTP_METHOD_PROPFIND
    HTTP PROPFIND Method

enumerator HTTP_METHOD_PROPPATCH
    HTTP PROPPATCH Method

enumerator HTTP_METHOD_MKCOL
    HTTP MKCOL Method

enumerator HTTP_METHOD_MAX
enum `esp_http_client_auth_type_t`
HTTP Authentication type.

Values:

enumerator `HTTP_AUTH_TYPE_NONE`
No authentication

enumerator `HTTP_AUTH_TYPE_BASIC`
HTTP Basic authentication

enumerator `HTTP_AUTH_TYPE_DIGEST`
HTTP Digest authentication

enum `HttpStatus_Code`
Enum for the HTTP status codes.

Values:

enumerator `HttpStatus_Ok`

enumerator `HttpStatus_MultipleChoices`

enumerator `HttpStatus_MovedPermanently`

enumerator `HttpStatus_Found`

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

2.2.6 ESP Local Control
Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over HTTPS or Bluetooth® Low Energy. It provides access to application defined properties that are available for reading/writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over Bluetooth Low Energy transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <--------------------------------------
                 * ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0xad, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0xe1, 0x98, 0x3d
            }
        },
        .proto_sec = {
            .version = PROTOCOL_SEC0,
            .custom_handle = NULL,
            .sec_params = NULL,
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
            .usr_ctx_free_fn = NULL,
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    },
    /* Start esp_local_ctrl service */
    ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
}
```

Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
--start");
extern const unsigned char servercert_end[] asm("_binary_servercert_pem_
--end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
--start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_
--end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;
esp_local_ctrl_config_t config = {
    (continues on next page)
}
```
You may set security for transport in ESP local control using following options:

1. PROTCOM_SEC2: specifies that SRP6a-based key exchange and end-to-end encryption based on AES-GCM are used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol, i.e., SRP6a.
2. PROTCOM_SEC1: specifies that Curve25519-based key exchange and end-to-end encryption based on AES-CTR are used.
3. PROTCOM_SEC0: specifies that data will be exchanged as a plain text (no security).
4. PROTCOM_SEC_CUSTOM: you can define your own security requirement. Please note that you will also have to provide custom_handle of type protocomm_security_t * in this context.

Note: The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in Protocol Communication for more details.

Creating a Property

Now that we know how to start the esp_local_ctrl service, let’s add a property to it. Each property must have a unique `name` (string), a type (e.g., enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g., if it is a string or bytestream). For data types with fixed-length property value, like int, float, etc., setting the size field to the right value helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up to the application, hence they may be used as enumerations, bitfields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines TYPE_TIMESTAMP and READONLY, which are used for setting the type and flags fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
};
```
Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get/set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
            /* Use static variable for saving the value. This is essential because the value has to be valid even after this function returns. Alternative is to use dynamic allocation and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see protocols/esp_local_ctrl.
Client Side Implementation

The client side implementation establishes a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service translates these messages into requests and then call the appropriate handlers (set/get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. get_prop_count: This should simply return the total number of properties supported by the service.
2. get_prop_values: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices.
3. set_prop_values: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices.

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call get_prop_count and then get_prop_values, hence form an index-to-name mapping for all properties. Now when calling set_prop_values for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index-to-name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by esp_local_ctrl are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (Bluetooth Low Energy + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending or receiving control messages</td>
</tr>
</tbody>
</table>

API Reference

Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h
- This header file can be included with:

  ```
  #include "esp_local_ctrl.h"
  ```

- This header file is a part of the API provided by the esp_local_ctrl component. To declare that your component depends on esp_local_ctrl, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_local_ctrl
  ```

  or

  ```
  PRIV_REQUIRES esp_local_ctrl
  ```

Functions

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)

Function for obtaining BLE transport mode.
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)
    Function for obtaining HTTPD transport mode.

esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)
    Start local control service.

    Parameters config -- [in] Pointer to configuration structure
    Returns
        • ESP_OK : Success
        • ESP_FAIL : Failure

esp_err_t esp_local_ctrl_stop (void)
    Stop local control service.

esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)
    Add a new property.

    This adds a new property and allocates internal resources for it. The total number of properties that could be
    added is limited by configuration option max_properties

    Parameters prop -- [in] Property description structure
    Returns
        • ESP_OK : Success
        • ESP_FAIL : Failure

esp_err_t esp_local_ctrl_remove_property (const char *name)
    Remove a property.

    This finds a property by name, and releases the internal resources which are associated with it.

    Parameters name -- [in] Name of the property to remove
    Returns
        • ESP_OK : Success
        • ESP_ERR_NOT_FOUND : Failure

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
    Get property description structure by name.

    This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is
    known

    Parameters name -- [in] Name of the property to find
    Returns
        • Pointer to property
        • NULL if not found

esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
    Register protocomm handler for a custom endpoint.

    This API can be called by the application to register a protocomm handler for an endpoint after the local control
    service has started.

    Note: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as
    a part of the protocomm_ble_config_t structure set in esp_local_ctrl_config_t, and passed
    to esp_local_ctrl_start().

    Parameters
        • ep_name -- [in] Name of the endpoint
        • handler -- [in] Endpoint handler function
        • user_ctx -- [in] User data
    Returns
Chapter 2. API Reference

- ESP_OK : Success
- ESP_FAIL : Failure

Unions

union esp_local_ctrl_transport_config_t
#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble
This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd
This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

struct esp_local_ctrl_prop
Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.
Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

Public Members

char *name
Unique name of property

uint32_t type
Type of property. This may be set to application defined enums

size_t size
Size of the property value, which:
- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.
void (*ctx_free_fn)(void *ctx)

Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val

Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data

Pointer to memory holding property value

size_t size

Size of property value

void (*free_fn)(void *data)

This may be set by the application in get_prop_values() handler to tell esp_local_ctrl to call this function on the data pointer above, for freeing its resources after sending the get_prop_values response.

struct esp_local_ctrl_handlers

Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

Note: If any of the properties have fixed sizes, the size field of corresponding element in prop_values need to be set

Param props_count [in] Total elements in the props array
Param props [in] Array of properties, the current values for which have been requested by the client
Param prop_values [out] Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
Param usr_ctx [in] This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure
Return Returning different error codes will convey the corresponding protocol level errors to the client:
   • ESP_OK : Success
   • ESP_ERR_INVALID_ARG : InvalidArgument
   • ESP_ERR_INVALID_STATE : InvalidProto
   • All other error codes : InternalError

esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for changing values of properties.

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

---

**Param props_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

```c
void *usr_ctx
```

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

**struct esp_local_ctrl_proto_sec_cfg**

Protocom security configs

**Public Members**

```c
struct esp_local_ctrl_proto_sec_t
```

**version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below

```c
void *custom_handle
```

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature

```c
const void *pop
```

Proof of possession to be used for local control. Could be NULL.

```c
const void *sec_params
```

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0. This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

**struct esp_local_ctrl_config**

Configuration structure to pass to `esp_local_ctrl_start()`
Public Members

const esp_local_ctrl_transport_t *transport
    Transport layer over which service will be provided

esp_local_ctrl_transport_config_t transport_config
    Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t proto_sec
    Security version and POP

esp_local_ctrl_handlers_t handlers
    Register handlers for responding to get/set requests on properties

size_t max_properties
    This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
    Property description data structure, which is to be populated and passed to the
    esp_local_ctrl_add_property() function.
    Once a property is added, its structure is available for read-only access inside get_prop_values() and
    set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
    Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
    Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
    Transport mode (BLE / HTTPD) over which the service will be provided.
    This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
    Configuration for transport mode BLE.
    This is a forward declaration for protocomm_ble_config_t. To use this, application must set CON-
    FIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_config esp_local_ctrl_transport_config_httpd_t
    Configuration for transport mode HTTPD.
    This is a forward declaration for httpd_ssl_config_t (for HTTPS) or httpd_config_t (for HTTP)
typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
    Security types for esp_local_control.

typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t

typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t

typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
    Protocom security configs

typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to esp_local_ctrl_start()

Enumerations

typedef enum esp_local_ctrl_proto_sec
    Security types for esp_local_control.

    Values:

    enumerator PROTOCOM_SEC0

    enumerator PROTOCOM_SEC1

    enumerator PROTOCOM_SEC2

    enumerator PROTOCOM_SEC_CUSTOM

2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The esp_serial_slave_link component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an esp_serial_slave_link device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Note: The ESP-IDF component esp_serial_slave_link has been moved from ESP-IDF since version v5.0 to a separate repository:

• ESSL component on GitHub

To add ESSL component in your project, please run idf.py add-dependency espressif/esp_serial_slave_link.
Espressif Device Protocols

For more details about Espressif device protocols, see the following documents.

Communication with ESP SDIO Slave

This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to functions 1-7) without any details regarding the underlying hardware implementation.

SDIO Slave Capabilities of Espressif Chips

The services provided by the SDIO Slave peripheral of the ESP32-C6 chip are listed in the table below:

<table>
<thead>
<tr>
<th>Services</th>
<th>ESP32-C6</th>

<td>Y</td>
</tr>
<tr>
<td>Shared registers</td>
<td>56*</td>
</tr>
</tbody>
</table>

* Not including the interrupt registers

ESP SDIO Slave Initialization

The host should initialize the ESP32-C6 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of SDIO Simplified Specification). In this specification as well as below, the SDIO slave is called an SDIO/IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. SDIO reset
   CMD52 (Write 0x6 = 0x8)
2. SD reset
   CMD0
3. Check whether IO card (optional)
   CMD8
4. Send SDIO op cond and wait for card ready
   CMD5 arg = 0x00000000
   CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)
   **Example:**
   Arg of R4 after first CMD5 (arg = 0x00000000) is 0XFFFFF00.
   Keep sending CMD5 with arg = 0x00FFFF00 until the R4 shows card ready (arg bit 31 = 1).
5. Set address
   CMD3
6. Select card
   CMD7 (arg address according to CMD3 response)
   **Example:**
   Arg of R6 after CMD3 is 0x0001xxxx.
   Arg of CMD7 should be 0x00010000.
7. Select 4-bit mode (optional)
   CMD52 (Write 0x07 = 0x02)
8. Enable func1
   CMD52 (Write 0x02 = 0x02)
9. Enable SDIO interrupt (required if interrupt line (DAT1) is used)
   CMD52 (Write 0x04 = 0x03)
10. Set Func0 blocksize (optional, default value is 512 (0x200))
   CMD52/53 (Read 0x10 ~ 0x11)
   CMD52/53 (Write 0x10 = 0x00)
   CMD52/53 (Write 0x11 = 0x02)
   CMD52/53 (Read 0x10 ~ 0x11, read to check the final value)

11. Set Func1 blocksize (optional, default value is 512 (0x200))
   CMD52/53 (Read 0x110 ~ 0x111)
   CMD52/53 (Write 0x110 = 0x00)
   CMD52/53 (Write 0x111 = 0x02)
   CMD52/53 (Read 0x110 ~ 0x111, read to check the final value)

ESP SDIO Slave Protocol  The ESP SDIO Slave protocol is based on the SDIO Specification's I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see ESP32-C6 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers [PDF])
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example: peripherals/sdio

The ESP Serial Slave Link component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

Slave Register Table

32-bit

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

8-bit Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers:

- 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

FIFO (Sending and Receiving)  0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

\[ \text{requested length} = 0x1F800 - \text{address} \]

The slave responds to data that has a length equal to the length field of CMD53. In cases where the data is longer than the **requested length**, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.
**Chapter 2. API Reference**

**Note:** The function number should be set to 1, and OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write or get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count = 2 (1024 bytes) to address 0x1F3F9 = 0x1F800 - **1031**.
2. Then send CMD53 in byte mode, byte count = 8 (or 7 if your controller supports that) to address 0x1F7F9 = 0x1F800 - **7**.

**Interrupts**  
SDIO interrupts are "level sensitive". For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32-C6, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

**Receiving FIFO**  
To write to the slave's receiving FIFO, the host should complete the following steps:

1. Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044). The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient (buffer_size x buffer_num is greater than the data to write, buffer_size is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to step 1 until the buffer size is sufficient.
3. Write to the FIFO address with CMD53. Note that the requested length should not exceed the length calculated at step 2, and the FIFO address is related to requested length.
4. Calculate used buffers. Note that a partially-used buffer at the tail is counted as used.

**Sending FIFO**  
To read the slave's sending FIFO, the host should complete the following steps:

1. Wait for the interrupt line to become active (optional, low by default).
2. Read (poll) the interrupt bits in the INT_ST register to monitor if new packets exist.
3. If new packets are ready, read the PKT_LEN register. Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. Read from the FIFO using CMD53. Note that the requested length should not be greater than calculated at Step 3, and the FIFO address is related to requested length.
5. Update the read length.

**ESP SPI Slave HD (Half Duplex) Mode Protocol**

<td>64</td>
<td>64</td>
<td>64</td>
</tr>
</tbody>
</table>
**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (listed by the order they should exist):

- **Command**: 8-bit, master to slave
  This phase determines the rest phases of the transactions. See *Supported Commands*.
- **Address**: 8-bit, master to slave, optional
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared register to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy**: 8-bit, floating, optional
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data**: variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The **direction** means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number (WN) used in corresponding modes:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Command WN</th>
<th>Address WN</th>
<th>Dummy cycles</th>
<th>Data WN</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>1</td>
<td>1</td>

<td>4</td>
<td>4</td>
</tr>
<tr>
<td>QIO</td>
<td>1</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it is not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

**Supported Commands**

*Note:* The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.
## Chapter 2. API Reference

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, and RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>

</tr>
</tbody>
</table>

### Segment Transaction Mode

Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave loads onto the DMA, the master is allowed to read or write in segments. In this way, the master does not have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for WRDMA and CMD8 (0x08) for RDDMA.

Here is an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA.
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave.
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave.
5. The slave loads another 4092 bytes of data onto the RDDMA.
6. The master can start new reading transactions after it sends the CMD8.

Terminology

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the `esp_serial_slave_link` component.
- **ESSL device**: A virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: A handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  - The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: The slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: A counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: A counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services Provided by ESP Slave

There are some common services provided by the Espressif slaves:

1. **Tohost Interrupts**: The slave can inform the master about certain events by the interrupt line. (optional)
2. **Frhost Interrupts**: The master can inform the slave about certain events.
3. **TX FIFO (master to slave)**: The slave can receive data from the master in units of receiving buffers.
   - The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. **RX FIFO (slave to master)**: The slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   - The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. **Shared registers**: The master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See [SDIO Slave Capabilities of Espressif Chips](http://example.com) and [SPI Slave Capabilities of Espressif Chips](http://example.com) for more details.

Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the SDMMC component. It includes the usage of communicating with ESP SDIO Slave device via the SDMMC Host or SDSPI Host feature. The ESSL device should be initialized as below:

1. Initialize a SDMMC card (see :doc:` Document of SDMMC driver </api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the SDIO interface instead.

Has not been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**To Host Interrupts (Optional)**
1. Call `essl_get_intr_ena()` to know which events trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**From Host Interrupts**
1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**
1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it tries to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

**RX FIFO**
1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it updates the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset Counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

**Application Example**

The example below shows how ESP32-C6 SDIO host and slave communicate with each other. The host uses the ESSL SDIO:

`peripherals/sdio`

Please refer to the specific example README.md for details.
API Reference

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

```c
esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)
```
Initialize the slave.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer init.

```c
esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)
```
Wait for interrupt of an ESSL slave device.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)
```
Get buffer num for the host to send data to the slave. The buffers are size of buffer_size.

**Parameters**
- **handle** -- Handle of a ESSL device.
- **out_tx_num** -- Output of buffer num that host can send data to ESSL slave.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)
```
Get the size, in bytes, of the data that the ESSL slave is ready to send

**Parameters**
- **handle** -- Handle of an ESSL device.
- **out_rx_size** -- Output of data size to read from slave, in bytes
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_reset_cnt (essl_handle_t handle)
```
Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**Parameters**
- **handle** -- Handle of an ESSL device.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.
**esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)**

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

**Parameters**
- **handle** -- Handle of an ESSL device.
- **start** -- Start address of the packet to send
- **length** -- Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not initor other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

**esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)**

Get a packet from ESSL slave.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **out_data** -- [out] Data output address
- **size** -- The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- **out_length** -- [out] Output of length the data actually received from slave.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

**esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t *value, uint8_t *value_o, uint32_t wait_ms)**

Write general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**
- **handle** -- Handle of an ESSL device.
- **addr** -- Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** -- Value to write to the register.
- **value_o** -- Output of the returned written value.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**esp_err_t essl_read_reg (essl_handle_t handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)**

Read general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.
Parameters

- **handle** -- Handle of a essl device.
- **add** -- Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see essl_spi.h
- **value_o** -- Output value read from the register.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

Parameters

- **handle** -- Handle of an ESSL device.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

```c
esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Parameters

- **handle** -- Handle of an ESSL device.
- **intr_mask** -- Mask of interrupt bits to clear.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

Parameters

- **handle** -- Handle of an ESSL device.
- **intr_raw** -- Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** -- Output of the masked interrupt bits. Set to NULL if only raw bits are read.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_INVALID_ARG: If both intr_raw and intr_st are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Parameters

- **handle** -- Handle of an ESSL device.
- **ena_mask** -- Mask of the interrupt bits to enable.
- **wait_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller
`esp_err_t` **essl_get_intr_ena**( `essl_handle_t` handle, uint32_t *ena_mask_o, uint32_t wait_ms )

Get interrupt enable bits of ESSL slave.

**Parameters**
- handle -- Handle of an ESSL device.
- ena_mask_o -- Output of interrupt bit enable mask.
- wait_ms -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_send_slave_intr**( `essl_handle_t` handle, uint32_t intr_mask, uint32_t wait_ms )

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**
- handle -- Handle of an ESSL device.
- intr_mask -- Mask of interrupt bits to send to slave.
- wait_ms -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

```
components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h
```

**Functions**

`esp_err_t` **essl_sdio_init_dev**( `essl_handle_t` *out_handle, const `essl_sdio_config_t` *config )

Initialize the ESSL SDIO device and get its handle.

**Parameters**
- out_handle -- Output of the handle.
- config -- Configuration for the ESSL SDIO device.

**Returns**
- ESP_OK: success
- ESP_ERR_NO_MEM: memory exhausted.

`esp_err_t` **essl_sdio_deinit_dev**( `essl_handle_t` handle )

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters**
- handle -- Handle of the ESSL SDIO device to deinit.

**Returns**
- ESP_OK: success
- ESP_ERR_INVALID_ARG: wrong handle passed

**Structures**

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.
Public Members

sdmmc_card_t *card

The initialized sdmmc card pointer of the slave.

int recv_buffer_size

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

`esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)`

Initialize the ESSL SPI device function list and get its handle.

Parameters

- `out_handle` -- [out] Output of the handle
- `init_config` -- Configuration for the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

`esp_err_t essl_spi_deinit_dev (essl_handle_t handle)`

Deinitialize the ESSL SPI device and free the memory used by the device.

Parameters

- `handle` -- Handle of the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

`esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)`

Read from the shared registers.

Parameters

- `arg` -- Context of the component. (Member `arg` from `essl_handle_t`)
- `addr` -- Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- `out_value` -- [out] Read buffer for the shared registers.
- `wait_ms` -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from `cpp:func:spi_device_transmit`

`esp_err_t essl_spi_get_packet (void *arg, void *out_data, size_t size, uint32_t wait_ms)`

Get a packet from Slave.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)
Chapter 2. API Reference

Parameters
- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** -- [out] Output data address
- **size** -- The size of the output data.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires `size` bytes of data but Slave did not load enough bytes.

```c
esp_err_t essl_spi_write_reg (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)
```
Write to the shared registers.

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

Parameters
- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** -- Buffer for data to send, should be align to 4.
- **out_value** -- [out] Not supported, should be set to NULL.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send `size` bytes of data but Slave did not load enough RX buffer

```c
esp_err_t essl_spi_send_packet (void *arg, const void *data, size_t size, uint32_t wait_ms)
```
Send a packet to Slave.

Parameters
- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **data** -- Address of the data to send
- **size** -- Size of the data to send.
- **wait_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send `size` bytes of data but Slave did not load enough RX buffer
void essl_spi_reset_cnt (void *arg)
Reset the counter in Master context.

Note: Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

Parameters arg -- Context of the component. (Member arg from essl_handle_t)

esp_err_t essl_spi_rdbuf (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in ISR way.

Note: The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
- spi -- SPI device handle representing the slave
- out_data -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- addr -- Address of the slave shared buffer
- len -- Length to read
- flags -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: on success
- or other return value from :cpp:func:speed_device_transmit.

esp_err_t essl_spi_rdbuf_polling (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in polling way.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
- spi -- SPI device handle representing the slave
- out_data -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- addr -- Address of the slave shared buffer
- len -- Length to read
- flags -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
- ESP_OK: on success
- or other return value from :cpp:func:speed_device_transmit.

esp_err_t essl_spi_wrbuf (spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
Write the shared buffer of the slave in ISR way.
Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Returns

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

#### esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in polling way.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Returns

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_polling_transmit`.

#### esp_err_t essl_spi_rddma(spi_device_handle_t spi, uint8_t*out_data, int len, int seg_len, uint32_t flags)

Receive long buffer in segments from the slave through its DMA.

Note: This function combines several :cpp:func:`essl_spi_rddma_seg` and one :cpp:func:`essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

### Parameters

- **spi** -- SPI device handle representing the slave
- **out_data** -- [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** -- Total length of data to receive.
- **seg_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Returns

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.
**esp_err_t essl_spi_rddma_seg** (spi_device_handle_t spi, uint8_t*out_data, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

**Parameters**
- *spi* -- SPI device handle representing the slave
- *out_data* -- [out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- *seg_len* -- Length of this segment
- *flags* -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

**esp_err_t essl_spi_rddma_done** (spi_device_handle_t spi, uint32_t flags)

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**Parameters**
- *spi* -- SPI device handle representing the slave
- *flags* -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

**esp_err_t essl_spi_wrdma** (spi_device_handle_t spi, const uint8_t*data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

**Parameters**
- *spi* -- SPI device handle representing the slave
- *data* -- Buffer for data to send, strongly suggested to be in the DRAM
- *len* -- Total length of data to send.
- *seg_len* -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- *flags* -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

**esp_err_t essl_spi_wrdma_seg** (spi_device_handle_t spi, const uint8_t*data, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

**Parameters**
- *spi* -- SPI device handle representing the slave
- *data* -- Buffer for data to send, strongly suggested to be in the DRAM
- *seg_len* -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- *flags* -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

**esp_err_t essl_spi_wrdma** (spi_device_handle_t spi, const uint8_t*data, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

**Parameters**
- *spi* -- SPI device handle representing the slave
- *data* -- Buffer for data to send, strongly suggested to be in the DRAM
- *seg_len* -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- *flags* -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.
Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len** -- Length of this segment
- **flags** -- SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

```c
int32_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

**Note:** This is required only when the slave is working in segment mode.

**Structures**

struct essl_spi_config_t

Configuration of ESSL SPI device.

**Public Members**

```c
spi_device_handle_t *spi
```

Pointer to SPI device handle.

```c
uint32_t tx_buf_size
```

The pre-negotiated Master TX buffer size used by both the host and the slave.

```c
uint8_t tx_sync_reg
```

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

```c
uint8_t rx_sync_reg
```

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.2.8 ESP x509 Certificate Bundle
Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

Note: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the gen_crt_bundle.py python utility, the certificates' subject name and public key are stored in a file and embedded in the ESP32-C6 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jan 10 04:12:06 2023 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition, it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Note: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

Configuration

Most configuration is done through menuconfig. CMake generates the bundle according to the configuration and embed it:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root certificate list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
 mbedtls_ssl_config_init(&conf);
 esp_crt_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found here

The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl.
Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey.

These authorities were then used to pick the names of the certificates for the filter list, cmn_crtAuthorities.csv, from this list provided by Mozilla.

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in Generating the List of Root Certificates.

### Application Examples

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

### API Reference

#### Header File

- components/mbedtls/esp.crt_bundle/include/esp.crt_bundle.h
- This header file can be included with:

  ```
  #include "esp.crt_bundle.h"
  ```

- This header file is a part of the API provided by the mbedtls component. To declare that your component depends on mbedtls, add the following to your CMakeLists.txt:

  ```
  REQUIRE mbedtls
  ```

  or

  ```
  PRIV_REQUIRE mbedtls
  ```

#### Functions

- `esp_err_t esp.crt_bundle_attach(void *conf)`
  
  Attach and enable use of a bundle for certificate verification.
  
  Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through esp.crt_bundle_set() it will default to the bundle defined in menuconfig and embedded in the binary.
  
  Parameters **conf** -- [in] The config struct for the SSL connection.
  
  Returns
  
  - ESP_OK if adding certificates was successful.
  - Other if an error occurred or an action must be taken by the calling process.

- `void esp.crt_bundle_detach(mbedtls_ssl_config *conf)`
  
  Disable and dealloc the certification bundle.
  
  Removes the certificate verification callback and deallocates used resources
  
  Parameters **conf** -- [in] The config struct for the SSL connection.
**esp_err_t esp_crt_bundle_set** (const uint8_t *x509_bundle, size_t bundle_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**Parameters**
- **x509_bundle** -- [in] A pointer to the certificate bundle.
- **bundle_size** -- [in] Size of the certificate bundle in bytes.

**Returns**
- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

## 2.2.9 HTTP Server

### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C6. Following are detailed steps to use the API exposed by HTTP Server:

- **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task closes all open connections, removes registered URI handlers and resets all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri` name, `method` type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), `function` pointer of type `esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

### Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. */
    * httpd_req_recv() accepts char* only, but content could
    * as well be any binary data (needs type casting).
    * In case of string data, null termination will be absent, and
    (continues on next page)
```
/* content length would give length of string */
char content[100];

/* Truncate if content length larger than the buffer */
size_t recv_size = MIN(req->content_len, sizeof(content));

int ret = httpd_req_recv(req, content, recv_size);
if (ret <= 0) {    /* 0 return value indicates connection closed */
    /* Check if timeout occurred */
    if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
        /* In case of timeout one can choose to retry calling
        * httpd_req_recv(), but to keep it simple, here we
        * respond with an HTTP 408 (Request Timeout) error */
        httpd_resp_send_408(req);
    }
    /* In case of error, returning ESP_FAIL will
    * ensure that the underlying socket is closed */
    return ESP_FAIL;
}

/* Send a simple response */
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
   .uri = "/uri",
   .method = HTTP_GET,
   .handler = get_handler,
   .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
   .uri = "/uri",
   .method = HTTP_POST,
   .handler = post_handler,
   .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    } /* If server failed to start, handle will be NULL */
    return server;
}
/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP Server Example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE));  /* Pointer to context data */
        req->free_ctx = free_ctx_func;  /* Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* Respond */
    ................
    ................
    return ESP_OK;
}

Check the example under protocols/http_server/persistent_sockets.

Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the CONFIG_HTTPD_WS_SUPPORT option. Please refer to the protocols/http_server/ws_echo_server example which demonstrates usage of the websocket feature.
Event Handling

ESP HTTP server has various events for which a handler can be triggered by the Event Loop library when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP server.

`esp_http_server_event_id_t` has all the events which can happen for ESP HTTP server.

Expected data type for different ESP HTTP server events in event loop:

- **HTTP_SERVER_EVENT_ERROR**: `httpd_err_code_t`
- **HTTP_SERVER_EVENT_START**: `NULL`
- **HTTP_SERVER_EVENT_ON_CONNECTED**: `int`
- **HTTP_SERVER_EVENT_ON_HEADER**: `int`
- **HTTP_SERVER_EVENT_HEADERS_SENT**: `int`
- **HTTP_SERVER_EVENT_ON_DATA**: `esp_http_server_event_data`
- **HTTP_SERVER_EVENT_SENT_DATA**: `esp_http_server_event_data`
- **HTTP_SERVER_EVENT_DISCONNECTED**: `int`
- **HTTP_SERVER_EVENT_STOP**: `NULL`

API Reference

Header File

- `components/esp_http_server/include/esp_http_server.h`

This header file can be included with:

```c
#include "esp_http_server.h"
```

This header file is a part of the API provided by the `esp_http_server` component. To declare that your component depends on `esp_http_server`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES esp_http_server
```

or

```cmake
PRIV_REQUIRES esp_http_server
```

Functions

`esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req) {
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}
```

(continues on next page)
// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

Note: URI handlers can be registered in real time as long as the server handle is valid.

**Parameters**
- **handle** -- [in] handle to HTTPD server instance
- **uri_handler** -- [in] pointer to handler that needs to be registered

**Returns**
- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

```c
esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)
```

Unregister a URI handler.

**Parameters**
- **handle** -- [in] handle to HTTPD server instance
- **uri** -- [in] URI string
- **method** -- [in] HTTP method

**Returns**
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

```c
esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char *uri)
```

Unregister all URI handlers with the specified uri string.

**Parameters**
- **handle** -- [in] handle to HTTPD server instance
- **uri** -- [in] uri string specifying all handlers that need to be deregistered

**Returns**
- ESP_OK: On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: No handler registered with specified uri string

```c
esp_err_t httpd_sess_set_recv_override(httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)
```

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.
Note: This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Parameters
• hd -- [in] HTTPD instance handle
• sockfd -- [in] Session socket FD
• recv_func -- [in] The receive function to be set for this session

Returns
• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

```c
esp_err_t httpd_sess_set_send_override(httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)
```

Override web server's send function (by session FD)
This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

Note: This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Parameters
• hd -- [in] HTTPD instance handle
• sockfd -- [in] Session socket FD
• send_func -- [in] The send function to be set for this session

Returns
• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

```c
esp_err_t httpd_sess_set_pending_override(httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
```

Override web server's pending function (by session FD)
This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

Note: This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Parameters
• hd -- [in] HTTPD instance handle
• sockfd -- [in] Session socket FD
• pending_func -- [in] The receive function to be set for this session

Returns
• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments
### httpd_req_async_handler_begin

**Declaration**: `esp_err_t httpd_req_async_handler_begin(httpd_req_t *r, httpd_req_t **out)`

Start an asynchronous request. This function can be called in a request handler to get a request copy that can be used on an async thread.

**Note:**
- This function is necessary in order to handle multiple requests simultaneously. See examples/async_requests for example usage.
- You must call `httpd_req_async_handler_complete()` when you are done with the request.

**Parameters**
- `r` -- [in] The request to create an async copy of
- `out` -- [out] A newly allocated request which can be used on an async thread

**Returns**
- ESP_OK: async request object created

### httpd_req_async_handler_complete

**Declaration**: `esp_err_t httpd_req_async_handler_complete(httpd_req_t *r)`

Mark an asynchronous request as completed. This will.

- free the request memory
- relinquish ownership of the underlying socket, so it can be reused.
- allow the http server to close our socket if needed (lru_purge_enable)

**Note:** If async requests are not marked completed, eventually the server will no longer accept incoming connections. The server will log a "httpd_accept_conn: error in accept (23)" message if this happens.

**Parameters**
- `r` -- [in] The request to mark async work as completed

**Returns**
- ESP_OK: async request was marked completed

### httpd_req_to_sockfd

**Declaration**: `int httpd_req_to_sockfd(httpd_req_t *r)`

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, i.e.: `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note:** This API is supposed to be called only from the context of a URI handler where `httpd_req_t`* request pointer is valid.

**Parameters**
- `r` -- [in] The request whose socket descriptor should be found

**Returns**
- Socket descriptor: The socket descriptor for this request
- -1 : Invalid/NULL request pointer

### httpd_req_recv

**Declaration**: `int httpd_req_recv(httpd_req_t *r, char *buf, size_t buf_len)`

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching `buf_len` number of bytes, while the pointer to content data is incremented internally by the same number.
Chapter 2. API Reference

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

Parameters
- \texttt{r} -- [in] The request being responded to
- \texttt{buf} -- [in] Pointer to a buffer that the data will be read into
- \texttt{buf_len} -- [in] Length of the buffer

Returns
- Bytes: Number of bytes read into the buffer successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv() 
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

\textbf{size_t \texttt{httpd}\_req\_get\_hdr\_value\_len}} (\texttt{httpd}\_req\_t *\textit{r}, const char *\textit{field})
Search for a field in request headers and return the string length of it's value.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once \texttt{httpd_resp_send()} API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters
- \texttt{r} -- [in] The request being responded to
- \texttt{field} -- [in] The header field to be searched in the request

Returns
- Length: If field is found in the request URL
- Zero: Field not found / Invalid request / Null arguments

\textbf{esp\_err\_t \texttt{httpd}\_req\_get\_hdr\_value\_str}} (\texttt{httpd}\_req\_t *\textit{r}, const char *\textit{field}, char *\textit{val}, size\_t \textit{val\_size})
Get the value string of a field from the request headers.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once \texttt{httpd_resp_send()} API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use \texttt{httpd_req_get_hdr_value_len()} to know the right buffer length

Parameters
- \texttt{r} -- [in] The request being responded to
- \texttt{field} -- [in] The field to be searched in the header
- \texttt{val} -- [out] Pointer to the buffer into which the value will be copied if the field is found
- \texttt{val\_size} -- [in] Size of the user buffer "val"
Returns

- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

size_t httpd_req_get_url_query_len(httpd_req_t *r)

Get Query string length from the request URL.

Note: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Parameters  

r -- [in] The request being responded to

Returns

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)

Get Query string from the request URL.

Note:

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Parameters

- r -- [in] The request being responded to
- buf -- [out] Pointer to the buffer into which the query string will be copied (if found)
- buf_len -- [in] Length of output buffer

Returns

- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

esp_err_t httpd_query_key_value(const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

Note:

- The components of URL query string (keys and values) are not URL decoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
Chapter 2. API Reference

- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Parameters
- `qry` -- [in] Pointer to query string
- `key` -- [in] The key to be searched in the query string
- `val` -- [out] Pointer to the buffer into which the value will be copied if the key is found
- `val_size` -- [in] Size of the user buffer "val"

Returns
- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

```c
esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char*cookie_name, char*val, size_t *val_size)
```

Get the value string of a cookie value from the "Cookie" request headers by cookie name.

Parameters
- `req` -- [in] Pointer to the HTTP request
- `cookie_name` -- [in] The cookie name to be searched in the request
- `val` -- [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- `val_size` -- [inout] Pointer to size of the user buffer "val". This variable will contain cookie length if ESP_OK is returned and required buffer length in case ESP_ERR_HTTPD_RESULT_TRUNC is returned.

Returns
- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

```c
bool httpd_uri_matchWildcard(const char*uri_template, const char*uri_to_match, size_t match_upto)
```

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "*" for a wildcard match, and "?*" to make the previous character optional, and if present, allow anything to follow.

Example:
- "*" matches everything
- "/foo/" matches /foo and /foo/
- "/foo/*" (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- "/foo/?" or "/foo/*/" (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters "/?" and "*/" anywhere else in the template will be taken literally.

Parameters
- `uri_template` -- [in] URI template (pattern)
- `uri_to_match` -- [in] URI to be matched
- `match_upto` -- [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

Returns true if a match was found

```c
esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk().
instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- `httpd_resp_set_status()` - for setting the HTTP status string
- `httpd_resp_set_type()` - for setting the Content Type
- `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

### Parameters

- `r` -- [in] The request being responded to
- `buf` -- [in] Buffer from where the content is to be fetched
- `buf_len` -- [in] Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

### Returns

- `ESP_OK`: On successfully sending the response packet
- `ESP_ERR_INVALID_ARG`: Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR`: Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND`: Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ`: Invalid request

```c
esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- `httpd_resp_set_status()` - for setting the HTTP status string
- `httpd_resp_set_type()` - for setting the Content Type
- `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

### Parameters

- `r` -- [in] The request being responded to
- `buf` -- [in] Pointer to a buffer that stores the data
- `buf_len` -- [in] Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

### Returns

- `ESP_OK`: On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG`: Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR`: Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND`: Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ`: Invalid request pointer
static inline esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

Parameters
- \texttt{r} -- [in] The request being responded to
- \texttt{str} -- [in] String to be sent as response body

Returns
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

static inline esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

Parameters
- \texttt{r} -- [in] The request being responded to
- \texttt{str} -- [in] String to be sent as response body (NULL to finish response packet)

Returns
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the '200 OK' response is sent as the response.

Note:
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

Parameters
- \texttt{r} -- [in] The request being responded to
- \texttt{status} -- [in] The HTTP status code of this response

Returns
- ESP_OK: On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)

API to set the HTTP content type.

This API sets the 'Content Type' field of the response. The default content type is 'text/html'.

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the type string is valid till send function is called.

Parameters
• r -- [in] The request being responded to
• type -- [in] The Content Type of the response

Returns
• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• The header isn’t sent out until any of the send APIs is executed.
• The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
• Make sure that the lifetime of the field value strings are valid till send function is called.

Parameters
• r -- [in] The request being responded to
• field -- [in] The field name of the HTTP header
• value -- [in] The value of this HTTP header

Returns
• ESP_OK : On successfully appending new header
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)

For sending out error code in response to HTTP request.

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Parameters
• req -- [in] Pointer to the HTTP request for which the response needs to be sent
• error -- [in] Error type to send
• msg -- [in] Error message string (pass NULL for default message)

Returns
Chapter 2. API Reference

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline esp_err_t httpd_resp_send_404 (httpd_req_t *r)
Helper function for HTTP 404.
Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters  r -- [in] The request being responded to
Returns
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline esp_err_t httpd_resp_send_408 (httpd_req_t *r)
Helper function for HTTP 408.
Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters  r -- [in] The request being responded to
Returns
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline esp_err_t httpd_resp_send_500 (httpd_req_t *r)
Helper function for HTTP 500.
Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
Parameters \( r \) -- \([\text{in}]\) The request being responded to

Returns
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

int \texttt{httpd\_send}(\texttt{httpd\_req\_t} *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, e.g. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note:
- This API is supposed to be called only from the context of a URI handler where \texttt{httpd\_req\_t} request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : \texttt{httpd\_resp\_send()}, \texttt{httpd\_resp\_send\_chunk()}

Parameters
- \( r \) -- \([\text{in}]\) The request being responded to
- \( \texttt{buf} \) -- \([\text{in}]\) Buffer from where the fully constructed packet is to be read
- \( \texttt{buf\_len} \) -- \([\text{in}]\) Length of the buffer

Returns
- Bytes : Number of bytes that were sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket send()

int \texttt{httpd\_socket\_send}(\texttt{httpd\_handle\_t} hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by \texttt{httpd\_sess\_set\_send\_override()}.

Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

Parameters
- \( \texttt{hd} \) -- \([\text{in}]\) server instance
- \( \texttt{sockfd} \) -- \([\text{in}]\) session socket file descriptor
- \( \texttt{buf} \) -- \([\text{in}]\) buffer with bytes to send
- \( \texttt{buf\_len} \) -- \([\text{in}]\) data size
- \( \texttt{flags} \) -- \([\text{in}]\) flags for the send() function

Returns
- Bytes : The number of bytes sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
**Chapter 2. API Reference**

- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socketsend()

```c
int httpd_socket_recv(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

A low level API to receive data from a given socket.

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Parameters**
- `hd` -- [in] server instance
- `sockfd` -- [in] session socket file descriptor
- `buf` -- [in] buffer with bytes to send
- `buf_len` -- [in] data size
- `flags` -- [in] flags for the send() function

**Returns**
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

```c
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

**Parameters**
- `handle` -- [in] HTTP server handle
- `error` -- [in] Error type
- `handler_fn` -- [in] User implemented handler function (Pass NULL to unset any previously set handler)

**Returns**
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
//Function for starting the webserver
httpd_handle_t start_webserver(void) {
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {

    }
```

(continues on next page)
### API Reference

**// Register URI handlers**

```c
httpd_register_uri_handler(server, &uri_get);
httpd_register_uri_handler(server, &uri_post);
}
// If server failed to start, handle will be NULL
return server;
```

#### Parameters
- **config** -- [in] Configuration for new instance of the server
- **handle** -- [out] Handle to newly created instance of the server. NULL on error

#### Returns
- ESP_OK: Instance created successfully
- ESP_ERR_INVALID_ARG: Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK: Failed to launch server task

**esp_err_t httpd_stop(httpd_handle_t handle)**

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
// Ensure handle is non NULL
if (server != NULL) {
// Stop the httpd server
    httpd_stop(server);
}
}
```

#### Parameters
- **handle** -- [in] Handle to server returned by httpd_start

#### Returns
- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Handle argument is null

**esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)**

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

---

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

#### Parameters
- **handle** -- [in] Handle to server returned by httpd_start
- **work** -- [in] Pointer to the function to be executed in the HTTPD's context
- **arg** -- [in] Pointer to the arguments that should be passed to this function

#### Returns
- ESP_OK: On successfully queueing the work
- ESP_FAIL: Failure in control socket
- ESP_ERR_INVALID_ARG: Null arguments
void **httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor for which the context should be extracted.

**Returns**
- **void**: Pointer to the context associated with this session
- **NULL**: Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session context by socket descriptor.

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor for which the context should be extracted.
- **ctx** -- [in] Context object to assign to the session
- **free_fn** -- [in] Function that should be called to free the context

void **httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See also:
httpd_sess_get_ctx()

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor for which the context should be extracted.

**Returns**
- **void**: Pointer to the transport context associated with this session
- **NULL**: Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session 'transport' context by socket descriptor.

See also:
httpd_sess_set_ctx()

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor for which the context should be extracted.
- **ctx** -- [in] Transport context object to assign to the session
- **free_fn** -- [in] Function that should be called to free the transport context

void *httpd_get_global_user_ctx(httpd_handle_t handle)
Get HTTPD global user context (it was set in the server config struct)

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start

**Returns**
global user context
**httpd_get_global_transport_ctx** (*httpd_handle_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start

**Returns**
- global transport context

**esp_err_t** **httpd_sess_trigger_close** (*httpd_handle_t* handle, int sockfd)

Trigger an httpd session close externally.

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor of the session to be closed

**Returns**
- ESP_OK: On successfully initiating closure
- ESP_FAIL: Failure to queue work
- ESP_ERR_NOT_FOUND: Socket fd not found
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t** **httpd_sess_update_lru_counter** (*httpd_handle_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Parameters**
- **handle** -- [in] Handle to server returned by httpd_start
- **sockfd** -- [in] The socket descriptor of the session for which LRU counter is to be updated

**Returns**
- ESP_OK: Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND: Socket not found
- ESP_ERR_INVALID_ARG: Null arguments

**esp_err_t** **httpd_get_client_list** (*httpd_handle_t* handle, size_t*fds, int*client_fds)

Returns list of current socket descriptors of active sessions.

**Note:** Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.
Returns

- ESP_OK: Successfully retrieved session list
- ESP_ERR_INVALID_ARG: Wrong arguments or list is longer than provided array

Structures

struct esp_http_server_event_data

Argument structure for HTTP_SERVER_EVENT_ON_DATA and HTTP_SERVER_EVENT_SENT_DATA event

Public Members

int fd
Session socket file descriptor

int data_len
Data length

struct httpd_config

HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned task_priority
Priority of FreeRTOS task which runs the server

size_t stack_size
The maximum stack size allowed for the server task

BaseType_t core_id
The core the HTTP server task will run on

uint16_t server_port
TCP Port number for receiving and transmitting HTTP traffic

uint16_t ctrl_port
UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t max_open_sockets
Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16_t max_uri_handlers
Maximum allowed uri handlers
uint16_t max_resp_headers
Maximum allowed additional headers in HTTP response

uint16_t backlog_conn
Number of backlog connections

bool lru_purge_enable
Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
Timeout for recv function (in seconds)

uint16_t send_wait_timeout
Timeout for send function (in seconds)

void *global_user_ctx
Global user context.
This field can be used to store arbitrary user data within the server context. The value can be retrieved
using the server handle, available e.g. in the httpd_req_t struct.
When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.
If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
Free function for global user context

void *global_transport_ctx
Global transport context.
Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It
will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
Free function for global transport context

bool enable_so_linger
bool to enable/disable linger

int linger_timeout
linger timeout (in seconds)

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)
int `keep_alive_count`

Keep-alive packet retry send count. Default is 3 counts

`httpd_open_func_t open_fn`

Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than ESP_OK will immediately close the new socket.

`httpd_close_func_t close_fn`

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket.

This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

`httpd_uri_match_func_t uri_match_fn`

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strncpy()` 2) `httpd_uri_matchWildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct `httpd_req`

HTTP Request Data Structure.

**Public Members**

`httpd_handle_t handle`

Handle to server instance

int `method`

The type of HTTP request, -1 if unsupported method

const char `uri[HTTPD_MAX_URI_LEN + 1]`

The URI of this request (1 byte extra for null termination)
size_t content_len
   Length of the request body

void *aux
   Internally used members

void *user_ctx
   User context pointer passed during URI registration.

void *sess_ctx
   Session Context Pointer
   A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One
   session could have multiple request responses. The web server will ensure that the context persists across
   all these request and responses.
   By default, this is NULL. URI Handlers can set this to any meaningful value.
   If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context
   by calling free(), unless free_ctx function is set.

httpd_free_ctx_fn_t free_ctx
   Pointer to free context hook
   Function to free session context
   If the web server's socket closes, it frees up the session context by calling free() on the sess_ctx member.
   If you wish to use a custom function for freeing the session context, please specify that here.

bool ignore_sess_ctx_changes
   Flag indicating if Session Context changes should be ignored
   By default, if you change the sess_ctx in some URI handler, the http server will internally free the
   earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform
   any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the
   socket gets closed.

struct httpd_uri
   Structure for URI handler.

   Public Members

const char *uri
   The URI to handle

httpd_method_t method
   Method supported by the URI

esp_err_t (*handler)(httpd_req_t *r)
   Handler to call for supported request method. This must return ESP_OK, or else the underlying socket
   will be closed.
void *user_ctx

Pointer to user context data which will be available to handler

**Macros**

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD_SOCK_ERR_FAIL

HTTPD_SOCK_ERR_INVALID

HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200

HTTP Response 200

HTTPD_204

HTTP Response 204

HTTPD_207

HTTP Response 207

HTTPD_400

HTTP Response 400

HTTPD_404

HTTP Response 404

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML

HTTPD_TYPE_OCTET

HTTP Content type octet-stream

ESP_HTTPD_DEF_CTRL_PORT

HTTP Server control socket port

HTTPD_DEFAULT_CONFIG()
Chapter 2. API Reference

ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions

typedef struct httpd_req httpd_req_t
    HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
    Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
    Prototype for HTTPDs low-level send function.

Note: User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_codes, which will eventually be conveyed as return value of httpd_send() function

Param hd [in] server instance
Param sockfd [in] session socket file descriptor
Param buf [in] buffer with bytes to send
Param buf_len [in] data size
Param flags [in] flags for the send() function
Return
Chapter 2. API Reference

- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level recv function.

Note: User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

Param hd [in] server instance
Param sockfd [in] session socket file descriptor
Param buf [in] buffer with bytes to send
Param buf_len [in] data size
Param flags [in] flags for the send() function

Return
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPDs low-level "get pending bytes" function.

Note: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Param hd [in] server instance
Param sockfd [in] session socket file descriptor

Return
- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.
This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note:
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

**Param req** [in] HTTP request for which the error needs to be handled

**Param error** [in] Error type

**Return**
- ESP_OK: error handled successful
- ESP_FAIL: failure indicates that the underlying socket needs to be closed

```c
typedef void *httpd_handle_t
HTTP Server Instance Handle.
Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.

typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)

**Param ctx** [in] object to free

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param hd** [in] server instance

**Param sockfd** [in] session socket file descriptor

**Return**
- ESP_OK: On success
- Any value other than ESP_OK will signal the server to close the socket immediately

```c
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for closing a session.
	note: It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

```c

**Param hd** [in] server instance

**Param sockfd** [in] session socket file descriptor

typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
Function prototype for URI matching.

**Param reference_uri** [in] URI/template with respect to which the other URI is matched

**Param uri_to_match** [in] URI/template being matched to the reference URI/template

**Param match_upto** [in] For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

**Return** true on match
typedef struct httpd_config httpd_config_t
    HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)
Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

Param arg [in] The arguments for this work function

Enumerations
enum httpd_err_code_t
    Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.
    Values:

enumerator HTTPD_500_INTERNAL_SERVER_ERROR
enumerator HTTPD_501_METHOD_NOT_IMPLEMENTED
enumerator HTTPD_505_VERSION_NOT_SUPPORTED
enumerator HTTPD_400_BAD_REQUEST
enumerator HTTPD_401_UNAUTHORIZED
enumerator HTTPD_403_FORBIDDEN
enumerator HTTPD_404_NOT_FOUND
enumerator HTTPD_405_METHOD_NOT_ALLOWED
enumerator HTTPD_408_REQ_TIMEOUT
enumerator HTTPD_411_LENGTH_REQUIRED
enumerator HTTPD_414_URI_TOO_LONG
enumerator HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
enumerator HTTPD_ERR_CODE_MAX

enum esp_http_server_event_id_t
    HTTP Server events id.
    Values:
Chapter 2. API Reference

enumerator HTTP_SERVER_EVENT_ERROR
This event occurs when there are any errors during execution

enumerator HTTP_SERVER_EVENT_START
This event occurs when HTTP Server is started

enumerator HTTP_SERVER_EVENT_ON_CONNECTED
Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator HTTP_SERVER_EVENT_ON_HEADER
Occurs when receiving each header sent from the client

enumerator HTTP_SERVER_EVENT_HEADERS_SENT
After sending all the headers to the client

enumerator HTTP_SERVER_EVENT_ON_DATA
Occurs when receiving data from the client

enumerator HTTP_SERVER_EVENT_SENT_DATA
Occurs when an ESP HTTP server session is finished

enumerator HTTP_SERVER_EVENT_DISCONNECTED
The connection has been disconnected

enumerator HTTP_SERVER_EVENT_STOP
This event occurs when HTTP Server is stopped

2.2.10 HTTPS Server

Overview
This component is built on top of HTTP Server. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for HTTP Server applies also to a server you create this way.

Used APIs
The following APIs of HTTP Server should not be used with HTTPS Server, as they are used internally to handle secure sessions and to maintain internal state:

- "send", "receive" and "pending" callback registration functions - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()

- "transport context" - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx() - returns the shared SSL context
Chapter 2. API Reference

- `httpd_config::global_transport_ctx`
- `httpd_config::global_transport_ctx_free_fn`
- `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

**Usage**

Please see the example `protocols/https_server` to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

**Performance**

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

**API Reference**

**Header File**

- `components/esp_https_server/include/esp_https_server.h`

This header file can be included with:

```c
#include "esp_https_server.h"
```

This header file is a part of the API provided by the `esp_https_server` component. To declare that your component depends on `esp_https_server`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_https_server
```

or

```cmake
PRIV_REQUIRES esp_https_server
```

**Functions**

`esp_err_t httpd_ssl_start (httpd_handle_t *handle, httpd_ssl_config_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Parameters**

- `config` -- [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- `handle` -- [out] - storage for the server handle, must be a valid pointer

**Returns**

- success

`esp_err_t httpd_ssl_stop (httpd_handle_t handle)`

Stop the server. Blocks until the server is shut down.

**Parameters**

- `handle` -- [in]

**Returns**

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server
Structures

struct esp_https_server_user_cb_arg
Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

Public Members

httpd_ssl_user_cb_state_t user_cb_state
State of user callback

esp_tls_t *tls
ESP-TLS connection handle

struct httpd_ssl_config
HTTPS server config struct
Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

httpd_config_t httpd
Underlying HTTPD server config
Parameters like task stack size and priority can be adjusted here.

const uint8_t *servercert
Server certificate

size_t servercert_len
Server certificate byte length

const uint8_t *cacert_pem
CA certificate ((CA used to sign clients, or client cert itself)

size_t cacert_len
CA certificate byte length

const uint8_t *prvtkey_pem
Private key

size_t prvtkey_len
Private key byte length

bool use_ecdsa_peripheral
Use ECDSA peripheral to use private key

uint8_t ecdsa_key_efuse_blk
The efuse block where ECDSA key is stored
Chapter 2. API Reference

**httpd_ssl_transport_mode_t** `transport_mode`

Transport Mode (default secure)

`uint16_t` `port_secure`

Port used when transport mode is secure (default 443)

`uint16_t` `port_insecure`

Port used when transport mode is insecure (default 80)

`bool` `session_tickets`

Enable tls session tickets

`bool` `use_secure_element`

Enable secure element for server session

`esp_https_server_user_cb *user_cb`

User callback for esp_https_server

`void *ssl_userdata`

User data to add to the ssl context

`esp_tls_handshake_callback cert_select_cb`

Certificate selection callback to use

`const char **alpn_protos`

Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself!

**Macros**

`HTTPD_SSL_CONFIG_DEFAULT()`

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- Port is set when starting the server, according to 'transport_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

**Type Definitions**

typedef struct `esp_https_server_user_cb_arg` `esp_https_server_user_cb_arg_t`

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef void `esp_https_server_user_cb` `(esp_https_server_user_cb_arg_t *user_cb)`

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

**Param user_cb** Callback data struct
typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations

enum httpd_ssl_transport_mode_t

Values:

enumerator HTTPD_SSL_TRANSPORT_SECURE

enumerator HTTPD_SSL_TRANSPORT_INSECURE

enum httpd_ssl_user_cb_state_t

Indicates the state at which the user callback is executed, i.e at session creation or session close.

Values:

enumerator HTTPD_SSL_USER_CB_SESS_CREATE

enumerator HTTPD_SSL_USER_CB_SESS_CLOSE

2.2.11 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g., packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending or parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a New Ping Session  To create a ping session, you need to fill in the esp_ping_config_t configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the esp_ping_callbacks_t structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on.ping.success(esp ping.handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
}
```

(continues on next page)
typedef struct ip_addr
ip_addr_t target_addr;

esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n", recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct sockaddr_in addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;        // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;   // ping in infinite mode, esp_ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
}
cbs.cb_args = "foo"; // arguments that feeds to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop Ping Session You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session does not start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a Ping Session If a ping session will not be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e., you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get Runtime Statistics As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File

- components/lwip/include/apps/ping/ping_sock.h
- This header file can be included with:

```c
#include "ping/ping_sock.h"
```

- This header file is a part of the API provided by the lwip component. To declare that your component depends on lwip, add the following to your CMakeLists.txt:

```c
REQUIRES lwip
```

or

```c
PRIV_REQUIRES lwip
```

Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t *config`, const `esp_ping_callbacks_t *cbs`, `esp_ping_handle_t *hdl_out`)

Create a ping session.

Parameters

- `config` -- ping configuration
- `cbs` -- a bunch of callback functions invoked by internal ping task
- `hdl_out` -- handle of ping session

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
• ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

```c
esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)
```
Delete a ping session.

**Parameters**
- **hdl** -- handle of ping session

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

```c
esp_err_t esp_ping_start(esp_ping_handle_t hdl)
```
Start the ping session.

**Parameters**
- **hdl** -- handle of ping session

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

```c
esp_err_t esp_ping_stop(esp_ping_handle_t hdl)
```
Stop the ping session.

**Parameters**
- **hdl** -- handle of ping session

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

```c
esp_err_t esp_ping_get_profile(esp_ping_handle_t hdl, esp_ping_profile_t profile, void* data, uint32_t size)
```
Get runtime profile of ping session.

**Parameters**
- **hdl** -- handle of ping session
- **profile** -- type of profile
- **data** -- profile data
- **size** -- profile data size

**Returns**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn't match the “size” parameter
- ESP_OK: get profile successfully

**Structures**

```c
typedef struct esp_ping_callbacks_t
```
Type of "ping" callback functions.

```
  void* cb_args
  arguments for callback functions

  void (*on_ping_success)(esp_ping_handle_t hdl, void* args)
  Invoked by internal ping thread when received ICMP echo reply packet.

  void (*on_ping_timeout)(esp_ping_handle_t hdl, void* args)
  Invoked by internal ping thread when receive ICMP echo reply packet timeout.
```
void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
Type of "ping" configuration.

Public Members

uint32_t count
A "ping" session contains count procedures

uint32_t interval_ms
Milliseconds between each ping procedure

uint32_t timeout_ms
Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
Size of the data next to ICMP packet header

int tos
Type of Service, a field specified in the IP header

int ttl
Time to Live, a field specified in the IP header

ip_addr_t target_addr
Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
Stack size of internal ping task

uint32_t task_prio
Priority of internal ping task

uint32_t interface
Netif index, interface=0 means NETIF_NO_INDEX

Macros
ESP_PING_DEFAULT_CONFIG()
Default ping configuration.

ESP_PING_COUNT_INFINITE
Set ping count to zero will ping target infinitely

Type Definitions
typedef void *esp_ping_handle_t
Type of "ping" session handle.
Enumerations

enum esp_ping_profile_t
Profile of ping session.

Values:

enumerator ESP_PING_PROF_SEQNO
Sequence number of a ping procedure

enumerator ESP_PING_PROF_TOS
Type of service of a ping procedure

enumerator ESP_PING_PROF_TTL
Time to live of a ping procedure

enumerator ESP_PING_PROF_REQUEST
Number of request packets sent out

enumerator ESP_PING_PROF_REPLY
Number of reply packets received

enumerator ESP_PING_PROF_IPADDR
IP address of replied target

enumerator ESP_PING_PROF_SIZE
Size of received packet

enumerator ESP_PING_PROF_TIMEGAP
Elapsed time between request and reply packet

enumerator ESP_PING_PROF_DURATION
Elapsed time of the whole ping session

2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
The ESP-IDF component mDNS has been moved from ESP-IDF since version v5.0 to a separate repository:

• mDNS component on GitHub

To add mDNS component in your project, please run idf.py add-dependency espressif/mdns.

Hosted Documentation

The documentation can be found on the link below:

• mDNS documentation
2.2.13 Mbed TLS

Mbed TLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

Note: ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like bignum (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

Supported TLS versions include SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, and TLS 1.3, but on the latest ESP-IDF, SSL 3.0, TLS 1.0, and TLS 1.1 have been removed from Mbed TLS. Supported DTLS versions include DTLS 1.0, DTLS 1.1, and DTLS 1.2, but on the latest ESP-IDF, DTLS 1.0 has been removed from Mbed TLS.

Mbed TLS Documentation

For Mbed TLS documentation please refer to the following (upstream) pointers:

- API Reference
- Knowledge Base

Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions presented in different branches of ESP-IDF here.

Note: Please refer the Mbed TLS to migrate from Mbed TLS version 2.x to version 3.0 or greater.

Application Examples

Examples in ESP-IDF use ESP-TLS which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples protocols/https_server/simple (Simple HTTPS server) and protocols/https_request (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example protocols/https_mbedtls.

Alternatives

ESP-TLS acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to ESP-TLS: Underlying SSL/TLS Library Options docs for more information on this and comparison of Mbed TLS and wolfSSL.
Important Config Options

Following is a brief list of important config options accessible at Component Config -> mbedTLS. The full list of config options can be found here.

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: ESP x509 Certificate Bundle)
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration
- `CONFIG_MBEDTLS_HARDWARE_ECC`: Support for hardware ECC acceleration

Note: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1, and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage

The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

<table>
<thead>
<tr>
<th>Mbed TLS Test</th>
<th>Related Configs</th>
<th>Heap Usage (approx.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>NA</td>
<td>42196 B</td>
</tr>
<tr>
<td>Enable SSL Variable Length</td>
<td><code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code></td>
<td>42120 B</td>
</tr>
<tr>
<td>Disable Keep Peer Certificate</td>
<td><code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code></td>
<td>38533 B</td>
</tr>
<tr>
<td>Enable Dynamic TX/RX Buffer</td>
<td><code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</code></td>
<td>22013 B</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size

Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in Minimizing Binary Size docs.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

Macros

ESP_BLUEDROID_STATUS_CHECK (status)

ESP_BT_STATUS_BASE_FOR_HCI_ERR
**ESP_BT_OCTET16_LEN**

**ESP_BT_OCTET8_LEN**

**ESP_DEFAULT_GATT_IF**
Default GATT interface id.

**ESP_BLE_PRIM_ADV_INT_MIN**
Minimum advertising interval for undirected and low duty cycle directed advertising

**ESP_BLE_PRIM_ADV_INT_MAX**
Maximum advertising interval for undirected and low duty cycle directed advertising

**ESP_BLE_CONN_INT_MIN**
relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

**ESP_BLE_CONN_INT_MAX**
relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

**ESP_BLE_CONN_LATENCY_MAX**
relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

**ESP_BLE_CONN_SUP_TOUT_MIN**
relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

**ESP_BLE_CONN_SUP_TOUT_MAX**
relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

**ESP_BLE_IS_VALID_PARAM**(x, min, max)
Check the param is valid or not.

**ESP_UUID_LEN_16**

**ESP_UUID_LEN_32**

**ESP_UUID_LEN_128**

**ESP_BD_ADDR_LEN**
Bluetooth address length.

**ESP_BLE_ENC_KEY_MASK**
Used to exchange the encryption key in the init key & response key.

**ESP_BLE_ID_KEY_MASK**
Used to exchange the IRK key in the init key & response key.

**ESP_BLE_CSR_KEY_MASK**
Used to exchange the CSRK key in the init key & response key.
**ESP_BLE_LINK_KEY_MASK**

Used to exchange the link key (this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP_APP_ID_MIN**

Minimum of the application id.

**ESP_APP_ID_MAX**

Maximum of the application id.

**ESP_BD_ADDR_STR**

**ESP_BD_ADDR_HEX** (addr)

### Type Definitions

typedef uint8_t esp_bt_octet16_t [ESP_BT_OCTET16_LEN]

typedef uint8_t esp_bt_octet8_t [ESP_BT_OCTET8_LEN]

typedef uint8_t esp_link_key [ESP_BT_OCTET16_LEN]

typedef uint8_t esp_bd_addr_t [ESP_BD_ADDR_LEN]

   Bluetooth device address.

typedef uint8_t esp_ble_key_mask_t

### Enumerations

enum esp_bt_status_t

   Status Return Value.

   **Values:**

   enumerator ESP_BT_STATUS_SUCCESS

   enumerator ESP_BT_STATUS_FAIL

   enumerator ESP_BT_STATUS_NOT_READY

   enumerator ESP_BT_STATUS_NOMEM

enumerator ESP_BT_STATUS_HCI_CONN_FAILED_EStABLISHMENT
enumerator ESP_BT_STATUS_HCI_MAC_CONNECTION_FAILED

enum esp_bt_dev_type_t
  Bluetooth device type.
  
  Values:

  enumerator ESP_BT_DEVICE_TYPE_BREDR
  enumerator ESP_BT_DEVICE_TYPE_BLE
  enumerator ESP_BT_DEVICE_TYPE_DUMO

enum esp_ble_addr_type_t
  BLE device address type.
  
  Values:

  enumerator BLE_ADDR_TYPE_PUBLIC
    Public Device Address
  enumerator BLE_ADDR_TYPE_Random
    Random Device Address. To set this address, use the function
    esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)
  enumerator BLE_ADDR_TYPE_RPA_PUBLIC
    Resolvable Private Address (RPA) with public identity address
  enumerator BLE_ADDR_TYPE_RPA_RANDOM
    Resolvable Private Address (RPA) with random identity address. To set this address, use the function
    esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)
Chapter 2. API Reference

enum esp_ble_wl_addr_type_t
    white list address type

    Values:

    enumerator BLE_WL_ADDR_TYPE_PUBLIC

    enumerator BLE_WL_ADDR_TYPE_RANDOM

Bluetooth® Main API

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_bt_main.h
• This header file can be included with:

```c
#include "esp_bt_main.h"
```

• This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

Functions

`esp_bluedroid_status_t esp_bluedroid_get_status (void)`
Get bluetooth stack status.

    Returns Bluetooth stack status

`esp_err_t esp_bluedroid_enable (void)`
Enable bluetooth, must after esp_bluedroid_init()/esp_bluedroid_init_with_cfg().

    Returns
    • ESP_OK : Succeed
    • Other : Failed

`esp_err_t esp_bluedroid_disable (void)`
Disable bluetooth, must prior to esp_bluedroid_deinit().

    Returns
    • ESP_OK : Succeed
    • Other : Failed

`esp_err_t esp_bluedroid_init (void)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

    Returns
    • ESP_OK : Succeed
    • Other : Failed

`esp_err_t esp_bluedroid_init_with_cfg (esp_bluedroid_config_t *cfg)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

    Parameters cfg -- Initial configuration of ESP Bluedroid stack.
Chapter 2. API Reference

Returns
- ESP_OK : Succeed
- Other : Failed

```c
esp_err_t esp_bluedroid_deinit (void)
```
- Deinit and free the resource for bluetooth, must be after every bluetooth stuff.
- Returns
  - ESP_OK : Succeed
  - Other : Failed

Structures

```c
struct esp_bluedroid_config_t
```
- Bluetooth stack configuration.

Public Members

```c
bool ssp_en
```
- Whether SSP(secure simple pairing) or legacy pairing is used for Classic Bluetooth

Macros

```c
BT_BLUEDROID_INIT_CONFIG_DEFAULT ()
```

Enumerations

```c
enum esp_bluedroid_status_t
```
- Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

```c
enumerator ESP_BLUEDROID_STATUS_UNINITIALIZED
```
- Bluetooth not initialized

```c
enumerator ESP_BLUEDROID_STATUS_INITIALIZED
```
- Bluetooth initialized but not enabled

```c
enumerator ESP_BLUEDROID_STATUS_ENABLED
```
- Bluetooth initialized and enabled

Bluetooth® Device APIs

Overview
- Bluetooth device reference APIs.

API Reference

Header File

- This header file can be included with:
Chapter 2. API Reference

#include "esp_bt_device.h"

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```
or
```
PRIV_REQUIRES bt
```

### Functions

#### const uint8_t *esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after "esp_bluedroid_enable".

Returns: bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled.

#### esp_err_t esp_bt_dev_set_device_name (const char* name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully. A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Parameters:
- name -- [in]: device name to be set

Returns:
- ESP_OK: Succeed
- ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

#### esp_err_t esp_bt_dev_coex_status_config (esp_bt_dev_coex_type_t type, esp_BT_DEV_COEX_OP_t op, uint8_t status)
Config bluetooth device coexis status. This function should be called after esp_bluedroid_enable() completes successfully.

Parameters:
- type -- [in]: coexist type to operate on
- op -- [in]: clear or set coexist status
- status -- [in]: coexist status to be configured

Returns:
- ESP_OK: Succeed
- ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

#### esp_err_t esp_bt_config_file_path_update (const char* file_path)
This function is used to update the path name of bluetooth bond keys saved in the NVS module and need to be called before esp_bluedroid_init().

Parameters:
- file_path -- [in] the name of config file path, the length of file_path should be less than NVS_NS_NAME_MAX_SIZE

Returns:
- ESP_OK: success
- other: failed

### Macros

```c
ESP_BT_DEV_COEX_BLE_ST_MESH_CONFIG
```
Type Definitions

typedef uint8_t esp_bt_dev_coex_op_t

Enumerations

enum esp_bt_dev_coex_type_t
    Bluetooth device coex type.
    Values:

    enumerator ESP_BT_DEV_COEX_TYPE_BLE

    enumerator ESP_BT_DEV_COEX_TYPE_BT

2.3.2 Bluetooth® Low Energy (Bluetooth LE)

GAP API

Application Example  Check the bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- The following shows an SMP security client demo with its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_client
  - GATT Security Client Example Walkthrough
- The following shows an SMP security server demo with its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - bluetooth/bluedroid/ble/gatt_security_server
  - GATT Security Server Example Walkthrough

API Reference
Header File

- components/bluetooth/api/include/api/esp_gap_ble_api.h
- This header file can be included with:

```c
#include "esp_gap_ble_api.h"
```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

Functions

```c
esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)
```

This function is called to occur gap event, such as scan result.

Parameters

- callback -- [in] callback function

Returns

- ESP_OK : success
- other : failed

```c
esp_gap_ble_cb_t esp_ble_gap_get_callback()
```

This function is called to get the current gap callback.

Returns

- esp_gap_ble_cb_t : callback function

```c
esp_err_t esp_ble_gap_config_adv_data(esp_ble_adv_data_t *adv_data)
```

This function is called to override the BTA default ADV parameters.

Parameters

- adv_data -- [in] Pointer to User defined ADV data structure. This memory space cannot be freed until callback of config_adv_data is received.

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)
```

This function is called to set scan parameters.

Parameters

- scan_params -- [in] Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_start_scanning(uint32_t duration)
```

This procedure keep the device scanning the peer device which advertising on the air.

Parameters

- duration -- [in] Keeping the scanning time, the unit is second.

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_stop_scanning()
```

This function call to stop the device scanning the peer device which advertising on the air.

Returns

- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_start_advertising (esp_ble_adv_params_t *adv_params)\**

This function is called to start advertising.

**Parameters**
- `adv_params` -- [in] pointer to User defined `adv_params` data structure.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_stop_advertising (void)\**

This function is called to stop advertising.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)\**

Update connection parameters, can only be used when connection is up.

**Parameters**
- `params` -- [in] - connection update parameters

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_pkt_data_len (esp_bd_addr_t remote_device, uint16_t tx_data_length)\**

This function is to set maximum LE data packet size.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_set_rand_addr (esp_bd_addr_t rand_addr)\**

This function allows configuring either a Non-Resolvable Private Address or a Static Random Address.

**Parameters**
- `rand_addr` -- [in] The address to be configured. Refer to the table below for possible address subtypes:

<table>
<thead>
<tr>
<th>address [47:46]</th>
<th>Address Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-Resolvable Private Address</td>
</tr>
<tr>
<td>0b11</td>
<td>Static Random Address</td>
</tr>
</tbody>
</table>

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_clear_rand_addr (void)\**

This function clears the random address for the application.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_local_privacy (bool privacy_enable)\**

Enable/disable privacy (including address resolution) on the local device.

**Parameters**
- `privacy_enable` -- [in] - enable/disable privacy on remote device.

**Returns**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)**

set local gap appearance icon

Parameters **icon** -- [in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to [https://www.bluetooth.com/specifications/assigned-numbers/](https://www.bluetooth.com/specifications/assigned-numbers/)

Returns
- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)**

Add or remove device from white list.

Parameters
- **add_remove** -- [in] the value is true if added the ble device to the white list, and false remove to the white list.
- **remote_bda** -- [in] the remote device address add/remove from the white list.
- **wl_addr_type** -- [in] whitelist address type

Returns
- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_clear_whitelist (void)**

Clear all white list.

Returns
- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_get_whitelist_size (uint16_t* length)**

Get the whitelist size in the controller.

Parameters **length** -- [out] the white list length.

Returns
- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_set_prefer_conn_params (esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)**

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Parameters
- **bd_addr** -- [in] BD address of the peripheral
- **min_conn_int** -- [in] minimum preferred connection interval
- **max_conn_int** -- [in] maximum preferred connection interval
- **slave_latency** -- [in] preferred slave latency
- **supervision_tout** -- [in] preferred supervision timeout

Returns
- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_set_device_name (const char *name)**

Set device name to the local device Note: This API don’t affect the advertising data.

Parameters **name** -- [in] - device name.

Returns
- ESP_OK : success
  - other : failed
**esp_err_t esp_ble_gap_get_device_name (void)**

Get device name of the local device.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_get_local_used_addr (esp_bd_addr_t local_used_addr, uint8_t *addr_type)**

This function is called to get local used address and address type. uint8_t *esp_bt_dev_get_address(void) get the public address.

**Parameters**
- local_used_addr -- [in] : current local used ble address (six bytes)
- addr_type -- [in] : ble address type

**Returns**
- ESP_OK : success
- other : failed

**uint8_t* esp_ble_resolve_adv_data (uint8_t* adv_data, uint8_t type, uint8_t* length)**

This function is called to get ADV data for a specific type.

**Parameters**
- adv_data -- [in] : pointer of ADV data which to be resolved
- type -- [in] : finding ADV data type
- length -- [out] : return the length of ADV data not including type

**Returns**
- pointer of ADV data

**esp_err_t esp_ble_gap_config_adv_data_raw (uint8_t* raw_data, uint32_t raw_data_len)**

This function is called to set raw advertising data. User need to fill ADV data by self.

**Parameters**
- raw_data -- [in] : raw advertising data with the format: [Length1][DataType1][Data1][Length2][DataType2][Data2]...
- raw_data_len -- [in] : raw advertising data length , less than 31 bytes

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_config_scan_rsp_data_raw (uint8_t* raw_data, uint32_t raw_data_len)**

This function is called to set raw scan response data. User need to fill scan response data by self.

**Parameters**
- raw_data -- [in] : raw scan response data
- raw_data_len -- [in] : raw scan response data length , less than 31 bytes

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_read_rssi (esp_bd_addr_t remote_addr)**

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

**Parameters**
- remote_addr -- [in] : The remote connection device address.

**Returns**
- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)**

This function is called to add a device info into the duplicate scan exceptional list.

**Parameters**
**type** -- [in] device info type, it is defined in `esp_ble_duplicate_exceptional_info_type_t` when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device info is invalid.

**device_info -- [in]** the device information.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)
```

This function is called to remove a device info from the duplicate scan exceptional list.

**Parameters**
- **type** -- [in] device info type, it is defined in `esp_ble_duplicate_exceptional_info_type_t` when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device info is invalid.
- **device_info -- [in]** the device information.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list(esp_duplicate_scan_exceptional_list_type_t list_type)
```

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Parameters**
- **list_type -- [in]** duplicate scan exceptional list type, the value can be one or more of `esp_duplicate_scan_exceptional_list_type_t`.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_security_param(esp_ble_sm_param_t param_type, void *value, uint8_t len)
```

Set a GAP security parameter value. Overrides the default value.

```
Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only 'secure connection mode', it is necessary do as...
```

```
1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` ('param_type' is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` ('param_type' is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).
```

**Parameters**
- **param_type -- [in]** the type of the param which to be set
- **value -- [in]** the param value
- **len -- [in]** the length of the param value

**Returns**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_security_rsp**(esp_bd_addr_t bd_addr, bool accept)

Grant security request access.

**Parameters**

- **bd_addr** -- [in]: BD address of the peer
- **accept** -- [in]: accept the security request or not

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_set_encryption**(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Parameters**

- **bd_addr** -- [in]: the address of the peer device need to encryption
- **sec_act** -- [in]: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_passkey_reply**(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)

Reply the key value to the peer device in the legacy connection stage.

**Parameters**

- **bd_addr** -- [in]: BD address of the peer
- **accept** -- [in]: passkey entry successful or declined.
- **passkey** -- [in]: passkey value, must be a 6 digit number, can be lead by 0.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_confirm_reply**(esp_bd_addr_t bd_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

**Parameters**

- **bd_addr** -- [in]: BD address of the peer device
- **accept** -- [in]: numbers to compare are the same or different.

**Returns**

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_remove_bond_device**(esp_bd_addr_t bd_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Parameters**

- **bd_addr** -- [in]: BD address of the peer device

**Returns**

- ESP_OK: success
- other: failed

**int esp_ble_get_bond_device_num**(void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Returns**

- >= 0: bonded devices number.
- ESP_FAIL: failed

**esp_err_t esp_ble_get_bond_device_list**(int *dev_num, esp_ble_bond_dev_t *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Parameters**

- **dev_num** -- [inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** -- [out] an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**Returns**

- ESP_OK: success
**Chapter 2. API Reference**

- other : failed

```c
esp_err_t esp_ble_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t *TK, uint8_t len)
```

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Parameters**
- **bd_addr** -- [in] BD address of the peer device.
- **TK** -- [in] Temporary Key value, the TK value shall be a 128-bit random number
- **len** -- [in] length of temporary key, should always be 128-bit

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_sc_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t p_c[16], uint8_t p_r[16])
```

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_SC_OOB_REQ_EVT.

**Parameters**
- **bd_addr** -- [in] BD address of the peer device.
- **p_c** -- [in] Confirmation value, it shall be a 128-bit random number
- **p_r** -- [in] Randomizer value, it should be a 128-bit random number

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_create_sc_oob_data()
```

This function is called to create the OOB data for SMP when secure connection.

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_disconnect(esp_bd_addr_t remote_device)
```

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

**Parameters**
- **remote_device** -- [in] : BD address of the peer device

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_get_current_conn_params(esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)
```

This function is called to read the connection parameters information of the device.

**Parameters**
- **bd_addr** -- [in] BD address of the peer device.
- **conn_params** -- [out] the connection parameters information

**Returns**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_gap_ble_set_channels(esp_gap_ble_channels channels)
```

BLE set channels.

**Parameters**
- **channels** -- [in] : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**Returns**
- ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other : failed

```c
esp_err_t esp_gap_ble_set_authorization(esp_bd_addr_t bd_addr, bool authorize)
```

This function is called to authorized a link after Authentication/MITM protection.
Parameters

- **bd_addr** -- **[in]** BD address of the peer device.
- **authorize** -- **[out]** Authorized the link or not.

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_read_phy (esp_bd_addr_t bd_addr)
```

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Parameters

- **bd_addr** -- **[in]** : BD address of the peer device

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_preferred_default_phy (esp_ble_gap_phy_mask_t tx_phy_mask,
                                             esp_ble_gap_phy_mask_t rx_phy_mask)
```

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

Parameters

- **tx_phy_mask** -- **[in]** : indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** -- **[in]** : indicates the receiver PHYs that the Host prefers the Controller to use

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_preferred_phy (esp_bd_addr_t bd_addr,
                                      esp_ble_gap_all_phys_t all_phys_mask,
                                      esp_ble_gap_phy_mask_t tx_phy_mask,
                                      esp_ble_gap_phy_mask_t rx_phy_mask,
                                      esp_ble_gap_prefer_phy_options_t phy_options)
```

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

Parameters

- **bd_addr** -- **[in]** : remote address
- **all_phys_mask** -- **[in]** : a bit field that allows the Host to specify
- **tx_phy_mask** -- **[in]** : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** -- **[in]** : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- **phy_options** -- **[in]** : a bit field that allows the Host to specify options for PHYs

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_ext_adv_set_rand_addr (uint8_t instance, esp_bd_addr_t rand_addr)
```

This function is used by the Host to set the random device address specified by the Random_Address parameter.

Parameters

- **instance** -- **[in]** : Used to identify an advertising set
- **rand_addr** -- **[in]** : Random Device Address

Returns

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_ext_adv_set_params (uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)
```

This function is used by the Host to set the advertising parameters.

Parameters

- **instance** -- **[in]** : identifies the advertising set whose parameters are being configured.
- **params** -- **[in]** : advertising parameters
### Chapter 2. API Reference

#### Returns

- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_config_ext_adv_data_raw**(uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in advertising PDUs that have a data field.

**Parameters**

- **instance** -- [in] : identifies the advertising set whose data are being configured.
- **length** -- [in] : data length
- **data** -- [in] : data information

**Returns**

- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw**(uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

**Parameters**

- **instance** -- [in] : identifies the advertising set whose response data are being configured.
- **length** -- [in] : responsedata length
- **scan_rsp_data** -- [in] : response data information

**Returns**

- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_ext_adv_start**(uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

- **num_adv** -- [in] : Number of advertising sets to enable or disable
- **ext_adv** -- [in] : adv parameters

**Returns**

- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_ext_adv_stop**(uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

- **num_adv** -- [in] : Number of advertising sets to enable or disable
- **ext_adv_inst** -- [in] : ext adv instance

**Returns**

- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_ext_adv_set_remove**(uint8_t instance)

This function is used to remove an advertising set from the Controller.

**Parameters**

- **instance** -- [in] : Used to identify an advertising set

**Returns**

- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_ext_adv_set_clear**(void)

This function is used to remove all existing advertising sets from the Controller.

**Returns**

- ESP_OK : success
  - other : failed

**esp_err_t esp_ble_gap_periodic_adv_set_params**(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)

This function is used by the Host to set the parameters for periodic advertising.
Parameters
- **instance** -- [in]: identifies the advertising set whose periodic advertising parameters are being configured.
- **params** -- [in]: periodic adv parameters

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_config_periodic_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)
```

This function is used to set the data used in periodic advertising PDUs.

Parameters
- **instance** -- [in]: identifies the advertising set whose periodic advertising parameters are being configured.
- **length** -- [in]: the length of periodic data
- **data** -- [in]: periodic data information

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_periodic_adv_start(uint8_t instance)
```

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Parameters **instance** -- [in]: Used to identify an advertising set

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_periodic_adv_stop(uint8_t instance)
```

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Parameters **instance** -- [in]: Used to identify an advertising set

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_set_ext_scan_params(const esp_ble_ext_scan_params_t *params)
```

This function is used to set the extended scan parameters to be used on the advertising channels.

Parameters **params** -- [in]: scan parameters

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_start_ext_scan(uint32_t duration, uint16_t period)
```

This function is used to enable scanning.

Parameters
- **duration** -- [in] Scan duration time, where Time = N * 10 ms. Range: 0x0001 to 0xFFFF.
- **period** -- [in] Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration. Time = N * 1.28 sec. Range: 0x0001 to 0xFFFF.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_stop_ext_scan(void)
```

This function is used to disable scanning.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gap_periodic_adv_create_sync(const esp_ble_gap_periodic_adv_sync_params_t *params)
```

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Parameters **params** -- [in]: sync parameters
Returns - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_sync_cancel (void)`

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

Returns - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_sync_terminate (uint16_t sync_handle)`

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

Parameters `sync_handle -- [in]` : identify the periodic advertiser

Returns - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr,uint8_t sid)`

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

Parameters
  • `addr_type -- [in]` : address type
  • `addr -- [in]` : Device Address
  • `sid -- [in]` : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

Returns - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)`

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

Parameters
  • `addr_type -- [in]` : address type
  • `addr -- [in]` : Device Address
  • `sid -- [in]` : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

Returns - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_clear_dev (void)`

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

Returns - ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_prefer_ext_connect_params_set (esp_bd_addr_t addr, esp_ble_gap_phy_mask_t phy_mask, const esp_ble_gap_conn_params_t *phy_1m_conn_params, const esp_ble_gap_conn_params_t *phy_2m_conn_params, const esp_ble_gap_conn_params_t *phy_coded_conn_params)`

This function is used to set aux connection parameters.

Parameters
  • `addr -- [in]` : device address
  • `phy_mask -- [in]` : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
• **phy_1m_conn_params** -- [in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.

• **phy_2m_conn_params** -- [in] : Connection parameters for the LE 2M PHY are provided.

• **phy_coded_conn_params** -- [in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Returns**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_recv_enable (uint16_t sync_handle, uint8_t enable)
```

This function is used to set periodic advertising receive enable.

**Parameters**

- **sync_handle** -- [in] : Handle of periodic advertising sync
- **enable** -- [in] : Determines whether reporting and duplicate filtering are enabled or disabled

**Returns**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_sync_trans (esp_bd_addr_t addr, uint16_t service_data, uint16_t sync_handle)
```

This function is used to transfer periodic advertising sync.

**Parameters**

- **addr** -- [in] : Peer device address
- **service_data** -- [in] : Service data used by Host
- **sync_handle** -- [in] : Handle of periodic advertising sync

**Returns**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_set_info_trans (esp_bd_addr_t addr, uint16_t service_data, uint8_t adv_handle)
```

This function is used to transfer periodic advertising set info.

**Parameters**

- **addr** -- [in] : Peer device address
- **service_data** -- [in] : Service data used by Host
- **adv_handle** -- [in] : Handle of advertising set

**Returns**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_periodic_adv_sync_trans_params (esp_bd_addr_t addr, const esp_ble_gap_past_params_t *params)
```

This function is used to set periodic advertising sync transfer params.

**Parameters**

- **addr** -- [in] : Peer device address
- **params** -- [in] : Params of periodic advertising sync transfer

**Returns**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_dtm_tx_start (const esp_ble_dtm_tx_t *tx_params)
```

This function is used to start a test where the DUT generates reference packets at a fixed interval.

**Parameters**

- **tx_params** -- [in] : DTM Transmitter parameters

**Returns**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_dtm_rx_start (const esp_ble_dtm_rx_t *rx_params)
```

This function is used to start a test where the DUT receives test reference packets at a fixed interval.

**Parameters**

- **rx_params** -- [in] : DTM Receiver parameters
Chapter 2. API Reference

Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_dtm_enh_tx_start (const esp_ble_dtm_enh_tx_t *tx_params)`
This function is used to start a test where the DUT generates reference packets at a fixed interval.

Parameters `tx_params` -- [in] : DTM Transmitter parameters
Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_dtm_enh_rx_start (const esp_ble_dtm_enh_rx_t *rx_params)`
This function is used to start a test where the DUT receives test reference packets at a fixed interval.

Parameters `rx_params` -- [in] : DTM Receiver parameters
Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_dtm_stop (void)`
This function is used to stop any test which is in progress.

Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_clear_advertising (void)`
This function is used to clear legacy advertising.

Returns - ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_vendor_command_send (esp_ble_vendor_cmd_params_t *vendor_cmd_param)`
This function is called to send vendor hci command.

Parameters `vendor_cmd_param` -- [in] vendor hci command parameters
Returns
• ESP_OK : success
• other : failed

```c
int num_resps

Scan result number
```

```c
uint8_t adv_data_len

Adv data length
```

```c
uint8_t scan_rsp_len

Scan response length
```

```c
uint32_t num_dis

The number of discard packets
```

```c
struct ble_scan_rsp_data_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status

Indicate the set scan response data operation success status
```

```c
struct ble_scan_rsp_data_raw_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status

Indicate the set raw advertising data operation success status
```

```c
struct ble_scan_start_cmpl_evt_param

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.
```

**Public Members**
**Public Members**

```c
struct ble_scan_stop_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.
```

**Public Members**

```c
struct ble_set_channels_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.
```

**Public Members**

```c
struct ble_set_ext_scan_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

**Public Members**

```c
struct ble_set_past_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT.
```

**Public Members**

```c
struct ble_set_perf_def_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.
```

---

### Chapter 2. API Reference

```c
esp_bt_status_t status
Indicate scan start operation success status
```

```c
struct ble_scan_stop_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
Indicate scan stop operation success status
```

```c
struct ble_set_channels_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.
```

**Public Members**

```c
esp_bt_status_t stat
BLE set channel status
```

```c
struct ble_set_ext_scan_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
Indicate extend advertising parameters set status
```

```c
struct ble_set_past_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
Set periodic advertising sync transfer params status
```

```c
esp_bd_addr_t bda
The remote device address
```

```c
struct ble_set_perf_def_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.
```

**Public Members**

```c
esp_bt_status_t status
Indicate perf default phy set status
```
```c
struct ble_set_perf_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT.

Public Members

  esp_BT_status_t status
  Indicate perf phy set status

struct ble_set_rand_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.

Public Members

  esp_BT_status_t status
  Indicates set static rand address operation success status

struct ble_update_conn_params_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.

Public Members

  esp_BT_status_t status
  Indicate update connection parameters success status

  esp_bd_addr_t bda
  Bluetooth device address

  uint16_t min_int
  Min connection interval

  uint16_t max_int
  Max connection interval

  uint16_t latency
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

  uint16_t conn_int
  Current connection interval

  uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x0000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct ble_update_duplicate_exceptional_list_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
```
Chapter 2. API Reference

**Public Members**

`esp_bt_status_t status`
Indicate update duplicate scan exceptional list operation success status

`uint8_t subcode`
Define in `esp_bt_duplicate_exceptional_subcode_type_t`

`uint16_t length`
The length of `device_info`

`esp_duplicate_info_t device_info`
device information, when subcode is `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN`, the value is invalid

`struct ble_update_whitelist_cmpl_evt_param`

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```

**Public Members**

`esp_bt_status_t status`
Indicate the add or remove whitelist operation success status

`esp_ble_wl_operation_t wl_operation`
The value is `ESP_BLE_WHITELIST_ADD` if add address to whitelist operation success, `ESP_BLE_WHITELIST_REMOVE` if remove address from the whitelist operation success

`struct vendor_cmd_cmpl_evt_param`

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_VENDOR_CMD_COMPLETE_EVT.
```

**Public Members**

`uint16_t opcode`
vendor hci command opcode

`uint16_t param_len`
The length of parameter buffer

`uint8_t *p_param_buf`
The point of parameter buffer

**Structures**

`struct esp_ble_vendor_cmd_params_t`
Vendor HCI command parameters.
Chapter 2. API Reference

Public Members

uint16_t **opcode**
vendor hci command opcode

uint8_t **param_len**
the length of parameter

uint8_t **p_param_buf**
the point of parameter buffer

struct **esp_ble_dtm_tx_t**
DTM TX parameters.

Public Members

uint8_t **tx_channel**
channel for sending test data, tx_channel = (Frequency - 2402)/2, tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

uint8_t **len_of_data**
length in bytes of payload data in each packet

*esp_ble_dtm_pkt_payload_t** **pkt_payload**
packet payload type. value range: 0x00-0x07

struct **esp_ble_dtm_rx_t**
DTM RX parameters.

Public Members

uint8_t **rx_channel**
channel for test data reception, rx_channel = (Frequency - 2402)/2, tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

struct **esp_ble_adv_params_t**
Advertising parameters.

Public Members

uint16_t **adv_int_min**
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t **adv_int_max**
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval
**Chapter 2. API Reference**

```c
#define esp_ble_adv_type_t adv_type
    Advertising type

#define esp_ble_addr_type_t own_addr_type
    Owner bluetooth device address type

#define esp_bd_addr_t peer_addr
    Peer device bluetooth device address

#define esp_ble_addr_type_t peer_addr_type
    Peer device bluetooth device address type, only support public address type and random address type

#define esp_ble_adv_channel_t channel_map
    Advertising channel map

#define esp_ble_adv_filter_t adv_filter_policy
    Advertising filter policy

struct esp_ble_adv_data_t
    Advertising data content, according to "Supplement to the Bluetooth Core Specification".

**Public Members**

```c
bool set_scan_rsp
    Set this advertising data as scan response or not

bool include_name
    Advertising data include device name or not

bool include_txpower
    Advertising data include TX power

int min_interval
    Advertising data show slave preferred connection min interval. The connection interval in the following manner: \( \text{connIntervalmin} = \text{Conn\_Interval\_Min} \times 1.25 \text{ ms} \) \( \text{Conn\_Interval\_Min range: 0x0006 to 0xC80} \) Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval
    Advertising data show slave preferred connection max interval. The connection interval in the following manner: \( \text{connIntervalmax} = \text{Conn\_Interval\_Max} \times 1.25 \text{ ms} \) \( \text{Conn\_Interval\_Max range: 0x0006 to 0xC80} \) \( \text{Conn\_Interval\_Max shall be equal to or greater than the Conn\_Interval\_Min} \). Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
    External appearance of device

uint16_t manufacturer_len
    Manufacturer data length
```
** dims**: uint8_t *p_manufacturer_data
  Manufacturer data point

** service data**: uint16_t service_data_len
  Service data length

** service**: uint8_t *p_service_data
  Service data point

** uuid**: uint16_t service_uuid_len
  Service uuid length

** uuid array**: uint8_t *p_service_uuid
  Service uuid array point

** flag**: uint8_t flag
  Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

** struct**: esp_ble_scan_params_t
  Blescanparameters.

** Public Members**

** scan type**: esp_ble_scan_type_t
  Scan type

** addr type**: esp_ble_addr_type_t
  Owner address type

** filter policy**: esp_ble_scan_filter_t
  Scan filter policy

** interval**: uint16_t
  Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

** window**: uint16_t
  Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

** duplicate**: esp_ble_scan_duplicate_t
  The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

** struct**: esp_gap_conn_params_t
  connection parameters information
Chapter 2. API Reference

**Public Members**

```c
uint16_t interval
  connection interval
```

```c
uint16_t latency
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
```

```c
uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds
```

```c
struct esp_ble_conn_update_params_t
  Connection update parameters.
```

**Public Members**

```c
esp_bd_addr_t bda
  Bluetooth device address
```

```c
uint16_t min_int
  Min connection interval
```

```c
uint16_t max_int
  Max connection interval
```

```c
uint16_t latency
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
```

```c
uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds
```

```c
struct esp_ble_pkt_data_length_params_t
  BLE pkt data length keys.
```

**Public Members**

```c
uint16_t rx_len
  pkt rx data length value
```

```c
uint16_t tx_len
  pkt tx data length value
```

```c
struct esp_ble_penc_keys_t
  BLE encryption keys.
```
Chapter 2. API Reference

Public Members

```c
esp_bt_octet16_t ltk
```
The long term key

```c
esp_bt_octet8_t rand
```
The random number

```c
uint16_t ediv
```
The ediv value

```c
uint8_t sec_level
```
The security level of the security link

```c
uint8_t key_size
```
The key size (7~16) of the security link

```c
struct esp_ble_pcsrk_keys_t
```
BLE CSRK keys.

Public Members

```c
uint32_t counter
```
The counter

```c
esp_bt_octet16_t csrk
```
The csrk key

```c
uint8_t sec_level
```
The security level

```c
struct esp_ble_pid_keys_t
```
BLE pid keys.

Public Members

```c
esp_bt_octet16_t irk
```
The irk value

```c
esp_ble_addr_type_t addr_type
```
The address type

```c
esp_bd_addr_t static_addr
```
The static address

```c
struct esp_ble_lenc_keys_t
```
BLE Encryption reproduction keys.
### Public Members

**esp_bt_octet16_t ltk**
The long term key

uint16_t div
The div value

uint8_t key_size
The key size of the security link

uint8_t sec_level
The security level of the security link

struct **esp_ble_lcsrk_keys**
BLE SRK keys.

### Public Members

uint32_t counter
The counter value

uint16_t div
The div value

uint8_t sec_level
The security level of the security link

**esp_bt_octet16_t csrk**
The csrk key value

struct **esp_ble_sec_key_notif_t**
Structure associated with ESP_KEY_NOTIF_EVT.

### Public Members

**esp_bd_addr_t bd_addr**
peer address

uint32_t passkey
the numeric value for comparison. If just_works, do not show this number to UI

struct **esp_ble_sec_req_t**
Structure of the security request.
Public Members

```c
esp_bd_addr_t bd_addr
peer address
```

struct `esp_ble_bond_key_info_t`
struct type of the bond key information value

Public Members

```c
esp_ble_key_mask_t key_mask
the key mask to indicate which key is present
```

```c
esp_ble_penc_keys_t penc_key
received peer encryption key
```

```c
esp_ble_pcsrk_keys_t pcsrk_key
received peer device SRK
```

```c
esp_ble_pid_keys_t pid_key
peer device ID key
```

struct `esp_ble_bond_dev_t`
struct type of the bond device value

Public Members

```c
esp_bd_addr_t bd_addr
peer address
```

```c
esp_ble_bond_key_info_t bond_key
the bond key information
```

struct `esp_ble_key_t`
union type of the security key value

Public Members

```c
esp_bd_addr_t bd_addr
peer address
```

```c
esp_ble_key_type_t key_type
key type of the security link
```

```c
esp_ble_key_value_t p_key_value
the pointer to the key value
```
struct esp_ble_local_id_keys_t
structure type of the ble local id keys value

Public Members

esp_bt_octet16_t ir
the 16 bits of the ir value

esp_bt_octet16_t irk
the 16 bits of the ir key value

esp_bt_octet16_t dhk
the 16 bits of the dh key value

struct esp_ble_local_oob_data_t
structure type of the ble local oob data value

Public Members

esp_bt_octet16_t oob_c
the 128 bits of confirmation value

esp_bt_octet16_t oob_r
the 128 bits of randomizer value

struct esp_ble_auth_cmpl_t
Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t bd_addr
BD address peer device.

bool key_present
Valid link key value in key element

esp_link_key key
Link key associated with peer device.

uint8_t key_type
The type of Link Key

bool success
TRUE of authentication succeeded, FALSE if failed.
```c
uint8_t fail_reason
    The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t addr_type
    Peer device address type

esp_bt_dev_type_t dev_type
    Device type

esp_ble_auth_req_t auth_mode
    authentication mode

struct esp_ble_gap_ext_adv_params_t ext_adv_params_t
    ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t type
    ext adv type

uint32_t interval_min
    ext adv minimum interval

uint32_t interval_max
    ext adv maximum interval

esp_ble_adv_channel_t channel_map
    ext adv channel map

esp_ble_addr_type_t own_addr_type
    ext adv own address type

esp_ble_addr_type_t peer_addr_type
    ext adv peer address type

esp_bd_addr_t peer_addr
    ext adv peer address

esp_ble_adv_filter_t filter_policy
    ext adv filter policy

int8_t tx_power
    ext adv tx power

esp_ble_gap_pri_phy_t primary_phy
    ext adv primary phy
```
uint8_t max_skip
   ext adv maximum skip

esp_ble_gap_phy_t secondary_phy
   ext adv secondary phy

uint8_t sid
   ext adv sid

bool scan_req_notif
   ext adv scan request event notify

struct esp_ble_ext_scan_cfg_t
   ext scan config

Public Members

esp_ble_scan_type_t scan_type
   ext scan type

uint16_t scan_interval
   ext scan interval

uint16_t scan_window
   ext scan window

struct esp_ble_ext_scan_params_t
   ext scan parameters

Public Members

esp_ble_addr_type_t own_addr_type
   ext scan own address type

esp_ble_scan_filter_t filter_policy
   ext scan filter policy

esp_ble_scan_duplicate_t scan_duplicate
   ext scan duplicate scan

esp_ble_ext_scan_cfg_mask_t cfg_mask
   ext scan config mask

esp_ble_ext_scan_cfg_t uncoded_cfg
   ext scan uncoded config parameters
**Chapter 2. API Reference**

```
esp_ble_ext_scan_cfg_t coded_cfg
ext scan coded config parameters

struct esp_ble_gap_conn_params_t
create extend connection parameters

**Public Members**

uint16_t scan_interval
init scan interval

uint16_t scan_window
init scan window

uint16_t interval_min
minimum interval

uint16_t interval_max
maximum interval

uint16_t latency
ext scan type

uint16_t supervision_timeout
connection supervision timeout

uint16_t min_ce_len
minimum ce length

uint16_t max_ce_len
maximum ce length

```

**Public Members**

uint8_t instance
advertising handle

int duration
advertising duration

int max_events
maximum number of extended advertising events

```

struct esp_ble_gap_ext_adv_t
extend adv enable parameters

**Public Members**

```
Public Members

uint16_t interval_min
    periodic advertising minimum interval

uint16_t interval_max
    periodic advertising maximum interval

uint8_t properties
    periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
    periodic adv sync parameters

Public Members

esp_ble_gap_sync_t filter_policy
    Configures the filter policy for periodic advertising sync: 0: Use Advertising SID, Advertiser Address Type, and Advertiser Address parameters to determine the advertiser to listen to. 1: Use the Periodic Advertiser List to determine the advertiser to listen to.

uint8_t sid
    SID of the periodic advertising

esp_ble_addr_type_t addr_type
    Address type of the periodic advertising

esp_bd_addr_t addr
    Address of the periodic advertising

uint16_t skip
    Maximum number of periodic advertising events that can be skipped

uint16_t sync_timeout
    Synchronization timeout

struct esp_ble_gap_ext_adv_report_t
    extend adv report parameters

Public Members

esp_ble_gap_adv_type_t event_type
    extend advertising type

uint8_t addr_type
    extend advertising address type
**esp_bd_addr_t** `addr`
extend advertising address

**esp_ble_gap_pri_phy_t** `primary_phy`
extend advertising primary phy

**esp_ble_gap_phy_t** `secondly_phy`
extend advertising secondary phy

uint8_t `sid`
extend advertising sid

uint8_t `tx_power`
extend advertising tx power

int8_t `rssi`
extend advertising rssi

uint16_t `per_adv_interval`
periodic advertising interval

uint8_t `dir_addr_type`
direct address type

**esp_bd_addr_t** `dir_addr`
direct address

**esp_ble_gap_ext_adv_data_status_t** `data_status`
data type

uint8_t `adv_data_len`
extend advertising data length

uint8_t `adv_data[251]`
extend advertising data

struct **esp_ble_gap_periodic_adv_report_t**
periodic adv report parameters

**Public Members**

uint16_t `sync_handle`
periodic advertising train handle

uint8_t `tx_power`
periodic advertising tx power
int8_t rssi
    periodic advertising rssi

struct esp_ble_gap_ext_adv_data_status_t data_status
    periodic advertising data type

uint8_t data_length
    periodic advertising data length

uint8_t data[251]
    periodic advertising data

struct esp_ble_gap_periodic_adv_sync_estab_t
    periodic adv sync establish parameters

Public Members

uint8_t status
    periodic advertising sync status

uint16_t sync_handle
    periodic advertising train handle

uint8_t sid
    periodic advertising sid

struct esp_ble_addr_type_t addr_type
    periodic advertising address type

struct esp_bd_addr_t adv_addr
    periodic advertising address

struct esp_ble_gap_phy_t adv_phy
    periodic advertising adv phy type

uint16_t period_adv_interval
    periodic advertising interval

uint8_t adv_clk_accuracy
    periodic advertising clock accuracy

struct esp_ble_dtm_enh_tx_t
    DTM TX parameters.

Public Members
(uint8_t tx_channel)
channel for sending test data, tx_channel = (Frequency - 2402)/2, tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

(uint8_t len_of_data)
length in bytes of payload data in each packet

(esp_ble_dtm_pkt_payload_t pkt_payload)
packet payload type. value range: 0x00-0x07

(esp_ble_gap_phy_t phy)
the phy type used by the transmitter, coded phy with S=2:0x04

(struct esp_ble_dtm_enh_rx_t)
DTM RX parameters.

Public Members

(uint8_t rx_channel)
channel for test data reception, rx_channel = (Frequency - 2402)/2, tx_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

(esp_ble_gap_phy_t phy)
the phy type used by the receiver, 1M phy: 0x01, 2M phy: 0x02, coded phy: 0x03

(uint8_t modulation_idx)
modulation index, 0x00: standard modulation index, 0x01: stable modulation index

(struct esp_ble_gap_past_params_t)
periodic adv sync transfer parameters

Public Members

(esp_ble_gap_past_mode_t mode)
periodic advertising sync transfer mode

(uint16_t skip)
the number of periodic advertising packets that can be skipped

(uint16_t sync_timeout)
synchronization timeout for the periodic advertising train

(uint8_t cte_type)
periodic advertising sync transfer CET type
Chapter 2. API Reference

Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC
BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

ESP_BLE_ADV_FLAG_GEN_DISC

ESP_BLE_ADV_FLAG_BREDR_NOT_SPT

ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT

ESP_BLE_ADV_FLAG_DMT_HOST_SPT

ESP_BLE_ADV_FLAG_NON_LIMIT_DISC

ESP_LE_KEY_NONE
relate to BTM_LE_KEY_xxx in stack/btm_api.h
No encryption key

ESP_LE_KEY_PENC
encryption key, encryption information of peer device

ESP_LE_KEY_PID
identity key of the peer device

ESP_LE_KEY_PCSRK
peer SRK

ESP_LE_KEY_PLK
Link key

ESP_LE_KEY_LLK
peer link key

ESP_LE_KEY_LENC
master role security information: div

ESP_LE_KEY_LID
master device ID key

ESP_LE_KEY_LCSRK
local CSRK has been deliver to peer

ESP_LE_AUTH_NO_BOND
relate to BTM_LE_AUTH_xxx in stack/btm_api.h
0 no bonding

ESP_LE_AUTH_BOND
1 << 0 device in the bonding with peer
ESP_LE_AUTH_REQ_MITM
1 << 2 man in the middle attack

ESP_LE_AUTH_REQ_BOND_MITM
0101 banding with man in the middle attack

ESP_LE_AUTH_REQ_SC_ONLY
1 << 3 secure connection

ESP_LE_AUTH_REQ_SC_BOND
1001 secure connection with band

ESP_LE_AUTH_REQ_SC_MITM
1100 secure conn with MITM

ESP_LE_AUTH_REQ_SC_MITM_BOND
1101 SC with MITM and Bonding

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_DISABLE
authentication disable

ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE
authentication enable

relate to BTM_BLE_APPEARANCE_INSULIN_PUMP_PATCH_PUMP in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_INSULIN_PEN
relate to BTM_BLE_APPEARANCE_INSULIN_PEN in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY
relate to BTM_BLE_APPEARANCE_GENERIC_MEDICATION_DELIVERY in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS
relate to BTM_BLE_APPEARANCE_GENERIC_OUTDOOR_SPORTS in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV
relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in stack/btm_ble_api.h

BLE_DTM_PKT_PAYLOAD_0x00
PRBS9 sequence ‘111111110000011101...’ (in transmission order) as described in [Vol 6] Part F, Section 4.1.5

BLE_DTM_PKT_PAYLOAD_0x01
Repeated ‘11110000’ (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5

BLE_DTM_PKT_PAYLOAD_0x02
Repeated ‘10101010’ (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5

BLE_DTM_PKT_PAYLOAD_0x03
PRBS15 sequence as described in [Vol 6] Part F, Section 4.1.5

BLE_DTM_PKT_PAYLOAD_0x04
Repeated ‘11111111’ (in transmission order) sequence
Chapter 2. API Reference

**BLE_DTM_PKT_PAYLOAD_0x05**
Repeated ‘00000000’ (in transmission order) sequence

**BLE_DTM_PKT_PAYLOAD_0x06**
Repeated ‘00001111’ (in transmission order) sequence

**BLE_DTM_PKT_PAYLOAD_0x07**
Repeated ‘01010101’ (in transmission order) sequence

**BLE_DTM_PKT_PAYLOAD_MAX**
0x08 ~ 0xFF, Reserved for future use

**ESP_GAP_BLE_CHANNELS_LEN**
channel length

**ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT**
This is the old name, just for backwards compatibility.

**ESP_BLE_ADV_DATA_LEN_MAX**
Advertising data maximum length.

**ESP_BLE_SCAN_RSP_DATA_LEN_MAX**
Scan response data maximum length.

**VENDOR_HCI_CMD_MASK**

**BLE_BIT (n)**

**ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED**
Non-Connectable and Non-Scannable Undirected advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE**
Connectable advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE**
Scannable advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED**
Directed advertising

**ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED**
High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY**
Use legacy advertising PDUs

**ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV**
Omit advertiser's address from all PDUs ("anonymous advertising")
**ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR**
Include TxPower in the extended header of the advertising PDU

**ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK**
Reserved for future use. If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0) ADV_IND

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND**
ADV_DIRECT_IND (low duty cycle)

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR**
ADV_DIRECT_IND (high duty cycle)

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR**
ADV_SCAN_IND

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN**
ADV_NONCONN_IND

**ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN**

**ESP_BLE_GAP_PHY_1M**
Secondary Advertisement PHY is LE1M

**ESP_BLE_GAP_PHY_2M**
Secondary Advertisement PHY is LE2M

**ESP_BLE_GAP_PHY_CODED**
Secondary Advertisement PHY is LE Coded

**ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY**
No Prefer TX PHY supported by controller

**ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY**
No Prefer RX PHY supported by controller

**ESP_BLE_GAP_PRI_PHY_1M**
Primary phy only support 1M and LE coded phy. Primary Phy is LE1M

**ESP_BLE_GAP_PRI_PHY_CODED**
Primary Phy is LE CODED

**ESP_BLE_GAP_PHY_1M_PREF_MASK**
The Host prefers the LE1M transmitter or reciever PHY

**ESP_BLE_GAP_PHY_2M_PREF_MASK**
The Host prefers the LE2M transmitter or reciever PHY
ESP_BLE_GAP_PHY_CODED_PREF_MASK
The Host prefers use the LE CODED transmitter or reciever PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF
The Host has no preferred coding when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING
The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING
The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK
Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK
Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE
Advertising data.
extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE
extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED
extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO
Advertising SYNC policy.
sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST
periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND
Advertising report.
advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_IND
advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV
advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_RSP
advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13
ESP_BLE_LEGACY_ADV_TYPE_IND
   advertising report with legacy advertising indication type

ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND
   advertising report with legacy direct indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND
   advertising report with legacy scan indication type

ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND
   advertising report with legacy non connectable indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND
   advertising report with legacy scan response indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND
   advertising report with legacy advertising with scan response indication type

EXT_ADV_TX_PWR_NO_PREFERENCE
   Extend advertising tx power, range: [-127, +126] dBm.
   host has no preference for tx power

ESP_BLE_GAP_PAST_MODE_NO_SYNC_EVT
   Periodic advertising sync trans mode.
   No attempt is made to sync and no periodic adv sync transfer received event

ESP_BLE_GAP_PAST_MODE_NO_REPORT_EVT
   An periodic adv sync transfer received event and no periodic adv report events

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_DISABLED
   Periodic adv report events will be enabled with duplicate filtering disabled

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_ENABLED
   Periodic adv report events will be enabled with duplicate filtering enabled

Type Definitions

typedef uint8_t esp_ble_key_type_t

typedef uint8_t esp_ble_auth_req_t
   combination of the above bit pattern

typedef uint8_t esp_ble_io_cap_t
   combination of the io capability

typedef uint8_t esp_ble_dtm_pkt_payload_t

typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]
typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]

typedef uint16_t esp_ble_ext_adv_type_mask_t

typedef uint8_t esp_ble_gap_phy_t

typedef uint8_t esp_ble_gap_all_phys_t

typedef uint8_t esp_ble_gap_pri_phy_t

typedef uint8_t esp_ble_gap_phy_mask_t

typedef uint16_t esp_ble_gap_prefer_phy_options_t

typedef uint8_t esp_ble_ext_scan_cfg_mask_t

typedef uint8_t esp_ble_gap_ext_adv_data_status_t

typedef uint8_t esp_ble_gap_sync_t

typedef uint8_t esp_ble_gap_adv_type_t

typedef uint8_t esp_ble_gap_past_mode_t

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)

GAP callback function type.

Param event : Event type
Param param : Point to callback parameter, currently is union type

Enumerations

enum esp_gap_ble_cb_event_t

GAP BLE callback event type.

Values:

enumerator ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT

When advertising data set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT

When scan response data set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT

When scan parameters set complete, the event comes

enumerator ESP_GAP_BLE_SCAN_RESULT_EVT

When one scan result ready, the event comes each time
enumerator **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**
   When raw advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**
   When raw scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**
   When start advertising complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**
   When start scan complete, the event comes

enumerator **ESP_GAP_BLE_AUTH_CMPL.EVT**
   Authentication complete indication.

enumerator **ESP_GAP_BLE_KEY.EVT**
   BLE key event for peer device keys

enumerator **ESP_GAP_BLE_SEC_REQ_EVT**
   BLE security request

enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**
   passkey notification event

enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**
   passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**
   OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**
   BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**
   BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**
   Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**
   When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**
   When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**
   When set the static rand address complete, the event comes
enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**
   When update connection parameters complete, the event comes

enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**
   When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**
   When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**
   When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**
   When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**
   When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**
   When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**
   When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**
   When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**
   When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**
   When reading phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT**
   When preferred default phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT**
   When preferred phy complete, this event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**
   When extended set random address complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT**
   When extended advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT**
   When extended advertising data complete, the event comes
enumerator ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT
when extended scan response data complete, the event comes

enumerator ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT
when extended advertising start complete, the event comes

enumerator ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT
when extended advertising stop complete, the event comes

enumerator ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT
when extended advertising set remove complete, the event comes

enumerator ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT
when extended advertising set clear complete, the event comes

enumerator ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT
when periodic advertising parameter complete, the event comes

enumerator ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT
when periodic advertising data complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT
when periodic advertising parameter complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT
when periodic advertising data complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT
when periodic advertising start complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT
when periodic advertising stop complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT
when periodic advertising create sync complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT
when extended advertising sync cancel complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT
when extended advertising sync terminate complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT
when extended advertising add device complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT
when extended advertising remove device complete, the event comes

enumerator ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT
when extended advertising clear device, the event comes

enumerator ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT
when extended scan parameter complete, the event comes
enumerator `ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT`
when extended scan start complete, the event comes

enumerator `ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT`
when extended scan stop complete, the event comes

enumerator `ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT`
when extended prefer connection parameter set complete, the event comes

enumerator `ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT`
when BLE phy update complete, the event comes

enumerator `ESP_GAP_BLE_EXT_ADV_REPORT_EVT`
when extended advertising report complete, the event comes

enumerator `ESP_GAP_BLE_SCAN_TIMEOUT_EVT`
when scan timeout complete, the event comes

enumerator `ESP_GAP_BLE_ADV_TERMINATED_EVT`
when advertising terminate data complete, the event comes

enumerator `ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT`
when scan req received complete, the event comes

enumerator `ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT`
when channel select algorithm complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT`
when periodic report advertising complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT`
when periodic advertising sync lost complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT`
when periodic advertising sync establish complete, the event comes

enumerator `ESP_GAP_BLE_SC_OOB_REQ_EVT`
Secure Connection OOB request event

enumerator `ESP_GAP_BLE_SC_CR_LOC_OOB_EVT`
Secure Connection create OOB data complete event

enumerator `ESP_GAP_BLE_GET_DEV_NAME_COMPLETE_EVT`
When getting BT device name complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_RECV_ENABLE_COMPLETE_EVT`
when set periodic advertising receive enable complete, the event comes
enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_COMPLETE_EVT`
when periodic advertising sync transfer complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SET_INFO_TRANS_COMPLETE_EVT`
when periodic advertising set info transfer complete, the event comes

enumerator `ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT`
when set periodic advertising sync transfer params complete, the event comes

enumerator `ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_RECV_EVT`
when periodic advertising sync transfer received, the event comes

enumerator `ESP_GAP_BLE_DTM_TEST_UPDATE_EVT`
when direct test mode state changes, the event comes

enumerator `ESP_GAP_BLE_ADV_CLEAR_COMPLETE_EVT`
when clear advertising complete, the event comes

enumerator `ESP_GAP_BLE_VENDOR_CMD_COMPLETE_EVT`
when vendor hci command complete, the event comes

enumerator `ESP_GAP_BLE_EVT_MAX`
when maximum advertising event complete, the event comes

enum `esp_ble_adv_data_type`
The type of advertising data(not adv_type)

Values:

enumerator `ESP_BLE_AD_TYPE_FLAG`
enumerator `ESP_BLE_AD_TYPE_16SRV_PART`
enumerator `ESP_BLE_AD_TYPE_16SRV_CMPL`
enumerator `ESP_BLE_AD_TYPE_32SRV_PART`
enumerator `ESP_BLE_AD_TYPE_32SRV_CMPL`
enumerator `ESP_BLE_AD_TYPE_128SRV_PART`
enumerator `ESP_BLE_AD_TYPE_128SRV_CMPL`
enumerator `ESP_BLE_ADTYPE_NAME_SHORT`
enumerator `ESP_BLE_ADTYPE_NAME_CMPL`
enumerator `ESP_BLE_AD_TYPE_TX_PWR`

enumerator ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE

enumerator ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE

enumerator ESP_BLE_AD_MANUFACTURER_SPECIFIC_TYPE

enum esp_ble_adv_type_t

Advertising mode.

Values:

enumerator ADV_TYPE_IND

enumerator ADV_TYPE_DIRECT_IND_HIGH

enumerator ADV_TYPE_SCAN_IND

enumerator ADV_TYPE_NONCONN_IND

enumerator ADV_TYPE_DIRECT_IND_LOW

enum esp_ble_adv_channel_t

Advertising channel mask.

Values:

enumerator ADV_CHNL_37

enumerator ADV_CHNL_38

enumerator ADV_CHNL_39

enumerator ADV_CHNL_ALL

enum esp_ble_adv_filter_t

Values:

enumerator ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY

Allow both scan and connection requests from anyone.

enumerator ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY

Allow both scan req from White List devices only and connection req from anyone.

enumerator ADV_FILTER.Allow_SCAN_ANY_CON_WLST

Allow both scan req from anyone and connection req from White List devices only.

enumerator ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST

Allow scan and connection requests from White List devices only.
enum esp_ble_sec_act_t

Values:

enumerator ESP_BLE_SEC_ENCRYPT
relate to BTA_DM_BLE_SEC_ENCRYPT in bta/bta_api.h. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn’t bonded, the stack will use the default authentication request used the esp_ble_gap_set_security_param function set by the user.

enumerator ESP_BLE_SEC_ENCRYPT_NO_MITM
relate to BTA_DM_BLE_SEC_ENCRYPT_NO_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) Whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn’t been bonded, the stack will use NO MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

enumerator ESP_BLE_SEC_ENCRYPT_MITM
relate to BTA_DM_BLE_SEC_ENCRYPT_MITM in bta/bta_api.h. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn’t been bonded, the stack will use MITM authentication request in the current link instead of using the authreq in the esp_ble_gap_set_security_param function set by the user.

enum esp_ble_sm_param_t

Values:

enumerator ESP_BLE_SM_PASSKEY
Authentication requirements of local device

enumerator ESP_BLE_SM_AUTHEN_REQ_MODE
The IO capability of local device

enumerator ESP_BLE_SM_IOCAP_MODE
Initiator Key Distribution/Generation

enumerator ESP_BLE_SM_SET_INIT_KEY
Responder Key Distribution/Generation

enumerator ESP_BLE_SM_SET_RSP_KEY
Maximum Encryption key size to support

enumerator ESP_BLE_SM_MAX_KEY_SIZE
Minimum Encryption key size requirement from Peer

enumerator ESP_BLE_SM_MIN_KEY_SIZE
Set static Passkey

enumerator ESP_BLE_SM_SET_STATIC_PASSKEY
Reset static Passkey
enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**
Accept only specified SMP Authentication requirement

denumerator **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**
Enable/Disable OOB support

denumerator **ESP_BLE_SM_OOB_SUPPORT**
Apply encryption key size

denumerator **ESP_BLE_APP_ENC_KEY_SIZE**
Apply encryption max param

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_dtm_update_evt_t**
Values:

enumerator **DTM_TX_START_EVT**
DTM TX start event.

denumerator **DTM_RX_START_EVT**
DTM RX start event.

enumerator **DTM_TEST_STOP_EVT**
DTM test end event.

enum **esp_ble_scan_type_t**
Ble scan type.
Values:

enumerator **BLE_SCAN_TYPE_PASSIVE**
Passive scan

enumerator **BLE_SCAN_TYPE_ACTIVE**
Active scan

enum **esp_ble_scan_filter_t**
Ble scan filter type.
Values:

enumerator **BLE_SCAN_FILTER_ALLOW_ALL**
Accept all:
  i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**
Accept only:
  i. advertisement packets from devices where the advertiser’s address is in the White list.
  ii. Directed advertising packets which are not addressed for this device shall be ignored.
enumerator BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR
Accept all:
   i. undirected advertisement packets, and
   ii. directed advertising packets where the initiator address is a resolvable private address, and
   iii. directed advertising packets addressed to this device.

enumerator BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR
Accept all:
   i. advertisement packets from devices where the advertiser’s address is in the White list, and
   ii. directed advertising packets where the initiator address is a resolvable private address, and
   iii. directed advertising packets addressed to this device.

enum esp_ble_scan_duplicate_t
Ble scan duplicate type.
Values:

enumerator BLE_SCAN_DUPLICATE_DISABLE
the Link Layer should generate advertising reports to the host for each packet received

enumerator BLE_SCAN_DUPLICATE_ENABLE
the Link Layer should filter out duplicate advertising reports to the Host

enumerator BLE_SCAN_DUPLICATE_ENABLE_RESET
Duplicate filtering enabled, reset for each scan period, only supported in BLE 5.0.

enumerator BLE_SCAN_DUPLICATE_MAX
Reserved for future use.

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.
Values:

enumerator ESP_GAP_SEARCH_INQ_RES_EVT
Inquiry result for a peer device.

enumerator ESP_GAP_SEARCH_INQ_CMPL_EVT
Inquiry complete.

enumerator ESP_GAP_SEARCH_DISC_RES_EVT
Discovery result for a peer device.

enumerator ESP_GAP_SEARCH_DISC_BLE_RES_EVT
Discovery result for BLE GATT based service on a peer device.

enumerator ESP_GAP_SEARCH_DISC_CMPL_EVT
Discovery complete.
enumerator **ESP_GAP_SEARCH_DI_DISC_CMPL_EVT**
   Discovery complete.

enumerator **ESP_GAP_SEARCH_SEARCHCANCEL_CMPL_EVT**
   Search cancelled

enumerator **ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT**
   The number of pkt discarded by flow control

enum **esp_ble_evt_type_t**
   Ble scan result event type, to indicate the result is scan response or advertising data or other.

   Values:

   enumerator **ESP_BLE_EVT_CONN_ADV**
      Connectable undirected advertising (ADV_IND)

   enumerator **ESP_BLE_EVT_CONN_DIR_ADV**
      Connectable directed advertising (ADV_DIRECT_IND)

   enumerator **ESP_BLE_EVT_DISC_ADV**
      Scannable undirected advertising (ADV_SCAN_IND)

   enumerator **ESP_BLE_EVT_NON_CONN_ADV**
      Non connectable undirected advertising (ADV_NONCONN_IND)

   enumerator **ESP_BLE_EVT_SCAN_RSP**
      Scan Response (SCAN_RSP)

enum **esp_ble_wi_operation_t**
   Values:

   enumerator **ESP_BLE_WHITELIST_REMOVE**
      remove mac from whitelist

   enumerator **ESP_BLE_WHITELIST_ADD**
      add address to whitelist

   enumerator **ESP_BLE_WHITELIST_CLEAR**
      clear all device in whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**
   Values:

   enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**
      Add device info into duplicate scan exceptional list

   enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**
      Remove device info from duplicate scan exceptional list
Chapter 2. API Reference

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
Clean duplicate scan exceptional list

e num **esp_ble_duplicate_exceptional_info_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**
BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SOLIC_ADV**
BLE mesh adv with proxy solicitation PDU uuid, the format is | Len | 0x24 | data... |

enum **esp_duplicate_scan_exceptional_list_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST**
duplicate scan exceptional addr list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST**
duplicate scan exceptional mesh link ID list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST**
duplicate scan exceptional mesh beacon type list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST**
duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST**
duplicate scan exceptional mesh adv with proxy service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SOLIC_ADV_LIST**
duplicate scan exceptional mesh adv with proxy solicitation PDU uuid
enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_URI_ADV_LIST**

duplicate scan exceptional URI list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST**

duplicate scan exceptional all list

**GATT Defines**

**API Reference**

**Header File**

- components/bluetooth/api/include/api/esp_gatt_defs.h
- This header file can be included with:

```
#include "esp_gatt_defs.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

**Unions**

union **esp_gatt_rsp_t**

```
#include <esp_gatt_defs.h>
```

GATT remote read request response type.

**Public Members**

**esp_gatt_value_t** attr_value

Gatt attribute structure

```
uint16_t handle
```

Gatt attribute handle

**Structures**

struct **esp_gatt_id_t**

Gatt id, include uuid and instance id.

**Public Members**

**esp_bt_uuid_t** uuid

UUID

```
uint8_t inst_id
```

Instance id
struct esp_gatt_srvc_id_t
Gatt service id, include id (uuid and instance id) and primary flag.

**Public Members**

`esp_gatt_id_t id`
Gatt id, include uuid and instance

`bool is_primary`
This service is primary or not

struct esp_attr_desc_t
Attribute description (used to create database)

**Public Members**

`uint16_t uuid_length`
UUID length

`uint8_t *uuid_p`
UUID value

`uint16_t perm`
Attribute permission

`uint16_t max_length`
Maximum length of the element

`uint16_t length`
Current length of the element

`uint8_t *value`
Element value array

struct esp_attr_control_t
attribute auto response flag

**Public Members**

`uint8_t auto_rsp`
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
attribute type added to the gatt server database
Chapter 2. API Reference

Public Members

```c
esp_attr_control_t attr_control
```

The attribute control type

```c
esp_attr_desc_t att_desc
```

The attribute type

```c
struct esp_attr_value_t
```

set the attribute value type

Public Members

```c
uint16_t attr_max_len
```

attribute max value length

```c
uint16_t attr_len
```

attribute current value length

```c
uint8_t *attr_value
```

the pointer to attribute value

```c
struct esp_gatts_incl_svc_desc_t
```

Gatt includes service entry element.

Public Members

```c
uint16_t start_hdl
```

Gatt start handle value of included service

```c
uint16_t end_hdl
```

Gatt end handle value of included service

```c
uint16_t uuid
```

Gatt attribute value UUID of included service

```c
struct esp_gatts_incl128_svc_desc_t
```

Gatt include 128 bit service entry element.

Public Members

```c
uint16_t start_hdl
```

Gatt start handle value of included 128 bit service

```c
uint16_t end_hdl
```

Gatt end handle value of included 128 bit service
Chapter 2. API Reference

**struct esp_gatt_value_t**
Gatt attribute value.

**Public Members**

- `uint8_t value[ESP_GATT_MAX_ATTR_LEN]`
  Gatt attribute value

- `uint16_t handle`
  Gatt attribute handle

- `uint16_t offset`
  Gatt attribute value offset

- `uint16_t len`
  Gatt attribute value length

- `uint8_t auth_req`
  Gatt authentication request

**struct esp_gatt_conn_params_t**
Connection parameters information.

**Public Members**

- `uint16_t interval`
  connection interval

- `uint16_t latency`
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

- `uint16_t timeout`
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

**struct esp_gattc_multi_t**
read multiple attribute

**Public Members**

- `uint8_t num_attr`
  The number of the attribute

- `uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]`
  The handles list

**struct esp_gattc_db_elem_t**
data base attribute element
### Public Members

**esp_gatt_db_attr_type_t**
- type
  - The attribute type

**uint16_t**
- attribute_handle
  - The attribute handle, it's valid for all of the type

**uint16_t**
- start_handle
  - The service start handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

**uint16_t**
- end_handle
  - The service end handle, it's valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

**esp_gatt_char_prop_t**
- properties
  - The characteristic properties, it's valid only when the type = ESP_GATT_DB_CHARACTERISTIC

**esp_bt_uuid_t**
- uuid
  - The attribute uuid, it's valid for all of the type

**struct esp_gattc_service_elem_t**
- service element

### Public Members

**bool**
- is_primary
  - The service flag, true if the service is primary service, else is secondary service

**uint16_t**
- start_handle
  - The start handle of the service

**uint16_t**
- end_handle
  - The end handle of the service

**esp_bt_uuid_t**
- uuid
  - The uuid of the service

**struct esp_gattc_char_elem_t**
- characteristic element

### Public Members

**uint16_t**
- char_handle
  - The characteristic handle
Chapter 2. API Reference

```c
esp_gatt_char_prop_t properties
    The characteristic properties

esp_bt_uuid_t uuid
    The characteristic uuid

struct esp_gattc_descr_elem_t
descriptor element

Public Members

uint16_t handle
    The characteristic descriptor handle

esp_bt_uuid_t uuid
    The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
include service element

Public Members

uint16_t handle
    The include service current attribute handle

uint16_t incl_srvc_s_handle
    The start handle of the service which has been included

uint16_t incl_srvc_e_handle
    The end handle of the service which has been included

esp_bt_uuid_t uuid
    The include service uuid

Macros

ESP_GATT_CHAR_PROP_BIT_INDICATE

ESP_GATT_CHAR_PROP_BIT_AUTH

ESP_GATT_CHAR_PROP_BIT_EXT_PROP
ESP_GATT_MAX_ATTR_LEN
   GATT maximum attribute length.

ESP_GATT_RSP_BY_APP

ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE
   If callback report gattc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions

typedef uint16_t esp_gatt_perm_t

typedef uint8_t esp_gatt_char_prop_t

typedef uint8_t esp_gatt_if_t
   Gatt interface type, different application on GATT client use different gatt_if

Enumerations

enum esp_gatt_prep_write_type
   Attribute write data type from the client.
   Values:

   enumerator ESP_GATT_PREP_WRITE_CANCEL
      Prepare write cancel

   enumerator ESP_GATT_PREP_WRITE_EXEC
      Prepare write execute

enum esp_gatt_status_t
   GATT success code and error codes.
   Values:

   enumerator ESP_GATT_OK

   enumerator ESP_GATT_INVALID_HANDLE

   enumerator ESP_GATT_READ_NOT_PERMIT

   enumerator ESP_GATT_WRITE_NOT_PERMIT

   enumerator ESP_GATT_INVALID_PDU

enum esp_gatt_conn_reason_t

- Gatt Connection reason enum.

- Values:

  - Enumerator ESP_GATT_CONN_UNKNOWN
    - Gatt connection unknown
  
  - Enumerator ESP_GATT_CONN_L2C_FAILURE
    - General L2cap failure
  
  - Enumerator ESP_GATT_CONN_TIMEOUT
    - Connection timeout
  
  - Enumerator ESP_GATT_CONN_TERMINATE_PEER_USER
    - Connection terminate by peer user
enumerator **ESP_GATT_CONN_TERMINATE_LOCAL_HOST**  
Connection terminated by local host

enumerator **ESP_GATT_CONN_FAIL_ESTABLISH**  
Connection fail to establish

enumerator **ESP_GATT_CONN_LMP_TIMEOUT**  
Connection fail for LMP response tout

enumerator **ESP_GATT_CONN_CONN_CANCEL**  
L2CAP connection cancelled

enumerator **ESP_GATT_CONN_NONE**  
No connection to cancel

enum **esp_gatt_auth_req_t**  
Gatt authentication request type.  
*Values:*

enumerator **ESP_GATT_AUTH_REQ_NONE**

enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_MITM**

enum **esp_service_source_t**  
*Values:*

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**

enum **esp_gatt_write_type_t**  
Gatt write type.  
*Values:*

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**  
Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**  
Gatt write attribute need remote response
enum \texttt{esp\_gatt\_db\_attr\_type\_t}

the type of attribute element

\textit{Values:}

enumerator \texttt{ESP\_GATT\_DB\_PRIMARY\_SERVICE}

\begin{displayquote}
Gattc primary service attribute type in the cache
\end{displayquote}

enumerator \texttt{ESP\_GATT\_DB\_SECONDARY\_SERVICE}

\begin{displayquote}
Gattc secondary service attribute type in the cache
\end{displayquote}

enumerator \texttt{ESP\_GATT\_DB\_CHARACTERISTIC}

\begin{displayquote}
Gattc characteristic attribute type in the cache
\end{displayquote}

enumerator \texttt{ESP\_GATT\_DB\_DESCRIPTOR}

\begin{displayquote}
Gattc characteristic descriptor attribute type in the cache
\end{displayquote}

enumerator \texttt{ESP\_GATT\_DB\_INCLUDED\_SERVICE}

\begin{displayquote}
Gattc include service attribute type in the cache
\end{displayquote}

enumerator \texttt{ESP\_GATT\_DB\_ALL}

\begin{displayquote}
Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache
\end{displayquote}

\textbf{GATT Server API}

\textbf{Application Examples} Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

\begin{itemize}
  \item This is a GATT server demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from the operation of adding attributes one by one. This is the recommended method of adding attributes (officially recommended).
    \begin{itemize}
      \item \texttt{bluetooth/bluedroid/ble/gatt\_server\_service\_table}
      \item GATT Server Service Table Example Walkthrough
    \end{itemize}
  \item This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Blueend. The recommended method of adding attributes is presented in the example below.
    \begin{itemize}
      \item \texttt{bluetooth/bluedroid/ble/gatt\_server}
      \item GATT Server Example Walkthrough
    \end{itemize}
  \item This is a demo similar to Bluetooth® Low Energy (Bluetooth LE) SPP. In this demo, GATT server can receive data from UART and then send the data to the peer device automatically.
    \begin{itemize}
      \item \texttt{bluetooth/bluedroid/ble/ble\_spp\_server}
    \end{itemize}
\end{itemize}

\textbf{API Reference}

\textbf{Header File}

\begin{itemize}
  \item \texttt{components/bt/host/bluedroid/api/include/api/esp\_gatts\_api.h}
  \item This header file can be included with:
\end{itemize}

\begin{verbatim}
#include "esp\_gatts\_api\_.h"
\end{verbatim}
• This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

### Functions

**esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)**

This function is called to register application callbacks with BTA GATTS module.

**Returns**

- ESP_OK : success
- other : failed

**esp_gatts_cb_t esp_ble_gatts_get_callback (void)**

This function is called to get the current application callbacks with BTA GATTS module.

**Returns**

- esp_gatts_cb_t : current callback

**esp_err_t esp_ble_gatts_app_register (uint16_t app_id)**

This function is called to register application identifier.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)**

unregister with GATT Server.

**Parameters**

- **gatts_if** -- [in] GATT server access interface

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)**

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Parameters**

- **gatts_if** -- [in] GATT server access interface
- **service_id** -- [in] service ID.
- **num_handle** -- [in] number of handle requested for this service.

**Returns**

- ESP_OK : success
- other : failed

**esp_err_t esp_ble_gatts_create_attr_tab (const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint16_t max_nb_attr, uint8_t srvc_inst_id)**

Create a service attribute tab.

**Parameters**

- **gatts_attr_db** -- [in] the pointer to the service attr tab
- **gatts_if** -- [in] GATT server access interface
- **max_nb_attr** -- [in] the number of attribute to be added to the service database.
- **srvc_inst_id** -- [in] the instance id of the service

**Returns**
Chapter 2. API Reference

- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gatts_add_included_service**(uint16_t service_handle, uint16_t included_service_handle)

This function is called to add an included service. This function have to be called between 'esp_ble_gatts_create_service' and 'esp_ble_gatts_add_char'. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

**Parameters**
- **service_handle** -- [in] service handle to which this included service is to be added.
- **included_service_handle** -- [in] the service ID to be included.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gatts_add_char**(uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control)

This function is called to add a characteristic into a service.

**Parameters**
- **service_handle** -- [in] service handle to which this included service is to be added.
- **char_uuid** -- [in] : Characteristic UUID.
- **perm** -- [in] : Characteristic value declaration attribute permission.
- **property** -- [in] : Characteristic Properties
- **char_val** -- [in] : Characteristic value
- **control** -- [in] : attribute response control byte

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gatts_add_char_descr**(uint16_t service_handle, esp_bt_uuid_t *descr_uuid, esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val, esp_attr_control_t *control)

This function is called to add characteristic descriptor. When it's done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

**Parameters**
- **service_handle** -- [in] service handle to which this characteristic descriptor is to be added.
- **descr_uuid** -- [in] descriptor access permission.
- **perm** -- [in] descriptor access permission.
- **descr_uuid** -- [in] descriptor UUID.
- **char_descr_val** -- [in] : Characteristic descriptor value
- **control** -- [in] : attribute response control byte

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gatts_delete_service**(uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

**Parameters**
- **service_handle** -- [in] service_handle to be deleted.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gatts_start_service**(uint16_t service_handle)

This function is called to start a service.

**Parameters**
- **service_handle** -- [in] the service handle to be started.
Chapter 2. API Reference

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)`

This function is called to stop a service.

**Parameters**
- `service_handle` -- [in] - service to be topped.

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t* value, bool need_confirm)`

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication. Note: the size of indicate or notify data need less than MTU size, see "esp_ble_gatc_send_mtu_req".

**Parameters**
- `gatts_if` -- [in] GATT server access interface
- `conn_id` -- [in] - connection id to indicate.
- `attr_handle` -- [in] - attribute handle to indicate.
- `value_len` -- [in] - indicate value length.
- `value` -- [in] value to indicate.
- `need_confirm` -- [in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)`

This function is called to send a response to a request.

**Parameters**
- `gatts_if` -- [in] GATT server access interface
- `trans_id` -- [in] - transfer id
- `status` -- [in] - response status

**Returns**
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_set_attr_value (uint16_t attr_handle, uint16_t length, const uint8_t* value)`

This function is called to set the attribute value by the application.

**Parameters**
- `attr_handle` -- [in] the attribute handle which to be set
- `length` -- [in] the value length
- `value` -- [in] the pointer to the attribute value

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gatts_get_attr_value (uint16_t attr_handle, uint16_t *length, const uint8_t **value)`

Retrieve attribute value.

**Parameters**
- `length` -- [out] pointer to the attribute value length
- `value` -- [out] Pointer to attribute value payload, the value cannot be modified by user
Chapter 2. API Reference

Returns
- ESP_GATT_OK : success
- other : failed

`esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)`
Open a direct open connection or add a background auto connection.

Parameters
- `gatts_if` -- [in] GATT server access interface
- `remote_bda` -- [in] remote device bluetooth device address.
- `is_direct` -- [in] direct connection or background auto connection

Returns
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`
Close a connection a remote device.

Parameters
- `gatts_if` -- [in] GATT server access interface
- `conn_id` -- [in] connection ID to be closed.

Returns
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`
Send service change indication.

Parameters
- `gatts_if` -- [in] GATT server access interface
- `remote_bda` -- [in] remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Returns
- ESP_OK : success
- other : failed

`esp_err_t esp_ble_gatts_show_local_database(void)`
Print local database (GATT service table)

Returns
- ESP_OK : success
- other : failed

Unions

union `esp_ble_gatts_cb_param_t`

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct `esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg`
Gatt server callback param of ESP_GATTS_REG_EVT

struct `esp_ble_gatts_cb_param_t::gatts_read_evt_param read`
Gatt server callback param of ESP_GATTS_READ_EVT
struct esp_ble_gatts_ch_param_t::gatts_write_evt_param write
   Gatt server callback param of ESP_GATTS_WRITE_EVT

struct esp_ble_gatts_ch_param_t::gatts_exec_write_evt_param exec_write
   Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct esp_ble_gatts_ch_param_t::gatts_mtu_evt_param mtu
   Gatt server callback param of ESP_GATTS_MTU_EVT

struct esp_ble_gatts_ch_param_t::gatts_conf_evt_param conf
   Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct esp_ble_gatts_ch_param_t::gatts_create_evt_param create
   Gatt server callback param of ESP_GATTS_CREATE_EVT

struct esp_ble_gatts_ch_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
   Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_ch_param_t::gatts_add_char_evt_param add_char
   Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_ch_param_t::gatts_add_char_descr_evt_param add_char_descr
   Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_ch_param_t::gatts_delete_evt_param del
   Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_ch_param_t::gatts_start_evt_param start
   Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_ch_param_t::gatts_stop_evt_param stop
   Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_ch_param_t::gatts_connect_evt_param connect
   Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_ch_param_t::gatts_disconnect_evt_param disconnect
   Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_ch_param_t::gatts_open_evt_param open
   Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_ch_param_t::gatts_cancel_open_evt_param cancel_open
   Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_ch_param_t::gatts_close_evt_param close
   Gatt server callback param of ESP_GATTS_CLOSE_EVT
struct esp_ble_gatts_ch_param_t::gatts_congest_evt_param congest
Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_ch_param_t::gatts_rsp_evt_param rsp
Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_ch_param_t::gatts_add_attr_tab_evt_param add_attr_tab
Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_ch_param_t::gatts_set_attr_val_evt_param set_attr_val
Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_ch_param_t::gatts_send_service_change_evt_param service_change
Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
#include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

Type Definitions
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
    GATT Server callback function type.

    Param event : Event type
    Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile
    Param param : Point to callback parameter, currently is union type
Enumerations

enum esp_gatts_cb_event_t
    GATT Server callback function events.
    
    Values:
    
    enumerator ESP_GATTS_REG_EVT
        When register application id, the event comes
    
    enumerator ESP_GATTS_READ_EVT
        When gatt client request read operation, the event comes
    
    enumerator ESP_GATTS_WRITE_EVT
        When gatt client request write operation, the event comes
    
    enumerator ESP_GATTS_EXEC_WRITE_EVT
        When gatt client request execute write, the event comes
    
    enumerator ESP_GATTS_MTU_EVT
        When set mtu complete, the event comes
    
    enumerator ESP_GATTS_CONF_EVT
        When receive confirm, the event comes
    
    enumerator ESP_GATTS_UNREG_EVT
        When unregister application id, the event comes
    
    enumerator ESP_GATTS_CREATE_EVT
        When create service complete, the event comes
    
    enumerator ESP_GATTS_ADD_INCL_SRVC_EVT
        When add included service complete, the event comes
    
    enumerator ESP_GATTS_ADD_CHAR_EVT
        When add characteristic complete, the event comes
    
    enumerator ESP_GATTS_ADD_CHAR_DESCR_EVT
        When add descriptor complete, the event comes
    
    enumerator ESP_GATTS_DELETE_EVT
        When delete service complete, the event comes
    
    enumerator ESP_GATTS_START_EVT
        When start service complete, the event comes
    
    enumerator ESP_GATTS_STOP_EVT
        When stop service complete, the event comes
    
    enumerator ESP_GATTS_CONNECT_EVT
        When gatt client connect, the event comes
enumerator **ESP_GATTS_DISCONNECT_EVT**
   When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**
   When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**
   When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**
   When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**
   When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**
   When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**
   When gatt send response complete, the event comes

enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**
   When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**
   When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**
   When gatt send service change indication complete, the event comes

**GATT Client API**

**Application Example**  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gatc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
- This is a demo similar to Bluetooth® Low Energy (Bluetooth LE) SPP. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

**API Reference**
Header File

- components/bt/host/bluedroid/api/include/api/esp_gattc_api.h
- This header file can be included with:

```c
#include "esp_gattc_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

Functions

**esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)**
This function is called to register application callbacks with GATTC module.

- Parameters **callback** -- [in] : pointer to the application callback function.

- Returns
  - ESP_OK: success
  - other: failed

**esp_gattc_cb_t esp_ble_gattc_get_callback (void)**
This function is called to get the current application callbacks with BTA GATTC module.

- Returns
  - esp_gattC_cb_t: current callback

**esp_err_t esp_ble_gattc_app_register (uint16_t app_id)**
This function is called to register application callbacks with GATTC module.

- Parameters **app_id** -- [in] : Application Identify (UUID), for different application

- Returns
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gattc_app_unregister (esp_gatt_if_t gattc_if)**
This function is called to unregister an application from GATTC module.

- Returns
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gattc_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)**
Open a direct connection or add a background auto connection.

- Parameters
  - **remote_bda** -- [in] remote device bluetooth device address.
  - **remote_addr_type** -- [in] remote device bluetooth device the address type.
  - **is_direct** -- [in] direct connection or background auto connection(by now, background auto connection is not supported).

- Returns
  - ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gattc_aux_open (esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)**
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection, if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Parameters
- conn_id -- [in] connection ID to be closed.

Returns
- ESP_OK: success
- other: failed

esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

Parameters
- conn_id -- [in] connection ID.

Returns
- ESP_OK: success
- other: failed

esp_err_t esp_ble_gattc_search_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event. Note: 128-bit base UUID will automatically be converted to a 16-bit UUID in the search results. Other types of UUID remain unchanged.

Parameters
- conn_id -- [in] connection ID.
- filter_uuid -- [in] a UUID of the service application is interested in. If Null, discover for all services.

Returns
- ESP_OK: success
- other: failed

esp_gatt_status_t esp_ble_gattc_get_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

Parameters
- conn_id -- [in] connection ID which identify the server.
- svc_uuid -- [in] the pointer to the service uuid.
- result -- [out] The pointer to the service which has been found in the gattc cache.
- count -- [inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- offset -- [in] Offset of the service position to get.

Returns
- ESP_OK: success
- other: failed

esp_gatt_status_t esp_ble_gattc_get_all_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t offset)
Find all the characteristic with the given service in the gattc cache. Note: It just get characteristic from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle.
- `end_handle` -- [in] the attribute end handle
- `result` -- [out] The pointer to the characteristic in the service.
- `count` -- [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- `offset` -- [in] Offset of the characteristic position to get.

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gattc_get_all_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)`

Find all the descriptor with the given characteristic in the gattc cache. Note: It just get descriptor from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `char_handle` -- [in] the given characteristic handle
- `result` -- [out] The pointer to the descriptor in the characteristic.
- `count` -- [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- `offset` -- [in] Offset of the descriptor position to get.

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)`

Find the characteristic with the given characteristic uuid in the gattc cache. Note: It just get characteristic from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle
- `end_handle` -- [in] the attribute end handle
- `char_uuid` -- [in] the characteristic uuid
- `result` -- [out] The pointer to the characteristic in the service.
- `count` -- [inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)`

Find the descriptor with the given characteristic uuid in the gattc cache. Note: It just get descriptor from local cache, won't get from remote devices.

**Parameters**
- `conn_id` -- [in] connection ID which identify the server.
- `start_handle` -- [in] the attribute start handle
- `end_handle` -- [in] the attribute end handle
- `char_uuid` -- [in] the characteristic uuid
- `descr_uuid` -- [in] the descriptor uuid
- `result` -- [out] The pointer to the descriptor in the characteristic.
- `count` -- [inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**
- ESP_OK: success
- other: failed

`esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)`
cache, won’t get from remote devices.

Parameters
• `conn_id` -- [in] connection ID which identify the server.
• `start_handle` -- [in] the attribute start handle
• `end_handle` -- [in] the attribute end handle
• `char_uuid` -- [in] the characteristic uuid.
• `descr_uuid` -- [in] the descriptor uuid.
• `result` -- [out] The pointer to the descriptor in the given characteristic.
• `count` -- [inout] input the number of descriptor want to find, it will output the number
  of descriptor has been found in the gattc cache with the given characteristic.

Returns
• ESP_OK: success
• other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local
cache, won’t get from remote devices.

Parameters
• `conn_id` -- [in] connection ID which identify the server.
• `char_handle` -- [in] the characteristic handle.
• `descr_uuid` -- [in] the descriptor uuid.
• `result` -- [out] The pointer to the descriptor in the given characteristic.
• `count` -- [inout] input the number of descriptor want to find, it will output the number
  of descriptor has been found in the gattc cache with the given characteristic.

Returns
• ESP_OK: success
• other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from
local cache, won’t get from remote devices.

Parameters
• `conn_id` -- [in] connection ID which identify the server.
• `start_handle` -- [in] the attribute start handle
• `end_handle` -- [in] the attribute end handle
• `incl_uuid` -- [in] the include service uuid
• `result` -- [out] The pointer to the include service in the given service.
• `count` -- [inout] input the number of include service want to find, it will output the
  number of include service has been found in the gattc cache with the given service.

Returns
• ESP_OK: success
• other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)
```
Find the attribute count with the given service or characteristic in the gattc cache.

**Parameters**
- **gattc_if** -- [in]: Gatt client access interface.
- **conn_id** -- [in]: connection ID which identify the server.
- **type** -- [in]: the attribute type.
- **start_handle** -- [in]: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored.
- **end_handle** -- [in]: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored.
- **char_handle** -- [in]: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn't ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored.
- **count** -- [out]: output the number of attribute has been found in the gattc cache with the given attribute type.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

**Parameters**
- **gattc_if** -- [in]: Gatt client access interface.
- **start_handle** -- [in]: the attribute start handle
- **end_handle** -- [in]: the attribute end handle
- **conn_id** -- [in]: connection ID which identify the server.
- **db** -- [in]: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** -- [in]: number of elements in database.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic handle.

**Parameters**
- **gattc_if** -- [in]: Gatt client access interface.
- **conn_id** -- [in]: connection ID.
- **handle** -- [in]: characteristic handle to read.
- **auth_req** -- [in]: authenticate request type

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service's characteristics of the given characteristic UUID.

**Parameters**
- **gattc_if** -- [in]: Gatt client access interface.
- **conn_id** -- [in]: connection ID.
- **start_handle** -- [in]: the attribute start handle.
- **end_handle** -- [in]: the attribute end handle.
- **uuid** -- [in]: The UUID of attribute which will be read.
Chapter 2. API Reference

- auth_req -- [in] : authenticate request type

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)`

This function is called to read multiple characteristic or characteristic descriptors.

Parameters
- conn_id -- [in] : connection ID.
- read_multi -- [in] : pointer to the read multiple parameter.
- auth_req -- [in] : authenticate request type

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_read_multiple_variable(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)`

This function is called to read multiple variable length characteristic or characteristic descriptors.

Parameters
- conn_id -- [in] : connection ID.
- read_multi -- [in] : pointer to the read multiple parameter.
- auth_req -- [in] : authenticate request type

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)`

This function is called to read a characteristics descriptor.

Parameters
- conn_id -- [in] : connection ID.
- handle -- [in] : descriptor handle to read.
- auth_req -- [in] : authenticate request type

Returns
- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)`

This function is called to write characteristic value.

Parameters
- conn_id -- [in] : connection ID.
- handle -- [in] : characteristic handle to write.
- value_len -- [in] : length of the value to be written.
- value -- [in] : the value to be written.
- write_type -- [in] : the type of attribute write operation.

Returns
- ESP_OK: success
- other: failed
**esp_err_t esp_ble_gattc_write_char_descr**

`esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)`

This function is called to write characteristic descriptor value.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `handle` -- [in]: descriptor handle to write.
- `value_len` -- [in] length of the value to be written.
- `value` -- [in]: the value to be written.
- `write_type` -- [in]: the type of attribute write operation.
- `auth_req` -- [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_prepare_write**

`esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)`

This function is called to prepare write a characteristic value.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `handle` -- [in]: characteristic handle to prepare write.
- `offset` -- [in]: offset of the write value.
- `value_len` -- [in] length of the value to be written.
- `value` -- [in]: the value to be written.
- `auth_req` -- [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_prepare_write_char_descr**

`esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)`

This function is called to prepare write a characteristic descriptor value.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `handle` -- [in]: characteristic descriptor handle to prepare write.
- `offset` -- [in]: offset of the write value.
- `value_len` -- [in] length of the value to be written.
- `value` -- [in]: the value to be written.
- `auth_req` -- [in]: authentication request.

**Returns**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gattc_execute_write**

`esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)`

This function is called to execute write a prepare write sequence.

**Parameters**
- `conn_id` -- [in]: connection ID.
- `is_execute` -- [in]: execute or cancel.

**Returns**
• ESP_OK: success
• other: failed

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda,
                                          uint16_t handle)
```

This function is called to register for notification of a service.

**Parameters**
- `server_bda` -- [in]: target GATT server.
- `handle` -- [in]: GATT characteristic handle.

**Returns**
- ESP_OK: registration succeeds
- other: failed

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda,
                                             uint16_t handle)
```

This function is called to de-register for notification of a service.

**Parameters**
- `server_bda` -- [in]: target GATT server.
- `handle` -- [in]: GATT characteristic handle.

**Returns**
- ESP_OK: unregister succeeds
- other: failed

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Parameters** `remote_bda` -- [in] remote device BD address.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr,
                                     bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Parameters**
- `src_addr` -- [in] the source address which provide the attribute table.
- `assoc_addr` -- [in] the associated device address which went to share the attribute table with the source address.
- `is_assoc` -- [in] true add the associated device address, false remove the associated device address.

**Returns**
- ESP_OK: success
- other: failed

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

Chapter 2. API Reference

Returns

• ESP_OK: success
• other: failed

```
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```
Clean the service cache of this device in the gattc stack.

Parameters remote_bda -- [in] remote device BD address.

Returns

• ESP_OK: success
• other: failed

Unions

union esp_ble_gattc_cb_param_t

```

Type Definitions

typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)

GATT Client callback function type.

**Param event** : Event type
**Param gattc_if**: GATT client access interface, normally different gattc_if correspond to different profile

**Param param**: Point to callback parameter, currently is union type

**Enumerations**

```c
enum esp_gattc_cb_event_t
{
    GATTClientcallbackfunctionevents.

    Values:

    enumerator ESP_GATTC_REG_EVT
        When GATT client is registered, the event comes

    enumerator ESP_GATTC_UNREG_EVT
        When GATT client is unregistered, the event comes

    enumerator ESP_GATTC_OPEN_EVT
        When GATT virtual connection is set up, the event comes

    enumerator ESP_GATTC_READ_CHAR_EVT
        When GATT characteristic is read, the event comes

    enumerator ESP_GATTC_WRITE_CHAR_EVT
        When GATT characteristic write operation completes, the event comes

    enumerator ESP_GATTC_CLOSE_EVT
        When GATT virtual connection is closed, the event comes

    enumerator ESP_GATTC_SEARCH_CMPL_EVT
        When GATT service discovery is completed, the event comes

    enumerator ESP_GATTC_SEARCH_RES_EVT
        When GATT service discovery result is got, the event comes

    enumerator ESP_GATTC_READ_DESCR_EVT
        When GATT characteristic descriptor read completes, the event comes

    enumerator ESP_GATTC_WRITE_DESCR_EVT
        When GATT characteristic descriptor write completes, the event comes

    enumerator ESP_GATTC_NOTIFY_EVT
        When GATT notification or indication arrives, the event comes

    enumerator ESP_GATTC_PREP_WRITE_EVT
        When GATT prepare-write operation completes, the event comes

    enumerator ESP_GATTC_EXEC_EVT
        When write execution completes, the event comes
```
enumerator ESP_GATTC_ACL_EVT
    When ACL connection is up, the event comes

enumerator ESP_GATTC_CANCEL_OPEN_EVT
    When GATT client ongoing connection is cancelled, the event comes

enumerator ESP_GATTC_SRVC_CHG_EVT
    When "service changed" occurs, the event comes

enumerator ESP_GATTC_ENC_CMPL_CB_EVT
    When encryption procedure completes, the event comes

enumerator ESP_GATTC_CFG_MTU_EVT
    When configuration of MTU completes, the event comes

enumerator ESP_GATTC_ADV_DATA_EVT
    When advertising of data, the event comes

enumerator ESP_GATTC_MULT_ADV_ENB_EVT
    When multi-advertising is enabled, the event comes

enumerator ESP_GATTC_MULT_ADV_UPD_EVT
    When multi-advertising parameters are updated, the event comes

enumerator ESP_GATTC_MULT_ADV_DATA_EVT
    When multi-advertising data arrives, the event comes

enumerator ESP_GATTC_MULT_ADV_DIS_EVT
    When multi-advertising is disabled, the event comes

enumerator ESP_GATTC_CONGEST_EVT
    When GATT connection congestion comes, the event comes

enumerator ESP_GATTC_BTH_SCAN_ENB_EVT
    When batch scan is enabled, the event comes

enumerator ESP_GATTC_BTH_SCAN_CFG_EVT
    When batch scan storage is configured, the event comes

enumerator ESP_GATTC_BTH_SCAN_RD_EVT
    When Batch scan read event is reported, the event comes

enumerator ESP_GATTC_BTH_SCAN_THR_EVT
    When Batch scan threshold is set, the event comes

enumerator ESP_GATTC_BTH_SCAN_PARAM_EVT
    When Batch scan parameters are set, the event comes
enumerator **ESP_GATT_BTH_SCAN_DIS_EVT**
When Batch scan is disabled, the event comes

enumerator **ESP_GATT_SCAN_FLT_CFG_EVT**
When Scan filter configuration completes, the event comes

enumerator **ESP_GATT_SCAN_FLT_PARAM_EVT**
When Scan filter parameters are set, the event comes

enumerator **ESP_GATT_SCAN_FLT_STATUS_EVT**
When Scan filter status is reported, the event comes

enumerator **ESP_GATT_ADV_VSC_EVT**
When advertising vendor spec content event is reported, the event comes

enumerator **ESP_GATT_REG_FOR_NOTIFY_EVT**
When register for notification of a service completes, the event comes

enumerator **ESP_GATT_UNREG_FOR_NOTIFY_EVT**
When unregister for notification of a service completes, the event comes

enumerator **ESP_GATT_CONNECT_EVT**
When the ble physical connection is set up, the event comes

enumerator **ESP_GATT_DISCONNECT_EVT**
When the ble physical connection disconnected, the event comes

enumerator **ESP_GATT_READ_MULTI_EVT**
When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATT_QUEUE_FULL_EVT**
When the gattc command queue full, the event comes

enumerator **ESP_GATT_SET_ASSOC_EVT**
When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATT_GET_ADDR_LIST_EVT**
When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATT_DIS_SRVC_CMPL_EVT**
When the ble discover service complete, the event comes

enumerator **ESP_GATT_READ_MULTI_VAR_EVT**
When read multiple variable characteristic complete, the event comes

**BluFi API**

**Overview**  BluFi is a profile based GATT to config ESP32 Wi-Fi to connect/disconnect AP or setup a softap and etc.
Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the "Key Exchange/Negotiation" procedure.

**Application Example**  Check `bluetooth` folder in ESP-IDF examples, which contains the following application:

- This is the BluFi demo. This demo can set ESP32's Wi-Fi to softap/station/softap&station mode and config Wi-Fi connections - `bluetooth/blufi`

**API Reference**

**Header File**

- components/bt/common/api/include/api/esp_blufi_api.h

This header file can be included with:

```
#include "esp_blufi_api.h"
```

- This header file is part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

**Functions**

`esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)`

This function is called to receive blufi callback event.

**Parameters**

- `callbacks` -- [in] callback functions

**Returns**

- ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_init (void)`

This function is called to initialize blufi_profile.

**Returns**

- ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit (void)`

This function is called to de-initialize blufi_profile.

**Returns**

- ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`

This function is called to send wifi connection report.

**Parameters**

- `opmode` -- : wifi opmode
- `sta_conn_state` -- : station is already in connection or not
- `softap_conn_num` -- : softap connection number
- `extra_info` -- : extra information, such as sta_ssid, softap_ssid and etc.

**Returns**

- ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)`

This function is called to send wifi list.

**Parameters**
Chapter 2. API Reference

• **apCount** -- : wifi list count
• **list** -- : wifi list

**Returns** ESP_OK - success, other - failed

```c
uint16_t esp_blufi_get_version (void)
```
Get BLUFI profile version.

**Returns** Most 8bit significant is Great version, Least 8bit is Sub version

```c
esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)
```
This function is called to send blufi error information.

**Parameters**
- **state** -- : error state

**Returns** ESP_OK - success, other - failed

```c
esp_err_t esp_blufi_send_custom_data (uint8_t* data, uint32_t data_len)
```
This function is called to custom data.

**Parameters**
- **data** -- : custom data value
- **data_len** -- : the length of custom data

**Returns** ESP_OK - success, other - failed

### Unions

```c
union esp_blufi_cb_param_t
```
#include <esp_blufi_api.h> BLUFI callback parameters union.

    length of password of station interface

uint8_t *softap_ssid
    SSID of softap interface

int softap_ssid_len
    length of SSID of softap interface
uint8_t *softap_passwd
  password of station interface

int softap_passwd_len
  length of password of station interface

uint8_t softap_authmode
  authentication mode of softap interface

bool softap_authmode_set
  is authentication mode of softap interface set

uint8_t softap_max_conn_num
  max connection number of softap interface

bool softap_max_conn_num_set
  is max connection number of softap interface set

uint8_t softap_channel
  channel of softap interface

bool softap_channel_set
  is channel of softap interface set

uint8_t sta_max_conn_retry
  max retry of sta establish connection

bool sta_max_conn_retry_set
  is max retry of sta establish connection set

uint8_t sta_conn_end_reason
  reason of sta connection end

bool sta_conn_end_reason_set
  is reason of sta connection end set

int8_t sta_conn_rssi
  rssi of sta connection

bool sta_conn_rssi_set
  is rssi of sta connection set

struct esp_blufi_ap_record_t
  Description of an WiFi AP.

Public Members

uint8_t *ssid[33]
  SSID of AP
int8_t rssi
    signal strength of AP

struct esp_blufi_callbacks_t
    BLUFI callback functions type.

    Public Members

    esp_blufi_event_cb_t event_cb
        BLUFI event callback

    esp_blufi_negotiate_data_handler_t negotiate_data_handler
        BLUFI negotiate data function for negotiate share key

    esp_blufi_encrypt_func_t encrypt_func
        BLUFI encrypt data function with share key generated by negotiate_data_handler

    esp_blufi_decrypt_func_t decrypt_func
        BLUFI decrypt data function with share key generated by negotiate_data_handler

    esp_blufi_checksum_func_t checksum_func
        BLUFI checksum function (FCS)

    Macros

    ESP_BLUFI_BD_ADDR_LEN
        Bluetooth address length.

    Type Definitions

typedef uint8_t esp_blufi_bd_addr_t[ESP_BLUFI_BD_ADDR_LEN]
    Bluetooth device address.
typedef void (*esp_blufi_event_cb_t)(esp_blufi_event_cb_t event, esp_blufi_cb_param_t *param)
    BLUFI event callback function type.
        Param event : Event type
        Param param : Point to callback parameter, currently is union type
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)
    BLUFI negotiate data handler.
        Param data : data from phone
        Param len : length of data from phone
        Param output_data : data want to send to phone
        Param output_len : length of data want to send to phone
        Param need_free : output reporting if memory needs to be freed or not *
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
    BLUFI encrypt the data after negotiate a share key.
**Chapter 2. API Reference**

**Param iv8**: initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt_data**: plain text and encrypted data, the encrypt function must support auto-chthonous encrypt

**Param crypt_len**: length of plain text

**Return**  Nonnegative number is encrypted length, if error, return negative number;

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

**Param iv8**: initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt_data**: encrypted data and plain text, the encrypt function must support auto-chthonous decrypt

**Param crypt_len**: length of encrypted text

**Return**  Nonnegative number is decrypted length, if error, return negative number;

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

**Param iv8**: initial vector(8bit), normally, blufi core will input packet sequence number

**Param data**: data need to checksum

**Param len**: length of data

**Enumerations**

**enum esp_blufi_cb_event_t**

**Values:**

```

Functions

**esp_err_t esp_ble_tx_power_set**(esp_ble_power_type_t power_type, esp_power_level_t power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

**Parameters**

- `power_type` --: The type of which tx power, could set Advertising/Connection/Default and etc
- `power_level` --: Power level(index) corresponding to absolute value(dbm)

**Returns** ESP_OK - success, other - failed

**esp_power_level_t esp_ble_tx_power_get**(esp_ble_power_type_t power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

**Parameters**

- `power_type` --: The type of which tx power, could set Advertising/Connection/Default and etc

**Returns** >=0 - Power level, <0 - Invalid

**esp_err_t esp_ble_tx_power_set_enhanced**(esp_ble_enhanced_power_type_t power_type, uint16_t handle, esp_power_level_t power_level)

ENHANCED API for Setting BLE TX power Connection Tx power should only be set after connection created.

**Parameters**

- `power_type` --: The enhanced type of which tx power, could set Advertising/Connection/Default and etc.
- `handle` --: The handle of Advertising or Connection and the value 0 for other enhanced power types.
- `power_level` --: Power level(index) corresponding to absolute value(dbm)

**Returns** ESP_OK - success, other - failed

**esp_power_level_t esp_ble_tx_power_get_enhanced**(esp_ble_enhanced_power_type_t power_type, uint16_t handle)

ENHANCED API of Getting BLE TX power Connection Tx power should only be get after connection created.

**Parameters**

- `power_type` --: The enhanced type of which tx power, could set Advertising/Connection/Default and etc
- `handle` --: The handle of Advertising or Connection and the value 0 for other enhanced power types.

**Returns** >=0 - Power level, <0 - Invalid
**esp_err_t** **esp_bt_controller_init**(esp_bt_controller_config_t *cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Parameters**
cfg -- Initial configuration of BT controller.

**Returns**
ESP_OK - success, other - failed

**esp_bt_controller_status_t** **esp_bt_controller_get_status**(void)

Get BT controller is initialised/de-initialised/enabled/disabled.

**Returns**
status value

**esp_err_t** **esp_bt_controller_deinit**(void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called. This function is not whole completed, esp_bt_controller_init cannot called after this function.

**Returns**
ESP_OK - success, other - failed

**esp_err_t** **esp_bt_controller_enable**(esp_bt_mode_t mode)

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

**Parameters**
mode -- : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument.

**Returns**
ESP_OK - success, other - failed

**esp_err_t** **esp_bt_controller_disable**(void)

Disable BT controller.

**Returns**
ESP_OK - success, other - failed

**bool** **esp_vhci_host_check_send_available**(void)

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.

**Returns**
true for ready to send, false means cannot send packet

**void** **esp_vhci_host_send_packet**(uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

• data -- the packet point
• len -- the packet length

**esp_err_t** **esp_vhci_host_register_callback**(const esp_vhci_host_callback_t *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

**Parameters**
callback -- esp_vhci_host_callback type variable

**Returns**
ESP_OK - success, ESP_FAIL - failed

**esp_err_t** **esp_bt_controller_mem_release**(esp_bt_mode_t mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.
If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls `esp_bt_controller_enable(ESP_BT_MODE_BLE)` to use BLE only then it is safe to call `esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT)` at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API `esp_bt_mem_release(ESP_BT_MODE_BTDM)` instead, which internally calls `esp_bt_controller_mem_release(ESP_BT_MODE_BTDM)` and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of `esp_bt_mem_release()` function.

**Parameters**
- **mode**: the mode want to release memory

**Returns**
- ESP_OK - success, other - failed

```c
esp_err_t esp_bt_mem_release(esp_bt_mode_t mode)
```

This function first releases controller memory by internally calling `esp_bt_controller_mem_release()`. Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation*. In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Parameters**
- **mode**: the mode whose memory is to be released

**Returns**
- ESP_OK - success, other - failed

```c
int esp_ble_hw_get_static_addr (esp_ble_addr_t *addr)
```

Returns random static address or -1 if not present.

**Returns**
- ESP_OK - success, other - failed

**Structures**

```c
struct esp_ble_addr_t
```

Address type and address value.

**Public Members**
Chapter 2. API Reference

```
uint8_t type
    Type of the Bluetooth address (public, random, etc.)

uint8_t val[6]
    Array containing the 6-byte Bluetooth address value

struct esp_bt_controller_config_t
    Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint32_t config_version
    Configuration version

uint16_t ble_ll_resolv_list_size
    Size of the BLE resolving list

uint16_t ble_hci_evt_hi_buf_count
    Number of high priority HCI event buffers

uint16_t ble_hci_evt_lo_buf_count
    Number of low priority HCI event buffers

uint8_t ble_ll_sync_list_cnt
    Number of entries in the BLE sync list

uint8_t ble_ll_sync_cnt
    Number of BLE sync instances

uint16_t ble_ll_rsp_dup_list_count
    Size of the BLE response duplicate list

uint16_t ble_ll_adv_dup_list_count
    Size of the BLE advertising duplicate list

uint8_t ble_ll_tx_pwr_dbm
    BLE transmit power in dBm

uint64_t rtc_freq
    RTC (Real-Time Clock) frequency

uint16_t ble_ll_sca
    BLE sleep clock accuracy in ppm

uint8_t ble_ll_scan_phy_number
    Number of BLE scanning physical layers
```
uint16_t ble_ll_conn_def_auth_pyld_tmo
BLE connection default authentication payload timeout

uint8_t ble_ll_jitter_usec
BLE link layer jitter in microseconds

uint16_t ble_ll_sched_max_adv_pdu_usec
BLE scheduler maximum advertising PDU duration in microseconds

uint16_t ble_ll_sched_direct_adv_max_usec
BLE scheduler maximum direct advertising duration in microseconds

uint16_t ble_ll_sched_adv_max_usec
BLE scheduler maximum advertising duration in microseconds

uint16_t ble_scan_rsp_data_max_len
Maximum length of BLE scan response data

uint8_t ble_ll_cfg_num_hci_cmd_pkts
Number of BLE LL configuration HCI command packets

uint32_t ble_ll_ctrl_proc_timeout_ms
BLE link layer controller process timeout in milliseconds

uint16_t nimble_max_connections
Maximum number of concurrent BLE connections

uint8_t ble_whitelist_size
Size of the BLE whitelist

uint16_t ble_acl_buf_size
Size of the BLE ACL data buffer

uint16_t ble_acl_buf_count
Number of BLE ACL data buffers

uint16_t blehci_evt_buf_size
Size of the BLE HCI event buffer

uint16_t ble_multi_adv_instances
Number of BLE multi-advertising instances

uint16_t ble_ext_adv_max_size
Maximum size of BLE extended advertising data

uint16_t controller_task_stack_size
Controller task stack size
uint8_t `controller_task_prio`
  Controller task priority

uint8_t `controller_run_cpu`
  CPU core on which the controller runs

uint8_t `enable_qa_test`
  Enable quality assurance (QA) testing

uint8_t `enable_bqb_test`
  Enable Bluetooth Qualification Test (BQB) testing

uint8_t `enable_uart_hci`
  Enable UART HCI (Host Controller Interface)

uint8_t `ble_hci_uart_port`
  UART port number for Bluetooth HCI

uint32_t `ble_hci_uart_baud`
  Baud rate for Bluetooth HCI UART

uint8_t `ble_hci_uart_data_bits`
  Number of data bits for Bluetooth HCI UART

uint8_t `ble_hci_uart_stop_bits`
  Number of stop bits for Bluetooth HCI UART

uint8_t `ble_hci_uart_flow_ctrl`
  Flow control settings for Bluetooth HCI UART

uint8_t `ble_hci_uart_uart_parity`
  Parity settings for Bluetooth HCI UART

uint8_t `enable_tx_cca`
  Enable Transmit Clear Channel Assessment (TX CCA)

uint8_t `cca_rssi_thresh`
  RSSI threshold for Transmit Clear Channel Assessment (CCA)

uint8_t `sleep_en`
  Enable sleep mode

uint8_t `coex_phy_coded_tx_rx_time_limit`
  PHY coded transmission and reception time limit for coexistence

uint8_t `dis_scan_backoff`
  Disable scan backoff
# Chapter 2. API Reference

### Public Members

```c
void (*notify_host_send_available)(void)
```

Callback used to notify that the host can send packet to controller.

```c
int (*notify_host_recv)(uint8_t*data, uint16_t len)
```

Callback used to notify that the controller has a packet to send to the host.

### Macros

- `CONFIG_VERSION`
- `CONFIG_MAGIC`
- `BT_CONTROLLER_INIT_CONFIG_DEFAULT()`
Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
        esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
        Bluetooth mode for controller enable/disable.
        Values:

        enumerator ESP_BT_MODE_IDLE
                Bluetooth is not running

        enumerator ESP_BT_MODE_BLE
                Run BLE mode

        enumerator ESP_BT_MODE_CLASSIC_BT
                Run Classic BT mode

        enumerator ESP_BT_MODE_BTDM
                Run dual mode

enum esp_bt_controller_status_t
        Bluetooth controller enable/disable/initialised/de-initialised status.
        Values:

        enumerator ESP_BT_CONTROLLER_STATUS_IDLE
                Controller is in idle state

        enumerator ESP_BT_CONTROLLER_STATUS_INITED
                Controller is in initialising state

        enumerator ESP_BT_CONTROLLER_STATUS_ENABLED
                Controller is in enabled state

        enumerator ESP_BT_CONTROLLER_STATUS_NUM
                Controller is in disabled state

enum esp_ble_power_type_t
        BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be
determined after connection completed. when disconnect, the correspond TX power is not affected.
        ESP_BLE_PWR_TYPE_DEFAULT : if each connection's TX power is not set, it will use this default value.
        if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will
        use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.
        Values:

        enumerator ESP_BLE_PWR_TYPE_CONN_HDL0
                For connection handle 0
enumerator ESP_BLE_PWR_TYPE_CONN_HDL1
   For connection handle 1

enumerator ESP_BLE_PWR_TYPE_CONN_HDL2
   For connection handle 2

enumerator ESP_BLE_PWR_TYPE_CONN_HDL3
   For connection handle 3

enumerator ESP_BLE_PWR_TYPE_CONN_HDL4
   For connection handle 4

enumerator ESP_BLE_PWR_TYPE_CONN_HDL5
   For connection handle 5

enumerator ESP_BLE_PWR_TYPE_CONN_HDL6
   For connection handle 6

enumerator ESP_BLE_PWR_TYPE_CONN_HDL7
   For connection handle 7

enumerator ESP_BLE_PWR_TYPE_CONN_HDL8
   For connection handle 8

enumerator ESP_BLE_PWR_TYPE_ADV
   For advertising

enumerator ESP_BLE_PWR_TYPE_SCAN
   For scan

enumerator ESP_BLE_PWR_TYPE_DEFAULT
   For default, if not set other, it will use default value

enumerator ESP_BLE_PWR_TYPE_NUM
   TYPE numbers

c enum esp_power_level_t
    Bluetooth TX power level(index), it's just a index corresponding to power(dbm).
    Values:

enumerator ESP_PWR_LVL_N15
   Corresponding to -15dbm

enumerator ESP_PWR_LVL_N12
   Corresponding to -12dbm

enumerator ESP_PWR_LVL_N9
   Corresponding to -9dbm
enumerator **ESP_PWR_LVL_N6**
Corresponding to -6dbm

enumerator **ESP_PWR_LVL_N3**
Corresponding to -3dbm

enumerator **ESP_PWR_LVL_N0**
Corresponding to 0dbm

enumerator **ESP_PWR_LVL_P3**
Corresponding to +3dbm

enumerator **ESP_PWR_LVL_P6**
Corresponding to +6dbm

enumerator **ESP_PWR_LVL_P9**
Corresponding to +9dbm

enumerator **ESP_PWR_LVL_P12**
Corresponding to +12dbm

enumerator **ESP_PWR_LVL_P15**
Corresponding to +15dbm

enumerator **ESP_PWR_LVL_P18**
Corresponding to +18dbm

enumerator **ESP_PWR_LVL_P20**
Corresponding to +20dbm

enumerator **ESP_PWR_LVL_INVALID**
Indicates an invalid value

enum **esp_ble_enhanced_power_type_t**
The enhanced type of which tx power, could set Advertising/Connection/Default and etc.

*Values:*

enumerator **ESP_BLE_ENHANCED_PWR_TYPE_DEFAULT**

enumerator **ESP_BLE_ENHANCED_PWR_TYPE_ADV**

enumerator **ESP_BLE_ENHANCED_PWR_TYPE_SCAN**

enumerator **ESP_BLE_ENHANCED_PWR_TYPE_INIT**

enumerator **ESP_BLE_ENHANCED_PWR_TYPE_CONN**
enumerator ESP_BLE_ENHANCED_PWR_TYPE_MAX

denum esp_ble_log_buf_t
    Select buffers.
    Values:
    
    enumerator ESP_BLE_LOG_BUF_HCI
    
    enumerator ESP_BLE_LOG_BUF_CONTROLLER

2.3.4 ESP-BLE-MESH

Note: The current ESP-BLE-MESH v1.1 related code is a preview version, so the Mesh Protocol v1.1 related Structures, MACROs, and APIs involved in the code may be changed.

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference
- ESP-BLE-MESH (v1.1) Core API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters
Chapter 2. API Reference

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h
- This header file can be included with:

```c
#include "esp_ble_mesh_defs.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

Unions

**union esp_ble_mesh_prov_cb_param_t**

```c
#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

Public Members

int err_code
Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr
Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side
Values:

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
Receive Friend Request from existing Low Power Node

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
Receive Friend Clear from other friend node

enumerator ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t lpn_addr
Low Power Node unicast address

cenum esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]
reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

```c
struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.
```

**Public Members**

- `uint8_t hops`
  - Heartbeat hops (InitTTL - RxTTL + 1)
- `uint16_t feature`
  - Bit field of currently active features of the node

```c

union esp_ble_mesh_server_state_value_t
#include <esp_ble_mesh_defs.h> Server model state value union.

Public Members

uint8_t onoff
The value of the Generic OnOff state
The value of the Light LC Light OnOff state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onoff
The Generic OnOff state

int16_t level
The value of the Generic Level state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_level
The Generic Level state

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onpowerup
The Generic OnPowerUp state

uint16_t power
The value of the Generic Power Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_power_actual
The Generic Power Actual state
```
uint16_t lightness
The value of the Light Lightness Actual state
The value of the Light Lightness Linear state
The value of the Light CTL Lightness state
The value of the Light HSL Lightness state
The value of the Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_actual
The Light Lightness Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_linear
The Light Lightness Linear state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_lightness
The Light CTL Lightness state

uint16_t temperature
The value of the Light CTL Temperature state

int16_t delta_uv
The value of the Light CTL Delta UV state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
The Light CTL Temperature & Delta UV states

uint16_t hue
The value of the Light HSL Hue state

uint16_t saturation
The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl
The Light HSL composite state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
The Light HSL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
The Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
The Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
The Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
The Light LC Light OnOff state
union esp_ble_mesh_model_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
    Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param model_send_comp
    Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param model_publish_comp
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_recv_publish_msg_param client_recv_publish_msg
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param client_send_timeout
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param model_publish_update
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param server_model_update_state
    Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

struct ble_mesh_client_model_send_timeout_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

uint32_t opcode
    Opcode of the previously sent message

esp_ble_mesh_model_t *model
    Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the previous message

struct ble_mesh_mod_recv_publish_msg_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.
**Public Members**

- `uint32_t opcode`
  Opcode of the unsolicited received message

- `esp_ble_mesh_model_t *model`
  Pointer to the model which receives the message

- `esp_ble_mesh_msg_ctx_t *ctx`
  Pointer to the context of the message

- `uint16_t length`
  Length of the received message

- `uint8_t *msg`
  Value of the received message

```
struct ble_mesh_model_operation_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.
```

**Public Members**

- `uint32_t opcode`
  Opcode of the received message

- `esp_ble_mesh_model_t *model`
  Pointer to the model which receives the message

- `esp_ble_mesh_msg_ctx_t *ctx`
  Pointer to the context of the message

- `uint16_t length`
  Length of the received message

- `uint8_t *msg`
  Value of the received message

```
struct ble_mesh_model_publish_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.
```

**Public Members**

- `int err_code`
  Indicate the result of publishing a message

- `esp_ble_mesh_model_t *model`
  Pointer to the model which publishes the message
struct **ble_mesh_model_publish_update_evt_param**

    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

**Public Members**

`esp_ble_mesh_model_t *model`

    Pointer to the model which is going to update its publish message

struct **ble_mesh_model_send_comp_param**

    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

**Public Members**

`int err_code`

    Indicate the result of sending a message

`uint32_t opcode`

    Opcode of the message

`esp_ble_mesh_model_t *model`

    Pointer to the model which sends the message

`esp_ble_mesh_msg_ctx_t *ctx`

    Context of the message

struct **ble_mesh_server_model_update_state_comp_param**

    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

**Public Members**

`int err_code`

    Indicate the result of updating server model state

`esp_ble_mesh_model_t *model`

    Pointer to the server model which state value is updated

`esp_ble_mesh_server_state_type_t type`

    Type of the updated server state

**Structures**

struct **esp_ble_mesh_deinit_param_t**

    BLE Mesh deinit parameters
**Public Members**

**bool erase_flash**
Indicate if erasing flash when deinit mesh stack

**struct esp_ble_mesh_uar_t**
Format of Unicast Address Range

**Public Members**

**uint16_t len_present**
Indicate the presence or absence of the RangeLength field

**uint16_t range_start**
15 least significant bits of the starting unicast address

**uint8_t range_length**
Number of addresses in the range (0x02 - 0xFF)

**struct esp_ble_mesh_elem_t**
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

**Public Members**

**uint16_t element_addr**
Element Address, assigned during provisioning.

**const uint16_t location**
Location Descriptor (GATT Bluetooth Namespace Descriptors)

**const uint8_t sig_model_count**
SIG Model count

**const uint8_t vnd_model_count**
Vendor Model count

**esp_ble_mesh_model_t *sig_models**
SIG Models

**esp_ble_mesh_model_t *vnd_models**
Vendor Models

**struct esp_ble_mesh_model_pub_t**
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h
Public Members

`esp_ble_mesh_model_t *model`

Pointer to the model to which the context belongs. Initialized by the stack.

`uint16_t publish_addr`

Publish Address.

`uint16_t app_idx`

Publish AppKey Index.

`uint16_t cred`

Friendship Credentials Flag.

`uint16_t send_rel`

Force reliable sending (segment acks)

`uint16_t send_szmic`

Size of TransMIC when publishing a Segmented Access message

`uint8_t ttl`

Publish Time to Live.

`uint8_t retransmit`

Retransmit Count & Interval Steps.

`uint8_t period`

Publish Period.

`uint8_t period_div`

Divisor for the Period.

`uint8_t fast_period`

Use FastPeriodDivisor

`uint8_t count`

Retransmissions left.

`uint32_t period_start`

Start of the current period.

`struct net_buf_simple *msg`

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the ESP_BLE_MESH_MODEL_PUB_DEFINE macro.

ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

`esp_ble_mesh_cb_t update`

Callback used to update publish message. Initialized by the stack.
struct k_delayed_work timer
    Publish Period Timer. Initialized by the stack.

uint8_t dev_role
    Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
    Abstraction that describes a model operation context. This structure is associated with struct bt_mesh_model_op in mesh_access.h

**Public Members**

const uint32_t opcode
    Message opcode

const size_t min_len
    Message minimum length

*esp_ble_mesh_cb_t* param_cb
    Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
    Abstraction that describes a model callback structure. This structure is associated with struct bt_mesh_model_cb in mesh_access.h.

**Public Members**

*esp_ble_mesh_cb_t* init_cb
    Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
    Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

**Public Members**

const uint16_t model_id
    16-bit model identifier

uint16_t company_id
    16-bit company identifier

uint16_t model_id
    16-bit model identifier

struct esp_ble_mesh_model::::[anonymous]::[anonymous] vnd
    Structure encapsulating a model ID with a company ID
union esp_ble_mesh_model::[anonymous] [anonymous]
    Model ID

uint8_t element_idx
    Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
    Is the Nth model in the element

uint16_t flags
    Information about what has changed

desp_ble_mesh_elem_t *element
    The Element to which this Model belongs

desp_ble_mesh_model_pub_t *const pub
    Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
    AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
    Subscription List (group or virtual addresses)

desp_ble_mesh_model_op_t *op
    Model operation context

desp_ble_mesh_model_cbs_t *cb
    Model callback structure

void *user_data
    Model-specific user data

struct desp_ble_mesh_msg_ctx_t
    Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
    NetKey Index of the subnet through which to send the message.

uint16_t app_idx
    AppKey Index for message encryption.

uint16_t addr
    Remote address.
uint16_t recv_dst  
Destination address of a received message. Not used for sending.

int8_t recv_rssi  
RSSI of a received message. Not used for sending.

uint32_t recv_op  
Opcode of a received message. Not used for sending.

uint8_t recv_ttl  
Received TTL value. Not used for sending.

uint8_t recv_cred  
Security credentials of a received message. Not used for sending.

uint8_t recv_tag  
Tag of a received message. Not used for sending.

uint8_t send_rel  
Forces sending reliably by using segment acknowledgement.

uint8_t send_szmic  
Size of TransMIC when sending a Segmented Access message.

uint8_t send_ttl  
TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint8_t send_cred  
Security credentials used for sending the message.

uint8_t send_tag  
Tag used for sending the message.

*esp_ble_mesh_model_t* model  
Model corresponding to the message, no need to be initialized before sending message

bool srv_send  
Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t  
Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t  
Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

**Public Members**
uint16_t cid
   16-bit SIG-assigned company identifier

uint16_t pid
   16-bit vendor-assigned product identifier

uint16_t vid
   16-bit vendor-assigned product version identifier

size_t element_count
   Element count

esp_ble_mesh_elem_t *elements
   A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
   Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t addr
   Device address

esp_ble_mesh_addr_type_t addr_type
   Device address type

uint8_t uuid[16]
   Device UUID

uint16_t oob_info
   Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both
PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t bearer
   Provisioning Bearer

struct esp_ble_mesh_device_delete_t
   Information of the device which is going to be deleted.

Public Members

esp_ble_mesh_bd_addr_t addr
   Device address

esp_ble_mesh_addr_type_t addr_type
   Device address type
uint8_t uuid[16]
   Device UUID

union esp_ble_mesh_device_delete_t::[anonymous] [anonymous]
   Union of Device information

uint8_t flag
   BIT0: device address; BIT1: device UUID

struct esp_ble_mesh_prov_data_info_t
   Information of the provisioner which is going to be updated.

   **Public Members**

uint16_t net_idx
   NetKey Index

uint8_t flags
   Flags

uint32_t iv_index
   IV Index

union esp_ble_mesh_prov_data_info_t::[anonymous] [anonymous]
   Provisioning data

uint8_t flag
   BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_node_t
   Information of the provisioned node

   **Public Members**

esp_ble_mesh_bd_addr_t addr
   Node device address

esp_ble_mesh_addr_type_t addr_type
   Node device address type

uint8_t dev_uuid[16]
   Device UUID

uint16_t oob_info
   Node OOB information
Chapter 2. API Reference

uint16_t **unicast_addr**
Node unicast address

uint8_t **element_num**
Node element number

uint16_t **net_idx**
Node NetKey Index

uint8_t **flags**
Node key refresh flag and iv update flag

uint32_t **iv_index**
Node IV Index

uint8_t **dev_key**[16]
Node device key

char **name**[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
Node name

uint16_t **comp_length**
Length of Composition Data

uint8_t **comp_data**
Value of Composition Data

struct **esp_ble_mesh_fast_prov_info_t**
Context of fast provisioning which need to be set.

**Public Members**

uint16_t **unicast_min**
Minimum unicast address used for fast provisioning

uint16_t **unicast_max**
Maximum unicast address used for fast provisioning

uint16_t **net_idx**
Netkey index used for fast provisioning

uint8_t **flags**
Flags used for fast provisioning

uint32_t **iv_index**
IV Index used for fast provisioning
uint8_t offset
Offset of the UUID to be compared

uint8_t match_len
Length of the UUID to be compared

uint8_t match_val[16]
Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t hb_src
Heartbeat source address (unicast address)

uint16_t hb_dst
Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

esp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.

uint32_t op_pair_size
Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode
uint32_t publish_status
   Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
   Pointer to the internal data of client model

void *vendor_data
   Pointer to the vendor data of client model

uint8_t msg_role
   Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
   Common parameters of the messages sent by Client Model.

   Public Members

   esp_ble_meshOpcode_t opcode
      Message opcode

   esp_ble_mesh_model_t *model
      Pointer to the client model structure

   esp_ble_mesh_msg_ctx_t ctx
      The context used to send message

   int32_t msg_timeout
      Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

   uint8_t msg_role
      Role of the device - Node/Provisioner

   struct esp_ble_mesh_state_transition_t
      Parameters of the server model state transition

   Public Functions

   BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
      Flag used to indicate if the transition timer has been started internally.
      If the model which contains esp_ble_mesh_state_transition_t sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.
      And users can use this flag to indicate whether the timer is started or not.
Public Members

bool just_started
    Indicate if the state transition has just started

dtype8 t trans_time
    State transition time

dtype8 t remain_time
    Remaining time of state transition

dtype8 t delay
    Delay before starting state transition

dtype32 t quo_tt
    Duration of each divided transition step

dtype32 t counter
    Number of steps which the transition duration is divided

dtype32 t total_duration
    State transition total duration

dtype64 t start_timestamp
    Time when the state transition is started

struct k_delayed_work timer
    Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
    Parameters of the server model received last same set message.

Public Members

dtype8 t tid
    Transaction number of the last message

dtype16 t src
    Source address of the last message

dtype16 t dst
    Destination address of the last message

dtype64 t timestamp
    Time when the last message is received

struct esp_ble_mesh_server_rsp_ctrl_t
    Parameters of the Server Model response control
Chapter 2. API Reference

Public Members

uint8_t get_auto_rsp

BLE Mesh Server Response Option.

i. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
ii. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
iii. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
iv. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
v. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
vi. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

uint8_t set_auto_rsp

Response control for Client Set messages

uint8_t status_auto_rsp

Response control for Server Status messages

Macros

ESP_BLE_MESH_SDU_MAX_LEN

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT

Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG

The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN

The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN

The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE

The default value of Random Update Interval Steps

ESP_BLE_MESH_RAND_UPDATE_INTERVAL_DEFAULT

Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX

Define the BLE Mesh octet 16 bytes size
Chapter 2. API Reference

ESP_BLE_MESH_OCTET16_LEN

ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_CID_NVAL

  Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT

  Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX

ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_PROXIES

Supported features

ESP_BLE_MESH_FEATURE_RELAY

ESP_BLE_MESH_FEATURE_PROXY

ESP_BLE_MESH_FEATURE_FRIEND

ESP_BLE_MESH_FEATURE_LOW_POWER

ESP_BLE_MESH_FEATURE_ALL_SUPPORTED

ESP_BLE_MESH_ADDR_IS_UNICAST(addr)

ESP_BLE_MESH_ADDR_IS_GROUP(addr)

ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)

ESP_BLE_MESH_ADDR_IS_RFU(addr)

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_PROV_RECORD_MAX_ID

ESP_BLE_MESH_TRANSMIT(count, int_ms)

Encode transmission count & interval steps.

Note: For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms (count is 3, step is 1, interval is 30 ms which includes 10 ms of advertising interval random delay).

Parameters

- count -- Number of retransmissions (first transmission is excluded).
- int_ms -- Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT(transmit)

Decode transmit count from a transmit value.

Parameters

- transmit -- Encoded transmit count & interval value.

Returns Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL(transmit)

Decode transmit interval from a transmit value.

Parameters

- transmit -- Encoded transmit count & interval value.

Returns Transmission interval in milliseconds.

ESP_BLE_MESH_PUBLISH_TRANSMIT(count, int_ms)

Encode Publish Retransmit count & interval steps.

Parameters
Chapter 2. API Reference

- **count** -- Number of retransmissions (first transmission is excluded).
- **int_ms** -- Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**Returns** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)
Decode Publish Retransmit count from a given value.

**Parameters**
- **transmit** -- Encoded Publish Retransmit count & interval value.

**Returns** Retransmission count (actual transmissions equal to N + 1).

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)
Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**Parameters**
- **transmit** -- Encoded Publish Retransmit count & interval value.

**Returns** Transmission interval in milliseconds.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**
Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**
Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

**Note:** This macro is associated with BLE_MESH_ELEM in mesh_access.h

**Parameters**
- **_loc** -- Location Descriptor.
- **_mods** -- Array of SIG models.
- **_vnd_mods** -- Array of vendor models.

**ESP_BLE_MESH_PROV** (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

ESP_BLE_MESH_MODEL_PUB_DEFINE((_name, _msg_len, _role))

Define a model publication context.

Parameters
- **_name** -- Variable name given to the context.
- **_msg_len** -- Length of the publication message.
- **_role** -- Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP(_opcode, _min_len)

Define a model operation context.

Parameters
- **_opcode** -- Message opcode.
- **_min_len** -- Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully.
**ADD_DEV_START_PROV_NOW_FLAG**
Start provisioning device immediately

**ADD_DEV_FLUSHABLE_DEV_FLAG**
Device can be removed when queue is full and new device is going to added

ESP_BLE_MESH_MODEL_STATUS_SUCCESS

ESP_BLE_MESH_MODEL_STATUS_CANNOT_SET_RANGE_MIN

ESP_BLE_MESH_MODEL_STATUS_CANNOT_SET_RANGE_MAX

ESP_BLE_MESH_SERVER_RSP_BY_APP
Response need to be sent in the application

ESP_BLE_MESH_SERVER_AUTO_RSP
Response will be sent internally
```
Type Definitions

typedef uint8_t esp_ble_mesh_octet16_t

Define the BLE Mesh octet 8 bytes size

typedef uint8_t esp_ble_mesh_octet8_t

Invalid Company ID

typedef uint32_t esp_ble_mesh_cb_t

typedef uint8_t UINT8

typedef uint16_t UINT16

typedef uint32_t UINT32

typedef uint64_t UINT64

typedef uint8_t BT_OCTET32[BT_OCTET32_LEN]

typedef uint8_t BD_ADDR[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_bd_addr_t

typedef uint8_t esp_ble_mesh_addr_type_t

BLE device address type.

typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t espble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t

espble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in
the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t

espble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to
locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in
the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t

espble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate
the opcodes used by the Config Model messages The following opcodes are used by the BLE Mesh Config
Server Model internally to respond to the Config Client Model's request messages.

typedef uint8_t espble_mesh_cfg_status_t

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status
message.
typedef uint32_t esp_ble_mesh_opcode_health_client_get_t

esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t

esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t

esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

defined enum esp_ble_mesh_cb_type_t

Values:

enumerator ESP_BLE_MESH_TYPE_PROV_CB
enumerator ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB
enumerator ESP_BLE_MESH_TYPE_OUTPUT_STR_CB
enumerator ESP_BLE_MESH_TYPE_INPUT_CB
enumerator ESP_BLE_MESH_TYPE_LINK_OPEN_CB
enumerator ESP_BLE_MESH_TYPE_LINK_CLOSE_CB
enumerator ESP_BLE_MESH_TYPE_COMPLETE_CB
enumerator ESP_BLE_MESH_TYPE_RESET_CB

enum esp_ble_mesh_oob_method_t
    Values:
    enumerator ESP_BLE_MESH_NO_OOB
    enumerator ESP_BLE_MESH_STATIC_OOB
    enumerator ESP_BLE_MESH_OUTPUT_OOB
    enumerator ESP_BLE_MESH_INPUT_OOB

enum esp_ble_mesh_output_action_t
    Values:
    enumerator ESP_BLE_MESH_NO_OUTPUT
    enumerator ESP_BLE_MESH_BLINK
    enumerator ESP_BLE_MESH_BEEP
    enumerator ESP_BLE_MESH_VIBRATE
    enumerator ESP_BLE_MESH_DISPLAY_NUMBER
    enumerator ESP_BLE_MESH_DISPLAY_STRING

enum esp_ble_mesh_input_action_t
    Values:
    enumerator ESP_BLE_MESH_NO_INPUT
    enumerator ESP_BLE_MESH_PUSH
    enumerator ESP_BLE_MESH_TWIST
Chapter 2. API Reference

enumerator ESP_BLE_MESH_ENTER_NUMBER
enumerator ESP_BLE_MESH_ENTER_STRING

enum esp_ble_mesh_prov_bearer_t
Values:

enumerator ESP_BLE_MESH_PROV_ADV
enumerator ESP_BLE_MESH_PROV_GATT

enum esp_ble_mesh_prov_oob_info_t
Values:

enumerator ESP_BLE_MESH_PROV_OOB_OTHER
enumerator ESP_BLE_MESH_PROV_OOB_URI
enumerator ESP_BLE_MESH_PROV_OOB_2D_CODE
enumerator ESP_BLE_MESH_PROV_OOB_BAR_CODE
enumerator ESP_BLE_MESH_PROV_OOB_NFC
enumerator ESP_BLE_MESH_PROV_OOB_NUMBER
enumerator ESP_BLE_MESH_PROV_OOB_STRING
enumerator ESP_BLE_MESH_PROV_CERT_BASED
enumerator ESP_BLE_MESH_PROV_RECORDS
enumerator ESP_BLE_MESH_PROV_OOB_ON_BOX
enumerator ESP_BLE_MESH_PROV_OOB_IN_BOX
enumerator ESP_BLE_MESH_PROV_OOB_ON_PAPER
enumerator ESP_BLE_MESH_PROV_OOB_IN_MANUAL
enumerator ESP_BLE_MESH_PROV_OOB_ON_DEV

enum esp_ble_mesh_dev_role_t
Values:

enumerator ROLE_NODE
 enumerator ROLE_PROVISIONER

 enumerator ROLE_FAST_PROV

 enum esp_ble_mesh_fast_prov_action_t
 Values:

  enumerator FAST_PROV_ACT_NONE

  enumerator FAST_PROV_ACT_ENTER

  enumerator FAST_PROV_ACT_SUSPEND

  enumerator FAST_PROV_ACT_EXIT

  enumerator FAST_PROV_ACT_MAX

 enum esp_ble_mesh_proxy_filter_type_t
 Values:

  enumerator PROXY_FILTER_WHITELIST

  enumerator PROXY_FILTER_BLACKLIST

 enum esp_ble_mesh_prov_cb_event_t
 Values:

  enumerator ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
       Initialize BLE Mesh provisioning capabilities and internal data information completion event

  enumerator ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
       Set the unprovisioned device name completion event

  enumerator ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
       Enable node provisioning functionality completion event

  enumerator ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
       Disable node provisioning functionality completion event

  enumerator ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
       Establish a BLE Mesh link event

  enumerator ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
       Close a BLE Mesh link event

  enumerator ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
       Generate Node input OOB public key event
enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT**
    Generate Node Output Number event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT**
    Generate Node Output String event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_EVT**
    Event requiring the user to input a number or string

enumerator **ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT**
    Provisioning done event

enumerator **ESP_BLE_MESH_NODE_PROV_RESET_EVT**
    Provisioning reset event

enumerator **ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT**
    Node set oob public key completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT**
    Node input number completion event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT**
    Node input string completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT**
    Enable BLE Mesh Proxy Identity advertising completion event

enumerator **ESP_BLE_MESH_NODE_PRIVATE_PROXY_IDENTITY_ENABLE_COMP_EVT**
    Enable BLE Mesh Private Proxy Identity advertising completion event

enumerator **ESP_BLE_MESH_NODE_PRIVATE_PROXY_IDENTITY_DISABLE_COMP_EVT**
    Disable BLE Mesh Private Proxy Identity advertising completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT**
    Enable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT**
    Disable BLE Mesh GATT Proxy Service completion event

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT**
    Node add NetKey locally completion event

enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**
    Node add AppKey locally completion event

enumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**
    Node bind AppKey to model locally completion event
enumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**
Provisioner enable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**
Provisioner disable provisioning functionality completion event

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT**
Provisioner receives unprovisioned device beacon event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**
Provisioner read unprovisioned device OOB public key event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT**
Provisioner input value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**
Provisioner output value for provisioning procedure event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**
Provisioner establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**
Provisioner close a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**
Provisioner provisioning done event

enumerator **ESP_BLE_MESH_PROVISIONER_CERT_BASED_PROV_START_EVT**
Provisioner initiate a certificate based provisioning

enumerator **ESP_BLE_MESH_PROVISIONER_RECV_PROV_RECORDS_LIST_EVT**
Provisioner receive provisioning records list event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_RECORD_RECV_COMP_EVT**
Provisioner receive provisioning record complete event

enumerator **ESP_BLE_MESH_PROVISIONER_SEND_PROV_RECORDS_GET_EVT**
Provisioner send provisioning records get to device event

enumerator **ESP_BLE_MESH_PROVISIONER_SEND_PROV_RECORD_REQUEST_EVT**
Provisioner send provisioning record request to device event

enumerator **ESP_BLE_MESH_PROVISIONER_SEND_PROV_INVITE_EVT**
Provisioner send provisioning invite to device event

enumerator **ESP_BLE_MESH_PROVISIONER_SEND_LINK_CLOSE_EVT**
Provisioner send link close to device event
enumerator ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
  Provisioner add a device to the list which contains devices that are waiting going to be provisioned completion event

enumerator ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
  Provisioner start to provision an unprovisioned device completion event

enumerator ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
  Provisioner delete a device from the list, close provisioning link with the device completion event

enumerator ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT
  Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

enumerator ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
  Provisioner set net_idx/flags/iv_index used for provisioning completion event

enumerator ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
  Provisioner set static oob value used for provisioning completion event

enumerator ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
  Provisioner set unicast address of primary element completion event

enumerator ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
  Provisioner read unprovisioned device OOB public key completion event

enumerator ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
  Provisioner input number completion event

enumerator ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
  Provisioner input string completion event

enumerator ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
  Provisioner set node name completion event

enumerator ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
  Provisioner add local app key completion event

enumerator ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
  Provisioner update local app key completion event

enumerator ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
  Provisioner bind local model with local app key completion event

enumerator ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
  Provisioner add local network key completion event

enumerator ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
  Provisioner update local network key completion event
enumerator ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT
Provisioner store node composition data completion event

tenumerator ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
Provisioner delete node with uuid completion event

tenumerator ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
Provisioner delete node with unicast address completion event

tenumerator ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
Provisioner start to receive heartbeat message completion event

tenumerator ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Provisioner set the heartbeat filter type completion event

tenumerator ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT
Provisioner set the heartbeat filter information completion event

tenumerator ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT
Provisioner receive heartbeat message event

tenumerator ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT
Provisioner directly erase settings completion event

tenumerator ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

tenumerator ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

tenumerator ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event

tenumerator ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

tenumerator ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

tenumerator ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

tenumerator ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

tenumerator ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event
enumerator ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
   Receive Heartbeat message event

enumerator ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
   Enable Low Power Node completion event

enumerator ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
   Disable Low Power Node completion event

enumerator ESP_BLE_MESH_LPN_POLL_COMP_EVT
   Low Power Node send Friend Poll completion event

enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
   Low Power Node establishes friendship event

enumerator ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
   Low Power Node terminates friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
   Friend Node establishes friendship event

enumerator ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
   Friend Node terminates friendship event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
   Proxy Client receives Network ID advertising packet event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
   Proxy Client establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
   Proxy Client terminates connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
   Proxy Client receives Proxy Filter Status event

enumerator ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
   Proxy Client connect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
   Proxy Client disconnect completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
   Proxy Client set filter type completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
   Proxy Client add filter address completion event
enumerator ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
   Proxy Client remove filter address completion event

enumerator ESP_BLE_MESH_PROXY_CLIENT_DIRECTED_PROXY_SET_COMP_EVT
   Proxy Client directed proxy set completion event

enumerator ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT
   Proxy Server establishes connection successfully event

enumerator ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT
   Proxy Server terminates connection successfully event

enumerator ESP_BLE_MESH_PROXY_CLIENT_SEND_SOLIC_PDU_COMP_EVT
   Proxy Client send Solicitation PDU completion event

enumerator ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
   Local model subscribes group address completion event

enumerator ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
   Local model unsubscribes group address completion event

enumerator ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
   De-initialize BLE Mesh stack completion event

enumerator ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
   BLE Mesh server models related definitions.
   This enum value is the flag of transition timer operation
   Values:

   enumerator ESP_BLE_MESH_SERVER_TRANS_TIMER_START

   enumerator ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
   This enum value is the type of server model states
   Values:

   enumerator ESP_BLE_MESH_GENERIC_ONOFF_STATE

   enumerator ESP_BLE_MESH_GENERIC_LEVEL_STATE

   enumerator ESP_BLE_MESH GENERIC_ONPOWERUP_STATE

   enumerator ESP_BLE_MESH_GENERIC_POWER_actual_STATE
enumerator ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
enumerator ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
enumerator ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
enumerator ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
enumerator ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
enumerator ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
enumerator ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t

Values:

enumerator ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

enumerator ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event

enumerator ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

enumerator ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

enumerator ESP_BLE_MESH_MODEL_EVT_MAX
Chapter 2.  API Reference

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- **ESP-BLE-MESH Stack Initialization**
- **Reading of Local Data Information**
- **Low Power Operation (Updating)**
- **Send/Publish Messages, add Local AppKey, etc.**
- **ESP-BLE-MESH Node/Provisioner Provisioning**
- **ESP-BLE-MESH GATT Proxy Server**

ESP-BLE-MESH Stack Initialization

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h
- This header file can be included with:

  ```
  #include "esp_ble_mesh_common_api.h"
  ```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

  ```
  REQUIRE bt
  ```

  or

  ```
  PRIV_REQUIRE bt
  ```

**Functions**

- **esp_err_t esp_ble_mesh_init** *(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)*

  Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

  **Note:** After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

  **Parameters**

  - **prov** -- [in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
  - **comp** -- [in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

  **Returns** ESP_OK on success or error code otherwise.

- **esp_err_t esp_ble_mesh_deinit** *(esp_ble_mesh_deinit_param_t *param)*

  De-initialize BLE Mesh module.

  **Note:** This function shall be invoked after esp_ble_mesh_client_model_deinit().

  **Parameters** **param** -- [in] Pointer to the structure of BLE Mesh deinit parameters.

  **Returns** ESP_OK on success or error code otherwise.

Reading of Local Data Information
Chapter 2. API Reference

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h
- This header file can be included with:

```c
#include "esp_ble_mesh_local_data_operation_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```c
REQUIRES bt
```

or

```c
PRIV_REQUIRES bt
```

Functions

### int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)

Get the model publish period, the unit is ms.

- **Parameters**
- **Returns**
  - Publish period value on success, 0 or (negative) error code from errno.h on failure.

### uint16_t esp_ble_mesh_get_primary_element_address (void)

Get the address of the primary element.

- **Returns**
  - Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

### uint16_t* esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

- **Parameters**
  - *model* -- [in] Pointer to the model.
- **Returns**
  - Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

### esp_ble_mesh_elem_t *esp_ble_mesh_find_element (uint16_t element_addr)

Find the BLE Mesh element pointer via the element address.

- **Parameters**
- **Returns**
  - Pointer to the element on success, or NULL on failure.

### uint8_t esp_ble_mesh_get_element_count (void)

Get the number of elements that have been registered.

- **Returns**
  - Number of elements.

### esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

- **Parameters**
  - *element* -- [in] Element to which the model belongs.
  - *company_id* -- [in] A 16-bit company identifier assigned by the Bluetooth SIG.
Returns Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)`

Find the SIG model with the given element and Model id.

**Parameters**
- `element` -- [in] Element to which the model belongs.

**Returns** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

`const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)`

Get the Composition data which has been registered.

**Returns** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

`esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)`

A local model of node or Provisioner subscribes a group address.

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Parameters**
- `element_addr` -- [in] Unicast address of the element to which the model belongs.
- `group_addr` -- [in] The group address to be subscribed.

**Returns** ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_model_unsubscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)`

A local model of node or Provisioner unsubscribes a group address.

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Parameters**
- `element_addr` -- [in] Unicast address of the element to which the model belongs.
- `group_addr` -- [in] The subscribed group address.

**Returns** ESP_OK on success or error code otherwise.

`const uint8_t *esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)`

This function is called by Node to get the local NetKey.

**Parameters** `net_idx` -- [in] NetKey index.

**Returns** NetKey on success, or NULL on failure.

`const uint8_t *esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)`

This function is called by Node to get the local AppKey.

**Parameters** `app_idx` -- [in] AppKey index.
Chapter 2. API Reference

**Returns**  AppKey on success, or NULL on failure.

*esp_err_t* esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

**Note:**  This function can only be called after the device is provisioned.

**Parameters**
- net_key -- [in] NetKey to be added.
- net_idx -- [in] NetKey Index.

**Returns**  ESP_OK on success or error code otherwise.

*esp_err_t* esp_ble_mesh_node_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

**Note:**  The net_idx must be an existing one. This function can only be called after the device is provisioned.

**Parameters**
- app_key -- [in] AppKey to be added.
- net_idx -- [in] NetKey Index.

**Returns**  ESP_OK on success or error code otherwise.

*esp_err_t* esp_ble_mesh_node_bind_app_key_to_local_model (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

**Note:**  If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Parameters**
- element_addr -- [in] Node local element address
- company_id -- [in] Node local company id
- model_id -- [in] Node local model id
- app_idx -- [in] Node local appkey index

**Returns**  ESP_OK on success or error code otherwise.

### Low Power Operation (Updating)

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

This header file can be included with:

```c
#include "esp_ble_mesh_low_power_api.h"
```

This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or
PRIV_REQUIRES bt

Functions

*esp_err_t* `esp_ble_mesh_lpn_enable(void)`

Enable BLE Mesh device LPN functionality.

**Note:** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Returns** ESP_OK on success or error code otherwise.

*esp_err_t* `esp_ble_mesh_lpn_disable(bool force)`

Disable BLE Mesh device LPN functionality.

**Parameters** `force` -- [in] when disabling LPN functionality, use this flag to indicate whether
directly clear corresponding information or just send friend clear to disable it if friendship has
already been established.

**Returns** ESP_OK on success or error code otherwise.

*esp_err_t* `esp_ble_mesh_lpn_poll(void)`

LPN tries to poll messages from the Friend Node.

**Note:** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it
has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API
is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer
expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages
for the Low Power node, then the Low Power node will stop scanning.

**Returns** ESP_OK on success or error code otherwise.

**Send/Publish Messages, Add Local AppKey, Etc.**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_networking_api.h"
```
- This header file is a part of the API provided by the bt component. To declare that your component depends
  on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

**Functions**

*esp_err_t* `esp_ble_mesh_register_custom_model_callback(esp_ble_mesh_model_cb_t callback)`

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events
generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
• If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
• If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
• If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note:** The client models (i.e., Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

### **Parameters**

**callback** -- [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

### **Parameters**

**data** -- [in] Pointer to the message data.

**opcode** -- [in] The message opcode.

**Returns** ESP_OK on success or error code otherwise.

### **Parameters**

**model** -- [in] BLE Mesh Client model to which the message belongs.

**Returns** ESP_OK on success or error code otherwise.

### **Parameters**

**model** -- [in] Pointer of the Client model.

**Returns** ESP_OK on success or error code otherwise.

### **Parameters**

**model** -- [in] BLE Mesh Server Model to which the message belongs.

**ctx** -- [in] Message context, includes keys, TTL, etc.

**length** -- [in] Message length (exclude the message opcode).

**data** -- [in] Parameters of Access Payload (exclude the message opcode) to be sent.

**Returns** ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_client_model_send_msg**

```c
esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
        esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
        uint16_t length, uint8_t *data, int32_t
        msg_timeout, bool need_rsp,
        esp_ble_mesh_dev_role_t device_role)
```

Send client model message (such as model get, set, etc).

**Parameters**

- **model** -- [in] BLE Mesh Client Model to which the message belongs.
- **ctx** -- [in] Message context, includes keys, TTL, etc.
- **length** -- [in] Message length (exclude the message opcode).
- **data** -- [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg_timeout** -- [in] Time to get response to the message (in milliseconds).
- **need_rsp** -- [in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **device_role** -- [in] Role of the device (Node/Provisioner) that sends the message.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_model_publish**

```c
esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t
        length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**Note:** Before calling this function, the user needs to ensure that the model publication message
`esp_ble_mesh_model_pub_t::msg` contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Parameters**

- **length** -- [in] Message length (exclude the message opcode).
- **data** -- [in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role** -- [in] Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_server_model_update_state**

```c
esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model,
        esp_ble_mesh_server_state_type_t type,
        esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note:** Currently this API is used to update bound state value, not for all server model states.

**Parameters**

- **model** -- [in] Server model which is going to update the state.
- **type** -- [in] Server model state type.
- **value** -- [in] Server model state value.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_local_reset**

```c
esp_ble_mesh_node_local_reset(void)
```

Reset the provisioning procedure of the local BLE Mesh node.
Note: All provisioning information in this node will be deleted and the node needs to be re-provisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name(uint16_t index, const char *name)
```
This function is called to set the node (provisioned device) name.

**Note:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Parameters**
- **index** -- [in] Index of the node in the node queue.
- **name** -- [in] Name (end by ‘\0’) to be set for the node.

**Returns** ESP_OK on success or error code otherwise.

```c
const char *esp_ble_mesh_provisioner_get_node_name(uint16_t index)
```
This function is called to get the node (provisioned device) name.

**Note:** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Parameters**
- **index** -- [in] Index of the node in the node queue.

**Returns** Node name on success, or NULL on failure.

```c
uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)
```
This function is called to get the node (provisioned device) index.

**Parameters**
- **name** -- [in] Name of the node (end by ‘\0’).

**Returns** Node index on success, or an invalid value (0xFFFF) on failure.

```c
esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)
```
This function is called to store the Composition Data of the node.

**Parameters**
- **unicast_addr** -- [in] Element address of the node
- **data** -- [in] Pointer of Composition Data
- **length** -- [in] Length of Composition Data

**Returns** ESP_OK on success or error code otherwise.

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])
```
This function is called to get the provisioned node information with the node device uuid.

**Parameters**
- **uuid** -- [in] Device UUID of the node

**Returns** Pointer of the node info struct or NULL on failure.

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)
```
This function is called to get the provisioned node information with the node unicast address.

**Parameters**
- **unicast_addr** -- [in] Unicast address of the node

**Returns** Pointer of the node info struct or NULL on failure.

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name(const char *name)
```
This function is called to get the provisioned node information with the node name.

**Parameters**
- **name** -- [in] Name of the node (end by ‘\0’).

**Returns** Pointer of the node info struct or NULL on failure.
uint16_t esp_ble_mesh_provisioner_get_prov_node_count (void)
This function is called by Provisioner to get provisioned node count.

Returns  Number of the provisioned nodes.

const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry (void)
This function is called by Provisioner to get the entry of the node table.

Note: After invoking the function to get the entry of nodes, users can use the "for" loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node's information. Before trying to read the node's information, users need to check if the node exists, i.e. if the *(esp_ble_mesh_node_t **node) is NULL. For example: ``` const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { ....... } } ```

Returns  Pointer to the start of the node table.

esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])
This function is called to delete the provisioned node information with the node device uuid.
Parameters  uuid -- [in] Device UUID of the node
Returns  ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr (uint16_t unicast_addr)
This function is called to delete the provisioned node information with the node unicast address.
Parameters  unicast_addr -- [in] Unicast address of the node
Returns  ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
This function is called to add a local AppKey for Provisioner.

Note:  app_key: If set to NULL, app_key will be generated internally.  net_idx: Should be an existing one.  app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

Parameters
• app_key -- [in] The app key to be set for the local BLE Mesh stack.
• net_idx -- [in] The network key index.
• app_idx -- [in] The app key index.
Returns  ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_update_local_app_key (const uint8_t app_key[16],
                                                      uint16_t net_idx, uint16_t app_idx)
This function is used to update a local AppKey for Provisioner.

Parameters
• app_key -- [in] Value of the AppKey.
• net_idx -- [in] Corresponding NetKey Index.
• app_idx -- [in] The AppKey Index
Returns  ESP_OK on success or error code otherwise.
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

Parameters
• net_idx -- [in] Network key index.
• app_idx -- [in] Application key index.

Returns App key on success, or NULL on failure.

esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

Note: company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Parameters
• element_addr -- [in] Provisioner local element address
• app_idx -- [in] Provisioner local appkey index
• model_id -- [in] Provisioner local model id
• company_id -- [in] Provisioner local company id

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

Note: net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Parameters
• net_key -- [in] The network key to be added to the Provisioner local BLE Mesh stack.
• net_idx -- [in] The network key index.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_update_local_net_key (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to update a local network key.

Parameters
• net_key -- [in] Value of the NetKey.
• net_idx -- [in] The NetKey Index.

Returns ESP_OK on success or error code otherwise.

const uint8_t *esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Returns Network key on success, or NULL on failure.

esp_err_t esp_ble_mesh_provisioner_recv_heartbeat (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.
Note: If enabling receiving heartbeat message successfully, the filter will be an empty reject list by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Parameters enable** -- [in] Enable or disable receiving heartbeat messages.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)
```

This function is called by Provisioner to set the heartbeat filter type.

**Note:**
1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   a. If the previous type is reject list, and changed to accept list, then the filter will be an empty accept list, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Parameters type** -- [in] Heartbeat filter type (accept list or reject list).

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)
```

This function is called by Provisioner to add or remove a heartbeat filter entry.

a. If the operation is "REMOVE", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • The filter entry with the same SRC or DST will be removed.

**Note:**
1. If the operation is "ADD", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
   • If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
   • If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

**Parameters**
- **op** -- [in] Add or REMOVE
- **info** -- [in] Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_direct_erase_settings(void)
```

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

**Note:** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

**Returns** ESP_OK on success or error code otherwise.
**esp_err_t** **esp_ble_mesh_provisioner_open_settings_with_index** *(uint8_t index)*

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Parameters**

- **index** -- [in] Settings index.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t** **esp_ble_mesh_provisioner_open_settings_with_uid** *(const char *uid)*

This function is called by Provisioner to open a nvs namespace for storing mesh information.

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

**Parameters**

- **uid** -- [in] Settings user id.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t** **esp_ble_mesh_provisioner_close_settings_with_index** *(uint8_t index, bool erase)*

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:** 1. Before closing the nvs namespace, it must be open.

   a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the "erase" flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

   b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

   c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ......

**Parameters**

- **index** -- [in] Settings index.
- **erase** -- [in] Indicate if erasing mesh information.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t** **esp_ble_mesh_provisioner_close_settings_with_uid** *(const char *uid, bool erase)*

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

**Note:** 1. Before closing the nvs namespace, it must be open.

   a. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the "erase" flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

   b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

   c. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ......
**Parameters**

- `uid` -- [in] Settings user id.
- `erase` -- [in] Indicate if erasing mesh information.

**Returns**
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index (uint8_t index)
```

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters**

- `index` -- [in] Settings index.

**Returns**
ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid (const char *uid)
```

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Parameters**

- `uid` -- [in] Settings user id.

**Returns**
ESP_OK on success or error code otherwise.

```c
const char * esp_ble_mesh_provisioner_get_settings_uid (uint8_t index)
```

This function is called by Provisioner to get settings user id.

**Parameters**

- `index` -- [in] Settings index.

**Returns**
Setting userid on success or NULL on failure.

```c
uint8_t esp_ble_mesh_provisioner_get_settings_index (const char *uid)
```

This function is called by Provisioner to get settings index.

**Parameters**

- `uid` -- [in] Settings user id.

**Returns**
Settings index.

```c
uint8_t esp_ble_mesh_provisioner_get_free_settings_count (void)
```

This function is called by Provisioner to get the number of free settings user id.

**Returns**
Number of free settings user id.

```c
const uint8_t * esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)
```

This function is called to get fast provisioning application key.

**Parameters**

**Returns**
Application key on success, or NULL on failure.

**Type Definitions**

typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)

: event, event code of user-defined model events; param, parameters of user-defined model events

**ESP-BLE-MESH Node/Provisioner Provisioning**
Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

This header file can be included with:

```c
#include "esp_ble_mesh_provisioning_api.h"
```

This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

Functions

**esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov_cb_t callback)**

Register BLE Mesh provisioning callback.

**Parameters**

- callback -- [in] Pointer to the callback function.

**Returns**

- ESP_OK on success or error code otherwise.

**bool esp_ble_mesh_node_is_provisioned (void)**

Check if a device has been provisioned.

**Parameters**

- None

**Returns**

- TRUE if the device is provisioned, FALSE if the device is unprovisioned.

**esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**

Enable specific provisioning bearers to get the device ready for provisioning.

**Parameters**

- bearers -- Bit-wise OR of provisioning bearers.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**Parameters**

- bearers -- Bit-wise OR of provisioning bearers.

**Returns**

- ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**

Unprovisioned device set own oob public key & private key pair.

**Parameters**

- pub_key_x -- [in] Unprovisioned device’s Public Key X
- pub_key_y -- [in] Unprovisioned device’s Public Key Y
- private_key -- [in] Unprovisioned device’s Private Key

**Returns**

- ESP_OK on success or error code otherwise.

**Note:** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.
Chapter 2. API Reference

**esp_err_t esp_ble_mesh_node_input_number (uint32_t number)**
Provisioning input OOB number.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Parameters**
- **number** -- [in] Number input by device.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_node_input_string (const char* string)**
Provisioning input OOB string.

**Note:** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Parameters**
- **string** -- [in] String input by device.
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_set_unprovisioned_device_name (const char* name)**
Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Parameters**
- **name** -- [in] Unprovisioned device name
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])**
Provisioner inputs unprovisioned device’s oob public key.

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Parameters**
- **link_idx** -- [in] The provisioning link index
- **pub_key_x** -- [in] Unprovisioned device’s Public Key X
- **pub_key_y** -- [in] Unprovisioned device’s Public Key Y
- **Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_input_string (const char* string, uint8_t link_idx)**
Provide provisioning input OOB string.

**Parameters**
- **string** -- [in] String input by Provisioner.
**Chapter 2. API Reference**

- **link_idx -- [in]** The provisioning link index.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)
```

Provide provisioning input OOB number.

---

**Parameters**

- **number -- [in]** Number input by Provisioner.
- **link_idx -- [in]** The provisioning link index.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
```

Enable one or more provisioning bearers.

---

**Note:** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Parameters**

- **bearers -- [in]** Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
```

Disable one or more provisioning bearers.

---

**Note:** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Parameters**

- **bearers -- [in]** Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)
```

Add unprovisioned device info to the unprov_dev queue.

---

**Note:** 1. Currently address type only supports public address and static random address.

a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.

b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.

- In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

c. Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
• If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
• If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
• If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
• Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG cannot be enabled at the same time.

Parameters
• add_dev -- [in] Pointer to a struct containing the device information
• flags -- [in] Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16], esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info, uint16_t unicast_addr)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Note: 1. Currently address type only supports public address and static random address.
   a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
   b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
   c. Recommend to use only one of the functions "esp_ble_mesh_provisioner_add_unprov_dev" and "esp_ble_mesh_provisioner_prov_device_with_addr" by a Provisioner.

Parameters
• uuid -- [in] Device UUID of the unprovisioned device
• addr -- [in] Device address of the unprovisioned device
• addr_type -- [in] Device address type of the unprovisioned device
• bearer -- [in] Provisioning bearer going to be used by Provisioner
• oob_info -- [in] OOB info of the unprovisioned device
• unicast_addr -- [in] Unicast address going to be allocated for the unprovisioned device

Returns Zero on success or (negative) error code otherwise.
**esp_err_t** `esp_ble_mesh_provisioner_delete_dev (esp_ble_mesh_device_delete_t *del_dev)`

Delete device from queue, and reset current provisioning link with the device.

**Note:** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Parameters `del_dev` -- [in] Pointer to a struct containing the device information.

Returns ESP_OK on success or error code otherwise.

**esp_err_t** `esp_ble_mesh_provisioner_set_dev_uuid_match (const uint8_t*match_val,uint8_t match_len,uint8_t offset,bool prov_after_match)`

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Parameters

- `match_val` -- [in] Value to be compared with the part of the device UUID.
- `match_len` -- [in] Length of the compared match value.
- `offset` -- [in] Offset of the device UUID to be compared (based on zero).
- `prov_after_match` -- [in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

Returns ESP_OK on success or error code otherwise.

**esp_err_t** `esp_ble_mesh_provisioner_set_prov_data_info (esp_ble_mesh_prov_data_info_t *prov_data_info)`

This function is called by Provisioner to set provisioning data information before starting to provision.

Parameters `prov_data_info` -- [in] Pointer to a struct containing net_idx or flags or iv_index.

Returns ESP_OK on success or error code otherwise.

**esp_err_t** `esp_ble_mesh_provisioner_set_static_oob_value (const uint8_t*value,uint8_t length)`

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note:** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Parameters

- `value` -- [in] Pointer to the static oob value.
- `length` -- [in] Length of the static oob value.

Returns ESP_OK on success or error code otherwise.

**esp_err_t** `esp_ble_mesh_provisioner_set_primary_elem_addr (uint16_t addr)`

This function is called by Provisioner to set own Primary element address.
Note: This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct `esp_ble_mesh_prov_t` will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Parameters**
- **addr** -- [in] Unicast address of the Primary element of Provisioner.
- **Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_fast_prov_info (esp_ble_mesh_fast_prov_info_t *fast_prov_info)
```
This function is called to set provisioning data information before starting fast provisioning.

**Parameters**
- **fast_prov_info** -- [in] Pointer to a struct containing unicast address range, net_idx, etc.
- **Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_set_fast_prov_action (esp_ble_mesh_fast_prov_action_t action)
```
This function is called to start/suspend/exit fast provisioning.

**Parameters**
- **action** -- [in] fast provisioning action (i.e. enter, suspend, exit).
- **Returns** ESP_OK on success or error code otherwise.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,
        esp_ble_mesh_prov_cb_param_t *param)
```
: event, event code of provisioning events; param, parameters of provisioning events

```c
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr,
        const esp_ble_mesh_addr_type_t addr_type,
        const uint8_t adv_type,
        const uint8_t *dev_uuid,
        const uint8_t *dev_role_info,
        esp_ble_mesh_prov_bearer_t bearer)
```
Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

- **Param addr** [in] Pointer to the unprovisioned device address.
- **Param addr_type** [in] Unprovisioned device address type.
- **Param adv_type** [in] Adv packet type(ADV_IND or ADV_NONCONN_IND).
- **Param dev_uuid** [in] Unprovisioned device UUID pointer.
- **Param oob_info** [in] OOB information of the unprovisioned device.
- **Param bearer** [in] Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**

**Header File**

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h`
- This header file can be included with:

```c
#include "esp_ble_mesh_proxy_api.h"
```
- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES bt
```

or
Chapter 2. API Reference

**Functions**

```c
esp_err_t esp_ble_mesh_proxy_identity_enable(void)
Enable advertising with Node Identity.
```

**Note:** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_enable(void)
Enable BLE Mesh GATT Proxy Service.
```

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_disable(void)
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.
```

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_private_proxy_identity_enable(void)
Enable advertising with Private Node Identity.
```

**Note:** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Private Node Identity for the next 60 seconds, and after 60s Private Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity, Network ID advertising, Proxy Private Node Identity and Private Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_private_proxy_identity_disable(void)
Disable advertising with Private Node Identity.
```

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_connect(esp_ble_mesh_bd_addr_t addr,
                                          esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)
Proxy Client creates a connection with the Proxy Server.
```

**Parameters**

- `addr_type` -- [in] Device address type (public or static random).

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_disconnect(uint8_t conn_handle)
Proxy Client terminates a connection with the Proxy Server.
```

**Parameters**

- `conn_handle` -- [in] Proxy connection handle.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_set_filter_type**

`esp_ble_mesh_proxy_client_set_filter_type(conn_handle, net_idx, filter_type)`

Proxy Client sets the filter type of the Proxy Server.

**Parameters**
- `conn_handle` -- [in] Proxy connection handle.
- `net_idx` -- [in] Corresponding NetKey Index.
- `filter_type` -- [in] whitelist or blacklist.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_add_filter_addr**

`esp_ble_mesh_proxy_client_add_filter_addr(conn_handle, net_idx, addr, addr_num)`

Proxy Client adds address to the Proxy Server filter list.

**Parameters**
- `conn_handle` -- [in] Proxy connection handle.
- `net_idx` -- [in] Corresponding NetKey Index.
- `addr` -- [in] Pointer to the filter address.
- `addr_num` -- [in] Number of the filter address.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr**

`esp_ble_mesh_proxy_client_remove_filter_addr(conn_handle, net_idx, addr, addr_num)`

Proxy Client removes address from the Proxy Server filter list.

**Parameters**
- `conn_handle` -- [in] Proxy connection handle.
- `net_idx` -- [in] Corresponding NetKey Index.
- `addr` -- [in] Pointer to the filter address.
- `addr_num` -- [in] Number of the filter address.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_directed_proxy_set**

`esp_ble_mesh_proxy_client_directed_proxy_set(conn_handle, net_idx, use_directed)`

Proxy Client sets whether or not the Directed Proxy Server uses directed forwarding for Directed Proxy Client messages.

**Parameters**
- `conn_handle` -- [in] Proxy connection handle.
- `net_idx` -- [in] Corresponding NetKey Index.
- `use_directed` -- [in] Whether or not to send message by directed forwarding.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_proxy_client_send_solic_pdu**

`esp_ble_mesh_proxy_client_send_solic_pdu(net_idx, ssrc, dst)`

Proxy Client sends Solicitation PDU.

**Parameters**
- `net_idx` -- [in] Corresponding NetKey Index.
- `ssrc` -- [in] Solicitation SRC, shall be one of its element address.

**Returns** ESP_OK on success or error code otherwise.

**Macros**

`ESP_BLE_MESH_PROXY_CLI_DIRECTED_FORWARDING_ENABLE`

`ESP_BLE_MESH_PROXY_CLI_DIRECTED_FORWARDING_DISABLE`
Chapter 2. API Reference

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h
- This header file can be included with:
  ```c
  #include "esp_ble_mesh_config_model_api.h"
  ```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRE bt
  ```
  or
  ```cmake
  PRIV_REQUIRE bt
  ```

Functions

```c
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

**Parameters**

- **callback** -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

**Parameters**

- **callback** -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get.t in esp_ble_mesh_defs.h

**Parameters**
• **params** -- [in] Pointer to BLE Mesh common client parameters.
• **get_state** -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_config_client_set_state
  (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

**Parameters**
• **params** -- [in] Pointer to BLE Mesh common client parameters.
• **set_state** -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

```c
union esp_ble_mesh_cfg_client_get_state_t

#include <esp_ble_mesh_config_model_api.h>  For ESP_BLE_MESH_MODEL_OP_BEACON_GET
ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET ESP_BLE_MESH_MODEL_OP_DEFAULT_TTL_GET
ESP_BLE_MESH_MODEL_OP_GATT_PROXY_GET ESP_BLE_MESH_MODEL_OP_RELAY_GET
ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET ESP_BLE_MESH_MODEL_OP_FRIEND_GET
ESP_BLE_MESH_MODEL_OP_HEARTBEAT_PUB_GET ESP_BLE_MESH_MODEL_OP_HEARTBEAT_SUB_GET
```

the get_state parameter in the esp_ble_mesh_config_client_get_state function should not be set to NULL.

**Public Members**

```c
esp_ble_mesh_cfg_model_pub_get_t model_pub_get
  For ESP_BLE_MESH_MODEL_OP_MODEL_PUB_GET.
```

```c
esp_ble_mesh_cfg_composition_data_get_t comp_data_get
  For ESP_BLE_MESH_MODEL_OP_COMPOSITION_DATA_GET.
```

```c
esp_ble_mesh_cfg_sig_model_sub_get_t sig_model_sub_get
  For ESP_BLE_MESH_MODEL_OP_SIG_MODEL_SUB_GET
```

```c
esp_ble_mesh_cfg_vnd_model_sub_get_t vnd_model_sub_get
  For ESP_BLE_MESH_MODEL_OP_VENDOR_MODEL_SUB_GET
```

```c
esp_ble_mesh_cfg_app_key_get_t app_key_get
  For ESP_BLE_MESH_MODEL_OP_APP_KEY_GET.
```

```c
esp_ble_mesh_cfg_node_identity_get_t node_identity_get
  For ESP_BLE_MESH_MODEL_OP_NODE_IDENTITY_GET.
```

```c
esp_ble_mesh_cfg_sig_model_app_get_t sig_model_app_get
  For ESP_BLE_MESH_MODEL_OP_SIG_MODEL_APP_GET
```

struct esp_ble_mesh_cfg_srv_t
```

Configuration Server Model context

#### Public Members

- `esp_ble_mesh_model_t *model`
  
  Pointer to Configuration Server Model

- `uint8_t net_transmit`
  
  Network Transmit state

- `uint8_t relay`
  
  Relay Mode state
uint8_t relay_retransmit
    Relay Retransmit state

text8_t beacon
    Secure Network Beacon state

text8_t gatt_proxy
    GATT Proxy state

text8_t friend_state
    Friend state

text8_t default_ttl
    Default TTL

struct kDelayed_work timer
    Heartbeat Publication timer

text16_t dst
    Destination address for Heartbeat messages

text16_t count
    Number of Heartbeat messages to be sent
    Number of Heartbeat messages received

text8_t period
    Period for sending Heartbeat messages

text8_t ttl
    TTL to be used when sending Heartbeat messages

text16_t feature
    Bit field indicating features that trigger Heartbeat messages when changed

text16_t net_idx
    NetKey Index used by Heartbeat Publication

struct esp_ble_mesh_cfg_serv_t::[anonymous] heartbeat_pub
    Heartbeat Publication

int64_t expiry
    Timestamp when Heartbeat subscription period is expired

text16_t src
    Source address for Heartbeat messages

text8_t min_hops
    Minimum hops when receiving Heartbeat messages
uint8_t \textbf{max\_hops}

Maximum hops when receiving Heartbeat messages

\textit{esp\_ble\_mesh\_cb\_t heartbeat\_recv\_cb}

Optional heartbeat subscription tracking function

\textbf{struct esp\_ble\_mesh\_cfg\_srv\_t::[anonymous] heartbeat\_sub}

Heartbeat Subscription

\textbf{struct esp\_ble\_mesh\_cfg\_composition\_data\_get\_t}

Parameters of Config Composition Data Get.

**Public Members**

\textbf{uint8_t page}

Page number of the Composition Data.

\textbf{struct esp\_ble\_mesh\_cfg\_model\_pub\_get\_t}

Parameters of Config Model Publication Get.

**Public Members**

\textbf{uint16_t element\_addr}

The element address

\textbf{uint16_t model\_id}

The model id

\textbf{uint16_t company\_id}

The company id, if not a vendor model, shall set to 0xFFFF

\textbf{struct esp\_ble\_mesh\_cfg\_sig\_model\_sub\_get\_t}

Parameters of Config SIG Model Subscription Get.

**Public Members**

\textbf{uint16_t element\_addr}

The element address

\textbf{uint16_t model\_id}

The model id

\textbf{struct esp\_ble\_mesh\_cfg\_vnd\_model\_sub\_get\_t}

Parameters of Config Vendor Model Subscription Get.
Public Members

uint16_t element_addr
   The element address
uint16_t model_id
   The model id
uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_app_key_get_t
   Parameters of Config AppKey Get.

Public Members

uint16_t net_idx
   The network key index

struct esp_ble_mesh_cfg_node_identity_get_t
   Parameters of Config Node Identity Get.

Public Members

uint16_t net_idx
   The network key index

struct esp_ble_mesh_cfg_sig_model_app_get_t
   Parameters of Config SIG Model App Get.

Public Members

uint16_t element_addr
   The element address
uint16_t model_id
   The model id

struct esp_ble_mesh_cfg_vnd_model_app_get_t
   Parameters of Config Vendor Model App Get.

Public Members

uint16_t element_addr
   The element address
uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_get_t
    Parameters of Config Key Refresh Phase Get.

    Public Members

    uint16_t net_idx
        The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
    Parameters of Config Low Power Node PollTimeout Get.

    Public Members

    uint16_t lpn_addr
        The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
    Parameters of Config Beacon Set.

    Public Members

    uint8_t beacon
        New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
    Parameters of Config Default TTL Set.

    Public Members

    uint8_t ttl
        The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
    Parameters of Config Friend Set.

    Public Members

    uint8_t friend_state
        The friend state value
struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t relay
The relay value

uint8_t relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.

Public Members

uint16_t net_idx
The network key index

uint8_t net_key[16]
The network key value

struct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.
Public Members

uint16_t element_addr
    The element address

uint16_t model_app_idx
    Index of the app key to bind with the model

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t
    Parameters of Config Model Publication Set.

Public Members

uint16_t element_addr
    The element address

uint16_t publish_addr
    Value of the publish address

uint16_t publish_app_idx
    Index of the application key

bool cred_flag
    Value of the Friendship Credential Flag

uint8_t publish_ttl
    Default TTL value for the publishing messages

uint8_t publish_period
    Period for periodic status publishing

uint8_t publish_retransmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_add_t
    Parameters of Config Model Subscription Add.
Public Members

uint16_t **element_addr**
   The element address

uint16_t **sub_addr**
   The address to be added to the Subscription List

uint16_t **model_id**
   The model id

uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_t**
   Parameters of Config Model Subscription Delete.

Public Members

uint16_t **element_addr**
   The element address

uint16_t **sub_addr**
   The address to be removed from the Subscription List

uint16_t **model_id**
   The model id

uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_overwrite_t**
   Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t **element_addr**
   The element address

uint16_t **sub_addr**
   The address to be added to the Subscription List

uint16_t **model_id**
   The model id

uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF
**struct esp_ble_mesh_cfg_model_sub_va_add_t**
Parameters of Config Model Subscription Virtual Address Add.

**Public Members**

`uint16_t element_addr`
The element address

`uint8_t [16] label_uuid`
The Label UUID of the virtual address to be added to the Subscription List

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_delete_t**
Parameters of Config Model Subscription Virtual Address Delete.

**Public Members**

`uint16_t element_addr`
The element address

`uint8_t [16] label_uuid`
The Label UUID of the virtual address to be removed from the Subscription List

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_model_sub_va_overwrite_t**
Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

`uint16_t element_addr`
The element address

`uint8_t [16] label_uuid`
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
    Parameters of Config Model Publication Virtual Address Set.

    **Public Members**

    uint16_t element_addr
        The element address

    uint8_t label_uuid[16]
        Value of the Label UUID publish address

    uint16_t publish_app_idx
        Index of the application key

    bool cred_flag
        Value of the Friendship Credential Flag

    uint8_t publish_ttl
        Default TTL value for the publishing messages

    uint8_t publish_period
        Period for periodic status publishing

    uint8_t publish_retransmit
        Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
    Parameters of Config Model Subscription Delete All.

    **Public Members**

    uint16_t element_addr
        The element address
uint16_t model_id
   The model id
uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
   Parameters of Config NetKey Update.

   **Public Members**

   uint16_t net_idx
      The network key index
   
   uint8_t net_key[16]
      The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
   Parameters of Config NetKey Delete.

     **Public Members**

     uint16_t net_idx
        The network key index

struct esp_ble_mesh_cfg_app_key_update_t
   Parameters of Config AppKey Update.

   **Public Members**

   uint16_t net_idx
      The network key index
   
   uint16_t app_idx
      The app key index
   
   uint8_t app_key[16]
      The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
   Parameters of Config AppKey Delete.

   **Public Members**

   uint16_t net_idx
      The network key index
uint16_t app_idx
    The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
    Parameters of Config Node Identity Set.

    Public Members

    uint16_t net_idx
        The network key index

    uint8_t identity
        New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
    Parameters of Config Model App Unbind.

    Public Members

    uint16_t element_addr
        The element address

    uint16_t model_app_idx
        Index of the app key to bind with the model

    uint16_t model_id
        The model id

    uint16_t company_id
        The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_set_t
    Parameters of Config Key Refresh Phase Set.

    Public Members

    uint16_t net_idx
        The network key index

    uint8_t transition
        New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_net_transmit_set_t
    Parameters of Config Network Transmit Set.
Public Members

uint8_t net_transmit
   Network Transmit State

struct esp_ble_mesh_cfg_heartbeat_pub_set_t
   Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t dst
   Destination address for Heartbeat messages

uint8_t count
   Number of Heartbeat messages to be sent

uint8_t period
   Period for sending Heartbeat messages

uint8_t ttl
   TTL to be used when sending Heartbeat messages

uint16_t feature
   Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
   NetKey Index

struct esp_ble_mesh_cfg_heartbeat_sub_set_t
   Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t src
   Source address for Heartbeat messages

uint16_t dst
   Destination address for Heartbeat messages

uint8_t period
   Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
   Parameter of Config Beacon Status
Chapter 2. API Reference

Public Members

uint8_t _t beacon

Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t

Parameters of Config Composition Data Status

Public Members

uint8_t _t page

Page number of the Composition Data

struct net_buf_simple * composition_data

Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t

Parameter of Config Default TTL Status

Public Members

uint8_t _t default_ttl

Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t

Parameter of Config GATT Proxy Status

Public Members

uint8_t _t gatt_proxy

GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t

Parameters of Config Relay Status

Public Members

uint8_t _t relay

Relay state value

uint8_t _t retransmit

Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t

Parameters of Config Model Publication Status
Public Members

`uint8_t status`
Status Code for the request message

`uint16_t element_addr`
Address of the element

`uint16_t publish_addr`
Value of the publish address

`uint16_t app_idx`
Index of the application key

`bool cred_flag`
Value of the Friendship Credential Flag

`uint8_t ttl`
Default TTL value for the outgoing messages

`uint8_t period`
Period for periodic status publishing

`uint8_t transmit`
Number of retransmissions and number of 50-millisecond steps between retransmissions

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

`struct esp_ble_mesh_cfg_model_sub_status_cb_t`
Parameters of Config Model Subscription Status

Public Members

`uint8_t status`
Status Code for the request message

`uint16_t element_addr`
Address of the element

`uint16_t sub_addr`
Value of the address

`uint16_t company_id`
Company ID
Chapter 2. API Reference

- `uint16_t model_id`
  Model ID

- `struct esp_ble_mesh_cfg_net_key_status_cb_t`
  Parameters of Config NetKey Status
  - `uint8_t status`
    Status Code for the request message
  - `uint16_t net_idx`
    Index of the NetKey

- `struct esp_ble_mesh_cfg_app_key_status_cb_t`
  Parameters of Config AppKey Status
  - `uint8_t status`
    Status Code for the request message
  - `uint16_t net_idx`
    Index of the NetKey
  - `uint16_t app_idx`
    Index of the application key

- `struct esp_ble_mesh_cfg_mod_app_status_cb_t`
  Parameters of Config Model App Status
  - `uint8_t status`
    Status Code for the request message
  - `uint16_t element_addr`
    Address of the element
  - `uint16_t app_idx`
    Index of the application key
  - `uint16_t company_id`  
    Company ID
**Public Members**

```c
uint8_t friend_state
```
Friend state value

**Public Members**

```c
uint8_t status
```
Status Code for the request message

```c
uint16_t dst
```
Destination address for Heartbeat messages

```c
uint8_t count
```
Number of Heartbeat messages remaining to be sent

```c
uint8_t period
```
Period for sending Heartbeat messages

```c
uint8_t ttl
```
TTL to be used when sending Heartbeat messages

```c
uint16_t features
```
Features that trigger Heartbeat messages when changed

```c
uint16_t net_idx
```
Index of the NetKey

**Public Members**

```c
uint8_t status
```
Status Code for the request message
uint16_t src
   Source address for Heartbeat messages

uint16_t dst
   Destination address for Heartbeat messages

uint8_t period
   Remaining Period for processing Heartbeat messages

uint8_t count
   Number of Heartbeat messages received

uint8_t min_hops
   Minimum hops when receiving Heartbeat messages

uint8_t max_hops
   Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
   Parameters of Config Network Transmit Status

Public Members

uint8_t net_trans_count
   Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step
   Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t
   Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t status
   Status Code for the request message

uint16_t element_addr
   Address of the element

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID
struct net_buf_simple *sub_addr
    A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
    Parameter of Config NetKey List

    Public Members

    struct net_buf_simple *net_idx
        A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
    Parameters of Config AppKey List

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        NetKey Index of the NetKey that the AppKeys are bound to

    struct net_buf_simple *app_idx
        A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct esp_ble_mesh_cfg_node_id_status_cb_t
    Parameters of Config Node Identity Status

    Public Members

    uint8_t status
        Status Code for the request message

    uint16_t net_idx
        Index of the NetKey

    uint8_t identity
        Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
    Parameters of Config SIG/Vendor Model App List

    Public Members

    uint8_t status
        Status Code for the request message
`uint16_t element_addr`
Address of the element

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

`struct net_buf_simple *app_idx`
All AppKey indexes bound to the Model

```c
struct esp_ble_mesh_cfg_kr_phase_status_cb_t
Parameters of Config Key Refresh Phase Status
```

**Public Members**

`uint8_t status`
Status Code for the request message

`uint16_t net_idx`
Index of the NetKey

`uint8_t phase`
Key Refresh Phase state

```c
struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
Parameters of Config Low Power Node PollTimeout Status
```

**Public Members**

`uint16_t lpn_addr`
The unicast address of the Low Power node

`int32_t poll_timeout`
The current value of the PollTimeout timer of the Low Power node

```c
struct esp_ble_mesh_cfg_client_cb_param_t
Configuration Client Model callback parameters
```

**Public Members**

`int error_code`
Appropriate error code
**Chapter 2. API Reference**

```c
esp_ble_mesh_client_common_param_t *params
```
The client common parameters

```c
esp_ble_mesh_cfg_client_common_cb_param_t status_cb
```
The config status message callback values

```c
struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
```
Configuration Server model related context.
Parameters of Config Model Publication Set

### Public Members

- `uint16_t element_addr`
  Element Address

- `uint16_t pub_addr`
  Publish Address

- `uint16_t app_idx`
  AppKey Index

- `bool cred_flag`
  Friendship Credential Flag

- `uint8_t pub_ttl`
  Publish TTL

- `uint8_t pub_period`
  Publish Period

- `uint8_t pub_retransmit`
  Publish Retransmit

- `uint16_t company_id`
  Company ID

- `uint16_t model_id`
  Model ID

```c
struct esp_ble_mesh_state_change_cfg_mod_pub_va_set_t
```
Parameters of Config Model Publication Virtual Address Set

### Public Members

- `uint16_t element_addr`
  Element Address
uint8_t label_uuid[16]
    Label UUID

uint16_t app_idx
    AppKey Index

bool cred_flag
    Friendship Credential Flag

uint8_t pub_ttl
    Publish TTL

uint8_t pub_period
    Publish Period

uint8_t pub_retransmit
    Publish Retransmit

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_add_t
    Parameters of Config Model Subscription Add

    Public Members

    uint16_t element_addr
        Element Address

    uint16_t sub_addr
        Subscription Address

    uint16_t company_id
        Company ID

    uint16_t model_id
        Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
    Parameters of Config Model Subscription Delete

    Public Members
uint16_t `element_addr`
Element Address

uint16_t `sub_addr`
Subscription Address

uint16_t `company_id`
Company ID

uint16_t `model_id`
Model ID

```c
struct esp_ble_mesh_state_change_cfg_netkey_add_t
Parameters of Config NetKey Add

Public Members

uint16_t `net_idx`
NetKey Index

uint8_t `net_key`[16]
NetKey
```

```c
struct esp_ble_mesh_state_change_cfg_netkey_update_t
Parameters of Config NetKey Update

Public Members

uint16_t `net_idx`
NetKey Index

uint8_t `net_key`[16]
NetKey
```

```c
struct esp_ble_mesh_state_change_cfg_netkey_delete_t
Parameter of Config NetKey Delete

Public Members

uint16_t `net_idx`
NetKey Index
```

```c
struct esp_ble_mesh_state_change_cfg_appkey_add_t
Parameters of Config AppKey Add
```
Public Members

`uint16_t net_idx`
NetKey Index

`uint16_t app_idx`
AppKey Index

`uint8_t app_key[16]`
AppKey

`struct esp_ble_mesh_state_change_cfg_appkey_update_t`
Parameters of Config AppKey Update

Public Members

`uint16_t net_idx`
NetKey Index

`uint16_t app_idx`
AppKey Index

`uint8_t app_key[16]`
AppKey

`struct esp_ble_mesh_state_change_cfg_appkey_delete_t`
Parameters of Config AppKey Delete

Public Members

`uint16_t net_idx`
NetKey Index

`uint16_t app_idx`
AppKey Index

`struct esp_ble_mesh_state_change_cfg_model_app_bind_t`
Parameters of Config Model App Bind

Public Members

`uint16_t element_addr`
Element Address

`uint16_t app_idx`
AppKey Index
struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind

Public Members

uint16_t element_addr
Element Address

uint16_t app_idx
AppKey Index

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
NetKey Index

uint8_t kr_phase
New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to the server model structure

esp_ble_mesh_msg_ctx_t *ctx
Context of the received message

esp_ble_mesh_cfg_server_cb_value_t value
Value of the received configuration messages
Chapter 2. API Reference

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)

Define a new Config Server Model.

Note: The Config Server Model can only be included by a Primary Element.

Parameters

• srv_data -- Pointer to a unique Config Server Model user_data.

Returns New Config Server Model instance.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)

Define a new Config Client Model.

Note: The Config Client Model can only be included by a Primary Element.

Parameters

• cli_data -- Pointer to a unique struct esp_ble_mesh_client_t.

Returns New Config Client Model instance.

Type Definitions

typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event, esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event, esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

Param event Event type

Param param Pointer to callback parameter

Enumerations

enum esp_ble_mesh_cfg_client_cb_event_t

This enum value is the event of Configuration Client Model

Values:

enumerator ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT

enumerator ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT

enumerator ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT

enumerator ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT

enumerator ESP_BLE_MESH_CFG_CLIENT_EVT_MAX
enum esp_ble_mesh_cfg_server_cb_event_t
This enum value is the event of Configuration Server model

Values:

enumerator ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
enumerator ESP_BLE_MESH_CFG_SERVER_EVT_MAX

Health Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h
- This header file can be included with:
  ```
  #include "esp_ble_mesh_health_model_api.h"
  ```
- This header file is a part of the API provided by the bt component. To declare that your component depends
  on bt, add the following to your CMakeLists.txt:
  ```
  REQUIRES bt
  ```
  or
  ```
  PRIV_REQUIRES bt
  ```

Functions

```c
esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)
```

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Parameters callback -- [in] Pointer to the callback function.
Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)
```

Register BLE Mesh Health Server Model callback.

Parameters callback -- [in] Pointer to the callback function.
Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
```

This function is called to get the Health Server states using the Health Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

Parameters

- **params** -- [in] Pointer to BLE Mesh common client parameters.
- **get_state** -- [in] Pointer to a union, each kind of opcode corresponds to one structure
  inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.
esp_err_t esp_ble_mesh_health_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)

This function is called to set the Health Server states using the Health Client Model set messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

Parameters

• params -- [in] Pointer to BLE Mesh common client parameters.
• set_state -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_health_server_fault_update (esp_ble_mesh_elem_t *element)

This function is called by the Health Server Model to update the context of its Health Current status.

Parameters element -- [in] The element to which the Health Server Model belongs.

Returns ESP_OK on success or error code otherwise.

Unions

union esp_ble_mesh_health_client_get_state_t

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t fault_get

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union esp_ble_mesh_health_client_set_state_t

#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD脘 ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_attention_set_t attention_set

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

esp_ble_mesh_health_period_set_t period_set

For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.
Chapter 2. API Reference

```c
esp_ble_mesh_health_fault_test_t fault_test
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.
```

```c
esp_ble_mesh_health_fault_clear_t fault_clear
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.
```

union esp_ble_mesh_health_client_common_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

**Public Members**

```c
esp_ble_mesh_health_current_status_cb_t current_status
The health current status value
```

```c
esp_ble_mesh_health_fault_status_cb_t fault_status
The health fault status value
```

```c
esp_ble_mesh_health_period_status_cb_t period_status
The health period status value
```

```c
esp_ble_mesh_health_attention_status_cb_t attention_status
The health attention status value
```

union esp_ble_mesh_health_server_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.

**Public Members**

```c
esp_ble_mesh_health_fault_update_comp_cb_t fault_update_comp
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
```

```c
esp_ble_mesh_health_clear_comp_cb_t fault_clear
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
```

```c
esp_ble_mesh_health_test_comp_cb_t fault_test
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
```

```c
esp_ble_mesh_health_attent_ion_on_comp_cb_t attention_on
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
```

```c
esp_ble_mesh_health_attent_ion_off_comp_cb_t attention_off
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
```

**Structures**

```c
struct esp_ble_mesh_health_srv_cb_t
ESP BLE Mesh Health Server callback
```
Public Members

`esp_ble_mesh_cb_t fault_clear`
Clear health registered faults. Initialized by the stack.

`esp_ble_mesh_cb_t fault_test`
Run a specific health test. Initialized by the stack.

`esp_ble_mesh_cb_t attention_on`
Health attention on callback. Initialized by the stack.

`esp_ble_mesh_cb_t attention_off`
Health attention off callback. Initialized by the stack.

struct `esp_ble_mesh_health_test_t`
ESP BLE Mesh Health Server test Context

Public Members

`uint8_t id_count`
Number of Health self-test ID

const `uint8_t *test_ids`
Array of Health self-test IDs

`uint16_t company_id`
Company ID used to identify the Health Fault state

`uint8_t prev_test_id`
Current test ID of the health fault test

`uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
Array of current faults

`uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
Array of registered faults

struct `esp_ble_mesh_health_srv_t`
ESP BLE Mesh Health Server Model Context

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Health Server Model

`esp_ble_mesh_health_srv_cb_t health_cb`
Health callback struct
struct k_delayed_work attention_timer
    Attention Timer state

bool attention_timer_start
    Attention Timer start flag

defined esp_ble_mesh_health_test_t health_test
    Health Server fault test

struct esp_ble_mesh_health_fault_get_t
    Parameter of Health Fault Get

    Public Members

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
    Parameter of Health Attention Set

    Public Members

uint8_t attention
    Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
    Parameter of Health Period Set

    Public Members

uint8_t fast_period_divisor
    Divider for the Publish Period

struct esp_ble_mesh_health_fault_test_t
    Parameter of Health Fault Test

    Public Members

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

uint8_t test_id
    ID of a specific test to be performed

struct esp_ble_mesh_health_fault_clear_t
    Parameter of Health Fault Clear
Chapter 2. API Reference

Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_current_status_cb_t
Parameters of Health Current Status

Public Members

uint8_t test_id
ID of a most recently performed test

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_fault_status_cb_t
Parameters of Health Fault Status

Public Members

uint8_t test_id
ID of a most recently performed test

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_period_status_cb_t
Parameter of Health Period Status

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
Parameter of Health Attention Status
Public Members

uint8_t **attention**
Value of the Attention Timer state

struct **esp_ble_mesh_health_client_cb_param_t**
Health Client Model callback parameters

Public Members

int **error_code**
Appropriate error code

**esp_ble_mesh_client_common_param_t** *params*
The client common parameters.

**esp_ble_mesh_health_client_common_cb_param_t** status_cb
The health message status callback values

struct **esp_ble_mesh_health_fault_update_comp_cb_t**
Parameter of publishing Health Current Status completion event

Public Members

int **error_code**
The result of publishing Health Current Status

**esp_ble_mesh_elem_t** *element*
Pointer to the element which contains the Health Server Model

struct **esp_ble_mesh_health_fault_clear_cb_t**
Parameters of Health Fault Clear event

Public Members

**esp_ble_mesh_model_t** *model*
Pointer to the Health Server Model

uint16_t **company_id**
Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_fault_test_cb_t**
Parameters of Health Fault Test event
Public Members

*esp_ble_mesh_model_t* `model`

Pointer to the Health Server Model

`uint8_t` `test_id`

ID of a specific test to be performed

`uint16_t` `company_id`

Bluetooth assigned 16-bit Company ID

```
struct esp_ble_mesh_health_attention_on_cb_t
```

Parameter of Health Attention On event

```
Public Members
```

*esp_ble_mesh_model_t* `model`

Pointer to the Health Server Model

`uint8_t` `time`

Duration of attention timer on (in seconds)

```
struct esp_ble_mesh_health_attention_off_cb_t
```

Parameter of Health Attention Off event

```
Public Members
```

*esp_ble_mesh_model_t* `model`

Pointer to the Health Server Model

Macros

```
ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
```

Define a new Health Server Model.

**Note:** The Health Server Model can only be included by a Primary Element.

Parameters

- `srv` -- Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

Returns

New Health Server Model instance.

```
ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)
```

Define a new Health Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Health Client Model.
Parameters

- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns

New Health Client Model instance.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)

A helper to define a health publication context

Parameters

- `_name` -- Name given to the publication context variable.
- `_max` -- Maximum number of faults the element can have.
- `_role` -- Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

Param event  Event type
Param param  Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Param event  Event type
Param param  Pointer to callback parameter

Enumerations

enum esp_ble_mesh_health_client_cb_event_t

This enum value is the event of Health Client Model

Values:
enumerator ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t
    This enum value is the event of Health Server Model
    Values:
        enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
        enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
        enumerator ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
        enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
        enumerator ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
        enumerator ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_generic_model_api.h"
```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

`esp_err_t esp_ble_mesh_register_generic_client_callback (esp_ble_mesh_generic_client_cb_t callback)`

Register BLE Mesh Generic Client Model callback.

Parameters callback -- [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_generic_client_get_state**
```c
(esp_ble_mesh_client_common_param_t *params,
 esp_ble_mesh_generic_client_get_state_t *get_state)
```
Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- **params** -- [in] Pointer to BLE Mesh common client parameters.
- **get_state** -- [in] Pointer to generic get message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_generic_client_set_state**
```c
(esp_ble_mesh_client_common_param_t *params,
 esp_ble_mesh_generic_client_set_state_t *set_state)
```
Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**
- **params** -- [in] Pointer to BLE Mesh common client parameters.
- **set_state** -- [in] Pointer to generic set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_generic_server_callback**
```c
(esp_ble_mesh_generic_server_cb_t callback)
```
Register BLE Mesh Generic Server Model callback.

**Parameters**
- **callback** -- [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

### Unions

**union esp_ble_mesh_generic_client_get_state_t**
```c
#include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.
```

**Structures**

struct *esp_ble_mesh_gen_onoff_set_t*

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

**Public Members**

bool **op_en**

Indicate if optional parameters are included

uint8_t **onoff**

Target value of Generic OnOff state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct *esp_ble_mesh_gen_level_set_t*

Parameters of Generic Level Set.

**Public Members**

bool **op_en**

Indicate if optional parameters are included

int16_t **level**

Target value of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)
**uint8_t delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_delta_set_t**
Parameters of Generic Delta Set.

**Public Members**

**bool op_en**
Indicate if optional parameters are included

**int32_t level**
Delta change of Generic Level state

**uint8_t tid**
Transaction ID

**uint8_t trans_time**
Time to complete state transition (optional)

**uint8_t delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_move_set_t**
Parameters of Generic Move Set.

**Public Members**

**bool op_en**
Indicate if optional parameters are included

**int16_t delta_level**
Delta Level step to calculate Move speed for Generic Level state

**uint8_t tid**
Transaction ID

**uint8_t trans_time**
Time to complete state transition (optional)

**uint8_t delay**
Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_def_trans_time_set_t**
Parameter of Generic Default Transition Time Set.
Chapter 2. API Reference

Public Members

`uint8_t trans_time`

The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_set_t`

Parameter of Generic OnPowerUp Set.

Public Members

`uint8_t onpowerup`

The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_level_set_t`

Parameters of Generic Power Level Set.

Public Members

`bool op_en`

Indicate if optional parameters are included

`uint16_t power`

Target value of Generic Power Actual state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

`struct esp_ble_mesh_gen_power_default_set_t`

Parameter of Generic Power Default Set.

Public Members

`uint16_t power`

The value of the Generic Power Default state

`struct esp_ble_mesh_gen_power_range_set_t`

Parameters of Generic Power Range Set.
Public Members

`uint16_t range_min`
Value of Range Min field of Generic Power Range state

`uint16_t range_max`
Value of Range Max field of Generic Power Range state

**struct esp_ble_mesh_gen_loc_global_set_t**
Parameters of Generic Location Global Set.

Public Members

`int32_t global_latitude`
Global Coordinates (Latitude)

`int32_t global_longitude`
Global Coordinates (Longitude)

`int16_t global_altitude`
Global Altitude

**struct esp_ble_mesh_gen_loc_local_set_t**
Parameters of Generic Location Local Set.

Public Members

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

**struct esp_ble_mesh_gen_user_property_get_t**
Parameter of Generic User Property Get.
Public Members

uint16_t property_id
   Property ID identifying a Generic User Property

struct esp_ble_mesh_gen_user_property_set_t
   Parameters of Generic User Property Set.

Public Members

uint16_t property_id
   Property ID identifying a Generic User Property

struct net_buf_simple *property_value
   Raw value for the User Property

struct esp_ble_mesh_gen_admin_property_get_t
   Parameter of Generic Admin Property Get.

Public Members

uint16_t property_id
   Property ID identifying a Generic Admin Property

struct esp_ble_mesh_gen_admin_property_set_t
   Parameters of Generic Admin Property Set.

Public Members

uint16_t property_id
   Property ID identifying a Generic Admin Property

uint8_t user_access
   Enumeration indicating user access

struct net_buf_simple *property_value
   Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
   Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property
struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic Manufacturer Property

- `uint8_t user_access`
  Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

**Public Members**

- `uint16_t property_id`
  A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included

- `uint8_t present_onoff`
  Current value of Generic OnOff state

- `uint8_t target_onoff`
  Target value of Generic OnOff state (optional)

- `uint8_t remain_time`
  Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
Parameters of Generic Level Status.

**Public Members**

- `bool op_en`
  Indicate if optional parameters are included
int16_t `present_level`
Current value of Generic Level state

int16_t `target_level`
Target value of the Generic Level state (optional)

uint8_t `remain_time`
Time to complete state transition (C.1)

struct `esp_ble_mesh_gen_def_trans_time_status_cb_t`
Parameter of Generic Default Transition Time Status.

**Public Members**

uint8_t `trans_time`
The value of the Generic Default Transition Time state

struct `esp_ble_mesh_gen_onpowerup_status_cb_t`

**Public Members**

uint8_t `onpowerup`
The value of the Generic OnPowerUp state

struct `esp_ble_mesh_gen_power_level_status_cb_t`
Parameters of Generic Power Level Status.

**Public Members**

bool `op_en`
Indicate if optional parameters are included

uint16_t `present_power`
Current value of Generic Power Actual state

uint16_t `target_power`
Target value of Generic Power Actual state (optional)

uint8_t `remain_time`
Time to complete state transition (C.1)

struct `esp_ble_mesh_gen_power_last_status_cb_t`
Parameter of Generic Power Last Status.
Public Members

uint16_t **power**
The value of the Generic Power Last state

struct **esp_ble_mesh_gen_power_default_status_cb_t**
Parameter of Generic Power Default Status.

Public Members

uint16_t **power**
The value of the Generic Default Last state

struct **esp_ble_mesh_gen_power_range_status_cb_t**
Parameters of Generic Power Range Status.

Public Members

uint8_t **status_code**
Status Code for the request message

uint16_t **range_min**
Value of Range Min field of Generic Power Range state

uint16_t **range_max**
Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_battery_status_cb_t**
Parameters of Generic Battery Status.

Public Members

uint32_t **battery_level**
Value of Generic Battery Level state

uint32_t **time_to_discharge**
Value of Generic Battery Time to Discharge state

uint32_t **time_to_charge**
Value of Generic Battery Time to Charge state

uint32_t **flags**
Value of Generic Battery Flags state

struct **esp_ble_mesh_gen_loc_global_status_cb_t**
Parameters of Generic Location Global Status.
**Public Members**

`int32_t global_latitude`
Global Coordinates (Latitude)

`int32_t global_longitude`
Global Coordinates (Longitude)

`int16_t global_altitude`
Global Altitude

**struct esp_ble_mesh_gen_loc_local_status_cb_t**
Parameters of Generic Location Local Status.

**Public Members**

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

**struct esp_ble_mesh_gen_user_properties_status_cb_t**
Parameter of Generic User Properties Status.

**Public Members**

**struct net_buf_simple *property_ids**
Buffer contains a sequence of N User Property IDs

**struct esp_ble_mesh_gen_user_property_status_cb_t**
Parameters of Generic User Property Status.

**Public Members**

`bool op_en`
Indicate if optional parameters are included
uint16_t property_id
    Property ID identifying a Generic User Property

uint8_t user_access
    Enumeration indicating user access (optional)

struct net_buf_simple *property_value
    Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
    Parameter of Generic Admin Properties Status.

    **Public Members**

    struct net_buf_simple *property_ids
        Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
    Parameters of Generic Admin Property Status.

    **Public Members**

    bool op_en
        Indicate if optional parameters are included

    uint16_t property_id
        Property ID identifying a Generic Admin Property

    uint8_t user_access
        Enumeration indicating user access (optional)

    struct net_buf_simple *property_value
        Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
    Parameter of Generic Manufacturer Properties Status.

    **Public Members**

    struct net_buf_simple *property_ids
        Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
    Parameters of Generic Manufacturer Property Status.
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the Manufacturer Property (C.1)

Public Members

struct esp_ble_mesh_gen_client_properties_status_cb_t
   Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
   Generic Client Model callback parameters

Public Members

int error_code
   Appropriate error code

   esp_ble_mesh_client_common_param_t *params
   The client common parameters.

   esp_ble_mesh_gen_client_status_cb_t status_cb
   The generic status message callback values

Public Members

uint8_t onoff
   The present value of the Generic OnOff state

uint8_t target_onoff
   The target value of the Generic OnOff state
struct esp_ble_mesh_gen_onoff_srv_t
    User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
    Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
    Parameters of Generic Level state

Public Members

int16_t level
    The present value of the Generic Level state

int16_t target_level
    The target value of the Generic Level state

int16_t last_level
    When a new transaction starts, level should be set to last_level, and use "level + incoming delta" to calculate the target level. In another word, "last_level" is used to record "level" of the last transaction, and "last_delta" is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
    The last delta change of the Generic Level state

bool move_start
    Indicate if the transition of the Generic Level state has been started

bool positive
    Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
    User data of Generic Level Server Model
Chapter 2. API Reference

Public Members

\texttt{esp\_ble\_mesh\_model\_t \*model}

Pointer to the Generic Level Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t \*rsp\_ctrl}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_gen\_level\_state\_t \*state}

Parameters of the Generic Level state

\texttt{esp\_ble\_mesh\_last\_msg\_info\_t \*last}

Parameters of the last received set message

\texttt{esp\_ble\_mesh\_state\_transition\_t \*transition}

Parameters of state transition

\texttt{int32\_t \*tt\_delta\_level}

Delta change value of level state transition

\texttt{struct \_esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t}

Parameter of Generic Default Transition Time state

Public Members

\texttt{uint8\_t \*trans\_time}

The value of the Generic Default Transition Time state

\texttt{struct \_esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t}

User data of Generic Default Transition Time Server Model

Public Members

\texttt{esp\_ble\_mesh\_model\_t \*model}

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t \*rsp\_ctrl}

Response control of the server model received messages

\texttt{esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t \*state}

Parameters of the Generic Default Transition Time state

\texttt{struct \_esp\_ble\_mesh\_gen\_onpowerup\_state\_t}

Parameter of Generic OnPowerUp state
Chapter 2. API Reference

Public Members

uint8_t onpowerup

The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_srv_t

User data of Generic Power OnOff Server Model

```

```c
esp_ble_mesh_state_transition_t transition
Parameters of state transition
```

```c
int32_t tt_delta_level
Delta change value of level state transition
```

**struct esp_ble_mesh_gen_power_level_setup_srv_t**
User data of Generic Power Level Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
"Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages
```
Chapter 2. API Reference

*esp_ble_mesh_gen_power_level_state_t* state
Parameters of the Generic Power Level state

**Public Members**

uint32_t battery_level
The value of the Generic Battery Level state

uint32_t time_to_discharge
The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge
The value of the Generic Battery Time to Charge state

uint32_t battery_flags
The value of the Generic Battery Flags state

**struct esp_ble_mesh_gen_battery_state_t**
Parameters of Generic Battery state

**Public Members**

**struct esp_ble_mesh_gen_battery_srv_t**
User data of Generic Battery Server Model

**Public Members**

*esp_ble_mesh_model_t* model
Pointer to the Generic Battery Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_gen_battery_state_t* state
Parameters of the Generic Battery state

**struct esp_ble_mesh_gen_location_state_t**
Parameters of Generic Location state

**Public Members**

int32_t global_latitude
The value of the Global Latitude field

int32_t global_longitude
The value of the Global Longitude field
int16_t `global_altitude`
   The value of the Global Altitude field

int16_t `local_north`
   The value of the Local North field

int16_t `local_east`
   The value of the Local East field

int16_t `local_altitude`
   The value of the Local Altitude field

uint8_t `floor_number`
   The value of the Floor Number field

uint16_t `uncertainty`
   The value of the Uncertainty field

struct `esp_ble_mesh_gen_location_srv_t`
User data of Generic Location Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
   Pointer to the Generic Location Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
   Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
   Parameters of the Generic Location state

struct `esp_ble_mesh_gen_location_setup_srv_t`
User data of Generic Location Setup Server Model

**Public Members**

`esp_ble_mesh_model_t *model`
   Pointer to the Generic Location Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
   Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
   Parameters of the Generic Location state

struct `esp_ble_mesh_generic_property_t`
Parameters of Generic Property states
Public Members

`uint16_t id`

The value of User/Admin/Manufacturer Property ID

`uint8_t user_access`

The value of User Access field

`uint8_t admin_access`

The value of Admin Access field

`uint8_t manu_access`

The value of Manufacturer Access field

`struct net_buf_simple *val`

The value of User/Admin/Manufacturer Property

`struct esp_ble_mesh_gen_user_prop_srv_t`  
User data of Generic User Property Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Generic User Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`

Response control of the server model received messages

`uint8_t property_count`

Generic User Property count

`esp_ble_mesh_generic_property_t *properties`

Parameters of the Generic User Property state

`struct esp_ble_mesh_gen_admin_prop_srv_t`  
User data of Generic Admin Property Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Generic Admin Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`

Response control of the server model received messages

`uint8_t property_count`

Generic Admin Property count
struct esp_ble_mesh_generic_property_t *properties
Parameters of the Generic Admin Property state

struct esp_ble_mesh_gen_manu_prop_srv_t
User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic Manufacturer Property count

struct esp_ble_mesh_generic_property_t *properties
Parameters of the Generic Manufacturer Property state

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t id_count
Generic Client Property ID count

uint16_t *property_ids
Parameters of the Generic Client Property state

struct esp_ble_mesh_state_change_gen_onoff_set_t
Parameter of Generic OnOff Set state change event

Public Members

uint8_t onoff
The value of Generic OnOff state

struct esp_ble_mesh_state_change_gen_level_set_t
Parameter of Generic Level Set state change event
Chapter 2. API Reference

Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_delta_set_t
Parameter of Generic Delta Set state change event

Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_move_set_t
Parameter of Generic Move Set state change event

Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t trans_time
The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t onpowerup
The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
Parameter of Generic Power Level Set state change event

Public Members

uint16_t power
The value of Generic Power Actual state
Chapter 2. API Reference

struct esp_ble_mesh_state_change_gen_power_default_set_t
Parameter of Generic Power Default Set state change event

Public Members

uint16_t power
The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
The minimum value of Generic Power Range state

uint16_t range_max
The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
The Global Latitude value of Generic Location state

int32_t longitude
The Global Longitude value of Generic Location state

int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state

int16_t east
The Local East value of Generic Location state

int16_t altitude
The Local Altitude value of Generic Location state
uint8_t floor_number
    The Floor Number value of Generic Location state

uint16_t uncertainty
    The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
    Parameters of Generic User Property Set state change event

Public Members

uint16_t id
    The property id of Generic User Property state

struct net_buf_simple *value
    The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
    Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
    The property id of Generic Admin Property state

uint8_t access
    The property access of Generic Admin Property state

struct net_buf_simple *value
    The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
    Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
    The property id of Generic Manufacturer Property state

uint8_t access
    The property value of Generic Manufacturer Property state

struct esp_ble_mesh_server_recv_gen_user_property_get_t
    Context of the received Generic User Property Get message
Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

```c
uint8_t delay
   Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_gen_level_set_t
Context of the received Generic Level Set message
```

**Public Members**

```c
bool op_en
   Indicate if optional parameters are included
```

```c
int16_t level
   Target value of Generic Level state
```

```c
uint8_t tid
   Transaction ID
```

```c
uint8_t trans_time
   Time to complete state transition (optional)
```

```c
uint8_t delay
   Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_gen_delta_set_t
Context of the received Generic Delta Set message
```

**Public Members**

```c
bool op_en
   Indicate if optional parameters are included
```

```c
int32_t delta_level
   Delta change of Generic Level state
```

```c
uint8_t tid
   Transaction ID
```

```c
uint8_t trans_time
   Time to complete state transition (optional)
```

```c
uint8_t delay
   Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_gen_move_set_t
Context of the received Generic Move Set message
```
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t delta_level
   Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
   Context of the received Generic Default Transition Time Set message

Public Members

uint8_t trans_time
   The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
   Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
   The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
   Context of the received Generic Power Level Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t power
   Target value of Generic Power Actual state

uint8_t tid
   Transaction ID
Chapter 2. API Reference

uint8_t \texttt{trans\_time} \\
Time to complete state transition (optional)

uint8_t \texttt{delay} \\
Indicate message execution delay (C.1)

\textbf{struct} \texttt{esp\_ble\_mesh\_server\_recv\_gen\_power\_default\_set\_t} \\
Context of the received Generic Power Default Set message

\textbf{Public Members}

uint16_t \texttt{power} \\
The value of the Generic Power Default state

\textbf{struct} \texttt{esp\_ble\_mesh\_server\_recv\_gen\_power\_range\_set\_t} \\
Context of the received Generic Power Range Set message

\textbf{Public Members}

uint16_t \texttt{range\_min} \\
Value of Range Min field of Generic Power Range state

uint16_t \texttt{range\_max} \\
Value of Range Max field of Generic Power Range state

\textbf{struct} \texttt{esp\_ble\_mesh\_server\_recv\_gen\_loc\_global\_set\_t} \\
Context of the received Generic Location Global Set message

\textbf{Public Members}

int32_t \texttt{global\_latitude} \\
Global Coordinates (Latitude)

int32_t \texttt{global\_longitude} \\
Global Coordinates (Longitude)

int16_t \texttt{global\_altitude} \\
Global Altitude

\textbf{struct} \texttt{esp\_ble\_mesh\_server\_recv\_gen\_loc\_local\_set\_t} \\
Context of the received Generic Location Local Set message

\textbf{Public Members}

int16_t \texttt{local\_north} \\
Local Coordinates (North)
int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message

**Public Members**

uint16_t property_id
Property ID identifying a Generic User Property

struct net_buf_simple *property_value
Raw value for the User Property

struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message

**Public Members**

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message

**Public Members**

uint16_t property_id
Property ID identifying a Generic Manufacturer Property
uint8_t **user_access**

Enumeration indicating user access

**struct esp_ble_mesh_generic_server_cb_param_t**

Generic Server Model callback parameters

**Public Members**

*esp_ble_mesh_model_t* **model**

Pointer to Generic Server Models

*esp_ble_mesh_msg_ctx_t* **ctx**

Context of the received messages

*esp_ble_mesh_generic_server_cb_value_t* **value**

Value of the received Generic Messages

**Macros**

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)

Define a new Generic OnOff Client Model.

*Note:* This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

*Parameters*  
- cli_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.  
- cli_data -- Pointer to the unique struct esp_ble_mesh_client_t.  

*Returns* New Generic OnOff Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)

Define a new Generic Level Client Model.

*Note:* This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

*Parameters*  
- cli_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.  
- cli_data -- Pointer to the unique struct esp_ble_mesh_client_t.  

*Returns* New Generic Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

*Note:* This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

*Parameters*  
- cli_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
**Chapter 2. API Reference**

- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Default Transition Time Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI** (cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Power OnOff Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Power Level Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)

Define a new Generic Battery Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Battery Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)

Define a new Generic Location Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Parameters**

- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Location Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)

Define a new Generic Property Client Model.
Chapter 2. API Reference

**Note:** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Parameters**
- **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Generic Location Client Model instance.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)
Generic Server Models related context.
Define a new Generic OnOff Server Model.

**Note:**
1. The Generic OnOff Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**Returns** New Generic OnOff Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

**Note:**
1. The Generic Level Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**Returns** New Generic Level Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

**Note:**
1. The Generic Default Transition Time Server Model is a root model.
   a. This model shall support model publication and model subscription.

**Parameters**
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

**Returns** New Generic Default Transition Time Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV** (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

**Note:**
1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.

b. This model shall support model publication and model subscription.

Parameters

- \texttt{srv\_pub} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{srv\_data} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t}.

Returns

New Generic Power OnOff Server Model instance.

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SETUP\_SRV}(\texttt{srv\_pub}, \texttt{srv\_data})

Define a new Generic Power OnOff Setup Server Model.

a. This model shall support model subscription.

Parameters

- \texttt{srv\_pub} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{srv\_data} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t}.

Returns

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SRV}(\texttt{srv\_pub}, \texttt{srv\_data})

Define a new Generic Power Level Server Model.

\textbf{Note: } 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

Parameters

- \texttt{srv\_pub} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{srv\_data} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_gen\_power\_level\_srv\_t}.

Returns

New Generic Power Level Server Model instance.

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SETUP\_SRV}(\texttt{srv\_pub}, \texttt{srv\_data})

Define a new Generic Power Level Setup Server Model.

a. This model shall support model subscription.

Parameters

- \texttt{srv\_pub} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
- \texttt{srv\_data} -- Pointer to the unique struct \texttt{esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t}.

Returns

New Generic Power Level Setup Server Model instance.

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_SRV}(\texttt{srv\_pub}, \texttt{srv\_data})

Define a new Generic Battery Server Model.

\textbf{Note: } 1. The Generic Battery Server Model is a root model.
a. This model shall support model publication and model subscription.
b. The model may be used to represent an element that is powered by a battery.

Parameters
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

Returns New Generic Battery Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV** (srv_pub, srv_data)
Define a new Generic Location Server Model.

Note: 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be used to represent an element that knows its location (global or local).

Parameters
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

Returns New Generic Location Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV** (srv_pub, srv_data)
Define a new Generic Location Setup Server Model.

Note: 1. The Generic Location Setup Server model extends the Generic Location Server model.
   a. This model shall support model subscription.

Parameters
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

Returns New Generic Location Setup Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV** (srv_pub, srv_data)
Define a new Generic User Property Server Model.

Note: 1. The Generic User Property Server model is a root model.
   a. This model shall support model publication and model subscription.

Parameters
- **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data** -- Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

Returns New Generic User Property Server Model instance.

**ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV** (srv_pub, srv_data)
Define a new Generic Admin Property Server Model.

Note: 1. The Generic Admin Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.
Parameters

- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

Returns

New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

Note: 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   a. This model shall support model publication and model subscription.

Parameters

- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

Returns

New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

Note: 1. The Generic Client Property Server model is a root model.
   a. This model shall support model publication and model subscription.

Parameters

- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

Returns

New Generic Client Property Server Model instance.

Type Definitions

typedef void (*`esp_ble_mesh_generic_client_cb_t`)(`esp_ble_mesh_generic_client_cb_event_t` event, `esp_ble_mesh_generic_client_cb_param_t` *param)

   Bluetooth Mesh Generic Client Model function.
   Generic Client Model callback function type

   Param event Event type
   Param param Pointer to callback parameter

typedef void (*`esp_ble_mesh_generic_server_cb_t`)(`esp_ble_mesh_generic_server_cb_event_t` event, `esp_ble_mesh_generic_server_cb_param_t` *param)

   Bluetooth Mesh Generic Server Model function.
   Generic Server Model callback function type

   Param event Event type
   Param param Pointer to callback parameter

Enumerations

define `esp_ble_mesh_generic_client_cb_event_t`

   This enum value is the event of Generic Client Model

   Values:
enumerator `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT PUBLISH_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`

enumerator `ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX`

enum `esp_ble_mesh_gen_user_prop_access_t`
This enum value is the access value of Generic User Property

Values:

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_READ`

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_WRITE`

enumerator `ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE`

enum `esp_ble_mesh_gen_admin_prop_access_t`
This enum value is the access value of Generic Admin Property

Values:

enumerator `ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP`

enumerator `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ`

enumerator `ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE`

enumerator `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE`

enum `esp_ble_mesh_gen_manu_prop_access_t`
This enum value is the access value of Generic Manufacturer Property

Values:

enumerator `ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP`

enumerator `ESP_BLE_MESH_GEN_MANU_ACCESS_READ`

enum `esp_ble_mesh_generic_server_cb_event_t`
This enum value is the event of Generic Server Model

Values:
Chapter 2. API Reference

enumerator ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.

enumerator ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Sensor Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h
• This header file can be included with:

```
#include "esp_ble_mesh_sensor_model_api.h"
```

• This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

\textbf{esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t \textit{callback})}

Register BLE Mesh Sensor Client Model callback.

\textbf{Parameters} \textit{callback} -- [in] Pointer to the callback function.

\textbf{Returns} ESP_OK on success or error code otherwise.

\textbf{esp_err_t esp_ble_mesh_sensor_client_get_state (esp_ble_mesh_client_common_param_t \textit{params}, esp_ble_mesh_sensor_client_get_state_t \textit{get_state})}

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

\textbf{Note:} If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

\textbf{Parameters}

\begin{itemize}
  \item \textit{params} -- [in] Pointer to BLE Mesh common client parameters.
  \item \textit{get_state} -- [in] Pointer to sensor get message value. Shall not be set to NULL.
\end{itemize}

\textbf{Returns} ESP_OK on success or error code otherwise.
**esp_err_t esp_ble_mesh_sensor_client_set_state**

```c
*params, esp_ble_mesh_sensor_client_set_state_t *set_state)
```

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_messageOpcode_t in esp_ble_mesh_defs.h

**Parameters**
- **params** -- [in] Pointer to BLE Mesh common client parameters.
- **set_state** -- [in] Pointer to sensor set message value. Shall not be set to NULL.

**Returns** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_sensor_server_callback**

```c
*callback
```

Register BLE Mesh Sensor Server Model callback.

**Parameters**
- **callback** -- [in] Pointer to the callback function.

**Returns** ESP_OK on success or error code otherwise.

**Unions**

- **union esp_ble_mesh_sensor_client_get_state_t**
  ```c
  #include <esp_ble_mesh_sensor_model_api.h> 
  Sensor Client Model get message union.
  ```

**Public Members**

Structures

struct esp_ble_mesh_sensor_descriptor_get_t
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
Parameters of Sensor Descriptor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID of a sensor (optional)

struct esp_ble_mesh_sensor_cadence_get_t
Parameter of Sensor Cadence Get

Public Members

uint16_t property_id
Property ID of a sensor

struct esp_ble_mesh_sensor_cadence_set_t
Parameters of Sensor Cadence Set

Public Members

uint16_t property_id
Property ID for the sensor

uint8_t fast_cadence_period_divisor
Divisor for the publish period

uint8_t status_trigger_type
The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
Delta up value that triggers a status message

uint8_t status_min_interval
Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
Low value for the fast cadence range
struct net_buf_simple *fast_cadence_high
Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t
Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)
struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x1
Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure. Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
Property for the sensor
struct net_buf_simple *sensor_cadence_value
    Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
    Parameters of Sensor Settings Status

**Public Members**

uint16_t sensor_property_id
    Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
    A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
    Parameters of Sensor Setting Status

**Public Members**

bool op_en
    Indicate id optional parameters are included

uint16_t sensor_property_id
    Property ID identifying a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor

uint8_t sensor_setting_access
    Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
    Raw value for the setting

struct esp_ble_mesh_sensor_status_cb_t
    Parameter of Sensor Status

**Public Members**

struct net_buf_simple *marshalled_sensor_data
    Value of sensor data state (optional)

struct esp_ble_mesh_sensor_column_status_cb_t
    Parameters of Sensor Column Status
Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
Left values of sensor column status

struct esp_ble_mesh_sensor_series_status_cb_t
Parameters of Sensor Series Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
Left values of sensor series status

struct esp_ble_mesh_sensor_client_cb_param_t
Sensor Client Model callback parameters

Public Members

int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t status_cb
The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t
Parameters of Sensor Descriptor state

Public Members

uint32_t positive_tolerance
The value of Sensor Positive Tolerance field

uint32_t negative_tolerance
The value of Sensor Negative Tolerance field

uint32_t sampling_function
The value of Sensor Sampling Function field
uint8_t measure_period
    The value of Sensor Measurement Period field

uint8_t update_interval
    The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t
    Parameters of Sensor Setting state

Public Members

uint16_t property_id
    The value of Sensor Setting Property ID field

uint8_t access
    The value of Sensor Setting Access field

struct net_buf_simple *raw
    The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
    Parameters of Sensor Cadence state

Public Members

uint8_t period_divisor
    The value of Fast Cadence Period Divisor field

uint8_t trigger_type
    The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
    Note: The parameter "size" in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the "size" precisely. The value of Status Trigger Delta Down field

struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up field

uint8_t min_interval
    The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
    The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
    The value of Fast Cadence High field
struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t format
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 – 16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t length
The value of the Sensor Data length

struct net_buf_simple *raw_value
The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
Parameters of Sensor Series Column state

Public Members

struct net_buf_simple *raw_value_x
The value of Sensor Raw Value X field

struct net_buf_simple *column_width
The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
Parameters of Sensor states

Public Members

uint16_t sensor_property_id
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
Parameters of the Sensor Descriptor state

const uint8_t setting_count
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
Parameters of the Sensor Setting state
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

```c
esp_ble_mesh_sensor_data_t *sensor_data
```
Parameters of the Sensor Data state

```c
esp_ble_mesh_sensor_series_column_t *series_column
```
Parameters of the Sensor Series Column state

```c
struct esp_ble_mesh_sensor_srv_t
```
User data of Sensor Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to the Sensor Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```
Response control of the server model received messages

```c
const uint8_t state_count
```
Sensor state count

```c
esp_ble_mesh_sensor_state_t *states
```
Parameters of the Sensor states

```c
struct esp_ble_mesh_sensor_setup_srv_t
```
User data of Sensor Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```
Pointer to the Sensor Setup Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```
Response control of the server model received messages

```c
const uint8_t state_count
```
Sensor state count

```c
esp_ble_mesh_sensor_state_t *states
```
Parameters of the Sensor states

```c
struct esp_ble_mesh_state_change_sensor_cadence_set_t
```
Parameters of Sensor Cadence Set state change event
Public Members

uint16_t property_id
The value of Sensor Property ID state

uint8_t period_divisor
The value of Fast Cadence Period Divisor state

uint8_t trigger_type
The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up state

uint8_t min_interval
The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
The value of Sensor Property ID state

uint16_t setting_property_id
The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
Context of the received Sensor Descriptor Get message

Public Members

bool op_en
Indicate if optional parameters are included
uint16_t property_id
    Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
    Context of the received Sensor Cadence Get message

**Public Members**

uint16_t property_id
    Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
    Context of the received Sensor Settings Get message

**Public Members**

uint16_t property_id
    Property ID of a sensor

uint16_t setting_property_id
    Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_setting_get_t
    Context of the received Sensor Setting Get message

**Public Members**

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_get_t
    Context of the received Sensor Get message

**Public Members**

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID for the sensor (optional)
Chapter 2. API Reference

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_server_recv_sensor_series_get_t
Context of the received Sensor Series Get message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value
Raw value containing X1 and X2 (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_set_t
Context of the received Sensor Cadence Set message

Public Members

uint16_t property_id
Property ID for the sensor

struct net_buf_simple *cadence
Value of Sensor Cadence state

struct esp_ble_mesh_server_recv_sensor_setting_set_t
Context of the received Sensor Setting Set message

Public Members

uint16_t property_id
Property ID identifying a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw
Raw value for the setting
struct esp_ble_mesh_sensor_server_cb_param_t

Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model

Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t ctx

Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t value

Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)

Define a new Sensor Client Model.

Note: This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Parameters

• cli_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
• cli_data -- Pointer to the unique struct esp_ble_mesh_client_t.

Returns New Sensor Client Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

Note: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

Parameters

• srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data -- Pointer to the unique struct esp_ble_mesh_sensor_srv_t.

Returns New Sensor Server Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)

Define a new Sensor Setup Server Model.

Note: 1. The Sensor Setup Server model extends the Sensor Server model.

a. This model shall support model publication and model subscription.

Parameters

• srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
• **srv_data** -- Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

**Returns**  New Sensor Setup Server Model instance.

```c
ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID
Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN
Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN
Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE
Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE
Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD
Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL
Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
Maximum value of Sensor Period Divisor
```
ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX

Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16

Sensor Status Trigger Type - Format Type "uint16"

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A

Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B

Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN

MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN

MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)

Get format of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Parameters

• _data -- Pointer to the start of the sensor data.

Returns Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)

Get length of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Parameters

• _data -- Pointer to the start of the sensor data.
• _fmt -- Format of the sensor data.

Returns Length (zero-based) of the sensor data.
ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)

Get Sensor Property ID of the sensor data.

**Note:** Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Parameters**
- _data -- Pointer to the start of the sensor data.
- _fmt -- Format of the sensor data.

**Returns** Sensor Property ID of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)

Generate a MPID value for sensor data with Format A.

**Note:**
1. The Format field is 0b0 and indicates that Format A is used.
   a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
   b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
   c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Parameters**
- _len -- Length of Sensor Raw value.
- _id -- Sensor Property ID.

**Returns** 2-octet MPID value for sensor data with Format A.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)

Generate a MPID value for sensor data with Format B.

**Note:**
1. The Format field is 0b1 and indicates Format B is used.
   a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
   b. The Property ID is a 16-bit bit field representing a Property ID.
   c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
   d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Parameters**
- _len -- Length of Sensor Raw value.
- _id -- Sensor Property ID.

**Returns** 3-octet MPID value for sensor data with Format B.

**Type Definitions**

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,
        esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

  Bluetooth Mesh Sensor Server Model function.
  Sensor Server Model callback function type
  
  Param event  Event type
  Param param  Pointer to callback parameter

Enumerations

define esp_ble_mesh_sensor_client_cb_event_t

  This enum value is the event of Sensor Client Model
  
  Values:

  enumerator ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
  enumerator ESP_BLE_MESHSENSOR_CLIENT_SET_STATE_EVT
  enumerator ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
  enumerator ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
  enumerator ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func

  This enum value is value of Sensor Sampling Function
  
  Values:

  enumerator ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
  enumerator ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
  enumerator ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
  enumerator ESP_BLE_MESH_SAMPLE_FUNC_RMS
  enumerator ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
  enumerator ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
  enumerator ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
  enumerator ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t

  This enum value is the event of Sensor Server Model
  
  Values:
enumerator ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.

ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_time_scene_model_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

`esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)`

Register BLE Mesh Time Scene Client Model callback.

Parameters callback -- [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state)`

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

Parameters

• params -- [in] Pointer to BLE Mesh common client parameters.

• get_state -- [in] Pointer to time scene get message value. Shall not be set to NULL.
Returns ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_time_scene_client_set_state
```

*params, *set_state

- **set_state** -- [in] Pointer to time scene set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**

- **params** -- [in] Pointer to BLE Mesh common client parameters.

**Returns** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_time_scene_server_callback
```

*callback*

- **callback** -- [in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

**Unions**

### Structures

#### struct esp_ble_mesh_time_set_t

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set
Public Members

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds
```

```c
uint8_t sub_second
    The sub-second time in units of 1/256 second
```

```c
uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps
```

```c
uint16_t time_authority
    0 = No Time Authority, 1 = Time Authority
```

```c
uint16_t tai_utc_delta
    Current difference between TAI and UTC in seconds
```

```c
uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_time_zone_set_t
    Parameters of Time Zone Set
```

Public Members

```c
uint8_t time_zone_offset_new
    Upcoming local time zone offset
```

```c
uint8_t tai_zone_change[5]
    TAI Second time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_tai_utc_delta_set_t
    Parameters of TAI-UTC Delta Set
```

Public Members

```c
uint16_t tai_utc_delta_new
    Upcoming difference between TAI and UTC in seconds
```

```c
uint16_t padding
    Always 0b0. Other values are Prohibited.
```

```c
uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change
```

```c
struct esp_ble_mesh_time_role_set_t
    Parameter of Time Role Set
```
**Public Members**

```c
uint8_t time_role
```

The Time Role for the element

**Public Members**

```c
struct esp_ble_mesh_scene_store_t
```

Parameter of Scene Store

**Public Members**

```c
uint16_t scene_number
```

The number of scenes to be stored

**Public Members**

```c
bool op_en
```

Indicate if optional parameters are included

```c
uint16_t scene_number
```

The number of scenes to be recalled

```c
uint8_t tid
```

Transaction ID

```c
uint8_t trans_time
```

Time to complete state transition (optional)

```c
uint8_t delay
```

Indicate message execution delay (C.1)

**Public Members**

```c
struct esp_ble_mesh_scene_delete_t
```

Parameter of Scene Delete

**Public Members**

```c
uint16_t scene_number
```

The number of scenes to be deleted

**Public Members**

```c
struct esp_ble_mesh_scheduler_act_get_t
```

Parameter of Scheduler Action Get
Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_scheduler_act_set_t
Parameters of Scheduler Action Set

Public Members

uint64_t index
Index of the Schedule Register entry to set

uint64_t year
Scheduled year for the action

uint64_t month
Scheduled month for the action

uint64_t day
Scheduled day of the month for the action

uint64_t hour
Scheduled hour for the action

uint64_t minute
Scheduled minute for the action

uint64_t second
Scheduled second for the action

uint64_t day_of_week
Scheduled days of the week for the action

uint64_t action
Action to be performed at the scheduled time

uint64_t trans_time
Transition time for this action

uint16_t scene_number
Transition time for this action

struct esp_ble_mesh_time_status_cb_t
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.
Parameters of Time Status
Public Members

uint8_t \texttt{tai\_seconds}[5]  
The current TAI time in seconds

uint8_t \texttt{sub\_second}  
The sub-second time in units of 1/256 second

uint8_t \texttt{uncertainty}  
The estimated uncertainty in 10-millisecond steps

uint16_t \texttt{time\_authority}  
0 = No Time Authority, 1 = Time Authority

uint16_t \texttt{tai\_utc\_delta}  
The current difference between TAI and UTC in seconds

uint8_t \texttt{time\_zone\_offset}  
The local time zone offset in 15-minute increments

\textbf{struct} \texttt{esp\_ble\_mesh\_time\_zone\_status\_cb\_t}  
Parameters of Time Zone Status

Public Members

uint8_t \texttt{time\_zone\_offset\_curr}  
The current local time zone offset

uint8_t \texttt{time\_zone\_offset\_new}  
The upcoming local time zone offset

uint8_t \texttt{tai\_zone\_change}[5]  
The TAI Seconds time of the upcoming Time Zone Offset change

\textbf{struct} \texttt{esp\_ble\_mesh\_tai\_utc\_delta\_status\_cb\_t}  
Parameters of TAI-UTC Delta Status

Public Members

uint16_t \texttt{tai\_utc\_delta\_curr}  
The current difference between TAI and UTC in seconds

uint16_t \texttt{padding\_1}  
Always 0b0. Other values are Prohibited.

uint16_t \texttt{tai\_utc\_delta\_new}  
The upcoming difference between TAI and UTC in seconds
uint16_t padding_2
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
    Parameter of Time Role Status

    Public Members

    uint8_t time_role
        The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
    Parameters of Scene Status

    Public Members

    bool op_en
        Indicate if optional parameters are included

    uint8_t status_code
        Status code of the last operation

    uint16_t current_scene
        Scene Number of the current scene

    uint16_t target_scene
        Scene Number of the target scene (optional)

    uint8_t remain_time
        Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
    Parameters of Scene Register Status

    Public Members

    uint8_t status_code
        Status code for the previous operation

    uint16_t current_scene
        Scene Number of the current scene
Chapter 2. API Reference

struct net_buf_simple *scenes
    A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
    Parameter of Scheduler Status

    Public Members

    uint16_t schedules
        Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t
    Parameters of Scheduler Action Status

    Public Members

    uint64_t index
        Enumerates (selects) a Schedule Register entry

    uint64_t year
        Scheduled year for the action

    uint64_t month
        Scheduled month for the action

    uint64_t day
        Scheduled day of the month for the action

    uint64_t hour
        Scheduled hour for the action

    uint64_t minute
        Scheduled minute for the action

    uint64_t second
        Scheduled second for the action

    uint64_t day_of_week
        Schedule days of the week for the action

    uint64_t action
        Action to be performed at the scheduled time

    uint64_t trans_time
        Transition time for this action
uint16_t scene_number
    Transition time for this action

struct esp_ble_mesh_time_scene_client_cb_param_t
    Time Scene Client Model callback parameters

Public Members

int error_code
    Appropriate error code

    *params
    The client common parameters.

    status_cb
    The scene status message callback values

Public Members

uint8_t tai_seconds[5]
    The value of the TAI Seconds state

uint8_t subsecond
    The value of the Subsecond field

uint8_t uncertainty
    The value of the Uncertainty field

uint8_t time_zone_offset_cur
    The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
    The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
    The value of the TAI of Zone Change field

uint16_t time_authority
    The value of the Time Authority bit

uint16_t tai_utc_delta_curr
    The value of the TAI-UTC Delta Current state
**Chapter 2. API Reference**

```c
uint16_t tai_utc_delta_new
    The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
    The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
    Parameters of the Time state

uint8_t time_role
    The value of the Time Role state

struct esp_ble_mesh_time_srv_t
    User data of Time Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

struct esp_ble_mesh_time_srv_t
    User data of Time Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_time_state_t *state
    Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
    User data of Time Setup Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

struct esp_ble_mesh_scene_register_t
    a. Scene Store is an operation of storing values of a present state of an element.
    b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
    c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
    d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state
```
Chapter 2. API Reference

Public Members

uint16_t scene_number
  The value of the Scene Number

uint8_t scene_type
  The value of the Scene Type

struct net_buf_simple *scene_value
  Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct esp_ble_mesh_scenes_state_t
  Parameters of Scenes state.
  Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.
  A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.
  The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.
  The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t scene_count
  The Scenes state's scene count

esp_ble_mesh_scene_register_t *scenes
  Parameters of the Scenes state

uint16_t current_scene
  The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.
  When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.
  When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.
  When any of the element's state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.
  When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene
  The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.
When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

```
uint8_t status_code
```

The status code of the last scene operation

```
bool in_progress
```

Indicate if the scene transition is in progress

```
struct esp_ble_mesh_scene_srv_t
```

User data of Scene Server Model

**Public Members**

```
esp_ble_mesh_model_t *model
```

Pointer to the Scene Server Model. Initialized internally.

```
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```
esp_ble_mesh_scenes_state_t *state
```

Parameters of the Scenes state

```
esp_ble_mesh_last_msg_info_t *last
```

Parameters of the last received set message

```
esp_ble_mesh_state_transition_t transition
```

Parameters of state transition

```
struct esp_ble_mesh_scene_setup_srv_t
```

User data of Scene Setup Server Model

**Public Members**

```
esp_ble_mesh_model_t *model
```

Pointer to the Scene Setup Server Model. Initialized internally.

```
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```
esp_ble_mesh_scenes_state_t *state
```

Parameters of the Scenes state

```
struct esp_ble_mesh_schedule_register_t
```

Parameters of Scheduler Register state
**Public Members**

bool `in_use`

Indicate if the registered schedule is in use

uint64_t `year`

The value of Scheduled year for the action

uint64_t `month`

The value of Scheduled month for the action

uint64_t `day`

The value of Scheduled day of the month for the action

uint64_t `hour`

The value of Scheduled hour for the action

uint64_t `minute`

The value of Scheduled minute for the action

uint64_t `second`

The value of Scheduled second for the action

uint64_t `day_of_week`

The value of Schedule days of the week for the action

uint64_t `action`

The value of Action to be performed at the scheduled time

uint64_t `trans_time`

The value of Transition time for this action

uint16_t `scene_number`

The value of Scene Number to be used for some actions

struct `esp_ble_mesh_scheduler_state_t`

Parameters of Scheduler state

**Public Members**

const uint8_t `schedule_count`

Scheduler count

`esp_ble_mesh_schedule_register_t *schedules`

Up to 16 scheduled entries

struct `esp_ble_mesh_scheduler_srv_t`

User data of Scheduler Server Model
Chapter 2. API Reference

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Scheduler Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`

Parameters of the Scheduler state

struct `esp_ble_mesh_scheduler_setup_srv_t`

User data of Scheduler Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Scheduler Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`

Parameters of the Scheduler state

struct `esp_ble_mesh_state_change_time_set_t`

Parameters of Time Set state change event

Public Members

uint8_t `tai_seconds[5]`

The current TAI time in seconds

uint8_t `subsecond`

The sub-second time in units of 1/256 second

uint8_t `uncertainty`

The estimated uncertainty in 10-millisecond steps

uint16_t `time_authority`

0 = No Time Authority, 1 = Time Authority

uint16_t `tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

uint8_t `time_zone_offset_curr`

The local time zone offset in 15-minute increments
struct esp_ble_mesh_state_change_time_status_t
Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t tai_utc_delta_new
Upcoming difference between TAI and UTC in seconds

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
Parameter of Time Role Set state change event
Public Members

`uint8_t time_role`

The Time Role for the element

`struct esp_ble_mesh_state_change_scene_store_t`

Parameter of Scene Store state change event

Public Members

`uint16_t scene_number`

The number of scenes to be stored

`struct esp_ble_mesh_state_change_scene_recall_t`

Parameter of Scene Recall state change event

Public Members

`uint16_t scene_number`

The number of scenes to be recalled

`struct esp_ble_mesh_state_change_scene_delete_t`

Parameter of Scene Delete state change event

Public Members

`uint16_t scene_number`

The number of scenes to be deleted

`struct esp_ble_mesh_state_change_scheduler_act_set_t`

Parameter of Scheduler Action Set state change event

Public Members

`uint64_t index`

Index of the Schedule Register entry to set

`uint64_t year`

Scheduled year for the action

`uint64_t month`

Scheduled month for the action

`uint64_t day`

Scheduled day of the month for the action
```c
uint64_t hour
    Scheduled hour for the action

uint64_t minute
    Scheduled minute for the action

uint64_t second
    Scheduled second for the action

uint64_t day_of_week
    Schedule days of the week for the action

uint64_t action
    Action to be performed at the scheduled time

uint64_t trans_time
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
    Context of the received Scheduler Action Get message

    Public Members

    uint8_t index
        Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
    Context of the received Time Set message

    Public Members

    uint8_t tai_seconds[5]
        The current TAI time in seconds

    uint8_t subsecond
        The sub-second time in units of 1/256 second

    uint8_t uncertainty
        The estimated uncertainty in 10-millisecond steps

    uint16_t time_authority
        0 = No Time Authority, 1 = Time Authority
```

uint16_t **tai_utc_delta**
Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**
The local timezone offset in 15-minute increments

**struct esp_ble_mesh_server_recv_time_zone_set_t**
Context of the received Time Zone Set message

**Public Members**

uint8_t **time_zone_offset_new**
Upcoming local timezone offset

uint8_t **tai_zone_change[5]**
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_server_recv_tai_utc_delta_set_t**
Context of the received TAI UTC Delta Set message

**Public Members**

uint16_t **tai_utc_delta_new**
Upcoming difference between TAI and UTC in seconds

uint16_t **padding**
Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change[5]**
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_server_recv_time_role_set_t**
Context of the received Time Role Set message

**Public Members**

uint8_t **time_role**
The Time Role for the element

**struct esp_ble_mesh_server_recv_scene_store_t**
Context of the received Scene Store message

**Public Members**

uint16_t **scene_number**
The number of scenes to be stored
struct esp_ble_mesh_server_recv_scene_recall_t
Context of the received Scene Recall message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t scene_number
The number of scenes to be recalled

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
Context of the received Scene Delete message

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
Context of the received Scheduler Action Set message

Public Members

uint64_t index
Index of the Schedule Register entry to set

uint64_t year
Scheduled year for the action

uint64_t month
Scheduled month for the action

uint64_t day
Scheduled day of the month for the action
### Chapter 2. API Reference

- **uint64_t hour**
  Scheduled hour for the action

- **uint64_t minute**
  Scheduled minute for the action

- **uint64_t second**
  Scheduled second for the action

- **uint64_t day_of_week**
  Schedule days of the week for the action

- **uint64_t action**
  Action to be performed at the scheduled time

- **uint64_t trans_time**
  Transition time for this action

- **uint16_t scene_number**
  Scene number to be used for some actions

#### Public Members

- **uint8_t tai_seconds[5]**
  The current TAI time in seconds

- **uint8_t subsecond**
  The sub-second time in units of 1/256 second

- **uint8_t uncertainty**
  The estimated uncertainty in 10-millisecond steps

- **uint16_t time_authority**
  0 = No Time Authority, 1 = Time Authority

- **uint16_t tai_utc_delta**
  Current difference between TAI and UTC in seconds

- **uint8_t time_zone_offset**
  The local time zone offset in 15-minute increments

#### Context of the received Time Status message

#### TimeSceneServerModel callback parameters
Public Members

`esp_ble_mesh_model_t *model`
Pointer to Time and Scenes Server Models

`esp_ble_mesh_msg_ctx_t *ctx`
Context of the received messages

`esp_ble_mesh_time_scene_server_cb_value_t *value`
Value of the received Time and Scenes Messages

Macros

`ESP_BLE_MESH_MODEL_TIME_CLI(cli_pub, cli_data)`
Define a new Time Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Time Client Model.

**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Time Client Model instance.

`ESP_BLE_MESH_MODEL_SCENE_CLI(cli_pub, cli_data)`
Define a new Scene Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Scene Client Model.

**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Scene Client Model instance.

`ESP_BLE_MESH_MODEL_SCHEDULER_CLI(cli_pub, cli_data)`
Define a new Scheduler Client Model.

**Note:** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**Parameters**
- `cli_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data` -- Pointer to the unique struct `esp_ble_mesh_client_t`.

**Returns** New Scheduler Client Model instance.

`ESP_BLE_MESH_MODEL_TIME_SRV(srv_pub, srv_data)`
Time Scene Server Models related context.
Define a new Time Server Model.
Chapter 2. API Reference

Note: 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.

Parameters
   • srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data -- Pointer to the unique struct esp_ble_mesh_time_srv_t.

Returns New Time Server Model instance.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)
Define a new Time Setup Server Model.

Note: 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
   a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
   b. This model does not support subscribing nor publishing.

Parameters
   • srv_data -- Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)
Define a new Scene Server Model.

Note: 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.

Parameters
   • srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data -- Pointer to the unique struct esp_ble_mesh_scene_srv_t.

Returns New Scene Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)
Define a new Scene Setup Server Model.

Note: 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

Parameters
   • srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data -- Pointer to the unique struct esp_ble_mesh_scene_setup_srv_t.

Returns New Scene Setup Server Model instance.
ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

**Note:** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
   a. This model shall support model publication and model subscription.
   b. The model may be present only on the Primary element of a node.
   c. The model requires the Time Server model shall be present on the element.

**Parameters**
- **srv_pub** -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **srv_data** -- Pointer to the unique struct esp_ble_mesh_scheduler_srv_t.

**Returns** New Scheduler Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

**Note:** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   a. This model shall support model subscription.
   b. The model may be present only on the Primary element of a node.

**Parameters**
- **srv_pub** -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **srv_data** -- Pointer to the unique struct esp_ble_mesh_scheduler_setup_srv_t.

**Returns** New Scheduler Setup Server Model instance.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE
Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN
Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN
Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN
Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER
Invalid Scene Number
ESP_BLE_MESH_SCENE_NUMBER_LEN
Length of the Scene Number

ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall
**Chapter 2. API Reference**

### Type Definitions

```c
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param);
```

Bluetooth Mesh Time Scene Client Model function.

- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param);
```

Bluetooth Mesh Time and Scenes Server Model function.

- **Param event** Event type
- **Param param** Pointer to callback parameter

### Enumerations

- **ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION**
  Scheduled Action - No Action

- **ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE**
  Scheduled Scene - No Scene

- **ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX**
  Maximum number of Scheduled entries

- **ESP_BLE_MESH_TIME_NONE**
  Time Role - None

- **ESP_BLE_MESH_TIME_AUTHORITY**
  Time Role - Mesh Time Authority

- **ESP_BLE_MESH_TIME_RELAY**
  Time Role - Mesh Time Relay

- **ESP_BLE_MESH_TIME_CLIENT**
  Time Role - Mesh Time Client

- **ESP_BLE_MESH_SCENE_SUCCESS**
  Scene operation - Success

- **ESP_BLE_MESH_SCENE_REG_FULL**
  Scene operation - Scene Register Full

- **ESP_BLE_MESH_SCENE_NOT_FOUND**
  Scene operation - Scene Not Found
Chapter 2. API Reference

enum esp_ble_mesh_time_scene_client_cb_event_t
This enum value is the event of Time Scene Client Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
enumerator ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

enum esp_ble_mesh_time_scene_server_cb_event_t
This enum value is the event of Time Scene Server Model

Values:

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
  i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.
  ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
  When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

enumerator ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_lighting_model_api.h"
```
- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:
**REQUIRES bt**

or

**PRIV_REQUIRES bt**

## Functions

**esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)**

Register BLE Mesh Light Client Model callback.

**Parameters**

- callback -- [in] pointer to the callback function.

**Returns**

ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)**

Get the value of Light Server Model states using the Light Client Model get messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**

- params -- [in] Pointer to BLE Mesh common client parameters.
- get_state -- [in] Pointer of light get message value. Shall not be set to NULL.

**Returns**

ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)**

Set the value of Light Server Model states using the Light Client Model set messages.

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Parameters**

- params -- [in] Pointer to BLE Mesh common client parameters.
- set_state -- [in] Pointer of light set message value. Shall not be set to NULL.

**Returns**

ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)**

Register BLE Mesh Lighting Server Model callback.

**Parameters**

- callback -- [in] Pointer to the callback function.

**Returns**

ESP_OK on success or error code otherwise.

## Unions

union esp_ble_mesh_light_client_get_state_t

struct esp_ble_mesh_light_lightness_set_t
Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.
Parameters of Light Lightness Set

Public Members
```
bool op_en
    Indicate if optional parameters are included

uint16_t lightness
    Target value of light lightness actual state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_linear_set_t
    Parameters of Light Lightness Linear Set

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t lightness
    Target value of light lightness linear state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_default_set_t
    Parameter of Light Lightness Default Set

Public Members

uint16_t lightness
    The value of the Light Lightness Default state

struct esp_ble_mesh_light_lightness_range_set_t
    Parameters of Light Lightness Range Set
Public Members

```c
uint16_t range_min
    Value of range min field of light lightness range state
```

```c
uint16_t range_max
    Value of range max field of light lightness range state
```

```c
struct esp_ble_mesh_light_ctl_set_t
    Parameters of Light CTL Set
```

```c
Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

int16_t ctl_delta_uv
    Target value of light ctl delta UV state
```
uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range Set

**Public Members**

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_set_t
Parameters of Light CTL Default Set

**Public Members**

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_light_hsl_set_t
Parameters of Light HSL Set

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Target value of light hsl lightness state
uint16_t hsl_hue
    Target value of light hsl hue state

uint16_t hsl_saturation
    Target value of light hsl saturation state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_hue_set_t
    Parameters of Light HSL Hue Set

    Public Members

    bool op_en
        Indicate if optional parameters are included

uint16_t hue
    Target value of light hsl hue state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
    Parameters of Light HSL Saturation Set

    Public Members

    bool op_en
        Indicate if optional parameters are included

uint16_t saturation
    Target value of light hsl hue state
uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_default_set_t
    Parameters of Light HSL Default Set

Public Members

uint16_t lightness
    Value of light lightness default state

uint16_t hue
    Value of light hue default state

uint16_t saturation
    Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_set_t
    Parameters of Light HSL Range Set

Public Members

uint16_t hue_range_min
    Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
    Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
    Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
    Parameters of Light xYL Set

Public Members
bool op_en
   Indicate whether optional parameters included

uint16_t xyl_lightness
   The target value of the Light xyL Lightness state

uint16_t xyl_x
   The target value of the Light xyL x state

uint16_t xyl_y
   The target value of the Light xyL y state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
   Parameters of Light xyL Default Set

   Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t xyl_x
   The value of the Light xyL x Default state

uint16_t xyl_y
   The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
   Parameters of Light xyL Range Set

   Public Members

uint16_t xyl_x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
   The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_set_t
Parameter of Light LC Mode Set

**Public Members**

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
Parameter of Light LC OM Set

**Public Members**

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
Parameters of Light LC Light OnOff Set

**Public Members**

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
Parameter of Light LC Property Get
Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
    Parameters of Light LC Property Set

Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
    Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
    Parameters of Light Lightness Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness actual state

uint16_t target_lightness
    Target value of light lightness actual state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
    Parameters of Light Lightness Linear Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness linear state
uint16_t target_lightness
   Target value of light lightness linear state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
   Parameter of Light Lightness Last Status

**Public Members**

uint16_t lightness
   The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
   Parameter of Light Lightness Default Status

**Public Members**

uint16_t lightness
   The value of the Light Lightness Default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
   Parameters of Light Lightness Range Status

**Public Members**

uint8_t status_code
   Status Code for the request message

uint16_t range_min
   Value of range min field of light lightness range state

uint16_t range_max
   Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
   Parameters of Light CTL Status

**Public Members**

bool op_en
   Indicate if optional parameters are included

uint16_t present_ctl_lightness
   Current value of light ctl lightness state
uint16_t present_ctl_temperature
    Current value of light ctl temperature state

uint16_t target_ctl_lightness
    Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
    Target value of light ctl temperature state (C.1)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
    Parameters of Light CTL Temperature Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_ctl_temperature
    Current value of light ctl temperature state

uint16_t present_ctl_delta_uv
    Current value of light ctl delta UV state

uint16_t target_ctl_temperature
    Target value of light ctl temperature state (optional)

uint16_t target_ctl_delta_uv
    Target value of light ctl delta UV state (C.1)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
    Parameters of Light CTL Temperature Range Status

Public Members

uint8_t status_code
    Status code for the request message

uint16_t range_min
    Value of temperature range min field of light ctl temperature range state
uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
Parameters of Light CTL Default Status

**Public Members**

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_light_hsl_status_cb_t
Parameters of Light HSL Status

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Current value of light hsl lightness state

uint16_t hsl_hue
Current value of light hsl hue state

uint16_t hsl_saturation
Current value of light hsl saturation state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_target_status_cb_t
Parameters of Light HSL Target Status

**Public Members**

bool op_en
Indicate if optional parameters are included
**Chapter 2. API Reference**

```c
uint16_t hsl_lightness_target
    Target value of light hsl lightness state

        The target value of the Light LC Light OnOff state (Optional)

    uint8_t remain_time
        Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_light_lc_property_status_cb_t
    Parameters of Light LC Property Status
```
Public Members

uint16_t property_id
   Property ID identifying a Light LC Property

struct net_buf_simple *property_value
   Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
   Lighting Client Model callback parameters

Public Members

int error_code
   Appropriate error code

esp_ble_mesh_client_common_param_t *params
   The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb
   The light status message callback values

struct esp_ble_mesh_light_lightness_state_t
   Parameters of Light Lightness state

Public Members

uint16_t lightness_linear
   The present value of Light Lightness Linear state

uint16_t target_lightness_linear
   The target value of Light Lightness Linear state

uint16_t lightness_actual
   The present value of Light Lightness Actual state

uint16_t target_lightness_actual
   The target value of Light Lightness Actual state

uint16_t lightness_last
   The value of Light Lightness Last state

uint16_t lightness_default
   The value of Light Lightness Default state

uint8_t status_code
   The status code of setting Light Lightness Range state

```c
uint16_t lightness_range_min
    The minimum value of Light Lightness Range state

uint16_t lightness_range_max
    The maximum value of Light Lightness Range state
```

```c
struct esp_ble_mesh_light_lightness_srv_t
    User data of Light Lightness Server Model
```

**Public Members**

```c
d春夏秋冬 template_t *model
    Pointer to the Lighting Lightness Server Model. Initialized internally.

d春夏秋冬 esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

d春夏秋冬 esp_ble_mesh_light_lightness_state_t *state
    Parameters of the Light Lightness state

d春夏秋冬 esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

d春夏秋冬 esp_ble_mesh_state_transition_t actual_transition
    Parameters of state transition

d春夏秋冬 esp_ble_mesh_state_transition_t linear_transition
    Parameters of state transition

int32_t tt_delta_lightness_actual
    Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
    Delta change value of lightness linear state transition
```

```c
struct esp_ble_mesh_light_lightness_setup_srv_t
    User data of Light Lightness Setup Server Model
```

**Public Members**

```c
enz template_t *model
    Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

d春夏秋冬 esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
```
**esp_ble_mesh_light_lightness_state_t**

Parameters of the Light Lightness state

**struct esp_ble_mesh_light_ctl_state_t**

Parameters of Light CTL state

**Public Members**

```c
uint16_t lightness
    The present value of Light CTL Lightness state

uint16_t target_lightness
    The target value of Light CTL Lightness state

uint16_t temperature
    The present value of Light CTL Temperature state

uint16_t target_temperature
    The target value of Light CTL Temperature state

int16_t delta_uv
    The present value of Light CTL Delta UV state

int16_t target_delta_uv
    The target value of Light CTL Delta UV state

uint8_t status_code
    The statue code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
    The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
    The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
    The value of Light Lightness Default state

uint16_t temperature_default
    The value of Light CTL Temperature Default state

int16_t delta_uv_default
    The value of Light CTL Delta UV Default state
```

**struct esp_ble_mesh_light_ctl_srv_t**

User data of Light CTL Server Model
Public Members

`esp_ble_mesh_model_t *model`
Point to the Lighting CTL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_ctl_setup_srv_t`  
User data of Light CTL Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Point to the Lighting CTL Setp Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`struct esp_ble_mesh_light_ctl_temp_srv_t`  
User data of Light CTL Temperature Server Model

Public Members

`esp_ble_mesh_model_t *model`
Point to the Lighting CTL Temperature Server Model. Initialized internally.
**Chapter 2. API Reference**

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

*esp_ble_mesh_light_ctl_state_t* `state`
Parameters of the Light CTL state

*esp_ble_mesh_last_msg_info_t* `last`
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* `transition`
Parameters of state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

**Public Members**

`uint16_t lightness`
The present value of Light HSL Lightness state

`uint16_t target_lightness`
The target value of Light HSL Lightness state

`uint16_t hue`
The present value of Light HSL Hue state

`uint16_t target_hue`
The target value of Light HSL Hue state

`uint16_t saturation`
The present value of Light HSL Saturation state

`uint16_t target_saturation`
The target value of Light HSL Saturation state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint16_t hue_default`
The value of Light HSL Hue Default state
uint16_t saturation_default
    The value of Light HSL Saturation Default state

uint8_t status_code
    The status code of setting Light HSL Hue & Saturation Range state

uint16_t hue_range_min
    The minimum value of Light HSL Hue Range state

uint16_t hue_range_max
    The maximum value of Light HSL Hue Range state

uint16_t saturation_range_min
    The minimum value of Light HSL Saturation state

uint16_t saturation_range_max
    The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
    User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
    Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t *last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_hue
    Delta change value of hue state transition

int32_t tt_delta_saturation
    Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
    User data of Light HSL Setup Server Model
Public Members

`esp_ble_mesh_model_t *model`
Point to the Lighting HSL Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`struct esp_ble_mesh_light_hsl_hue_srv_t`
User data of Light HSL Hue Server Model

Public Members

`esp_ble_mesh_model_t *model`
Point to the Lighting HSL Hue Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`struct esp_ble_mesh_light_hsl_sat_srv_t`
User data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Point to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state
**esp_ble_mesh_last_msg_info_t**

Parameters of the last received set message

**esp_ble_mesh_state_transition_t**

Parameters of state transition

**int32_t tt_delta_saturation**

Delta change value of saturation state transition

**struct esp_ble_mesh_light_xyl_state_t**

Parameters of Light xyL state

### Public Members

**uint16_t lightness**

The present value of Light xyL Lightness state

**uint16_t target_lightness**

The target value of Light xyL Lightness state

**uint16_t x**

The present value of Light xyL x state

**uint16_t target_x**

The target value of Light xyL x state

**uint16_t y**

The present value of Light xyL y state

**uint16_t target_y**

The target value of Light xyL y state

**uint16_t lightness_default**

The value of Light Lightness Default state

**uint16_t x_default**

The value of Light xyL x Default state

**uint16_t y_default**

The value of Light xyL y Default state

**uint8_t status_code**

The status code of setting Light xyL x & y Range state

**uint16_t x_range_min**

The minimum value of Light xyL x Range state
uint16_t \texttt{x\_range\_max}  
   The maximum value of Light xyL x Range state

uint16_t \texttt{y\_range\_min}  
   The minimum value of Light xyL y Range state

uint16_t \texttt{y\_range\_max}  
   The maximum value of Light xyL y Range state

\begin{verbatim}
struct esp_ble_mesh_light_xyl_srv_t  
   User data of Light xyL Server Model
\end{verbatim}

**Public Members**

\begin{verbatim}
esp_ble_mesh_model_t *model  
   Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl  
   Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state  
   Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t last  
   Parameters of the last received set message

esp_ble_mesh_state_transition_t transition  
   Parameters of state transition

int32_t \texttt{tt\_delta\_lightness}  
   Delta change value of lightness state transition

int32_t \texttt{tt\_delta\_x}  
   Delta change value of x state transition

int32_t \texttt{tt\_delta\_y}  
   Delta change value of y state transition
\end{verbatim}

\begin{verbatim}
struct esp_ble_mesh_light_xyl_setup_srv_t  
   User data of Light xyL Setup Server Model
\end{verbatim}

**Public Members**

\begin{verbatim}
esp_ble_mesh_model_t *model  
   Pointer to the Lighting xyL Setup Server Model. Initialized internally.
\end{verbatim}
Chapter 2. API Reference

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_xyl_state_t *state`
Parameters of the Light xyl state

`struct esp_ble_mesh_light_lc_state_t`
Parameters of Light LC states

**Public Members**

- `uint32_t mode`
  0b0 The controller is turned off.
  - The binding with the Light Lightness state is disabled.
  0b1 The controller is turned on.
  - The binding with the Light Lightness state is enabled. The value of Light LC Mode state

- `uint32_t occupancy_mode`
  The value of Light LC Occupancy Mode state

- `uint32_t light_onoff`
  The present value of Light LC Light OnOff state

- `uint32_t target_light_onoff`
  The target value of Light LC Light OnOff state

- `uint32_t occupancy`
  The value of Light LC Occupancy state

- `uint32_t ambient_luxlevel`
  The value of Light LC Ambient LuxLevel state

- `uint16_t linear_output`
  i. Light LC Linear Output = max((LightnessOut)^2/65535, Regulator Output)
  ii. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
  iii. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

`struct esp_ble_mesh_light_lc_property_state_t`
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members**
uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state
uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade
uint8_t **fade_standby_auto**
The value of transition time of Light LC Time Fade Standby Auto

uint8_t **fade_standby_manual**
The value of transition time of Light LC Time Fade Standby Manual

struct **esp_ble_mesh_light_lc_state_machine_t**::[anonymous] **trans_time**
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

**esp_ble_mesh_light_lc_state_t** **state**
The value of Light LC state machine state

struct **k_delayed_work** **timer**
Timer of Light LC state machine

struct **esp_ble_mesh_light_control_t**
Parameters of Light Lightness controller

**Public Members**

**esp_ble_mesh_light_lc_state_t** **state**
Parameters of Light LC state

**esp_ble_mesh_light_lc_property_state_t** **prop_state**
Parameters of Light LC Property state

**esp_ble_mesh_light_lc_state_machine_t** **state_machine**
Parameters of Light LC state machine

struct **esp_ble_mesh_light_lc_srv_t**
User data of Light LC Server Model

**Public Members**

**esp_ble_mesh_model_t** **model**
Pointer to the Lighting LC Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t** **rsp_ctrl**
Response control of the server model received messages

**esp_ble_mesh_light_control_t** **lc**
Parameters of the Light controller

**esp_ble_mesh_last_msg_info_t** **last**
Parameters of the last received set message
**esp_ble_mesh_state_transition_t** transition

Parameters of state transition

**struct esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

**Public Members**

**esp_ble_mesh_model_t** *model

Pointer to the Lighting LC Setup Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t** *rsp_ctrl

Response control of the server model received messages

**esp_ble_mesh_light_control_t** *lc

Parameters of the Light controller

**struct esp_ble_mesh_state_change_light_lightness_set_t**

Parameter of Light Lightness Actual state change event

**Public Members**

**uint16_t** lightness

The value of Light Lightness Actual state

**struct esp_ble_mesh_state_change_light_lightness_linear_set_t**

Parameter of Light Lightness Linear state change event

**Public Members**

**uint16_t** lightness

The value of Light Lightness Linear state

**struct esp_ble_mesh_state_change_light_lightness_default_set_t**

Parameter of Light Lightness Default state change event

**Public Members**

**uint16_t** lightness

The value of Light Lightness Default state

**struct esp_ble_mesh_state_change_light_lightness_range_set_t**

Parameters of Light Lightness Range state change event
Public Members

```c
uint16_t range_min
The minimum value of Light Lightness Range state
```

```c
uint16_t range_max
The maximum value of Light Lightness Range state
```

```c
struct esp_ble_mesh_state_change_light_ctl_set_t
Parameters of Light CTL state change event
```

Public Members

```c
uint16_t lightness
The value of Light CTL Lightness state
```

```c
uint16_t temperature
The value of Light CTL Temperature state
```

```c
int16_t delta_uv
The value of Light CTL Delta UV state
```

```c
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event
```

Public Members

```c
uint16_t temperature
The value of Light CTL Temperature state
```

```c
int16_t delta_uv
The value of Light CTL Delta UV state
```

```c
struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event
```

Public Members

```c
uint16_t range_min
The minimum value of Light CTL Temperature Range state
```

```c
uint16_t range_max
The maximum value of Light CTL Temperature Range state
```

```c
struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event
```
Public Members

uint16_t **lightness**
The value of Light Lightness Default state

uint16_t **temperature**
The value of Light CTL Temperature Default state

int16_t **delta_uv**
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t **lightness**
The value of Light HSL Lightness state

uint16_t **hue**
The value of Light HSL Hue state

uint16_t **saturation**
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t **hue**
The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

Public Members

uint16_t **saturation**
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event
Public Members

uint16_t lightness
The value of Light HSL Lightness Default state

uint16_t hue
The value of Light HSL Hue Default state

uint16_t saturation
The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event

Public Members

uint16_t hue_range_min
The minimum hue value of Light HSL Range state

uint16_t hue_range_max
The maximum hue value of Light HSL Range state

uint16_t saturation_range_min
The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max
The maximum saturation value of Light HSL Range state

struct esp_ble_mesh_state_change_light_xyl_set_t
Parameters of Light xyL state change event

Public Members

uint16_t lightness
The value of Light xyL Lightness state

uint16_t x
The value of Light xyL x state

uint16_t y
The value of Light xyL y state

struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyL Default state change event
Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t x
The value of Light xyL x Default state

uint16_t y
The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
The minimum value of Light xyL x Range state

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event
Public Members

uint8_t onoff
   The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
   Parameters of Light LC Property state change event

Public Members

uint16_t property_id
   The property id of Light LC Property state

struct net_buf_simple *property_value
   The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
   Parameters of Sensor Status state change event

Public Members

uint16_t property_id
   The value of Sensor Property ID

uint8_t occupancy
   The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
   The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
   The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
   Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
   Context of the received Light LC Property Get message

Public Members

uint16_t property_id
   Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
   Context of the received Light Lightness Set message
**Public Members**

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
   Context of the received Light Lightness Linear Set message

**Public Members**

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness linear state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
   Context of the received Light Lightness Default Set message

**Public Members**

uint16_t lightness
   The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
   Context of the received Light Lightness Range Set message
Chapter 2. API Reference

Public Members

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_server_recv_light_ctl_set_t
Context of the received Light CTL Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light ctl lightness state

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
Context of the received Light CTL Temperature Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state
uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
    Context of the received Light CTL Temperature Range Set message

Public Members

uint16_t range_min
    Value of temperature range min field of light ctl temperature range state

uint16_t range_max
    Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_server_recv_light_ctl_default_set_t
    Context of the received Light CTL Default Set message

Public Members

uint16_t lightness
    Value of light lightness default state

uint16_t temperature
    Value of light temperature default state

int16_t delta_uv
    Value of light delta UV default state

struct esp_ble_mesh_server_recv_light_hsl_set_t
    Context of the received Light HSL Set message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t lightness
    Target value of light hsl lightness state
uint16_t hue
   Target value of light hsl hue state

uint16_t saturation
   Target value of light hsl saturation state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
   Context of the received Light HSL Hue Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t hue
   Target value of light hsl hue state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
   Context of the received Light HSL Saturation Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t saturation
   Target value of light hsl hue state
uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t hue
Value of light hue default state

uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xyl Set message

Public Members
bool op_en
   Indicate whether optional parameters included

uint16_t lightness
   The target value of the Light xyL Lightness state

uint16_t x
   The target value of the Light xyL x state

uint16_t y
   The target value of the Light xyL y state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
   Context of the received Light xyL Default Set message

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t x
   The value of the Light xyL x Default state

uint16_t y
   The value of the Light xyL y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
   Context of the received Light xyL Range Set message

Public Members

uint16_t x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t x_range_max
   The value of the xyL x Range Max field of the Light xyL x Range state
uint16_t y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_server_recv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_server_recv_light_lc_om_set_t
Context of the received Light OM Set message

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
Context of the received Light LC Property Set message
Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_server_recv_sensor_status_t
Context of the received Sensor Status message

Public Members

struct net_buf_simple *data
Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t value
Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI(cli_pub, cli_data)
Define a new Light Lightness Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

Parameters

- cli_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data -- Pointer to the unique struct esp_ble_mesh_client_t.

Returns
New Light Lightness Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI(cli_pub, cli_data)
Define a new Light CTL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light CTL Client Model.
Chapter 2. API Reference

Parameters
• **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light CTL Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)
Define a new Light HSL Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Parameters
• **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light HSL Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)
Define a new Light xyL Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Parameters
• **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light xyL Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_CLI** (cli_pub, cli_data)
Define a new Light LC Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Parameters
• **cli_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **cli_data** -- Pointer to the unique struct `esp_ble_mesh_client_t`.

Returns New Light LC Client Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)
Lighting Server Models related context.
Define a new Light Lightness Server Model.

---

**Note:** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

a. This model shall support model publication and model subscription.

Parameters
• **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`. 
Chapter 2. API Reference

**Returns** New Light Lightness Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV**(srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

**Note:** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
   
a. This model shall support model subscription.

**Parameters**

- srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data -- Pointer to the unique struct esp_ble_mesh_light_lightness_setup_srv_t.

**Returns** New Light Lightness Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV**(srv_pub, srv_data)

Define a new Light CTL Server Model.

**Note:** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
   
a. This model shall support model publication and model subscription.
   
b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Parameters**

- srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data -- Pointer to the unique struct esp_ble_mesh_light_ctl_srv_t.

**Returns** New Light CTL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV**(srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

**Note:** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
   
a. This model shall support model subscription.

**Parameters**

- srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data -- Pointer to the unique struct esp_ble_mesh_light_ctl_setup_srv_t.

**Returns** New Light CTL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV**(srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

**Note:** 1. The Light CTL Temperature Server model extends the Generic Level Server model.
   
a. This model shall support model publication and model subscription.
Parameters

- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

Returns

New Light CTL Temperature Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** `(srv_pub, srv_data)`

Define a new Light HSL Server Model.

**Note:** 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- b. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Parameters

- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

Returns

New Light HSL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV** `(srv_pub, srv_data)`

Define a new Light HSL Setup Server Model.

**Note:** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.

Parameters

- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

Returns

New Light HSL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV** `(srv_pub, srv_data)`

Define a new Light HSL Hue Server Model.

**Note:** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- a. This model shall support model publication and model subscription.

Parameters

- `srv_pub` -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data` -- Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

Returns

New Light HSL Hue Server Model instance.
**Chapter 2. API Reference**

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV** (srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

**Note:** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

   a. This model shall support model publication and model subscription.

   **Parameters**
   
   * **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   
   * **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

   **Returns** New Light HSL Saturation Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV** (srv_pub, srv_data)

Define a new Light xyL Server Model.

**Note:** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   **Parameters**
   
   * **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   
   * **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

   **Returns** New Light xyL Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV** (srv_pub, srv_data)

Define a new Light xyL Setup Server Model.

**Note:** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

   a. This model shall support model subscription.

   **Parameters**
   
   * **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   
   * **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

   **Returns** New Light xyL Setup Server Model instance.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SRV** (srv_pub, srv_data)

Define a new Light LC Server Model.

**Note:** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

   a. This model shall support model publication and model subscription.

   b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

   **Parameters**
   
   * **srv_pub** -- Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   
   * **srv_data** -- Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.
Returns New Light LC Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)
Define a new Light LC Setup Server Model.

Note: 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
   a. This model shall support model publication and model subscription.
   b. This model may be used to configure setup parameters for the Light LC Server model.

Parameters
  * srv_pub -- Pointer to the unique struct esp_ble_mesh_model_pub_t.
  * srv_data -- Pointer to the unique struct esp_ble_mesh_light_lc_setup_srv_t.

Returns New Light LC Setup Server Model instance.

Type Definitions
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,
                                            esp_ble_mesh_light_client_cb_param_t *param)
  Bluetooth Mesh Light Client Model function.
  Lighting Client Model callback function type
  Param event Event type
  Param param Pointer to callback parameter
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,
                                               esp_ble_mesh_lighting_server_cb_param_t *param)
  Bluetooth Mesh Lighting Server Model function.
  Lighting Server Model callback function type
  Param event Event type
  Param param Pointer to callback parameter

Enumerations
enum esp_ble_mesh_light_client_cb_event_t
  This enum value is the event of Lighting Client Model
  Values:
  enumerator ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
  enumerator ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
  enumerator ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
  enumerator ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
  enumerator ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX
enum esp_ble_mesh_lc_state_t
  This enum value is the Light LC State Machine states
  Values:
Chapter 2. API Reference

enumerator ESP_BLE_MESH_LC_OFF
enumerator ESP_BLE_MESH_LC_STANDBY
enumerator ESP_BLE_MESH_LC_FADE_ON
enumerator ESP_BLE_MESH_LC_RUN
enumerator ESP_BLE_MESH_LC_FADE
enumerator ESP_BLE_MESH_LC_PROLONG
enumerator ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
enumerator ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

enum esp_ble_mesh_lighting_server_cb_event_t
This enum value is the event of Lighting Server Model
Values:

enumerator ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
  i. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Lighting Get messages are received.
  ii. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Lighting Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Lighting Get messages are received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Lighting Set/Set Unack messages are received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
  When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Sensor Status message is received.

enumerator ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

ESP-BLE-MESH (v1.1) Core API Reference

Note: This section is a preview version, so the related structures, macros, and APIs may be changed.

This section contains ESP-BLE-MESH v1.1 Core related APIs, event types, event parameters, etc.
This API reference covers 10 components:
Chapter 2. API Reference

- Remote Provisioning
- Directed Forwarding
- Subnet Bridge Configuration
- Mesh Private Beacon
- On-Demand Private Proxy
- SAR Configuration
- Solicitation PDU RPL Configuration
- Opcodes Aggregator
- Large Composition Data
- Composition and Metadata

Remote Provisioning

Header File

- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_rpr_model_api.h
- This header file can be included with:

```
#include "esp_ble_mesh_rpr_model_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```
REQUIRES bt
```

or

```
PRIV_REQUIRES bt
```

Functions

- `esp_err_t esp_ble_mesh_register_rpr_client_callback(esp_ble_mesh_rpr_client_cb_t callback)`
  Register BLE Mesh Remote Provisioning Client model callback.
  
  Parameters `callback` -- [in] Pointer to the callback function.
  
  Returns ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_rpr_client_send(esp_ble_mesh_client_common_param_t *params,
                                         esp_ble_mesh_rpr_client_msg_t *msg)`
  Get the value of Remote Provisioning Server model state with the corresponding get message.
  
  Parameters
  
  - `params` -- [in] Pointer to BLE Mesh common client parameters.
  
  Returns ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_rpr_client_action(esp_ble_mesh_rpr_client_act_type_t type,
                                          esp_ble_mesh_rpr_client_act_param_t *param)`
  Remote Provisioning Client model perform related actions, e.g. start remote provisioning.
  
  Parameters
  
  - `type` -- [in] Type of the action to be performed.
  - `param` -- [in] Parameters of the action to be performed.
  
  Returns ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_register_rpr_server_callback(esp_ble_mesh_rpr_server_cb_t callback)`
  Register BLE Mesh Remote Provisioning Server model callback.
  
  Parameters `callback` -- [in] Pointer to the callback function.
  
  Returns ESP_OK on success or error code otherwise.

Event type of the performed action

`esp_ble_mesh_model_t` **model**
Pointer of Remote Provisioning Client

`uint16_t` **rpr_srv_addr**
Unicast address of Remote Provisioning Server

struct `esp_ble_mesh_rpr_client_cb_param_t`: [anonymous]: [anonymous] **start_rpr_comp**
ESP_BLE_MESH_START_RPR_COMP_SUB_EVT.
Event parameter of ESP_BLE_MESH_START_RPR_COMP_SUB_EVT

struct `esp_ble_mesh_rpr_client_cb_param_t`: [anonymous] **act**
Event parameters of performed actions Event parameters of performed actions

struct `esp_ble_mesh_rpr_client_cb_param_t`: [anonymous] **link_open**
ESP_BLE_MESH_RPR_CLIENT_LINK_OPEN_EVT.
Event parameters of ESP_BLE_MESH_RPR_CLIENT_LINK_OPEN_EVT

`uint8_t` **reason**
Reason of closing provisioning link
struct esp_ble_mesh_rpr_client_cb_param_t::[anonymous] link_close

ESP_BLE_MESH_RPR_CLIENT_LINK_CLOSE_EVT.

Event parameters of ESP_BLE_MESH_RPR_CLIENT_LINK_CLOSE_EVT

uint8_t nppi
NPPI Procedure

uint16_t index
Index of the provisioned node

uint8_t uuid[16]
Device UUID

uint16_t unicast_addr
Primary element address

uint8_t element_num
Element number

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_rpr_client_cb_param_t::[anonymous] prov

ESP_BLE_MESH_RPR_CLIENT_PROV_COMP_EVT.

Event parameters of ESP_BLE_MESH_RPR_CLIENT_PROV_COMP_EVT

union esp_ble_mesh_rpr_server_cb_param_t

#include <esp_ble_mesh_rpr_model_api.h> Remote Provisioning Server model related context.

Remote Provisioning Server model callback value union

Public Members

esp_ble_mesh_model_t *model
Pointer to the server model structure

uint8_t scan_items_limit
Maximum number of scanned items to be reported

uint8_t timeout
Time limit for a scan (in seconds)
Time limit for extended scan (in seconds)
Time limit for opening a link (in seconds)

uint8_t uuid[16]
Device UUID (All ZERO if not present)
Device UUID (ZERO if not present)
uint16_t net_idx
NetKey Index used by Remote Provisioning Client

uint16_t rpr_cli_addr
Unicast address of Remote Provisioning Client

struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] scan_start
ESP_BLE_MESH_RPR_SERVER_SCAN_START_EVT.

struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] scan_stop
ESP_BLE_MESH_RPR_SERVER_SCAN_STOP_EVT.

uint8_t ad_type_filter_count
Number of AD Types in the ADTypeFilter field

uint8_t *ad_type_filter
List of AD Types to be reported

uint8_t index
Index of the extended scan instance

struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] ext_scan_start
ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_START_EVT.

struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] ext_scan_stop
ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_STOP_EVT.

uint8_t status
Status of Link Open procedure

uint8_t nppi
Node Provisioning Protocol Interface
Provisioning bearer link close reason code

struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] link_open
ESP_BLE_MESH_RPR_SERVER_LINK_OPEN_EVT.

bool close_by_device
Indicate if the link is closed by the Unprovisioned Device

uint8_t reason
Provisioning bearer link close reason code

struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] link_close
ESP_BLE_MESH_RPR_SERVER_LINK_CLOSE_EVT.

struct esp_ble_mesh_rpr_server_cb_param_t::[anonymous] prov_comp
ESP_BLE_MESH_RPR_SERVER_PROV_COMP_EVT. TODO: Duplicate with Link Close event?
Chapter 2. API Reference

Structures

struct esp_ble_mesh_rpr_scan_start_t

Remote Provisioning Server model context Parameters of Remote Provisioning Scan Start

Public Members

uint8_t scan_items_limit
Maximum number of scanned items to be reported

uint8_t timeout
Time limit for a scan (in seconds)

bool uuid_en
Indicate if Device UUID is present

uint8_t uuid[16]
Device UUID (Optional)

struct esp_ble_mesh_rpr_ext_scan_start_t

Parameters of Remote Provisioning Extended Scan Start

Public Members

uint8_t ad_type_filter_count
Number of AD Types in the ADTypeFilter field

uint8_t ad_type_filter[16]
List of AD Types to be reported. Minimum is 1, maximum is 16

bool uuid_en
Indicate if Device UUID is present

uint8_t uuid[16]
Device UUID (Optional)

uint8_t timeout
Time limit for a scan (in seconds) (C.1)

struct esp_ble_mesh_rpr_link_open_t

Parameters of Remote Provisioning Link Open

Public Members

bool uuid_en
Indicate if Device UUID is present
uint8_t **uuid[16]
        Device UUID (Optional)

bool timeout_en
        Indicate if Link open timeout is present

uint8_t timeout
        Link open timeout in seconds (C.1)

uint8_t nppi
        Node Provisioning Protocol Interface (C.2)

struct esp_ble_mesh_rpr_link_close_t
        Parameters of Remote Provisioning Link Close

    Public Members

    uint8_t reason
            Provisioning bearer link close reason code

struct esp_ble_mesh_rpr_client_start_rpr_t
        Parameters of starting remote provisioning

    Public Members

    esp_ble_mesh_model_t *model
            Pointer of Remote Provisioning Client

    uint16_t rpr_srv_addr
            Unicast address of Remote Provisioning Server

struct esp_ble_mesh_rpr_scan_caps_status_t
        Parameters of Remote Provisioning Scan Capabilities Status

    Public Members

    uint8_t max_scan_items
            The maximum number of UUIDs that can be reported during scanning

    uint8_t active_scan
            Indication if active scan is supported

struct esp_ble_mesh_rpr_scan_status_t
        Parameters of Remote Provisioning Scan Status
Public Members

```c
uint8_t status
    Status for the requesting message
```

```c
uint8_t rpr_scanning
    The Remote Provisioning Scan state value
```

```c
uint8_t scan_items_limit
    Maximum number of scanned items to be reported
```

```c
uint8_t timeout
    Time limit for a scan (in seconds)
```

```c
struct esp_ble_mesh_rpr_scan_report_t
    Parameters of Remote Provisioning Scan Report
```

Public Members

```c
int8_t rssi
    An indication of received signal strength measured in dBm
```

```c
uint8_t uuid[16]
    Device UUID
```

```c
uint16_t oob_info
    OOB information
```

```c
uint32_t uri_hash
    URI Hash (Optional)
```

```c
struct esp_ble_mesh_rpr_ext_scan_report_t
    Parameters of Remote Provisioning Extended Scan Report
```

Public Members

```c
uint8_t status
    Status for the requesting message
```

```c
uint8_t uuid[16]
    Device UUID
```

```c
bool oob_info_en
    Indicate if OOB Information is present
```

```c
uint16_t oob_info
    OOB Information (Optional)
```
struct netbuf_simple *adv_structures
    Concatenated list of AD Structures (C.1)

struct esp_ble_mesh_rpr_link_status_t
    Parameters of Remote Provisioning Link Status

    Public Members

    uint8_t status
        Status for the requesting message

    uint8_t rpr_state
        Remote Provisioning Link state

struct esp_ble_mesh_rpr_link_report_t
    Parameters of Remote Provisioning Link Report

    Public Members

    uint8_t status
        Status of the provisioning bearer or the NPPI

    uint8_t rpr_state
        Remote Provisioning Link state

    bool reason_en
        Indicate if Link close Reason code is present

    uint8_t reason
        Link close Reason code (Optional)

**Chapter 2. API Reference**

**ESP_BLE_MESH_MODEL_RPR_SRV (srv_data)**

Define a new Remote Provisioning Server model.

*Note:* If supported, the model shall be supported by a primary element and may be supported by any secondary element.

**Parameters**

- *srv_data* -- Pointer to a unique Remote Provisioning Server model user_data.

**Returns**

New Remote Provisioning Server model instance.

**ESP_BLE_MESH_MODEL_RPR_CLI (cli_data)**

Define a new Remote Provisioning Client model.

*Note:* If supported, the model shall be supported by a primary element and may be supported by any secondary element.

**Parameters**

- *cli_data* -- Pointer to a unique Remote Provisioning Client model user_data.

**Returns**

New Remote Provisioning Client model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_rpr_client_cb_t)(esp_ble_mesh_rpr_client_cb_event_t event,
                                          esp_ble_mesh_rpr_client_cb_param_t *param)
```

Remote Provisioning client and server model functions.

```c
Remote Provisioning Client model callback function type
```

**Param event** Event type

**Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_rpr_server_cb_t)(esp_ble_mesh_rpr_server_cb_event_t event,
                                          esp_ble_mesh_rpr_server_cb_param_t *param)
```

Remote Provisioning Server model callback function type.

**Param event** Event type

**Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_rpr_client_act_type_t
```

This enum value is the action of Remote Provisioning Client model

**Values:**

- enumerator **ESP_BLE_MESH_RPR_CLIENT_ACT_MAX**

```c
enum esp_ble_mesh_rpr_client_actEvt_t
```

This enum value is the event type of the performed action

**Values:**

- enumerator **ESP_BLE_MESH_RPR_CLIENT_ACT_MAX**
**Chapter 2. API Reference**

`enumerator ESP_BLE_MESH_START_RPR_COMP_SUB_EVT`

```c
enum esp_ble_mesh_rpr_client_cb_event_t
```

This enum value is the event of Remote Provisioning Client model

**Values:**

- `enumerator ESP_BLE_MESH_RPR_CLIENT_SEND_COMP_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_SEND_TIMEOUT_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_RECV_RSP_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_RECV_PUB_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_ACT_COMP_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_LINK_OPEN_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_LINK_CLOSE_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_PROV_COMP_EVT`
- `enumerator ESP_BLE_MESH_RPR_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_rpr_server_cb_event_t
```

This enum value is the event of Remote Provisioning Server model

**Values:**

- `enumerator ESP_BLE_MESH_RPR_SERVER_SCAN_START_EVT`
- `enumerator ESP_BLE_MESH_RPR_SERVER_SCAN_STOP_EVT`
- `enumerator ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_START_EVT`
- `enumerator ESP_BLE_MESH_RPR_SERVER_EXT_SCAN_STOP_EVT`
- `enumerator ESP_BLE_MESH_RPR_SERVER_LINK_OPEN_EVT`
- `enumerator ESP_BLE_MESH_RPR_SERVER_LINK_CLOSE_EVT`
- `enumerator ESP_BLE_MESH_RPR_SERVER_PROV_COMP_EVT`
- `enumerator ESP_BLE_MESH_RPR_SERVER_EVT_MAX`

**Directed Forwarding**
Header File

- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_df_model_api.h
- This header file can be included with:

```c
#include "esp_ble_mesh_df_model_api.h"
```

- This header file is a part of the API provided by the bt component. To declare that your component depends on bt, add the following to your CMakeLists.txt:

```cmake
REQUIRES bt
```

or

```cmake
PRIV_REQUIRES bt
```

Functions

- `esp_err_t esp_ble_mesh_register_df_client_callback (esp_ble_mesh_df_client_cb_t callback)`
  Register BLE Mesh Directed Forwarding Configuration Client model callback.

  **Parameters**
  - `callback` -- [in] Pointer to the callback function.

  **Returns**
  - ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_register_df_server_callback (esp_ble_mesh_df_server_cb_t callback)`
  Register BLE Mesh Directed Forwarding Configuration Server model callback.

  **Parameters**
  - `callback` -- [in] Pointer to the callback function.

  **Returns**
  - ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_df_client_get_state (esp_ble_mesh_client_common_param_t *params,
  esp_ble_mesh_df_client_get_t *get)`
  Get the value of Directed Forwarding Configuration Server model state with the corresponding get message.

  **Parameters**
  - `params` -- [in] Pointer to BLE Mesh common client parameters.
  - `get` -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside.

  **Returns**
  - ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_df_client_set_state (esp_ble_mesh_client_common_param_t *params,
  esp_ble_mesh_df_client_set_t *set)`
  Set the value of Directed Forwarding Configuration Server model state with the corresponding set message.

  **Parameters**
  - `params` -- [in] Pointer to BLE Mesh common client parameters.
  - `set` -- [in] Pointer to a union, each kind of opcode corresponds to one structure inside.

  **Returns**
  - ESP_OK on success or error code otherwise.

Unions

- `union esp_ble_mesh_df_client_get_t`

Directed Control Network Transmit state

uint8_t directed_ctl_relay_retransmit
Directed Control Relay Retransmit state

struct esp_ble_mesh_directed_control_get_t
Parameters of Directed Control Get.

Public Members

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_directed_control_set_t
Parameters of Directed Control Set.

Public Members

uint16_t net_idx
NetKey Index

uint8_t directed_forwarding
New Directed Forwarding state
uint8_t directed_relay
    New Directed Relay state

uint8_t directed_proxy
    New Directed Proxy state

uint8_t directed_proxy_use_default
    New Directed Proxy Use Directed Default state or value to ignore

uint8_t directed_friend
    New Directed Friend state or value to ignore

struct esp_ble_mesh_path_metric_get_t
    Parameters of Path Metric Get.

    **Public Members**

    uint16_t net_idx
        NetKey Index

struct esp_ble_mesh_path_metric_set_t
    Parameters of Path Metric Set.

    **Public Members**

    uint16_t net_idx
        NetKey Index

    uint8_t path_metric_type
        New Path Metric Type state

    uint8_t path_lifetime
        New Path Lifetime state

struct esp_ble_mesh_discovery_table_caps_get_t
    Parameters of Discovery Table Capabilities Get.

    **Public Members**

    uint16_t net_idx
        NetKey Index

struct esp_ble_mesh_discovery_table_caps_set_t
    Parameters of Discovery Table Capabilities Set.
Public Members

uint16_t `net_idx`
NetKey Index

uint8_t `max_concurr_init`
New Max Concurrent Init state

struct `esp_ble_mesh_forwarding_table_add_t`
Parameters of Forwarding Table Add.

Public Members

uint16_t `net_idx`
NetKey Index

uint16_t `unicast_dst`
Indicates whether or not the destination of the path is a unicast address

uint16_t `bw_path_validated`
Indicates whether or not the backward path has been validated

`esp_ble_mesh_uar_t` `path_origin`
Unicast address range of the Path Origin

`esp_ble_mesh_uar_t` `path_target`
Unicast address range of the Path Target

uint16_t `multicast_dst`
Multicast destination address

union `esp_ble_mesh_forwarding_table_add_t::[anonymous]` [anonymous]
Path target address

uint16_t `bearer_twd_path_origin`
Index of the bearer toward the Path Origin

uint16_t `bearer_twd_path_target`
Index of the bearer toward the Path Target

struct `esp_ble_mesh_forwarding_table_delete_t`
Parameters of Forwarding Table Delete.

Public Members

uint16_t `net_idx`
NetKey Index
**Public Members**

- **uint16_t path_origin**
  Primary element address of the Path Origin

- **uint16_t dst**
  Destination address

**struct esp_ble_mesh_forwarding_table_deps_add_t**
Parameters of Forwarding Table Dependents Add.

- **uint16_t net_idx**
  NetKey Index

- **uint16_t path_origin**
  Primary element address of the Path Origin

- **uint16_t dst**
  Destination address

- **uint8_t dep_origin_uar_list_size**
  Number of entries in the Dependent-Origin_Unicast.Addr.Range.List field

- **uint8_t dep_target_uar_list_size**
  Number of entries in the Dependent-Target_Unicast.Addr.Range.List field

- **esp_ble_mesh_uar_t *dep_origin_uar_list**
  List of the unicast address ranges of the dependent nodes of the Path Origin

- **esp_ble_mesh_uar_t *dep_target_uar_list**
  List of the unicast address ranges of the dependent nodes of the Path Target

**struct esp_ble_mesh_forwarding_table_deps_delete_t**
Parameters of Forwarding Table Dependents Delete.

**Public Members**

- **uint16_t net_idx**
  NetKey Index

- **uint16_t path_origin**
  Primary element address of the Path Origin

- **uint16_t dst**
  Destination address
uint8_t dep_origin_list_size
    Number of entries in the Dependent_Origin_List field

uint8_t dep_target_list_size
    Number of entries in the Dependent_Target_List field

uint16_t *dep_origin_list
    List of the primary element addresses of the dependent nodes of the Path Origin

uint16_t *dep_target_list
    List of the primary element addresses of the dependent nodes of the Path Target

struct esp_ble_mesh_forwarding_table_entries_cnt_get_t
    Parameters of Forwarding Table Entries Count Get.

    **Public Members**

    uint16_t net_idx
        NetKey Index

struct esp_ble_mesh_forwarding_table_entries_get_t
    Parameters of Forwarding Table Entries Get.

    **Public Members**

    uint16_t net_idx
        NetKey Index

    uint16_t filter_mask
        Filter to be applied to the Forwarding Table entries

    uint16_t start_index
        Start offset to read in units of Forwarding Table entries

    uint16_t path_origin
        Primary element address of the Path Origin

    uint16_t dst
        Destination address

    bool include_id
        Indicate whether or not the Forwarding Table Update Identifier is present

    uint16_t update_id
        Last saved Forwarding Table Update Identifier (Optional)

struct esp_ble_mesh_forwarding_table_deps_get_t
    Parameters of Forwarding Table Dependents Get.
Public Members

uint16_t net_idx
   NetKey Index

uint16_t dep_list_mask
   Filter applied to the lists of unicast address ranges for dependent nodes

uint16_t fixed_path_flag
   Indicate whether or not to return the unicast address ranges of dependent nodes in a fixed path entry

uint16_t start_index
   Start offset in units of unicast address ranges

uint16_t path_origin
   Primary element address of the Path Origin

uint16_t dst
   Destination address

bool include_id
   Indicate whether or not the Forwarding Table Update Identifier is present

uint16_t update_id
   Last saved Forwarding Table Update Identifier (Optional)

struct esp_ble_mesh_wanted_lanes_get_t
   Parameters of Wanted Lanes Get.

Public Members

uint16_t net_idx
   NetKey Index

struct esp_ble_mesh_wanted_lanes_set_t
   Parameters of Wanted Lanes Set.

Public Members

uint16_t net_idx
   NetKey Index

uint8_t wanted_lanes
   New Wanted Lanes state

struct esp_ble_mesh_two_way_path_get_t
   Parameters of Two Way Path Get.
Chapter 2. API Reference

Public Members

**uint16_t net_idx**
NetKey Index

**struct esp_ble_mesh_two_way_path_set_t**
Parameters of Two Way Path Set.

Public Members

**uint16_t net_idx**
NetKey Index

**uint8_t two_way_path**
Two way path flag

**struct esp_ble_mesh_path_echo_interval_get_t**
Parameters of Path Echo Interval Get.

Public Members

**uint16_t net_idx**
NetKey Index

**struct esp_ble_mesh_path_echo_interval_set_t**
Parameters of Path Echo Interval Set.

Public Members

**uint16_t net_idx**
NetKey Index

**uint8_t unicast_echo_interval**
New Unicast Echo Interval state or indication of no state change

**uint8_t multicast_echo_interval**
New Multicast Echo Interval state or indication of no state change

**struct esp_ble_mesh_directed_net_transmit_set_t**
Parameters of Directed Network Transmit Set.

Public Members

**uint8_t net_transmit**
New Directed Network Transmit state
struct `esp_ble_mesh_directed_relay_retransmit_set_t`
Parameters of Directed Relay Retransmit Set.

Public Members

uint8_t `relay_retransmit`
New Directed Relay Retransmit state

struct `esp_ble_mesh_rssi_threshold_set_t`
Parameters of RSSI Threshold Set.

Public Members

uint8_t `rssi_margin`
New RSSI Margin state

struct `esp_ble_mesh_directed_publish_policy_get_t`
Parameters of Directed Publish Policy Get.

Public Members

uint16_t `element_addr`
Address of the element

uint16_t `company_id`
Company ID

uint16_t `model_id`
Model ID

struct `esp_ble_mesh_directed_publish_policy_set_t`
Parameters of Directed Publish Policy Set.

Public Members

uint8_t `direct_pub_policy`
New Directed Publish Policy state

uint16_t `element_addr`
Address of the element

uint16_t `company_id`
Company ID

uint16_t `model_id`
Model ID
struct esp_ble_mesh_path_discovery_timing_ctl_set_t
Parameters of Path Discovery Timing Control Set.

Public Members

uint16_t path_monitor_interval
New Path Monitoring Interval state

uint16_t path_disc_retry_interval
New Path Discovery Retry Interval state

uint8_t path_disc_interval
New Path Discovery Interval state

uint8_t lane_disc_guard_interval
New Lane Discovery Guard Interval state

struct esp_ble_mesh_directed_ctl_net_transmit_set_t
Parameters of Directed Control Network Transmit Set.

Public Members

uint8_t net_transmit
New Directed Control Network Transmit Count state

struct esp_ble_mesh_directed_ctl_relay_retransmit_set_t
Parameters of Directed Control Relay Retransmit Set.

Public Members

uint8_t relay_retransmit
New Directed Control Relay Retransmit Count state

struct esp_ble_mesh_directed_control_status_t
Parameters of Directed Control Status.

Public Members

uint8_t status
Status code for the requesting message

uint16_t net_idx
NetKey Index

uint8_t directed_forwarding
Current Directed Forwarding state
uint8_t directed_relay
    Current Directed Relay state

uint8_t directed_proxy
    Current Directed Proxy state

uint8_t directed_proxy_use_default
    Current Directed Proxy Use Directed Default state or 0xFF

uint8_t directed_friend
    Current Directed Friend state

struct esp_ble_mesh_path_metric_status_t
    Parameters of Path Metric Status.

    **Public Members**

    uint8_t status
        Status code for the requesting message

    uint16_t net_idx
        NetKey Index

    uint8_t path_metric_type
        Current Path Metric Type state

    uint8_t path_lifetime
        Current Path Lifetime state

struct esp_ble_mesh_discovery_table_caps_status_t
    Parameters of Discovery Table Capabilities Status.

    **Public Members**

    uint8_t status
        Status code for the requesting message

    uint16_t net_idx
        NetKey Index

    uint8_t max_concurr_init
        Current Max Concurrent Init state

    uint8_t max_disc_entries
        Max Discovery Table Entries Count state

struct esp_ble_mesh_forwarding_table_status_t
    Parameters of Forwarding Table Status.
**Public Members**

```c
uint8_t status
Status code for the requesting message
```

```c
uint16_t net_idx
NetKey Index
```

```c
uint16_t path_origin
Primary element address of the Path Origin
```

```c
uint16_t dst
Destination address
```

```c
struct esp_ble_mesh_forwarding_table_deps_status_t
Parameters of Forwarding Table Dependent Status.
```

**Public Members**

```c
uint8_t status
Status code for the requesting message
```

```c
uint16_t net_idx
NetKey Index
```

```c
uint16_t path_origin
Primary element address of the Path Origin
```

```c
uint16_t dst
Destination address
```

```c
struct esp_ble_mesh_forwarding_table_entries_cnt_status_t
Parameters of Forwarding Table Entries Count Status.
```

**Public Members**

```c
uint8_t status
Status code for the requesting message
```

```c
uint16_t net_idx
NetKey Index
```

```c
uint16_t update_id
Current Forwarding Table Update Identifier state
```

```c
uint16_t fixed_entry_cnt
Number of fixed path entries in the Forwarding Table
```

```c
uint16_t non_fixed_entry_cnt
  Number of non-fixed path entries in the Forwarding Table

struct esp_ble_mesh_forwarding_table_entry_t
  Parameters of Forwarding Table Entry.

  **Public Members**

  uint16_t fixed_path_flag
    Indicates whether the table entry is a fixed path entry or a non-fixed path entry

  uint16_t unicast_dst_flag
    Indicates whether or not the destination of the path is a unicast address

  uint16_t bw_path_validated_flag
    Indicates whether or not the backward path has been validated

  uint16_t bearer_twd_path_origin_ind
    Indicates the presence or absence of the Bearer_Toward_Path_Origin field

  uint16_t bearer_twd_path_target_ind
    Indicates the presence or absence of the Bearer_Toward_Path_Target field

  uint16_t dep_origin_list_size_ind
    Indicates the size of the Dependent_Origin_List field

  uint16_t dep_target_list_size_ind
    Indicates the size of the Dependent_Target_List field

  uint8_t lane_counter
    Number of lanes in the path

  uint16_t path_remaining_time
    Path lifetime remaining

  uint8_t path_origin_forward_number
    Forwarding number of the Path Origin

  esp_ble_mesh_uar_t path_origin
    Path Origin unicast address range

  uint16_t dep_origin_list_size
    Current number of entries in the list of dependent nodes of the Path Origin

  uint16_t bearer_twd_path_origin
    Index of the bearer toward the Path Origin
```
```c
esp_ble_mesh_uar_t path_target
    Path Target unicast address range

tuint16_t multicast_dst
    Multicast destination address

tuint16_t dep_target_list_size
    Current number of entries in the list of dependent nodes of the Path Target

tuint16_t bearer_twd_path_target
    Index of the bearer toward the Path Target

struct esp_ble_mesh_forwarding_table_entries_status_t
    Parameters of Forwarding Table Entries Status.

Public Members

tuint8_t status
    Status code for the requesting message

tuint16_t net_idx
    NetKey Index

tuint16_t filter_mask
    Filter applied to the Forwarding Table entries

tuint16_t start_index
    Start offset in units of Forwarding Table entries

tuint16_t path_origin
    Primary element address of the Path Origin

tuint16_t dst
    Destination address

bool include_id
    Indicate whether or not the Forwarding Table Update Identifier is present

tuint16_t update_id
    Current Forwarding Table Update Identifier state

tuint8_t entry_list_size
    Current number of entries in the list of Forwarding Table entries

    esp_ble_mesh_forwarding_table_entry_t *entry_list
    List of Forwarding Table entries

struct esp_ble_mesh_forwarding_table_deps_get_status_t
    Parameters of Forwarding Table Dependents Get Status.
```
Chapter 2. API Reference

**Public Members**

`uint8_t status`  
Status code for the requesting message

`uint16_t net_idx`  
NetKey Index

`uint16_t dep_list_mask`  
Filter applied to the lists of unicast address ranges for dependent nodes

`uint16_t fixed_path_flag`  
Flag indicating whether or not to return the unicast address ranges of dependent nodes in a fixed path entry

`uint16_t start_index`  
Start offset in units of unicast address ranges

`uint16_t path_origin`  
Primary element address of the Path Origin

`uint16_t dst`  
Destination address

`bool include_id`  
Indicate whether or not the Forwarding Table Update Identifier is present

`uint16_t update_id`  
Current Forwarding Table Update Identifier state

`uint8_t dep_origin_uar_list_size`  
Number of unicast address ranges in the Dependent_Origin_Unicast_Addr_Range_List field

`uint8_t dep_target_uar_list_size`  
Number of unicast address ranges in the Dependent_Target_Unicast_Addr_Range_List field

`esp_ble_mesh_uar_t *dep_origin_uar_list`  
List of unicast address ranges of dependent nodes of the Path Origin

`esp_ble_mesh_uar_t *dep_target_uar_list`  
List of unicast address ranges of dependent nodes of the Path Target

`struct esp_ble_mesh_wanted_lanes_status_t`  
Parameters of Wanted Lanes Status.
uint8_t status
    Status code for the requesting message

gint16_t net_idx
    NetKey Index

gint8_t wanted_lanes
    Current Wanted Lanes state

struct esp_ble_mesh_two_way_path_status_t
    Parameters of Two Way Path Status.

Public Members

uint8_t status
    Status code for the requesting message

gint16_t net_idx
    NetKey Index

gint8_t two_way_path
    Current Two Way Path state

struct esp_ble_mesh_path_echo_interval_status_t
    Parameters of Path Echo Interval Status.

Public Members

uint8_t status
    Status code for the requesting message

gint16_t net_idx
    NetKey Index

gint8_t unicast_echo_interval
    Current Unicast Echo Interval state

gint8_t multicastEcho_interval
    Current Multicast Echo Interval state

struct esp_ble_mesh_directed_net_transmit_status_t
    Parameters of Directed Network Transmit Status.

Public Members

uint8_t net_transmit
Current Directed Network Transmit state

struct esp_ble_mesh_directed_relay_retransmit_status_t
Parameters of Directed Relay Retransmit Status.

Public Members

uint8_t relay_retransmit
Current Directed Relay Retransmit state

struct esp_ble_mesh_rssi_threshold_status_t
Parameters of RSSI Threshold Status.

Public Members

uint8_t default_rssi_threshold
Default RSSI Threshold state

uint8_t rssi_margin
Current RSSI Margin state

struct esp_ble_mesh_directed_paths_status_t
Parameters of Directed Paths Status.

Public Members

uint16_t directed_node_paths
Directed Node Paths state

uint16_t directed_relay_paths
Directed Relay Paths state

uint16_t directed_proxy_paths
Directed Proxy Paths state

uint16_t directed_friend_paths
Directed Friend Paths state

struct esp_ble_mesh_directed_pub_policy_status_t
Parameters of Directed Publish Policy Status.

Public Members

uint8_t status
Status code for the requesting message
Chapter 2. API Reference

```c
uint8_t directed_pub_policy
    Current Directed Publish Policy state

uint16_t element_addr
    Address of the element

uint16_t company_id
    Company ID

uint16_t model_id
    Model ID
```

```c
struct esp_ble_mesh_path_disc_timing_ctl_status_cb_t
    Parameters of Path Discovery Timing Control Status.
```

**Public Members**

```c
uint16_t path_monitor_interval
    Current Path Monitoring Interval state

uint16_t path_disc_retry_interval
    Current Path Discovery Retry Interval state

uint8_t path_disc_interval
    Current Path Discovery Interval state

uint8_t lane_disc_guard_interval
    Current Lane Discovery Guard Interval state
```

```c
struct esp_ble_mesh_directedCtlNetTransmit_status_t
    Parameters of Directed Control Network Transmit Status.
```

**Public Members**

```c
uint8_t net_transmit
    Current Directed Control Network Transmit state
```

```c
struct esp_ble_mesh_directed_ctl_relay_retransmit_status_t
    Parameters of Directed Control Relay Retransmit Status.
```

**Public Members**

```c
uint8_t relay_retransmit
    Current Directed Control Relay Retransmit state
```

```c
struct esp_ble_mesh_df_client_send_cb_t
    Result of sending Directed Forwarding Configuration Client messages
```
Public Members

int err_code
    Result of sending a message

struct esp_ble_mesh_df_client_cb_param_t
    Directed Forwarding Configuration Client model callback parameters

Public Members

desp_ble_mesh_client_common_param_t *params
    Client common parameters, used by all events.

desp_ble_mesh_df_client_send_cb_t send
    Result of sending a message

desp_ble_mesh_df_client_recv_cb_t recv
    Parameters of received status message

union desp_ble_mesh_df_client_cb_param_t::[anonymous] [anonymous]
    Union of DF Client callback

struct desp_ble_mesh_df_server_table_change_t
    Parameters of directed forwarding table entry change

Public Members

esp_ble_mesh_df_table_action_t action
    Action of directed forwarding table

esp_ble_mesh_uar_t path_origin
    Primary element address of the Path Origin

esp_ble_mesh_uar_t path_target
    Primary element address of the Path Target

esp_ble_mesh_uar_t *dep_origin_data
    List of the primary element addresses of the dependent nodes of the Path Origin

uint32_t dep_origin_num
    Number of entries in the Dependent_Origin_List field of the message

esp_ble_mesh_uar_t *dep_target_data
    List of the primary element addresses of the dependent nodes of the Path Target

uint32_t dep_target_num
    Number of entries in the Dependent_Target_List field of the message
uint8_t fixed_path
   Indicates whether the table entry is a fixed path entry or a non-fixed path entry

uint8_t bw_path_validate
   Indicates whether or not the backward path has been validated

uint8_t path_not_ready
   Flag indicating whether or not the path is ready for use

uint8_t forward_number
   Forwarding number of the Path Origin; If the entry is associated with a fixed path, the value is 0

uint8_t lane_counter
   Number of lanes discovered; if the entry is associated with a fixed path, the value is 1.

struct esp_ble_mesh_df_server_table_change_t::[anonymous]::[anonymous]
df_table_entry_add_remove
   Structure of directed forwarding table add and remove Structure of directed forwarding table add and remove

uint8_t dummy
   Event not used currently

struct esp_ble_mesh_df_server_table_change_t::[anonymous]::[anonymous] df_table_entry_change
   Structure of directed forwarding table entry change Directed forwarding table entry change

union esp_ble_mesh_df_server_table_change_t::[anonymous] df_table_info
   Union of directed forwarding table information Directed forwarding table information

struct esp_ble_mesh_df_server_cb_param_t
   Directed Forwarding Configuration Server model callback parameters

   esp_ble_mesh_model_t *model
      Pointer to the server model structure

   esp_ble_mesh_msg_ctx_t ctx
      Context of the received message

   esp_ble_mesh_df_server_cb_value_t value
      Value of the received configuration messages

Public Members

Define a new Directed Forwarding Configuration Server model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**

- **srv_data** -- Pointer to a unique Directed Forwarding Configuration Server model user_data.

**Returns** New Directed Forwarding Configuration Server model instance.

**ESP_BLE_MESH_MODEL_DF_CLI** (cli_data)

Define a new Directed Forwarding Configuration Client model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**

- **cli_data** -- Pointer to a unique Directed Forwarding Configuration Client model user_data.

**Returns** New Directed Forwarding Configuration Client model instance.
Type Definitions

typedef void (*esp_ble_mesh_df_client_cb_t)(esp_ble_mesh_df_client_cb_event_t event, esp_ble_mesh_df_client_cb_param_t *param)

Bluetooth Mesh Directed Forwarding Configuration client and server model functions.
Directed Forwarding Configuration Client model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (*esp_ble_mesh_df_server_cb_t)(esp_ble_mesh_df_server_cb_event_t event, esp_ble_mesh_df_server_cb_param_t *param)

Directed Forwarding Configuration Server model callback function type.

Param event Event type
Param param Pointer to callback parameter

Enumerations

enum esp_ble_mesh_df_client_cb_event_t

This enum value is the event of Directed Forwarding Configuration Client model

Values:

enumerator ESP_BLE_MESH_DF_CLIENT_SEND_COMP_EVT
enumerator ESP_BLE_MESH_DF_CLIENT_SEND_TIMEOUT_EVT
enumerator ESP_BLE_MESH_DF_CLIENT_RECV_GET_RSP_EVT
enumerator ESP_BLE_MESH_DF_CLIENT_RECV_SET_RSP_EVT
enumerator ESP_BLE_MESH_DF_CLIENT_RECV_PUB_EVT
enumerator ESP_BLE_MESH_DF_CLIENT_EVT_MAX

enum esp_ble_mesh_df_table_action_t

Values:

enumerator ESP_BLE_MESH_DF_TABLE_ACT_EMPTY
enumerator ESP_BLE_MESH_DF_TABLE_ADD
enumerator ESP_BLE_MESH_DF_TABLE_REMOVE
enumerator ESP_BLE_MESH_DF_TABLE_ENTRY_CHANGE
enumerator ESP_BLE_MESH_DF_TABLE_ACT_MAX_LIMIT

enum esp_ble_mesh_df_server_cb_event_t

This enum value is the event of Directed Forwarding Configuration Server model

Values:
enumerator ESP_BLE_MESH_DF_SERVER_STATE_CHANGE_EVT
enumerator ESP_BLE_MESH_DF_SERVER_TABLE_CHANGE_EVT
enumerator ESP_BLE_MESH_DF_SERVER_EVT_MAX

Subnet Bridge Configuration

Header File

- components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_brc_model_api.h

Functions

```
esp_err_t esp_ble_mesh_register_brc_client_callback (esp_ble_mesh_brc_client_cb_t callback)
```
Register BLE Mesh Bridge Configuration Client model callback.

**Parameters**
callback -- [in] Pointer to the callback function.

**Returns**
ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_brc_server_callback (esp_ble_mesh_brc_server_cb_t callback)
```
Register BLE Mesh Bridge Configuration Server model callback.

**Parameters**
callback -- [in] Pointer to the callback function.

**Returns**
ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_brc_client_send (esp_ble_mesh_client_common_param_t *params,
                                     esp_ble_mesh_brc_client_msg_t *msg)
```
Get/Set the value of Bridge Configuration Server model state with the corresponding message.

**Parameters**
- params -- [in] Pointer to BLE Mesh common client parameters.
- msg -- [in] Pointer to Bridge Configuration Client message.

**Returns**
ESP_OK on success or error code otherwise.

Unions

```
union esp_ble_mesh_brc_client_msg_t
```
Bridge Configuration Client model message union.

Public Members

`esp_ble_mesh_brc_server_state_change_t` *state_change*

For ESP_BLE_MESH_BRC_SERVER_STATE_CHANGE_EVT

Structures

struct `esp_ble_mesh_subnet_bridge_table_t`

Parameters of subnet bridge table

Public Members

uint8_t *bridge_direction*

Allowed directions for the bridged traffic

uint8_t *bridge_net_idx[3]*

Two NetKey Indexes are packed into three octets

uint16_t *bridge_addr_1*

Address of the node in the first subnet

uint16_t *bridge_addr_2*

Address of the node in the second subnet

struct `esp_ble_mesh_subnet_bridge_set_t`

Parameters of Subnet Bridge Set

Public Members

uint8_t *subnet_bridge*

New Subnet Bridge state

struct `esp_ble_mesh_bridging_table_add_t`

Parameters of Bridging Table Add

Public Members

uint8_t *bridge_direction*

Allowed directions for the bridged traffic

uint16_t *bridge_net_idx_1*

NetKey Index of the first subnet

uint16_t *bridge_net_idx_2*

NetKey Index of the second subnet
Chapter 2. API Reference

uint16_t bridge_addr_1
Address of the node in the first subnet

uint16_t bridge_addr_2
Address of the node in the second subnet

struct esp_ble_mesh_bridging_table_remove_t
Parameters of Bridging Table Remove

**Public Members**

uint16_t bridge_net_idx_1
NetKey Index of the first subnet

uint16_t bridge_net_idx_2
NetKey Index of the second subnet

uint16_t bridge_addr_1
Address of the node in the first subnet

uint16_t bridge_addr_2
Address of the node in the second subnet

struct esp_ble_mesh_bridged_subnets_get_t
Parameters of Bridged Subnets Get

**Public Members**

uint16_t bridge_filter
Filter to be applied when reporting the set of pairs of NetKey Indexes

uint16_t bridge_net_idx
NetKey Index of any of the subnets

uint8_t bridge_start_idx
Start offset in units of Bridging Table state entries

struct esp_ble_mesh_bridging_table_get_t
Parameters of Bridging Table Get

**Public Members**

uint16_t bridge_net_idx_1
NetKey Index of first subnet
Chapter 2. API Reference

uint16_t bridge_net_idx_2
NetKey Index of the second subnet

uint16_t bridge_start_idx
Start offset in units of Bridging Table state entries

struct esp_ble_mesh_subnet_bridge_status_t
Parameters of Subnet Bridge Status

Public Members

uint8_t subnet_bridge
Current Subnet Bridge state

struct esp_ble_mesh_bridging_table_status_t
Parameters of Bridging Table Status

Public Members

uint8_t status
Status Code for the requesting message

uint8_t bridge_direction
Allowed directions for the bridged traffic

uint16_t bridge_net_idx_1
NetKey Index of the first subnet

uint16_t bridge_net_idx_2
NetKey Index of the second subnet

uint16_t bridge_addr_1
Address of the node in the first subnet

uint16_t bridge_addr_2
Address of the node in the second subnet

#define ESP_BLE_MESH_MODEL_OP_BRIDGING_TABLE_LIST

#define ESP_BLE_MESH_MODEL_OP_BRIDGING_TABLE_SIZE_GET

#define ESP_BLE_MESH_MODEL_OP_BRIDGING_TABLE_SIZE_STATUS

#define ESP_BLE_MESH_MODEL_BRC_SRV (srv_data)

Define a new Bridge Configuration Server model.
```

### Note:
If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

### Parameters
- `srv_data` -- Pointer to a unique Bridge Configuration Server model user_data.

### Returns
New Bridge Configuration Server model instance.
**ESP_BLE_MESH_MODEL_BRC_CLI** (cli_data)

Define a new Bridge Configuration Client model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**
- *cli_data* -- Pointer to a unique Bridge Configuration Client model user_data.

**Returns** New Bridge Configuration Client model instance.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_brc_client_cb_t)(esp_ble_mesh_brc_client_cb_event_t event, esp_ble_mesh_brc_client_cb_param_t *param)
```

Bluetooth Mesh Bridge Configuration client and server model functions.
Bridge Configuration Client model callback function type
- **Param event** Event type
- **Param param** Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_brc_server_cb_t)(esp_ble_mesh_brc_server_cb_event_t event, esp_ble_mesh_brc_server_cb_param_t *param)
```

Bridge Configuration Server model callback function type.
- **Param event** Event type
- **Param param** Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_brc_client_cb_event_t
```

This enum value is the event of Bridge Configuration Client model

**Values:**
- **enumerator ESP_BLE_MESH_BRC_CLIENT_SEND_COMP_EVT**
- **enumerator ESP_BLE_MESH_BRC_CLIENT_SEND_TIMEOUT_EVT**
- **enumerator ESP_BLE_MESH_BRC_CLIENT_RECV_RSP_EVT**
- **enumerator ESP_BLE_MESH_BRC_CLIENT_RECV_PUB_EVT**
- **enumerator ESP_BLE_MESH_BRC_CLIENT_EVT_MAX**

```c
enum esp_ble_mesh_brc_server_cb_event_t
```

This enum value is the event of Bridge Configuration Server model

**Values:**
- **enumerator ESP_BLE_MESH_BRC_SERVER_STATE_CHANGE_EVT**
- **enumerator ESP_BLE_MESH_BRC_SERVER_EVT_MAX**
Mesh Private Beacon

Functions

```
esp_err_t esp_ble_mesh_register_prb_client_callback(esp_ble_mesh_prb_client_cb_t callback)
```
Register BLE Mesh Private Beacon Client Model callback.

**Parameters**
callback -- [in] Pointer to the callback function.

**Returns**
ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_prb_server_callback(esp_ble_mesh_prb_server_cb_t callback)
```
Register BLE Mesh Private Beacon Server Model callback.

**Parameters**
callback -- [in] Pointer to the callback function.

**Returns**
ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_prb_client_send(esp_ble_mesh_client_common_param_t *params,
                                        esp_ble_mesh_prb_client_msg_t *msg)
```
Get/Set the value of Private Beacon Server Model states using the corresponding messages of Private Beacon Client Model.

**Parameters**
- params -- [in] Pointer to BLE Mesh common client parameters.

**Returns**
ESP_OK on success or error code otherwise.

ESP_BLE_MESH_MODEL_PRB_SRV (srv_data)
Define a new Private Beacon Server Model.

Note: The Private Beacon Server Model can only be included by a Primary Element.

Parameters
Chapter 2. API Reference

- **srv_data** -- Pointer to a unique Private Beacon Server Model user_data.

  **Returns**  New Private Beacon Server Model instance.

**ESP_BLE_MESH_MODEL_PRB_CLI** (cli_data)

Define a new Private Beacon Client Model.

**Note:** The Private Beacon Client Model can only be included by a Primary Element.

**Parameters**

- **cli_data** -- Pointer to a unique struct esp_ble_mesh_client_t.

  **Returns**  New Private Beacon Client Model instance.

**Type Definitions**

```c
define void (*esp_ble_mesh_prb_client_cb_t)(esp_ble_mesh_prb_client_cb_event_t event, esp_ble_mesh_prb_client_cb_param_t *param)

  Bluetooth Mesh Private Beacon Client and Server Model functions.

  Private Beacon Client Model callback function type

  Param event  Event type

  Param param  Pointer to callback parameter
```

```c
define void (*esp_ble_mesh_prb_server_cb_t)(esp_ble_mesh_prb_server_cb_event_t event, esp_ble_mesh_prb_server_cb_param_t *param)

  Private Beacon Server Model callback function type.

  Param event  Event type

  Param param  Pointer to callback parameter
```

**Enumerations**

```c
eenum esp_ble_mesh_prb_client_cb_event_t

  This enum value is the event of Private Beacon Client Model

  Values:

  enum ESP_BLE_MESH_PRB_CLIENT_SEND_COMP_EVT

  enum ESP_BLE_MESH_PRB_CLIENT_SEND_TIMEOUT_EVT

  enum ESP_BLE_MESH_PRB_CLIENT_RECV_RSP_EVT

  enum ESP_BLE_MESH_PRB_CLIENT_RECV_PUB_EVT

  enum ESP_BLE_MESH_PRB_CLIENT_EVT_MAX

  enum esp_ble_mesh_prb_server_cb_event_t

  This enum value is the event of Private Beacon Server model

  Values:

  enum ESP_BLE_MESH_PRB_SERVER_STATE_CHANGE_EVT

  enum ESP_BLE_MESH_PRB_SERVER_EVT_MAX
```
On-Demand Private Proxy

Header File

```

or

```
PRIV_REQUIRES bt
```

Functions

```
esp_err_t esp_ble_mesh_register_odp_client_callback (esp_ble_mesh_odp_client_cb_t callback)
```
Register BLE Mesh On-Demand Private Proxy Config Client model callback.

- **Parameters**
  - `callback` -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_odp_client_send (esp_ble_mesh_client_common_param_t *params,
                                       esp_ble_mesh_odp_client_msg_t *msg)
```
Get the value of On-Demand Private Proxy Config Server model state with the corresponding get message.

- **Parameters**
  - `params` -- [in] Pointer to BLE Mesh common client parameters.
  - `msg` -- [in] Pointer to On-Demand Private Proxy Config Client message.
- **Returns**
  - ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_odp_server_callback (esp_ble_mesh_odp_server_cb_t callback)
```
Register BLE Mesh On-Demand Private Proxy Config Server model callback.

- **Parameters**
  - `callback` -- [in] Pointer to the callback function.
- **Returns**
  - ESP_OK on success or error code otherwise.

ESP_BLE_MESH_MODEL_OP_OD_PRIV_PROXY_STATUS

ESP_BLE_MESH_MODEL_ODP_SRV (srv_data)

Define a new On-Demand Private Proxy Config Server model.

Note: The On-Demand Private Proxy Server model is used to represent the ability to enable advertising with Private Network Identity type of a node. This model extends the Mesh Private Beacon Server model. When this model is present on an element, the corresponding Solicitation PDU RPL Configuration Server model shall also be present. The model shall be supported by a primary element and shall not be supported by any secondary elements.

Parameters

• srv_data -- Pointer to a unique On-Demand Private Proxy Config Server model user_data.

Returns New On-Demand Private Proxy Config Server model instance.

ESP_BLE_MESH_MODEL_ODP_CLI (cli_data)

Define a new On-Demand Private Proxy Config Client model.

Note: The model shall be supported by a primary element and shall not be supported by any secondary elements.

Parameters

• cli_data -- Pointer to a unique On-Demand Private Proxy Config Client model user_data.

Returns New On-Demand Private Proxy Config Client model instance.

Type Definitions

typedef void (*esp_ble_mesh_odp_client_cb_t)(esp_ble_mesh_odp_client_cb_event_t event, esp_ble_mesh_odp_client_cb_param_t *param)

Bluetooth Mesh On-Demand Private Proxy Config client and server model functions.

On-Demand Private Proxy Config Client model callback function type

Param event Event type
Param param Pointer to callback parameter

typedef void (*esp_ble_mesh_odp_server_cb_t)(esp_ble_mesh_odp_server_cb_event_t event, esp_ble_mesh_odp_server_cb_param_t *param)

On-Demand Private Proxy Config Server model callback function type.

Param event Event type
Param param Pointer to callback parameter

Enumerations
Chapter 2. API Reference

enum esp_ble_mesh_odp_client_cb_event_t
This enum value is the event of On-Demand Private Proxy Config Client model
Values:

enumerator ESP_BLE_MESH_ODP_CLIENT_SEND_COMP_EVT
enumerator ESP_BLE_MESH_ODP_CLIENT_SEND_TIMEOUT_EVT
enumerator ESP_BLE_MESH_ODP_CLIENT_RECV_RSP_EVT
enumerator ESP_BLE_MESH_ODP_CLIENT_RECV_PUB_EVT
enumerator ESP_BLE_MESH_ODP_CLIENT_EVT_MAX

enum esp_ble_mesh_odp_server_cb_event_t
This enum value is the event of On-Demand Private Proxy Config Server model
Values:

```

Functions

`esp_err_t esp_ble_mesh_register_sar_client_callback (esp_ble_mesh_sar_client_cb_t callback)`
Register BLE Mesh SAR Configuration Client model callback.

Parameters
- `callback` -- [in] Pointer to the callback function.

Returns
- ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_sar_client_send (esp_ble_mesh_client_common_param_t *params,
                                        esp_ble_mesh_sar_client_msg_t *msg)`
Get the value of SAR Configuration Server model state with the corresponding get message.

Parameters
- `params` -- [in] Pointer to BLE Mesh common client parameters.
- `msg` -- [in] Pointer to SAR Configuration Client message.
 Returns  ESP_OK on success or error code otherwise.

\[\text{esp_err_t esp_ble_mesh_register_sar_server_callback(esp_ble_mesh_sar_server_cb_t callback)}\]

Register BLE Mesh SAR Configuration Server model callback.

\textbf{Parameters}
\textit{callback} -- [in] Pointer to the callback function.

\textbf{Returns}  ESP_OK on success or error code otherwise.

Parameters of Aggregator Item

Public Members

uint16_t length_format
0: Length_Short; 1: Length_Long

uint16_t length
Size of Opcode_And_Parameters field

const uint8_t *data
Opcode and parameters

struct `esp_ble_mesh_agg_sequence_t`
Parameters of Opcodes Aggregator Sequence

Public Members

uint16_t element_addr
Element address

struct net_buf_simple *items
List of items with each item represented as an Aggregator Item

struct `esp_ble_mesh_agg_status_t`
Parameters of Opcodes Aggregator Status

Public Members
**uint8_t** status

Status of the most recent operation

**uint16_t** element_addr

Element Address

**struct net_buf_simple** *items

List of status items with each status item containing an unacknowledged access layer message or empty item (Optional)

**struct esp_ble_mesh_agg_client_send_cb_t**

Result of sending Opcodes Aggregator Client messages

### Public Members

**int** err_code

Result of sending a message

**struct esp_ble_mesh_agg_client_cb_param_t**

Opcodes Aggregator Client model callback parameters

### Public Members

**esp_ble_mesh_client_common_param_t** *params

Client common parameters, used by all events

**esp_ble_mesh_agg_client_send_cb_t** send

Result of sending a message

**esp_ble_mesh_agg_client_recv_cb_t** recv

Parameters of received status message

union **esp_ble_mesh_agg_client_cb_param_t**::[anonymous] [anonymous]

Union of AGG Client callback

**struct esp_ble_mesh_agg_server_cb_param_t**

Opcodes Aggregator Server model callback parameters

### Public Members

**esp_ble_mesh_model_t** *model

Pointer to the server model structure

**esp_ble_mesh_msg_ctx_t** ctx

Context of the received message
**esp_ble_mesh_agg_server_recv_msg_t**

Received message callback values

union *esp_ble_mesh_agg_server_cb_param_t*:

Union of AGG Server callback

### Macros

**ESP_BLE_MESH_MODEL_OP_AGG_SEQUENCE**

Defines the Opcodes Aggregator message opcode.

**ESP_BLE_MESH_MODEL_OP_AGG_STATUS**

**ESP_BLE_MESH_AGG_STATUS_SUCCESS**

Defines the status codes for Opcodes Aggregator messages.

**ESP_BLE_MESH_AGG_STATUS_INVALID_ADDRESS**

**ESP_BLE_MESH_AGG_STATUS_INVALID_MODEL**

**ESP_BLE_MESH_AGG_STATUS_WRONG_ACCESS_KEY**

**ESP_BLE_MESH_AGG_STATUS_WRONG_OPCODE**

**ESP_BLE_MESH_AGG_STATUS_MSG_NOT_UNDERSTOOD**

**ESP_BLE_MESH_AGG_ITEM_LENGTH_FORMAT_SHORT**

Values of the Length Format

**ESP_BLE_MESH_AGG_ITEM_LENGTH_FORMAT_LONG**

**ESP_BLE_MESH_MODEL_AGG_SRV** (srv_data)

Define a new Opcodes Aggregator Server model.

**Note:** If supported, the Opcodes Aggregator Server model shall be supported by a primary element.

**Parameters**

- *srv_data* -- Pointer to a unique Opcodes Aggregator Server model user_data.

**Returns** New Opcodes Aggregator Server model instance.

**ESP_BLE_MESH_MODEL_AGG_CLI** (cli_data)

Define a new Opcodes Aggregator Client model.

**Note:** If supported, the model shall be supported by the primary element and shall not be supported by any secondary elements.

**Parameters**

- *cli_data* -- Pointer to a unique Opcodes Aggregator Client model user_data.

**Returns** New Opcodes Aggregator Client model instance.
Type Definitions

typedef void (*esp_ble_mesh_agg_client_cb_t)(esp_ble_mesh_agg_client_cb_event_t event, esp_ble_mesh_agg_client_cb_param_t *param)

Bluetooth Mesh Opcodes Aggregator client and server model functions.

Opcodes Aggregator Client model callback function type

  Param event  Event type
  Param param  Pointer to callback parameter

typedef void (*esp_ble_mesh_agg_server_cb_t)(esp_ble_mesh_agg_server_cb_event_t event, esp_ble_mesh_agg_server_cb_param_t *param)

Opcodes Aggregator Server model callback function type.

  Param event  Event type
  Param param  Pointer to callback parameter

Enumerations

enum esp_ble_mesh_agg_client_cb_event_t

This enum value is the event of Opcodes Aggregator Client model

Values:

  enumerator ESP_BLE_MESH_AGG_CLIENT_SEND_COMP_EVT

  enumerator ESP_BLE_MESH_AGG_CLIENT_SEND_TIMEOUT_EVT

  enumerator ESP_BLE_MESH_AGG_CLIENT_RECV_RSP_EVT

  enumerator ESP_BLE_MESH_AGG_CLIENT_RECV_PUB_EVT

  enumerator ESP_BLE_MESH_AGG_CLIENT_EVT_MAX

enum esp出血_mesh_agg_server_cb_event_t

This enum value is the event of Opcodes Aggregator Server model

Values:

  enumerator ESP_BLE_MESH_AGG_SERVER_RECV_MSG_EVT

  enumerator ESP_BLE_MESH_AGG_SERVER_EVT_MAX

Large Composition Data

Header File

  components/bt/esp_ble_mesh/v1.1/api/core/include/esp_ble_mesh_lcd_model_api.h

  This header file can be included with:

  #include "esp_ble_mesh_lcd_model_api.h"

  This header file is a part of the API provided by the bt component. To declare that your component depends
  on bt, add the following to your CMakeLists.txt:
Functions

```c
esp_err_t esp_ble_mesh_register_lcd_client_callback (esp_ble_mesh_lcd_client_cb_t callback)
```
Register BLE Mesh Large Composition Data Client model callback.

**Parameters**

- `callback` -- [in] Pointer to the callback function.

**Returns**

- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_lcd_client_send (esp_ble_mesh_client_common_param_t *params,
                                       esp_ble_mesh_lcd_client_msg_t *msg)
```
Get the value of Large Composition Data Server model state with the corresponding get message.

**Parameters**

- `params` -- [in] Pointer to BLE Mesh common client parameters.
- `msg` -- [in] Pointer to Large Composition Data Client message.

**Returns**

- ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_register_lcd_server_callback (esp_ble_mesh_lcd_server_cb_t callback)
```
Register BLE Mesh Large Composition Data Server model callback.

**Parameters**

- `callback` -- [in] Pointer to the callback function.

**Returns**

- ESP_OK on success or error code otherwise.

Unions

```c
union esp_ble_mesh_lcd_client_msg_t

`ESP_BLE_MESH_MODEL_OP_MODELS_METADATA_GET`

`ESP_BLE_MESH_MODEL_OP_MODELS_METADATA_STATUS`

`ESP_BLE_MESH_MODEL_LCD_SRV (srv_data)`
Define a new Large Composition Data Server model.

**Note:** If supported, the model shall be supported by a primary element and shall not be supported by any secondary elements.

**Parameters**

- `srv_data` -- Pointer to a unique Large Composition Data Server model user_data.

**Returns** New Large Composition Data Server model instance.
**Chapter 2. API Reference**

**ESP_BLE_MESH_MODEL_LCD_CLI (cli_data)**

Define a new Large Composition Data Client model.

**Note:** If supported, the model shall be supported by the primary element and shall not be supported by any secondary elements.

**Parameters**

* cli_data -- Pointer to a unique Large Composition Data Client model user_data.

**Returns** New Large Composition Data Client model instance.

**Type Definitions**

typedef void (*esp_ble_mesh_lcd_client_cb_t)(esp_ble_mesh_lcd_client_cb_event_t event, esp_ble_mesh_lcd_client_cb_param_t *param)

Large Composition Data client and server model functions.

Large Composition Data Client model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

typedef void (*esp_ble_mesh_lcd_server_cb_t)(esp_ble_mesh_lcd_server_cb_event_t event, esp_ble_mesh_lcd_server_cb_param_t *param)

Large Composition Data Server model callback function type.

**Param event** Event type

**Param param** Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_lcd_client_cb_event_t

This enum value is the event of Large Composition Data Client model

**Values:**

enumerator ESP_BLE_MESH_LCD_CLIENT_SEND_COMP_EVT

enumerator ESP_BLE_MESH_LCD_CLIENT_SEND_TIMEOUT_EVT

enumerator ESP_BLE_MESH_LCD_CLIENT_RECV_RSP_EVT

enumerator ESP_BLE_MESH_LCD_CLIENT_RECV_PUB_EVT

enumerator ESP_BLE_MESH_LCD_CLIENT_EVT_MAX

enum esp_ble_mesh_lcd_server_cb_event_t

This enum value is the event of Large Composition Data Server model

**Values:**

enumerator ESP_BLE_MESH_LCD_SERVER_STATE_CHANGE_EVT

enumerator ESP_BLE_MESH_LCD_SERVER_EVT_MAX

2.3.5 NimBLE-based Host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and Bluetooth® SIG qualifiable Bluetooth Low Energy (Bluetooth LE) stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including Bluetooth Low Energy Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.
Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For Bluetooth Low Energy Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`
- This header file can be included with:

```c
#include "esp_nimble_hci.h"
```
- This header file is a part of the API provided by the `bt` component. To declare that your component depends on `bt`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES bt
```
- or

```cmake
PRIV_REQUIRES bt
```

Functions

```c
esp_err_t esp_nimble_hci_init(void)
```

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Returns
Chapter 2. API Reference

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_deinit (void)
```

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note:** This function should be called after the NimBLE host is deinitialized.

### Returns
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

### Macros

- `BLE_HCI_UART_H4_NONE`
- `BLE_HCI_UART_H4_CMD`
- `BLE_HCI_UART_H4_ACL`
- `BLE_HCI_UART_H4_SCO`
- `BLE_HCI_UART_H4_EVT`

ESP-IDF currently supports two host stacks. The Bluez based stack (default) supports classic Bluetooth as well as Bluetooth Low Energy (Bluetooth LE). On the other hand, Apache NimBLE based stack is Bluetooth Low Energy only. For users to make a choice:

- For use cases involving classic Bluetooth as well as Bluetooth Low Energy, Bluez should be used.
- For Bluetooth Low Energy-only use cases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the `bluetooth/bluedroid` directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough

2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*.

- `ESP_FAIL` (-1): Generic esp_err_t code indicating failure
- `ESP_OK` (0): esp_err_t value indicating success (no error)
- `ESP_ERR_NO_MEM` (0x101): Out of memory
- `ESP_ERR_INVALID_ARG` (0x102): Invalid argument
**Chapter 2. API Reference**

**ESP_ERR_INVALID_STATE** (0x103): Invalid state

**ESP_ERR_INVALID_SIZE** (0x104): Invalid size

**ESP_ERR_NOT_FOUND** (0x105): Requested resource not found

**ESP_ERR_NOT_SUPPORTED** (0x106): Operation or feature not supported

**ESP_ERR_TIMEOUT** (0x107): Operation timed out

**ESP_ERR_INVALID_RESPONSE** (0x108): Received response was invalid

**ESP_ERR_INVALID_CRC** (0x109): CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid

**ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid

**ESP_ERR_NOT_FINISHED** (0x10c): Operation has not fully completed

**ESP_ERR_NOT_ALLOWED** (0x10d): Operation is not allowed

**ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND** (0x1102): A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long

**ESP_ERR_NVS_PAGE_FULL** (0x110a): Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE** (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** (0x110c): String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** (0x110e): Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** (0x110f): Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (0x1111): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (0x1112): XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED** (0x1113): XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** (0x1114): XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** (0x1115): NVS encryption is not supported in this version
ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116): NVS key partition is uninitialized
ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt
ESP_ERR_NVS_CONTENT_DIFFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison
ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.
ESP_ERR_ULP_BASE (0x1200): Offset for ULP-related error codes
ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn’t fit into RTC memory reserved for the ULP
ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP
ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined
ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label
ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)
ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api
ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition
ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content
ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid
ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.
ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible
ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTAP_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible
ESP_ERR_EFUSE (0x1600): Base error code for efuse api.
ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.
ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.
ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.
ESP_ERR_CODING (0x1604): Error while a encoding operation.
ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available
ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.
ESP_ERR_IMAGE_BASE (0x2000)
ESP_ERR_IMAGE_FLASH_FAIL (0x2001)
ESP_ERR_IMAGE_INVALID (0x2002)
ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF (0x3004): WiFi interface error
Chapter 2. API Reference

ESP_ERR_WIFI_MODE (0x3005): WiFi mode error
ESP_ERR_WIFI_STATE (0x3006): WiFi internal state error
ESP_ERR_WIFI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NVSP (0x3008): WiFi internal NVS module error
ESP_ERR_WIFI_MAC (0x3009): MAC address is invalid
ESP_ERR_WIFI_SSID (0x300a): SSID is invalid
ESP_ERR_WIFI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WIFI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WIFI_WAKE_FAIL (0x300d): WiFi is in sleep state(RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_TWT_FULL (0x3017): no available flow id
ESP_ERR_WIFI_TWT_SETUP_TIMEOUT (0x3018): Timeout of receiving twt setup response frame, timeout times can be set during twt setup
ESP_ERR_WIFI_TWT_SETUP_TXFAIL (0x3019): TWT setup frame tx failed
ESP_ERR_WIFI_TWT_SETUP_REJECT (0x301a): The twt setup request was rejected by the AP
ESP_ERR_WIFI_DISCARD (0x301b): Discard frame
ESP_ERR_WIFI_ROC_IN_PROGRESS (0x301c): ROC op is in progress
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported
ESP_ERR_WIFI_WPS_TYPE (0x3034): WPS type error
ESP_ERR_WIFI_WPS_SN (0x3035): WPS state machine is not initialized

ESP_ERR_NVS_SEC_BASE (0xf000): Starting number of error codes
ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND (0xf001): HMAC Key required to generate the NVS encryption keys not found
ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED (0xf002): Provided eFuse block for HMAC key generation is already in use
ESP_ERR_NVS_SEC_HMAC_KEY_GENERATION_FAILED (0xf003): Failed to generate/write the HMAC key to eFuse
ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED (0xf004): Failed to derive the NVS encryption keys based on the HMAC-based scheme

2.5 Networking APIs

2.5.1 Wi-Fi

ESP-NOW

Overview ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection.

CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

```
<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specific Content</td>
<td>FCS</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value field is used to prevent relay attacks.

Espressif Systems 710 Release v5.2.2
Submit Document Feedback
Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0-250 bytes</td>
</tr>
</tbody>
</table>

- **Element ID**: The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length**: The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier**: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type**: The Type field is set to the value (4) indicating ESP-NOW.
- **Version**: The Version field is set to the version of ESP-NOW.
- **Body**: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

### Security
ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. The Wi-Fi device maintains a Primary Master Key (PMK) and several Local Master Keys (LMKs, each paired device has one LMK). The lengths of both PMK and LMK are 16 bytes.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

### Initialization and Deinitialization
Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW.

When `esp_now_deinit()` is called, all of the information of paired devices are deleted.

### Add Paired Device
Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 17, the default is 7. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

### Send ESP-NOW Data
Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device does not exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending
callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data**  Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate**  Call `esp_now_set_peer_rate_config()` to configure ESP-NOW rate of each peer. Make sure that the peer is added before configuring the rate. This API should be called after `esp_wifi_start()` and `esp_now_add_peer()`.

**Note:** The function `esp_wifi_config_espnow_rate()` is deprecated, please use `esp_now_set_peer_rate_config()` instead.

**Config ESP-NOW Power-saving Parameter**  Sleep is supported only when ESP32-C6 is configured as station. Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time.

If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to *connectionless module power save* to get more detail.

**Application Examples**

- Example of sending and receiving ESP-NOW data between two devices: wifi/espnow.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

**API Reference**

**Header File**

- `components/esp_wifi/include/esp_now.h`

- This header file can be included with:

  ```c
  #include "esp_now.h"
  ```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your CMakeLists.txt:

  ```c
  REQUIRES esp_wifi
  ```

  or

  ```c
  PRIV_REQUIRES esp_wifi
  ```

**Functions**

`esp_err_t esp_now_init (void)`

Initialize ESPNOW function.

**Returns**

- ESP_OK : succeed
Chapter 2. API Reference

- ESP_ERR_ESPNOW_INTERNAL: Internal error

```c
esp_err_t esp_now_deinit (void)
```
De-initialize ESPNOW function.

Returns
- ESP_OK: succeed

```c
esp_err_t esp_now_get_version (uint32_t *version)
```
Get the version of ESPNOW.

Parameters version -- ESPNOW version

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_ARG: invalid argument

```c
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)
```
Register callback function of receiving ESPNOW data.

Parameters cb -- callback function of receiving ESPNOW data

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

```c
esp_err_t esp_now_unregister_recv_cb (void)
```
Unregister callback function of receiving ESPNOW data.

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

```c
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)
```
Register callback function of sending ESPNOW data.

Parameters cb -- callback function of sending ESPNOW data

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

```c
esp_err_t esp_now_unregister_send_cb (void)
```
Unregister callback function of sending ESPNOW data.

Returns
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

```c
esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)
```
Send ESPNOW data.

**Attention**
1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Parameters
- peer_addr -- peer MAC address
- data -- data to send
- len -- length of data

Returns
- ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_INTERNAL: internal error
• ESP_ERR_ESPNOW_NO_MEM: out of memory, when this happens, you can delay a while before sending the next data
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found
• ESP_ERR_ESPNOW_IF: current Wi-Fi interface doesn’t match that of peer
• ESP_ERR_ESPNOW_CHAN: current Wi-Fi channel doesn’t match that of peer

doesn’t match that of peer.
doesn’t match that of peer.

\texttt{esp_err_t esp_now_add_peer} (const \texttt{esp_now_peer_info_t} *peer)
Add a peer to peer list.

\textbf{Parameters} peer -- peer information

\textbf{Returns}
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_FULL: peer list is full
• ESP_ERR_ESPNOW_NO_MEM: out of memory
• ESP_ERR_ESPNOW_EXIST: peer has existed

\texttt{esp_err_t esp_now_del_peer} (const uint8_t *peer_addr)
Delete a peer from peer list.

\textbf{Parameters} peer_addr -- peer MAC address

\textbf{Returns}
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

\texttt{esp_err_t esp_now_mod_peer} (const \texttt{esp_now_peer_info_t} *peer)
Modify a peer.

\textbf{Parameters} peer -- peer information

\textbf{Returns}
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_FULL: peer list is full

\texttt{esp_err_t esp_wifi_config_espnow_rate} (wifi_interface_t ifx, wifi_phy_rate_t rate)
Config ESPNOW rate of specified interface.

\textit{Deprecated:}
please use \texttt{esp_now_set_peer_rate_config()} instead.

\textbf{Attention} 1. This API should be called after \texttt{esp_wifi_start()}. 
\textbf{Attention} 2. This API only work when not use Wi-Fi 6 and \texttt{esp_now_set_peer_rate_config()} not called.

\textbf{Parameters}
• ifx -- Interface to be configured.
• rate -- Phy rate to be configured.

\textbf{Returns}
• ESP_OK: succeed
• others: failed
**esp_err_t esp_now_set_peer_rate_config** (const uint8_t *peer_addr, esp_now_rate_config_t *config)

Set ESPNOW rate config for each peer.

**Attention** 1. This API should be called after esp_wifi_start() and esp_now_init().

**Parameters**
- **peer_addr** -- peer MAC address
- **config** -- rate config to be configured.

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_INTERNAL: internal error

**esp_err_t esp_now_get_peer** (const uint8_t *peer_addr, esp_now_peer_info_t *peer)

Get a peer whose MAC address matches peer_addr from peer list.

**Parameters**
- **peer_addr** -- peer MAC address
- **peer** -- peer information

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**esp_err_t esp_now_fetch_peer** (bool from_head, esp_now_peer_info_t *peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**
- **from_head** -- fetch from head of list or not
- **peer** -- peer information

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

**bool esp_now_is_peer_exist** (const uint8_t *peer_addr)

Peer exists or not.

**Parameters** **peer_addr** -- peer MAC address

**Returns**
- true: peer exists
- false: peer not exists

**esp_err_t esp_now_get_peer_num** (esp_now_peer_num_t *num)

Get the number of peers.

**Parameters** **num** -- number of peers

**Returns**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

**esp_err_t esp_now_set_pmk** (const uint8_t *pmk)

Set the primary master key.
**Attention** 1. primary master key is used to encrypt local master key

**Parameters** pmk -- primary master key

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

```c
esp_err_t esp_now_set_wake_window(uint16_t window)
```
Set wake window for esp_now to wake up in interval unit.

**Attention** 1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

**Attention** 2. Default value is the maximum.

**Parameters** window -- Milliseconds would the chip keep waked each interval, from 0 to 65535.

**Returns**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

**Structures**

```c
struct esp_now_peer_info
```
ESPNOW peer information parameters.

**Public Members**

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
```
ESPNOW peer MAC address that is also the MAC address of station or softap

```c
uint8_t lmk[ESP_NOW_KEY_LEN]
```
ESPNOW peer local master key that is used to encrypt data

```c
uint8_t channel
```
Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

```c
wifi_interface_t ifidx
```
Wi-Fi interface that peer uses to send/receive ESPNOW data

```c
bool encrypt
```
ESPNOW data that this peer sends/receives is encrypted or not

```c
void *priv
```
ESPNOW peer private data

```c
struct esp_now_peer_num
```
Number of ESPNOW peers which exist currently.
Chapter 2. API Reference

Public Members

```c
int total_num
    Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM
```

```c
int encrypt_num
    Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
```

```c
struct esp_now_recv_info
    ESPNOW packet information.
```

Public Members

```c
uint8_t *src_addr
    Source address of ESPNOW packet
```

```c
uint8_t *des_addr
    Destination address of ESPNOW packet
```

```c
wifi_pkt_rx_ctrl_t *rx_ctrl
    Rx control info of ESPNOW packet
```

```c
struct esp_now_rate_config
    ESPNOW rate config.
```

Public Members

```c
wifi_phy_mode_t phymode
    ESPNOW phymode of specified interface
```

```c
wifi_phy_rate_t rate
    ESPNOW rate of specified interface
```

```c
bool ersu
    ESPNOW using ersu send frame
```

```c
bool dcm
    ESPNOW using dcm rate to send frame
```

Macros

```c
ESP_ERR_ESPNOW_BASE
    ESPNOW error number base.
```

```c
ESP_ERR_ESPNOW_NOT_INIT
    ESPNOW is not initialized.
```
Chapter 2. API Reference

ESP_ERR_ESPNOW_ARG
Invalid argument

ESP_ERR_ESPNOW_NO_MEM
Out of memory

ESP_ERR_ESPNOW_FULL
ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
Internal error

ESP_ERR_ESPNOW_EXIST
ESPNOW peer has existed

ESP_ERR_ESPNOW_IF
Interface error

ESP_ERR_ESPNOW_CHAN
Channel error

ESP_NOW_ETH_ALEN
Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN
Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.

typedef struct esp_now_recv_info esp_now_recv_info_t
ESPNOW packet information.
typedef struct esp_now_rate_config esp_now_rate_config_t
ESP_NOW rate config.

typedef void (*esp_now_recv_cb_t)(const esp_now_recv_info_t *esp_now_info, const uint8_t *data, int data_len)
Callback function of receiving ESP_NOW data.

Attention esp_now_info is a local variable, it can only be used in the callback.

Param esp_now_info received ESP_NOW packet information
Param data received data
Param data_len length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
Callback function of sending ESP_NOW data.

Param mac_addr peer MAC address
Param status status of sending ESP_NOW data (succeed or fail)

Enumerations
enum esp_now_send_status_t
Status of sending ESP_NOW data.

Values:

enumerator ESP_NOW_SEND_SUCCESS
Send ESP_NOW data successfully

enumerator ESP_NOW_SEND_FAIL
Send ESP_NOW data fail

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. ESP-WIFI-MESH Programming Model
2. Writing an ESP-WIFI-MESH Application
3. Self-Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-WIFI-MESH protocol, please see the ESP-WIFI-MESH API Guide. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

ESP-WIFI-MESH Programming Model

Software Stack The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e., the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.
An application interfaces with ESP-WIFI-MESH via ESP-WIFI-MESH Events. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the Wi-Fi Event Task. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The mesh_event_id_t defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a Mesh Events handler via esp_event_handler_register() to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as MESH_EVENT_PARENT_CONNECTED and MESH_EVENT_CHILD_CONNECTED to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, IP_EVENT_STA_GOT_IP and IP_EVENT_STA_LOST_IP can be used to indicate when the root node can and cannot transmit data to the external IP network.

Warning: When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH's self-organizing behavior. Therefore, users should not call Wi-Fi APIs after esp_mesh_start() is called, and before esp_mesh_stop() is called.

LwIP & ESP-WIFI-MESH The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.
Chapter 2. API Reference

Each node that could become root is required to initialize LwIP by calling \texttt{esp_netif_init()}. In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using \texttt{esp_netif APIs}.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application**  The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
ESP_ERROR_CHECK(esp_netif_init());
/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());
/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_,
  →event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

**Initialize Mesh**  The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_,
  →event_handler, NULL));
```

**Configuring an ESP-WIFI-MESH Network**  ESP-WIFI-MESH is configured via \texttt{esp_mesh_set_config()} which receives its arguments using the \texttt{mesh_cfg_t} structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see \texttt{mesh_addr_t}</td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see \texttt{mesh_router_t}</td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see \texttt{mesh_ap_cfg_t}</td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see \texttt{mesh_crypto_funcs_t}</td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
```

(continues on next page)
Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self-Organized Networking  Self-organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self-organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self-organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self-organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self-Organized Networking  Self-organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self-organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self-organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self-organized networking.

Disabling Self-Organized Networking  The following code snippet demonstrates how to disable self-organized networking.

```c
//Disable self-organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self-organized networking.

- If the node was previously connected to other nodes, it will remain connected.
• If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
• If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self-Organized Networking** ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when enabling self-organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self-organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
                |              | • Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             |              | • A root node already connected to router will stay connected.  
                |              | • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
                |              | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |              | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self-organized networking.

```c
//Enable self-organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self-organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```
Calling Wi-Fi API  There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self-organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self-organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-WIFI-MESH.

```c
//Disable self-organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self-organized networking if still connected
esp_mesh_set_self_organized(1, 0);

... 

//Re-enable self-organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self-organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Do not select new parent
esp_mesh_connect(); //Manually reconnect to router
```

Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example  demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example  demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h

This header file can be included with:

```c
#include "esp_mesh.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES esp_wifi
```

or
Functions

**esp_err_t esp_mesh_init**(void)
Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_deinit**(void)
Mesh de-initialization.

- Release resources and stop the mesh

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_start**(void)
Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

**esp_err_t esp_mesh_stop**(void)
Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
• Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
• Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Returns**

- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)
```

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**Parameters**

- **to** -- [in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** -- [in] pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** -- [in] bitmap for data sent
  - Speed up the route search
    - If the packet is to the root and "to" parameter is NULL, set this parameter to 0.
    - If the packet is to an internal device, MESH_DATA_P2P should be set.
    - If the packet is to the root ("to" parameter isn't NULL) or to external IP network, MESH_DATA_TODS should be set.
    - If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
    - Specify whether this API is block or non-block, block by default
      - If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
    - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn't read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- **opt** -- [in] options
  - In case of sending a packet to a certain group, MESH_OPT_SENDGROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **opt_count** -- [in] option count
Currently, this API only takes one option, so opt_count is only supported to be 1.

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_send_block_time (uint32_t time_ms)
```

Set blocking time of esp_mesh_send()

**Attention**  This API shall be called before mesh is started.

**Parameters**
- `time_ms` -- [in] blocking time of esp_mesh_send(), unit: ms

**Returns**
- ESP_OK

```c
esp_err_t esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention**  Mesh RX queue should be checked regularly to avoid running out of memory.
- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Parameters**
- `from` -- [out] the address of the original source of the packet
- `data` -- [out] pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- `timeout_ms` -- [in] wait time if a packet isn't immediately available (0: no wait, port-MAX_DELAY: wait forever)
- `flag` -- [out] bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network
- `opt` -- [out] options desired to receive
  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- `opt_count` -- [in] option count desired to receive
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
**esp_err_t esp_mesh_recv_toDS (mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)**

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network.
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

Flag could be MESH_DATA_TODS.

**Attention** This API is only called by the root.

**Parameters**
- `from` -- [out] the address of the original source of the packet
- `to` -- [out] the address contains remote IP address and port (IPv4:PORT)
- `data` -- [out] pointer to the received packet
- `timeout_ms` -- [in] wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
- `flag` -- [out] bitmap for data received
- `opt` -- [out] options desired to receive
- `opt_count` -- [in] option count desired to receive

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

**esp_err_t esp_mesh_set_config (const mesh_cfg_t *config)**

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with
same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Parameters**
- `config` -- [in] pointer to mesh stack configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

**Parameters**
- `config` -- [out] pointer to mesh stack configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```
Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Parameters**
- `router` -- [in] pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```
Get router configuration.

**Parameters**
- `router` -- [out] pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Parameters**
- `id` -- [in] pointer to mesh network ID

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```
Get mesh network ID.

**Parameters**
- `id` -- [out] pointer to mesh network ID

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
### esp_err_t esp_mesh_set_type (mesh_type_t type)

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Parameters**
- `type` -- [in] device type

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

### mesh_type_t esp_mesh_get_type (void)

Get device type over mesh network.

**Attention**
This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns**
- mesh type

### esp_err_t esp_mesh_set_max_layer (int max_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention**
This API shall be called before mesh is started.

**Parameters**
- `max_layer` -- [in] max layer value

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

### int esp_mesh_get_max_layer (void)

Get max layer value.

**Returns**
- max layer value

### esp_err_t esp_mesh_set_ap_password (const uint8_t *pwd, int len)

Set mesh softAP password.

**Attention**
This API shall be called before mesh is started.

**Parameters**
- `pwd` -- [in] pointer to the password
- `len` -- [in] password length

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED
**esp_err_t esp_mesh_set_ap_authmode (wifi_auth_mode_t authmode)**

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters** authmode -- [in] authentication mode

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**wifi_auth_mode_t esp_mesh_get_ap_authmode (void)**

Get mesh softAP authentication mode.

**Returns** authentication mode

**esp_err_t esp_mesh_set_ap_connections (int connections)**

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** connections -- [in] the number of max connections

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**int esp_mesh_get_ap_connections (void)**

Get mesh max connection configuration.

**Returns** the number of mesh max connections

**int esp_mesh_get_non_mesh_connections (void)**

Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

**int esp_mesh_get_layer (void)**

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns** layer value

**esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)**

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Parameters** bssid -- [out] pointer to parent BSSID

**Returns**
• ESP_OK
• ESP_FAIL

bool esp_mesh_is_root (void)
Return whether the device is the root node of the network.

Returns true/false

esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)
Enable/disable self-organized networking.

• Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
• Self-organized networking is enabled by default.
• If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

Attention This API is used to dynamically modify whether to enable the self organizing.

Parameters
• enable -- [in] enable or disable self-organized networking
• select_parent -- [in] Only valid when self-organized networking is enabled.
  – if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

Returns
• ESP_OK
• ESP_FAIL

bool esp_mesh_get_self_organized (void)
Return whether enable self-organized networking or not.

Returns true/false

esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

• A device is elected root primarily based on RSSI from the external router.
• If external router conditions change, users can call this API to perform a root switch.
• In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
• If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
• After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Parameters
• vote -- [in] vote configuration
  – If this parameter is set NULL, the vote will perform the default 15 times.
  – Field percentage threshold is 0.9 by default.
  – Field is_rc_specified shall be false.
  – Field attempts shall be at least 15 times.
• reason -- [in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

Returns
• ESP_OK
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_DISCARD
• ESP_FAIL

`esp_err_t esp_mesh_set_vote_percentage(float percentage)`
Set vote percentage threshold for approval of being a root (default: 0.9)

• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Parameters**
- `percentage` -- [in] vote percentage threshold

**Returns**
- ESP_OK
- ESP_FAIL

`float esp_mesh_get_vote_percentage(void)`
Get vote percentage threshold for approval of being a root.

**Returns**
- percentage threshold

`esp_err_t esp_mesh_set_ap_assoc_expire(int seconds)`
Set mesh softAP associate expired time (default: 10 seconds)

• If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters**
- `seconds` -- [in] the expired time

**Returns**
- ESP_OK
- ESP_FAIL

`int esp_mesh_get_ap_assoc_expire(void)`
Get mesh softAP associate expired time.

**Returns**
- seconds

`int esp_mesh_get_total_node_num(void)`
Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Returns**
- total number of devices (including the root)

`int esp_mesh_get_routing_table_size(void)`
Get the number of devices in this device's sub-network (including self)

**Returns**
- the number of devices over this device's sub-network (including self)
esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)

Get routing table of this device's sub-network (including itself)

Parameters
• mac -- [out] pointer to routing table
• len -- [in] routing table size(in bytes)
• size -- [out] pointer to the number of devices in routing table (including itself)

Returns
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

esp_err_t esp_mesh_post_toDS_state (bool reachable)

Post the toDS state to the mesh stack.

Attention This API is only for the root.

Parameters reachable -- [in] this state represents whether the root is able to access external IP network

Returns
• ESP_OK
• ESP_FAIL

esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Parameters pending -- [out] pointer to the TX pending

Returns
• ESP_OK
• ESP_FAIL

esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)

Return the number of packets available in the queue waiting to be received by applications.

Parameters pending -- [out] pointer to the RX pending

Returns
• ESP_OK
• ESP_FAIL

int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)

Return the number of packets could be accepted from the specified address.

Parameters
• addr -- [in] self address or an associate children address
• xseqno_in -- [out] sequence number of the last received packet from the specified address

Returns the number of upQ for a certain address

esp_err_t esp_mesh_set_xon_qsize (int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is: 
wnd = xon_qsize / (2 * max_connection + 1). However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

Attention This API shall be called before mesh is started.

Parameters qsize -- [in] default:32 (min:16)

Returns
• ESP_OK
• ESP_FAIL
int esp_mesh_get_xon_qsize (void)
Get queue size.

**Returns**  the number of queue

esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
Set whether allow more than one root existing in one network.

**Parameters**  allowed -- [in] allow or not

**Returns**
- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

bool esp_mesh_is_root_conflicts_allowed (void)
Check whether allow more than one root to exist in one network.

**Returns**  true/false

esp_err_t esp_mesh_set_group_id (const mesh_addr_t *addr, int num)
Set group ID addresses.

**Parameters**
- addr -- [in] pointer to new group ID addresses
- num -- [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t esp_mesh_delete_group_id (const mesh_addr_t *addr, int num)
Delete group ID addresses.

**Parameters**
- addr -- [in] pointer to deleted group ID address
- num -- [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

int esp_mesh_get_group_num (void)
Get the number of group ID addresses.

**Returns**  the number of group ID addresses

esp_err_t esp_mesh_get_group_list (mesh_addr_t *addr, int num)
Get group ID addresses.

**Parameters**
- addr -- [out] pointer to group ID addresses
- num -- [in] the number of group ID addresses

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

bool esp_mesh_is_my_group (const mesh_addr_t *addr)
Check whether the specified group address is my group.

**Returns**  true/false

esp_err_t esp_mesh_set_capacity_num (int num)
Set mesh network capacity (max:1000, default:300)

**Attention**  This API shall be called before mesh is started.
Parameters num -- [in] mesh network capacity

Returns
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

int esp_mesh_get_capacity_num (void)
Get mesh network capacity.

Returns mesh network capacity

esp_err_t esp_mesh_set_ie_crypto_funcs (const mesh_crypto_funcs_t *crypto_funcs)
Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is configured.

Parameters crypto_funcs -- [in] crypto functions for mesh IE
- If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

Returns
- ESP_OK

esp_err_t esp_mesh_set_ie_crypto_key (const char *key, int len)
Set mesh IE crypto key.

Attention This API can be called at any time after mesh is configured.

Parameters
- key -- [in] ASCII crypto key
- len -- [in] length in bytes, range:8~64

Returns
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t esp_mesh_get_ie_crypto_key (char *key, int len)
Get mesh IE crypto key.

Parameters
- key -- [out] ASCII crypto key
- len -- [in] length in bytes, range:8~64

Returns
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)
Set delay time before starting root healing.

Parameters delay_ms -- [in] delay time in milliseconds

Returns
- ESP_OK

int esp_mesh_get_root_healing_delay (void)
Get delay time before network starts root healing.

Returns delay time in milliseconds

esp_err_t esp_mesh_fix_root (bool enable)
Enable network Fixed Root Setting.
• Enabling fixed root disables automatic election of the root node via voting.
• All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
• If Fixed Root is enabled, users should make sure a root node is designated for the network.

Parameters enable -- [in] enable or not

Returns
• ESP_OK

bool esp_mesh_is_root_fixed(void)
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the "flag" value in parent networking IE.

Returns true/false

esp_err_t esp_mesh_set_parent(const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Parameters
• parent -- [in] parent configuration, the SSID and the channel of the parent are mandatory.
  – If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
• parent_mesh_id -- [in] parent mesh ID,
  – If this value is not set, the original mesh ID is used.
• my_type -- [in] mesh type
  – MESH_STA is not supported.
  – If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
• my_layer -- [in] mesh layer
  – my_layer of the device may change after joining the network.
  – If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  – If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

Returns
• ESP_OK
• ESP_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_CONFIG

esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)
Get mesh networking IE length of one AP.

Parameters len -- [out] mesh networking IE length

Returns
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_INVALID_ARG
• ESP_ERR_WIFI_FAIL
### esp_err_t esp_mesh_scan_get_ap_record(wifi_ap_record_t *ap_record, void *buffer)

Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See "manual_networking" example.

**Parameters**
- **ap_record** -- [out] pointer to one AP record
- **buffer** -- [out] pointer to the mesh networking IE of this AP

**Returns**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG
- ESP_ERR_WIFI_FAIL

### esp_err_t esp_mesh_flush_upstream_packets(void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Returns**
- ESP_OK

### esp_err_t esp_mesh_get_subnet_nodes_num(const mesh_addr_t *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

**Parameters**
- **child_mac** -- [in] an associated child address of this device
- **nodes_num** -- [out] pointer to the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

### esp_err_t esp_mesh_get_subnet_nodes_list(const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

**Parameters**
- **child_mac** -- [in] an associated child address of this device
- **nodes** -- [out] pointer to nodes in the subnet of a specific child
- **nodes_num** -- [in] the number of nodes in the subnet of a specific child

**Returns**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

### esp_err_t esp_mesh_disconnect(void)

Disconnect from current parent.

**Returns**
- ESP_OK

### esp_err_t esp_mesh_connect(void)

Connect to current parent.

**Returns**
- ESP_OK

### esp_err_t esp_mesh_flush_scan_result(void)

Flush scan result.

**Returns**
• ESP_OK

**esp_err_t esp_mesh_switch_channel** (const uint8_t *new_bssid, int csa_newchan, int csa_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

• Set the new channel
• Set how many beacons with CSA IE will be sent before changing a new channel
• Enable the channel switch function

**Attention**  This API is only called by the root.

**Parameters**

- **new_bssid** -- [in] the new router BSSID if the router changes
- **csa_newchan** -- [in] the new channel number to which the whole network is moving
- **csa_count** -- [in] channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**

• ESP_OK

**esp_err_t esp_mesh_get_router_bssid** (uint8_t *router_bssid)

Get the router BSSID.

**Parameters**

- **router_bssid** -- [out] pointer to the router BSSID

**Returns**

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_INVALID_ARG

**int64_t esp_mesh_get_tsf_time** (void)

Get the TSF time.

**Returns** the TSF time

**esp_err_t esp_mesh_set_topology** (**esp_mesh_topology_t** topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

• MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Parameters**

- **topo** -- [in] MESH_TOPO_TREE or MESH_TOPO_CHAIN

**Returns**

• ESP_OK
• ESP_MESH_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

**esp_mesh_topology_t esp_mesh_get_topology** (void)

Get mesh topology.

**Returns** MESH_TOPO_TREE or MESH_TOPO_CHAIN

**esp_err_t esp_mesh_enable_ps** (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.
Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

**esp_err_t esp_mesh_disable_ps (void)**

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

**bool esp_mesh_is_ps_enabled (void)**

Check whether the mesh Power Save function is enabled.

**Returns** true/false

**bool esp_mesh_is_device_active (void)**

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

**Returns** true/false

**esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)**

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PSDEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

**Attention** This API can be called at any time after mesh is started.

**Parameters**

- **dev_duty** -- [in] device duty cycle
- **dev_duty_type** -- [in] device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

**Returns**

- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)**

Get device duty cycle and type.

**Parameters**
# API Reference

## Chapter 2

- **dev_duty** -- [out] device duty cycle
- **dev_duty_type** -- [out] device PS duty cycle type

### Returns
- ESP_OK

### esp_err_t esp_mesh_set_network_duty_cycle(int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1) nwk_duty shall be set to the same value for all devices; (2) duration_mins shall be set to (-1); (3) applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

### Parameters
- **nwk_duty** -- [in] network duty cycle
- **duration_mins** -- [in] duration (unit: minutes)
- **applied_rule** -- [in] only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

### Returns
- ESP_OK
- ESP_FAIL

### esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)

Get the network duty cycle, duration, type and rule.

### Parameters
- **nwk_duty** -- [out] current network duty cycle
- **duration_mins** -- [out] the duration of current nwk_duty
- **dev_duty_type** -- [out] if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- **applied_rule** -- [out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

### Returns
- ESP_OK
int esp_mesh_get_running_active_duty_cycle (void)
Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev.duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Returns the running active duty cycle

esp_err_t esp_mesh_ps_duty_signaling (int fwd_times)
Duty signaling.

Parameters fwd_times -- [in] the times of forwarding duty signaling packets

Returns
- ESP_OK

Unions

    layer change

mesh_event_toDS_state_t toDS_state
    toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
    vote started

mesh_event_root_address_t root_addr
    root address

mesh_event_root_switch_req_t switch_req
    root switch request

mesh_event_root_conflict_t root_conflict
    other powerful root

mesh_event_root_fixed_t root_fixed
    fixed root

mesh_event_scan_done_t scan_done
    scan done

mesh_event_network_state_t network_state
    network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
    network found that can join

mesh_event_router_switch_t router_switch
    new router information

mesh_event_ps_duty_t ps_duty
    PS duty information
union mesh_rc_config_t
   #include <esp_mesh.h> Vote address configuration.

   Public Members

   int attempts
       max vote attempts before a new root is elected automatically by mesh network. (min:15, by default)

   mesh_addr_t rc_addr
       a new root address specified by users for API esp_mesh_waive_root()

Structures

struct mip_t
   IP address and port.

   Public Members

   exp_ip4_addr_t ip4
       IP address

   uint16_t port
       port

struct mesh_event_channel_switch_t
   Channel switch information.

   Public Members

   uint8_t channel
       new channel

struct mesh_event_connected_t
   Parent connected information.

   Public Members

   wifi_event_sta_connected_t connected
       parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

   uint16_t self_layer
       layer

   uint8_t duty
       parent duty
struct **mesh_event_no_parent_found_t**
No parent found information.

**Public Members**

int **scan_times**
scan times being through

struct **mesh_event_layer_change_t**
Layer change information.

**Public Members**

uint16_t **new_layer**
new layer

struct **mesh_event_vote_started_t**
vote started information

**Public Members**

int **reason**
vote reason, vote could be initiated by children or by the root itself

int **attempts**
max vote attempts before stopped

**mesh_addr_t** **rc_addr**
root address specified by users via API esp_mesh_waive_root()

struct **mesh_event_find_network_t**
find a mesh network that this device can join

**Public Members**

uint8_t **channel**
channel number of the new found network

uint8_t **router_bssid[6]**
router BSSID

struct **mesh_event_root_switch_req_t**
Root switch request information.

**Public Members**

```c
int reason

root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()
```

```c
mesh_addr_t rc_addr

the address of root switch requester
```

```c
struct mesh_event_root_conflict_t

Other powerful root address.
```

**Public Members**

```c
int8_t rssi

rssi with router
```

```c
uint16_t capacity

the number of devices in current network
```

```c
uint8_t addr[6]

other powerful root address
```

```c
struct mesh_event_routing_table_change_t

Routing table change.
```

**Public Members**

```c
uint16_t rt_size_new

the new value
```

```c
uint16_t rt_size_change

the changed value
```

```c
struct mesh_event_root_fixed_t

Root fixed.
```

**Public Members**

```c
bool is_fixed

status
```

```c
struct mesh_event_scan_done_t

Scan done event information.
```
Public Members

```c
uint8_t number
the number of APs scanned
```

```c
struct mesh_event_network_state_t
Network state information.
```

Public Members

```c
bool is_rootless
whether current mesh network has a root
```

```c
struct mesh_event_ps_duty_t
PS duty information.
```

Public Members

```c
uint8_t duty
parent or child duty
```

```c
mesh_event_child_connected_t child_connected
child info
```

```c
struct mesh_opt_t
Mesh option.
```

Public Members

```c
uint8_t type
option type
uint16_t len
option length
uint8_t* val
option value
```

```c
struct mesh_data_t
Mesh data for esp_mesh_send() and esp_mesh_recv()
```

Public Members

```c
uint8_t* data
data
```
# Chapter 2. API Reference

```c
uint16_t size
    data size

mesh_proto_t proto
    data protocol

mesh_tos_t tos
    data type of service
```

**struct mesh_router_t**

Router configuration.

## Public Members

- `uint8_t ssid[32]`  
  SSID

- `uint8_t ssid_len`  
  length of SSID

- `uint8_t bssid[6]`  
  BSSID, if this value is specified, users should also specify "allow_router_switch".

- `uint8_t password[64]`  
  password

- `bool allow_router_switch`  
  if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after "fail" (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh_ap_cfg_t**

Mesh softAP configuration.

## Public Members

- `uint8_t password[64]`  
  mesh softAP password

- `uint8_t max_connection`  
  max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

- `uint8_t nonmesh_max_connection`  
  max non-mesh connections
struct **mesh_cfg_t**
Mesh initialization configuration.

**Public Members**

- **uint8_t channel**
  channel, the mesh network on

- **bool allow_channel_switch**
  if this value is set, when "fail" (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

- **mesh_addr_t mesh_id**
  mesh network identification

- **mesh_router_t router**
  router configuration

- **mesh_ap_cfg_t mesh_ap**
  mesh softAP configuration

- **const mesh_crypto_funcs_t *crypto_funcs**
  crypto functions

struct **mesh_vote_t**
Vote.

**Public Members**

- **float percentage**
  vote percentage threshold for approval of being a root

- **bool is_rc_specified**
  if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

- **mesh_rc_config_t config**
  vote address configuration

struct **mesh_tx_pending_t**
The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members**

- **int to_parent**
  to parent queue
Chapter 2. API Reference

```c
int to_parent_p2p
    to parent (P2P) queue

int to_child
    to child queue

int to_child_p2p
    to child (P2P) queue

int mgmt
    management queue

int broadcast
    broadcast and multicast queue

struct mesh_rx_pending_t
    The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
    to external DS

int toSelf
    to self

Macros

MESH_ROOT_LAYER
    root layer value

MESH_MTU
    max transmit unit(in bytes)

MESH_MPS
    max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START
    Mesh error code definition.
    Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
    mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
    mesh isn’t configured
```
ESP_ERR_MESH_NOT_START
mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
not supported yet

ESP_ERR_MESH_NOT_ALLOWED
operation is not allowed

ESP_ERR_MESH_NO_MEMORY
out of memory

ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED
disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
queue fail

ESP_ERR_MESHQUEUE_FULL
queue full

ESP_ERR_MESH_NO_PARENT_FOUND
no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option

ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error
ESP_ERR_MESH_DISCARD_DUPLICATE
  discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
  discard the packet

ESP_ERR_MESH_VOTING
  vote in progress

ESP_ERR_MESH_XMIT
  XMIT

ESP_ERR_MESH_QUEUE_READ
  error in reading queue

ESP_ERR_MESH_PS
  mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
  release esp_mesh_recv_toDS

MESH_DATA_ENC
  Flags bitmap for esp_mesh_send() and esp_mesh_recv()
  data encrypted (Unimplemented)

MESH_DATA_P2P
  point-to-point delivery over the mesh network

MESH_DATA_FROMDS
  receive from external IP network

MESH_DATA_TODS
  identify this packet is target to external IP network

MESH_DATA_NONBLOCK
  esp_mesh_send() non-block

MESH_DATA_DROP
  in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
  identify this packet is target to a group address

MESH_OPT_SEND_GROUP
  Option definitions for esp_mesh_send() and esp_mesh_recv()
  data transmission by group; used with esp_mesh_send() and shall have payload
**MESH_OPT_RECV_DS_ADDR**

return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

**MESH_ASSOC_FLAG_MAP_ASSOC**

Flag of mesh networking IE.

Mesh AP doesn’t detect children leave yet

**MESH_ASSOC_FLAG_VOTE_IN_PROGRESS**

station in vote, set when root vote start, clear when connect to router or when root switch

**MESH_ASSOC_FLAG_STA_VOTED**

station vote done, set when connect to router

**MESH_ASSOC_FLAG_NETWORK_FREE**

no root in current network

**MESH_ASSOC_FLAG_STA_VOTE_EXPIRE**

the voted address is expired, means the voted device lose the chance to be root

**MESH_ASSOC_FLAG_ROOTS_FOUND**

roots conflict is found, means that there are at least two roots in the mesh network

**MESH_ASSOC_FLAG_ROOT_FIXED**

the root is fixed in the mesh network

**MESH_PS_DEVICE_DUTY_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

**MESH_INIT_CONFIG_DEFAULT()**

**Type Definitions**

typedef mesh_addr_t mesh_event_root_address_t

Root address.
Chapter 2. API Reference

typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
    Parent disconnected information.

typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
    Child connected information.

typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
    Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
    New router information.

Enumerations

enum mesh_event_id_t
    Enumerated list of mesh event id.
    Values:

    enumerator MESH_EVENT_STARTED
        mesh is started

    enumerator MESH_EVENT_STOPPED
        mesh is stopped

    enumerator MESH_EVENT_CHANNEL_SWITCH
        channel switch

    enumerator MESH_EVENT_CHILD_CONNECTED
        a child is connected on softAP interface

    enumerator MESH_EVENT_CHILD_DISCONNECTED
        a child is disconnected on softAP interface

    enumerator MESH_EVENT_ROUTING_TABLE_ADD
        routing table is changed by adding newly joined children

    enumerator MESH_EVENT_ROUTING_TABLE_REMOVE
        routing table is changed by removing leave children

    enumerator MESH_EVENT_PARENT_CONNECTED
        parent is connected on station interface

    enumerator MESH_EVENT_PARENT_DISCONNECTED
        parent is disconnected on station interface

    enumerator MESH_EVENT_NO_PARENT_FOUND
        no parent found
enumerator **MESH_EVENT_LAYER_CHANGE**
    layer changes over the mesh network

enumerator **MESH_EVENT_TODS_STATE**
    state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with esp_mesh_post_toDS_state().

enumerator **MESH_EVENT_VOTE_STARTED**
    the process of voting a new root is started either by children or by the root

enumerator **MESH_EVENT_VOTE_STOPPED**
    the process of voting a new root is stopped

enumerator **MESH_EVENT_ROOT_ADDRESS**
    the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH_EVENT_ROOT_SWITCH_REQ**
    root switch request sent from a new voted root candidate

enumerator **MESH_EVENT_ROOT_SWITCH_ACK**
    root switch acknowledgment responds the above request sent from current root

enumerator **MESH_EVENT_ROOT_ASKED_YIELD**
    the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH_EVENT_ROOT_FIXED**
    when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**
    if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**
    network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**
    the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**
    when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**
    if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.
enumerator **MESH_EVENT_PS_PARENT_DUTY**
  parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**
  child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**
  device duty

enumerator **MESH_EVENT_MAX**

**enum mesh_type_t**

Device type.

*Values:*

enumerator **MESH_IDLE**
  hasn’t joined the mesh network yet

enumerator **MESH_ROOT**
  the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**
  intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**
  has no forwarding ability

enumerator **MESH_STA**
  connect to router with a standalone Wi-Fi station mode, no network expansion capability

**enum mesh_proto_t**

Protocol of transmitted application data.

*Values:*

enumerator **MESH_PROTO_BIN**
  binary

enumerator **MESH_PROTO_HTTP**
  HTTP protocol

enumerator **MESH_PROTO_JSON**
  JSON format

enumerator **MESH_PROTO_MQTT**
  MQTT protocol

enumerator **MESH_PROTO_AP**
  IP network mesh communication of node’s AP interface
enumerator MESH_PROTO_STA
   IP network mesh communication of node’s STA interface

enum mesh_tos_t
   For reliable transmission, mesh stack provides three type of services.
   Values:

   enumerator MESH_TOS_P2P
      provide P2P (point-to-point) retransmission on mesh stack by default

   enumerator MESH_TOS_E2E
      provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

   enumerator MESH_TOS_DEF
      no retransmission on mesh stack

enum mesh_vote_reason_t
   Vote reason.
   Values:

   enumerator MESH_VOTE_REASON_ROOT_INITIATED
      vote is initiated by the root

   enumerator MESH_VOTE_REASON_CHILD_INITIATED
      vote is initiated by children

enum mesh_disconnect_reason_t
   Mesh disconnect reason code.
   Values:

   enumerator MESH_REASON_CYCLIC
      cyclic is detected

   enumerator MESH_REASON_PARENT_IDLE
      parent is idle

   enumerator MESH_REASON_LEAF
      the connected device is changed to a leaf

   enumerator MESH_REASON_DIFF_ID
      in different mesh ID

   enumerator MESH_REASON_ROOTS
      root conflict is detected

   enumerator MESH_REASON_PARENT_STOPPED
      parent has stopped the mesh
enumerator **MESH_REASON_SCAN_FAIL**
    scan fail
enumerator **MESH_REASON_IE_UNKNOWN**
    unknown IE
enumerator **MESH_REASON_WAIVE_ROOT**
    waive root
enumerator **MESH_REASON_PARENT_WORSE**
    parent with very poor RSSI
enumerator **MESH_REASON_EMPTY_PASSWORD**
    use an empty password to connect to an encrypted parent
enumerator **MESH_REASON_PARENT_UNENCRYPTED**
    connect to an unencrypted parent/router

enum **esp_mesh_topology_t**
    Mesh topology.
    
    Values:

enumerator **MESH_TOPO_TREE**
    tree topology
enumerator **MESH_TOPO_CHAIN**
    chain topology

enum **mesh_event_toDS_state_t**
    The reachability of the root to a DS (distribut system)
    
    Values:

enumerator **MESH_TODS_UNREACHABLE**
    the root isn’t able to access external IP network
enumerator **MESH_TODS_REACHABLE**
    the root is able to access external IP network

**SmartConfig**

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile application to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C6 devices, check Provisioning API.
Application Example  Connect ESP32-C6 to the target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

- components/esp_wifi/include/esp_smartconfig.h
- This header file can be included with:

```c
#include "esp_smartconfig.h"
```
- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_wifi
```

or

```cmake
PRIV_REQUIRES esp_wifi
```

Functions

**const char* esp_smartconfig_get_version (void)**
Get the version of SmartConfig.

**Returns**
- SmartConfig version const char.

```c
esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
```
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.
**Attention** 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

**Parameters** config -- pointer to smartconfig start configure structure

**Returns**
- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_smartconfig_stop (void)
```
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

**Returns**
- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_esptouch_set_timeout (uint8_t time_s)
```
Set timeout of SmartConfig process.

**Attention** Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

**Parameters** time_s -- range 15s~255s, offset:45s.
Returns

- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_smartconfig_set_type (smartconfig_type_t type)
```
Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

**Parameters**

- **type** -- Choose from the `smartconfig_type_t`.

**Returns**

- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_smartconfig_fast_mode (bool enable)
```
Set mode of SmartConfig. default normal mode.

**Attention**

1. Please call it before API `esp_smartconfig_start`.
2. Fast mode have corresponding APP(phone).
3. Two mode is compatible.

**Parameters**

- **enable** -- false-disable(default); true-enable;

**Returns**

- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_smartconfig_get_rvd_data (uint8_t *rvd_data, uint8_t len)
```
Get reserved data of ESPTouch v2.

**Parameters**

- **rvd_data** -- reserved data
- **len** -- length of reserved data

**Returns**

- ESP_OK: succeed
- others: fail

**Structures**

```c
struct smartconfig_event_got_ssid_pswd_t
```
Argument structure for SC_EVENT_GOT_SSID_PSWD event

**Public Members**

```c
uint8_t ssid[32]
```
SSID of the AP. Null terminated string.

```c
uint8_t password[64]
```
Password of the AP. Null terminated string.

```c
bool bssid_set
```
whether set MAC address of target AP or not.
Chapter 2. API Reference

uint8_t bssid[6]
MAC address of target AP.

smartconfig_type_t type
Type of smartconfig (ESPTouch or AirKiss).

uint8_t token
Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
IP address of cellphone.

struct smartconfig_start_config_t
Configure structure for esp_smartconfig_start

Public Members

bool enable_log
Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
ESPTouch v2 crypt key, len should be 16.

Macros
SMARTCONFIG_START_CONFIG_DEFAULT()

Enumerations

class smartconfig_type_t

Values:

enumerator SC_TYPE_ESPTOUCH
protocol: ESPTouch

enumerator SC_TYPE_AIRKISS
protocol: AirKiss

enumerator SC_TYPE_ESPTOUCH_AIRKISS
protocol: ESPTouch and AirKiss

enumerator SC_TYPE_ESPTOUCH_V2
protocol: ESPTouch v2

enum smartconfig_event_t
Smartconfig event declarations

Values:
enumerator **SC_EVENT_SCAN_DONE**
Station smartconfig has finished to scan for APs

enumerator **SC_EVENT_FOUND_CHANNEL**
Station smartconfig has found the channel of the target AP

enumerator **SC_EVENT_GOT_SSID_PSWD**
Station smartconfig got the SSID and password

enumerator **SC_EVENT_SEND_ACK_DONE**
Station smartconfig has sent ACK to cellphone

**Wi-Fi**

**Introduction** The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C6 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-C6 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C6.
- Station/AP-coexistence mode (ESP32-C6 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples** Several application examples demonstrating the functionality of Wi-Fi library are provided in **wifi** directory of ESP-IDF repository. Please check the **README** for more details.

**API Reference**

**Header File**

- `components/esp_wifi/include/esp_wifi.h`
- This header file is included with:

  ```
  #include "esp_wifi.h"
  ```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_wifi
  ```

  or

  ```
  PRIV_REQUIRES esp_wifi
  ```

**Functions**

```
esp_err_t esp_wifi_init (const wifi_init_config_t *config)
```

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.
Attention 1. This API must be called before all other WiFi API can be called
Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Parameters config -- pointer to WiFi initialized configuration structure; can point to a temporary variable.

Returns
  • ESP_OK: succeed
  • ESP_ERR_NO_MEM: out of memory
  • others: refer to error code esp_err.h

esp_err_t esp_wifi_deinit (void)
Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Returns
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_set_mode (wifi_mode_t mode)
Set the WiFi operating mode.

  Set the WiFi operating mode as station, soft-AP, station+soft-AP or NAN.
The default mode is station mode.

Parameters mode -- WiFi operating mode

Returns
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_INVALID_ARG: invalid argument
  • others: refer to error code in esp_err.h

esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)
Get current operating mode of WiFi.

Parameters mode -- [out] store current WiFi mode

Returns
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_INVALID_ARG: invalid argument

esp_err_t esp_wifi_start (void)
Start WiFi according to current configuration If mode is WIFI_MODE_STA, it creates station control block and starts station If mode is WIFI_MODE_AP, it creates soft-AP control block and starts soft-AP If mode is WIFI_MODE_APSTA, it creates soft-AP and station control block and starts soft-AP and station If mode is WIFI_MODE_NAN, it creates NAN control block and starts NAN.

Returns
  • ESP_OK: succeed
  • ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
  • ESP_ERR_INVALID_ARG: invalid argument
  • ESP_ERR_NO_MEM: out of memory
  • ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
  • ESP_FAIL: other WiFi internal errors
esp_err_t esp_wifi_stop(void)

Stop WiFi. If mode is WIFI_MODE_STA, it stops station and frees station control block. If mode is WIFI_MODE_AP, it stops soft-AP and frees soft-AP control block. If mode is WIFI_MODE_APSTA, it stops station/soft-AP and frees station/soft-AP control block. If mode is WIFI_MODE_NAN, it stops NAN and frees NAN control block.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_restore(void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:
- esp_wifi_set_bandwidth
- esp_wifi_set_protocol
- esp_wifi_set_config
- esp_wifi_set_mode

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_connect(void)

Connect WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If station interface is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between device and the AP is established. If device is scanning and connecting at the same time, it will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE.
Attention 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the 'failure_retry_cnt' feature in the 'wifi_sta_config_t'. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode error
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

esp_err_t esp_wifi_disconnect(void)

Disconnect WiFi station from the AP.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

esp_err_t esp_wifi_clear_fast_connect(void)

Currently this API is just an stub API.

Returns
- ESP_OK: succeed
**Chapter 2. API Reference**

- others: fail

**esp_err_t esp_wifi_deauth_sta (uint16_t aid)**

deauthenticate all stations or associated id equals to aid

**Parameters**
- **aid** -- when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

**esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)**

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory. And then can be freed in esp_wifi_scan_get_ap_records(), esp_wifi_scan_get_ap_record() or esp_wifi_clear_ap_list(), so call any one to free the memory once the scan is done.

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Parameters**
- **config** -- configuration settings for scanning, if set to NULL default settings will be used of which default values are show_hidden:false, scan_type:active, scan_time:active.min:0, scan_time:active.max:120 miliseconds, scan_time:passive:360 miliseconds
- **block** -- if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

**esp_err_t esp_wifi_scan_stop (void)**

Stop the scan in process.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)**

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Parameters**
- **number** -- [out] store number of APs found in last scan

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
**esp_err_t esp_wifi_scan_get_ap_records** (uint16_t* number, wifi_ap_record_t* ap_records)

Get AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list.

**Parameters**
- **number** -- [inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** -- wifi_ap_record_t array to hold the found APs

**Returns**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_INVALID_ARG**: invalid argument
- **ESP_ERR_NO_MEM**: out of memory

**esp_err_t esp_wifi_scan_get_ap_record** (wifi_ap_record_t* ap_record)

Get one AP record from the scanned AP list.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one AP record from the scanned AP list each time. This API will free the memory of one AP record, if the user doesn’t get all records in the scanned AP list, then needs to call esp_wifi_clear_ap_list() to free the remaining memory.

**Parameters**
- **ap_record** -- [out] pointer to one AP record

**Returns**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_INVALID_ARG**: invalid argument
- **ESP_FAIL**: scan APs is NULL, means all AP records fetched or no AP found

**esp_err_t esp_wifi_clear_ap_list** (void)

Clear AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list. When the obtained AP list fails, AP records must be cleared, otherwise it may cause memory leakage.

**Returns**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_WIFI_MODE**: WiFi mode is wrong
- **ESP_ERR_INVALID_ARG**: invalid argument

**esp_err_t esp_wifi_sta_get_ap_info** (wifi_ap_record_t* ap_info)

Get information of AP to which the device is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information.

**Parameters**
- **ap_info** -- the wifi_ap_record_t to hold AP information. sta can get the connected ap's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_Ir in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode
**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don't initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

```c
esp_err_t esp_wifi_set_ps(wifi_ps_type_t type)
```
Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters**
- **type** -- power save type

**Returns**
- ESP_OK: succeed

```c
esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)
```
Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters**
- **type** -- [out] store current power save type

**Returns**
- ESP_OK: succeed

```c
esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)
```
Set protocol type of specified interface. The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N).
If CONFIG_SOC_WIFI_HE_SUPPORT, the default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N|WIFI_PROTOCOL_11AX).

**Attention** Support 802.11b or 802.11bg or 802.11bgn or 802.11bgnx or LR mode

**Parameters**
- **ifx** -- interfaces
- **protocol_bitmap** -- WiFi protocol bitmap

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t *protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

**Parameters**
- **ifx** -- interface
- **protocol_bitmap** -- [out] store current WiFi protocol bitmap of interface ifx

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of specified interface.

**Attention**
1. API return false if try to configure an interface that is not enabled
2. WIFI_BW_HT40 is supported only when the interface support 11N
Parameters
- `ifx` -- interface to be configured
- `bw` -- bandwidth

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in `esp_err.h`

```c
esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t *bw)
```
Get the bandwidth of specified interface.

Attention 1. API return false if try to get a interface that is not enable

Parameters
- `ifx` -- interface to be configured
- `bw` -- [out] store bandwidth of interface `ifx`

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_channel(uint8_t primary, wifi_second_chan_t second)
```
Set primary/secondary channel of device.

Attention 1. This API should be called after `esp_wifi_start()` and before `esp_wifi_stop()`
Attention 2. When device is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
Attention 3. When device is in softAP mode, this API should not be called when softAP has connected to external STAs
Attention 4. When device is in STA+softAP mode, this API should not be called when in the scenarios described above
Attention 5. The channel info set by this API will not be stored in NVS. So If you want to remeber the channel used before `wifi stop`, you need to call this API again after `wifi start`, or you can call `esp_wifi_set_config()` to store the channel info in NVS.

Parameters
- `primary` -- for HT20, primary is the channel number, for HT40, primary is the primary channel
- `second` -- for HT20, second is ignored, for HT40, second is the second channel

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`

```c
esp_err_t esp_wifi_get_channel(uint8_t *primary, wifi_second_chan_t *second)
```
Get the primary/secondary channel of device.

Attention 1. API return false if try to get a interface that is not enable
Parameters

• primary -- store current primary channel
• second -- [out] store current second channel

Returns

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

\[
\text{esp_err_t esp_wifi_set_country}(\text{const wifi_country_t *country})
\]

configure country info

Attention 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

Attention 2. The default country is "01" (world safe mode) \{.cc="01", .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO\}.

Attention 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as '.'.

Attention 4. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is \{.cc="US", .schan=1, .nchan=11\} and the country info of the AP to which the station is connected is \{.cc="JP", .schan=1, .nchan=14\} then the country info that will be used is \{.cc="JP", .schan=1, .nchan=14\}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, \{.cc="US", .schan=1, .nchan=11\} in the example.

Attention 5. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

Attention 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 7. The country configuration is stored into flash.

Attention 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Parameters country -- the configured country info

Returns

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

\[
\text{esp_err_t esp_wifi_get_country}(\text{wifi_country_t *country})
\]

get the current country info

Parameters country -- country info

Returns

• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

\[
\text{esp_err_t esp_wifi_set_mac}(\text{wifi_interface_t ifx, const uint8_t mac[6]})
\]

Set MAC address of WiFi station, soft-AP or NAN interface.

Attention 1. This API can only be called when the interface is disabled

Attention 2. Above mentioned interfaces have different MAC addresses, do not set them to be the same.

Attention 3. The bit 0 of the first byte of MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

Parameters

• ifx -- interface
Chapter 2. API Reference

- `mac` -- the MAC address

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_WIFI_MAC`: invalid mac address
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- others: refer to error codes in `esp_err.h`

```c
esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])
```
Get mac of specified interface.

**Parameters**
- `ifx` -- interface
- `mac` -- [out] store mac of the interface ifx

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb(wifi_promiscuous_cb_t cb)
```
Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters**
- `cb` -- callback

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

```c
esp_err_t esp_wifi_set_promiscuous(bool en)
```
Enable the promiscuous mode.

**Parameters**
- `en` -- false - disable, true - enable

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

```c
esp_err_t esp_wifi_get_promiscuous(bool *en)
```
Get the promiscuous mode.

**Parameters**
- `en` -- [out] store the current status of promiscuous mode

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

```c
esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)
```
Enable the promiscuous mode packet type filter.

**Parameters**
- `filter` -- the packet type filtered in promiscuous mode.

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

---

**Note:** The default filter is to filter all packets except WIFI_PKT_MISC
esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)
Get the promiscuous filter.

Parameters filter -- [out] store the current status of promiscuous filter

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter)
Enable subtype filter of the control packet in promiscuous mode.

Note: The default filter is to filter none control packet.

Parameters filter -- the subtype of the control packet filtered in promiscuous mode.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_get_promiscuous_ctrl_filter (wifi_promiscuous_filter_t *filter)
Get the subtype filter of the control packet in promiscuous mode.

Parameters filter -- [out] store the current status of subtype filter of the control packet in promiscuous mode

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

esp_err_t esp_wifi_set_config (wifi_interface_t interface, wifi_config_t *conf)
Set the configuration of the STA, AP or NAN.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail
Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
Attention 3. ESP devices are limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the station.
Attention 4. The configuration will be stored in NVS for station and soft-AP

Parameters
• interface -- interface
• conf -- station, soft-AP or NAN configuration

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_WIFI_MODE: invalid mode
• ESP_ERR_WIFI_PASSWORD: invalid password
• ESP_ERR_WIFI_NVS: WiFi internal NVS error
• others: refer to the error code in esp_err.h

esp_err_t esp_wifi_get_config (wifi_interface_t interface, wifi_config_t *conf)
Get configuration of specified interface.

Parameters
• interface -- interface
Chapter 2. API Reference

- **conf** -- [out] station or soft-AP configuration

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

```c
esp_err_t esp_wifi_ap_get_sta_list ( wifi_sta_list_t *sta )
```

Get STAs associated with soft-AP.

**Attention**  SSC only API

**Parameters**
- **sta** -- [out] station list ap can get the connected sta's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_ap_get_sta_aid ( const uint8_t mac[6], uint16_t *aid )
```

Get AID of STA connected with soft-AP.

**Parameters**
- **mac** -- STA's mac address
- **aid** -- [out] Store the AID corresponding to STA mac

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_set_storage ( wifi_storage_t storage )
```

Set the WiFi API configuration storage type.

**Attention**  1. The default value is WIFI_STORAGE_FLASH

**Parameters**
- **storage** -- : storage type

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_vendor_ie ( bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie )
```

Set 802.11 Vendor-Specific Information Element.

**Parameters**
- **enable** -- If true, specified IE is enabled. If false, specified IE is removed.
- **type** -- Information Element type. Determines the frame type to associate with the IE.
- **idx** -- Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
Chapter 2. API Reference

- **vnd_ie** -- Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init()`
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```

Register Vendor-Specific Information Element monitoring callback.

**Parameters**
- `cb` -- Callback function
- `ctx` -- Context argument, passed to callback function.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```

Set maximum transmitting power after WiFi start.

**Attention**
1. Maximum power before wifi startup is limited by PHY init data bin.
2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.
3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.
4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19], 8}, {[20, 27], 20}, {[28, 33], 28}, {[34, 43], 34}, {[44, 51], 44}, {[52, 55], 52}, {[56, 59], 56}, {[60, 65], 60}, {[66, 71], 66}, {[72, 79], 72}, {[80, 84], 80}}.

**Parameters**
- `power` -- Maximum WiFi transmitting power.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is out of range

```c
esp_err_t esp_wifi_get_max_tx_power(int8_t *power)
```

Get maximum transmitting power after WiFi start.

**Parameters**
- `power` -- Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by `esp_wifi_start`
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_event_mask(uint32_t mask)
```

Set mask to enable or disable some WiFi events.

**Attention**
1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.
Parameters **mask** -- WiFi event mask.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_get_event_mask (uint32_t *mask)
```

Get mask of WiFi events.

Parameters **mask** -- WiFi event mask.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```

Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Parameters
- **ifx** -- interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer** -- raw ieee80211 buffer
- **len** -- the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq** -- indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_INVALID_ARG is returned.

Returns
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data.

| Each time a CSI data is received, the callback function will be called. |

Parameters
- **cb** -- callback
- **ctx** -- context argument, passed to callback function

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```

Set CSI data configuration.

```
return
```

---

Espressif Systems 774 Release v5.2.2

Submit Document Feedback
Chapter 2. API Reference

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters `config` -- configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```
Enable or disable CSI.

return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters `en` -- true - enable, false - disable

```c
esp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
```
Set antenna GPIO configuration.

Parameters `config` -- Antenna GPIO configuration.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL, invalid GPIO number etc

```c
esp_err_t esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)
```
Get current antenna GPIO configuration.

Parameters `config` -- Antenna GPIO configuration.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL

```c
esp_err_t esp_wifi_set_ant (const wifi_ant_config_t *config)
```
Set antenna configuration.

Parameters `config` -- Antenna configuration.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

```c
esp_err_t esp_wifi_get_ant (wifi_ant_config_t *config)
```
Get current antenna configuration.

Parameters `config` -- Antenna configuration.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL
int64_t esp_wifi_get_tsf_time (wifi_interface_t interface)
Get the TSF time. In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

Attention  Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Parameters  interface -- The interface whose tsf_time is to be retrieved.
Returns  0 or the TSF time

esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)
Set the inactive time of the STA or AP.

Attention  1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
Attention  2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
Attention  3. The inactive time configuration is not stored into flash

Parameters
• ifx -- interface to be configured.
• sec -- Inactive time. Unit seconds.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)
Get inactive time of specified interface.

Parameters
• ifx -- Interface to be configured.
• sec -- Inactive time. Unit seconds.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument

esp_err_t esp_wifi_stats_dump (uint32_t modules)
Dump WiFi statistics.

Parameters  modules -- statistic modules to be dumped
Returns
• ESP_OK: succeed
• others: failed

esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)
Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI_EVENT_STA_BSS_RSSI_LOW.

Attention  If the user wants to receive another WIFI_EVENT_STA_BSS_RSSI_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.
Chapter 2. API Reference

Parameters **rssi** -- threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)
```

Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** 1. Use this API only in Station mode.

**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

Parameters **cfg** -- FTM Initiator session configuration

Returns

- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_end_session(void)
```

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

Returns

- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_resp_set_offset(int16_t offset_cm)
```

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

Parameters **offset_cm** -- T1 Offset to be added in centimeters

Returns

- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_get_report(wifi_ftm_report_entry_t *report, uint8_t num_entries)
```

Get FTM measurements report copied into a user provided buffer.

**Attention** 1. To get the FTM report, user first needs to allocate a buffer of size (sizeof(wifi_ftm_report_entry_t) * num_entries) where the API will fill up to num_entries valid FTM measurements in the buffer. Total number of entries can be found in the event WIFI_EVENT_FTM_REPORT as ftm_report_num_entries

**Attention** 2. The internal FTM report is freed upon use of this API which means the API can only be used once after every FTM session initiated

**Attention** 3. Passing the buffer as NULL merely frees the FTM report

Parameters

- **report** -- Pointer to the buffer for receiving the FTM report
Chapter 2. API Reference

- **num_entries** -- Number of FTM report entries to be filled in the report

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)
```
Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.
**Attention** 2. Only when really need to disable 11b rate call this API otherwise don't call this.

**Parameters**
- `ifx` -- Interface to be configured.
- `disable` -- true means disable 11b rate while false means enable 11b rate.

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_connectionless_module_set_wake_interval(uint16_t wake_interval)
```
Set wake interval for connectionless modules to wake up periodically.

**Attention** 1. Only one wake interval for all connectionless modules.
**Attention** 2. This configuration could work at connected status. When `ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` is enabled, this configuration could work at disconnected status.
**Attention** 3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.
**Attention** 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)
**Attention** 5. Recommend to configure interval to ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE to get stable performance at coexistence mode.

**Parameters**
- `wake_interval` -- Milliseconds after would the chip wake up, from 1 to 65535.

```c
esp_err_t esp_wifi_force_wakeup_acquire(void)
```
Request extra reference of Wi-Fi radio. Wi-Fi keep active state (RF opened) to be able to receive packets.

**Attention** Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

```c
esp_err_t esp_wifi_force_wakeup_release(void)
```
Release extra reference of Wi-Fi radio. Wi-Fi go to sleep state (RF closed) if no more use of radio.

**Attention** Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_set_country_code**(const char* country, bool ieee80211d_enabled)
configure country

**Attention** 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used.
   E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
**Attention** 2. When ieee80211d_enabled is disabled, then the configured country info is used always.
**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
**Attention** 4. The country configuration is stored into flash.
**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
**Attention** 7. When country code "01" (world safe mode) is set, SoftAP mode won't contain country IE.
**Attention** 8. The default country is "01" (world safe mode) and ieee80211d_enabled is TRUE.
**Attention** 9. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ''.

**Parameters**
- country -- the configured country ISO code
- ieee80211d_enabled -- 802.11d is enabled or not

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_get_country_code**(char* country)
get the current country code

**Parameters**
country -- country code

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_config_80211_tx_rate**(wifi_interface_t ifx, wifi_phy_rate_t rate)
Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Parameters**
- ifx -- Interface to be configured.
- rate -- Phy rate to be configured.

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_disable_pmf_config**(wifi_interface_t ifx)
Disable PMF configuration for specified interface.
Attention  This API should be called after esp_wifi_set_config() and before esp_wifi_start().

**Parameters**  *ifx* -- Interface to be configured.

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_sta_get_aid(uint16_t* aid)
```
Get the Association id assigned to STA by AP.

**Attention**  aid = 0 if station is not connected to AP.

**Parameters**  *aid* -- [out] store the aid

**Returns**
- ESP_OK: succeed

```c
esp_err_t esp_wifi_sta_get_negotiated_phymode(wifi_phy_mode_t* phymode)
```
Get the negotiated phymode after connection.

**Parameters**  *phymode* -- [out] store the negotiated phymode.

**Returns**
- ESP_OK: succeed

```c
esp_err_t esp_wifi_set_dynamic_cs(bool enabled)
```
Config dynamic carrier sense.

**Attention**  This API should be called after esp_wifi_start().

**Parameters**  *enabled* -- Dynamic carrier sense is enabled or not.

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_sta_get_rssi(int* rssi)
```
Get the rssi information of AP to which the device is associated with.

**Attention**  1. This API should be called after station connected to AP.
               2. Use this API only in WIFI_MODE_STA or WIFI_MODE_APSTA mode.

**Parameters**  *rssi* -- store the rssi info received from last beacon.

**Returns**
- ESP_OK: succeed
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_FAIL: failed

**Structures**

```c
struct wifi_init_config_t
```
WiFi stack configuration parameters passed to esp_wifi_init call.

Type Definitions

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Param buf Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.

Param type promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Param ctx Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.

Param type Information element type, based on frame type received.

Param sa Source 802.11 address.

Param vnd_ie Pointer to the vendor specific element data received.

Param rssi Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Param ctx context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.

Param data CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- components/esp_wifi/include/esp_wifi_types.h

This header file can be included with:

```
#include "esp_wifi_types.h"
```

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:
Unions

union wifi_config_t
#include <esp_wifi_types.h> Configuration data for device’s AP or STA or NAN.
The usage of this union (for ap, sta or nan configuration) is determined by the accompanying interface argument
passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t ap
configuration of AP

wifi_sta_config_t sta
configuration of STA

wifi_nan_config_t nan
configuration of NAN

Structures

struct wifi_country_t
Structure describing WiFi country-based regional restrictions.

Public Members

char cc[3]
country code string

uint8_t schan
start channel

uint8_t nchan
total channel number

int8_t max_tx_power
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set
the maximum transmitting power.

wifi_country_policy_t policy
country policy

struct wifi_active_scan_time_t
Range of active scan times per channel.
Chapter 2. API Reference

Public Members

uint32_t min
minimum active scan time per channel, units: millisecond

uint32_t max
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to
disconnect from AP and are not recommended.

struct wifi_scan_time_t
Aggregate of active & passive scan time per channel.

Public Members

  wifi_active_scan_time_t active
active scan time per channel, units: millisecond.

uint32_t passive
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect
from AP and are not recommended.

struct wifi_scan_config_t
Parameters for an SSID scan.

Public Members

uint8_t *ssid
SSID of AP

uint8_t *bssid
MAC address of AP

uint8_t channel
channel, scan the specific channel

bool show_hidden
enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
scan type, active or passive

wifi_scan_time_t scan_time
scan time per channel

uint8_t home_chan_dwell_time
time spent at home channel between scanning consecutive channels.

struct wifi_he_ap_info_t
Description of a WiFi AP HE Info.
Public Members

`uint8_t bss_color`

an unsigned integer whose value is the BSS Color of the BSS corresponding to the AP

`uint8_t partial_bss_color`

indicate if an AID assignment rule based on the BSS color

`uint8_t bss_color_disabled`

indicate if the use of BSS color is disabled

`uint8_t bssid_index`

in M-BSSID set, identifies the nontransmitted BSSID

struct `wifi_ap_record_t`

Description of a WiFi AP.

Public Members

`uint8_t bssid[6]`

MAC address of AP

`uint8_t ssid[33]`

SSID of AP

`uint8_t primary`

channel of AP

`wifi_second_chan_t second`

secondary channel of AP

`int8_t rssi`

signal strength of AP. Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive

`wifi_auth_mode_t authmode`

authmode of AP

`wifi_cipher_type_t pairwise_cipher`

pairwise cipher of AP

`wifi_cipher_type_t group_cipher`

group cipher of AP

`wifi_ant_t ant`

antenna used to receive beacon from AP
uint32_t phy_11b
  bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
  bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
  bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
  bit: 3 flag to identify if low rate is enabled or not

uint32_t phy_11ax
  bit: 4 flag to identify if 11ax mode is enabled or not

uint32_t wps
  bit: 5 flag to identify if WPS is supported or not

uint32_t ftm_responder
  bit: 6 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator
  bit: 7 flag to identify if FTM is supported in initiator mode

uint32_t reserved
  bit: 8..31 reserved

wifi_country_t country
  country information of AP

wifi_he_ap_info_t he_ap
  HE AP info

struct wifi_scan_threshold_t
  Structure describing parameters for a WiFi fast scan.

**Public Members**

int8_t rssi
  The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t authmode
  The weakest authmode to accept in the fast scan mode Note: Incase this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won't connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI_AUTH_WEP/WIFI_AUTH_WPA_PSK to connect to WEP/WPA networks

struct wifi_pmf_config_t
  Configuration structure for Protected Management Frame
Public Members

bool capable
Depreciated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool required
Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct wifi_ap_config_t
Soft-AP configuration settings for the device.

Public Members

uint8_t ssid[32]
SSID of soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

uint8_t password[64]
Password of soft-AP.

uint8_t ssid_len
Optional length of SSID field.

uint8_t channel
Channel of soft-AP

wifi_auth_mode_t authmode
Auth mode of soft-AP. Do not support AUTH_WEP, AUTH_WAPI_PSK and AUTH_OWE in soft-AP mode. When the auth mode is set to WPA2_PSK, WPA2_WPA3_PSK or WPA3_PSK, the pairwise cipher will be overwritten with WIFI_CIPHER_TYPE_CCMP.

uint8_t ssid_hidden
Broadcast SSID or not, default 0, broadcast the SSID

uint8_t max_connection
Max number of stations allowed to connect in

uint16_t beacon_interval
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t pairwise_cipher
Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.
bool **ftm_responder**
   Enable FTM Responder mode

```c
wifi_pmf_config_t pmf_cfg
```
   Configuration for Protected Management Frame

```c
wifi_sae_pwe_method_t sae_pwe_h2e
```
   Configuration for SAE PWE derivation method

```c
struct wifi_sta_config_t
```
   STA configuration settings for the device.

### Public Members

```c
uint8_t ssid[32]
```
   SSID of target AP.

```c
uint8_t password[64]
```
   Password of target AP.

```c
wifi_scan_method_t scan_method
```
   do all channel scan or fast scan

```c
bool bssid_set
```
   whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

```c
uint8_t bssid[6]
```
   MAC address of target AP

```c
uint8_t channel
```
   channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

```c
uint16_t listen_interval
```
   Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

```c
wifi_sort_method_t sort_method
```
   sort the connect AP in the list by rssi or security mode

```c
wifi_scan_threshold_t threshold
```
   When scan_threshold is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

```c
wifi_pmf_config_t pmf_cfg
```
   Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.
Chapter 2. API Reference

```c
uint32_t rm_enabled
    Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled
    Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled
    Whether MBO is enabled for the connection

uint32_t ft_enabled
    Whether FT is enabled for the connection

uint32_t owe_enabled
    Whether OWE is enabled for the connection

uint32_t transition_disable
    Whether to enable transition disable feature

uint32_t reserved
    Reserved for future feature set

wifi_sae_pwe_method_t sae_pwe_h2e
    Configuration for SAE PWE derivation method

wifi_sae_pk_mode_t sae_pk_mode
    Configuration for SAE-PK (Public Key) Authentication method

uint8_t failure_retry_cnt
    Number of connection retries station will do before moving to next AP. scan_method should be set as WIFI_ALL_CHANNEL_SCAN to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

uint32_t he_dcm_set
    Whether DCM max.constellation for transmission and reception is set.

uint32_t he_dcm_max_constellation_tx
    Indicate the max.constellation for DCM in TB PPDU the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

uint32_t he_dcm_max_constellation_rx
    Indicate the max.constellation for DCM in both Data field and HE-SIG-B field the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

uint32_t he_mcs9_enabled
    Whether to support HE-MCS 0 to 9. The default value is 0.

uint32_t he_su_beamformee_disabled
    Whether to disable support for operation as an SU beamformee.
```
uint32_t \texttt{he\_trig\_su\_bmforming\_feedback\_disabled}
  Whether to disable support the transmission of SU feedback in an HE TB sounding sequence.

uint32_t \texttt{he\_trig\_mu\_bmforming\_partial\_feedback\_disabled}
  Whether to disable support the transmission of partial-bandwidth MU feedback in an HE TB sounding sequence.

uint32_t \texttt{he\_trig\_cqi\_feedback\_disabled}
  Whether to disable support the transmission of CQI feedback in an HE TB sounding sequence.

uint32_t \texttt{he\_reserved}
  Reserved for future feature set

uint8_t \texttt{sae\_h2e\_identifier}[SAE\_H2E\_IDENTIFIER\_LEN]
  Password identifier for H2E. this needs to be null terminated string

\begin{verbatim}
struct \texttt{wifi\_nan\_config\_t}
  NAN Discovery start configuration.

\textbf{Public Members}

uint8_t \texttt{op\_channel}
  NAN Discovery operating channel

uint8_t \texttt{master\_pref}
  Device's preference value to serve as NAN Master

uint8_t \texttt{scan\_time}
  Scan time in seconds while searching for a NAN cluster

uint16_t \texttt{warm\_up\_sec}
  Warm up time before assuming NAN Anchor Master role
\end{verbatim}

\begin{verbatim}
struct \texttt{wifi\_sta\_info\_t}
  Description of STA associated with AP.

\textbf{Public Members}

uint8_t \texttt{mac}[6]
  mac address

int8_t \texttt{rssi}
  current average rssi of sta connected

uint32_t \texttt{phy\_11b}
  bit: 0 flag to identify if 11b mode is enabled or not
\end{verbatim}

```c
uint32_t phy_11g
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
    bit: 3 flag to identify if low rate is enabled or not

uint32_t phy_11ax
    bit: 4 flag to identify if 11ax mode is enabled or not

uint32_t is_mesh_child
    bit: 5 flag to identify mesh child

uint32_t reserved
    bit: 6..31 reserved
```

```c
struct wifi_sta_list_t
    List of stations associated with the Soft-AP.

Public Members

    wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
        station list

    int num
        number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
    Vendor Information Element header.
    The first bytes of the Information Element will match this header. Payload follows.

Public Members

    uint8_t element_id
        Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

    uint8_t length
        Length of all bytes in the element data following this field. Minimum 4.

    uint8_t vendor_oui[3]
        Vendor identifier (OUI).

    uint8_t vendor_oui_type
        Vendor-specific OUI type.
```
uint8_t \texttt{payload}[0]  
Payload. Length is equal to value in 'length' field, minus 4.

\textbf{struct wifi\_promiscuous\_pkt\_t}  
Payload passed to 'buf' parameter of promiscuous mode RX callback.

\textbf{Public Members}\

\texttt{wifi\_pkt\_rx\_ctrl\_t} \texttt{rx\_ctrl}  
metadata header

uint8_t \texttt{payload}[0]  
Data or management payload. Length of payload is described by \texttt{rx\_ctrl.sig\_len}. Type of content determined by packet type argument of callback.

\textbf{struct wifi\_promiscuous\_filter\_t}  
Mask for filtering different packet types in promiscuous mode.

\textbf{Public Members}\

uint32_t \texttt{filter\_mask}  
OR of one or more filter values WIFI\_PROMIS\_FILTER\_*

\textbf{struct wifi\_csi\_info\_t}  
CSI data type.

\textbf{Public Members}\

\texttt{wifi\_pkt\_rx\_ctrl\_t} \texttt{rx\_ctrl}  
received packet radio metadata header of the CSI data

uint8_t \texttt{mac}[6]  
source MAC address of the CSI data

uint8_t \texttt{dmac}[6]  
destination MAC address of the CSI data

bool \texttt{first\_word\_invalid}  
first four bytes of the CSI data is invalid or not, true indicates the first four bytes is invalid due to hardware limitation

int8_t *\texttt{buf}  
valid buffer of CSI data

uint16_t \texttt{len}  
valid length of CSI data
uint8_t *hdr
    header of the wifi packet

uint8_t *payload
    payload of the wifi packet

uint16_t payload_len
    payload len of the wifi packet

uint16_t rx_seq
    rx sequence number of the wifi packet

struct wifi_ant_gpio_t
    WiFi GPIO configuration for antenna selection.

    Public Members

    uint8_t gpio_select
        Whether this GPIO is connected to external antenna switch

    uint8_t gpio_num
        The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
    WiFi GPIOs configuration for antenna selection.

    Public Members

    wifi_ant_gpio_t gpio_cfg[4]
        The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
    WiFi antenna configuration.

    Public Members

    wifi_ant_mode_t rx_ant_mode
        WiFi antenna mode for receiving

    wifi_ant_mode_t rx_ant_default
        Default antenna mode for receiving, it's ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

    wifi_ant_mode_t tx_ant_mode
        WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO
uint8_t enabled_ant0
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
   Action Frame Tx Request.

   Public Members

   wifi_interface_t ifx
      WiFi interface to send request to

   uint8_t dest_mac[6]
      Destination MAC address

   bool no_ack
      Indicates no ack required

   wifi_action_rx_cb_t rx_cb
      Rx Callback to receive any response

   uint32_t data_len
      Length of the appended Data

   uint8_t data[0]
      Appended Data payload

struct wifi_ftm_initiator_cfg_t
   FTM Initiator configuration.

   Public Members

   uint8_t resp_mac[6]
      MAC address of the FTM Responder

   uint8_t channel
      Primary channel of the FTM Responder

   uint8_t frm_count
      No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

   uint16_t burst_period
      Requested period between FTM bursts in 100's of milliseconds (allowed values 0(No pref) - 100)
bool use_get_report_api
    True - Using esp_wifi_ftm_get_report to get FTM report, False - Using ftm_report_data from WIFI_EVENT_FTM_REPORT to get FTM report

struct wifi_beacon_monitor_config_t
    WiFi beacon monitor parameter configuration.

    Public Members

    bool enable
        Enable or disable beacon monitor

    uint8_t loss_timeout
        Beacon lost timeout

    uint8_t loss_threshold
        Maximum number of consecutive lost beacons allowed

    uint8_t delta_intr_early
        Delta early time for RF PHY on

    uint8_t delta_loss_timeout
        Delta timeout time for RF PHY off

    uint8_t beacon_abort
        Enable or disable beacon abort

    uint8_t broadcast_wakeup
        Enable or disable TIM element multicast wakeup

    uint8_t reserved
        Reserved

    uint8_t tsf_time_sync_deviation
        Deviation range to sync with AP TSF timestamp

    uint16_t modem_state_consecutive
        PMU MODEM state consecutive count limit

    uint16_t rf_ctrl_wait_cycle
        RF on wait time (unit: Modem APB clock cycle)

struct wifi_nan_publish_cfg_t
    NAN Publish service configuration parameters.

    Public Members
char service_name[ESP_WIFI_MAX_SVC_NAME_LEN]
    Service name identifier

wifi_nan_service_type_t type
    Service type

char matching_filter[ESP_WIFI_MAX_FILTER_LEN]
    Comma separated filters for filtering services

char svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
    Service info shared in Publish frame

uint8_t single_replied_event
    Give single Replied event or every time

uint8_t datapath_reqd
    NAN Datapath required for the service

uint8_t reserved
    Reserved

struct wifi_nan_subscribe_cfg_t
    NAN Subscribe service configuration parameters.

Public Members

char service_name[ESP_WIFI_MAX_SVC_NAME_LEN]
    Service name identifier

wifi_nan_service_type_t type
    Service type

char matching_filter[ESP_WIFI_MAX_FILTER_LEN]
    Comma separated filters for filtering services

char svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
    Service info shared in Subscribe frame

uint8_t single_match_event
    Give single Match event or every time

uint8_t reserved
    Reserved

struct wifi_nan_followup_params_t
    NAN Follow-up parameters.
Chapter 2. API Reference

Public Members

```c
uint8_t inst_id
  Own service instance id
```

```c
uint8_t peer_inst_id
  Peer's service instance id
```

```c
uint8_t peer_mac[6]
  Peer's MAC address
```

```c
char svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
  Service info(or message) to be shared
```

```c
struct wifi_nan_datapath_req_t
  NAN Datapath Request parameters.
```

Public Members

```c
uint8_t pub_id
  Publisher's service instance id
```

```c
uint8_t peer_mac[6]
  Peer's MAC address
```

```c
bool confirm_required
  NDP Confirm frame required
```

```c
struct wifi_nan_datapath_resp_t
  NAN Datapath Response parameters.
```

Public Members

```c
bool accept
  True - Accept incoming NDP, False - Reject it
```

```c
uint8_t ndp_id
  NAN Datapath Identifier
```

```c
uint8_t peer_mac[6]
  Peer's MAC address
```

```c
struct wifi_nan_datapath_end_req_t
  NAN Datapath End parameters.
```
**Public Members**

`uint8_t ndp_id`
NAN Datapath Identifier

`uint8_t peer_mac[6]`
Peer’s MAC address

**struct wifi_event_sta_scan_done_t**
Argument structure for WIFI_EVENT_SCAN_DONE event

**Public Members**

`uint32_t status`
status of scanning APs: 0 — success, 1 - failure

`uint8_t number`
number of scan results

`uint8_t scan_id`
scan sequence number, used for block scan

**struct wifi_event_sta_connected_t**
Argument structure for WIFIEVENT_STA_CONNECTED event

**Public Members**

`uint8_t ssid[32]`
SSID of connected AP

`uint8_t ssid_len`
SSID length of connected AP

`uint8_t bssid[6]`
BSSID of connected AP

`uint8_t channel`
channel of connected AP

`wifi_auth_mode_t authmode`
authentication mode used by AP

`uint16_t aid`
authentication id assigned by the connected AP

**struct wifi_event_sta_disconnected_t**
Argument structure for WIFI_EVENT_STA_DISCONNECTED event
**Public Members**

`uint8_t ssid[32]`
SSID of disconnected AP

`uint8_t ssid_len`
SSID length of disconnected AP

`uint8_t bssid[6]`
BSSID of disconnected AP

`uint8_t reason`
reason of disconnection

`int8_t rssi`
rssi of disconnection

**struct wifi_event_sta_authmode_change_t**
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

**Public Members**

`wifi_auth_mode_t old_mode`
the old auth mode of AP

`wifi_auth_mode_t new_mode`
the new auth mode of AP

**struct wifi_event_sta_wps_er_pin_t**
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

**Public Members**

`uint8_t pin_code[8]`
PIN code of station in enrollee mode

**struct wifi_event_sta_wps_er_success_t**
Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

**Public Members**

`uint8_t ap_cred_cnt`
Number of AP credentials received

`uint8_t ssid[MAX_SSID_LEN]`
SSID of AP
Chapter 2. API Reference

```c
uint8_t passphrase[\text{MAX\_PASSPHRASE\_LEN}]
    Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[\text{anonymous}] ap_cred[\text{MAX\_WPS\_AP\_CRED}]
    All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
    Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

Public Members

uint8_t mac[6]
    MAC address of the station connected to Soft-AP

uint8_t aid
    the aid that soft-AP gives to the station connected to

bool is_mesh_child
    flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
    Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

Public Members

uint8_t mac[6]
    MAC address of the station disconnects to soft-AP

uint8_t aid
    the aid that soft-AP gave to the station disconnects to

bool is_mesh_child
    flag to identify mesh child

uint8_t reason
    reason of disconnection

struct wifi_event_ap_probe_req_rx_t
    Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event

Public Members

int rssi
    Received probe request signal strength
uint8_t *mac[6]
MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
RSSI value of bss

struct wifi_event_home_channel_change_t
Argument structure for WIFI_EVENT_HOME_CHANNEL_CHANGE event

Public Members

uint8_t old_chan
old home channel of the device

wifi_second_chan_t old_snd
old second channel of the device

uint8_t new_chan
new home channel of the device

wifi_second_chan_t new_snd
new second channel of the device

struct wifi_ftm_report_entry_t
Argument structure for

Public Members

uint8_t *dlog_token
Dialog Token of the FTM frame

int8_t rssi
RSSI of the FTM frame received

uint32_t *rtt
Round Trip Time in pSec with a peer

uint64_t *t1
Time of departure of FTM frame from FTM Responder in pSec
Chapter 2. API Reference

uint64_t t2
    Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t t3
    Time of departure of ACK from FTM Initiator in pSec

uint64_t t4
    Time of arrival of ACK at FTM Responder in pSec

struct wifi_event_ftm_report_t
    Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members

uint8_t peer_mac[6]
    MAC address of the FTM Peer

wifi_ftm_status_t status
    Status of the FTM operation

uint32_t rtt_raw
    Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t rtt_est
    Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t dist_est
    Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t *ftm_report_data
    Pointer to FTM Report, should be freed after use. Note: Highly recommended to use API esp_wifi_ftm_get_report to get the report instead of using this

uint8_t ftm_report_num_entries
    Number of entries in the FTM Report data

struct wifi_event_action_tx_status_t
    Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t ifx
    WiFi interface to send request to

uint32_t context
    Context to identify the request
Chapter 2. API Reference

uint8_t da[6]
    Destination MAC address

uint8_t status
    Status of the operation

struct wifi_event_roc_done_t
    Argument structure for WIFI_EVENT_ROC_DONE event

    Public Members

    uint32_t context
        Context to identify the request

struct wifi_event_ap_wps_rg_pin_t
    Argument structure for WIFI_EVENT_AP_WPS_RG_PIN event

    Public Members

    uint8_t pin_code[8]
        PIN code of station in enrollee mode

struct wifi_event_ap_wps_rg_fail_reason_t
    Argument structure for WIFI_EVENT_AP_WPS_RG_FAILED event

    Public Members

    wps_fail_reason_t reason
        WPS failure reason wps_fail_reason_t

    uint8_t peer_macaddr[6]
        Enrollee mac address

struct wifi_event_ap_wps_rg_success_t
    Argument structure for WIFI_EVENT_AP_WPS_RG_SUCCESS event

    Public Members

    uint8_t peer_macaddr[6]
        Enrollee mac address

struct wifi_event_nan_svc_match_t
    Argument structure for WIFI_EVENT_NAN_SVC_MATCH event
Public Members

uint8_t subscribe_id
   Subscribe Service Identifier

uint8_t publish_id
   Publish Service Identifier

uint8_t pub_if_mac[6]
   NAN Interface MAC of the Publisher

bool update_pub_id
   Indicates whether publisher’s service ID needs to be updated

struct wifi_event_nan_replied_t
   Argument structure for WIFI_EVENT_NAN_REPLIED event

Public Members

uint8_t publish_id
   Publish Service Identifier

uint8_t subscribe_id
   Subscribe Service Identifier

uint8_t sub_if_mac[6]
   NAN Interface MAC of the Subscriber

struct wifi_event_nan_receive_t
   Argument structure for WIFI_EVENT_NAN_RECEIVE event

Public Members

uint8_t inst_id
   Our Service Identifier

uint8_t peer_inst_id
   Peer’s Service Identifier

uint8_t peer_if_mac[6]
   Peer’s NAN Interface MAC

uint8_t peer_svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
   Peer Service Info

struct wifi_event_ndp_indication_t
   Argument structure for WIFI_EVENT_NDP_INDICATION event
Public Members

uint8_t publish_id
Publish Id for NAN Service

uint8_t ndp_id
NDP instance id

uint8_t peer_nmi[6]
Peer’s NAN Management Interface MAC

uint8_t peer_ndi[6]
Peer’s NAN Data Interface MAC

uint8_t svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
Service Specific Info

struct wifi_event_ndp_confirm_t
Argument structure for WIFI_EVENT_NDP_CONFIRM event

Public Members

uint8_t status
NDP status code

uint8_t ndp_id
NDP instance id

uint8_t peer_nmi[6]
Peer’s NAN Management Interface MAC

uint8_t peer_ndi[6]
Peer’s NAN Data Interface MAC

uint8_t own_ndi[6]
Own NDI MAC

uint8_t svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
Service Specific Info

struct wifi_event_ndp_terminated_t
Argument structure for WIFI_EVENT_NDP_TERMINATED event

Public Members

uint8_t reason
Termination reason code
uint8_t ndp_id
   NDP instance id

uint8_t init_ndi[6]
   Initiator's NAN Data Interface MAC

**Macros**

WIFI_OFFCHAN_TX_REQ

WIFI_OFFCHAN_TX_CANCEL

WIFI_ROC_REQ

WIFI_ROC_CANCEL

WIFI_PROTOCOL_11B

WIFI_PROTOCOL_11G

WIFI_PROTOCOL_11N

WIFI_PROTOCOL_LR

WIFI_PROTOCOL_11AX

SAE_H2E_IDENTIFIER_LEN

ESP_WIFI_MAX_CONN_NUM
   max number of stations which can connect to ESP32C3 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
   filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
   filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
   filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
   filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
   filter the packets with type of WIFI_PKT_MISC
WIFI_PROMIS_FILTER_MASK_DATA_MPDU
    filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
    filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
    filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
    filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
    filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
    filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
    filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
    filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
    filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
    filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
    filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
    filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
    filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
    mask all WiFi events

WIFI_EVENT_MASK_NONE
    mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
    mask SYSTEM_EVENT_AP_PROBEREQRECVED event
ESP_WIFI_NAN_MAX_SVC_SUPPORTED

ESP_WIFI_NAN_DATAPATH_MAX_PEERS

ESP_WIFI_NDP_ROLE_INITIATOR

ESP_WIFI_NDP_ROLE_RESPONDER

Type Definitions

typedef esp_wifi_rxctrl_t wifi_pkt_rx_ctrl_t

typedef wifi_csi_acquire_config_t wifi_csi_config_t

Channel state information(CSI) configuration type.

typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)

The Rx callback function of Action Tx operations.

Param hdr pointer to the IEEE 802.11 Header structure
Param payload pointer to the Payload following 802.11 Header
Param len length of the Payload
Param channel channel number the frame is received on
Enumerations

enum wifi_mode_t

Values:

enumerator WIFI_MODE_NULL
null mode

enumerator WIFI_MODE_STA
WiFi station mode

enumerator WIFI_MODE_AP
WiFi soft-AP mode

enumerator WIFI_MODE_APSTA
WiFi station + soft-AP mode

enumerator WIFI_MODE_NAN
WiFi NAN mode

enumerator WIFI_MODE_MAX

enum wifi_interface_t

Values:

enumerator WIFI_IF_STA

enumerator WIFI_IF_AP

enumerator WIFI_IF_MAX

enum wifi_country_policy_t

Values:

enumerator WIFI_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

enumerator WIFI_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

enum wifi_auth_mode_t

Values:

enumerator WIFI_AUTH_OPEN
authenticate mode : open

enumerator WIFI_AUTH_WEP
authenticate mode : WEP
enumerator WIFI_AUTH_WPA_PSK
authenticate mode : WPA_PSK

enumerator WIFI_AUTH_WPA2_PSK
authenticate mode : WPA2_PSK

enumerator WIFI_AUTH_WPA2_WPA2_PSK
authenticate mode : WPA_WPA2_PSK

enumerator WIFI_AUTH_ENTERPRISE
authenticate mode : WiFi EAP security

enumerator WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode : WiFi EAP security

enumerator WIFI_AUTH_WPA3_PSK
authenticate mode : WPA3_PSK

enumerator WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode : WPA2_WPA3_PSK

enumerator WIFI_AUTH_WAPI_PSK
authenticate mode : WAPI_PSK

enumerator WIFI_AUTH_OWE
authenticate mode : OWE

enumerator WIFI_AUTH_WPA3_ENT_192
authenticate mode : WPA3_ENT_SUITE_B_192_BIT

enumerator WIFI_AUTH_WPA3_EXT_PSK
this authentication mode will yield same result as WIFI_AUTH_WPA3_PSK and not recommended to be used. It will be deprecated in future, please use WIFI_AUTH_WPA3_PSK instead.

enumerator WIFI_AUTH_WPA3_EXT_PSK_MIXED_MODE
this authentication mode will yield same result as WIFI_AUTH_WPA3_PSK and not recommended to be used. It will be deprecated in future, please use WIFI_AUTH_WPA3_PSK instead.

enumerator WIFI_AUTH_MAX

enum wifi_err_reason_t

Values:

enum wifi_second_chan_t
   Values:
      enumerator WIFI_SECOND_CHAN_NONE
         the channel width is HT20
      enumerator WIFI_SECOND_CHAN_ABOVE
         the channel width is HT40 and the secondary channel is above the primary channel
      enumerator WIFI_SECOND_CHAN_BELOW
         the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
   Values:
      enumerator WIFI_SCAN_TYPE_ACTIVE
         active scan
      enumerator WIFI_SCAN_TYPE_PASSIVE
         passive scan

enum wifi_cipher_type_t
   Values:
enumerator WiFi_CIPHER_TYPE_NONE
  the cipher type is none

enumerator WiFi_CIPHER_TYPE_WEP40
  the cipher type is WEP40

enumerator WiFi_CIPHER_TYPE_WEP104
  the cipher type is WEP104

enumerator WiFi_CIPHER_TYPE_TKIP
  the cipher type is TKIP

enumerator WiFi_CIPHER_TYPE_CCMP
  the cipher type is CCMP

enumerator WiFi_CIPHER_TYPE_TKIP_CCMP
  the cipher type is TKIP and CCMP

enumerator WiFi_CIPHER_TYPE_AES_CMAC128
  the cipher type is AES-CMAC-128

enumerator WiFi_CIPHER_TYPE_SMS4
  the cipher type is SMS4

enumerator WiFi_CIPHER_TYPE_GCMP
  the cipher type is GCMP

enumerator WiFi_CIPHER_TYPE_GCMP256
  the cipher type is GCMP-256

enumerator WiFi_CIPHER_TYPE_AES_GMAC128
  the cipher type is AES-GMAC-128

enumerator WiFi_CIPHER_TYPE_AES_GMAC256
  the cipher type is AES-GMAC-256

enumerator WiFi_CIPHER_TYPE_UNKNOWN
  the cipher type is unknown

enum wifi_ant_t
  WiFi antenna.
  Values:

enumerator WiFi_ANT_ANT0
  WiFi antenna 0

enumerator WiFi_ANT_ANT1
  WiFi antenna 1
enumerator **WIFI_ANT_MAX**
Invalid WiFi antenna

enum **wifi_scan_method_t**
Values:

enumerator **WIFI_FAST_SCAN**
Do fast scan, scan will end after find SSID match AP

enumerator **WIFI_ALL_CHANNEL_SCAN**
All channel scan, scan will end after scan all the channel

enum **wifi_sort_method_t**
Values:

enumerator **WIFI_CONNECT_AP_BY_SIGNAL**
Sort match AP in scan list by RSSI

enumerator **WIFI_CONNECT_AP_BY_SECURITY**
Sort match AP in scan list by security mode

enum **wifi_ps_type_t**
Values:

enumerator **WIFI_PS_NONE**
No power save

enumerator **WIFI_PS_MIN_MODEM**
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI_PS_MAX_MODEM**
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in `wifi_sta_config_t`

enum **wifi_bandwidth_t**
Values:

enumerator **WIFI_BW_HT20**

enumerator **WIFI_BW_HT40**

enum **wifi_sae_pwe_method_t**
Configuration for SAE PWE derivation
Values:

enumerator **WPA3_SAE_PWE_UNSPECIFIED**

enumerator **WPA3_SAE_PWE_HUNT_AND_PECK**
Chapter 2. API Reference

enum\texttt{\textsl{WPA3\_SAE\_PWE\_HASH\_TO\_ELEMENT}}

enum\texttt{\textsl{WPA3\_SAE\_PWE\_BOTH}}

enum\texttt{wifi\_sae\_pk\_mode\_t}
Configuration for SAE-PK

\textit{Values:}

enumerator\texttt{\textsl{WPA3\_SAE\_PK\_MODE\_AUTOMATIC}}

enumerator\texttt{\textsl{WPA3\_SAE\_PK\_MODE\_ONLY}}

enumerator\texttt{\textsl{WPA3\_SAE\_PK\_MODE\_DISABLED}}

enum\texttt{wifi\_storage\_t}

\textit{Values:}

enumerator\texttt{\textsl{WIFI\_STORAGE\_FLASH}}
    all configuration will store in both memory and flash

enumerator\texttt{\textsl{WIFI\_STORAGE\_RAM}}
    all configuration will only store in the memory

enum\texttt{wifi\_vendor\_ie\_type\_t}
Vendor Information Element type.
Determines the frame type that the IE will be associated with.

\textit{Values:}

enumerator\texttt{\textsl{WIFI\_VND\_IE\_TYPE\_BEACON}}

enumerator\texttt{\textsl{WIFI\_VND\_IE\_TYPE\_PROBE\_REQ}}

enumerator\texttt{\textsl{WIFI\_VND\_IE\_TYPE\_PROBE\_RESP}}

enumerator\texttt{\textsl{WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ}}

enumerator\texttt{\textsl{WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP}}

enum\texttt{wifi\_vendor\_ie\_id\_t}
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.

\textit{Values:}

enumerator\texttt{\textsl{WIFI\_VND\_IE\_ID\_0}}
enumerator WIFI_VND_IE_ID_1

enum wifi_phy_mode_t
    Operation Phymode.
    Values:

    enumerator WIFI_PHY_MODE_LR
        PHY mode for Low Rate

    enumerator WIFI_PHY_MODE_11B
        PHY mode for 11b

    enumerator WIFI_PHY_MODE_11G
        PHY mode for 11g

    enumerator WIFI_PHY_MODE_HT20
        PHY mode for Bandwidth HT20

    enumerator WIFI_PHY_MODE_HT40
        PHY mode for Bandwidth HT40

    enumerator WIFI_PHY_MODE_HE20
        PHY mode for Bandwidth HE20

enum wifi_promiscuous_pkt_type_t
    Promiscuous frame type.
    Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
    Values:

    enumerator WIFI_PKT_MGMT
        Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

    enumerator WIFI_PKT_CTRL
        Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

    enumerator WIFI_PKT_DATA
        Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

    enumerator WIFI_PKT_MISC
        Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t
    WiFi antenna mode.
    Values:

    enumerator WIFI_ANT_MODE_ANT0
        Enable WiFi antenna 0 only
enumerator WiFi_ANT_MODE_ANT1
   Enable WiFi antenna 1 only

enumerator WiFi_ANT_MODE_AUTO
   Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator WiFi_ANT_MODE_MAX
   Invalid WiFi enabled antenna

enum wifi_nan_service_type_t
   NAN Services types.
   
   Values:
   
   enumerator NAN_PUBLISH_SOLICITED
      Send unicast Publish frame to Subscribers that match the requirement

   enumerator NAN_PUBLISH_UNSOLICITED
      Send broadcast Publish frames in every Discovery Window(DW)

   enumerator NAN_SUBSCRIBE_ACTIVE
      Send broadcast Subscribe frames in every DW

   enumerator NAN_SUBSCRIBE_PASSIVE
      Passively listens to Publish frames

enum wifi_phy_rate_t
   WiFi PHY rate encodings.
   
   Values:
   
   enumerator WIFI_PHY_RATE_1M_L
      1 Mbps with long preamble

   enumerator WIFI_PHY_RATE_2M_L
      2 Mbps with long preamble

   enumerator WIFI_PHY_RATE_5M_L
      5.5 Mbps with long preamble

   enumerator WIFI_PHY_RATE_11M_L
      11 Mbps with long preamble

   enumerator WIFI_PHY_RATE_2M_S
      2 Mbps with short preamble

   enumerator WIFI_PHY_RATE_5M_S
      5.5 Mbps with short preamble
enumerato**r WIFI_PHY_RATE_11M_S
  11 Mbps with short preamble

enumerato**r WIFI_PHY_RATE_48M
  48 Mbps

enumerato**r WIFI_PHY_RATE_24M
  24 Mbps

enumerato**r WIFI_PHY_RATE_12M
  12 Mbps

enumerato**r WIFI_PHY_RATE_6M
  6 Mbps

enumerato**r WIFI_PHY_RATE_54M
  54 Mbps

enumerato**r WIFI_PHY_RATE_36M
  36 Mbps

enumerato**r WIFI_PHY_RATE_18M
  18 Mbps

enumerato**r WIFI_PHY_RATE_9M
  9 Mbps rate table and guard interval information for each MCS rate

enumerato**r WIFI_PHY_RATE_MCS0_LGI
  MCS0 with long GI

enumerato**r WIFI_PHY_RATE_MCS1_LGI
  MCS1 with long GI

enumerato**r WIFI_PHY_RATE_MCS2_LGI
  MCS2 with long GI

enumerato**r WIFI_PHY_RATE_MCS3_LGI
  MCS3 with long GI

enumerato**r WIFI_PHY_RATE_MCS4_LGI
  MCS4 with long GI

enumerato**r WIFI_PHY_RATE_MCS5_LGI
  MCS5 with long GI

enumerato**r WIFI_PHY_RATE_MCS6_LGI
  MCS6 with long GI
enumerator WIFI_PHY_RATE_MCS7_LGI
   MCS7 with long GI
enumerator WIFI_PHY_RATE_MCS8_LGI
   MCS8 with long GI
enumerator WIFI_PHY_RATE_MCS9_LGI
   MCS9 with long GI
enumerator WIFI_PHY_RATE_MCS0_SGI
   MCS0 with short GI
enumerator WIFI_PHY_RATE_MCS1_SGI
   MCS1 with short GI
enumerator WIFI_PHY_RATE_MCS2_SGI
   MCS2 with short GI
enumerator WIFI_PHY_RATE_MCS3_SGI
   MCS3 with short GI
enumerator WIFI_PHY_RATE_MCS4_SGI
   MCS4 with short GI
enumerator WIFI_PHY_RATE_MCS5_SGI
   MCS5 with short GI
enumerator WIFI_PHY_RATE_MCS6_SGI
   MCS6 with short GI
enumerator WIFI_PHY_RATE_MCS7_SGI
   MCS7 with short GI
enumerator WIFI_PHY_RATE_MCS8_SGI
   MCS8 with short GI
enumerator WIFI_PHY_RATE_MCS9_SGI
   MCS9 with short GI
enumerator WIFI_PHY_RATE_LORA_250K
   250 Kbps
enumerator WIFI_PHY_RATE_LORA_500K
   500 Kbps
enumerator WIFI_PHY_RATE_MAX
enum wifi_event_t

 WiFi event declarations

 Values:

 enumerator WIFI_EVENT_WIFI_READY
 WiFi ready

 enumerator WIFI_EVENT_SCAN_DONE
 Finished scanning AP

 enumerator WIFI_EVENT_STA_START
 Station start

 enumerator WIFI_EVENT_STA_STOP
 Station stop

 enumerator WIFI_EVENT_STA_CONNECTED
 Station connected to AP

 enumerator WIFI_EVENT_STA_DISCONNECTED
 Station disconnected from AP

 enumerator WIFI_EVENT_STA_AUTHMODE_CHANGE
 the auth mode of AP connected by device's station changed

 enumerator WIFI_EVENT_STA_WPS_ER_SUCCESS
 Station wps succeeds in enrollee mode

 enumerator WIFI_EVENT_STA_WPS_ER_FAILED
 Station wps fails in enrollee mode

 enumerator WIFI_EVENT_STA_WPS_ER_TIMEOUT
 Station wps timeout in enrollee mode

 enumerator WIFI_EVENT_STA_WPS_ER_PIN
 Station wps pin code in enrollee mode

 enumerator WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
 Station wps overlap in enrollee mode

 enumerator WIFI_EVENT_AP_START
 Soft-AP start

 enumerator WIFI_EVENT_AP_STOP
 Soft-AP stop

 enumerator WIFI_EVENT_AP_STACONNECTED
 a station connected to Soft-AP
enumerator WIFI_EVENT_AP_STADISCONNECTED
    a station disconnected from Soft-AP

enumerator WIFI_EVENT_AP_PROBEREQRECVED
    Receive probe request packet in soft-AP interface

enumerator WIFI_EVENT_FTM_REPORT
    Receive report of FTM procedure

enumerator WIFI_EVENT_STA_BSS_RSSI_LOW
    AP’s RSSI crossed configured threshold

enumerator WIFI_EVENT_ACTION_TX_STATUS
    Status indication of Action Tx operation

enumerator WIFI_EVENT_ROC_DONE
    Remain-on-Channel operation complete

enumerator WIFI_EVENT_STA_BEACON_TIMEOUT
    Station beacon timeout

enumerator WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START
    Connectionless module wake interval start

enumerator WIFI_EVENT_AP_WPS_RG_SUCCESS
    Soft-AP wps succeeds in registrar mode

enumerator WIFI_EVENT_AP_WPS_RG_FAILED
    Soft-AP wps fails in registrar mode

enumerator WIFI_EVENT_AP_WPS_RG_TIMEOUT
    Soft-AP wps timeout in registrar mode

enumerator WIFI_EVENT_AP_WPS_RG_PIN
    Soft-AP wps pin code in registrar mode

enumerator WIFI_EVENT_AP_WPS_RG_PBC_OVERLAP
    Soft-AP wps overlap in registrar mode

enumerator WIFI_EVENT_ITWT_SETUP
    iTWT setup

enumerator WIFI_EVENT_ITWT_TEARDOWN
    iTWT teardown

enumerator WIFI_EVENT_ITWT_PROBE
    iTWT probe
enumerator `WIFI_EVENT_ITWT_SUSPEND`
    iTWT suspend

enumerator `WIFI_EVENT_TWT_WAKEUP`
    TWT wakeup

enumerator `WIFI_EVENT_NAN_STARTED`
    NAN Discovery has started

enumerator `WIFI_EVENT_NAN_STOPPED`
    NAN Discovery has stopped

enumerator `WIFI_EVENT_NAN_SVC_MATCH`
    NAN Service Discovery match found

enumerator `WIFI_EVENT_NAN_REPLIED`
    Replied to a NAN peer with Service Discovery match

enumerator `WIFI_EVENT_NAN_RECEIVE`
    Received a Follow-up message

enumerator `WIFI_EVENT_NDP_INDICATION`
    Received NDP Request from a NAN Peer

enumerator `WIFI_EVENT_NDP_CONFIRM`
    NDP Confirm Indication

enumerator `WIFI_EVENT_NDP_TERMINATED`
    NAN Datapath terminated indication

enumerator `WIFI_EVENT_HOME_CHANNEL_CHANGE`
    WiFi home channel change, doesn't occur when scanning

enumerator `WIFI_EVENT_MAX`
    Invalid WiFi event ID

enum `wifi_event_sta_wps_fail_reason_t`
    Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event
    
    *Values:*

enumerator `WPS_FAIL_REASON_NORMAL`
    WPS normal fail reason

enumerator `WPS_FAIL_REASON_RECV_M2D`
    WPS receive M2D frame

enumerator `WPS_FAIL_REASON_MAX`
enum wifi_ftm_status_t

FTM operation status types.

Values:

enumerator FTM_STATUS_SUCCESS
FTM exchange is successful

enumerator FTM_STATUS_UNSUPPORTED
Peer does not support FTM

enumerator FTM_STATUS_CONF_REJECTED
Peer rejected FTM configuration in FTM Request

enumerator FTM_STATUS_NO_RESPONSE
Peer did not respond to FTM Requests

enumerator FTM_STATUS_FAIL
Unknown error during FTM exchange

enumerator FTM_STATUS_NO_VALID_MSMT
FTM session did not result in any valid measurements

enumerator FTM_STATUS_USER_TERM
User triggered termination

enum wps_fail_reason_t

Values:

enumerator WPS_AP_FAIL_REASON_NORMAL
WPS normal fail reason

enumerator WPS_AP_FAIL_REASON_CONFIG
WPS failed due to incorrect config

enumerator WPS_AP_FAIL_REASON_AUTH
WPS failed during auth

enumerator WPS_AP_FAIL_REASON_MAX

Header File

- components/wpa_supplicant/esp_supplicant/include/esp_eap_client.h

This header file can be included with:

```c
#include "esp_eap_client.h"
```

- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

```cmake
REQUIRES wpa_supplicant
```

or
PRIV_REQUIRES wpa_supplicant

Functions

```c
esp_err_t esp_wifi_sta_enterprise_enable (void)
```
Enable EAP authentication (WiFi Enterprise) for the station mode.

This function enables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is enabled, the ESP device will attempt to authenticate with the configured EAP credentials when connecting to a secure Wi-Fi network.

**Note:** Before calling this function, ensure that the Wi-Fi configuration and EAP credentials (such as username and password) have been properly set using the appropriate configuration APIs.

**Returns**
- ESP_OK: EAP authentication enabled successfully.
- ESP_ERR_NO_MEM: Failed to enable EAP authentication due to memory allocation failure.

```c
esp_err_t esp_wifi_sta_enterprise_disable (void)
```
Disable EAP authentication (WiFi Enterprise) for the station mode.

This function disables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is disabled, the ESP device will not attempt to authenticate using EAP credentials when connecting to a secure Wi-Fi network.

**Note:** Disabling EAP authentication may cause the device to connect to the Wi-Fi network using other available authentication methods, if configured using esp_wifi_set_config().

**Returns**
- ESP_OK: EAP authentication disabled successfully.
- ESP_ERR_INVALID_STATE: EAP client is in an invalid state for disabling.

```c
esp_err_t esp_eap_client_set_identity (const unsigned char* identity, int len)
```
Set identity for PEAP/TTLS authentication method.

This function sets the identity to be used during PEAP/TTLS authentication.

**Parameters**
- `len` -- [in] Length of the identity data (limited to 1~127 bytes).

**Returns**
- ESP_OK: The identity was set successfully.
- ESP_ERR_INVALID_ARG: Invalid argument (len <= 0 or len >= 128).
- ESP_ERR_NO_MEM: Memory allocation failure.

```c
void esp_eap_client_clear_identity (void)
```
Clear the previously set identity for PEAP/TTLS authentication.

This function clears the identity that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured identity during the authentication process.

```c
esp_err_t esp_eap_client_set_username (const unsigned char* username, int len)
```
Set username for PEAP/TTLS authentication method.

This function sets the username to be used during PEAP/TTLS authentication.

**Parameters**
Chapter 2. API Reference

• **username** -- [in] Pointer to the username data.
• **len** -- [in] Length of the username data (limited to 1~127 bytes).

**Returns**
• ESP_OK: The username was set successfully.
• ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0 or len >= 128).
• ESP_ERR_NO_MEM: Failed due to memory allocation failure.

```c
void esp_eap_client_clear_username (void)
```
Clear username for PEAP/TTLS method.

This function clears the previously set username for the EAP client.

```c
esp_err_t esp_eap_client_set_password (const unsigned char *password, int len)
```
Set password for PEAP/TTLS authentication method.

This function sets the password to be used during PEAP/TTLS authentication.

**Parameters**
• **password** -- [in] Pointer to the password data.
• **len** -- [in] Length of the password data (len > 0).

**Returns**
• ESP_OK: The password was set successfully.
• ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
• ESP_ERR_NO_MEM: Failed due to memory allocation failure.

```c
void esp_eap_client_clear_password (void)
```
Clear password for PEAP/TTLS method.

This function clears the previously set password for the EAP client.

```c
esp_err_t esp_eap_client_set_new_password (const unsigned char *new_password, int len)
```
Set a new password for MSCHAPv2 authentication method.

This function sets the new password to be used during MSCHAPv2 authentication. The new password is used to substitute the old password when an eap-mschapv2 failure request message with error code ERROR_PASSWD_EXPIRED is received.

**Parameters**
• **new_password** -- [in] Pointer to the new password data.
• **len** -- [in] Length of the new password data.

**Returns**
• ESP_OK: The new password was set successfully.
• ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
• ESP_ERR_NO_MEM: Failed due to memory allocation failure.

```c
void esp_eap_client_clear_new_password (void)
```
Clear new password for MSCHAPv2 method.

This function clears the previously set new password for the EAP client.

```c
esp_err_t esp_eap_client_set_ca_cert (const unsigned char *ca_cert, int ca_cert_len)
```
Set CA certificate for EAP authentication.

This function sets the Certificate Authority (CA) certificate to be used during EAP authentication. The CA certificate is passed to the EAP client module through a global pointer.

**Parameters**
• **ca_cert** -- [in] Pointer to the CA certificate data.
• **ca_cert_len** -- [in] Length of the CA certificate data.

**Returns**
• ESP_OK: The CA certificate was set successfully.
void esp_eap_client_clear_ca_cert (void)

Clear the previously set Certificate Authority (CA) certificate for EAP authentication.

This function clears the CA certificate that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured CA certificate during the authentication process.

esp_err_t esp_eap_client_set_certificate_and_key (const unsigned char *client_cert, int client_cert_len, const unsigned char *private_key, int private_key_len, const unsigned char *private_key_password, int private_key_passwd_len)

Set client certificate and private key for EAP authentication.

This function sets the client certificate and private key to be used during authentication. Optionally, a private key password can be provided for encrypted private keys.

**Attention** 1. The client certificate, private key, and private key password are provided as pointers to the respective data arrays.

**Attention** 2. The client_cert, private_key, and private_key_password should be zero-terminated.

**Parameters**
- `client_cert` -- [in] Pointer to the client certificate data.
- `client_cert_len` -- [in] Length of the client certificate data.
- `private_key` -- [in] Pointer to the private key data.
- `private_key_len` -- [in] Length of the private key data (limited to 1~4096 bytes).
- `private_key_password` -- [in] Pointer to the private key password data (optional).
- `private_key_passwd_len` -- [in] Length of the private key password data (can be 0 for no password).

**Returns**
- ESP_OK: The certificate, private key, and password (if provided) were set successfully.

void esp_eap_client_clear_certificate_and_key (void)

Clear the previously set client certificate and private key for EAP authentication.

This function clears the client certificate and private key that were previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured certificate and private key during the authentication process.

esp_err_t esp_eap_client_set_disable_time_check (bool disable)

Set EAP client certificate time check (disable or not).

This function enables or disables the time check for EAP client certificates. When disabled, the certificates' expiration time will not be checked during the authentication process.

**Parameters**
- `disable` -- [in] True to disable EAP client certificates time check, false to enable it.

**Returns**
- ESP_OK: The EAP client certificates time check setting was updated successfully.

esp_err_t esp_eap_client_get_disable_time_check (bool *disable)

Get EAP client certificates time check status.

This function retrieves the current status of the EAP client certificates time check.

**Parameters**
- `disable` -- [out] Pointer to a boolean variable to store the disable status.

**Returns**
- ESP_OK: The status of EAP client certificates time check was retrieved successfully.

esp_err_t esp_eap_client_set_ttls_phase2_method (esp_eap_ttls_phase2_types type)

Set EAP-TTLS phase 2 method.

This function sets the phase 2 method to be used during EAP-TTLS authentication.
### Chapter 2. API Reference

**Parameters**

- **type** -- [in] The type of phase 2 method to be used (e.g., EAP, MSCHAPv2, MSCHAP, PAP, CHAP).

**Returns**

- ESP_OK: The EAP-TTLS phase 2 method was set successfully.

**esp_err_t esp_eap_client_set_suiteb_192bit_certification (bool enable)**

Enable or disable Suite-B 192-bit certification checks.

This function enables or disables the 192-bit Suite-B certification checks during EAP-TLS authentication. Suite-B is a set of cryptographic algorithms which generally are considered more secure.

- **enable** -- [in] True to enable 192-bit Suite-B certification checks, false to disable it.

**Returns**

- ESP_OK: The 192-bit Suite-B certification checks were set successfully.

**esp_err_t esp_eap_client_set_pac_file (const unsigned char *pac_file, int pac_file_len)**

Set the PAC (Protected Access Credential) file for EAP-FAST authentication.

EAP-FAST requires a PAC file that contains the client’s credentials.

**Attention**

1. For files read from the file system, length has to be decremented by 1 byte.

2. Disabling the ESP_WIFI_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

**Parameters**

- **pac_file** -- [in] Pointer to the PAC file buffer.
- **pac_file_len** -- [in] Length of the PAC file buffer.

**Returns**

- ESP_OK: The PAC file for EAP-FAST authentication was set successfully.

**esp_err_t esp_eap_client_set_fast_params (esp_eap_fast_config config)**

Set the parameters for EAP-FAST Phase 1 authentication.

EAP-FAST supports Fast Provisioning, where clients can be authenticated faster using precomputed keys (PAC). This function allows configuring parameters for Fast Provisioning.

**Attention**

1. Disabling the ESP_WIFI_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

**Parameters**

- **config** -- [in] Configuration structure with Fast Provisioning parameters.

**Returns**

- ESP_OK: The parameters for EAP-FAST Phase 1 authentication were set successfully.

**esp_err_t esp_eap_client_use_default_cert_bundle (bool use_default_bundle)**

Use the default certificate bundle for EAP authentication.

By default, the EAP client uses a built-in certificate bundle for server verification. Enabling this option allows the use of the default certificate bundle.

**Parameters**

- **use_default_bundle** -- [in] True to use the default certificate bundle, false to use a custom bundle.

**Returns**

- ESP_OK: The option to use the default certificate bundle was set successfully.

**Structures**

**struct esp_eap_fast_config**

Configuration settings for EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling).
This structure defines the configuration options that can be used to customize the behavior of the EAP-FAST authentication protocol, specifically for Fast Provisioning and PAC (Protected Access Credential) handling.

**Public Members**

```c
int fast_provisioning
   Enable or disable Fast Provisioning in EAP-FAST (0 = disabled, 1 = enabled)
```

```c
int fast_max_pac_list_len
   Maximum length of the PAC (Protected Access Credential) list
```

```c
bool fast_pac_format_binary
   Set to true for binary format PAC, false for ASCII format PAC
```

**Enumerations**

```c
eenum esp_eap_ttls_phase2_types
   Enumeration of phase 2 authentication types for EAP-TTLS.
   This enumeration defines the supported phase 2 authentication methods that can be used in the EAP-TTLS (Extensible Authentication Protocol - Tunneled Transport Layer Security) protocol for the second authentication phase.
   Values:
```

```c
enumerator ESP_EAP_TTLS_PHASE2_EAP
   EAP (Extensible Authentication Protocol)
```

```c
enumerator ESP_EAP_TTLS_PHASE2_MSCHAPV2
   MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol - Version 2)
```

```c
enumerator ESP_EAP_TTLS_PHASE2_MSCHAP
   MS-CHAP (Microsoft Challenge Handshake Authentication Protocol)
```

```c
enumerator ESP_EAP_TTLS_PHASE2_PAP
   PAP (Password Authentication Protocol)
```

```c
enumerator ESP_EAP_TTLS_PHASE2_CHAP
   CHAP (Challenge Handshake Authentication Protocol)
```

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_wps.h
- This header file can be included with:

  ```c
  #include "esp_wps.h"
  ```

- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE wpa_supplicant
  ```
  or

Submit Document Feedback
Chapter 2. API Reference

```
PRIV_REQUIRES wpa_supplicant
```

**Functions**

`esp_err_t esp_wifi_wps_enable(const esp_wps_config_t *config)`

Enable Wi-Fi WPS function.

**Parameters**

`config` -- WPS config to be used in connection

**Returns**

- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_TYPE : wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on
- ESP_FAIL : wps initialization fails

`esp_err_t esp_wifi_wps_disable(void)`

Disable Wi-Fi WPS function and release resource it taken.

**Returns**

- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on

`esp_err_t esp_wifi_wps_start(int timeout_ms)`

Start WPS session.

**Attention**

WPS can only be used when station is enabled. WPS needs to be enabled first for using this API.

**Parameters**

`timeout_ms` -- deprecated: This argument's value will have not effect in functionality of API. The argument will be removed in future. The app should start WPS and register for WIFI events to get the status. WPS status is updated through WPS events. See wifi_event_t enum for more info.

**Returns**

- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_TYPE : wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on
- ESP_ERR_WIFI_WPS_SM : wps state machine is not initialized
- ESP_FAIL : wps initialization fails

`esp_err_t esp_wifi_ap_wps_enable(const esp_wps_config_t *config)`

Enable Wi-Fi AP WPS function.

**Attention**

WPS can only be used when softAP is enabled.

**Parameters**

`config` -- wps configuration to be used.

**Returns**

- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_TYPE : wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on
- ESP_FAIL : wps initialization fails

`esp_err_t esp_wifi_ap_wps_disable(void)`

Disable Wi-Fi SoftAP WPS function and release resource it taken.

**Returns**

- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on
**esp_err_t esp_wifi_ap_wps_start** (const unsigned char *pin)

WPS starts to work.

**Attention**  WPS can only be used when softAP is enabled.

**Parameters**  pin -- : Pin to be used in case of WPS mode is pin. If Pin is not provided, device will use the pin generated/provided during esp_wifi_ap_wps_enable() and reported in WIFI_EVENT_AP_WPS_RG_PIN

**Returns**
- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_TYPE : wps type is invalid
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on
- ESP_ERR_WIFI_WPS_SM : wps state machine is not initialized
- ESP_FAIL : wps initialization fails

**Structures**

**struct wps_factory_information_t**

Structure representing WPS factory information for ESP device.

This structure holds various strings representing factory information for a device, such as the manufacturer, model number, model name, and device name. Each string is a null-terminated character array. If any of the strings are empty, the default values are used.

**Public Members**

char manufacturer[WPS_MAX_MANUFACTURER_LEN]

Manufacturer of the device. If empty, the default manufacturer is used.

char model_number[WPS_MAX_MODEL_NUMBER_LEN]

Model number of the device. If empty, the default model number is used.

char model_name[WPS_MAX_MODEL_NAME_LEN]

Model name of the device. If empty, the default model name is used.

char device_name[WPS_MAX_DEVICE_NAME_LEN]

Device name. If empty, the default device name is used.

**struct esp_wps_config_t**

Structure representing configuration settings for WPS (Wi-Fi Protected Setup).

This structure encapsulates various configuration settings for WPS, including the WPS type (PBC or PIN), factory information that will be shown in the WPS Information Element (IE), and a PIN if the WPS type is set to PIN.

**Public Members**

**wps_type_t wps_type**

The type of WPS to be used (PBC or PIN).
**wps_factory_information_t** `factory_info`

Factory information to be shown in the WPS Information Element (IE). Vendor can choose to display their own information.

`char pin[PIN_LEN]`

WPS PIN (Personal Identification Number) used when `wps_type` is set to `WPS_TYPE_PIN`.

### Macros

**ESP_ERR_WIFI_REGISTRAR**

WPS registrar is not supported

**ESP_ERR_WIFI_WPS_TYPE**

WPS type error

**ESP_ERR_WIFI_WPS_SM**

WPS state machine is not initialized

**WPS_MAX_MANUFACTURER_LEN**

Maximum length of the manufacturer name in WPS information

**WPS_MAX_MODEL_NUMBER_LEN**

Maximum length of the model number in WPS information

**WPS_MAX_MODEL_NAME_LEN**

Maximum length of the model name in WPS information

**WPS_MAX_DEVICE_NAME_LEN**

Maximum length of the device name in WPS information

**PIN_LEN**

The length of the WPS PIN (Personal Identification Number).

**WPS_CONFIG_INIT_DEFAULT** (`type`)

Initialize a default WPS configuration structure with specified WPS type.

This macro initializes a `esp_wps_config_t` structure with default values for the specified WPS type. It sets the WPS type, factory information (including default manufacturer, model number, model name, and device name), and a default PIN value if applicable.

**Parameters**

- `type` -- The WPS type to be used (PBC or PIN).

**Returns**

An initialized `esp_wps_config_t` structure with the specified WPS type and default values.

### Type Definitions

typedef enum `wps_type` `wps_type_t`

Enumeration of WPS (Wi-Fi Protected Setup) types.
Enumerations

definition of wps_type

- WPS (Wi-Fi Protected Setup) types.

- Enumerator WPS_TYPE_DISABLE
  - WPS is disabled

- Enumerator WPS_TYPE_PBC
  - WPS Push Button Configuration method

- Enumerator WPS_TYPE_PIN
  - WPS PIN (Personal Identification Number) method

- Enumerator WPS_TYPE_MAX
  - Maximum value for WPS type enumeration

Header File

- components/wpa_supplicant/esp_supplicant/include/esp_rrm.h

- This header file can be included with:

  ```
  #include "esp_rrm.h"
  ```

- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

  ```
  REQUIRES wpa_supplicant
  or
  PRIV_REQUIRES wpa_supplicant
  ```

Functions

```python
int esp_rrm_send_neighbor_rep_request (neighbor_rep_request_cb cb, void *cb_ctx)
```

Send Radio measurement neighbor report request to connected AP.

- Parameters
  - cb -- callback function for neighbor report
  - cb_ctx -- callback context

- Returns
  - 0: success
  - -1: AP does not support RRM
  - -2: station not connected to AP

```python
bool esp_rrm_is_rrm_supported_connection (void)
```

Check RRM capability of connected AP.

- Returns
  - true: AP supports RRM
  - false: AP does not support RRM or station not connected to AP

Type Definitions
typedef void (*neighbor_rep_request_cb)(void *ctx, const uint8_t *report, size_t report_len)

Callback function type to get neighbor report.

Param ctx neighbor report context
Param report neighbor report
Param report_len neighbor report length
Return
  • void

Header File

• components/wpa_supplicant/esp_supplicant/include/esp_wnm.h
• This header file can be included with:

```
#include "esp_wnm.h"
```

• This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

```
REQUIRES wpa_supplicant

or

PRIV_REQUIRES wpa_supplicant
```

Functions

int esp_wnm_send_bss_transition_mgmt_query (enum btm_query_reason query_reason, const char *btm_candidates, int cand_list)

Send bss transition query to connected AP.

Parameters
  • query_reason -- reason for sending query
  • btm_candidates -- btm candidates list if available
  • cand_list -- whether candidate list to be included from scan results available in supplicant’s cache.

Returns
  • 0: success
  • -1: AP does not support BTM
  • -2: station not connected to AP

bool esp_wnm_is_btm_supported_connection (void)

Check bss transition capability of connected AP.

Returns
  • true: AP supports BTM
  • false: AP does not support BTM or station not connected to AP

Enumerations

enum btm_query_reason

enum btm_query_reason: Reason code for sending btm query

Values:

enumerator REASON_UNSPECIFIED
enumerator REASON_FRAME_LOSS
enumerator **REASON_DELAY**

enumerator **REASON_BANDWIDTH**

enumerator **REASON_LOAD_BALANCE**

enumerator **REASON_RSSI**

enumerator **REASON_RETRANSMISSIONS**

enumerator **REASON_INTERFERENCE**

enumerator **REASON_GRAY_ZONE**

enumerator **REASON_PREMIUM_AP**

### Header File

- components/wpa_supplicant/esp_supplicant/include/esp_mbo.h
- This header file can be included with:
  ```
  #include "esp_mbo.h"
  ```
- This header file is a part of the API provided by the *wpa_supplicant* component. To declare that your component depends on *wpa_supplicant*, add the following to your CMakeLists.txt:
  ```
  REQUIRES wpa_supplicant
  or
  PRIV_REQUIRES wpa_supplicant
  ```

### Functions

**int esp_mbo_update_non_pref_chan** (struct *non_pref_chan* )

Update channel preference for MBO IE.

**Parameters**

- **non_pref_chan** -- Non preference channel list

**Returns**

- 0: success else failure

### Structures

**struct non_pref_chan**

Structure representing a non-preferred channel in a wireless network.

This structure encapsulates information about a non-preferred channel including the reason for its non-preference, the operating class, channel number, and preference level.

### Public Members

**enum non_pref_chan_reason reason**

Reason for the channel being non-preferred
uint8_t oper_class
    Operating class of the channel

uint8_t chan
    Channel number

uint8_t preference
    Preference level of the channel

struct non_pref_chan_s
    Structure representing a list of non-preferred channels in a wireless network.
    This structure encapsulates information about a list of non-preferred channels including the number of non-preferred channels and an array of structures representing individual non-preferred channels.

Public Members

size_t non_pref_chan_num
    Number of non-preferred channels in the list

struct non_pref_chan chan[]
    Array of structures representing individual non-preferred channels

Enumerations

enum non_pref_chan_reason
    Enumeration of reasons for a channel being non-preferred in a wireless network.
    This enumeration defines various reasons why a specific channel might be considered non-preferred in a wireless network configuration.

Values:

enumerator NON_PREF_CHAN_REASON_UNSPECIFIED
    Unspecified reason for non-preference

enumerator NON_PREF_CHAN_REASON_RSSI
    Non-preferred due to low RSSI (Received Signal Strength Indication)

enumerator NON_PREF_CHAN_REASON_EXT_INTERFERENCE
    Non-preferred due to external interference

enumerator NON_PREF_CHAN_REASON_INT_INTERFERENCE
    Non-preferred due to internal interference

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect, adding a new device to a network is as simple as scanning a QR Code. This reduces
complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like Wi-Fi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added.

Easy Connect brings many benefits in the user experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32-C6 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C6 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™.

Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect, no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-C6 using a supported smartphone:

```
wifi/wifi_easy_connect/dpp-enrollee
```

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h
- This header file can be included with:

  ```
  #include "esp_dpp.h"
  ```

- This header file is a part of the API provided by the **wpa_supplicant** component. To declare that your component depends on **wpa_supplicant**, add the following to your CMakeLists.txt:

  ```
  REQUIRES wpa_supplicant
  ```

  or
  ```
  PRIV_REQUIRES wpa_supplicant
  ```

**Functions**

```
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
```

Initialize DPP Supplicant.

```
Starts DPP Supplicant and initializes related Data Structures.
```

return

- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters** evt_cb -- Callback function to receive DPP related events
void **esp_supp_dpp_deinit**(void)
De-initialize DPP Supplicant.

Frees memory from DPP Supplicant Data Structures.

**esp_err_t** **esp_supp_dpp_bootstrap_gen**(const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)
Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Parameters**
- **chan_list** -- List of channels device will be available on for listening
- **type** -- Bootstrap method type, only QR Code method is supported for now.
- **key** -- (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** -- (Optional) Ancilliary Device Information like Serial Number

**Returns**
- ESP_OK: Success
- ESP_FAIL: Failure

**esp_err_t** **esp_supp_dpp_start_listen**(void)
Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.

Listens on every Channel from Channel List for a pre-defined wait time.

**Returns**
- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

void **esp_supp_dpp_stop_listen**(void)
Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

**Macros**

**ESP_DPP_AUTH_TIMEOUT_SECS**

**ESP_ERR_DPP_FAILURE**
Generic failure during DPP Operation

**ESP_ERR_DPP_TX_FAILURE**
DPP Frame Tx failed OR not Aced

**ESP_ERR_DPP_INVALID_ATTR**
Encountered invalid DPP Attribute

**ESP_ERR_DPP_AUTH_TIMEOUT**
DPP Auth response was not received in time
### Type Definitions

typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t

Types of Bootstrap Methods for DPP.

typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

- **Param** `evt` DPP event ID
- **Param** `data` Event data payload

### Enumerations

enum dpp_bootstrap_type

Types of Bootstrap Methods for DPP.

- **enumerator** `DPP_BOOTSTRAP_QR_CODE` QR Code Method
- **enumerator** `DPP_BOOTSTRAP_PKEX` Proof of Knowledge Method
- **enumerator** `DPP_BOOTSTRAP_NFC_URI` NFC URI record Method

enum esp_supp_dpp_event_t

Types of Callback Events received from DPP Supplicant.

- **enumerator** `ESP_SUPP_DPP_URI_READY` URI is ready through Bootstrapping
- **enumerator** `ESP_SUPP_DPP_CFG_RECVD` Config received via DPP Authentication
- **enumerator** `ESP_SUPP_DPP_FAIL` DPP Authentication failure

Code examples for the Wi-Fi API are provided in the `wifi` directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the `mesh` directory of ESP-IDF examples.

### 2.5.2 Ethernet

**Ethernet**
Overview
ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc Control of Ethernet Driver

Basic Ethernet Concepts
Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low-power applications. However, with ubiquitous deployment, internet connectivity, high data rates, and limitless-range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, a data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling appears as shown below:

<table>
<thead>
<tr>
<th>1</th>
<th>Preamble (7 Bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Start-of-Frame Delimiter (1 Byte)</td>
</tr>
<tr>
<td>3</td>
<td>Destination Address (6 Bytes)</td>
</tr>
<tr>
<td>4</td>
<td>Source Address (6 Bytes)</td>
</tr>
<tr>
<td>5</td>
<td>Type / Length (2 Bytes)</td>
</tr>
<tr>
<td>6</td>
<td>Payload (0 ~ 1500 Bytes)</td>
</tr>
<tr>
<td>7</td>
<td>Pad (if necessary)</td>
</tr>
<tr>
<td>8</td>
<td>Frame Check Sequence (4 Bytes)</td>
</tr>
</tbody>
</table>

Fig. 4: Ethernet Data Frame Format

Preamble and Start-of-Frame Delimiter
The preamble contains seven bytes of 55H. It allows the receiver to lock onto the stream of data before the actual frame arrives.

The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.
When transmitting and receiving data, the preamble and SFD bytes will be automatically generated or stripped from the packets.

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multicast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not.

Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multicast address, i.e., FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a unicast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or unicast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationaly Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. For more information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length** The type/length field is a 2-byte field. If the value in this field is <= 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is >= 1536, it represents the protocol the following packet data belongs to. The followings are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets violates Ethernet standards and will be dropped by most Ethernet nodes.

This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet the IEEE 802.3 specification requirements when small data payloads are used.

The DA, SA, type, payload, and padding of an Ethernet packet must be no smaller than 60 bytes in total. If the required 4-byte FCS field is added, packets must be no smaller than 64 bytes. If the payload field is less than 46-byte long, a padding field is required.

The FCS field is a 4-byte field that contains an industry-standard 32-bit CRC calculated with the data from the DA, SA, type, payload, and padding fields. Given the complexity of calculating a CRC, the hardware normally automatically generates a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and
CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:** Besides the basic data frame described above, there are two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN-tagged frames. They are not supported in ESP-IDF.

---

**Configure MAC and PHY** The Ethernet driver is composed of two parts: MAC and PHY.

You need to set up the necessary parameters for MAC and PHY respectively based on your Ethernet board design, and then combine the two together to complete the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds. Typically, MAC reset should be finished within 100 ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets. These two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when the cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY devices can share the same SMI bus, so each PHY needs a unique address. Usually, this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds. Typically, PHY reset should be finished within 100 ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. The Ethernet driver starts negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connects the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** The Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of the two.

**SPI-Ethernet Module**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();  // apply default MAC config
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();  // apply default PHY config
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;        // alter the PHY address
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt-driven)
```

(continues on next page)
gpio_install_isr_service(0);

// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
  .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
  .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
  .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
  .quadwp_io_num = -1,
  .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));

// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
  .mode = 0,
  .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
  .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
  .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_~SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);

Note:
• When creating MAC and PHY instances for SPI-Ethernet modules (e.g., DM9051), the constructor function must have the same suffix (e.g., esp_eth_mac_new_dm9051 and esp_eth_phy_new_dm9051). This is because we don’t have other choices but the integrated PHY.
• The SPI device configuration (i.e., spi_device_interface_config_t) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module’s specs and the examples in ESP-IDF.

Install Driver  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e., not specific to either MAC or PHY) in esp_eth_config_t:

• esp_eth_config_t::mac: instance that created from MAC generator (e.g., esp_eth_mac_new_esp32()).
• esp_eth_config_t::phy: instance that created from PHY generator (e.g., esp_eth_phy_new_ip101()).
• esp_eth_config_t::check_link_period_ms: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
• esp_eth_config_t::stack_input: In most Ethernet IoT applications, any Ethernet frame received by a driver should be passed to the upper layer (e.g., TCP/IP stack). This field is set to a function that is responsible to deal with the incoming frames. You can even update this field at runtime via function esp_eth_update_input_path() after driver installation.
• esp_eth_config_t::on_lowlevel_init_done and esp_eth_config_t::on_lowlevel_deinit_done: These two fields are used to specify the hooks which get invoked when low-level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro ETH_DEFAULT_CONFIG.

esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after the driver is installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
Chapter 2. API Reference

The Ethernet driver also includes an event-driven model, which sends useful and important events to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id)
    {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x", mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}
```

Start Ethernet Driver    After driver installation, we can start Ethernet immediately.

```c
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

Connect Driver to TCP/IP Stack    Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we are still on level 2 (i.e., Data Link Layer). While we can detect link up and down events and gain MAC address in user space, it is infeasible to obtain the IP address, let alone send an HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP. For more information about it, please refer to LwIP.

To connect the Ethernet driver to TCP/IP stack, follow these three steps:

1. Create a network interface for the Ethernet driver
2. Attach the network interface to the Ethernet driver
3. Register IP event handlers

For more information about the network interface, please refer to Network Interface.

```c
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
```
Chapter 2. API Reference

(continued from previous page)

```c
{    ip_event_got_ip_t *event = {ip_event_got_ip_t *} event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP: IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK: IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW: IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
}
```

```c
esp_netif_init(); // Initialize TCP/IP network interface (should be called only once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for Ethernet driver
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface before registering the user's Ethernet/IP event handlers, i.e., register the event handlers as the last thing prior to starting the Ethernet driver. Such an approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface so the system is in the expected state when executing the user's handlers.

### Misc Control of Ethernet Driver

The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```c
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow Control**  Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. The ethernet flow control mechanism allows the receiving node to signal the sender requesting the suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with
Chapter 2. API Reference

the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After the Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing that should be kept in mind is that the pause frame ability is advertised to the peer end by PHY during auto-negotiation. The Ethernet driver sends a pause frame only when both sides of the link support it.

**Application Examples**

- Ethernet basic example: `ethernet/basic`
- Ethernet iperf example: `ethernet/iperf`
- Ethernet to Wi-Fi AP "router": `network/eth2ap`
- Wi-Fi station to Ethernet "bridge": `network/sta2eth`
- Most protocol examples should also work for Ethernet: `protocols`

**Advanced Topics**

**Custom PHY Driver**  There are multiple PHY manufacturers with wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies the user’s actual needs due to price, features, stock availability, etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in Section 22.2.4 Management Functions. It defines provisions of the so-called "MII Management Interface" to control the PHY and gather status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration, etc. This basic management functionality is addressed by `esp_eth/src/esp_eth_phy_802_3.c` in ESP-IDF and so it makes the creation of a new custom PHY chip driver quite a simple task.

**Note:**  Always consult with PHY datasheets since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, but it just requires more effort. You will have to define all PHY management functions.

The majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the `esp_eth/src/esp_eth_phy_802_3.c`. However, the following may require developing chip-specific management functions:

- Link status which is almost always chip-specific
- Chip initialization, even though not strictly required, should be customized to at least ensure that the expected chip is used
- Chip-specific features configuration

**Steps to create a custom PHY driver:**

1. Define vendor-specific registry layout based on the PHY datasheet. See `esp_eth/src/esp_eth_phy_ip101.c` as an example.
2. Prepare derived PHY management object info structure which:
   - must contain at least parent IEEE 802.3 `phy_802_3_t` object
   - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See `esp_eth/src/esp_eth_phyksz80xx.c` as an example.
3. Define chip-specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip-specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among other users via IDF Component Registry.
API Reference

Header File

- components/esp_eth/include/esp_eth.h
  - This header file can be included with:
    ```
    #include "esp_eth.h"
    ```
  - This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:
    ```
    REQUIRES esp_eth
    ```
    or
    ```
    PRIV_REQUIRES esp_eth
    ```

Header File

- components/esp_eth/include/esp_eth_driver.h
  - This header file can be included with:
    ```
    #include "esp_eth_driver.h"
    ```
  - This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:
    ```
    REQUIRES esp_eth
    ```
    or
    ```
    PRIV_REQUIRES esp_eth
    ```

Functions

**esp_err_t esp_eth_driver_install**(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)

Install Ethernet driver.

**Parameters**

- config -- [in] configuration of the Ethernet driver
- out_hdl -- [out] handle of Ethernet driver

**Returns**

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there's no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

**esp_err_t esp_eth_driver_uninstall**(esp_eth_handle_t hdl)

Uninstall Ethernet driver.

**Note:** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Parameters**

- hdl -- [in] handle of Ethernet driver

**Returns**

- ESP_OK: uninstall esp_eth driver successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_start (esp_eth_handle_t hdl)
```

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note:** This API will start driver state machine and internal software timer (for checking link status).

**Parameters**

- **hdl** -- [in] handle of Ethernet driver

**Returns**

- ESP_OK: start esp_eth driversuccessfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_stop (esp_eth_handle_t hdl)
```

Stop Ethernet driver.

**Note:** This function does the opposite operation of esp_eth_start.

**Parameters**

- **hdl** -- [in] handle of Ethernet driver

**Returns**

- ESP_OK: stop esp_eth driversuccessfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

```
esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t*buffer,uint32_t length,void *priv), void *priv)
```

Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note:** After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Parameters**

- **hdl** -- [in] handle of Ethernet driver
- **stack_input** -- [in] function pointer, which does the actual process on incoming packets
- **priv** -- [in] private resource, which gets passed to stack_input callback without any modification

**Returns**

- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

```
esp_err_t esp_eth_transmit (esp_eth_handle_t hdl, void *buf, size_t length)
```

General Transmit.
Parameters

- **hdl** -- [in] handle of Ethernet driver
- **buf** -- [in] buffer of the packet to transfer
- **length** -- [in] length of the buffer to transfer

Returns

- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_STATE: invalid driver state (e.g., driver is not started)
- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

**esp_err_t esp_eth_transmit_vargs (esp_eth_handle_t hdl, uint32_t argc, ...)**

Special Transmit with variable number of arguments.

Parameters

- **hdl** -- [in] handle of Ethernet driver
- **argc** -- [in] number variable arguments
- **...** -- variable arguments

Returns

- ESP_OK: transmit successfull
- ESP_ERR_INVALID_STATE: invalid driver state (e.g., driver is not started)
- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

**esp_err_t esp_eth_ioctl (esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)**

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- **ETH_CMD_S_MAC_ADDR** sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
- **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. data argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- **ETH_CMD_S_PHY_ADDR** sets PHY address in range of <0-31>. data argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- **ETH_CMD_G_PHY_ADDR** gets PHY address. data argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- **ETH_CMD_S_SPEED** sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_SPEED** gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_DUPLEX_MODE** sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
Chapter 2. API Reference

- **ETH_CMD_G_DUPLEX_MODE** gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- **ETH_CMD_S_PHY_LOOPBACK** sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

**Parameters**

- **hdl** -- [in] handle of Ethernet driver
- **cmd** -- [in] IO control command
- **data** -- [inout] address of data for `set` command or address where to store the data when used with `get` command

**Returns**

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```c
esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)
```
Increase Ethernet driver reference.

**Parameters**

- **hdl** -- [in] handle of Ethernet driver

**Returns**

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

```c
esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)
```
Decrease Ethernet driver reference.

**Parameters**

- **hdl** -- [in] handle of Ethernet driver

**Returns**

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Structures**

- `struct esp_eth_config_t`
  Configuration of Ethernet driver.

**Public Members**

```c
esp_eth_mac_t *mac
```
Ethernet MAC object.

```c
esp_eth_phy_t *phy
```
Ethernet PHY object.

---

**Note:** Ethernet driver handle can be obtained by os timer, netif, etc. It's dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.
uint32_t check_link_period_ms

Period time of checking Ethernet link status.

esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)

Input frame buffer to user's stack.

    Param eth_handle [in] handle of Ethernet driver
    Param buffer [in] frame buffer that will get input to upper stack
    Param length [in] length of the frame buffer
    Return
     • ESP_OK: input frame buffer to upper stack successfully
     • ESP_FAIL: error occurred when inputting buffer to upper stack

esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)

Callback function invoked when lowlevel initialization is finished.

    Param eth_handle [in] handle of Ethernet driver
    Return
     • ESP_OK: process extra lowlevel initialization successfully
     • ESP_FAIL: error occurred when processing extra lowlevel initialization

esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

    Param eth_handle [in] handle of Ethernet driver
    Return
     • ESP_OK: process extra lowlevel deinitialization successfully
     • ESP_FAIL: error occurred when processing extra lowlevel deinitialization

esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the
PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding
read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

    Param eth_handle [in] handle of Ethernet driver
    Param phy_addr [in] PHY chip address (0~31)
    Param phy_reg [in] PHY register index code
    Param reg_value [out] PHY register value
    Return
     • ESP_OK: read PHY register successfully
     • ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
     • ESP_ERR_TIMEOUT: read PHY register failed because of timeout
     • ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the
PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding
read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Param eth_handle [in]** handle of Ethernet driver  
**Param phy_addr [in]** PHY chip address (0~31)  
**Param phy_reg [in]** PHY register index code  
**Param reg_value [in]** PHY register value  

**Return**  
- ESP_OK: write PHY register successfully  
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument  
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout  
- ESP_FAIL: write PHY register failed because some other error occurred

```
struct esp_eth_phy_reg_rw_data_t  
Data structure to Read/Write PHY register via ioctl API.
```

**Public Members**

```
uint32_t reg_addr  
PHY register address
```

```
uint32_t *reg_value_p  
Pointer to a memory where the register value is read/written
```

**Macros**

```
ETH_DEFAULT_CONFIG (emac, ephy)  
Default configuration for Ethernet driver.
```

**Type Definitions**

```
typedef void *esp_eth_handle_t  
Handle of Ethernet driver.
```

**Enumerations**

```
enum esp_eth_io_cmd_t  
Command list for ioctl API.  

Values:

enumerator ETH_CMD_G_MAC_ADDR  
Get MAC address  

enumerator ETH_CMD_S_MAC_ADDR  
Set MAC address  

enumerator ETH_CMD_G_PHY_ADDR  
Get PHY address  

enumerator ETH_CMD_S_PHY_ADDR  
Set PHY address
```
enumerator ETH_CMD_G_AUTONEGO
  Get PHY Auto Negotiation
enumerator ETH_CMD_S_AUTONEGO
  Set PHY Auto Negotiation
enumerator ETH_CMD_G_SPEED
  Get Speed
enumerator ETH_CMD_S_SPEED
  Set Speed
enumerator ETH_CMD_S_PROMISCUOUS
  Set promiscuous mode
enumerator ETH_CMD_S_FLOW_CTRL
  Set flow control
enumerator ETH_CMD_G_DUPLEX_MODE
  Get Duplex mode
enumerator ETH_CMD_S_DUPLEX_MODE
  Set Duplex mode
enumerator ETH_CMD_S_PHY_LOOPBACK
  Set PHY loopback
enumerator ETH_CMD_READ_PHY_REG
  Read PHY register
enumerator ETH_CMD_WRITE_PHY_REG
  Write PHY register
enumerator ETH_CMD_CUSTOM_MAC_CMDS
enumerator ETH_CMD_CUSTOM_PHY_CMDS

Header File
• components/esp_eth/include/esp_eth_com.h
• This header file can be included with:

```c
#include "esp_eth_com.h"
```
• This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

REQUIRES esp_eth
```
or
Chapter 2. API Reference

**Structures**

struct `esp_eth_mediator_s`

Ethernet mediator.

**Public Members**

```c
esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

- **Param eth** [in] mediator of Ethernet driver
- **Param phy_addr** [in] PHY Chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [out] PHY register value

**Return**
- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

```c
esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

- **Param eth** [in] mediator of Ethernet driver
- **Param phy_addr** [in] PHY Chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [in] PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

```c
esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)
```

Deliver packet to upper stack.

- **Param eth** [in] mediator of Ethernet driver
- **Param buffer** [in] packet buffer
- **Param length** [in] length of the packet

**Return**
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```

Callback on Ethernet state changed.

- **Param eth** [in] mediator of Ethernet driver
- **Param state** [in] new state
- **Param args** [in] optional argument for the new state

**Return**
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred
Type Definitions

typedef struct esp_eth_mediator_s esp_eth_mediator_t
    Ethernet mediator.

Enumerations

eenum esp_eth_state_t
    Ethernet driver state.
    Values:

    enumerator ETH_STATE_LLINIT
        Low level init done

    enumerator ETH_STATE_DEINIT
        Deinit done

    enumerator ETH_STATE_LINK
        Link status changed

    enumerator ETH_STATE_SPEED
        Speed updated

    enumerator ETH_STATE_DUPLEX
        Duplex updated

    enumerator ETH_STATE_PAUSE
        Pause ability updated

eenum eth_event_t
    Ethernet event declarations.
    Values:

    enumerator ETHERNET_EVENT_START
        Ethernet driver start

    enumerator ETHERNET_EVENT_STOP
        Ethernet driver stop

    enumerator ETHERNET_EVENT_CONNECTED
        Ethernet got a valid link

    enumerator ETHERNET_EVENT_DISCONNECTED
        Ethernet lost a valid link

Header File

- components/esp_eth/include/esp_eth_mac.h
- This header file can be included with:
#include "esp_eth_mac.h"

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```c
REQUIRES esp_eth
```

PRIV_REQUIRES esp_eth
```

## Unions

union `eth_mac_clock_config_t`

`#include <esp_eth_mac.h>` Ethernet MAC Clock Configuration.

### Public Members

```c
struct `eth_mac_clock_config_t`::[anonymous] mii
```
EMAC MII Clock Configuration

```c
enmac_rmii_clock_mode_t clock_mode
```
RMII Clock Mode Configuration

```c
enmac_rmii_clock_gpio_t clock_gpio
```
RMII Clock GPIO Configuration

```c
struct `eth_mac_clock_config_t`::[anonymous] rmii
```
EMAC RMII Clock Configuration

## Structures

struct `esp_eth_mac_s`
Ethernet MAC.

### Public Members

```c
esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
```
Set mediator for Ethernet MAC.

- **Param mac** [in] Ethernet MAC instance
- **Param eth** [in] Ethernet mediator

- Return
  - ESP_OK: set mediator for Ethernet MAC successfully
  - ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

```c
esp_err_t (*init)(esp_eth_mac_t *mac)
```
Initialize Ethernet MAC.

- **Param mac** [in] Ethernet MAC instance

- Return
  - ESP_OK: initialize Ethernet MAC successfully
• ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
• ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

```c
esp_err_t (*deinit)(esp_eth_mac_t *mac)
```
Deinitialize Ethernet MAC.

Param mac [in] Ethernet MAC instance
Return
• ESP_OK: deinitialize Ethernet MAC successfully
• ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

```c
esp_err_t (*start)(esp_eth_mac_t *mac)
```
Start Ethernet MAC.

Param mac [in] Ethernet MAC instance
Return
• ESP_OK: start Ethernet MAC successfully
• ESP_FAIL: start Ethernet MAC failed because some other error occurred

```c
esp_err_t (*stop)(esp_eth_mac_t *mac)
```
Stop Ethernet MAC.

Param mac [in] Ethernet MAC instance
Return
• ESP_OK: stop Ethernet MAC successfully
• ESP_FAIL: stop Ethernet MAC failed because some error occurred

```c
esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t* buf, uint32_t length)
```
Transmit packet from Ethernet MAC.

Note: Returned error codes may differ for each specific MAC chip.

```c
Param mac [in] Ethernet MAC instance
Param buf [in] packet buffer to transmit
Param length [in] length of packet
Return
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
• ESP_FAIL: transmit packet failed because some other error occurred
```

```c
esp_err_t (*transmit_vargs)(esp_eth_mac_t *mac, uint32_t argc, va_list args)
```
Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

Note: Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

Note: Returned error codes may differ for each specific MAC chip.
Chapter 2. API Reference

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

```c
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
```

Receive packet from Ethernet MAC.

**Note:** Memory of buf is allocated in the Layer2, make sure it get free after process.

**Note:** Before this function got invoked, the value of "length" should set by user, equals the size of buffer. After the function returned, the value of "length" means the real length of received data.

**Param mac [in]** Ethernet MAC instance  
**Param buf [out]** packet buffer which will preserve the received frame  
**Param length [out]** length of the received packet  
**Return**

- ESP_OK: receive packet successfully  
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument  
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned "length" indicates the real size of incoming data.  
- ESP_FAIL: receive packet failed because some other error occurred

```c
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

**Param mac [in]** Ethernet MAC instance  
**Param phy_addr [in]** PHY chip address (0~31)  
**Param phy_reg [in]** PHY register index code  
**Param reg_value [out]** PHY register value  
**Return**

- ESP_OK: read PHY register successfully  
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument  
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC  
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout  
- ESP_FAIL: read PHY register failed because some other error occurred

```c
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

**Param mac [in]** Ethernet MAC instance  
**Param phy_addr [in]** PHY chip address (0~31)  
**Param phy_reg [in]** PHY register index code  
**Param reg_value [in]** PHY register value  
**Return**

- ESP_OK: write PHY register successfully  
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC  
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout  
- ESP_FAIL: write PHY register failed because some other error occurred
```
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
Set MAC address.

Param mac [in] Ethernet MAC instance
Param addr [in] MAC address
Return
• ESP_OK: set MAC address successfully
• ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
• ESP_FAIL: set MAC address failed because some other error occurred

esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
Get MAC address.

Param mac [in] Ethernet MAC instance
Param addr [out] MAC address
Return
• ESP_OK: get MAC address successfully
• ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
• ESP_FAIL: get MAC address failed because some other error occurred

esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
Set speed of MAC.

Param mac [in] Ethernet MAC instance
Param speed [in] MAC speed
Return
• ESP_OK: set MAC speed successfully
• ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
• ESP_FAIL: set MAC speed failed because some other error occurred

esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
Set duplex mode of MAC.

Param mac [in] Ethernet MAC instance
Param duplex [in] MAC duplex
Return
• ESP_OK: set MAC duplex mode successfully
• ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
• ESP_FAIL: set MAC duplex failed because some other error occurred

esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
Set link status of MAC.

Param mac [in] Ethernet MAC instance
Param link [in] Link status
Return
• ESP_OK: set link status successfully
• ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
• ESP_FAIL: set link status failed because some other error occurred

esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
Set promiscuous of MAC.

Param mac [in] Ethernet MAC instance
Param enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode
Return
• ESP_OK: set promiscuous mode successfully
• ESP_FAIL: set promiscuous mode failed because some other error occurred
```
Chapter 2. API Reference

**esp_err_t** (*enable_flow_ctrl*) *(esp_eth_mac_t *mac, bool enable)*

Enable flow control on MAC layer or not.

**Param**
- [mac] Ethernet MAC instance
- [enable] set true to enable flow control; set false to disable flow control

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

**esp_err_t** (*set_peer_pause_ability*) *(esp_eth_mac_t *mac, uint32_t ability)*

Set the PAUSE ability of peer node.

**Param**
- [mac] Ethernet MAC instance
- [ability] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

**esp_err_t** (*custom_ioctl*) *(esp_eth_mac_t *mac, uint32_t cmd, void *data)*

Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

**Param**
- [mac] Ethernet MAC instance
- [cmd] IO control command
- [data] [inout] address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

**esp_err_t** (*del*) *(esp_eth_mac_t *mac)*

Free memory of Ethernet MAC.

**Param**
- [mac] Ethernet MAC instance

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

**struct** eth_mac_config_t

Configuration of Ethernet MAC object.

**Public Members**

**uint32_t** sw_reset_timeout_ms

Software reset timeout value (Unit: ms)
uint32_t rx_task_stack_size
    Stack size of the receive task

uint32_t rx_task_prio
    Priority of the receive task

uint32_t flags
    Flags that specify extra capability for mac driver

struct eth_spi_custom_driver_config_t
    Custom SPI Driver Configuration. This structure declares configuration and callback functions to access Ethernet SPI module via user's custom SPI driver.

Public Members

void *config
    Custom driver specific configuration data used by init() function.

Note: Type and its content is fully under user's control

void *(init)(const void *spi_config)
    Custom driver SPI Initialization.

Note: return type and its content is fully under user’s control

    Param spi_config [in] Custom driver specific configuration
    Return
        • spi_ctx: when initialization is successful, a pointer to context structure holding all variables needed for subsequent SPI access operations (e.g. SPI bus identification, mutexes, etc.)
        • NULL: driver initialization failed

esp_err_t (*deinit)(void *spi_ctx)
    Custom driver De-initialization.

    Param spi_ctx [in] a pointer to driver specific context structure
    Return
        • ESP_OK: driver de-initialization was successful
        • ESP_FAIL: driver de-initialization failed
        • any other failure codes are allowed to be used to provide failure isolation

esp_err_t (*read)(void *spi_ctx, uint32_t cmd, uint32_t addr, void *data, uint32_t data_len)
    Custom driver SPI read.

Note: The read function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

    Param spi_ctx [in] a pointer to driver specific context structure
Chapter 2. API Reference

Param cmd [in] command
Param addr [in] register address
Param data [out] read data
Param data_len [in] read data length in bytes

Return
  • ESP_OK: read was successful
  • ESP_FAIL: read failed
  • any other failure codes are allowed to be used to provide failure isolation

```c
esp_err_t(*write)(void*spi_ctx,uint32_tcmd,uint32_taddr,constvoid*data,uint32_tdata_len)
```

Custom driver SPI write.

Note: The write function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

Param spi_ctx [in] a pointer to driver specific context structure
Param cmd [in] command
Param addr [in] register address
Param data [in] data to write
Param data_len [in] length of data to write in bytes

Return
  • ESP_OK: write was successful
  • ESP_FAIL: write failed
  • any other failure codes are allowed to be used to provide failure isolation

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
  MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE
  Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()
  Default configuration for Ethernet MAC object.

ETH_DEFAULT_SPI
  Default configuration of the custom SPI driver. Internal ESP-IDF SPI Master driver is used by default.

Type Definitions

typedef struct esp_eth_mac_s esp_eth_mac_t
  Ethernet MAC.

Enumerations

enum emac_rmii_clock_mode_t
  RMII Clock Mode Options.
  Values:

  enumerator EMAC_CLK_DEFAULT
  Default values configured using Kconfig are going to be used when "Default" selected.
enumerator **EMAC_CLK_EXT_IN**
Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

**Note:** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_CLK_OUT**
Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac_rmii_clock_gpio_t**
RMII Clock GPIO number Options.

**Values:**

enumerator **EMAC_CLK_IN_GPIO**
MAC will get RMII clock from outside at this GPIO.

**Note:** ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_APPL_CLK_OUT_GPIO**
Output RMII Clock from internal APLL Clock available at GPIO0.

**Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

enumerator **EMAC_CLK_OUT_GPIO**
Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**
Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

**Header File**

- **components/esp_eth/include/esp_eth_phy.h**
- This header file can be included with:

```c
#include "esp_eth_phy.h"
```

- This header file is a part of the API provided by the **esp_eth** component. To declare that your component depends on **esp_eth**, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```

or
Functions

`esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)`

Create a PHY instance of IP101.

**Parameters**
config -- [in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_rtl8201(const eth_phy_config_t *config)`

Create a PHY instance of RTL8201.

**Parameters**
config -- [in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_lan87xx(const eth_phy_config_t *config)`

Create a PHY instance of LAN87xx.

**Parameters**
config -- [in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_dp83848(const eth_phy_config_t *config)`

Create a PHY instance of DP83848.

**Parameters**
config -- [in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_ksz80xx(const eth_phy_config_t *config)`

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters**
config -- [in] configuration of PHY

**Returns**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

```c
struct esp_eth_phy_s

Ethernet PHY.
```

Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)

Set mediator for PHY.
```
**Param** *phy* [in] Ethernet PHY instance  
**Param** *mediator* [in] mediator of Ethernet driver  
**Return**  
- ESP_OK: set mediator for Ethernet PHY instance successfully  
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```
Software Reset Ethernet PHY.

**Param** *phy* [in] Ethernet PHY instance  
**Return**  
- ESP_OK: reset Ethernet PHY successfully  
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```
Hardware Reset Ethernet PHY.

**Note:** Hardware reset is mostly done by pull down and up PHY’s nRST pin

```c
esp_err_t (*init)(esp_eth_phy_t *phy)
```
Initialize Ethernet PHY.

**Param** *phy* [in] Ethernet PHY instance  
**Return**  
- ESP_OK: initialize Ethernet PHY successfully  
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```
Deinitialize Ethernet PHY.

**Param** *phy* [in] Ethernet PHY instance  
**Return**  
- ESP_OK: deinitialize Ethernet PHY successfully  
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
```
Configure auto negotiation.

**Param** *phy* [in] Ethernet PHY instance  
**Param** *cmd* [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation  
**Param** *autonego_en_stat* [out] Address where to store current status of auto negotiation configuration  
**Return**  
- ESP_OK: restart auto negotiation successfully  
- ESP_FAIL: restart auto negotiation failed because some error occurred  
- ESP_ERR_INVALID_ARG: invalid command
`esp_err_t (*get_link)(esp_eth_phy_t *phy)`

Get Ethernet PHY link status.

**Param** phy [in] Ethernet PHY instance  
**Return**  
- ESP_OK: get Ethernet PHY link status successfully  
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

`esp_err_t (*set_link)(esp_eth_phy_t *phy, eth_link_t link)`

Set Ethernet PHY link status.

**Param** phy [in] Ethernet PHY instance  
**Param** link [in] new link status  
**Return**  
- ESP_OK: set Ethernet PHY link status successfully  
- ESP_FAIL: set Ethernet PHY link status failed because some error occurred

`esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)`

Power control of Ethernet PHY.

**Param** phy [in] Ethernet PHY instance  
**Param** enable [in] set true to power on Ethernet PHY; set false to power off Ethernet PHY  
**Return**  
- ESP_OK: control Ethernet PHY power successfully  
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

`esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)`

Set PHY chip address.

**Param** phy [in] Ethernet PHY instance  
**Param** addr [in] PHY chip address  
**Return**  
- ESP_OK: set Ethernet PHY address successfully  
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

`esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)`

Get PHY chip address.

**Param** phy [in] Ethernet PHY instance  
**Param** addr [out] PHY chip address  
**Return**  
- ESP_OK: get Ethernet PHY address successfully  
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

`esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)`

Advertise pause function supported by MAC layer.

**Param** phy [in] Ethernet PHY instance  
**Param** addr [out] Pause ability  
**Return**  
- ESP_OK: Advertise pause ability successfully  
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

`esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)`

Sets the PHY to loopback mode.

**Param** phy [in] Ethernet PHY instance
**Param enable** [in] enables or disables PHY loopback

**Return**
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

```c
esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
```
Sets PHY speed mode.

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param phy** [in] Ethernet PHY instance

**Param speed** [in] Speed mode to be set

**Return**
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

```c
esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
```
Sets PHY duplex mode.

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param phy** [in] Ethernet PHY instance

**Param duplex** [in] Duplex mode to be set

**Return**
- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

```c
esp_err_t (*custom_ioctl)(esp_eth_phy_t *phy, uint32_t cmd, void *data)
```
Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of PHY chip.

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

**Param phy** [in] Ethernet PHY instance

**Param cmd** [in] IO control command

**Param data** [inout] address of data for set command or address where to store the data when used with get command

**Return**
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```
Free memory of Ethernet PHY instance.
**Param**  phy  [in]  Ethernet PHY instance

**Return**
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

```c
struct eth_phy_config_t
    Ethernet PHY configuration.
```

**Public Members**

- `int32_t phy_addr`
  PHY address, set -1 to enable PHY address detection at initialization stage

- `uint32_t reset_timeout_ms`
  Reset timeout value (Unit: ms)

- `uint32_t autonego_timeout_ms`
  Auto-negotiation timeout value (Unit: ms)

- `int reset_gpio_num`
  Reset GPIO number, -1 means no hardware reset

**Macros**

```c
ESP_ETH_PHY_ADDR_AUTO
ETH_PHY_DEFAULT_CONFIG()
    Default configuration for Ethernet PHY object.
```

**Type Definitions**

typedef struct esp_eth_phy_s esp_eth_phy_t
    Ethernet PHY.

**Enumerations**

```c
enum eth_phy_autoneg_cmd_t
    Auto-negotiation control commands.

Values:

- enumerator ESP_ETH_PHY_AUTONEGO_RESTART
- enumerator ESP_ETH_PHY_AUTONEGO_EN
- enumerator ESP_ETH_PHY_AUTONEGO_DIS
- enumerator ESP_ETH_PHY_AUTONEGO_G_STAT
```
Chapter 2. API Reference

Header File

- components/esp_eth/include/esp_eth_phy_802_3.h
- This header file can be included with:

```c
#include "esp_eth_phy_802_3.h"
```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```
or

```cmake
PRIV_REQUIRES esp_eth
```

Functions

### esp_eth_phy_802_3_set_mediator

#### Parameters
- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `eth` -- Ethernet mediator pointer

#### Returns
- ESP_OK: Ethernet mediator set successfully
- ESP_ERR_INVALID_ARG: if `eth` is NULL

### esp_eth_phy_802_3_reset

#### Parameters
- `phy_802_3` -- IEEE 802.3 PHY object info structure

#### Returns
- ESP_OK: Ethernet PHY reset successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

### esp_eth_phy_802_3_autonego_ctrl

#### Parameters
- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `cmd` -- autonegotiation command enumeration
- `autonego_en_stat` -- [out] autonegotiation enabled flag

#### Returns
- ESP_OK: Ethernet PHY autonegotiation configured successfully
- ESP_FAIL: Ethernet PHY autonegotiation configuration fail because some error occurred
- ESP_ERR_INVALID_ARG: invalid value of `cmd`

### esp_eth_phy_802_3_pwrctl

#### Parameters
- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `enable` -- set true to power ON Ethernet PHY; set false to power OFF Ethernet PHY

#### Returns
- ESP_OK: Ethernet PHY power down mode set successfully
- ESP_FAIL: Ethernet PHY power up or power down failed because some error occurred

### esp_eth_phy_802_3_set_addr

#### Parameters
- `phy_802_3` -- IEEE 802.3 PHY object info structure
- `addr` -- Ethernet PHY address

#### Returns
• **addr** -- new PHY address

**Returns**

• ESP_OK: Ethernet PHY address set

```c
esp_err_t esp_eth_phy_802_3_get_addr (phy_802_3_t *phy_802_3, uint32_t *addr)
```

Get Ethernet PHY address.

**Parameters**

• **phy_802_3** -- IEEE 802.3 PHY object info structure  
• **addr** -- [out] Ethernet PHY address

**Returns**

• ESP_OK: Ethernet PHY address read successfully  
• ESP_ERR_INVALID_ARG: addr pointer is NULL

```c
esp_err_t esp_eth_phy_802_3_advertise_pause_ability (phy_802_3_t *phy_802_3, uint32_t ability)
```

Advertise pause function ability.

**Parameters**

• **phy_802_3** -- IEEE 802.3 PHY object info structure  
• **ability** -- enable or disable pause ability

**Returns**

• ESP_OK: pause ability set successfully  
• ESP_FAIL: Advertise pause function ability failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_loopback (phy_802_3_t *phy_802_3, bool enable)
```

Set Ethernet PHY loopback mode.

**Parameters**

• **phy_802_3** -- IEEE 802.3 PHY object info structure  
• **enable** -- set true to enable loopback; set false to disable loopback

**Returns**

• ESP_OK: Ethernet PHY loopback mode set successfully  
• ESP_FAIL: Ethernet PHY loopback configuration failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_speed (phy_802_3_t *phy_802_3, eth_speed_t speed)
```

Set Ethernet PHY speed.

**Parameters**

• **phy_802_3** -- IEEE 802.3 PHY object info structure  
• **speed** -- new speed of Ethernet PHY link

**Returns**

• ESP_OK: Ethernet PHY speed set successfully  
• ESP_FAIL: Set Ethernet PHY speed failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_duplex (phy_802_3_t *phy_802_3, eth_duplex_t duplex)
```

Set Ethernet PHY duplex mode.

**Parameters**

• **phy_802_3** -- IEEE 802.3 PHY object info structure  
• **duplex** -- new duplex mode for Ethernet PHY link

**Returns**

• ESP_OK: Ethernet PHY duplex mode set successfully  
• ESP_ERR_INVALID_STATE: unable to set duplex mode to Half if loopback is enabled  
• ESP_FAIL: Set Ethernet PHY duplex mode failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_link (phy_802_3_t *phy_802_3, eth_link_t link)
```

Set Ethernet PHY link status.

**Parameters**

• **phy_802_3** -- IEEE 802.3 PHY object info structure  
• **link** -- new link status
• ESP_OK: Ethernet PHY link set successfully

```c
esp_err_t esp_eth_phy_802_3_init (phy_802_3_t *phy_802_3)
```

Initialize Ethernet PHY.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: Ethernet PHY initialized successfully

```c
esp_err_t esp_eth_phy_802_3_deinit (phy_802_3_t *phy_802_3)
```

Power off Ethernet PHY.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: Ethernet PHY powered off successfully

```c
esp_err_t esp_eth_phy_802_3_del (phy_802_3_t *phy_802_3)
```

Delete Ethernet PHY infostructure.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: Ethernet PHY infostructure deleted

```c
esp_err_t esp_eth_phy_802_3_reset_hw (phy_802_3_t *phy_802_3, uint32_t reset_assert_us)
```

Performs hardware reset with specific reset pin assertion time.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object infostructure
- `reset_assert_us` -- Hardware reset pin assertion time

**Returns**
- ESP_OK: reset Ethernet PHY successfully

```c
esp_err_t esp_eth_phy_802_3_detect_phy_addr (esp_eth_mediator_t *eth, int *detected_addr)
```

Detect PHY address.

**Parameters**
- `eth` -- Mediator of Ethernet driver
- `detected_addr` -- [out] a valid address after detection

**Returns**
- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can't detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_basic_phy_init (phy_802_3_t *phy_802_3)
```

Performs basic PHY chip initialization.

**Parameters**
- `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: initialized Ethernet PHY successfully
- ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: PHY device not detected
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

---

**Note:** It should be called as the first function in PHY specific driver instance
**esp_err_t esp_eth_phy_802_3_basic_phy_deinit (phy_802_3_t *phy_802_3)**

Performs basic PHY chip de-initialization.

**Note:** It should be called as the last function in PHY specific driver instance

**Parameters**
phy_802_3 -- IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: de-initialized Ethernet PHY successfully
- ESP_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_read_oui (phy_802_3_t *phy_802_3, uint32_t *oui)**

Reads raw content of OUI field.

**Parameters**
- phy_802_3 -- IEEE 802.3 PHY object infostructure
- oui -- [out] OUI value

**Returns**
- ESP_OK: OUI field read successfully
- ESP_FAIL: OUI field read failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid oui argument
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_read_manufac_info (phy_802_3_t *phy_802_3, uint8_t *model, uint8_t *rev)**

Reads manufacturer’s model and revision number.

**Parameters**
- phy_802_3 -- IEEE 802.3 PHY object infostructure
- model -- [out] Manufacturer’s model number (can be NULL when not required)
- rev -- [out] Manufacturer’s revision number (can be NULL when not required)

**Returns**
- ESP_OK: Manufacturer’s info read successfully
- ESP_FAIL: Manufacturer’s info read failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

**esp_err_t esp_eth_phy_802_3_get_mmd_addr (phy_802_3_t *phy_802_3, uint8_t devaddr, uint16_t *mmd_addr)**

Reads MDIO device’s internal address register.

**Parameters**
- phy_802_3 -- IEEE 802.3 PHY object infostructure
- devaddr -- Address of MDIO device
- mmd_addr -- [out] Current address stored in device’s register

**Returns**
- ESP_OK: Address register read successfully
- ESP_FAIL: Address register read failed because of some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

**esp_err_t esp_eth_phy_802_3_set_mmd_addr (phy_802_3_t *phy_802_3, uint8_t devaddr, uint16_t mmd_addr)**

Write to DIO device’s internal address register.

**Parameters**
- phy_802_3 -- IEEE 802.3 PHY object infostructure
• devaddr -- Address of MDIO device
• mmd_addr -- [out] New value of MDIO device's address register value

Returns
• ESP_OK: Address register written successfully
• ESP_FAIL: Address register write failed because of some error occurred
• ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```c
esp_err_t esp_eth_phy_802_3_read_mmd_data (phy_802_3_t *phy_802_3, uint8_t devaddr,
                                         esp_eth_phy_802_3_mmd_func_t function, uint32_t *data)
```

Read data of MDIO device's memory at address register.

Parameters
• phy_802_3 -- IEEE 802.3 PHY object infrastructure
• devaddr -- Address of MDIO device
• function -- MMD function
• data -- [out] Data read from the device's memory

Returns
• ESP_OK: Memory read successfully
• ESP_FAIL: Memory read failed because of some error occurred
• ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

```c
esp_err_t esp_eth_phy_802_3_write_mmd_data (phy_802_3_t *phy_802_3, uint8_t devaddr,
                                          esp_eth_phy_802_3_mmd_func_t function, uint32_t data)
```

Write data to MDIO device's memory at address register.

Parameters
• phy_802_3 -- IEEE 802.3 PHY object infrastructure
• devaddr -- Address of MDIO device
• function -- MMD function
• data -- [out] Data to write to the device's memory

Returns
• ESP_OK: Memory written successfully
• ESP_FAIL: Memory write failed because of some error occurred
• ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

```c
esp_err_t esp_eth_phy_802_3_read_mmd_register (phy_802_3_t *phy_802_3, uint8_t devaddr,
                                              uint16_t mmd_addr, uint32_t *data)
```

Set MMD address to mmd_addr with function MMD_FUNC_NOINCR and read contents to *data.

Parameters
• phy_802_3 -- IEEE 802.3 PHY object infrastructure
• devaddr -- Address of MDIO device
• mmd_addr -- Address of MDIO device register
• data -- [out] Data read from the device's memory

Returns
• ESP_OK: Memory read successfully
• ESP_FAIL: Memory read failed because of some error occurred
• ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```c
esp_err_t esp_eth_phy_802_3_write_mmd_register (phy_802_3_t *phy_802_3, uint8_t devaddr,
                                              uint16_t mmd_addr, uint32_t data)
```

Set MMD address to mmd_addr with function MMD_FUNC_NOINCR and write data.

Parameters
• phy_802_3 -- IEEE 802.3 PHY object infrastructure
Chapter 2. API Reference

• **devaddr** -- Address of MDIO device
• **mmd_addr** -- Address of MDIO device register
• **data** -- [out] Data to write to the device's memory

**Returns**

• ESP_OK: Memory written successfully
• ESP_FAIL: Memory write failed because of some error occurred
• ESP_ERR_INVALID_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```c
inline phy_802_3_t *esp_eth_phy_into_phy_802_3 (esp_eth_phy_t *phy)
```

Returns address to parent IEEE 802.3 PHY object infrastructure.

**Parameters**

phy -- Ethernet PHY instance

**Returns**

phy_802_3_t*

• address to parent IEEE 802.3 PHY object infrastructure

```c
esp_err_t esp_eth_phy_802_3_obj_config_init (phy_802_3_t *phy_802_3, const eth_phy_config_t *config)
```

Initializes configuration of parent IEEE 802.3 PHY object infrastructure.

**Parameters**

• phy_802_3 -- Address to IEEE 802.3 PHY object infrastructure
• config -- Configuration of the IEEE 802.3 PHY object

**Returns**

• ESP_OK: configuration initialized successfully
• ESP_ERR_INVALID_ARG: invalid config argument

**Structures**

```c
struct phy_802_3_t
```

IEEE 802.3 PHY object infrastructure.

**Public Members**

```c
esp_eth_phy_t parent
```

Parent Ethernet PHY instance

```c
esp_eth_mediator_t *eth
```

Mediator of Ethernet driver

```c
int addr
```

PHY address

```c
uint32_t reset_timeout_ms
```

Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```

Auto-negotiation timeout value (Unit: ms)

```c
eth_link_t link_status
```

Current Link status

```c
int reset_gpio_num
```

Reset GPIO number, -1 means no hardware reset
Enumerations

enum esp_eth_phy_802_3_mmd_func_t
IEEE 802.3 MMD modes enumeration.

Values:

enumerator MMD_FUNC_ADDRESS
enumerator MMD_FUNC_DATA_NOINCR
enumerator MMD_FUNC_DATA_RWINCR
enumerator MMD_FUNC_DATA_WINCR

Header File

- components/esp_eth/include/esp_eth_netif_glue.h
- This header file can be included with:

```c
#include "esp_eth_netif_glue.h"
```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```

or

```cmake
PRIV_REQUIRES esp_eth
```

Functions

```c
typedef struct esp_eth_netif_glue_t*
esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the ethernet directory of ESP-IDF examples.

Note: netif glue is used to attach io driver to TCP/IP netif

```
Parameters
eth_hdl -- Ethernet driver handle
Returns glue object, which inherits esp_netif_driver_base_t
```

```
esp_err_t esp_eth_del_netif_glue (esp_eth_netif_glue_handle_t eth_netif_glue)
Delete netif glue of Ethernet driver.

Parameters
eth_netif_glue -- netif glue
Returns -ESP_OK: delete netif glue successfully
```

Type Definitions

typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t

Handle of netif glue - an intermediate layer between netif and Ethernet driver.
2.5.3 Thread

Thread

Introduction Thread is an IP-based mesh networking protocol. It is based on the 802.15.4 physical and MAC layer.

Application Examples The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell openthread/ot_cli
- The Thread Border Router openthread/ot_br
- The Thread Radio Co-Processor openthread/ot_rcp

API Reference For manipulating the Thread network, the OpenThread API shall be used. The OpenThread API docs can be found at the OpenThread API docs.

ESP-IDF provides extra APIs for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- components/openthread/include/esp_openthread.h
- This header file can be included with:

  ```c
  #include "esp_openthread.h"
  ```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE openthread
  ```

  or

  ```cmake
  PRIV_REQUIRES openthread
  ```

Functions

`esp_err_t esp_openthread_init (const esp_openthread_platform_config_t *init_config)`

Initializes the full OpenThread stack.

Note: The OpenThread instance will also be initialized in this function.

**Parameters** `init_config` -- [in] The initialization configuration.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

`esp_err_t esp_openthread_auto_start (otOperationalDatasetTlvs *datasetTlvs)`

Starts the Thread protocol operation and attaches to a Thread network.

**Parameters** `datasetTlvs` -- [in] The operational dataset (TLV encoded), if it’s NULL, the function will generate the dataset based on the configurations from kconfig.

**Returns**
Chapter 2. API Reference

• ESP_OK on success
• ESP_FAIL on failures

`esp_err_t esp_openthread_launch_mainloop (void)`
Launches the OpenThread main loop.

**Note:** This function will not return unless error happens when running the OpenThread stack.

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

`esp_err_t esp_openthread_deinit (void)`
This function performs OpenThread stack and platform driver deinitialization.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

OtInstance * `esp_openthread_get_instance` (void)
This function acquires the underlying OpenThread instance.

**Note:** This function can be called on other tasks without lock.

**Returns** The OpenThread instance pointer

**Header File**
- `components/openthread/include/esp_openthread_types.h`
- This header file can be included with:
  ```c
  #include "esp_openthread_types.h"
  ```
- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:
  ```
  REQUIRES openthread
  
  or
  
  PRIV_REQUIRES openthread
  ```

**Structures**

struct `esp_openthread_role_changed_event_t`
OpenThread role changed event data.

**Public Members**

otDeviceRole `previous_role`
Previous Thread role
otDeviceRole `current_role`
Current Thread role

struct `esp_openthread_mainloop_context_t`
This structure represents a context for a select() based mainloop.

**Public Members**

fd_set `read_fds`
The read file descriptors

fd_set `write_fds`
The write file descriptors

fd_set `error_fds`
The error file descriptors

int `max_fd`
The max file descriptor

struct timeval `timeout`
The timeout

struct `esp_openthread_uart_config_t`
The uart port config for OpenThread.

**Public Members**

`uart_port_t` `port`
UART port number

`uart_config_t` `uart_config`
UART configuration, see `uart_config_t` docs

`gpio_num_t` `rx_pin`
UART RX pin

`gpio_num_t` `tx_pin`
UART TX pin

struct `esp_openthread_spi_host_config_t`
The spi port config for OpenThread.

**Public Members**

`spi_host_device_t` `host_device`
SPI host device
**spi_dma_chan_t** dma_channel
  DMA channel

**spi_bus_config_t** spi_interface
  SPI bus

**spi_device_interface_config_t** spi_device
  SPI peripheral device

**gpio_num_t** intr_pin
  SPI interrupt pin

struct esp_openthread_spi_slave_config_t
  The spi slave config for OpenThread.

**Public Members**

**spi_host_device_t** host_device
  SPI host device

**spi_bus_config_t** bus_config
  SPI bus config

**spi_slave_interface_config_t** slave_config
  SPI slave config

**gpio_num_t** intr_pin
  SPI interrupt pin

struct esp_openthread_radio_config_t
  The OpenThread radio configuration.

**Public Members**

**esp_openthread_radio_mode_t** radio_mode
  The radio mode

**esp_openthread_uart_config_t** radio_uart_config
  The uart configuration to RCP

**esp_openthread_spi_host_config_t** radio_spi_config
  The spi configuration to RCP

struct esp_openthread_host_connection_config_t
  The OpenThread host connection configuration.
Public Members

`esp_openthread_host_connection_mode_t host_connection_mode`
The host connection mode

`esp_openthread_uart_config_t host_uart_config`
The uart configuration to host

`usb_serial_jtag_driver_config_t host_usb_config`
The usb configuration to host

`esp_openthread_spi_slave_config_t spi_slave_config`
The spi configuration to host

`struct esp_openthread_port_config_t`
The OpenThread port specific configuration.

Public Members

`const char *storage_partition_name`
The partition for storing OpenThread dataset

`uint8_t netif_queue_size`
The packet queue size for the network interface

`uint8_t task_queue_size`
The task queue size

`struct esp_openthread_platform_config_t`
The OpenThread platform configuration.

Public Members

`esp_openthread_radio_config_t radio_config`
The radio configuration

`esp_openthread_host_connection_config_t host_config`
The host connection configuration

`esp_openthread_port_config_t port_config`
The port configuration

Type Definitions

typedef void (*`esp_openthread_rcp_failure_handler`)(void)
Enumerations

class esp_openthread_event_t

OpenThread event declarations.

Values:

enumerator OPENTHREAD_EVENT_START
OpenThread stack start

enumerator OPENTHREAD_EVENT_STOP
OpenThread stack stop

enumerator OPENTHREAD_EVENT_DETACHED
OpenThread detached

enumerator OPENTHREAD_EVENT_ATTACHED
OpenThread attached

enumerator OPENTHREAD_EVENT_ROLE_CHANGED
OpenThread role changed

enumerator OPENTHREAD_EVENT_IF_UP
OpenThread network interface up

enumerator OPENTHREAD_EVENT_IF_DOWN
OpenThread network interface down

enumerator OPENTHREAD_EVENT_GOT_IP6
OpenThread stack added IPv6 address

enumerator OPENTHREAD_EVENT_LOST_IP6
OpenThread stack removed IPv6 address

enumerator OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN
OpenThread stack joined IPv6 multicast group

enumerator OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE
OpenThread stack left IPv6 multicast group

enumerator OPENTHREAD_EVENT_TREL_ADD_IP6
OpenThread stack added TREL IPv6 address

enumerator OPENTHREAD_EVENT_TREL_REMOVE_IP6
OpenThread stack removed TREL IPv6 address

enumerator OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN
OpenThread stack joined TREL IPv6 multicast group

enumerator OPENTHREAD_EVENT_SET_DNS_SERVER
OpenThread stack set DNS server >
enumerator **OPENTHREAD_EVENT_PUBLISH_MESHCOPE**
  OpenThread stack start to publish meshcope service >

enumerator **OPENTHREAD_EVENT_REMOVE_MESHCOPE**
  OpenThread stack start to remove meshcope service >

enum **esp_openthread_radio_mode_t**
The radio mode of OpenThread.
*Values:*

enumerator **RADIO_MODE_NATIVE**
  Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**
  UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**
  SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_MAX**
  Using for parameter check

enum **esp_openthread_host_connection_mode_t**
  How OpenThread connects to the host.
*Values:*

enumerator **HOST_CONNECTION_MODE_NONE**
  Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**
  CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_CLI_USB**
  CLI USB connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**
  RCP UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_SPI**
  RCP SPI connection to the host

enumerator **HOST_CONNECTION_MODE_MAX**
  Using for parameter check

**Header File**
- components/openthread/include/esp_openthread_lock.h
- This header file can be included with:
#include "esp_openthread_lock.h"

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```
REQUIRES openthread
```

```
PRIV_REQUIRES openthread
```

## Functions

**esp_err_t esp_openthread_lock_init (void)**

This function initializes the OpenThread API lock.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

**void esp_openthread_lock_deinit (void)**

This function deinitializes the OpenThread API lock.

**bool esp_openthread_lock_acquire (TickType_t block_ticks)**

This function acquires the OpenThread API lock.

**Note:** Every OT APIs that takes an otiInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

**Parameters** block_ticks -- [in] The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**void esp_openthread_lock_release (void)**

This function releases the OpenThread API lock.

**bool esp_openthread_task_switching_lock_acquire (TickType_t block_ticks)**

This function acquires the OpenThread API task switching lock.

**Note:** In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it’s not allowed, since the previous OpenThread API lock is not released yet. This task_switching lock allows the OpenThread API can be called in this case.

**Note:** Please use esp_openthread_lock_acquire() for normal cases.

**Parameters** block_ticks -- [in] The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**void esp_openthread_task_switching_lock_release (void)**

This function releases the OpenThread API task switching lock.

Header File

- components/openthread/include/esp_openthread_netif_glue.h
- This header file can be included with:

```c
#include "esp_openthread_netif_glue.h"
```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES openthread
```

or

```cmake
PRIV_REQUIRES openthread
```

Functions

void *`esp_openthread_netif_glue_init` (const `esp_openthread_platform_config_t` *config)

This function initializes the OpenThread network interface glue.

**Parameters**
- `config` -- [in] The platform configuration.

**Returns**
- glue pointer on success
- NULL on failure

void `esp_openthread_netif_glue_deinit` (void)

This function deinitializes the OpenThread network interface glue.

`esp_netif_t` *`esp_openthread_get_netif` (void)

This function acquires the OpenThread netif.

**Returns**
- The OpenThread netif or NULL if not initialized.

void `esp_openthread_register_meshcop_e_handler` (`esp_event_handler_t` handler, bool for_publish)

This function register a handler for meshcop-e service publish event and remove event.

**Parameters**
- `for_publish` -- [in] The usage of handler, true for publish event and false for remove event.

Macros

```c
ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD ()
```

Default configuration reference of OpenThread esp-netif.

```c
ESP_NETIF_DEFAULT_OPENTHREAD ()
```

Header File

- components/openthread/include/esp_openthread_border_router.h
- This header file can be included with:

```c
#include "esp_openthread_border_router.h"
```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES openthread
```

or
Functions

void *esp_openthread_set_backbone_netif *(esp_netif_t *backbone_netif)
Sets the backbone interface used for border routing.

Note: This function must be called before esp_openthread_init

Parameters backbone_netif -- [in] The backbone network interface (WiFi or ethernet)

esp_err_t esp_openthread_border_router_init (void)
Initializes the border router features of OpenThread.

Note: Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

Returns
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if feature not supported
• ESP_ERR_INVALID_STATE if already initialized
• ESP_FAIL on other failures

esp_err_t esp_openthread_border_router_deinit (void)
Deinitializes the border router features of OpenThread.

Returns
• ESP_OK on success
• ESP_ERR_INVALID_STATE if not initialized
• ESP_FAIL on other failures

esp_netif_t *esp_openthread_get_backbone_netif (void)
Gets the backbone interface of OpenThread border router.

Returns The backbone interface or NULL if border router not initialized.

void esp_openthread_register_rcp_failure_handler (esp_openthread_rcp_failure_handler handler)
Registers the callback for RCP failure.

esp_err_t esp_openthread_rcp_deinit (void)
Deinitializes the connection to RCP.

Returns
• ESP_OK on success
• ESP_ERR_INVALID_STATE if fail to deinitialize RCP

esp_err_t esp_openthread_rcp_init (void)
Initializes the connection to RCP.

Returns
• ESP_OK on success
• ESP_FAIL if fail to initialize RCP

Thread is an IPv6-based mesh networking technology for IoT.

Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.
2.5.4 ESP-NETIF

The purpose of the ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This allows applications to choose between IP stacks in the future.
- The APIs it provides are thread-safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation-agnostic and allows different implementations.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to components/esp_netif_stack/README.md.

Some ESP-NETIF API functions are intended to be called by application code, for example, to get or set interface IP addresses, and configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called by the default network event handlers.

**ESP-NETIF Architecture**

![Diagram of ESP-NETIF architecture](continues on next page)
Data and Event Flow in the Diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagate to the driver, user code, and network stack
- User settings and runtime configuration

ESP-NETIF Interaction

A) User Code, Boilerplate  Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and is outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure it with
   - ESP-NETIF specific options (flags, behavior, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - Use default handlers for common interfaces defined in IO drivers; or define a specific handler for customized behavior or new interfaces
   - Register handlers for app-related events (such as IP lost or acquired)

B) Interaction with network interfaces using ESP-NETIF API

1) Gets and sets TCP/IP-related parameters (DHCP, IP, etc)
2) Receives IP events (connect or disconnect)
3) Controls application lifecycle (set interface up or down)

B) Communication Driver, IO Driver, and Media Driver  Communication driver plays these two important roles in relation to ESP-NETIF:

1) Event handlers: Defines behavior patterns of interaction with ESP-NETIF (e.g., ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input or output functions to use ESP-NETIF transmit, receive, and free receive buffer
• Installs driver_transmit to the appropriate ESP-NETIF object so that outgoing packets from the network stack are passed to the IO driver
• Calls `esp_netif_receive()` to pass incoming data to the network stack

C) ESP-NETIF  ESP-NETIF serves as an intermediary between an IO driver and a network stack, connecting the packet data path between the two. It provides a set of interfaces for attaching a driver to an ESP-NETIF object at runtime and configures a network stack during compiling. Additionally, a set of APIs is provided to control the network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface can be divided into six groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input or Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters API for basic network interface properties
5) Network stack abstraction API: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
   • `SNTP API`
6) Driver conversion utilities API

D) Network Stack  The network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface  The ESP-NETIF L2 TAP interface is a mechanism in ESP-IDF used to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from the user application. Its typical usage in the embedded world might be the implementation of non-IP-related protocols, e.g., PTP, Wake on LAN. Note that only Ethernet (IEEE 802.3) is currently supported.

From a user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS, which provides file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). To learn more, refer to Virtual Filesystem Component.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configurations can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as a generic entry point to the Layer 2 infrastructure. What is important is then the specific configuration of the particular file descriptor. It can be configured to give access to a specific Network Interface identified by `if_key` (e.g., `ETH_DEF`) and to filter only specific frames based on their type (e.g., Ethernet type in the case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with the IP stack and so the IP-related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though this option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from the perspective of the user’s application, as it only gets access to the frame types it is interested in, and the remaining traffic is either passed to other L2 TAP file descriptors or to the IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization  To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.
open()  Once the ESP-NETIF L2 TAP is registered, it can be opened at path name "/dev/net/tap". The same path name can be opened multiple times up to CONFIG_ESP_NETIF_L2_TAP_MAX_FDS and multiple file descriptors with a different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with the O_NONBLOCK file status flag to make sure the read() does not block. Note that the write() may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using fcntl().

On success, open() returns the new file descriptor (a nonnegative integer). On error, -1 is returned, and errno is set to indicate the error.

ioctl()  The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior to its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- L2TAP_S_INTF_DEVICE - bounds the file descriptor to a specific Network Interface that is identified by its if_key. ESP-NETIF Network Interface if_key is passed to ioctl() as the third parameter. Note that default Network Interfaces if_key's used in ESP-IDF can be found in esp_netif/include/esp_netif_defaults.h.
- L2TAP_S_DEVICE_DRV_HNDL - is another way to bound the file descriptor to a specific Network Interface. In this case, the Network interface is identified directly by IO Driver handle (e.g., esp_eth_handle_t in case of Ethernet). The IO Driver handle is passed to ioctl() as the third parameter.
- L2TAP_S_RCV_FILTER - sets the filter to frames with the type to be passed to the file descriptor. In the case of Ethernet frames, the frames are to be filtered based on the Length and Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field, and all frames with values in interval <0,0x05DC> at that field are passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by the user's application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames that are equal to the set value are to be passed to the file descriptor.

All above-set configuration options have a getter counterpart option to read the current settings.

Warning:  The file descriptor needs to be firstly bounded to a specific Network Interface by L2TAP_S_INTF_DEVICE or L2TAP_S_DEVICE_DRV_HNDL to make L2TAP_S_RCV_FILTER option available.

Note:  VLAN-tagged frames are currently not recognized. If the user needs to process VLAN-tagged frames, they need a set filter to be equal to the VLAN tag (i.e., 0x8100 or 0x88A8) and process the VLAN-tagged frames in the user application.

Note:  L2TAP_S_DEVICE_DRV_HNDL is particularly useful when the user's application does not require the usage of an IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its if_key and hence it needs to be identified directly by its IO Driver handle.

On success, ioctl() returns 0. On error, -1 is returned, and errno is set to indicate the error.
* EBADF - not a valid file descriptor.
* EACCESS - options change is denied in this state (e.g., file descriptor has not been bounded to Network interface yet).
* EINVAL - invalid configuration argument. Ethernet type filter is already used by other file descriptors on that same Network interface.
* ENODEV - no such Network Interface which is tried to be assigned to the file descriptor exists.
* ENOSYS - unsupported operation, passed configuration option does not exist.
fcntl()

fcntl() is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with the file descriptor:

- **F_GETFD** - the function returns the file descriptor flags, and the third argument is ignored.
- **F_SETFD** - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* ENOSYS - unsupported command.

read()

Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on the actual state of the `O_NONBLOCK` file status flag. When the file status flag is set to blocking, the read operation waits until a frame is received and the context is switched to other tasks. When the file status flag is set to non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reached a configured threshold, the newly arrived frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when the size of the destination buffer is 0.
On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* EAGAIN - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

write()

A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. The user's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of an Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header, and user data. The length of these fields is as follows:

<table>
<thead>
<tr>
<th>Destination MAC</th>
<th>Source MAC</th>
<th>Type/Length</th>
<th>Payload (protocol header/data)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 B</td>
<td>6 B</td>
<td>2 B</td>
<td>0-1486 B</td>
</tr>
</tbody>
</table>

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when the size of the input buffer is 0.
On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* EBADMSG - The Ethernet type of the frame is different from the file descriptor configured filter.
* EIO - Network interface not available or busy.

close()

Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread-safe and can be called from a different task than the file descriptor is actually used. If such a situation occurs and one task is blocked in the I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with an error.
On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

* `EBADF` - not a valid file descriptor.

### `select()`
Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to make the `select()` function available.

### SNTP API
You can find a brief introduction to SNTP in general, its initialization code, and basic modes in Section `SNTP Time Synchronization` in `System Time`.

This section provides more details about specific use cases of the SNTP service, with statically configured servers, or use the DHCP-provided servers, or both. The workflow is usually very simple:

1. Initialize and configure the service using `esp_netif_sntp_init()`.
2. Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It is useful to start the service explicitly after connecting if we want to use the DHCP-obtained NTP servers. Please note, this option needs to be enabled before connecting, but the SNTP service should be started after.
3. Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).
4. Stop and destroy the service using `esp_netif_sntp_deinit()`.

#### Basic Mode with Statically Defined Server(s)
Initialize the module with the default configuration after connecting to the network. Note that it is possible to provide multiple NTP servers in the configuration struct:

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2, ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"));
esp_netif_sntp_init(&config);
```

**Note:** If we want to configure multiple SNTP servers, we have to update the lwIP configuration `CONFIG_LWIP_SNTP_MAX_SERVERS`.

#### Use DHCP-Obtained SNTP Server(s)
First of all, we have to enable the lwIP configuration option `CONFIG_LWIP_DHCP_GET_NTP_SRV`. Then we have to initialize the SNTP module with the DHCP option and without the NTP server:

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});
config.start = false; // start the SNTP service explicitly
config.server_from_dhcp = true; // accept the NTP offer from the DHCP
esp_netif_sntp_init(&config);
```

Then, once we are connected, we could start the service using:

```c
esp_netif_sntp_start();
```

**Note:** It is also possible to start the service during initialization (default `config.start=true`). This would likely to cause the initial SNTP request to fail (since we are not connected yet) and lead to some back-off time for subsequent requests.

#### Use Both Static and Dynamic Servers
Very similar to the scenario above (DHCP provided SNTP server), but in this configuration, we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when the DHCP-provided information
gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining a DHCP lease.

The typical configuration now looks as per below, providing the specific IP_EVENT to update the config and index of the first server to reconfigure (for example setting config.index_of_first_server=1 would keep the DHCP provided server at index 0, and the statically configured server at index 1).

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // start the SNTP service explicitly
config.server_from_dhcp = true; // accept the NTP offers from DHCP
config.renew_servers_after_new_IP = true; // let esp-netif update the configured
//SNTP server(s) after receiving the DHCP lease
config.index_of_first_server = 1; // updates from server num 1, leaving
//server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP; // IP event on which we refresh
//the configuration
```

Then we start the service normally with `esp_netif_sntp_start()`.

**ESP-NETIF Programmer’s Manual** Please refer to the following example to understand the initialization process of the default interface:

- Wi-Fi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet_example_main.c](#)
- L2TAP: [protocols/l2tap/main/l2tap_main.c](#)
- Wi-Fi Access Point: [wifi/getting_started/softAP/main/softap_example_main.c](#)

For more specific cases, please consult this guide: **ESP-NETIF Custom I/O Driver**.

**Wi-Fi Default Initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`  
- `esp_netif_create_default_wifi_ap()`  

Please note that these functions return the `esp_netif` handle, i.e., a pointer to a network interface object allocated and configured with default settings, as a consequence, which means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These `default` interfaces must not be created multiple times unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wi-Fi in AP+STA mode, both these interfaces have to be created.

**API Reference**

**Header File**

- `components/esp_netif/include/esp_netif.h`
- This header file can be included with:

  ```c
  #include "esp_netif.h"
  ```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your CMakeLists.txt:
Chapter 2. API Reference

REQUIRES esp_netif

or

PRIV_REQUIRES esp_netif

Functions

**esp_err_t esp_netif_init**(void)

Initialize the underlying TCP/IP stack.

**Note:** This function should be called exactly once from application code, when the application starts up.

**Returns**

- ESP_OK on success
- ESP_FAIL if initializing failed

**esp_err_t esp_netif_deinit**(void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Returns**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

**esp_netif_t** *esp_netif_new**(const esp_netif_config_t *esp_netif_config)

Creates an instance of new esp-netif object based on provided config.

**Parameters**

esp_netif_config -- [in] pointer esp-netif configuration

**Returns**

- pointer to esp-netif object on success
- NULL otherwise

void **esp_netif_destroy**(esp_netif_t *esp_netif)

Destroys the esp_netif object.

**Parameters**

esp_netif -- [in] pointer to the object to be deleted

**esp_err_t esp_netif_set_driver_config**(esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)

Configures driver related options of esp_netif object.

**Parameters**

- esp_netif -- [inout] pointer to the object to be configured
- driver_config -- [in] pointer esp-netif io driver related configuration

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**esp_err_t esp_netif_attach**(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Parameters**

- esp_netif -- [inout] pointer to esp_netif object to be attached
Chapter 2. API Reference

- **driver_handle** -- [in] pointer to the driver handle

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver's pot_attach callback failed

*esp_err_t* **esp_netif_receive**(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack. This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance
- **buffer** -- [in] Received data
- **len** -- [in] Length of the data frame
- **eb** -- [in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**
- ESP_OK

void **esp_netif_action_start**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Note:** This API can be directly used as event handler

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_stop**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

**Note:** This API can be directly used as event handler

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp_netif_action_connected**(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver connected event.

**Note:** This API can be directly used as event handler

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event_id** -- The specific ID of the event
- **data** -- Optional data associated with the event
Chapter 2. API Reference

void esp_netif_action_disconnected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

Note: This API can be directly used as event handler

Parameters
  • esp_netif -- [in] Handle to esp-netif instance
  • base -- The base type of the event
  • event_id -- The specific ID of the event
  • data -- Optional data associated with the event

void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

Note: This API can be directly used as event handler

Parameters
  • esp_netif -- [in] Handle to esp-netif instance
  • base -- The base type of the event
  • event_id -- The specific ID of the event
  • data -- Optional data associated with the event

void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

Note: This API can be directly used as event handler

Parameters
  • esp_netif -- [in] Handle to esp-netif instance
  • base -- The base type of the event
  • event_id -- The specific ID of the event
  • data -- Optional data associated with the event

void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

Note: This API can be directly used as event handler

Parameters
  • esp_netif -- [in] Handle to esp-netif instance
  • base -- The base type of the event
  • event_id -- The specific ID of the event
  • data -- Optional data associated with the event

void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.
Chapter 2. API Reference

**Note:** This API can be directly used as event handler

---

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

```c
void esp_netif_action_remove_ip6_address (void*esp_netif, esp_event_base_t base, int32_t event_id, void*data)
```

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note:** This API can be directly used as event handler

---

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `base` -- The base type of the event
- `event_id` -- The specific ID of the event
- `data` -- Optional data associated with the event

```c
esp_err_t esp_netif_set_default_netif (esp_netif_t *esp_netif)
```

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK on success

```c
esp_netif_t *esp_netif_get_default_netif (void)
```

Getter function of the default netif.

This API returns the selected default netif.

**Returns**
- Handle to esp-netif instance of the default netif.

```c
esp_err_t esp_netif_join_ip6_multicast_group (esp_netif_t *esp_netif, const esp_ip6_addr_t *addr)
```

Cause the TCP/IP stack to join a IPv6 multicast group.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `addr` -- [in] The multicast group to join

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

```c
esp_err_t esp_netif_leave_ip6_multicast_group (esp_netif_t *esp_netif, const esp_ip6_addr_t *addr)
```

Cause the TCP/IP stack to leave a IPv6 multicast group.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `addr` -- [in] The multicast group to leave

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

```c
esp_err_t esp_netif_set_mac(esp_netif_t *esp_netif, uint8_t mac[])
```

Set the mac address for the interface instance.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `mac` -- [in] Desired mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_get_mac(esp_netif_t *esp_netif, uint8_t mac[])
```

Get the mac address for the interface instance.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `mac` -- [out] Resultant mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_set_hostname(esp_netif_t *esp_netif, const char *hostname)
```

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

```c
esp_err_t esp_netif_get_hostname(esp_netif_t *esp_netif, const char **hostname)
```

Get interface hostname.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `hostname` -- [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

```c
bool esp_netif_is_netif_up(esp_netif_t *esp_netif)
```

Test if supplied interface is up or down.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- true - Interface is up
- false - Interface is down
**esp_err_t** esp_netif_get_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**Parameters**

- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [out] If successful, IP information will be returned in this argument.

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**esp_err_t** esp_netif_get_old_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Parameters**

- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [out] If successful, IP information will be returned in this argument.

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**esp_err_t** esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note:** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Parameters**

- **esp_netif** -- [in] Handle to esp-netif instance
- **ip_info** -- [in] IP information to set on the specified interface

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

**esp_err_t** esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.
Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `ip_info` -- [in] Store the old IP information for the specified interface

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
```

Get net interface index from network stack implementation.

**Note:** This index could be used in `setsockopt()` to bind socket with multicast interface

**Parameters** `esp_netif` -- [in] Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied `esp_netif`

```c
esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)
```

Get net interface name from network stack implementation.

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `name` -- [out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_napt_enable(esp_netif_t *esp_netif)
```

Enable NAPT on an interface.

**Note:** Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

**Parameters** `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

```c
esp_err_t esp_netif_napt_disable(esp_netif_t *esp_netif)
```

Disable NAPT on an interface.

**Parameters** `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED
**esp_err_t esp_netif_dhcps_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance
- **opt_op** -- [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** -- [in] Option index to get or set, must be one of the supported enum values.
- **opt_val** -- [inout] Pointer to the option parameter.
- **opt_len** -- [in] Length of the option parameter.

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**esp_err_t esp_netif_dhcpc_option** (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance
- **opt_op** -- [in] ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- **opt_id** -- [in] Option index to get or set, must be one of the supported enum values.
- **opt_val** -- [inout] Pointer to the option parameter.
- **opt_len** -- [in] Length of the option parameter.

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**esp_err_t esp_netif_dhcpc_start** (esp_netif_t *esp_netif)

Start DHCP client (only if enabled in interface object)

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

**esp_err_t esp_netif_dhcpc_stop** (esp_netif_t *esp_netif)

Stop DHCP client (only if enabled in interface object)

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Note:** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

**Note:** Calling action_netif_stop() will also stop the DHCP Client if it is running.
### Chapter 2. API Reference

- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**esp_err_t esp_netif_dhcpc_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP client status.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `status` -- [out] If successful, the status of DHCP client will be returned in this argument.

**Returns**
- ESP_OK

**esp_err_t esp_netif_dhcps_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)**

Get DHCP Server status.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `status` -- [out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**
- ESP_OK

**esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)**

Start DHCP server (only if enabled in interface object)

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)**

Stop DHCP server (only if enabled in interface object)

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**esp_err_t esp_netif_dhcps_get_clients_by_mac (esp_netif_t *esp_netif, int num, esp_netif_pair_mac_ip_t *mac_ip_pair)**

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `num` -- [in] Number of clients with specified MAC addresses in the array of pairs
- `mac_ip_pair` -- [inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
- ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

**esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)**

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled.
If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**

- `esp_netif` -- [in] Handle to esp-netif instance
- `type` -- [in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` -- [in] DNS Server address to set

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```
esp_err_t esp_netif_get_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Parameters**

- `esp_netif` -- [in] Handle to esp-netif instance
- `type` -- [in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` -- [out] DNS Server result is written here on success

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```
esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Parameters**

- `esp_netif` -- [in] Handle to esp-netif instance

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```
esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- `esp_netif` -- [in] Handle to esp-netif instance
- `if_ip6` -- [out] IPv6 information will be returned in this argument if successful.

**Returns**

- ESP_OK
• ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

```c
esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `if_ip6` -- [out] IPv6 information will be returned in this argument if successful.

**Returns**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

```c
int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
```
Get all IPv6 addresses of the specified interface.

**Parameters**
- `esp_netif` -- [in] Handle to esp-netif instance
- `if_ip6` -- [out] Array of IPv6 addresses will be copied to the argument

**Returns**
- Number of returned IPv6 addresses

```c
void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```
Sets IPv4 address to the specified octets.

**Parameters**
- `addr` -- [out] IP address to be set
- `a` -- the first octet (127 for IP 127.0.0.1)
- `b` --
- `c` --
- `d` --

```c
char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
```
Converts numeric IP address into decimal dotted ASCII representation.

**Parameters**
- `addr` -- IP address in network order to convert
- `buf` -- target buffer where the string is stored
- `buflen` -- length of buf

**Returns**
- Either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

```c
uint32_t esp_ip4addr_aton (const char *addr)
```
ASCII internet address interpretation routine The value returned is in network order.

**Parameters**
- `addr` -- IP address in ascii representation (e.g. "127.0.0.1")

**Returns**
- IP address in network order

```c
esp_err_t esp_netif_str_to_ip4 (const char *src, esp_ip4_addr_t *dst)
```
Converts ASCII internet IPv4 address into esp_ip4_addr_t.

**Parameters**
- `src` -- [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
- `dst` -- [out] Address of the target esp_ip4_addr_t structure to receive converted address

**Returns**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into
**esp_err_t esp_netif_str_to_ip6 (const char *src, esp_ip6_addr_t *dst)**

Converts Ascii internet IPv6 address into esp_ip4_addr_t. Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:2:1" or "2001:db8::2:1"

**Parameters**
- **src** -- [in] IPv6 address in ascii representation (e.g. "2001:0db8:85a3:0000:0000:0000:0002:0001")
- **dst** -- [out] Address of the target esp_ip6_addr_t structure to receive converted address

**Returns**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

**esp_netif_iodriver_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)**

Gets media driver handle for this esp-netif instance.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- opaque pointer of related IO driver

**esp_netif_iodriver_handle esp_netif_get_handle_from_ifkey (const char *if_key)**

Searches over a list of created objects to find an instance with supplied if key.

**Parameters**
- **if_key** -- Textual description of network interface

**Returns**
- Handle to esp-netif instance

**esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)**

Returns configured flags for this interface.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- Configuration flags

**const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)**

Returns configured interface key for this esp-netif instance.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- Textual description of related interface

**const char *esp_netif_get_desc (esp_netif_t *esp_netif)**

Returns configured interface type for this esp-netif instance.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- Enumerated type of this interface, such as station, AP, ethernet

**int esp_netif_get_route_prio (esp_netif_t *esp_netif)**

Returns configured routing priority number.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance

**Returns**
- Integer representing the instance’s route-prio, or -1 if invalid paramters

**int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)**

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**
- **esp_netif** -- [in] Handle to esp-netif instance
- **event_type** -- (either get or lost IP)

**Returns**
- specific event id which is configured to be raised if the interface lost or acquired IP address
- -1 if supplied event_type is not known

**esp_netif_t *esp_netif_next (esp_netif_t *esp_netif)**

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

---

**Note:** This API doesn’t lock the list, nor the TCPIP context, as this it's usually required to get atomic access between iteration steps rather that within a single iteration. Therefore it is recommended to iterate over the
interfaces inside `esp_netif_tcpip_exec()`

---

**Note:** This API is deprecated. Please use `esp_netif_next_unsafe()` directly if all the system interfaces are under your control and you can safely iterate over them. Otherwise, iterate over interfaces using `esp_netif_tcpip_exec()`, or use `esp_netif_find_if()` to search in the list of netifs with defined predicate.

---

**Parameters** `esp_netif` -- [in] Handle to esp-netif instance  
**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

```c
esp_netif_t *esp_netif_next_unsafe (esp_netif_t *esp_netif)
```

Iterates over list of interfaces without list locking. Returns first netif if NULL given as parameter.

- Used for bulk search loops within TCPIP context, e.g. using `esp_netif_tcpip_exec()`, or if we're sure that the iteration is safe from our application perspective (e.g. no interface is removed between iterations)

**Parameters** `esp_netif` -- [in] Handle to esp-netif instance  
**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

```c
esp_netif_t *esp_netif_find_if (esp_netif_find_predicate_t fn, void *ctx)
```

Return a netif pointer for the first interface that meets criteria defined by the callback.

**Parameters**  
• `fn` -- Predicate function returning true for the desired interface  
• `ctx` -- Context pointer passed to the predicate, typically a descriptor to compare with

**Returns** valid netif pointer if found, NULL if not

```c
size_t esp_netif_get_nr_of_ifs (void)
```

Returns number of registered esp_netif objects.

**Parameters**

**Returns** Number of esp_netifs

```c
void esp_netif_netstack_buf_ref (void*netstack_buf)
```

increase the reference counter of net stack buffer

**Parameters** `netstack_buf` -- [in] the net stack buffer

```c
void esp_netif_netstack_buf_free (void*netstack_buf)
```

free the netstack buffer

**Parameters** `netstack_buf` -- [in] the net stack buffer

```c
esp_err_t esp_netif_tcpip_exec (esp_netif_callback_fn fn, void *ctx)
```

Utility to execute the supplied callback in TCP/IP context.

**Parameters**  
• `fn` -- Pointer to the callback  
• `ctx` -- Parameter to the callback

**Returns** The error code (esp_err_t) returned by the callback

---

**Type Definitions**

typedef bool (*esp_netif_find_predicate_t)(esp_netif_t *netif, void *ctx)

Predicate callback for `esp_netif_find_if()` used to find interface which meets defined criteria.

typedef `esp_err_t` (*esp_netif_callback_fn)(void *ctx)

TCP/IP thread safe callback used with `esp_netif_tcpip_exec()`
Header File

- components/esp_netif/include/esp_netif_sntp.h
- This header file can be included with:

```c
#include "esp_netif_sntp.h"
```
- This header file is a part of the API provided by the esp_netif component. To declare that your component depends on esp_netif, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_netif
```
or

```cmake
PRIV_REQUIRES esp_netif
```

Functions

```c
esp_err_t esp_netif_sntp_init (const esp_sntp_config_t *config)
```
Initialize SNTP with supplied config struct.

- **Parameters**
  - `config` -- Config struct
- **Returns**
  - ESP_OK on success

```c
esp_err_t esp_netif_sntp_start (void)
```
Start SNTP service if it wasn’t started during init (config.start = false) or restart it if already started.

- **Returns**
  - ESP_OK on success

```c
void esp_netif_sntp_deinit (void)
```
Deinitialize esp_netif SNTP module.

```c
esp_err_t esp_netif_sntp_sync_wait (TickType_t tout)
```
Wait for time sync event.

- **Parameters**
  - `tout` -- Specified timeout in RTOS ticks
- **Returns**
  - ESP_TIMEOUT if sync event didn’t came withing the timeout
  - ESP_ERR_NOT_FINISHED if the sync event came, but we’re in smooth update mode and still in progress (SNTP_SYNC_STATUS_IN_PROGRESS)
  - ESP_OK if time sync’ed

Structures

```c
struct esp_sntp_config
```
SNTP configuration struct.

Public Members

```c
bool smooth_sync
```
set to true if smooth sync required

```c
bool server_from_dhcp
```
set to true to request NTP server config from DHCP

```c
bool wait_for_sync
```
if true, we create a semaphore to signal time sync event

```c
bool start
```
set to true to automatically start the SNTP service
**esp_sntp_time_cb_t** `sync_cb`

optionally sets callback function on time sync event

```c
bool renew_servers_after_new_IP
```

this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

```c
ip_event_t ip_event_to_renew
```

set the IP event id on which we refresh server list (if `renew_servers_after_new_IP`=true)

```c
size_t index_of_first_server
```

refresh server list after this server (if `renew_servers_after_new_IP`=true)

```c
size_t num_of_servers
```

number of preconfigured NTP servers

```c
const char *servers[1]
```

list of servers

### Macros

**ESP_SNTP_SERVER_LIST(...)**

Utility macro for providing multiple servers in parentheses.

**ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE (servers_in_list, list_of_servers)**

Default configuration to init SNTP with multiple servers.

**Parameters**

- `servers_in_list` -- Number of servers in the list
- `list_of_servers` -- List of servers (use `ESP_SNTP_SERVER_LIST(...)`)

**ESP_NETIF_SNTP_DEFAULT_CONFIG (server)**

Default configuration with a single server.

### Type Definitions

```c
typedef void (*esp_sntp_time_cb_t)(struct timeval *tv)
```

Time sync notification function.

```c
typedef struct esp_sntp_config esp_sntp_config_t
```

SNTP configuration struct.

### Header File

- `components/esp_netif/include/esp_netif_types.h`
- This header file can be included with:

  ```c
  #include "esp_netif_types.h"
  ```

  This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

  ```cmake
  REQUIRES esp_netif
  ```

  or

  ```cmake
  PRIV_REQUIRES esp_netif
  ```
Structures

```c
struct esp_netif_dns_info_t
    DNS server info.

Public Members

    esp_ip_addr_t ip
        IPV4 address of DNS server

struct esp_netif_ip_info_t
    Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events

Public Members

    esp_ip4_addr_t ip
        Interface IPV4 address

    esp_ip4_addr_t netmask
        Interface IPV4 netmask

    esp_ip4_addr_t gw
        Interface IPV4 gateway address

struct esp_netif_ip6_info_t
    IPV6 IP address information.

Public Members

    esp_ip6_addr_t ip
        Interface IPV6 address

struct ip_event_got_ip_t
    Event structure for IP_EVENT_GOT_IP event.

Public Members

    esp_netif_t *esp_netif
        Pointer to corresponding esp-netif object

    esp_netif_ip_info_t ip_info
        IP address, netmask, gateway IP address

    bool ip_changed
        Whether the assigned IP has changed or not

struct ip_event_got_ip6_t
    Event structure for IP_EVENT_GOT_IP6 event
```
Chapter 2. API Reference

Public Members

*esp_netif_t* **esp_netif**

Pointer to corresponding esp-netif object

*esp_netif_ip6_info_t* **ip6_info**

IPv6 address of the interface

int **ip_index**

IPv6 address index

struct **ip_event_add_ip6_t**

Event structure for ADD_IP6 event

Public Members

*esp_ip6_addr_t* **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip_event_ap_staipassigned_t**

Event structure for IP_EVENT_AP_STAIPASSIGNED event

Public Members

*esp_netif_t* **esp_netif**

Pointer to the associated netif handle

*esp_ip4_addr_t* **ip**

IP address which was assigned to the station

uint8_t **mac[6]**

MAC address of the connected client

struct **bridgeif_config**

LwIP bridge configuration

Public Members

uint16_t **max_fdb_dyn_entries**

maximum number of entries in dynamic forwarding database

uint16_t **max_fdb_sta_entries**

maximum number of entries in static forwarding database
Chapter 2. API Reference

```c
uint8_t max_ports
    maximum number of ports the bridge can consist of

struct esp_netif_inherent_config
    ESP-netif inherent config parameters.

Public Members

esp_netif_flags_t flags
    flags that define esp-netif behavior

uint8_t mac[6]
    initial mac address for this interface

const esp_netif_ip_info_t *ip_info
    initial ip address for this interface

uint32_t get_ip_event
    event id to be raised when interface gets an IP

uint32_t lost_ip_event
    event id to be raised when interface losts its IP

const char *if_key
    string identifier of the interface

const char *if_desc
    textual description of the interface

int route_prio
    numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t *bridge_info
    LwIP bridge configuration

struct esp_netif_driver_base_s
    ESP-netif driver base handle.

Public Members

esp_err_t (*post_attach)(esp_netif_t *netif, esp_netif_iodriver_handle h)
    post attach function pointer

esp_netif_t *netif
    netif handle
```
struct `esp_netif_driver_ifconfig`  
Specific IO driver configuration.

### Public Members

- `esp_netif_iiodriver_handle` **handle**  
  io-driver handle

- `esp_err_t (*transmit)(void *h, void *buffer, size_t len)`  
  transmit function pointer

- `esp_err_t (*transmit_wrap)(void *h, void *buffer, size_t len, void *netstack_buffer)`  
  transmit wrap function pointer

- `void (*driver_free_rx_buffer)(void *h, void *buffer)`  
  free rx buffer function pointer

struct `esp_netif_config`  
Generic esp_netif configuration.

### Public Members

- `const esp_netif_inherent_config_t *base`  
  base config

- `const esp_netif_driver_ifconfig_t *driver`  
  driver config

- `const esp_netif_netstack_config_t *stack`  
  stack config

struct `esp_netif_pair_mac_ip_t`  
DHCP client's addr info (pair of MAC and IP address)

### Public Members

- `uint8_t *mac[6]`  
  Clients MAC address

- `esp_ip4_addr_t ip`  
  Clients IP address

### Macros

**ESP_ERR_ESP_NETIF_BASE**  
Definition of ESP-NETIF based errors.
Chapter 2. API Reference

ESP_ERR_ESP_NETIF_INVALID_PARAMS
ESP_ERR_ESP_NETIF_IF_NOT_READY
ESP_ERR_ESP_NETIF_DHCPC_START_FAILED
ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
ESP_ERR_ESP_NETIF_NO_MEM
ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED
ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED
ESP_ERR_ESP_NETIF_INIT_FAILED
ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED
ESP_ERR_ESP_NETIF_MLD6_FAILED
ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED
ESP_ERR_ESP_NETIF_DHCPS_START_FAILED
ESP_NETIF_BR_FLOOD
   Definition of ESP-NETIF bridge control.
ESP_NETIF_BR_DROP
ESP_NETIF_BR_FDW_CPU

Type Definitions

typedef struct esp_netif_obj esp_netif_t

typedef enum esp_netif_flags esp_netif_flags_t

typedef enum esp_netif_ip_event_type esp_netif_ip_event_type_t

typedef struct bridgeif_config bridgeif_config_t
   LwIP bridge configuration

typedef struct esp_netif_inherent_config esp_netif_inherent_config_t
   ESP-netif inherent config parameters.
typedef struct \textit{esp_netif_config} \textit{esp_netif_config_t} 

typedef void *\textit{esp_netif_iodriver_handle} 

IO driver handle type.

typedef struct \textit{esp_netif_driver_base_s} \textit{esp_netif_driver_base_t} 

ESP-netif driver base handle.

typedef struct \textit{esp_netif_driver_ifconfig} \textit{esp_netif_driver_ifconfig_t} 

ESP-netif driver ifconfig type.

typedef struct \textit{esp_netif_netstack_config} \textit{esp_netif_netstack_config_t} 

Specific L3 network stack configuration.

typedef \textit{esp_err_t} (*\textit{esp_netif_receive_t})(\textit{esp_netif_t} *\textit{esp_netif}, void *\textit{buffer}, size_t \textit{len}, void *\textit{eb}) 

ESP-NETIF Receive function type.

\textbf{Enumerations}

\textbf{enum} \textit{esp_netif_dns_type_t} 

Type of DNS server.

\textit{Values}: 

- enumerator \textit{ESP_NETIF_DNS_MAIN} 
  DNS main server address 

- enumerator \textit{ESP_NETIF_DNS_BACKUP} 
  DNS backup server address (Wi-Fi STA and Ethernet only) 

- enumerator \textit{ESP_NETIF_DNS_FALLBACK} 
  DNS fallback server address (Wi-Fi STA and Ethernet only) 

- enumerator \textit{ESP_NETIF_DNS_MAX}

\textbf{enum} \textit{esp_netif_dhcp_status_t} 

Status of DHCP client or DHCP server.

\textit{Values}: 

- enumerator \textit{ESP_NETIF_DHCP_INIT} 
  DHCP client/server is in initial state (not yet started) 

- enumerator \textit{ESP_NETIF_DHCP_STARTED} 
  DHCP client/server has been started 

- enumerator \textit{ESP_NETIF_DHCP_STOPPED} 
  DHCP client/server has been stopped 

- enumerator \textit{ESP_NETIF_DHCP_STATUS_MAX}
enum `esp_netif_dhcp_option_mode_t`  
Mode for DHCP client or DHCP server option functions.  
Values:

enumerator `ESP_NETIF_OP_START`  

enumerator `ESP_NETIF_OP_SET`  
Set option

enumerator `ESP_NETIF_OP_GET`  
Get option

enumerator `ESP_NETIF_OP_MAX`

enum `esp_netif_dhcp_option_id_t`  
Supported options for DHCP client or DHCP server.  
Values:

enumerator `ESP_NETIF_SUBNET_MASK`  
Network mask

enumerator `ESP_NETIF_DOMAIN_NAME_SERVER`  
Domain name server

enumerator `ESP_NETIF_ROUTER_SOLICITATION_ADDRESS`  
Solicitation router address

enumerator `ESP_NETIF_REQUESTED_IP_ADDRESS`  
Request specific IP address

enumerator `ESP_NETIF_IP_ADDRESSLEASE_TIME`  
Request IP address lease time

enumerator `ESP_NETIF_IP_REQUEST_RETRY_TIME`  
Request IP address retry counter

enumerator `ESP_NETIF_VENDOR_CLASS_IDENTIFIER`  
Vendor Class Identifier of a DHCP client

enumerator `ESP_NETIF_VENDOR_SPECIFIC_INFO`  
Vendor Specific Information of a DHCP server

enum `ip_event_t`  
IP event declarations  
Values:

enumerator `IP_EVENT_STA_GOT_IP`  
station got IP from connected AP
enumerator **IP_EVENT_STA_LOST_IP**
station lost IP and the IP is reset to 0

denumerator **IP_EVENT_AP_STAIPASSIGNED**
soft-AP assign an IP to a connected station

denumerator **IP_EVENT_GOT_IP6**
station or ap or ethernet interface v6IP addr is preferred

denumerator **IP_EVENT_ETH_GOT_IP**
ethernet got IP from connected AP

denumerator **IP_EVENT_ETH_LOST_IP**
ethernet lost IP and the IP is reset to 0

denumerator **IP_EVENT_PPP_GOT_IP**
PPP interface got IP

denumerator **IP_EVENT_PPP_LOST_IP**
PPP interface lost IP

enum **esp_netif_flags**  
*Values:*

denumerator **ESP_NETIF_DHCP_CLIENT**

denumerator **ESP_NETIF_DHCP_SERVER**

denumerator **ESP_NETIF_FLAG_AUTOUP**

denumerator **ESP_NETIF_FLAG_GARP**

denumerator **ESP_NETIF_FLAG_EVENT_IP_MODIFIED**

denumerator **ESP_NETIF_FLAG_IS_PPP**

denumerator **ESP_NETIF_FLAG_IS_BRIDGE**

denumerator **ESP_NETIF_FLAG_MLDV6_REPORT**

enum **esp_netif_ip_event_type**  
*Values:*

denumerator **ESP_NETIF_IP_EVENT_GOT_IP**

denumerator **ESP_NETIF_IP_EVENT_LOST_IP**
**Header File**

```cmake
PRIV_REQUIRES esp_netif
```

**Functions**

*esp_ip6_addr_type_t* **esp_netif_ip6_get_addr_type**(esp_ip6_addr_t *ip6_addr)

Get the IPv6 address type.

- **Parameters** ip6_addr -- [in] IPv6 type
- **Returns** IPv6 type in form of enum esp_ip6_addr_type_t

static inline void **esp_netif_ip_addr_copy**(esp_ip_addr_t *dest, const esp_ip_addr_t *src)

Copy IP addresses.

- **Parameters**
  - dest -- [out] destination IP
  - src -- [in] source IP

**Structures**

struct **esp_ip6_addr**

IPv6 address.

- **Public Members**

  - uint32_t addr[4]
    - IPv6 address
  - uint8_t zone
    - zone ID

struct **esp_ip4_addr**

IPv4 address.

- **Public Members**

  - uint32_t addr
    - IPv4 address

struct **_ip_addr**

IP address.
Chapter 2. API Reference

Public Members

### Functions

**`esp_err_t esp_vfs_l2tap_intf_register (l2tap_vfs_config_t *config)`**

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

- **Parameters** `config` -- L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tapis used when this parameter is NULL.
- **Returns** `esp_err_t`
  - ESP_OK on success

**`esp_err_t esp_vfs_l2tap_intf_unregister (const char* base_path)`**

Removes L2 TAP virtual filesystem driver.

- **Parameters** `base_path` -- Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tapis used when this parameter is NULL.
- **Returns** `esp_err_t`
  - ESP_OK on success

**`esp_err_t esp_vfs_l2tap_eth_filter (l2tap_iodriver_handle driver_handle, void* buff, size_t *size)`**

Filters received Ethernet L2 frames into L2 TAP infrastructure.

- **Parameters**
  - `driver_handle` -- handle of driver at which the frame was received
  - `buff` -- received L2 frame
  - `size` -- input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP
- **Returns** `esp_err_t`
  - ESP_OK is always returned

### Structures

**struct l2tap_vfs_config_t**

L2Tap VFS config parameters.

### Public Members

```c
const char *base_path
```

vfs base path

### Macros

```c
L2TAP_VFS_DEFAULT_PATH
L2TAP_VFS_CONFIG_DEFAULT()
```
Type Definitions

  ```
• This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:
  ```
  REQUIRES esp_wifi
  ```
or
  ```
  PRIV_REQUIRES esp_wifi
  ```

Functions
```c
esp_err_t esp_netif_attach_wifi_station(esp_netif_t *esp_netif)
```
Attaches wifi station interface to supplied netif.

Parameters esp_netif -- instance to attach the wifi station to
Returns
• ESP_OK on success
• ESP_FAIL if attach failed

```c
esp_err_t esp_netif_attach_wifi_ap(esp_netif_t *esp_netif)
```
Attaches wifi soft AP interface to supplied netif.

Parameters esp_netif -- instance to attach the wifi AP to
Returns
• ESP_OK on success
• ESP_FAIL if attach failed
**esp_err_t esp_wifi_set_default_wifi_sta_handlers (void)**
Sets default wifi event handlers for STA interface.

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_set_default_wifi_ap_handlers (void)**
Sets default wifi event handlers for AP interface.

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_set_default_wifi_nan_handlers (void)**
Sets default wifi event handlers for NAN interface.

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers (void *esp_netif)**
Clears default wifi event handlers for supplied network interface.

**Parameters**
- **esp_netif** -- instance of corresponding if object

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_netif_t *esp_netif_create_default_wifi_ap (void)**
Creates default WIFI AP. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

**Returns**
- pointer to esp-netif instance

**esp_netif_t *esp_netif_create_default_wifi_sta (void)**
Creates default WIFI STA. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

**Returns**
- pointer to esp-netif instance

**esp_netif_t *esp_netif_create_default_wifi_nan (void)**
Creates default WIFI NAN. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. (Note that the default event loop needs to be created prior to calling this API)

**Returns**
- pointer to esp-netif instance
### Chapter 2. API Reference

#### void esp_netif_destroy_default_wifi (void *esp_netif)

Destroys default WIFI netif created with esp_netif_create_default_wifi_...() API.

**Note:** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

**Parameters**
- esp_netif -- [in] object to detach from WiFi and destroy

#### esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, const esp_netif_inherent_config_t *esp_netif_config)

Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Parameters**
- wifi_if -- [in] type of wifi interface
- esp_netif_config -- [in] inherent esp-netif configuration pointer

**Returns** pointer to esp-netif instance

#### esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

**Returns** created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Parameters**
- p_netif_sta -- [out] pointer where the resultant STA interface is saved (if non NULL)
- p_netif_ap -- [out] pointer where the resultant AP interface is saved (if non NULL)

**Returns** ESP_OK on success

### 2.5.5 IP Network Layer

#### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with ESP-NETIF connection capabilities.

By convention, the I/O driver has to register itself as an ESP-NETIF driver, and thus holds a dependency on ESP-NETIF component and is responsible for providing data path functions, post-attach callback and in most cases, also default event handlers to define network interface actions based on driver’s lifecycle transitions.

**Packet Input/Output** According to the diagram shown in the **ESP-NETIF Architecture** part, the following three API functions for the packet data path must be defined for connecting with ESP-NETIF:

- esp_netif_transmit()
- esp_netif_free_rx_buffer()
- esp_netif_receive()

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e., they get called from ESP-NETIF (and its underlying TCP/IP stack) and I/O driver provides their implementation.
The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

**Post Attach Callback**  A final part of the network interface initialization consists of attaching the ESP-NETIF instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_→driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to:

- post-attach function callback
- related ESP-NETIF instance

As a result, the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;        /*< base structure reserved as_→esp-netif driver */
    driver_impl *h;                      /*< handle of driver_→implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`.

So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between ESP-NETIF and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver→driver_impl
    };
    driver→base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver→driver_impl);
    return ESP_OK;
}
```

**Default Handlers**  I/O drivers also typically provide default definitions of lifecycle behavior of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc.

An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver→driver_impl, esp_netif_action_start, MY_DRV_→EVENT_START, esp_netif);
    driver_set_event_handler(driver→driver_impl, esp_netif_action_stop, MY_DRV_→EVENT_STOP, esp_netif);
    return ESP_OK;
}
```
Network Stack Connection  The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the ESP-NETIF, specifically from its TCP/IP stack connecting layer.

Note that ESP-IDF provides several network stack configurations for the most common network interfaces, such as for the Wi-Fi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set.

The following API reference outlines these network stack interaction with the ESP-NETIF:

Header File

- `components/esp_netif/include/esp_netif_net_stack.h`
- This header file can be included with:
  ```
#include "esp_netif_net_stack.h"
  ```
- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your CMakeLists.txt:
  ```
REQUIRES esp_netif
  ```
  or
  ```
PRIV_REQUIRES esp_netif
  ```

Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)`

Returns esp-netif handle.

Parameters `dev` -- [in] opaque ptr to network interface of specific TCP/IP stack

Returns handle to related esp-netif instance

`void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)`

Returns network stack specific implementation handle (if supported)

Parameters `esp_netif` -- [in] Handle to esp-netif instance

Returns handle to related network stack netif handle

`esp_err_t esp_netif_set_link_speed(esp_netif_t *esp_netif, uint32_t speed)`

Set link-speed for the specified network interface.

Parameters

- `esp_netif` -- [in] Handle to esp-netif instance
- `speed` -- [in] Link speed in bit/s

Returns `ESP_OK` on success

`esp_err_t esp_netif_transmit(esp_netif_t *esp_netif, void *data, size_t len)`

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Parameters

- `esp_netif` -- [in] Handle to esp-netif instance
- `data` -- [in] Data to be transmitted
- `len` -- [in] Length of the data frame

Returns `ESP_OK` on success, an error passed from the I/O driver otherwise

`esp_err_t esp_netif_transmit_wrap(esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)`

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.
Parameters

- esp_netif -- [in] Handle to esp-netif instance
- data -- [in] Data to be transmitted
- len -- [in] Length of the data frame
- netstack_buf -- [in] net stack buffer

Returns ESP_OK on success, an error passed from the I/O driver otherwise

void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters

- esp_netif -- [in] Handle to esp-netif instance
- buffer -- [in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

2.6 Peripherals API

2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pins.

ESP32-C6 has one ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide introduces ADC oneshot mode conversion.

Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- Resource Allocation - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- Unit Configuration - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- Read Conversion Result - covers how to get ADC conversion raw result.
- Hardware Limitations - describes the ADC-related hardware limitations.
- Power Management - covers power management-related information.
- IRAM Safe - describes tips on how to read ADC conversion raw results when the cache is disabled.
Chapter 2. API Reference

- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**  The ADC oneshot mode driver is implemented based on ESP32-C6 SAR ADC module. Different ESP chips might have different numbers of independent ADCs. From the oneshot mode driver’s point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::clk_src` selects the source clock of the ADC. If set to 0, the driver will fallback to using a default clock source, see `adc_oneshot_clk_src_t` to know the details.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

**Create an ADC Unit Handle Under Normal Oneshot Mode**

```c
adc_oneshot_unit_handle_t acl1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &acl1_handle));
```

**Recycle the ADC Unit**

```c
ESP_ERROR_CHECK(adc_oneshot_del_unit(acl1_handle));
```

**Unit Configuration**  After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to TRM > On-Chip Sensor and Analog Signal Processing.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note:**  For the IO corresponding ADC channel number, check datasheet to know the ADC IOs.

Additionally, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with the above configuration structure. You should specify an ADC channel to be configured as well. Function `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.
Configure Two ADC Channels

```c
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle,
    EXAMPLE_ADC1_CHAN0, &config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle,
    EXAMPLE_ADC1_CHAN1, &config));
```

Read Conversion Result  
After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safe to use. ADC(s) are shared by some other drivers/peripherals, see **Hardware Limitations**. This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers/peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

This function will fail due to invalid arguments.

The ADC conversion results read from this function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to TRM &gt; On-Chip Sensor and Analog Signal Processing.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is (2^\text{bitwidth}), where bitwidth is the :cpp:member:<code>adc_oneshot_chan_cfg_t::bitwidth</code> configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc **Analog to Digital Converter (ADC) Calibration Driver**.

Read Raw Result

```c
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0, adc_raw[0][0]);
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1, adc_raw[0][1]);
```

Hardware Limitations

- Random Number Generator (RNG) uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.

Power Management  
When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of
time, the task in which ADC oneshot mode driver resides will not be blocked. Therefore the clock frequency is stable when reading.

**IRAM Safe** By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled. Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc. If these APIs execute when the Cache is disabled, you will probably see errors like *Illegal Instruction* or *Load/Store Prohibited*.

**Thread Safety**

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`  
- `adc_oneshot_read()`

Above functions are guaranteed to be thread-safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread-safe. Besides, concurrently calling this function may result in failures of the above thread-safe APIs.

**Kconfig Options**

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see *IRAM Safe* for more details.

**Application Examples**

- ADC oneshot mode example: `peripherals/adc/oneshot_read`.

**API Reference**

**Header File**

- `components/hal/include/hal/adc_types.h`
- This header file can be included with:

  ```
  #include "hal/adc_types.h"
  ```

**Structures**

```
struct adc_digi_pattern_config_t

ADC digital controller pattern configuration.
```

**Public Members**

```
uint8_t atten

Attenuation of this ADC channel.
```

```
uint8_t channel

ADC channel.
```

```
uint8_t unit

ADC unit.
```
uint8_t `bit_width`
  ADC output bit width.

struct `adc_digi_output_data_t`
  ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

**Public Members**

`uint32_t data`
  ADC real output data info. Resolution: 12 bit.

`uint32_t reserved12`
  Reserved 12.

`uint32_t channel`
  ADC channel index info. If `channel < ADC_CHANNEL_MAX`, The data is valid. If `channel > ADC_CHANNEL_MAX`, The data is invalid.

`uint32_t reserved17_31`
  Reserved 17-31.

struct `adc_digi_output_data_t::[anonymous]::[anonymous]` `type2`
  When the configured output format is 12bit.

`uint32_t val`
  Raw data value

**Type Definitions**

typedef `soc_periph_adc_digi_clk_src_t` `adc_oneshot_clk_src_t`
  Clock source type of oneshot mode which uses digital controller.

typedef `soc_periph_adc_digi_clk_src_t` `adc_continuous_clk_src_t`
  Clock source type of continuous mode which uses digital controller.

**Enumerations**

denum `adc_unit_t`
  ADC unit.
  Values:

  enumerator `ADC_UNIT_1`
    SAR ADC 1.

  enumerator `ADC_UNIT_2`
    SAR ADC 2.

denum `adc_channel_t`
  ADC channels.
  Values:
enumerator ADC_CHANNEL_0
    ADC channel.

enumerator ADC_CHANNEL_1
    ADC channel.

enumerator ADC_CHANNEL_2
    ADC channel.

enumerator ADC_CHANNEL_3
    ADC channel.

enumerator ADC_CHANNEL_4
    ADC channel.

enumerator ADC_CHANNEL_5
    ADC channel.

enumerator ADC_CHANNEL_6
    ADC channel.

enumerator ADC_CHANNEL_7
    ADC channel.

enumerator ADC_CHANNEL_8
    ADC channel.

enumerator ADC_CHANNEL_9
    ADC channel.

enum adc_atten_t
    ADC attenuation parameter. Different parameters determine the range of the ADC.
    Values:

enumerator ADC_ATTEN_DB_0
    No input attenuation, ADC can measure up to approx.

enumerator ADC_ATTEN_DB_2_5
    The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator ADC_ATTEN_DB_6
    The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator ADC_ATTEN_DB_12
    The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator ADC_ATTEN_DB_11
    This is deprecated, it behaves the same as ADC_ATTEN_DB_12
enum adc_bitwidth_t

Values:

enumerator ADC_BITWIDTH_DEFAULT
   Default ADC output bits, max supported width will be selected.

enumerator ADC_BITWIDTH_9
   ADC output width is 9Bit.

enumerator ADC_BITWIDTH_10
   ADC output width is 10Bit.

enumerator ADC_BITWIDTH_11
   ADC output width is 11Bit.

enumerator ADC_BITWIDTH_12
   ADC output width is 12Bit.

enumerator ADC_BITWIDTH_13
   ADC output width is 13Bit.

enum adc_ulp_mode_t

Values:

enumerator ADC_ULP_MODE_DISABLE
   ADC ULP mode is disabled.

enumerator ADC_ULP_MODE_FSM
   ADC is controlled by ULP FSM.

enumerator ADC_ULP_MODE_RISCV
   ADC is controlled by ULP RISCV.

enum adc_digi_convert_mode_t

ADC digital controller (DMA mode) work mode.

Values:

enumerator ADC_CONV_SINGLE_UNIT_1
   Only use ADC1 for conversion.

enumerator ADC_CONV_SINGLE_UNIT_2
   Only use ADC2 for conversion.

enumerator ADC_CONV_BOTH_UNIT
   Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator ADC_CONV_ALTER_UNIT
   Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2.....
enum **adc_digi_output_format_t**

ADC digital controller (DMA mode) output data format option.

*Values:*

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**

See `adc_digi_output_data_t.type1`

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**

See `adc_digi_output_data_t.type2`

enum **adc_digi_iir_filter_t**

ADC IIR Filter ID.

*Values:*

enumerator **ADC_DIGI_IIR_FILTER_0**

Filter 0.

enumerator **ADC_DIGI_IIR_FILTER_1**

Filter 1.

enum **adc_digi_iir_filter_coeff_t**

IIR Filter Coefficient.

*Values:*

enumerator **ADC_DIGI_IIR_FILTER_COEFF_2**

The filter coefficient is 2.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_4**

The filter coefficient is 4.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_8**

The filter coefficient is 8.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_16**

The filter coefficient is 16.

enumerator **ADC_DIGI_IIR_FILTER_COEFF_64**

The filter coefficient is 64.

enum **adc_monitor_id_t**

ADC monitor (continuous mode) ID.

*Values:*

enumerator **ADC_MONITOR_0**

The monitor index 0.

enumerator **ADC_MONITOR_1**

The monitor index 1.
enum adc_monitor_mode_t
    Monitor config/event mode type.
    
    Values:
    
    enumerator ADC_MONITOR_MODE_HIGH
                ADC raw_result > threshold value, monitor interrupt will be generated.
    
    enumerator ADC_MONITOR_MODE_LOW
                ADC raw_result < threshold value, monitor interrupt will be generated.

Header File

- components/esp_adc/include/esp_adc/adc_oneshot.h
- This header file can be included with:

```c
#include "esp_adc/adc_oneshot.h"
```

- This header file is a part of the API provided by the esp_adc component. To declare that your component depends on esp_adc, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_adc
```

or

```cmake
PRIV_REQUIRES esp_adc
```

Functions

`esp_err_t adc_oneshot_new_unit` (const `adc_oneshot_unit_init_cfg_t` *init_config, `adc_oneshot_unit_handle_t` *ret_unit)

Create a handle to a specific ADC unit.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- `init_config` -- [in] Driver initial configurations
- `ret_unit` -- [out] ADC unit handle

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use
- ESP_FAIL: Clock source isn’t initialised correctly

`esp_err_t adc_oneshot_config_channel` (`adc_oneshot_unit_handle_t` handle, `adc_channel_t` channel, const `adc_oneshot_chan_cfg_t` *config)

Set ADC oneshot mode required configurations.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- `handle` -- [in] ADC handle
- `channel` -- [in] ADC channel to be configured
- `config` -- [in] ADC configurations
Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments

```c
esp_err_t adc_oneshot_read (adc_oneshot_unit_handle_t handle, adc_channel_t chan, int*out_raw)
```

Get one ADC conversion raw result.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Note:** This API should NOT be called in an ISR context

Parameters

- **handle** -- [in] ADC handle
- **chan** -- [in] ADC channel
- **out_raw** -- [out] ADC conversion raw result

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

```c
esp_err_t adc_oneshot_del_unit (adc_oneshot_unit_handle_t handle)
```

Delete the ADC unit handle.

**Note:** This API is thread-safe. For more details, see ADC programming guide

Parameters

- **handle** -- [in] ADC handle

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NOT_FOUND: The ADC peripheral to be disclaimed isn’t in use

```c
esp_err_t adc_oneshot_io_to_channel (int io_num, adc_unit_t *const unit_id, adc_channel_t *const channel)
```

Get ADC channel from the given GPIO number.

Parameters

- **io_num** -- [in] GPIO number
- **unit_id** -- [out] ADC unit
- **channel** -- [out] ADC channel

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_oneshot_channel_to_io (adc_unit_t unit_id, adc_channel_t channel, int *const io_num)
```

Get GPIO number from the given ADC channel.

Parameters

- **unit_id** -- [in] ADC unit
- **channel** -- [in] ADC channel
- **io_num** -- [out] GPIO number
- **--** -- ESP_OK: On success
- **--** ESP_ERR_INVALID_ARG: Invalid argument

```c
esp_err_t adc_oneshot_get_calibrated_result(adc_oneshot_unit_handle_t handle,
                                          adc_cali_handle_t cali_handle, adc_channel_t chan,
                                          int *cali_result)
```

Convenience function to get ADC calibrated result.

This is an all-in-one function which does:

- one-shot read ADC raw result
- calibrate the raw result and convert it into calibrated result (in mV)

**Parameters**

- `handle` -- [in] ADC oneshot handle, you should call `adc_oneshot_new_unit()` to get this handle
- `cali_handle` -- [in] ADC calibration handle, you should call `adc_cali_create_scheme_x()` in `adc_cali_scheme.h` to create a handle
- `chan` -- [in] ADC channel
- `cali_result` -- [out] Calibrated ADC result (in mV)

**Returns**

- ESP_OK Other return errors from `adc_oneshot_read()` and `adc_cali_raw_to_voltage()`

**Structures**

struct `adc_oneshot_unit_init_cfg_t`

ADC oneshot driver initial configurations.

**Public Members**

- `adc_unit_t unit_id`  
  ADC unit.

- `adc_oneshot_clk_src_t clk_src`  
  Clock source.

- `adc_ulp_mode_t ulp_mode`  
  ADC controlled by ULP, see `adc_ulp_mode_t`

struct `adc_oneshot_chan_cfg_t`

ADC channel configurations.

**Public Members**

- `adc_atten_t atten`  
  ADC attenuation.

- `adc_bitwidth_t bitwidth`  
  ADC conversion result bits.

**Type Definitions**

typedef struct `adc_oneshot_unit_ctx_t` *`adc_oneshot_unit_handle_t`  
Type of ADC unit handle for oneshot mode.
2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pads. Additionally, the Direct Memory Access (DMA) functionality is utilized to efficiently retrieve ADC conversion results.

ESP32-C6 has one ADC unit(s), which can be used in scenarios like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide introduces ADC continuous mode conversion.

Driver Concepts

ADC continuous mode conversion is made up of multiple conversion frames.

- **Conversion Frame**: One conversion frame contains multiple conversion results. Conversion frame size is configured in `adc_continuous_new_handle()` in bytes.
- **Conversion Result**: One conversion result contains multiple bytes, see `SOC_ADC_DIGI_RESULT_BYTES`. Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel, and raw data.

![One Conversion Frame](image)

Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from a group of ADC channels continuously:

- **Resource Allocation**: covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- **ADC Configurations**: describes how to configure the ADC(s) to make it work under continuous mode.
- **ADC Control**: describes ADC control functions.
- **Register Event Callbacks**: describes how to hook user-specific code to an ADC continuous mode event callback function.
- **Read Conversion Result**: covers how to get ADC conversion result.
- **Hardware Limitations**: describes the ADC-related hardware limitations.
- **Power Management**: covers power management-related information.
- **IRAM Safe**: covers the IRAM safe functions.
- **Thread Safety**: lists which APIs are guaranteed to be thread-safe by the driver.

Resource Allocation

The ADC continuous mode driver is implemented based on ESP32-C6 SAR ADC module. Different ESP targets might have different numbers of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size`: set the maximum size of the pool in bytes, and the driver saves ADC conversion result into the pool. If this pool is full, new conversion results will be lost.
Chapter 2. API Reference

- \textit{adc_continuous_handle_cfg_t::conv_frame_size} set the size of the ADC conversion frame, in bytes.
- \textit{adc_continuous_handle_cfg_t::flags} set the flags that can change the driver's behavior.
  - \textit{flush_pool} auto flush the pool when it's full.

After setting up the above configurations for the ADC, call \textit{adc_continuous_new_handle()} with the prepared \textit{adc_continuous_handle_cfg_t}. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns \textit{ESP_ERR_NOT_FOUND}, this means there is no free GDMA channel.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling \textit{adc_continuous_deinit()}.

\textbf{IIR filter} Two IIR filters are available when ADC is working in continuous mode. To create an IIR filter, you should set up \textit{adc_continuous_iir_filter_config_t} and call \textit{adc_new_continuous_iir_filter()}.

- \textit{adc_digi_filter_config_t::unit} ADC unit.
- \textit{adc_digi_filter_config_t::channel} ADC channel to be filtered.
- \textit{adc_digi_filter_config_t::coeff} Filter coefficient.

To recycle a filter, you should call \textit{adc_del_continuous_iir_filter()}.

\textbf{Note:} If you use both filters on the same ADC channel, then only the first one will take effect.

\textbf{Monitor} 2 monitors are available when ADC is working under continuous mode, you can set one or two threshold(s) of a monitor on a working ADC channel, then the monitor will invoke interrupts every sample loop if conversion result outranges of the threshold. To create an ADC monitor, you need to set up the \textit{adc_monitor_config_t} and call \textit{adc_new_continuous_monitor()}.

- \textit{adc_monitor_config_t::adc_unit} Configures which ADC unit the channel you want to monitor belongs to.
- \textit{adc_monitor_config_t::channel} The channel you want to monitor.
- \textit{adc_monitor_config_t::h_threshold} The high threshold, conversion result larger than this value invokes interrupt, set to -1 if do not use.
- \textit{adc_monitor_config_t::l_threshold} The low threshold, conversion result less than this value invokes interrupt, set to -1 if do not use.

Once a monitor is created, you can operate it by following APIs to construct your apps.

- \textit{adc_continuous_monitor_enable():} Enable a monitor.
- \textit{adc_continuous_monitor_disable():} Disable a monitor.
- \textit{adc_monitor_register_callbacks():} register user callbacks to take action when the ADC value exceeds of the threshold.
- \textit{adc_del_continuous_monitor():} Delete a created monitor and free resources.

\textbf{Initialize the ADC Continuous Mode Driver}

\begin{verbatim}
adc_continuous_handle_cfg_t adc_config = {
  .max_store_buf_size = 1024,
  .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
\end{verbatim}

\textbf{Recycle the ADC Unit}

\begin{verbatim}
ESP_ERROR_CHECK(adc_continuous_deinit());
\end{verbatim}
ADC Configurations After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`: number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`: list of configs for each ADC channel that will be used, see the description below.
- `adc_continuous_config_t::sample_freq_hz`: expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`: continuous conversion mode.
- `adc_continuous_config_t::format`: conversion output format.

Set `adc_digi_pattern_config_t` with the following process:

- `adc_digi_pattern_config_t::atten`: ADC attenuation. Refer to the On-Chip Sensor and Analog Signal Processing chapter in TRM.
- `adc_digi_pattern_config_t::channel`: the IO corresponding ADC channel number. See the note below.
- `adc_digi_pattern_config_t::unit`: the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`: the bitwidth of the raw conversion result.

Note: For the IO corresponding ADC channel number, check TRM to acquire the ADC IOs. Besides, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you should not call this API at this moment.

See ADC continuous mode example peripherals/adc/continuous_read to see configuration codes.

To enable/disable the ADC IIR filter, you should call `adc_continuous_iir_filter_enable()` / `adc_continuous_iir_filter_disable()`.

To enable/disable the ADC monitor, you should call `adc_continuous_monitor_enable()` / `adc_continuous_monitor_disable()`.

ADC Control

Start and Stop Calling `adc_continuous_start()` makes the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results.

On the contrary, calling `adc_continuous_stop()` stops the ADC conversion.

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

Register Event Callbacks By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t`.

- `adc_continuous_evt_cbs_t::on_conv_done`: this is invoked when one conversion frame finishes.
- `adc_continuous_evt_cbs_t::on_pool_ovf`: this is invoked when the internal pool is full. Newer conversion results will be discarded.

As the above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logic should not appear in these callbacks. The callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()` by the parameter `user_data`. This user data will be passed to the callback functions directly.
This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Especially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions are not in the internal RAM. Check the error log for more details. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, it indicates that the ADC continuous mode driver is started, and you should not add a callback at this moment.

**Conversion Done Event**  
When the driver completes a conversion, it triggers the `adc_continuous_evt_cbs_t::on_conv_done` event and fills the event data. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

**Note:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

**Pool Overflow Event**  
The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver will not fill in the event data. This usually happens because the speed to read data from the pool by calling `adc_continuous_read()` is much slower than the ADC conversion speed.

**Read Conversion Result**  
After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

Function `adc_continuous_read()` tries to read the expected length of conversion results each time.

- When calling `adc_continuous_read()`, you can request to read a conversion result of the specified length. Sometimes, however, the actual available conversion results may be less than the requested length, in which case the function still moves the data from the internal pool into the buffer you provided. Therefore, to learn the number of conversion results actually moved into the buffer, please check the value of `out_length`.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there are still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, newly generated results will be lost. Next time when `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` to indicate this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from the above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor and Analog Signal Processing chapter in TRM.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is (2^{\text{bitwidth}}), where the bitwidth is the <code>adc_digi_pattern_config_t::bit_width</code> configured before.</td>
</tr>
</tbody>
</table>
Chapter 2. API Reference

To do further calibration to convert the ADC raw result to voltage in mV, please refer to Analog to Digital Converter (ADC) Calibration Driver.

Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or one-shot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator (RNG) uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.

Power Management

When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise, the power management will be out of action.

IRAM Safe
All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, the driver’s internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

Thread Safety
ADC continuous mode driver APIs are not guaranteed to be thread-safe. However, the share hardware mutual exclusion is provided by the driver. See Hardware Limitations for more details.

Application Examples

- ADC continuous mode example: `peripherals/adc/continuous_read`.

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_continuous.h`
- This header file can be included with:

```
#include "esp_adc/adc_continuous.h"
```
- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your CMakelists.txt:

```
REQUIRES esp_adc
```

or

```
PRIV_REQUIRES esp_adc
```

Functions

`esp_err_t adc_continuous_new_handle` (const `adc_continuous_handle_cfg_t` *hdl_config, `adc_continuous_handle_t` *ret_handle)

Initialize ADC continuous driver and get a handle to it.

Parameters
Chapter 2. API Reference

- **hdl_config**  --  [in]  Pointer to ADC initialization config. Refer to `adc_continuous_handle_cfg_t`.
- **ret_handle**  --  [out]  ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

```c
esp_err_t adc_continuous_config(adc_continuous_handle_t handle, const adc_continuous_config_t *config)
```

Set ADC continuous mode required configurations.

**Parameters**
- **handle**  --  [in]  ADC continuous mode driver handle
- **config**  --  [in]  Refer to `adc_digi_config_t`.

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_register_event_callbacks(adc_continuous_handle_t handle, const adc_continuous_evt_cbs_t *cbs, void *user_data)
```

Register callbacks.

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including `user_data`) should be in internal RAM as well.

**Note:** You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

**Parameters**
- **handle**  --  [in]  ADC continuous mode driver handle
- **cbs**  --  [in]  Group of callback functions
- **user_data**  --  [in]  User data, which will be delivered to the callback functions directly

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn't call this API at this moment

```c
esp_err_t adc_continuous_start(adc_continuous_handle_t handle)
```

Start the ADC under continuous mode. After this, the hardware starts working.

**Parameters**
- **handle**  --  [in]  ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success
**esp_err_t adc_continuous_read** (adc_continuous_handle_t handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)

Read bytes from ADC under continuous mode.

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle
- **buf** -- [out] Conversion result buffer to read from ADC. Suggest convert to adc_digi_output_data_t for ADC Conversion Results. See the subsection Driver Backgrounds in this header file to learn about this concept.
- **length_max** -- [in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out_length** -- [out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout_ms** -- [in] Time to wait for data via this API, in millisecond.

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

**esp_err_t adc_continuous_stop** (adc_continuous_handle_t handle)

Stop the ADC. After this, the hardware stops working.

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

**esp_err_t adc_continuous_deinit** (adc_continuous_handle_t handle)

Deinitialize the ADC continuous driver.

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

**esp_err_t adc_continuous_flush_pool** (adc_continuous_handle_t handle)

Flush the driver internal pool.

**Note:** This API is not supposed to be called in an ISR context

**Parameters**
- **handle** -- [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE Driver state is invalid, you should call this API when it's in init state
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_OK On success

**esp_err_t adc_continuous_io_to_channel** (int io_num, adc_unit_t *const unit_id, adc_channel_t *const channel)

Get ADC channel from the given GPIO number.

**Parameters**
- **io_num** -- [in] GPIO number
- **unit_id** -- [out] ADC unit
- **channel** -- [out] ADC channel

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_continuous_channel_to_io (adc_unit_t unit_id, adc_channel_t channel, int *const io_num)
```

Get GPIO number from the given ADC channel.

**Parameters**
- `unit_id` -- [in] ADC unit
- `channel` -- [in] ADC channel
- `io_num` -- [out] GPIO number
- `--` ESP_OK: On success
  - ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

```c
struct adc_continuous_handle_cfg_t
```

ADC continuous mode driver initial configurations.

**Public Members**

```c
uint32_t max_store_buf_size
```
Max length of the conversion results that driver can store, in bytes.

```c
uint32_t conv_frame_size
```
Conversion frame size, in bytes. This should be in multiples of 
`SOC_ADC_DIGI_DATA_BYTES_PER_CONV`.

```c
uint32_t flush_pool
```
Flush the internal pool when the pool is full.

```c
struct adc_continuous_handle_cfg_t::[anonymous] flags
```
Driver flags.

```c
struct adc_continuous_config_t
```
ADC continuous mode driver configurations.

**Public Members**

```c
uint32_t pattern_num
```
Number of ADC channels that will be used.

```c
adc_digi_pattern_config_t *adc_pattern
```
List of configs for each ADC channel that will be used.

```c
uint32_t sample_freq_hz
```
The expected ADC sampling frequency in Hz. Please refer to `soc/soc_caps.h` to know available 
sampling frequency range

```c
adc_digi_convert_mode_t conv_mode
```
ADC DMA conversion mode, see `adc_digi_convert_mode_t`.  

---

Espressif Systems 946  
Submit Document Feedback

Release v5.2.2
Chapter 2. API Reference

\[\text{adc_digi_output_format_t format}\]
ADC DMA conversion output format, see `adc_digi_output_format_t`.

**struct adc_continuous_evt_data_t**
Event data structure.

**Note:** The `conv_frame_buffer` is maintained by the driver itself, so never free this piece of memory.

### Public Members

- `uint8_t* conv_frame_buffer`
  Pointer to conversion result buffer for one conversion frame.

- `uint32_t size`
  Conversion frame size.

**struct adc_continuous_evt_cbs_t**
Group of ADC continuous mode callbacks.

**Note:** These callbacks are all running in an ISR environment.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

### Public Members

- `adc_continuous_callback_t on_conv_done`
  Event callback, invoked when one conversion frame is done. See the subsection Driver Backgrounds in this header file to learn about the conversion frame concept.

- `adc_continuous_callback_t on_pool_ovf`
  Event callback, invoked when the internal pool is full.

### Macros

**ADC_MAX_DELAY**
ADC read max timeout value, it may make the `adc_continuous_read` block forever if the OS supports.

### Type Definitions

```
typedef struct adc_continuous_ctx_t *adc_continuous_handle_t
```
Type of adc continuous mode driver handle.
typedef bool (*adc_continuous_callback_t)(adc_continuous_handle_t handle, const adc_continuous_evt_data_t *edata, void *user_data)

Prototype of ADC continuous mode event callback.

Param handle [in] ADC continuous mode driver handle
Param edata [in] Pointer to ADC continuous mode event data
Param user_data [in] User registered context, registered when in adc_continuous_register_event_callbacks()

Return Whether a high priority task is woken up by this function

2.6.3 Analog to Digital Converter (ADC) Calibration Driver

Introduction

In ESP32-C6, the digital-to-analog converter (ADC) compares the input analog voltage to the reference, and determines each bit of the output digital result. By design, the ADC reference voltage for ESP32-C6 is 1100mV. However, the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide introduces the ADC calibration driver to minimize the effect of different reference voltages, and get more accurate output results.

Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- Calibration Scheme Creation - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- Result Conversion - covers how to convert ADC raw result to calibrated result.
- Thread Safety - lists which APIs are guaranteed to be thread-safe by the driver.
- Minimize Noise - describes a general way to minimize the noise.

Calibration Scheme Creation

The ADC calibration driver provides ADC calibration scheme(s). From the calibration driver’s point of view, an ADC calibration scheme is created for an ADC calibration handle adc_cali_handle_t.

adc_cali_check_scheme() can be used to know which calibration scheme is supported on the chip. If you already know the supported schemes, this step can be skipped. Just call the corresponding function to create the scheme handle.

If you use your custom ADC calibration schemes, you could either modify this function adc_cali_check_scheme(), or just skip this step and call your custom creation function.

ADC Calibration Curve Fitting Scheme

ESP32-C6 supports ADC_CALI_SCHEME_VER_CURVE_FITTING scheme. To create this scheme, set up adc_cali_curve_fitting_config_t first.

- adc_cali_curve_fitting_config_t::unit_id, the ADC that your ADC raw results are from.
- adc_cali_curve_fitting_config_t::chan, the ADC channel that your ADC raw results are from. The calibration scheme not only differs by attenuation but is also related to the channels.
- adc_cali_curve_fitting_config_t::atten, ADC attenuation that your ADC raw results use.
- adc_cali_curve_fitting_config_t::bitwidth, bit width of ADC raw result.

After setting up the configuration structure, call adc_cali_create_scheme_curve_fitting() to create a Curve Fitting calibration scheme handle. This function may fail due to reasons such as ESP_ERR_INVALID_ARG or ESP_ERR_NO_MEM. Especially, when the function return ESP_ERR_NOT_SUPPORTED, this means the calibration scheme required eFuse bits are not burnt on your board.
Create Curve Fitting Scheme

```c
ESP_LOGI(TAG, "calibration scheme version is %s", "Curve Fitting");
adc_cali_curve_fitting_config_t cali_config = {
  .unit_id = unit,
  .atten = atten,
  .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_curve_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme driver from the calibration handle by calling `adc_cali_delete_scheme_curve_fitting()`.

Delete Curve Fitting Scheme

```c
ESP_LOGI(TAG, "delete %s calibration scheme", "Curve Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_curve_fitting(handle));
```

**Note:** If you want to use your custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in `components/esp_adc/interface/adc_cali_interface.h` to know the ESP ADC calibration interface.

**Result Conversion** After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to an invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme is not created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

**Get Voltage**

```c
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &voltage[0][0]));
ESP_LOGI(TAG, "%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE__ADC1_CHAN0, voltage[0][0]);
```

**Thread Safety** The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread-safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread-safe, you should avoid calling them from multiple tasks.

**Minimize Noise** The ESP32-C6 ADC is sensitive to noise, leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g., a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

**API Reference**

**Header File**

- `components/esp_adc/include/esp_adc/adc_cali.h`
- This header file can be included with:
```c
#include "esp_adc/adc_cali.h"
```

- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your CMakeLists.txt:

  ```
  REQUIRE esp_adc
  ```
  or

  ```
  PRIV_REQUIRES esp_adc
  ```

### Functions

**`esp_err_t` `adc_cali_check_scheme` (**`adc_cali_scheme_ver_t` *scheme_mask*)

Check the supported ADC calibration scheme.

- **Parameters** `scheme_mask` - [out] Supported ADC calibration scheme(s)
- **Returns**
  - `ESP_OK`: On success
  - `ESP_ERR_INVALID_ARG`: Invalid argument
  - `ESP_ERR_NOT_SUPPORTED`: No supported calibration scheme

**`esp_err_t` `adc_cali_raw_to_voltage` (**`adc_cali_handle_t` handle, int raw, int *voltage*)

Convert ADC raw data to calibrated voltage.

- **Parameters**
  - `handle` - [in] ADC calibration handle
  - `raw` - [in] ADC raw data
  - `voltage` - [out] Calibrated ADC voltage (in mV)
- **Returns**
  - `ESP_OK`: On success
  - `ESP_ERR_INVALID_ARG`: Invalid argument
  - `ESP_ERR_INVALID_STATE`: Invalid state, scheme didn’t registered

### Type Definitions

```c
typedef struct adc_cali_scheme_t *adc_cali_handle_t
```

ADC calibration handle.

### Enumerations

```c
enum adc_cali_scheme_ver_t
```

ADC calibration scheme.

**Values:**

- `ADC_CALI_SCHEME_VER_LINE_FITTING`, Line fitting scheme.
- `ADC_CALI_SCHEME_VER_CURVE_FITTING`, Curve fitting scheme.

### Header File

- `components/esp_adc/include/esp_adc/adc_cali_scheme.h`
- This header file can be included with:
#include "esp_adc/adc_cali_scheme.h"

- This header file is a part of the API provided by the esp_adc component. To declare that your component depends on esp_adc, add the following to your CMakeLists.txt:

```
REQUIRES esp_adc
```
or
```
PRIV_REQUIRES esp_adc
```

## 2.6.4 Clock Tree

The clock subsystem of ESP32-C6 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that can be called to monitor the status of the module clocks at runtime.

### Introduction

This section lists definitions of ESP32-C6's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help select a proper source clock for the peripheral.

### Root Clocks

Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), Wi-Fi, Bluetooth, the RTC, and the peripherals.

ESP32-C6's root clocks are listed in `soc_root_clk_t`:

- Internal 17.5 MHz RC Oscillator (RC_FAST)
  This RC oscillator generates a about 17.5 MHz clock signal output as the RC_FAST_CLK. The exact frequency of RC_FAST_CLK can be computed in runtime through calibration.
- External 40 MHz Crystal (XTAL)
- Internal 136 kHz RC Oscillator (RC_SLOW)
  This RC oscillator generates a about 136kHz clock signal output as the RC_SLOW_CLK. The exact frequency of this clock can be computed in runtime through calibration.
- External 32 kHz Crystal - optional (XTAL32K)
  The clock source for this XTAL32K_CLK can be either a 32 kHz crystal connecting to the XTAL_32K_P and XTAL_32K_N pins or a 32 kHz clock signal generated by an external circuit. The external signal must be connected to the XTAL_32K_P pin. XTAL32K_CLK can also be calibrated to get its exact frequency.
- External Slow Clock - optional (OSC_SLOW)
  A clock signal generated by an external circuit can be connected to GPIO0 to be the clock source for the RTC_SLOW_CLK. This clock can also be calibrated to get its exact frequency.
- Internal 32 kHz RC Oscillator (RC32K)
  The exact frequency of this clock can be computed in runtime through calibration.

Typically, the frequency of the signal generated from an RC oscillator circuit is less accurate and more sensitive to the environment compared to the signal generated from a crystal. ESP32-C6 provides several clock source options
for the RTC_SLOW_CLK, and it is possible to make the choice based on the requirements for system time accuracy and power consumption. For more details, please refer to *RTC Timer Clock Sources*.

**Module Clocks** ESP32-C6's available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

**API Usage**

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, `esp_clk_tree_src_get_freq_hz()`. This function allows you to obtain the clock frequency at any time by providing the clock name `soc_module_clk_t` and specifying the desired precision level for the returned frequency value `esp_clk_tree_src_freq_precision_t`.

**API Reference**

**Header File**

- `components/soc/esp32c6/include/soc/clk_tree_defs.h`

This header file can be included with:

```c
#include "soc/clk_tree_defs.h"
```

**Macros**

- `SOC_CLK_RC_FAST_FREQ_APPROX` Approximate RC_FAST_CLK frequency in Hz
- `SOC_CLK_RC_SLOW_FREQ_APPROX` Approximate RC_SLOW_CLK frequency in Hz
- `SOC_CLK_RC32K_FREQ_APPROX` Approximate RC32K_CLK frequency in Hz
- `SOC_CLK_XTAL32K_FREQ_APPROX` Approximate XTAL32K_CLK frequency in Hz
- `SOC_CLK_OSC_SLOW_FREQ_APPROX` Approximate OSC_SLOW_CLK (external slow clock) frequency in Hz
- `SOC_GPTIMER_CLKS` Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```c
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_ "soc/clk_tree_defs.h"
for (size_t i = 0; i < sizeof(gptimer_clks) / 248; i++) {
  soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
  // Test GPTimer with the clock `clk`
}
```

- `SOC_RMT_CLKS` Array initializer for all supported clock sources of RMT.
SOC_TEMP_SENSOR_CLKS
  Array initializer for all supported clock sources of Temperature Sensor.

SOC_UART_CLKS
  Array initializer for all supported clock sources of UART.

SOC_LP_UART_CLKS
  Array initializer for all supported clock sources of LP_UART.

SOC_MCPWM_TIMER_CLKS
  Array initializer for all supported clock sources of MCPWM Timer.

SOC_MCPWM_CAPTURE_CLKS
  Array initializer for all supported clock sources of MCPWM Capture Timer.

SOC_MCPWM_CARRIER_CLKS
  Array initializer for all supported clock sources of MCPWM Carrier.

SOC_I2S_CLKS
  Array initializer for all supported clock sources of I2S.

SOC_I2C_CLKS
  Array initializer for all supported clock sources of I2C.

SOC_LP_I2C_CLKS
  Array initializer for all supported clock sources of LP_I2C.

SOC_SPI_CLKS
  Array initializer for all supported clock sources of SPI.

SOC_SDM_CLKS
  Array initializer for all supported clock sources of SDM.

SOC_GLITCH_FILTER_CLKS
  Array initializer for all supported clock sources of Glitch Filter.

SOC_TWAI_CLKS
  Array initializer for all supported clock sources of TWAI.

SOC_ADC_DIGI_CLKS
  Array initializer for all supported clock sources of ADC digital controller.

SOC_MWDT_CLKS
  Array initializer for all supported clock sources of MWDT.

SOC_LEDC_CLKS
  Array initializer for all supported clock sources of LEDC.

SOC_PARLIO_CLKS
  Array initializer for all supported clock sources of PARLIO.
Enumerations

enum soc_root_clk_t

Root clock.

Values:

enumerator SOC_ROOT_CLK_INT_RC_FAST
Internal 17.5MHz RC oscillator

enumerator SOC_ROOT_CLK_INT_RC_SLOW
Internal 136kHz RC oscillator

enumerator SOC_ROOT_CLK_EXT_XTAL
External 40MHz crystal

enumerator SOC_ROOT_CLK_EXT_XTAL32K
External 32kHz crystal

enumerator SOC_ROOT_CLK_INT_RC32K
Internal 32kHz RC oscillator

enumerator SOC_ROOT_CLK_EXT_OSC_SLOW
External slow clock signal at pin0

enum soc_cpu_clk_src_t

CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

Note: Enum values are matched with the register field values on purpose

Values:

enumerator SOC_CPU_CLK_SRC_XTAL
Select XTAL_CLK as CPU_CLK source

enumerator SOC_CPU_CLK_SRC_PLL
Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, 480MHz)

enumerator SOC_CPU_CLK_SRC_RC_FAST
Select RC_FAST_CLK as CPU_CLK source

enumerator SOC_CPU_CLK_SRC_INVALID
Invalid CPU_CLK source

enum soc_rtc_slow_clk_src_t

RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

Note: Enum values are matched with the register field values on purpose

Values:
enumerator **SOC_RTC_SLOW_CLK_SRC_RC_SLOW**  
Select RC_SLOW_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**  
Select XTAL32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_RC32K**  
Select RC32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_OSC_SLOW**  
Select OSC_SLOW_CLK (external slow clock) as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**  
Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**  
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

**Note:** Enum values are matched with the register field values on purpose

**Values:**

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**  
Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D2**  
Select XTAL_D2_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**  
Alias name for SOC_RTC_FAST_CLK_SRC_XTAL_D2

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**  
Invalid RTC_FAST_CLK source

enum **soc_module_clk_t**  
Supported clock sources for modules (CPU, peripherals, RTC, etc.)

**Note:** enum starts from 1, to save 0 for special purpose

**Values:**

enumerator **SOC_MOD_CLK_CPU**  
CPU_CLK can be sourced from XTAL, PLL, or RC_FAST by configuring soc_cpu_clk_src_t

enumerator **SOC_MOD_CLK_RTC_FAST**  
RTC_FAST_CLK can be sourced from XTAL_D2 or RC_FAST by configuring soc_rtc_fast_clk_src_t
Chapter 2. API Reference

enumerator **SOC_MOD_CLK_RTC_SLOW**

RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, RC32K, or OSC_SLOW by configuring **soc_rtc_slow_clk_src_t**

enumerator **SOC_MOD_CLK_PLL_F80M**

PLL_F80M_CLK is derived from PLL (clock gating + fixed divider of 6), it has a fixed frequency of 80MHz

enumerator **SOC_MOD_CLK_PLL_F160M**

PLL_F160M_CLK is derived from PLL (clock gating + fixed divider of 3), it has a fixed frequency of 160MHz

enumerator **SOC_MOD_CLK_PLL_F240M**

PLL_F240M_CLK is derived from PLL (clock gating + fixed divider of 2), it has a fixed frequency of 240MHz

enumerator **SOC_MOD_CLK_XTAL32K**

XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST**

RC_FAST_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_XTAL**

XTAL_CLK comes from the external 40MHz crystal

enumerator **SOC_MOD_CLK_XTAL_D2**

XTAL_D2_CLK comes from the external 40MHz crystal, passing a div of 2 to the LP peripherals

enumerator **SOC_MOD_CLK_INVALID**

Indication of the end of the available module clock sources

defined **soc_periph_systimer_clk_src_t**

Type of SYSTIMER clock source.

Values:

enumerator **SYSTIMER_CLK_SRC_XTAL**

SYSTIMER source clock is XTAL

enumerator **SYSTIMER_CLK_SRC_RC_FAST**

SYSTIMER source clock is RC_FAST

enumerator **SYSTIMER_CLK_SRC_DEFAULT**

SYSTIMER source clock default choice is XTAL

defined **soc_periph_gptimer_clk_src_t**

Type of GPTimer clock source.

Values:
enumerator GPTIMER_CLK_SRC_PLL_F80M
   Select PLL_F80M as the source clock
enumerator GPTIMER_CLK_SRC_RC_FAST
   Select RC_FAST as the source clock
enumerator GPTIMER_CLK_SRC_XTAL
   Select XTAL as the source clock
enumerator GPTIMER_CLK_SRC_DEFAULT
   Select PLL_F80M as the default choice

enum socPeriph_tg_clk_src_legacy_t
   Type of Timer Group clock source, reserved for the legacy timer group driver.
   Values:
   
enumerator TIMER_SRC_CLK_PLL_F80M
       Timer group clock source is PLL_F80M
enumerator TIMER_SRC_CLK_XTAL
       Timer group clock source is XTAL
enumerator TIMER_SRC_CLK_DEFAULT
       Timer group clock source default choice is PLL_F80M

enum socPeriph_rmt_clk_src_t
   Type of RMT clock source.
   Values:
   
enumerator RMT_CLK_SRC_PLL_F80M
       Select PLL_F80M as the source clock
enumerator RMT_CLK_SRC_RC_FAST
       Select RC_FAST as the source clock
enumerator RMT_CLK_SRC_XTAL
       Select XTAL as the source clock
enumerator RMT_CLK_SRC_DEFAULT
       Select PLL_F80M as the default choice

enum socPeriph_rmt_clk_src_legacy_t
   Type of RMT clock source, reserved for the legacy RMT driver.
   Values:
   
enumerator RMT_BASECLK_PLL_F80M
       RMT source clock is PLL_F80M
enumerator **RMT_BASECLK_XTAL**
    RMT source clock is XTAL.

enumerator **RMT_BASECLK_DEFAULT**
    RMT source clock default choice is PLL_F80M

e num **soc_periph_temperature_sensor_clk_src_t**
    Type of Temp Sensor clock source.
    
    **Values:**
    
    enumerator **TEMPERATURE_SENSOR_CLK_SRC_XTAL**
        Select XTAL as the source clock
    
    enumerator **TEMPERATURE_SENSOR_CLK_SRC_RC_FAST**
        Select RC_FAST as the source clock
    
    enumerator **TEMPERATURE_SENSOR_CLK_SRC_DEFAULT**
        Select XTAL as the default choice

e num **soc_periph_uart_clk_src_legacy_t**
    Type of UART clock source, reserved for the legacy UART driver.
    
    **Values:**
    
    enumerator **UART_SCLK_PLL_F80M**
        UART source clock is PLL_F80M
    
    enumerator **UART_SCLK_RTC**
        UART source clock is RC_FAST
    
    enumerator **UART_SCLK_XTAL**
        UART source clock is XTAL
    
    enumerator **UART_SCLK_DEFAULT**
        UART source clock default choice is PLL_F80M

e num **soc_periph_lp_uart_clk_src_t**
    Type of LP_UART clock source.
    
    **Values:**
    
    enumerator **LP_UART_SCLK_LP_FAST**
        LP_UART source clock is LP(RTC)_FAST
    
    enumerator **LP_UART_SCLK_XTAL_D2**
        LP_UART source clock is XTAGL_D2
    
    enumerator **LP_UART_SCLK_DEFAULT**
        LP_UART source clock default choice is LP(RTC)_FAST
enum soc_periph_mcpwm_timer_clk_src_t
Type of MCPWM timer clock source.
Values:

enumerator MCPWM_TIMER_CLK_SRC_PLL160M
    Select PLL_F160M as the source clock

enumerator MCPWM_TIMER_CLK_SRC_XTAL
    Select XTAL as the source clock

enumerator MCPWM_TIMER_CLK_SRC_DEFAULT
    Select PLL_F160M as the default clock choice

enum soc_periph_mcpwm_capture_clk_src_t
Type of MCPWM capture clock source.
Values:

enumerator MCPWM_CAPTURE_CLK_SRC_PLL160M
    Select PLL_F160M as the source clock

enumerator MCPWM_CAPTURE_CLK_SRC_XTAL
    Select XTAL as the source clock

enumerator MCPWM_CAPTURE_CLK_SRC_DEFAULT
    Select PLL_F160M as the default clock choice

enum soc_periph_mcpwm_carrier_clk_src_t
Type of MCPWM carrier clock source.
Values:

enumerator MCPWM_CARRIER_CLK_SRC_PLL160M
    Select PLL_F160M as the source clock

enumerator MCPWM_CARRIER_CLK_SRC_XTAL
    Select XTAL as the source clock

enumerator MCPWM_CARRIER_CLK_SRC_DEFAULT
    Select PLL_F160M as the default clock choice

enum soc_periph_i2s_clk_src_t
I2S clock source enum.
Values:

enumerator I2S_CLK_SRC_DEFAULT
    Select PLL_F160M as the default source clock

enumerator I2S_CLK_SRC_PLL_160M
    Select PLL_F160M as the source clock
enumerator I2S_CLK_SRC_XTAL
   Select XTAL as the source clock

enumerator I2S_CLK_SRC_EXTERNAL
   Select external clock as source clock

enum soc_periph_i2c_clk_src_t
   Type of I2C clock source.
   Values:
   
   enumerator I2C_CLK_SRC_XTAL
      Select XTAL as the source clock
   
   enumerator I2C_CLK_SRC_RC_FAST
      Select RC_FAST as the source clock
   
   enumerator I2C_CLK_SRC_DEFAULT
      Select XTAL as the default source clock

enum soc_periph_lp_i2c_clk_src_t
   Type of LP_I2C clock source.
   Values:
   
   enumerator LP_I2C_SCLK_LP_FAST
      LP_I2C source clock is RTC_FAST
   
   enumerator LP_I2C_SCLK_XTAL_D2
      LP_I2C source clock is XTAL_D2
   
   enumerator LP_I2C_SCLK_DEFAULT
      LP_I2C source clock default choice is RTC_FAST

enum soc_periph_spi_clk_src_t
   Type of SPI clock source.
   Values:
   
   enumerator SPI_CLK_SRC_DEFAULT
      Select PLL_80M as SPI source clock
   
   enumerator SPI_CLK_SRC_PLL_F80M
      Select PLL_80M as SPI source clock
   
   enumerator SPI_CLK_SRC_XTAL
      Select XTAL as SPI source clock
   
   enumerator SPI_CLK_SRC_RC_FAST
      Select RC_FAST as SPI source clock
enum `soc_periph_sdm_clk_src_t`
Sigma Delta Modulator clock source.

\textit{Values:}

- \texttt{SDM_CLK_SRC_XTAL}
  Select XTAL clock as the source clock

- \texttt{SDM_CLK_SRC_PLL_F80M}
  Select PLL_F80M clock as the source clock

- \texttt{SDM_CLK_SRC_DEFAULT}
  Select PLL_F80M clock as the default clock choice

enum `soc_periph_glitch_filter_clk_src_t`
Glitch filter clock source.

\textit{Values:}

- \texttt{GLITCH_FILTER_CLK_SRC_XTAL}
  Select XTAL clock as the source clock

- \texttt{GLITCH_FILTER_CLK_SRC_PLL_F80M}
  Select PLL_F80M clock as the source clock

- \texttt{GLITCH_FILTER_CLK_SRC_DEFAULT}
  Select PLL_F80M clock as the default clock choice

enum `soc_periph_twai_clk_src_t`
TWAI clock source.

\textit{Values:}

- \texttt{TWAI_CLK_SRC_XTAL}
  Select XTAL as the source clock

- \texttt{TWAI_CLK_SRC_DEFAULT}
  Select XTAL as the default clock choice

enum `soc_periph_adc_digi_clk_src_t`
ADC digital controller clock source.

\textit{Values:}

- \texttt{ADC_DIGI_CLK_SRC_XTAL}
  Select XTAL as the source clock

- \texttt{ADC_DIGI_CLK_SRC_PLL_F80M}
  Select PLL_F80M as the source clock

- \texttt{ADC_DIGI_CLK_SRC_RC_FAST}
  Select RC_FAST as the source clock
enumerator ADC_DIGI_CLK_SRC_DEFAULT
    Select PLL_F80M as the default clock choice

denum soc_periph_mwdt_clk_src_t
    MWDT clock source.
    Values:
    
    enumerator MWDT_CLK_SRC_XTAL
        Select XTAL as the source clock
    
    enumerator MWDT_CLK_SRC_PLL_F80M
        Select PLL fixed 80 MHz as the source clock
    
    enumerator MWDT_CLK_SRC_RC_FAST
        Select RTC fast as the source clock
    
    enumerator MWDT_CLK_SRC_DEFAULT
        Select PLL fixed 80 MHz as the default clock choice

denum soc_periph_ledc_clk_src_legacy_t
    Type of LEDC clock source, reserved for the legacy LEDC driver.
    Values:
    
    enumerator LEDC_AUTO_CLK
        LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer
    
    enumerator LEDC_USE_PLL_DIV_CLK
        Select PLL_F80M clock as the source clock
    
    enumerator LEDC_USE_RC_FAST_CLK
        Select RC_FAST as the source clock
    
    enumerator LEDC_USE_XTAL_CLK
        Select XTAL as the source clock
    
    enumerator LEDC_USE_RTC8M_CLK
        Alias of 'LEDC_USE_RC_FAST_CLK'

denum soc_periph_parlio_clk_src_t
    PARLIO clock source.
    Values:
    
    enumerator PARLIO_CLK_SRC_XTAL
        Select XTAL as the source clock
    
    enumerator PARLIO_CLK_SRC_PLL_F240M
        Select PLL_F240M as the source clock
enumerator **PARLIO_CLK_SRC_DEFAULT**
Select PLL\_F240M as the default clock choice

enum **soc\_clkout\_sig\_id\_t**
**Values:**

enumerator **CLKOUT\_SIG\_PLL**
PLL\_CLK is the output of crystal oscillator frequency multiplier

enumerator **CLKOUT\_SIG\_XTAL**
Main crystal oscillator clock

enumerator **CLKOUT\_SIG\_PLL\_F80M**
From PLL, usually be 80MHz

enumerator **CLKOUT\_SIG\_CPU**
CPU clock

enumerator **CLKOUT\_SIG\_AHB**
AHB clock

enumerator **CLKOUT\_SIG\_APB**
APB clock

enumerator **CLKOUT\_SIG\_XTAL32K**
External 32kHz crystal clock

enumerator **CLKOUT\_SIG\_EXT32K**
External slow clock input through XTAL\_32K\_P

enumerator **CLKOUT\_SIG\_RC\_FAST**
RC fast clock, about 17.5MHz

enumerator **CLKOUT\_SIG\_RC\_32K**
Internal slow RC oscillator

enumerator **CLKOUT\_SIG\_RC\_SLOW**
RC slow clock, depends on the RTC\_CLK\_SRC configuration

enumerator **CLKOUT\_SIG\_INVALID**

**Header File**

- components/esp\_hw\_support/include/esp\_clk\_tree.h
- This header file can be included with:

```c
#include "esp\_clk\_tree.h"
```
Functions

`esp_err_t esp_clk_tree_src_get_freq_hz(soc_module_clk_t clk_src, esp_clk_tree_src_freq_precision_t precision, uint32_t *freq_value)`

Get frequency of module clock source.

Parameters

- `clk_src` -- [in] Clock source available to modules, in `soc_module_clk_t`
- `precision` -- [in] Degree of precision, one of `esp_clk_tree_src_freq_precision_t` values. This arg only applies to the clock sources that their frequencies can vary: `SOC_MOD_CLK_RTC_FAST`, `SOC_MOD_CLK_RTC_SLOW`, `SOC_MOD_CLK_RC_FAST`, `SOC_MOD_CLK_XTAL32K`. For other clock sources, this field is ignored.
- `freq_value` -- [out] Frequency of the clock source, in Hz

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Calibration failed

Enumerations

```c
enum esp_clk_tree_src_freq_precision_t

Degree of precision of frequency value to be returned by `esp_clk_tree_src_get_freq_hz()`

Values:

- `ESP_CLK_TREE_SRC_FREQ_PRECISION_CACHED`
- `ESP_CLK_TREE_SRC_FREQ_PRECISION_APPROX`
- `ESP_CLK_TREE_SRC_FREQ_PRECISION_EXACT`
- `ESP_CLK_TREE_SRC_FREQ_PRECISION_INVALID`
```

2.6.5 Event Task Matrix (ETM)

Introduction

Normally, if a peripheral X needs to notify peripheral Y of a particular event, this could only be done via a CPU interrupt from peripheral X, where the CPU notifies peripheral Y on behalf of peripheral X. However, in time-critical applications, the latency introduced by CPU interrupts is non-negligible.

With the help of the Event Task Matrix (ETM) module, some peripherals can directly notify other peripherals of events through pre-set connections without the intervention of CPU interrupts. This allows precise and low latency synchronization between peripherals, and lessens the CPU’s workload as the CPU no longer needs to handle these events.

The ETM module has multiple programmable channels, they are used to connect a particular Event to a particular Task. When an event is activated, the ETM channel will trigger the corresponding task automatically.

Peripherals that support ETM functionality provide their or unique set of events and tasks to be connected by the ETM. An ETM channel can connect any event to any task, even looping back an event to a task on the same peripheral. However, an ETM channel can only connect one event to one task at a time (i.e., 1 to 1 relation). If you want to use different events to trigger the same task, you can set up more ETM channels.

Typically, with the help of the ETM module, you can implement features like:
Fig. 5: ETM channels Overview

- Toggle the GPIO when a timer alarm event happens
- Start an ADC conversion when a pulse edge is detected on a GPIO

Functional Overview

The following sections of this document cover the typical steps to configure and use the ETM module.

- **ETM Channel Allocation** - describes how to install and uninstall the ETM channel.
- **ETM Event** - describes how to allocate a new ETM event handle or fetch an existing handle from various peripherals.
- **ETM Task** - describes how to allocate a new ETM task handle or fetch an existing handle from various peripherals.
- **ETM Channel Control** - describes common ETM channel control functions.
- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**ETM Channel Allocation** There are many identical ETM channels in ESP32-C6¹, and each channel is represented by `esp_etm_channel_handle_t` in the software. The ETM core driver manages all available hardware resources in a pool so that you do not need to care about which channel is in use and which is not. The ETM core driver will allocate a channel for you when you call `esp_etm_new_channel()` and delete it when you call `esp_etm_del_channel()`. All requirements needed for allocating a channel are provided in `esp_etm_channel_config_t`.

Before deleting an ETM channel, please disable it by `esp_etm_channel_disable()` in advance or make sure it has not been enabled yet by `esp_etm_channel_enable()`.

**ETM Event** ETM Event abstracts the event source, masking the details of specific event sources, and is represented by `esp_etm_event_handle_t` in the software, allowing applications to handle different types of events more easily. ETM events can be generated from a variety of peripherals, thus the way to get the event handle differs from peripherals. When an ETM event is no longer used, you should call `esp_etm_channel_connect()` with a NULL event handle to disconnect it and then call `esp_etm_del_event()` to free the event resource.

**GPIO Events** GPIO edge event is the most common event type, it can be generated by any GPIO pin. You can call `gpio_new_etm_event()` to create a GPIO event handle, with the configurations provided in `gpio_etm_event_config_t`:

¹ Different ESP chip series might have different numbers of ETM channels. For more details, please refer to [ESP32-C6 Technical Reference Manual > Chapter Event Task Matrix (ETM)](PDF). The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing channel allocation (i.e., `esp_etm_new_channel()`).
Chapter 2. API Reference

- `gpio_etm_event_config_t::edge` or `gpio_etm_event_config_t::edges` decides which edge(s) to trigger the event(s), supported edge types are listed in the `gpio_etm_event_edge_t`.

You need to build a connection between the GPIO ETM event handle and the GPIO number. So you should call `gpio_etm_event_bind_gpio()` afterwards. Please note, only the ETM event handle that created by `gpio_new_etm_event()` can set a GPIO number. Calling this function with other kinds of ETM events returns `ESP_ERR_INVALID_ARG` error. Needless to say, this function does not help with the GPIO initialization, you still need to call `gpio_config()` to set the property like direction, pull up/down mode separately.

Other Peripheral Events
- You can call `esp_systick_new_etm_alarm_event()` to get the ETM event from RTOS Systick, one per CPU core.
- Refer to High Resolution Timer (ESP Timer) for how to get the ETM event handle from esp_timer.
- Refer to General Purpose Timer (GPTimer) for how to get the ETM event handle from GPTimer.
- Refer to Asynchronous Memory Copy for how to get the ETM event handle from asyncmemcpy.
- Refer to Motor Control Pulse Width Modulator (MCPWM) for how to get the ETM event handle from MCPWM.

ETM Task
ETM Task abstracts the task action and is represented by `esp_etm_task_handle_t` in the software, allowing tasks to be managed and represented in the same way. ETM tasks can be assigned to a variety of peripherals, thus the way to get the task handle differs from peripherals. When an ETM task is no longer used, you should call `esp_etm_channel_connect()` with a NULL task handle to disconnect it and then call `esp_etm_del_task()` to free the task resource.

GPIOTasks
GPIOTask is the most common task type. One GPIO can take one or more GPIO ETM task actions, and one GPIO ETM task action can manage multiple GPIOs. When the task gets activated by the ETM channel, all managed GPIOs can set/clear/toggle at the same time. You can call `gpio_new_etm_task()` to create a GPIO task handle, with the configurations provided in `gpio_etm_task_config_t`:

- `gpio_etm_task_config_t::action` or `gpio_etm_task_config_t::actions` decides what GPIO action(s) would be taken by the ETM task. Supported actions are listed in the `gpio_etm_task_action_t`. If one GPIO needs to take more than one actions, the action tasks have to be created in one `gpio_new_etm_task()` call with filling the actions into the array of `gpio_etm_task_config_t::actions`.

To build a connection between the GPIO ETM task and the GPIO number, you should call `gpio_etm_task_add_gpio()`. You can call this function by several times if you want the task handle to manage more GPIOs. Please note, only the ETM task handle that created by `gpio_new_etm_task()` can manage a GPIO. Calling this function with other kinds of ETM tasks returns `ESP_ERR_INVALID_ARG` error. Needless to say, this function does not help with the GPIO initialization, you still need to call `gpio_config()` to set the property like direction, pull up/down mode separately.

Before you call `esp_etm_del_task()` to delete the GPIO ETM task, make sure that all previously added GPIOs are removed by `gpio_etm_task_rm_gpio()` in advance.

Other Peripheral Tasks
- Refer to GPTimer for how to get the ETM task handle from GPTimer.

ETM Channel Control

Connect Event and Task
An ETM event has no association with an ETM task, until they are connected to the same ETM channel by calling `esp_etm_channel_connect()`. Especially, calling the function with a NULL task/event handle means disconnecting the channel from any task or event. Note that, this function can be called either before or after the channel is enabled. But calling this function at runtime to change the connection can be dangerous, because the channel may be in the middle of a cycle, and the new connection may not take effect immediately.
Enable and Disable Channel  You can call `esp_etm_channel_enable()` and `esp_etm_channel_disable()` to enable and disable the ETM channel from working.

ETM Channel Profiling  To check if the ETM channels are set with proper events and tasks, you can call `esp_etm_dump()` to dump all working ETM channels with their associated events and tasks. The dumping format is like:

```
==
==
==
==
==
ETM Dump Start
channel 0: event 48 => task 17
channel 1: event 48 => task 90
channel 2: event 48 => task 94
==
==
==
==
==
ETM Dump End
```

The digital ID printed in the dump information is defined in the `soc/soc_etm_source.h` file.

Thread Safety  The factory functions like `esp_etm_new_channel()` and `gpio_new_etm_task()` are guaranteed to be thread-safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

No functions are allowed to run within the ISR environment.

Other functions that take `esp_etm_channel_handle_t`, `esp_etm_task_handle_t` and `esp_etm_event_handle_t` as the first positional parameter, are not treated as thread-safe, which means you should avoid calling them from multiple tasks.

Kconfig Options  
- `CONFIG_ETM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size as well.

API Reference

Header File

- `components/esp_hw_support/include/esp_etm.h`
- This header file can be included with:

  ```c
  #include "esp_etm.h"
  ```

Functions

`esp_err_t esp_etm_new_channel(const esp_etm_channel_config_t *config, esp_etm_channel_handle_t *ret_chan)`

Allocate an ETM channel.

Note: The channel can later be freed by `esp_etm_del_channel`

Parameters

- `config` -- [in] ETM channel configuration
- `ret_chan` -- [out] Returned ETM channel handle

Returns

- ESP_OK: Allocate ETM channel successfully
- ESP_ERR_INVALID_ARG: Allocate ETM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Allocate ETM channel failed because of out of memory
- ESP_ERR_NOT_FOUND: Allocate ETM channel failed because all channels are used up and no more free one
• ESP_FAIL: Allocate ETM channel failed because of other reasons

```c
esp_err_t esp_etm_del_channel(esp_etm_channel_handle_t chan)
```
Delete an ETM channel.

**Parameters**
- `chan` -- [in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**
- ESP_OK: Delete ETM channel successfully
- ESP_ERR_INVALID_ARG: Delete ETM channel failed because of invalid argument
- ESP_FAIL: Delete ETM channel failed because of other reasons

```c
esp_err_t esp_etm_channel_enable(esp_etm_channel_handle_t chan)
```
Enable ETM channel.

**Note:** This function will transit the channel state from init to enable.

**Parameters**
- `chan` -- [in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**
- ESP_OK: Enable ETM channel successfully
- ESP_ERR_INVALID_ARG: Enable ETM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable ETM channel failed because the channel has been enabled already
- ESP_FAIL: Enable ETM channel failed because of other reasons

```c
esp_err_t esp_etm_channel_disable(esp_etm_channel_handle_t chan)
```
Disable ETM channel.

**Note:** This function will transit the channel state from enable to init.

**Parameters**
- `chan` -- [in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**
- ESP_OK: Disable ETM channel successfully
- ESP_ERR_INVALID_ARG: Disable ETM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable ETM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable ETM channel failed because of other reasons

```c
esp_err_t esp_etm_channel_connect(esp_etm_channel_handle_t chan, esp_etm_event_handle_t event, esp_etm_task_handle_t task)
```
Connect an ETM event to an ETM task via a previously allocated ETM channel.

**Note:** Setting the ETM event/task handle to NULL means to disconnect the channel from any event/task

**Parameters**
- `chan` -- [in] ETM channel handle that created by `esp_etm_new_channel`
- `event` -- [in] ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`
- `task` -- [in] ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

**Returns**
- ESP_OK: Connect ETM event and task to the channel successfully
- ESP_ERR_INVALID_ARG: Connect ETM event and task to the channel failed because of invalid argument
- ESP_FAIL: Connect ETM event and task to the channel failed because of other reasons

*Espressif Systems*  
**968**  
Release v5.2.2  
Submit Document Feedback
**esp_err_t esp_etm_del_event (esp_etm_event_handle_t event)**

Delete ETM event.

**Note:** Although the ETM event comes from various peripherals, we provide the same user API to delete the event handle seamlessly.

**Parameters**
- Event -- [in] ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`

**Returns**
- ESP_OK: Delete ETM event successfully
- ESP_ERR_INVALID_ARG: Delete ETM event failed because of invalid argument
- ESP_FAIL: Delete ETM event failed because of other reasons

**esp_err_t esp_etm_del_task (esp_etm_task_handle_t task)**

Delete ETM task.

**Note:** Although the ETM task comes from various peripherals, we provide the same user API to delete the task handle seamlessly.

**Parameters**
- Task -- [in] ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

**Returns**
- ESP_OK: Delete ETM task successfully
- ESP_ERR_INVALID_ARG: Delete ETM task failed because of invalid argument
- ESP_FAIL: Delete ETM task failed because of other reasons

**esp_err_t esp_etm_dump (FILE *out_stream)**

Dump ETM channel usages to the given IO stream.

**Parameters**
- Out_stream -- [in] IO stream (e.g. stdout)

**Returns**
- ESP_OK: Dump ETM channel usages successfully
- ESP_ERR_INVALID_ARG: Dump ETM channel usages failed because of invalid argument
- ESP_FAIL: Dump ETM channel usages failed because of other reasons

**Structures**

```c
struct esp_etm_channel_config_t
{
    // ETM channel configuration.
}
```

**Type Definitions**

```c
typedef struct esp_etm_channel_t *esp_etm_channel_handle_t
{
    // ETM channel handle.
}

typedef struct esp_etm_event_t *esp_etm_event_handle_t
{
    // ETM event handle.
}

typedef struct esp_etm_task_t *esp_etm_task_handle_t
{
    // ETM task handle.
}
```
Header File

- components/driver/gpio/include/driver/gpio_etm.h
- This header file can be included with:

```c
#include "driver/gpio_etm.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

Functions

**esp_err_t gpio_new_etm_event**
(const gpio_etm_event_config_t *config, esp_etm_event_handle_t *ret_event, ...

Create an ETM event object for the GPIO peripheral.

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

**Note:** The newly created ETM event object is not bind to any GPIO, you need to call `gpio_etm_event_bind_gpio` to bind the wanted GPIO

**Note:** Every success call to this function will acquire a free GPIO ETM event channel

**Parameters**

- **config** -- *[in]* GPIO ETM event configuration
- **ret_event** -- *[out]* Returned ETM event handle
- **...** -- *[out]* Other returned ETM event handles if any (the order of the returned event handles is aligned with the array order in field `edges` in `gpio_etm_event_config_t`)

**Returns**

- **ESP_OK:** Create ETM event successfully
- **ESP_ERR_INVALID_ARG:** Create ETM event failed because of invalid argument
- **ESP_ERR_NO_MEM:** Create ETM event failed because of out of memory
- **ESP_ERR_NOT_FOUND:** Create ETM event failed because all events are used up and no more free one
- **ESP_FAIL:** Create ETM event failed because of other reasons

**esp_err_t gpio_etm_event_bind_gpio**
(esp_etm_event_handle_t event, int gpio_num)

Bind the GPIO with the ETM event.

**Note:** Calling this function multiple times with different GPIO number can override the previous setting immediately.

**Note:** Only GPIO ETM object can call this function

**Parameters**

- **event** -- *[in]* ETM event handle that created by `gpio_new_etm_event`
- **gpio_num** -- *[in]* GPIO number that can trigger the ETM event
Returns

- ESP_OK: Set the GPIO for ETM event successfully
- ESP_ERR_INVALID_ARG: Set the GPIO for ETM event failed because of invalid argument, e.g. GPIO is not input capable, ETM event is not of GPIO type
- ESP_FAIL: Set the GPIO for ETM event failed because of other reasons

`esp_err_t gpio_new_etm_task` (const gpio_etm_task_config_t *config, esp_etm_task_handle_t *ret_task, ...)
Create an ETM task object for the GPIO peripheral.

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

**Note:** The GPIO ETM task works like a container, a newly created ETM task object doesn’t have GPIO members to be managed. You need to call `gpio_etm_task_add_gpio` to put one or more GPIOs to the container.

**Note:** Every success call to this function will acquire a free GPIO ETM task channel

Parameters

- `config` -- [in] GPIO ETM task configuration
- `ret_task` -- [out] Returned ETM task handle
- `...` -- [out] Other returned ETM task handles if any (the order of the returned task handles is aligned with the array order in field `actions` in `gpio_etm_task_config_t`)

**Returns**

- ESP_OK: Create ETM task successfully
- ESP_ERR_INVALID_ARG: Create ETM task failed because of invalid argument
- ESP_ERR_NO_MEM: Create ETM task failed because of out of memory
- ESP_ERR_NOT_FOUND: Create ETM task failed because all tasks are used up and no more free one
- ESP_FAIL: Create ETM task failed because of other reasons

`esp_err_t gpio_etm_task_add_gpio` (esp_etm_task_handle_t task, int gpio_num)
Add GPIO to the ETM task.

**Note:** You can call this function multiple times to add more GPIOs

**Note:** Only GPIO ETM object can call this function

Parameters

- `task` -- [in] ETM task handle that created by `gpio_new_etm_task`
- `gpio_num` -- [in] GPIO number that can be controlled by the ETM task

**Returns**

- ESP_OK: Add GPIO to the ETM task successfully
- ESP_ERR_INVALID_ARG: Add GPIO to the ETM task failed because of invalid argument, e.g. GPIO is not output capable, ETM task is not of GPIO type
- ESP_ERR_INVALID_STATE: Add GPIO to the ETM task failed because the GPIO is used by other ETM task already
- ESP_FAIL: Add GPIO to the ETM task failed because of other reasons
**esp_err_t gpio_etm_task_rm_gpio (esp_etm_task_handle_t task, int gpio_num)**

Remove the GPIO from the ETM task.

**Note:** Before deleting the ETM task, you need to remove all the GPIOs from the ETM task by this function.

**Note:** Only GPIO ETM object can call this function.

### Parameters
- **task** -- [in] ETM task handle that created by `gpio_new_etm_task`
- **gpio_num** -- [in] GPIO number that to be remove from the ETM task

### Returns
- **ESP_OK:** Remove the GPIO from the ETM task successfully
- **ESP_ERR_INVALID_ARG:** Remove the GPIO from the ETM task failed because of invalid argument
- **ESP_ERR_INVALID_STATE:** Remove the GPIO from the ETM task failed because the GPIO is not controlled by this ETM task
- **ESP_FAIL:** Remove the GPIO from the ETM task failed because of other reasons

### Structures

**struct gpio_etm_event_config_t**

GPIO ETM event configuration.

If more than one kind of ETM edge event want to be triggered on the same GPIO pin, you can configure them together. It helps to save GPIO ETM event channel resources for other GPIOs.

### Public Members

**gpio_etm_event_edge_t edge**

Which kind of edge can trigger the ETM event module

**gpio_etm_event_edge_t edges [GPIO_ETM_EVENT_EDGE_TYPES]**

Array of kinds of edges to trigger the ETM event module on the same GPIO

**struct gpio_etm_task_config_t**

GPIO ETM task configuration.

If multiple actions wants to be added to the same GPIO pin, you have to configure all the GPIO ETM tasks together.

### Public Members

**gpio_etm_task_action_t action**

Action to take by the ETM task module

**gpio_etm_task_action_t actions [GPIO_ETM_TASK_ACTION_TYPES]**

Array of actions to take by the ETM task module on the same GPIO
Chapter 2. API Reference

Macros

GPIO_ETM_EVENT_EDGE_TYPES
GPIO ETM edge events are POS/NEG/ANY

GPIO_ETM_TASK_ACTION_TYPES
GPIO ETM action tasks are SET/CLEAR/TOGGLE

Enumerations

enum gpio_etm_event_edge_t
GPIO edges that can be used as ETM event.

Values:

enumerator GPIO_ETM_EVENT_EDGE_POS
A rising edge on the GPIO will generate an ETM event signal

enumerator GPIO_ETM_EVENT_EDGE_NEG
A falling edge on the GPIO will generate an ETM event signal

enumerator GPIO_ETM_EVENT_EDGE_ANY
Any edge on the GPIO can generate an ETM event signal

enum gpio_etm_task_action_t
GPIO actions that can be taken by the ETM task.

Values:

enumerator GPIO_ETM_TASK_ACTION_SET
Set the GPIO level to high

enumerator GPIO_ETM_TASK_ACTION_CLR
Clear the GPIO level to low

enumerator GPIO_ETM_TASK_ACTION_TOG
Toggle the GPIO level

Header File

- components/esp_system/include/esp_systick_etm.h
- This header file can be included with:

  ```
  #include "esp_systick_etm.h"
  ```

Functions

esp_err_t esp_systick_new_etm_alarm_event (int core_id, esp_etm_event_handle_t *out_event)
Get the ETM event handle of systick hardware's alarm/heartbeat event.

Note: The created ETM event object can be deleted later by calling esp_etm_del_event

Parameters
2.6.6 GPIO & RTC GPIO

GPIO Summary

The ESP32-C6 chip features 31 physical GPIO pins (GPIO0 ~ GPIO30). Each pin can be used as a general-purpose I/O, or to be connected to an internal peripheral signal. Through GPIO matrix and IO_MUX, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see ESP32-C6 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

Chapter 2. API Reference

Note:

- **Strapping pin:** GPIO4, GPIO5, GPIO8, GPIO9, and GPIO15 are strapping pins. For more information, please refer to the datasheet.
  - SPI0/1: GPIO24-30 are usually used for SPI flash and not recommended for other uses.
  - USB-JTAG: GPIO 12 and 13 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
- For chip variants with an SiP flash built in, GPIO24 ~ GPIO30 are dedicated to connecting the SiP flash; GPIO10 ~ GPIO11 are not led out to any chip pins; therefore, only the remaining 22 GPIO pins are available.
- For chip variants without an in-package flash, GPIO14 is not led out to any chip pins.

GPIO driver offers a dump function `gpio_dump_io_configuration()` to show the configurations of the IOs at the moment, such as pull-up / pull-down, input / output enable, pin mapping etc. Below is an example dump:

```plaintext
.IO DUMP Start

IO[4]
Pullup: 1, Pulldown: 0, DriveCap: 2
InputEn: 1, OutputEn: 0, OpenDrain: 0
FuncSel: 1 (GPIO)
GPIO Matrix SigIn ID: (simple GPIO input)
SleepSelEn: 1

IO[18]
Pullup: 0, Pulldown: 0, DriveCap: 2
InputEn: 0, OutputEn: 1, OpenDrain: 0
FuncSel: 1 (GPIO)
GPIO Matrix SigOut ID: 256 (simple GPIO output)
SleepSelEn: 1

IO[26] "RESERVED" -
Pullup: 1, Pulldown: 0, DriveCap: 2
InputEn: 1, OutputEn: 0, OpenDrain: 0
FuncSel: 0 (IOMUX)
SleepSelEn: 1

.IO DUMP End
```

If an IO pin is routed to a peripheral signal through the GPIO matrix, the signal ID printed in the dump information is defined in the `soc/gpio_sig_map.h` file. The word "**RESERVED**" indicates the IO is occupied by either FLASH or PSRAM. It is strongly not recommended to reconfigure them for other application purposes.

There is also separate "RTC GPIO" support, which functions when GPIOs are routed to the "RTC" low-power, analog subsystem, and Low-Power(LP) peripherals. These pin functions can be used when:

- In Deep-sleep mode
- Analog functions such as ADC/DAC/etc are in use
- LP peripherals, such as LP_UART, LP_I2C, are in use

**GPIO Glitch Filter**

The ESP32-C6 chip features hardware filters to remove unwanted glitch pulses from the input GPIO, which can help reduce false triggering of the interrupt and prevent a noise being routed to the peripheral side.

Each GPIO can be configured with a glitch filter, which can be used to filter out pulses shorter than two sample clock cycles. The duration of the filter is not configurable. The sample clock is the clock source of the IO_MUX. In the driver, we call this kind of filter as pin glitch filter. You can create

the filter handle by calling `gpio_new_pin_glitch_filter()`. All the configurations for a pin glitch filter are listed in the `gpio_pin_glitch_filter_config_t` structure.

- `gpio_pin_glitch_filter_config_t::gpio_num` sets the GPIO number to enable the glitch filter.

ESP32-C6 provides 8 flexible glitch filters, whose duration is configurable. We refer to this kind of filter as `flex glitch filter`. Each of them can be applied to any input GPIO. However, applying multiple filters to the same GPIO does not make difference from one. You can create the filter handle by calling `gpio_new_flex_glitch_filter()`. All the configurations for a flexible glitch filter are listed in the `gpio_flex_glitch_filter_config_t` structure.

- `gpio_flex_glitch_filter_config_t::gpio_num` sets the GPIO that will be applied to the flex glitch filter.
- `gpio_flex_glitch_filter_config_t::window_width_ns` and `gpio_flex_glitch_filter_config_t::window_thres_ns` are the key parameters of the glitch filter. During `gpio_flex_glitch_filter_config_t::window_width_ns`, any pulse whose width is shorter than `gpio_flex_glitch_filter_config_t::window_thres_ns` will be discarded. Please note that, you can not set `gpio_flex_glitch_filter_config_t::window_thres_ns` bigger than `gpio_flex_glitch_filter_config_t::window_width_ns`.

Please note, the `pin glitch filter` and `flex glitch filter` are independent. You can enable both of them for the same GPIO.

The glitch filter is disabled by default, and can be enabled by calling `gpio_glitch_filter_enable()`. To recycle the filter, you can call `gpio_del_glitch_filter()`. Please note, before deleting the filter, you should disable it first by calling `gpio_glitch_filter_disable()`.

Application Example

- GPIO output and input interrupt example: `peripherals/gpio/generic_gpio`.

API Reference - Normal GPIO

Header File

- `components/driver/gpio/include/driver/gpio.h`
- This header file can be included with:
  ```c
  #include "driver/gpio.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:
  ```c
  REQUIREES driver
  ```
  or
  ```c
  PRIV_REQUIREES driver
  ```

Functions

`esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)`

Configure GPIO's Mode, pull-up, PullDown, IntrType

Parameters

- `pGPIOConfig` -- Pointer to GPIO configure struct

Returns
Chapter 2. API Reference

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_reset_pin (gpio_num_t gpio_num)
```

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Parameters**
- `gpio_num` -- GPIO number.

**Returns**
- Always return ESP_OK.

```c
esp_err_t gpio_set_intr_type (gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

GPIO set interrupt trigger type.

**Parameters**
- `gpio_num` -- GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `intr_type` -- Interrupt type, select from `gpio_int_type_t`

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_intr_enable (gpio_num_t gpio_num)
```

Enable GPIO module interrupt signal.

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of ESP32 ECO and Workarounds for Bugs for the description of this issue.

**Parameters**
- `gpio_num` -- GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_intr_disable (gpio_num_t gpio_num)
```

Disable GPIO module interrupt signal.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG_GPIO_CTRL_FUNC_IN_IRAM

**Parameters**
- `gpio_num` -- GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_set_level (gpio_num_t gpio_num, uint32_t level)
```

GPIO set output level.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG_GPIO_CTRL_FUNC_IN_IRAM
**Parameters**
- **gpio_num** -- GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16(16)`;
- **level** -- Output level. 0: low; 1: high

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

```c
int gpio_get_level(gpio_num_t gpio_num)
```

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters**
- **gpio_num** -- GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16(16)`;

**Returns**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

```c
esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)
```

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Parameters**
- **gpio_num** -- Configure GPIO pins number. It should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16(16)`;
- **mode** -- GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

```c
esp_err_t gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)
```

Configure GPIO pull-up/pull-down resistors.

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Parameters**
- **gpio_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16(16)`;
- **pull** -- GPIO pull up/down mode.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

```c
esp_err_t gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

Enable GPIO wake-up function.

**Parameters**
- **gpio_num** -- GPIO number.
- **intr_type** -- GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t gpio_wakeup_disable**(gpio_num_t gpio_num)

Disable GPIO wake-up function.

**Parameters**
gpio_num -- GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_isr_register**(void (*fn)(void*), void* arg, int intr_alloc_flags, gpio_isr_handle_t *handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

**Parameters**
- fn -- Interrupt handler function.
- arg -- Parameter for handler function
- intr_alloc_flags -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

**esp_err_t gpio_pullup_en**(gpio_num_t gpio_num)

Enable pull-up on GPIO.

**Parameters**
gpio_num -- GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_pullup_dis**(gpio_num_t gpio_num)

Disable pull-up on GPIO.

**Parameters**
gpio_num -- GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_pulldown_en**(gpio_num_t gpio_num)

Enable pull-down on GPIO.

**Parameters**
gpio_num -- GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_pulldown_dis**(gpio_num_t gpio_num)

Disable pull-down on GPIO.

**Parameters**
gpio_num -- GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_install_isr_service**(int intr_alloc_flags)

Install the GPIO driver's ETS_GPIO_INTR_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.
This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

**Parameters**

intr_alloc_flags -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

**void gpio_uninstall_isr_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

**esp_err_t gpio_isr_handler_add** (gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**

- gpio_num -- GPIO number
- isr_handler -- ISR handler function for the corresponding GPIO number.
- args -- parameter for ISR handler.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_isr_handler_remove** (gpio_num_t gpio_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters**

- gpio_num -- GPIO number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_set_drive_capability** (gpio_num_t gpio_num, gpio_drive_cap_t strength)

Set GPIO pad drive capability.

**Parameters**

- gpio_num -- GPIO number, only support output GPIOs
- strength -- Drive capability of the pad

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_get_drive_capability** (gpio_num_t gpio_num, gpio_drive_cap_t *strength)

Get GPIO pad drive capability.

**Parameters**

- gpio_num -- GPIO number, only support output GPIOs
- strength -- Pointer to accept drive capability of the pad

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_hold_en (gpio_num_t gpio_num)
```

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the chip or system is reset, for example, when watchdog time-out or Deep-sleep events are triggered.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters**
- `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

```c
esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
```

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level (because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters**
- `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

```c
void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
```

Set pad input to a peripheral signal through the IOMUX.

**Parameters**
- `gpio_num` -- GPIO number of the pad.
- `signal_idx` -- Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

```c
void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
```

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**
- `gpio_num` -- gpio_num GPIO number of the pad.
- `func` -- The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- `oen_inv` -- True if the output enable needs to be inverted, otherwise False.

```c
esp_err_t gpio_force_hold_all (void)
```

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.
This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

**Warning:** This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (til calling `gpio_force_unhold_all` to disable this feature), MUST be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

```c
esp_err_t gpio_force_unhold_all (void)
Force unhold all digital and rtc gpio pads.
```

```c
esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)
Enable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters  gpio_num -- GPIO number of the pad.

Returns  • ESP_OK Success
```

```c
esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)
Disable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters  gpio_num -- GPIO number of the pad.

Returns  • ESP_OK Success
```

```c
esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
GPIO set direction at sleep.

Configure GPIO direction, such as output_only, input_only, output_and_input

Parameters
  • gpio_num -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
  • mode -- GPIO direction

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG GPIO error
```

```c
esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)
Configure GPIO pull-up/pull-down resistors at sleep.

Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters
  • gpio_num -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
  • pull -- GPIO pull up/down mode.

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG : Parameter error
```

```c
esp_err_t gpio_deep_sleep_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
Enable GPIO deep-sleep wake-up function.

Note: Called by the SDK. User shouldn't call this directly in the APP.
```
Parameters

- **gpio_num** -- GPIO number.
- **intr_type** -- GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_deep_sleep_wakeup_disable (gpio_num_t gpio_num)
```
Disable GPIO deep-sleep wake-up function.

**Parameters**

- **gpio_num** -- GPIO number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_dump_io_configuration (FILE *out_stream, uint64_t io_bit_mask)
```
Dump IO configuration information to console.

**Parameters**

- **out_stream** -- IO stream (e.g. stdout)
- **io_bit_mask** -- IO pin bit mask, each bit maps to an IO

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Structures**

```c
struct gpio_config_t
```
Configuration parameters of GPIO pad for `gpio_config` function.

**Public Members**

- `uint64_t pin_bit_mask`
  
  GPIO pin: set with bit mask, each bit maps to a GPIO

- `gpio_mode_t mode`
  
  GPIO mode: set input/output mode

- `gpio_pulldown_t pull_down_en`
  
  GPIO pull-down

- `gpio_int_type_t intr_type`
  
  GPIO interrupt type

**Macros**

```c
GPIO_PIN_COUNT
```

- `GPIO_IS_VALID_GPIO (gpio_num)`
  
  Check whether it is a valid GPIO number.
Chapter 2. API Reference

GPIO_IS_VALID_OUTPUT_GPIO (gpio_num)
Check whether it can be a valid GPIO number of output mode.

GPIO_IS_VALID_DIGITAL_IO_PAD (gpio_num)
Check whether it can be a valid digital I/O pad.

GPIO_IS_DEEP_SLEEP_WAKEUP_VALID_GPIO (gpio_num)

Type Definitions

typedef intr_handle_t gpio_isr_handle_t

typedef void (*gpio_isr_t)(void *arg)
            GPIO interrupt handler.

    Param arg  User registered data

API Reference - RTC GPIO

Header File
- components/driver/gpio/include/driver/rtc_io.h
- This header file can be included with:

```c
#include "driver/rtc_io.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

Functions

bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)
    Determine if the specified GPIO is a valid RTC GPIO.

    **Parameters**
    - `gpio_num` -- GPIO number

    **Returns**
    - true if GPIO is valid for RTC GPIO use. false otherwise.

int rtc_io_number_get (gpio_num_t gpio_num)
    Get RTC IO index number by gpio number.

    **Parameters**
    - `gpio_num` -- GPIO number

    **Returns**
    - >=0: Index of rtcio. -1: The gpio is not rtcio.

`esp_err_t` rtc_gpio_init (gpio_num_t gpio_num)
    Init a GPIO as RTC GPIO.

    This function must be called when initializing a pad for an analog function.

    **Parameters**
    - `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

    **Returns**
    - ESP_OK success
    - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

`esp_err_t` rtc_gpio_deinit (gpio_num_t gpio_num)
    Init a GPIO as digital GPIO.

    **Parameters**
    - `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

    **Returns**
    - ESP_OK success
    - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)
    Get the RTC IO input level.

    **Parameters**
    - `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)
Returns
• 1 High level
• 0 Low level
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

```c
esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)
```
Set the RTC IO output level.

Parameters
• `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)
• `level` -- output level

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

```c
esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)
```
RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

Parameters
• `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)
• `mode` -- GPIO direction

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

```c
esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)
```
RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 supports INPUT_ONLY mode. The rest targets support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Parameters
• `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)
• `mode` -- GPIO direction

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

```c
esp_err_t rtc_gpio_pullup_en (gpio_num_t gpio_num)
```
RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Parameters `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

```c
esp_err_t rtc_gpio_pulldown_en (gpio_num_t gpio_num)
```
RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Parameters `gpio_num` -- GPIO number (e.g. GPIO_NUM_12)

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO
**esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)**

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

**Parameters**
- **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)**

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

**Parameters**
- **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)**

Set RTC GPIO pad drive capability.

**Parameters**
- **gpio_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)**

Get RTC GPIO pad drive capability.

**Parameters**
- **gpio_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_iomux_func_sel(gpio_num_t gpio_num, int func)**

Select a RTC IOMUX function for the RTC IO.

**Parameters**
- **gpio_num** -- GPIO number
- **func** -- Function to assign to the pin

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)**

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters**
- **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO
**esp_err_t rtc_gpio_hold_dis (gpio_num_t gpio_num)**

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

**Parameters**

- **gpio_num** -- GPIO number (e.g. GPIO_NUM_12)

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_force_hold_en_all** (void)

Enable force hold signal for all RTC I/Os.

Each RTC pad has a "force hold" input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all** (void)

Disable force hold signal for all RTC I/Os.

**esp_err_t rtc_gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Enable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio_num** -- GPIO number
- **intr_type** -- Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**esp_err_t rtc_gpio_wakeup_disable (gpio_num_t gpio_num)**

Disable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio_num** -- GPIO number

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Macros**

- **RTC_GPIO_IS_VALID_GPIO (gpio_num)**

**Header File**

- components/driver/gpio/include/driver/lp_io.h
- This header file can be included with:

```c
#include "driver/lp_io.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```
Enumerations
enum rtc_gpio_mode_t
    RTCIO output/input mode type.
    
    Values:

    enumerator RTC_GPIO_MODE_INPUT_ONLY
        Pad input

    enumerator RTC_GPIO_MODE_OUTPUT_ONLY
        Pad output

    enumerator RTC_GPIO_MODE_INPUT_OUTPUT
        Pad input + output

    enumerator RTC_GPIO_MODE_DISABLED
        Pad (output + input) disable

    enumerator RTC_GPIO_MODE_OUTPUT_OD
        Pad open-drain output

    enumerator RTC_GPIO_MODE_INPUT_OUTPUT_OD
        Pad input + open-drain output

API Reference - GPIO Glitch Filter

Functions
esp_err_t gpio_new_pin_glitch_filter(const gpio_pin_glitch_filter_config_t *config,
    gpio_glitch_filter_handle_t *ret_filter)
Create a pin glitch filter.

**Note:** Pin glitch filter parameters are fixed, pulses shorter than two sample clocks (IO-MUX’s source clock) will be filtered out. It’s independent with “flex” glitch filter. See also gpio_new_flex_glitch_filter.

**Note:** The created filter handle can later be deleted by gpio_del_glitch_filter.

### Parameters
- `config` -- [in] Glitch filter configuration
- `ret_filter` -- [out] Returned glitch filter handle

### Returns
- ESP_OK: Create a pin glitch filter successfully
- ESP_ERR_INVALID_ARG: Create a pin glitch filter failed because of invalid arguments (e.g. wrong GPIO number)
- ESP_ERR_NO_MEM: Create a pin glitch filter failed because of out of memory
- ESP_FAIL: Create a pin glitch filter failed because of other error

```c
esp_err_t gpio_new_flex_glitch_filter(const gpio_flex_glitch_filter_config_t *config,
    gpio_glitch_filter_handle_t *ret_filter)
```

Allocate a flex glitch filter.

**Note:** “flex” means the filter parameters (window, threshold) are adjustable. It’s independent with pin glitch filter. See also gpio_new_pin_glitch_filter.

**Note:** The created filter handle can later be deleted by gpio_del_glitch_filter.

### Parameters
- `config` -- [in] Glitch filter configuration
- `ret_filter` -- [out] Returned glitch filter handle

### Returns
- ESP_OK: Allocate a flex glitch filter successfully
- ESP_ERR_INVALID_ARG: Allocate a flex glitch filter failed because of invalid arguments (e.g. wrong GPIO number, filter parameters out of range)
- ESP_ERR_NO_MEM: Allocate a flex glitch filter failed because of out of memory
- ESP_ERR_NOT_FOUND: Allocate a flex glitch filter failed because the underlying hardware resources are used up
- ESP_FAIL: Allocate a flex glitch filter failed because of other error

```c
esp_err_t gpio_del_glitch_filter(gpio_glitch_filter_handle_t filter)
```

Delete a glitch filter.

### Parameters
- `filter` -- [in] Glitch filter handle returned from gpio_new_flex_glitch_filter or gpio_new_pin_glitch_filter

### Returns
- ESP_OK: Delete glitch filter successfully
- ESP_ERR_INVALID_ARG: Delete glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Delete glitch filter failed because the glitch filter is still in working
- ESP_FAIL: Delete glitch filter failed because of other error

```c
esp_err_t gpio_glitch_filter_enable(gpio_glitch_filter_handle_t filter)
```

Enable a glitch filter.
### Parameters

*filter* -- [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

### Returns

- ESP_OK: Enable glitch filter successfully
- ESP_ERR_INVALID_ARG: Enable glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Enable glitch filter failed because the glitch filter is already enabled
- ESP_FAIL: Enable glitch filter failed because of other error

### Structures

#### `struct gpio_pin_glitch_filter_config_t`
Configuration of GPIO pin glitch filter.

**Public Members**

- `glitch_filter_clock_source_t clk_src`  
  Clock source for the glitch filter

- `gpio_num_t gpio_num`  
  GPIO number

#### `struct gpio_flex_glitch_filter_config_t`
Configuration of GPIO flex glitch filter.

**Public Members**

- `glitch_filter_clock_source_t clk_src`  
  Clock source for the glitch filter

- `gpio_num_t gpio_num`  
  GPIO number

- `uint32_t window_width_ns`  
  Sample window width (in ns)

- `uint32_t window_thres_ns`  
  Sample window threshold (in ns), during the `window_width_ns` sample window, any pulse whose width < `window_thres_ns` will be discarded.
Type Definitions

typedef struct gpio_glitch_filter_t *gpio_glitch_filter_handle_t

Typedef of GPIO glitch filter handle.

2.6.7 General Purpose Timer (GPTimer)

Introduction

GPTimer (General Purpose Timer) is the driver of ESP32-C6 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- **Resource Allocation** - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- **Set and Get Count Value** - covers how to force the timer counting from a start point and how to get the count value at anytime.
- **Set up Alarm Action** - covers the parameters that should be set up to enable the alarm event.
- **Register Event Callbacks** - covers how to hook user specific code to the alarm event callback function.
- **Enable and Disable Timer** - covers how to enable and disable the timer.
- **Start and Stop Timer** - shows some typical use cases that start the timer with different alarm behavior.
- **ETM Event and Task** - describes what the events and tasks can be connected to the ETM channel.
- **Power Management** - describes how different source clock selections can affect power consumption.
- **IRAM Safe** - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation

Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.\(^1\)

A GPTimer instance is represented by gptimer_handle_t. The driver behind manages all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: gptimer_config_t:

- **gptimer_config_t::clk_src** selects the source clock for the timer. The available clocks are listed in gptimer_clock_source_t, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section Power Management.
- **gptimer_config_t::direction** sets the counting direction of the timer, supported directions are listed in gptimer_count_direction_t, you can only pick one of them.

---

\(^1\) Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to ESP32-C6 Technical Reference Manual > Chapter Timer Group (TIMG) [PDF]. The driver does forbid you from applying for more timers, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., gptimer_new_timer()).
Chapter 2. API Reference

- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to $1 / \text{resolution}_{hz}$ seconds.
- `gptimer_config::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to Interrupt Handling.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e., all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value depends on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This allows the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

Creating a GPTimer Handle with Resolution of 1 MHz

```c
#define HZ 1000
#define HZ_US 1000000

// GPTimer configuration
struct gptimer_config_t
{
  .clk_src = GPTIMER_CLK_SRC_DEFAULT,
  .direction = GPTIMER_COUNT_UP,
  .resolution_hz = 1 * HZ * HZ_US, // 1MHz, 1 tick = 1us
};

// Initialize GPTimer handle
gptimer_handle_t gptimer = NULL;

ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

Set and Get Count Value  When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

Set up Alarm Action  For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that triggers the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.
Chapter 2. API Reference

Note: If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

Register Event Callbacks After the timer starts up, it can generate a specific event (e.g., the "Alarm Event") dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling gptimer_register_event_callbacks(). All supported event callbacks are listed in gptimer_event_callbacks_t:

- gptimer_event_callbacks_t::on_alarm sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in gptimer_alarm_cb_t.

You can save your own context to gptimer_register_event_callbacks() as well, via the parameter user_data. The user data will be directly passed to the callback function.

This function lazy installs the interrupt service for the timer but not enable it. So please call this function before gptimer_enable(), otherwise the ESP_ERR_INVALID_STATE error will be returned. See Section Enable and Disable Timer for more information.

Enable and Disable Timer Before doing IO control to the timer, you need to enable the timer first, by calling gptimer_enable(). This function:

- Switches the timer driver state from init to enable.
- Enables the interrupt service if it has been lazy installed by gptimer_register_event_callbacks().
- Acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See Section Power Management for more information.

Calling gptimer_disable() does the opposite, that is, put the timer driver back to the init state, disable the interrupts service and release the power management lock.

Start and Stop Timer The basic IO operation of a timer is to start and stop. Calling gptimer_start() can make the internal counter work, while calling gptimer_stop() can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

Calling gptimer_start() transits the driver state from enable to run, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return ESP_ERR_INVALID_STATE. Most of the time, this error means that the timer is already stopped or in the "start protection" state (i.e., gptimer_start() is called but not finished).

Start Timer as a Wall Clock

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

Trigger Period Events

```
typedef struct {
   uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{

(continues on next page)
Trigger One-Shot Event

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
```

```c
// counter will reload with 0 on alarm event
.alarm_count = 1000000, // period = 1s @resolution 1MHz
.flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
```

```c
// register user callback
.esp_timer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb,
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

(continues on next page)
Dynamic Alarm Update  Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken = pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

ETM Event and Task  GPTimer is able to generate various events that can interact with the ETM module. The supported events are listed in the `gptimer_etm_event_type_t`. You can call `gptimer_new_etm_event()` to get the corresponding ETM event handle. Likewise, GPTimer exposes several tasks that can be triggered by other ETM events. The supported tasks are listed in the `gptimer_etm_task_type_t`. You can call `gptimer_new_etm_task()` to get the corresponding ETM task handle.

For how to connect the event and task to an ETM channel, please refer to the ETM documentation.

Power Management  There are some power management strategies, which might turn off or change the frequency of GPTimer's source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.
The driver can prevent the above situation from happening by creating different power management lock according
to different clock source. The driver increases the reference count of that power management lock in the `gpti-
mer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable
between `gptimer_enable()` and `gptimer_disable()`.

**IRAM Safe**  By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing
or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time
application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO con-
trol functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO
control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety**  All the APIs provided by the driver are guaranteed to be thread safe, which means you can call
them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under
ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

**Kconfig Options**

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM
or flash).
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or
flash).
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the
cache is disabled, see Section **IRAM Safe** for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will
increase the firmware binary size.

**Application Examples**

- Typical use cases of GPTimer are listed in the example `peripherals/timer_group/gptimer`.
- GPTimer capture external event's timestamp, with the help of ETM module: `peripher-
als/timer_group/gptimer_capture_hc_sr04`.

\[ ^2 \text{gptimer_event_callbacks_t::on_alarm callback and the functions invoked by the callback should also be placed in IRAM,}
\]  
\[ \text{please take care of them by yourself.} \]

```

Functions

**esp_err_t gptimer_new_timer** (const `gptimer_config_t` *config, `gptimer_handle_t` *ret_timer)

Create a new General Purpose Timer, and return the handle.

**Note:** The newly created timer is put in the "init" state.

**Parameters**

- `config` -- [in] GPTimer configuration
- `ret_timer` -- [out] Returned timer handle

**Returns**

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

**esp_err_t gptimer_del_timer** (`gptimer_handle_t` timer)

Delete the GPTimer handle.

**Note:** A timer must be in the "init" state before it can be deleted.

**Parameters**

- `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
- ESP_FAIL: Delete GPTimer failed because of other error

**esp_err_t gptimer_set_raw_count** (`gptimer_handle_t` timer, `uint64_t` value)

Set GPTimer raw count value.

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.
Note: This function is allowed to run within ISR context

Note: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

**Parameters**
- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [in] Count value to be set

**Returns**
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

`esp_err_t gptimer_get_raw_count(gptimer_handle_t timer, uint64_t*value)`

Get GPTimer raw count value.

Note: This function will trigger a software capture event and then return the captured count value.

Note: With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

Note: This function is allowed to run within ISR context

Note: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

**Parameters**
- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned GPTimer count value

**Returns**
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

`esp_err_t gptimer_get_resolution(gptimer_handle_t timer, uint32_t*out_resolution)`

Return the real resolution of the timer.

Note: usually the timer resolution is same as what you configured in the `gptimer_config_t::resolution_hz`, but some unstable clock source (e.g. RC_FAST) will do a calibration, the real resolution can be different from the configured one.

**Parameters**
- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **out_resolution** -- [out] Returned timer resolution, in Hz

**Returns**
Chapter 2. API Reference

- ESP_OK: Get GPTimer resolution successfully
- ESP_ERR_INVALID_ARG: Get GPTimer resolution failed because of invalid argument
- ESP_FAIL: Get GPTimer resolution failed because of other error

```c
esp_err_t gptimer_get_captured_count (gptimer_handle_t timer, uint64_t *value)
```

Get GPTimer captured count value.

**Note:** The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

**Parameters**
- `timer` -- [in] Timer handle created by `gptimer_new_timer`
- `value` -- [out] Returned captured count value

**Returns**
- ESP_OK: Get GPTimer captured count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer captured count value failed because of invalid argument
- ESP_FAIL: Get GPTimer captured count value failed because of other error

```c
esp_err_t gptimer_register_event_callbacks (gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for GPTimer.

**Note:** User registered callbacks are expected to be runnable within ISR context

**Note:** The first call to this function needs to be before the call to `gptimer_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**
- `timer` -- [in] Timer handle created by `gptimer_new_timer`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t gptimer_set_alarm_action (gptimer_handle_t timer, const gptimer_alarm_config_t *config)
```

Set alarm event actions for GPTimer.
Note: This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

Note: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters
- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] Alarm configuration, especially, set config to NULL means disabling the alarm function

Returns
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

```c
esp_err_t gptimer_enable (gptimer_handle_t timer)
```

Enable GPTimer.

Note: This function will transit the timer state from "init" to "enable".

Note: This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

Note: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while CONFIG_PM_ENABLE is enabled.

Note: Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

Parameters **timer** -- [in] Timer handle created by `gptimer_new_timer`

Returns
- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

```c
esp_err_t gptimer_disable (gptimer_handle_t timer)
```

Disable GPTimer.

Note: This function will transit the timer state from "enable" to "init".

Note: This function will disable the interrupt service if it's installed.
Note: This function will release the PM lock if it's acquired in the `gptimer_enable`.

Note: Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

### Parameters
- `timer` -- [in] Timer handle created by `gptimer_new_timer`

### Returns
- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

```c
esp_err_t gptimer_start (gptimer_handle_t timer)
```

Start GPTimer (internal counter starts counting)

Note: This function will transit the timer state from "enable" to "run".

Note: This function is allowed to run within ISR context

Note: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

### Parameters
- `timer` -- [in] Timer handle created by `gptimer_new_timer`

### Returns
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled or is already in running
- ESP_FAIL: Start GPTimer failed because of other error

```c
esp_err_t gptimer_stop (gptimer_handle_t timer)
```

Stop GPTimer (internal counter stops counting)

Note: This function will transit the timer state from "run" to "enable".

Note: This function is allowed to run within ISR context

Note: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

### Parameters
- `timer` -- [in] Timer handle created by `gptimer_new_timer`

### Returns
- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in running.
• ESP_FAIL: Stop GPTimer failed because of other error

**Structures**

struct **gptimer_config_t**

  General Purpose Timer configuration.

**Public Members**

  **gptimer_clock_source_t** clk_src

  GPTimer clock source

  **gptimer_count_direction_t** direction

  Count direction

  uint32_t resolution_hz

  Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

  int intr_priority

  GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1, 2, 3)

  uint32_t intr_shared

  Set true, the timer interrupt number can be shared with other peripherals

  struct **gptimer_config_t::[anonymous]** flags

  GPTimer config flags

struct **gptimer_event_callbacks_t**

  Group of supported GPTimer callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

**Public Members**

  **gptimer_alarm_cb_t** on_alarm

  Timer alarm callback

  struct **gptimer_alarm_config_t**

  General Purpose Timer alarm configuration.
Public Members

```
uint64_t alarm_count
    Alarm target count value

uint64_t reload_count
    Alarm reload count value, effect only when auto_reload_on_alarm is set to true

uint32_t auto_reload_on_alarm
    Reload the count value by hardware, immediately at the alarm event
```

```
struct gptimer_alarm_config_t::[anonymous] flags
    Alarm config flags
```

Header File

```
• components/driver/gptimer/include/driver/gptimer_etm.h
• This header file can be included with:

```cpp
#include "driver/gptimer_etm.h"
```

• This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cpp
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

Functions

```
estp_err_t gptimer_new_etm_event (gptimer_handle_t timer, const gptimer_etm_event_config_t *config, esp_etm_event_handle_t *out_event)
```

Get the ETM event for GPTimer.

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

**Parameters**

```
• timer -- [in] Timer handle created by gptimer_new_timer
• config -- [in] GPTimer ETM event configuration
• out_event -- [out] Returned ETM event handle
```

**Returns**

```
• ESP_OK: Get ETM event successfully
• ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
• ESP_FAIL: Get ETM event failed because of other error
```

```
estp_err_t gptimer_new_etm_task (gptimer_handle_t timer, const gptimer_etm_task_config_t *config, esp_etm_task_handle_t *out_task)
```

Get the ETM task for GPTimer.

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

**Parameters**
Chapter 2. API Reference

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM task configuration
- **out_task** -- [out] Returned ETM task handle

**Returns**
- ESP_OK: Get ETM task successfully
- ESP_ERR_INVALID_ARG: Get ETM task failed because of invalid argument
- ESP_FAIL: Get ETM task failed because of other error

**Structures**

```c
struct gptimer_etm_event_config_t
GPTimer ETM event configuration.
```

**Public Members**

```c
gptimer_etm_event_type_t event_type
GPTimer ETM event type
```

```c
struct gptimer_etm_task_config_t
GPTimer ETM task configuration.
```

**Public Members**

```c
gptimer_etm_task_type_t task_type
GPTimer ETM task type
```

**Header File**

- `components/driver/gptimer/include/driver/gptimer_types.h`
- This header file can be included with:
  ```c
  #include "driver/gptimer_types.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRE driver
  ```
  or
  ```cmake
  PRIV_REQUIRE driver
  ```

**Structures**

```c
struct gptimer_alarm_event_data_t
GPTimer alarm event data.
```

**Public Members**

```c
uint64_t count_value
Current count value
```
uint64_t alarm_value

Current alarm value

Type Definitions

typedef struct gptimer_t *gptimer_handle_t

Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)

Timer alarm callback prototype.

Param  timer  [in] Timer handle created by gptimer_new_timer
Param  edata  [in] Alarm event data, fed by driver
Param  user_ctx [in] User data, passed from gptimer_register_event_callbacks
Return  Whether a high priority task has been woken up by this function

Header File

• components/hal/include/hal/timer_types.h
• This header file can be included with:

```
#include "hal/timer_types.h"
```

Type Definitions

typedef soc_periph_gptimer_clk_src_t gptimer_clock_source_t

GPTimer clock source.

Note:  User should select the clock source based on the power and resolution requirement

Enumerations

enum gptimer_count_direction_t

GPTimer count direction.

Values:

enumerator  GPTIMER_COUNT_DOWN

Decrease count value

enumerator  GPTIMER_COUNT_UP

Increase count value

enum gptimer_etm_task_type_t

GPTimer specific tasks that supported by the ETM module.

Values:

enumerator  GPTIMER_ETM_TASK_START_COUNT

Start the counter
Chapter 2. API Reference

enumerator GPTIMER_ETM_TASK_STOP_COUNT
Stop the counter

enumerator GPTIMER_ETM_TASK_EN_ALARM
Enable the alarm

enumerator GPTIMER_ETM_TASK_RELOAD
Reload preset value into counter

enumerator GPTIMER_ETM_TASK_CAPTURE
Capture current count value into specific register

enumerator GPTIMER_ETM_TASK_MAX
Maximum number of tasks

def gptimer_etm_event_type_t
GPTimer specific events that supported by the ETM module.
Values:

enumerator GPTIMER_ETM_EVENT_ALARM_MATCH
Count value matches the alarm target value

enumerator GPTIMER_ETM_EVENT_MAX
Maximum number of events

2.6.8 Dedicated GPIO

Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as "dedicated" can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this "CPU Dedicated" way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What's more, the GPIO bundle has a strong relevance to the CPU which it derives from. Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to. Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

Note: Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It's highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’s impossible to control GPIOA.
To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- **gpio_array**: An array that contains GPIO number.
- **array_size**: Element number of `gpio_array`.
- **flags**: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install an output only GPIO bundle:

```c
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
  .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
  io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
  gpio_config(&io_conf);
}

// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
  .gpio_array = bundleA_gpios,
  .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
  .flags = {
    .out_en = 1,
  },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

**Note:** `_dedic_gpio_new_bundle()` doesn’t cover any GPIO pad configuration (e.g., pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g., `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

### GPIO Bundle Operations

<table>
<thead>
<tr>
<th>Operations</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write to GPIOs in the bundle by mask</td>
<td><code>dedic_gpio_bundle_write()</code></td>
</tr>
<tr>
<td>Read the value that output from the given GPIO bundle</td>
<td><code>dedic_gpio_bundle_read_out()</code></td>
</tr>
<tr>
<td>Read the value that input to the given GPIO bundle</td>
<td><code>dedic_gpio_bundle_read_in()</code></td>
</tr>
</tbody>
</table>

**Note:** Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try [Manipulate GPIOs by Writing Assembly Code](#) instead to reduce the overhead but should take care of the thread safety by themselves.

### Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:
1. Allocate a GPIO bundle: \texttt{dedic\_gpio\_new\_bundle()}
2. Query the mask occupied by that bundle: \texttt{dedic\_gpio\_get\_out\_mask()} or/and \texttt{dedic\_gpio\_get\_in\_mask()}
3. Call CPU LL apis (e.g., \texttt{dedic\_gpio\_cpu\_ll\_write\_mask}) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated "set/clear" instructions:
   - Set bits of GPIO: \texttt{csrrsi rd, csr, imm[4:0]}
   - Clear bits of GPIO: \texttt{csrrci rd, csr, imm[4:0]}
   - Note: Can only control the lowest 4 GPIO channels

Code examples for manipulating dedicated GPIOs from assembly are provided in the \texttt{peripherals/dedicated\_gpio} directory of ESP-IDF examples. These examples show how to emulate a UART, an I2C and an SPI bus in assembly thanks to dedicated GPIOs.

For details of supported dedicated GPIO instructions, please refer to ESP32-C6 Technical Reference Manual > ESP-RISC-V CPU [PDF].

Some of the dedicated CPU instructions are also wrapped inside \texttt{hal/dedic\_gpio\_cpu\_ll.h} as helper inline functions.

\textbf{Note:} Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

\section*{API Reference}

\subsection*{Header File}
- \texttt{components/driver/gpio/include/driver/dedic\_gpio.h}
- This header file can be included with:

```c
#include "driver/dedic\_gpio.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

\subsection*{Functions}

\texttt{esp\_err\_t dedic\_gpio\_get\_out\_mask(dedic\_gpio\_bundle\_handle\_t bundle, uint32\_t *mask)}

Get allocated channel mask.

\textbf{Note:} Each bundle should have at least one mask (in or out), based on bundle configuration.

\textbf{Note:} With the returned mask, user can directly invoke LL function like "dedic\_gpio\_cpu\_ll\_write\_mask" or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

\textbf{Parameters}
- \texttt{bundle} -- [in] Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"
- \texttt{mask} -- [out] Returned mask value for on specific direction (in or out)

\textbf{Returns}
- ESP_OK: Get channel mask successfully
- ESP\_ERR\_INVALID\_ARG: Get channel mask failed because of invalid argument
Chapter 2. API Reference

- ESP_FAIL: Get channel mask failed because of other error

```c
esp_err_t dedic_gpio_get_in_mask (dedic_gpio_bundle_handle_t bundle, uint32_t *mask)
```

- ESP_FAIL: Get channel out offset failed because of other error

```c
esp_err_t dedic_gpio_get_out_offset (dedic_gpio_bundle_handle_t bundle, uint32_t *offset)
```

Get the channel offset of the GPIO bundle.

A GPIO bundle maps the GPIOs of a particular direction to a consecutive set of channels within a particular GPIO bank of a particular CPU. This function returns the offset to the bundle’s first channel of a particular direction within the bank.

**Parameters**

- **bundle** -- [in] Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
- **offset** -- [out] Offset value to the first channel of a specific direction (in or out)

**Returns**

- ESP_OK: Get channel offset successfully
- ESP_ERR_INVALID_ARG: Get channel offset failed because of invalid argument
- ESP_FAIL: Get channel offset failed because of other error

```c
esp_err_t dedic_gpio_get_in_offset (dedic_gpio_bundle_handle_t bundle, uint32_t *offset)
```

```c
esp_err_t dedic_gpio_new_bundle (const dedic_gpio_bundle_config_t *config, dedic_gpio_bundle_handle_t *ret_bundle)
```

Create GPIO bundle and return the handle.

**Note:** One has to enable at least input or output mode in "config" parameter.

**Parameters**

- **config** -- [in] Configuration of GPIO bundle
- **ret_bundle** -- [out] Returned handle of the new created GPIO bundle

**Returns**

- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

```c
esp_err_t dedic_gpio_del_bundle (dedic_gpio_bundle_handle_t bundle)
```

Destroy GPIO bundle.

**Parameters**

- **bundle** -- [in] Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"

**Returns**

- ESP_OK: Destroy GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destroy GPIO bundle failed because of invalid argument
- ESP_FAIL: Destroy GPIO bundle failed because of other error

```c
void dedic_gpio_bundle_write (dedic_gpio_bundle_handle_t bundle, uint32_t mask, uint32_t value)
```

Write value to GPIO bundle.

**Note:** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.
Parameters

- **bundle** -- [in] Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
- **mask** -- [in] Mask of the GPIOs to be written in the given bundle
- **value** -- [in] Value to write to given GPIO bundle, low bit represents low member in the bundle

```c
uint32_t dedic_gpio_bundle_read_out(dedic_gpio_bundle_handle_t bundle)
```

Read the value that output from the given GPIO bundle.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

```c
uint32_t dedic_gpio_bundle_read_in(dedic_gpio_bundle_handle_t bundle)
```

Read the value that input to the given GPIO bundle.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Structures**

```c
struct dedic_gpio_bundle_config_t
```

Type of Dedicated GPIO bundle configuration.

**Public Members**

```c
const int *gpio_array
```

Array of GPIO numbers, gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num

```c
size_t array_size
```

Number of GPIOs in gpio_array

```c
unsigned int in_en
```

Enable input

```c
unsigned int in_invert
```

Invert input signal

```c
unsigned int out_en
```

Enable output
Chapter 2. API Reference

unsigned int out_invert

Invert output signal

struct dedic_gpio_bundle_config_t::[anonymous] flags

Flags to control specific behaviour of GPIO bundle

Type Definitions

typedef struct dedic_gpio_bundle_t * dedic_gpio_bundle_handle_t

Type of Dedicated GPIO bundle.

2.6.9 Hash-Based Message Authentication Code (HMAC)

Hash-based Message Authentication Code (HMAC) is a secure authentication technique that verifies the authenticity and integrity of a message with a pre-shared key. This module provides hardware acceleration for SHA256-HMAC generation using a key burnt into an eFuse block.

For more detailed information on the application workflow and the HMAC calculation process, see ESP32-C6 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel.

To verify A’s messages, B can do the following:

• A calculates the HMAC of the message it wants to send.
• A sends the message and the HMAC to B.
• B calculates the HMAC of the received message itself.
• B checks whether the received and calculated HMACs match.

If they do match, the message is authentic.

However, the HMAC itself is not bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

HMAC on ESP32-C6

On ESP32-C6, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, ESP32-C6 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called Upstream mode, while the last two modes are called Downstream modes.

eFuse Keys for HMAC

Six physical eFuse blocks can be used as keys for the HMAC module: block 4 ~ block 9. The enum hmac_key_id_t in the API maps them to HMAC_KEY0 ~ HMAC_KEY5.

Each key has a corresponding eFuse parameter key purpose determining for which of the three HMAC application scenarios (see below) the key may be used:
<table>
<thead>
<tr>
<th>Key Purpose</th>
<th>Application Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>HMAC generated for software use</td>
</tr>
<tr>
<td>7</td>
<td>HMAC used as a key for the Digital Signature (DS) module</td>
</tr>
<tr>
<td>6</td>
<td>HMAC used for enabling the soft-disabled JTAG interface</td>
</tr>
<tr>
<td>5</td>
<td>HMAC both as a key for the DS module and for enabling JTAG</td>
</tr>
</tbody>
</table>

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the key purpose (see ESP32-C6 Technical Reference Manual > eFuse Controller (eFuse) [PDF]).

Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

**HMAC Generation for Software**  
Key purpose value: 8

In this case, the HMAC is given out to the software, e.g., to authenticate a message.

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length, and the eFuse key block ID which contains the secret and has the efuse key purpose set to Upstream mode.

**HMAC for Digital Signature**  
Key purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. You only need to provide the eFuse key block and purpose on the HMAC side, additional parameters are required for the Digital Signature component in that case.

Neither the key nor the actual HMAC is ever exposed outside the HMAC module and DS component. The calculation of the HMAC and its handover to the DS component happen internally.

For more details, see ESP32-C6 Technical Reference Manual > Digital Signature (DS) [PDF].

**HMAC for Enabling JTAG**  
Key purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before.

Following is the procedure to re-enable the JTAG:

**Stage 1: Setup**

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6). This can be done using the `esp_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read-protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the soft JTAG disable bit/bits on ESP32-C6. This will permanently disable JTAG unless the correct key value is provided by the software.

**Note:** The API `esp_efuse_write_field_cnt(ESP_EFUSE_SOFT_DIS_JTAG, ESP_EFUSE_SOFT_DIS_JTAG[0]->bit_count)` can be used to burn soft JTAG disable bits on ESP32-C6.

**Note:** If DIS_PAD_JTAG eFuse is set, then SOFT_DIS_JTAG functionality does not work because JTAG is permanently disabled.
JTAG enablers

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see ESP32-C6 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

**Application Outline**

The following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage.

We use `esp_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. ESP_EFUSE_KEY_PURPOSE_HMAC_UP (8) means that this key can only be used for HMAC generation for software usage:

```c
#include "esp_efuse.h"

const uint8_t key_data[32] = { ... };

esp_err_t status = esp_efuse_write_key(EFUSE_BLK_KEY4, ESP_EFUSE_KEY_PURPOSE_HMAC_UP, key_data, sizeof(key_data));

if (status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```c
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

**API Reference**

**Header File**

- components/esp_hw_support/include/esp_hmac.h
- This header file can be included with:

```c
#include "esp_hmac.h"
```

**Functions**
esp_err_t esp_hmac_calculate(hmac_key_id_t key_id, const void* message, size_t message_len, uint8_t* hmac)

Calculate the HMAC of a given message.
Calculate the HMAC hmac of a given message message with length message_len. SHA256 is used for the calculation.

Note: Uses the HMAC peripheral in "upstream" mode.

Parameters
- **key_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** -- the message for which to calculate the HMAC
- **message_len** -- message length  return ESP_ERR_INVALID_STATE if unsuccessful
- **hmac** -- [out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

Returns
- ESP_OK, if the calculation was successful,
- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed

esp_err_t esp_hmac_jtag_enable(hmac_key_id_t key_id, const uint8_t* token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

Note: Return value of the API does not indicate the JTAG status.

Parameters
- **key_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** -- Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

Returns
- ESP_OK, if the key_purpose of the key_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- ESP_FAIL, if the key_purpose of the key_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

esp_err_t esp_hmac_jtag_disable(void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp_hmac_jtag_enable() API.

Returns
- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

Submit Document Feedback
Chapter 2. API Reference

enum hmac_key_id_t
    The possible efuse keys for the HMAC peripheral

    Values:

    enumerator HMAC_KEY0
    enumerator HMAC_KEY1
    enumerator HMAC_KEY2
    enumerator HMAC_KEY3
    enumerator HMAC_KEY4
    enumerator HMAC_KEY5
    enumerator HMAC_KEY_MAX

2.6.10 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see ESP32-C6 Technical Reference Manual > Digital Signature (DS) [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C6 or alternatively on a host. For this context, the IDF provides esp_efuse_write_block() to set the HMAC key and esp_hmac_calculate() to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in ESP32-C6 Technical Reference Manual > Digital Signature (DS) [PDF].
Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see ESP32-C6 Technical Reference Manual > Digital Signature (DS) [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is esp_ds_sign() and simply blocks until the calculation is finished. If software needs to do something else during the calculation, esp_ds_start_sign() can be called, followed by periodic calls to esp_ds_is_busy() to check when the calculation has finished. Once the calculation has finished, esp_ds_finish_sign() can be called to get the resulting signature.

The APIs esp_ds_sign() and esp_ds_start_sign() calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API esp_ds_rsa_sign() can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses esp_ds_start_sign() and converts the signature into PKCS#1 v1.5 format.

Note: Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-C6 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

1) Randomly generate a 256 bit value called the Initialization Vector (IV).
2) Randomly generate a 256 bit value called the HMAC_KEY.
3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
4) Then burn the 256 bit HMAC_KEY on the efuse, which can only be read by the DS peripheral.

For more details, see ESP32-C6 Technical Reference Manual > Digital Signature (DS) [PDF].

To configure the DS peripheral for development purposes, you can use the esp-secure-cert-tool.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the ds data from the flash which has been done through the API's provided by the esp_secure_cert_mgr component. Please refer the component/README. for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of ESP-TLS. Please refer to Digital Signature with ESP-TLS in ESP-TLS for more details. As mentioned in the ESP-TLS documentation, the application only needs to provide the encrypted private key parameters to the esp_tls context (as ds_data), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example ssl_ds shows how to use the DS peripheral for mutual authentication. The example uses mqtt_client (Implemented through ESP-MQTT) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with ESP-TLS. See example README for more details.
API Reference

Header File

- components/esp_hw_support/include/esp_ds.h
- This header file can be included with:

```c
#include "esp_ds.h"
```

Functions

```c
esp_err_t esp_ds_sign
(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, void *signature)
```

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

**Note:** Please see note section of `esp_ds_start_sign()` for more details about the input parameters.

Parameters

- **message** -- the message to be signed; its length should be \((\text{data->rsa_length} + 1) \times 4\) bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. message = padding(hash(inputMsg)))
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** -- the destination of the signature, should be \((\text{data->rsa_length} + 1) \times 4\) bytes long

Returns

- **ESP_OK** if successful, the signature was written to the parameter `signature`
- **ESP_ERR_INVALID_ARG** if one of the parameters is NULL or data->rsa_length is too long or 0
- **ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL** if there was an HMAC failure during retrieval of the decryption key
- **ESP_ERR_NO_MEM** if there hasn't been enough memory to allocate the context object
- **ESP_ERR_HW_CRYPTO_DS_INVALID_KEY** if there's a problem with passing the HMAC key to the DS component
- **ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST** if the message digest didn't match; the signature is invalid.
- **ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING** if the message padding is incorrect, the signature can be read though since the message digest matches.

```c
esp_err_t esp_ds_start_sign
(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, 
 esp_ds_context_t **esp_ds_ctx)
```

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

**Note:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner. The numbers \( Y, M, R_b \) which are a part of `esp_ds_data_t`
should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically. Please ensure the message is appropriate padded before calling the API.

Parameters

- **message** -- the message to be signed; its length should be (data->rsa_length + 1)*4 bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. message = padding(hash(inputMsg)))
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp_ds_ctx** -- the context object which is needed for finishing the signing process later

Returns

- ESP_OK if successful, the ds operation was started now and has to be finished with esp_ds_finish_sign()
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or data->rsa_length is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component

bool esp_ds_is_busy (void)

Return true if the DS peripheral is busy, otherwise false.

### Note:
Only valid if esp_ds_start_sign() was called before.

**esp_err_t esp_ds_finish_sign (void *signature, esp_ds_context_t *esp_ds_ctx)**

Finish the signing process.

Parameters

- **signature** -- the destination of the signature, should be (data->rsa_length + 1)*4 bytes long, the resultant signature bytes shall be written in little endian format.
- **esp_ds_ctx** -- the context object retrieved by esp_ds_start_sign()

Returns

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

**esp_err_t esp_ds_encrypt_params (esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)**

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

### Note:
The numbers Y, M, Rb which are a part of esp_ds_data_t should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to
the RSA private key bit length. No padding is applied to the message automatically. Please ensure the message is appropriate padded before calling the API.

**Parameters**
- **data** -- Output buffer to store encrypted data, suitable for later use generating signatures.
- **iv** -- Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p_data** -- Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** -- Pointer to 32 bytes of key data. Type determined by key_type parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

**Returns**
- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or p_data->rsa_length is too long

**Structures**

struct **esp_digital_signature_data**

Encrypted private key data. Recommended to store in flash in this format.

**Note:** This struct has to match one from the ROM code! This documentation is mostly taken from there.

**Public Members**

```c
esp_digital_signature_length_t rsa_length
```

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

**Note:** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangably. See the ROM code for the original declaration of struct ets_ds_data_t.

```c
uint32_t iv[ESP_DS_IV_BIT_LEN / 32]
```

IV value used to encrypt ’c’

```c
uint8_t c[ESP_DS_C_LEN]
```

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

**struct esp_ds_p_data_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling esp_ds_encrypt_params(). Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.
Note: Y, M, Rb, & M_Prime must all be in little endian format.

Public Members

```c
uint32_t Y[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
    RSA exponent.

uint32_t M[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
    RSA modulus.

uint32_t Rb[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]
    RSA r inverse operand.

uint32_t M_prime
    RSA M prime operand.

uint32_t length
    RSA length in words (32 bit)
```

Macros

```c
ESP_DS_IV_BIT_LEN
ESP_DS_IV_LEN
ESP_DS_SIGNATURE_MAX_BIT_LEN
ESP_DS_SIGNATURE_MD_BIT_LEN
ESP_DS_SIGNATURE_M_PRIME_BIT_LEN
ESP_DS_SIGNATURE_L_BIT_LEN
ESP_DS_SIGNATURE_PADDING_BIT_LEN
ESP_DS_C_LEN
```

Type Definitions

```c
typedef struct esp_ds_context esp_ds_context_t

typedef struct esp_digital_signature_data esp_ds_data_t
    Encrypted private key data. Recommended to store in flash in this format.
```

Note: This struct has to match to one from the ROM code! This documentation is mostly taken from there.
Enumeration

```c
enum esp_digital_signature_length_t
{
    enumerator ESP_DS_RSA_1024,
    enumerator ESP_DS_RSA_2048,
    enumerator ESP_DS_RSA_3072,
    enumerator ESP_DS_RSA_4096
};
```

### 2.6.11 Inter-Integrated Circuit (I2C)

**Introduction**

I2C is a serial, synchronous, multi-device, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. I2C uses two bidirectional open-drain lines: serial data line (SDA) and serial clock line (SCL), pulled up by resistors.

ESP32-C6 has 1 I2C controller (also called port), responsible for handling communication on the I2C bus. A single I2C controller can be a master or a slave.

Typically, an I2C slave device has a 7-bit address or 10-bit address. ESP32-C6 supports both I2C Standard-mode (Sm) and Fast-mode (Fm) which can go up to 100KHz and 400KHz respectively.

**Warning:** The clock frequency of SCL in master mode should not be larger than 400 KHz

**Note:** The frequency of SCL is influenced by both the pull-up resistor and the wire capacitance. Therefore, users are strongly recommended to choose appropriate pull-up resistors to make the frequency accurate. The recommended value for pull-up resistors usually ranges from 1K Ohms to 10K Ohms.

Keep in mind that the higher the frequency, the smaller the pull-up resistor should be (but not less than 1 KOhs). Indeed, large resistors will decline the current, which will increase the clock switching time and reduce the frequency. We usually recommend a range of 2 KOhs to 5 KOhs, but users may also need to make some adjustments depending on their current draw requirements.

### I2C Clock Configuration

- `i2c_clock_source_t::I2C_CLK_SRC_DEFAULT`: Default I2C source clock.
- `i2c_clock_source_t::I2C_CLK_SRC_XTAL`: External crystal for I2C clock source.
- `i2c_clock_source_t::I2C_CLK_RC_FAST`: Internal 20MHz rc oscillator for I2C clock source.

### I2C File Structure

**Public headers that need to be included in the I2C application**

- `i2c.h`: The header file of legacy I2C APIs (for apps using legacy driver).
- `i2c_master.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with master mode).
i2c_slave.h: The header file that provides standard communication mode specific APIs (for apps using new driver with slave mode).

**Note:** The legacy driver can’t coexist with the new driver. Include i2c.h to use the legacy driver or the other two headers to use the new driver. Please keep in mind that the legacy driver is now deprecated and will be removed in future.

**Public headers that have been included in the headers above**

- i2c_types_legacy.h: The legacy public types that only used in the legacy driver.
- i2c_types.h: The header file that provides public types.

**Functional Overview**

The I2C driver offers following services:

- **Resource Allocation** - covers how to allocate I2C bus with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **I2C Master Controller** - covers behavior of I2C master controller. Introduce data transmit, data receive, and data transmit and receive.
- **I2C Slave Controller** - covers behavior of I2C slave controller. Involve data transmit and data receive.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the I2C interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation** Both I2C master bus and I2C slave bus, when supported, are represented by i2c_bus_handle_t in the driver. The available ports are managed in a resource pool that allocates a free port on request.
Install I2C master bus and device  The I2C master is designed based on bus-device model. So `i2c_master_bus_config_t` and `i2c_device_config_t` are required separately to allocate the I2C master bus instance and I2C device instance.

![Fig. 7: I2C master bus-device module](image)

**I2C master bus** requires the configuration that specified by `i2c_master_bus_config_t`:

- `i2c_master_bus_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_master_bus_config_t::sda_io_num` sets the GPIO number for the serial data bus (SDA).
- `i2c_master_bus_config_t::scl_io_num` sets the GPIO number for the serial clock bus (SCL).
- `i2c_master_bus_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to "Power Management" section.
- `i2c_master_bus_config_t::glitch-ignore-cnt` sets the glitch period of master bus, if the glitch period on the line is less than this value, it can be filtered out, typically value is 7.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2,3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority` Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)).
- `i2c_master_bus_config_t::trans_queue-depth` Depth of internal transfer queue. Only valid in asynchronous transaction.
- `i2c_master_bus_config_t::enable-internal-pullup` Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. A suitable external pullup is recommended.

If the configurations in `i2c_master_bus_config_t` is specified, users can call `i2c_new_master_bus()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

**I2C master device** requires the configuration that specified by `i2c_device_config_t`:

- `i2c_device_config_t::dev-addr-length` configure the address bit length of the slave device. User can choose from enumerator `I2C_ADDR_BIT_LEN_7` or `I2C_ADDR_BIT_LEN_10` (if supported).
- `i2c_device_config_t::device-address` I2C device raw address. Please parse the device address to this member directly. For example, the device address is 0x28, then parse 0x28 to `i2c_device_config_t::device_address`, don't carry a write/read bit.
- `i2c_device_config_t::scl-speed-hz` set the scl line frequency of this device.
- `i2c_device_config_t::scl-wait-us` SCL await time (in us). Usually this value should not be very small because slave stretch will happen in pretty long time. (It's possible even stretch for 12ms). Set 0 means use default reg value.
Once the `i2c_device_config_t` structure is populated with mandatory parameters, users can call `i2c_master_bus_add_device()` to allocate an I2C device instance and mounted to the master bus then. This function will return an I2C device handle if it runs correctly. Specifically, when the I2C bus is not initialized properly, calling this function will result in an `ESP_ERR_INVALID_ARG` error.

```c
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```

**Uninstall I2C master bus and device**  If a previously installed I2C bus or device is no longer needed, it’s recommended to recycle the resource by calling `i2c_master_bus_rm_device()` or `i2c_del_master_bus()`, so that to release the underlying hardware.

**Install I2C slave device**  I2C slave requires the configuration that specified by `i2c_slave_config_t`:

- `i2c_slave_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_slave_config_t::sda_io_num` sets the GPIO number for serial data bus (SDA).
- `i2c_slave_config_t::scl_io_num` sets the GPIO number for serial clock bus (SCL).
- `i2c_slave_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to `Power Management` section.
- `i2c_slave_config_t::send_buf_depth` sets the sending buffer length.
- `i2c_slave_config_t::slave_addr` sets the slave address.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `i2c_del_master_bus()` is called.
- `i2c_slave_config_t::addr_bit_len` sets true if you need the slave to have a 10-bit address.
- `i2c_slave_config_t::stretch_en` Set true if you want the slave controller stretch works, please refer to [TRM](#) to learn how I2C stretch works.
- `i2c_slave_config_t::broadcast_en` Set true to enable the slave broadcast. When the slave receives the general call address 0x00 from the master and the R/W bit followed is 0, it responds to the master regardless of its own address.
- `i2c_slave_config_t::access_ram_en` Set true to enable the nonfifo mode. Thus the I2C data fifo can be used as RAM, and double addressing will be synchronised opened.
- `i2c_slave_config_t::slave_unmatch_en` Set true to enable the slave unmatch interrupt. If master send command address cannot match the slave address, and unmatch interrupt will be triggered.
Once the `i2c_slave_config_t` structure is populated with mandatory parameters, users can call `i2c_new_slave_device()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

```c
i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
```

Uninstall I2C slave device  If a previously installed I2C bus is no longer needed, it's recommended to recycle the resource by calling `i2c_del_slave_device()`, so that to release the underlying hardware.

I2C Master Controller  After installing the i2c master driver by `i2c_new_master_bus()`, ESP32-C6 is ready to communicate with other I2C devices. I2C APIs allow the standard transactions. Like the wave as follows:

![Standard I2C Transaction Timing Diagram](image)

**I2C Master Write**  After installing I2C master bus successfully, you can simply call `i2c_master_transmit()` to write data to the slave device. The principle of this function can be explained by following chart.

In order to organize the process, the driver uses a command link, that should be populated with a sequence of commands and then passed to I2C controller for execution.

![Fig. 8: I2C master write to slave](image)

Simple example for writing data to slave:

```c
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};

i2c_master_bus_handle_t bus_handle;
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
  .dev_addr_length = I2C_ADDR_BIT_LEN_7,
  .device_address = 0x58,
  .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
ESP_ERROR_CHECK(i2c_master_transmit(dev_handle, data_wr, DATA_LENGTH, -1));

I2C Master Read After installing I2C master bus successfully, you can simply call i2c_master_receive() to read data from the slave device. The principle of this function can be explained by following chart.

```
<table>
<thead>
<tr>
<th>Master</th>
<th>START</th>
<th>Device address</th>
<th>R</th>
<th>ACK</th>
<th>NACK</th>
<th>STOP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slave</td>
<td></td>
<td></td>
<td></td>
<td>ACK</td>
<td>Data</td>
<td>Data</td>
</tr>
</tbody>
</table>
```

Fig. 9: I2C master read from slave

Simple example for reading data from slave:

```
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
  .clk_source = I2C_CLK_SRC_DEFAULT,
  .i2c_port = I2C_PORT_NUM_0,
  .scl_io_num = I2C_MASTER_SCL_IO,
  .sda_io_num = I2C_MASTER_SDA_IO,
  .glitch_ignore_cnt = 7,
};

i2c_master_dev_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
  .dev_addr_length = I2C_ADDR_BIT_LEN_7,
  .device_address = 0x58,
  .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

i2c_master_receive(dev_handle, data_rd, DATA_LENGTH, -1);
```

I2C Master Write and Read Some I2C device needs write configurations before reading data from it, therefore, an interface called i2c_master_transmit_receive() can help. The principle of this function can be explained by following chart.

```
<table>
<thead>
<tr>
<th>Master</th>
<th>START</th>
<th>Device address</th>
<th>W</th>
<th>(Data(write))</th>
<th>START</th>
<th>Device address</th>
<th>R</th>
<th>NACK</th>
<th>STOP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slave</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>ACK</td>
<td>Data(read)</td>
</tr>
</tbody>
</table>
```

Fig. 10: I2C master write to slave and read from slave

Simple example for writing and reading from slave:
```c
i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};
```

```c
i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(I2C_PORT_NUM_0, &dev_cfg, &dev_handle));
```

```c
uint8_t buf[20] = {0x20};
uint8_t buffer[2];
ESP_ERROR_CHECK(i2c_master_transmit_receive(i2c_bus_handle, buf, sizeof(buf), buffer, 2, -1));
```

### I2C Master Probe

I2C driver can use `i2c_master_probe()` to detect whether the specific device has been connected on I2C bus. If this function return ESP_OK, that means the device has been detected.

**Important:** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get ESP_ERR_TIMEOUT while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, setting `flags.enable_internal_pullup` as true is also acceptable.

![Fig. 11: I2C master probe](image)

Simple example for probing an I2C device:

```c
i2c_master_bus_config_t i2c_mst_config_1 = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};
```

```c
i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config_1, &bus_handle));
ESP_ERROR_CHECK(i2c_master_probe(bus_handle, 0x22, -1));
ESP_ERROR_CHECK(i2c_del_master_bus(bus_handle));
```

### I2C Slave Controller

After installing the i2c slave driver by `i2c_new_slave_device()`, ESP32-C6 is ready to communicate with other I2C master as a slave.

### I2C Slave Write

The send buffer of the I2C slave is used as a FIFO to store the data to be sent. The data will queue up until the master requests them. You can call `i2c_slave_transmit()` to transfer data.

Simple example for writing data to FIFO:

```c
uint8_t *data_wr = (uint8_t *) malloc(DATA_LENGTH);
```

```c
i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7, // 7-bit address
    .clk_source = I2C_CLK_SRC_DEFAULT, // set the clock source
};
```
Chapter 2. API Reference

(continued from previous page)

```c
.i2c_port = 0, // set I2C port number
.send_buf_depth = 256, // set tx buffer length
.scl_io_num = 2, // SCL gpio number
.sda_io_num = 1, // SDA gpio number
.slave_addr = 0x58, // slave address
};

i2c_bus_handle_t i2c_bus_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &i2c_bus_handle));

for (int i = 0; i < DATA_LENGTH; i++) {
    data_wr[i] = i;
}

ESP_ERROR_CHECK(i2c_slave_transmit(i2c_bus_handle, data_wr, DATA_LENGTH, 10000));
```

### I2C Slave Read

Whenever the master writes data to the slave, the slave will automatically store data in the receive buffer. This allows the slave application to call the function `i2c_slave_receive()` as its own discretion. As `i2c_slave_receive()` is designed as a non-blocking interface. So the user needs to register callback `i2c_slave_register_event_callbacks()` to know when the receive has finished.

```c
static IRAM_ATTR bool i2c_slave_rx_done_callback(i2c_slave_dev_handle_t channel, ...
    on_recv_done = i2c_slave_rx_done_callback,
};

ESP_ERROR_CHECK(i2c_slave_register_event_callbacks(slave_handle, i2c_slave_rx_done_event_data_t *rx_data, void *user_data));
```

### Put Data In I2C Slave RAM

I2C slave fifo mentioned above can be used as RAM, which means user can access the RAM directly via address fields. For example, writing data to the 3rd ram block with following graph. Before
using this, please note that `i2c_slave_config_t::access_ram_en` needs to be set to true.

```
uint8_t data_rd[DATA_LENGTH_RAM] = {0};

i2c_slave_config_t i2c_slv_config = {
  .addr_bit_len = I2C_ADDR_BIT_LEN_7,
  .clk_source = I2C_CLK_SRC_DEFAULT,
  .i2c_port = TEST_I2C_PORT,
  .send_buf_depth = 256,
  .scl_io_num = I2C_SLAVE_SCL_IO,
  .sda_io_num = I2C_SLAVE_SDA_IO,
  .slave_addr = 0x58,
  .flags.access_ram_en = true,
};

// Master write to slave.

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
ESP_ERROR_CHECK(i2c_slave_write_ram(slave_handle, 0x2, data_wr, DATA_LENGTH_RAM));
ESP_ERROR_CHECK(i2c_del_slave_device(slave_handle));
```

**Get Data From I2C Slave RAM** Data can be stored in the RAM with a specific offset by the slave controller, and the master can read this data directly via the RAM address. For example, if the data is stored in 3rd ram block, master can read this data by following graph. Before using this, please note that `i2c_slave_config_t::access_ram_en` needs to be set to true.

```
uint8_t data_wr[DATA_LENGTH_RAM] = {0};

i2c_slave_config_t i2c_slv_config = {
  .addr_bit_len = I2C_ADDR_BIT_LEN_7,
  .clk_source = I2C_CLK_SRC_DEFAULT,
  .i2c_port = TEST_I2C_PORT,
  .send_buf_depth = 256,
  .scl_io_num = I2C_SLAVE_SCL_IO,
  .sda_io_num = I2C_SLAVE_SDA_IO,
  .slave_addr = 0x58,
  .flags.access_ram_en = true,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
ESP_ERROR_CHECK(i2c_slave_read_ram(slave_handle, 0x5, data_rd, DATA_LENGTH_RAM));
ESP_ERROR_CHECK(i2c_del_slave_device(slave_handle));
```
Register Event Callbacks

**I2C master callbacks**  When an I2C master bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some functions that need to be called when those events occurred, you can hook your functions to the ISR (Interrupt Service Routine) by calling `i2c_master_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback functions are required to return a boolean value, to tell the ISR whether a high priority task is woke up by it.

I2C master event callbacks are listed in the `i2c_master_event_callbacks_t`.

Although I2C is a synchronous communication protocol, we also support asynchronous behavior by registering above callback. In this way, I2C APIs will be non-blocking interface. But note that on the same bus, only one device can adopt asynchronous operation.

**Important:** I2C master asynchronous transaction is still an experimental feature. (The issue is when asynchronous transaction is very large, it will cause memory problem.)

- `i2c_master_event_callbacks_t::on_recv_done` sets a callback function for master "transaction-done" event. The function prototype is declared in `i2c_master_callback_t`.

**I2C slave callbacks**  When an I2C slave bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `i2c_slave_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

I2C slave event callbacks are listed in the `i2c_slave_event_callbacks_t`.

- `i2c_slave_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `i2c_slave_callback_t`.
- `i2c_slave_event_callbacks_t::on_stretch_occurs` sets a callback function for "stretch" cause. The function prototype is declared in `i2c_slave_stretch_callback_t`.

**Power Management**  If the controller clock source is selected to `I2C_CLK_SRC_XTAL`, then the driver won’t install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe**  By default, the I2C interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_I2C_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety**  The factory function `i2c_new_master_bus()` and `i2c_new_slave_device()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other public I2C APIs are not thread safe. which means the user should avoid calling them from multiple tasks, if user strongly needs to call them in multiple tasks, please add extra lock.
Kconfig Options

- **CONFIG_I2C_ISR_IRAM_SAFE** controls whether the default ISR handler can work when cache is disabled, see also [IRAM Safe](#) for more information.
- **CONFIG_I2C_ENABLE_DEBUG_LOG** is used to enable the debug log at the cost of increased firmware binary size.

API Reference

Header File

- components/driver/i2c/include/driver/i2c_master.h
- This header file can be included with:
  ```c
  #include "driver/i2c_master.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRES driver
  ```
  or
  ```cmake
  PRIV_REQUIRES driver
  ```

Functions

```c
esp_err_t i2c_new_master_bus(const i2c_master_bus_config_t *bus_config, i2c_master_bus_handle_t *ret_bus_handle)
```

Allocate an I2C master bus.

**Parameters**

- `bus_config` -- [in] I2C master bus configuration.
- `ret_bus_handle` -- [out] I2C bus handle

**Returns**

- ESP_OK: I2C master bus initialized successfully.
- ESP_ERR_INVALID_ARG: I2C bus initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create I2C bus failed because of out of memory.
- ESP_ERR_NOT_FOUND: No more free bus.

```c
esp_err_t i2c_master_bus_add_device(i2c_master_bus_handle_t bus_handle, const i2c_device_config_t *dev_config, i2c_master_dev_handle_t *ret_handle)
```

Add I2C master BUS device.

**Parameters**

- `bus_handle` -- [in] I2C bus handle.
- `dev_config` -- [in] device config.
- `ret_handle` -- [out] device handle.

**Returns**

- ESP_OK: Create I2C master device successfully.
- ESP_ERR_INVALID_ARGS: I2C device initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create I2C bus failed because of out of memory.

```c
esp_err_t i2c_del_master_bus(i2c_master_bus_handle_t bus_handle)
```

Deinitialize the I2C master bus and delete the handle.

**Parameters** `bus_handle` -- [in] I2C bus handle.

**Returns**

- ESP_OK: Delete I2C bus success, otherwise, failed.
- Otherwise: Some module delete failed.
Chapter 2. API Reference

```c
esp_err_t i2c_master_bus_rm_device(i2c_master_dev_handle_t handle)

I2C master bus delete device.

Parameters handle -- i2c device handle

Returns
- ESP_OK: If device is successfully deleted.
```

```c
esp_err_t i2c_master_transmit(i2c_master_dev_handle_t i2c_dev, const uint8_t *write_buffer, size_t write_size, int xfer_timeout_ms)
```

Perform a write transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

**Parameters**
- `i2c_dev` -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- `write_size` -- [in] Size, in bytes, of the write buffer.

**Returns**
- ESP_OK: I2C master transmit success
- ESP_ERR_INVALID_ARG: I2C master transmit parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

```c
esp_err_t i2c_master_transmit_receive(i2c_master_dev_handle_t i2c_dev, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, int xfer_timeout_ms)
```

Perform a write-read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

**Parameters**
- `i2c_dev` -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- `write_size` -- [in] Size, in bytes, of the write buffer.
- `read_buffer` -- [out] Data bytes received from I2C bus.
- `read_size` -- [in] Size, in bytes, of the read buffer.

**Returns**
- ESP_OK: I2C master transmit-receive success
- ESP_ERR_INVALID_ARG: I2C master transmit-receive parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.
**esp_err_t i2c_master_receive** *(i2c_master_dev_handle_t i2c_dev, uint8_t* read_buffer, size_t read_size, int xfer_timeout_ms)*

Perform a read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

**Parameters**
- `i2c_dev` — [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- `read_buffer` — [out] Data bytes received from I2C bus.
- `read_size` — [in] Size, in bytes, of the read buffer.

**Returns**
- ESP_OK: I2C master receive success
- ESP_ERR_INVALID_ARG: I2C master receive parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

**esp_err_t i2c_master_probe** *(i2c_master_bus_handle_t bus_handle, uint16_t address, int xfer_timeout_ms)*

Probe I2C address, if address is correct and ACK is received, this function will return ESP_OK.

**Attention** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get ESP_ERR_TIMEOUT while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, `flags.enable_internal_pullup` is also acceptable.

**Note:** The principle of this function is to sent device address with a write command. If the device on your I2C bus, there would be an ACK signal and function returns ESP_OK. If the device is not on your I2C bus, there would be a NACK signal and function returns ESP_ERR_NOT_FOUND. ESP_ERR_TIMEOUT is not an expected failure, which indicated that the i2c probe not works properly, usually caused by pull-up resistors not be connected properly. Suggestion check data on SDA/SCL line to see whether there is ACK/NACK signal is on line when i2c probe function fails.

**Note:** There are lots of I2C devices all over the world, we assume that not all I2C device support the behavior like `device_address+nack/ack`. So, if the on line data is strange and no ack/nack got respond. Please check the device datasheet.

**Parameters**
- `bus_handle` — [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- `address` — [in] I2C device address that you want to probe.

**Returns**
- ESP_OK: I2C device probe successfully
- ESP_ERR_NOT_FOUND: I2C probe failed, doesn’t find the device with specific address you gave.
• ESP_ERR_TIMEOUT: Operation timeout (larger than xfer_timeout_ms) because the bus is busy or hardware crash.

```c
esp_err_t i2c_master_register_event_callbacks (i2c_master_dev_handle_t i2c_dev, const i2c_master_event_callbacks_t *cbs, void *user_data)
```

Register I2C transaction callbacks for a master device.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**Note:** If the callback is used for helping asynchronous transaction. On the same bus, only one device can be used for performing asynchronous operation.

**Parameters**
- `i2c_dev` -- [in] I2C master device handle that created by `i2c_master_bus_add_device`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set I2C transaction callbacks successfully
- ESP_ERR_INVALID_ARG: Set I2C transaction callbacks failed because of invalid argument
- ESP_FAIL: Set I2C transaction callbacks failed because of other error

```c
esp_err_t i2c_master_bus_reset (i2c_master_bus_handle_t bus_handle)
```

Reset the I2C master bus.

**Parameters**
- `bus_handle` -- I2C bus handle.

**Returns**
- ESP_OK: Reset succeed.
- ESP_ERR_INVALID_ARG: I2C master bus handle is not initialized.
- Otherwise: Reset failed.

```c
esp_err_t i2c_master_bus_wait_all_done (i2c_master_bus_handle_t bus_handle, int timeout_ms)
```

Wait for all pending I2C transactions done.

**Parameters**
- `bus_handle` -- [in] I2C bus handle

**Returns**
- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error

**Structures**

```c
struct i2c_master_bus_config_t
```

I2C master bus specific configurations.
Chapter 2. API Reference

Public Members

i2c_port_num_t i2c_port
   I2C port number, -1 for auto selecting

gpio_num_t sda_io_num
   GPIO number of I2C SDA signal, pulled-up internally

gpio_num_t scl_io_num
   GPIO number of I2C SCL signal, pulled-up internally

i2c_clock_source_t clk_source
   Clock source of I2C master bus, channels in the same group must use the same clock source

uint8_t glitch_ignore_cnt
   If the glitch period on the line is less than this value, it can be filtered out, typically value is 7 (unit: I2C module clock cycle)

int intr_priority
   I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

size_t trans_queue_depth
   Depth of internal transfer queue, increase this value can support more transfers pending in the background, only valid in asynchronous transaction. (Typically max_device_num * per_transaction)

uint32_t enable_internal_pullup
   Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. Recommend proper external pull-up if possible

struct i2c_master_bus_config_t::[anonymous] flags
   I2C master config flags

struct i2c_device_config_t
   I2C device configuration.

Public Members

i2c_addr_bit_len_t dev_addr_length
   Select the address length of the slave device.

uint16_t device_address
   I2C device raw address. (The 7/10 bit address without read/write bit)

uint32_t scl_speed_hz
   I2C SCL line frequency.

uint32_t scl_wait_us
   Timeout value. (unit: us). Please note this value should not be so small that it can handle stretch/disturbance properly. If 0 is set, that means use the default reg value

```c
uint32_t disable_ack_check
Disable ACK check. If this is set false, that means ack check is enabled, the transaction will be stopped and API returns error when nack is detected.
```

```c
struct i2c_device_config_t::[anonymous] flags
I2C device config flags
```

```c
struct i2c_master_event_callbacks_t
Group of I2C master callbacks, can be used to get status during transaction or doing other small things. But take care potential concurrency issues.
```

**Note:** The callbacks are all running under ISR context

**Note:** When CONFIG_I2C_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

## Public Members

```c
i2c_master_callback_t on_trans_done
I2C master transaction finish callback
```

### Header File
- `components/driver/i2c/include/driver/i2c_slave.h`
- This header file can be included with:
  ```
  #include "driver/i2c_slave.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:
  ```
  REQUIRE driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

### Functions

**esp_err_t i2c_new_slave_device** (const `i2c_slave_config_t` *slave_config, `i2c_slave_dev_handle_t` *ret_handle)

Initialize an I2C slave device.

**Parameters**
- `slave_config` -- [in] I2C slave device configurations
- `ret_handle` -- [out] Return a generic I2C device handle

**Returns**
- ESP_OK: I2C slave device initialized successfully
- ESP_ERR_INVALID_ARG: I2C device initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create I2C device failed because of out of memory.

**esp_err_t i2c_del_slave_device** (`i2c_slave_dev_handle_t` i2c_slave)

Deinitialize the I2C slave device.
Chapter 2. API Reference

Parameters **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.

Returns
- ESP_OK: Delete I2C device successfully.
- ESP_ERR_INVALID_ARG: I2C device initialization failed because of invalid argument.

```c
esp_err_t i2c_slave_receive(i2c_slave_dev_handle_t i2c_slave, uint8_t* data, size_t buffer_size)
```

Read bytes from I2C internal buffer. Start a job to receive I2C data.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `i2c_slave_register_event_callbacks()`. 

Parameters
- **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- [out] Buffer to store data from I2C fifo. Should be valid until `on_recv_done` is triggered.
- **buffer_size** -- [in] Buffer size of data that provided by users.

Returns
- ESP_OK: I2C slave receive success.
- ESP_ERR_INVALID_ARG: I2C slave receive parameter invalid.
- ESP_ERR_NOT_SUPPORTED: This function should be work in fifo mode, but I2C_SLAVE_NONFIFO mode is configured

```c
esp_err_t i2c_slave_transmit(i2c_slave_dev_handle_t i2c_slave, const uint8_t* data, int size, int xfer_timeout_ms)
```

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

**Note:** If you connect this slave device to some master device, the data transaction direction is from slave device to master device.

Parameters
- **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- [in] Buffer to write to slave fifo, can pickup by master. Can be freed after this function returns. Equal or larger than `size`.
- **size** -- [in] In bytes, of `data` buffer.

Returns
- ESP_OK: I2C slave transmit success.
- ESP_ERR_INVALID_ARG: I2C slave transmit parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than `xfer_timeout_ms`) because the device is busy or hardware crash.
- ESP_ERR_NOT_SUPPORTED: This function should be work in fifo mode, but I2C_SLAVE_NONFIFO mode is configured

```c
esp_err_t i2c_slave_register_event_callbacks(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_event_callbacks_t *cbs, void *user_data)
```

Set I2C slave event callbacks for I2C slave channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback
member in the `cbs` structure to NULL.

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

### Parameters

- **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

### Returns

- ESP_OK: Set I2C transaction callbacks successfully
- ESP_ERR_INVALID_ARG: Set I2C transaction callbacks failed because of invalid argument
- ESP_FAIL: Set I2C transaction callbacks failed because of other error

```c
esp_err_t i2c_slave_read_ram(i2c_slave_dev_handle_t i2c_slave, uint8_t ram_address, uint8_t *data, size_t receive_size)
```

Read bytes from I2C internal ram. This can be only used when `access_ram_en` in configuration structure is set to true.

### Parameters

- **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`
- **ram_address** -- [in] The offset of RAM (Cannot larger than I2C RAM memory)
- **data** -- [out] Buffer to store data read from I2C ram.
- **receive_size** -- [in] Received size from RAM.

### Returns

- ESP_OK: I2C slave transmit success.
- ESP_ERR_INVALID_ARG: I2C slave transmit parameter invalid.
- ESP_ERR_NOT_SUPPORTED: This function should be work in non-fifo mode, but I2C_SLAVE_FIFO mode is configured

```c
esp_err_t i2c_slave_write_ram(i2c_slave_dev_handle_t i2c_slave, uint8_t ram_address, const uint8_t *data, size_t size)
```

Write bytes to I2C internal ram. This can be only used when `access_ram_en` in configuration structure is set to true.

### Parameters

- **i2c_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`
- **ram_address** -- [in] The offset of RAM (Cannot larger than I2C RAM memory)
- **data** -- [in] Buffer to fill.
- **size** -- [in] Received size from RAM.

### Returns

- ESP_OK: I2C slave transmit success.
- ESP_ERR_INVALID_ARG: I2C slave transmit parameter invalid.
- ESP_ERR_INVALID_SIZE: Write size is larger than
- ESP_ERR_NOT_SUPPORTED: This function should be work in non-fifo mode, but I2C_SLAVE_FIFO mode is configured

### Structures

```c
struct i2c_slave_config_t
```

I2C slave specific configurations.
Chapter 2. API Reference

Public Members

\texttt{i2c_port_num_t \textit{i2c_port}}

I2C port number, \texttt{-1} for auto selecting

\texttt{gpio_num_t \textit{sda_io_num}}

SDA IO number used by I2C bus

\texttt{gpio_num_t \textit{scl_io_num}}

SCL IO number used by I2C bus

\texttt{i2c_clock_source_t \textit{clk_source}}

Clock source of I2C bus.

\texttt{uint32_t \textit{send_buf_depth}}

Depth of internal transfer ringbuffer, increase this value can support more transfers pending in the background

\texttt{uint16_t \textit{slave_addr}}

I2C slave address

\texttt{i2c_addr_bit_len_t \textit{addr_bit_len}}

I2C slave address in bit length

\texttt{int \textit{intr_priority}}

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

\texttt{uint32_t \textit{stretch_en}}

Enable slave stretch

\texttt{uint32_t \textit{broadcast_en}}

I2C slave enable broadcast

\texttt{uint32_t \textit{access_ram_en}}

Can get access to I2C RAM directly

\texttt{uint32_t \textit{slave_unmatch_en}}

Can trigger unmatch interrupt when slave address does not match what master sends

\texttt{struct \textit{i2c_slave_config_t}::[anonymous] \textit{flags}}

I2C slave config flags

\texttt{struct \textit{i2c_slave_event_callbacks_t}}

Group of I2C slave callbacks (e.g. get i2c slave stretch cause). But take care of potential concurrency issues.

\textbf{Note:} The callbacks are all running under ISR context

\textbf{Note:} When \texttt{CONFIG_I2C_ISR_IRAM_SAFE} is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.
Public Members

i2c_slave_stretch_callback_t on_stretch_occur
I2C slave stretched callback

i2c_slave_received_callback_t on_recv_done
I2C slave receive done callback

Header File

- components/driver/i2c/include/driver/i2c_types.h
- This header file can be included with:

```

or

```cmake
PRIV_REQUIRES driver
```

Structures

struct i2c_master_event_data_t
Data type used in I2C event callback.

Public Members

i2c_master_event_t event
The I2C hardware event that I2C callback is called.

struct i2c_slave_rx_done_event_data_t
Event structure used in I2C slave.

Public Members

uint8_t *buffer
Pointer for buffer received in callback.

struct i2c_slave_stretch_event_data_t
Stretch cause event structure used in I2C slave.

Public Members

i2c_slave_stretch_cause_t stretch_cause
Stretch cause can be got in callback
Chapter 2. API Reference

Type Definitions

typedef int i2c_port_num_t
    I2C port number.

typedef struct i2c_master_bus_t *i2c_master_bus_handle_t
    Type of I2C master bus handle.

typedef struct i2c_master_dev_t *i2c_master_dev_handle_t
    Type of I2C master bus device handle.

typedef struct i2c_slave_dev_t *i2c_slave_dev_handle_t
    Type of I2C slave device handle.

typedef bool (*i2c_master_callback_t)(i2c_master_dev_handle_t i2c_dev, const i2c_master_event_data_t *evt_data, void *arg)
    An callback for I2C transaction.
    
    Param i2c_dev [in] Handle for I2C device.
    Param evt_data [out] I2C capture event data, fed by driver
    Param arg [in] User data, set in i2c_master_register_event_callbacks()
    Return Whether a high priority task has been waken up by this function

typedef bool (*i2c_slave_received_callback_t)(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_rx_done_event_data_t *evt_data, void *arg)
    Callback signature for I2C slave.
    
    Param i2c_slave [in] Handle for I2C slave.
    Param evt_data [out] I2C capture event data, fed by driver
    Param arg [in] User data, set in i2c_slave_register_event_callbacks()
    Return Whether a high priority task has been waken up by this function

typedef bool (*i2c_slave_stretch_callback_t)(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_stretch_event_data_t *evt_cause, void *arg)
    Callback signature for I2C slave stretch.
    
    Param i2c_slave [in] Handle for I2C slave.
    Param evt_cause [out] I2C capture event cause, fed by driver
    Param user_ctx [in] User data, set in i2c_slave_register_event_callbacks()
    Return Whether a high priority task has been waken up by this function

Enumerations

enum i2c_master_status_t
    Enumeration for I2C fsm status.
    
    Values:

    enumerator I2C_STATUS_READ
        read status for current master command

    enumerator I2C_STATUS_WRITE
        write status for current master command

    enumerator I2C_STATUS_START
        Start status for current master command
**Chapter 2. API Reference**

**enumerator I2C_STATUS_STOP**
stop status for current master command

**enumerator I2C_STATUS_IDLE**
idle status for current master command

**enumerator I2C_STATUS_ACK_ERROR**
ack error status for current master command

**enumerator I2C_STATUS_DONE**
I2C command done

**enumerator I2C_STATUS_TIMEOUT**
I2C bus status error, and operation timeout

**enum i2c_master_event_t**
Enumeration for I2C event.

*Values:*

**enumerator I2C_EVENT_ALIVE**
i2c bus in alive status.

**enumerator I2C_EVENT_DONE**
i2c bus transaction done

**enumerator I2C_EVENT_NACK**
i2c bus nack

**enumerator I2C_EVENT_TIMEOUT**
i2c bus timeout

**Header File**
- components/hal/include/hal/i2c_types.h
- This header file can be included with:

  ```
  #include "hal/i2c_types.h"
  ```

**Structures**

**struct i2c_hal_clk_config_t**
Data structure for calculating I2C bus timing.

**Public Members**

**uint16_t clkm_div**
I2C core clock devider
uint16_t scl_low
I2C scl low period

uint16_t scl_high
I2C scl high period

uint16_t scl_wait_high
I2C scl wait_high period

uint16_t sda_hold
I2C sda low period

uint16_t sda_sample
I2C sda sample time

uint16_t setup
I2C start and stop condition setup period

uint16_t hold
I2C start and stop condition hold period

uint16_t tout
I2C bus timeout period

Type Definitions

typedef soc_periph_i2c_clk_src_t i2c_clock_source_t
I2C group clock source.

Enumerations

enum i2c_port_t
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
Values:

enumerator I2C_NUM_0
I2C port 0

enumerator LP_I2C_NUM_0

enumerator I2C_NUM_MAX
I2C port max

enum i2c_addr_bit_len_t
Enumeration for I2C device address bit length.
Values:

enumerator I2C_ADDR_BIT_LEN_7
i2c address bit length 7
enumerator **I2C_ADDR_BIT_LEN_10**

  i2c address bit length 10

**enum i2c_mode_t**

*Values:*

enumerator **I2C_MODE_SLAVE**

  12C slave mode

enumerator **I2C_MODE_MASTER**

  12C master mode

enumerator **I2C_MODE_MAX**

**enum i2c_rw_t**

*Values:*

enumerator **I2C_MASTER_WRITE**

  12C write data

enumerator **I2C_MASTER_READ**

  12C read data

**enum i2c_trans_mode_t**

*Values:*

enumerator **I2C_DATA_MODE_MSB_FIRST**

  12C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**

  12C data lsb first

enumerator **I2C_DATA_MODE_MAX**

**enum i2c_addr_mode_t**

*Values:*

enumerator **I2C_ADDR_BIT_7**

  12C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**

  12C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

**enum i2c_ack_type_t**

*Values:*

enumerator **I2C_MASTER_ACK**
I2C ack for each byte read

eenumerator **I2C_MASTER_NACK**
I2C nack for each byte read

eenumerator **I2C_MASTER_LAST_NACK**
I2C nack for the last byte

eenumerator **I2C_MASTER_ACK_MAX**

enum **i2c_slave_stretch_cause_t**
Enum for I2C slave stretch causes.

Values:

eenumerator **I2C_SLAVE_STRETCH_CAUSE_ADDRESS_MATCH**
Stretching SCL low when the slave is read by the master and the address just matched

eenumerator **I2C_SLAVE_STRETCH_CAUSE_TX_EMPTY**
Stretching SCL low when TX FIFO is empty in slave mode

eenumerator **I2C_SLAVE_STRETCH_CAUSE_RX_FULL**
Stretching SCL low when RX FIFO is full in slave mode

eenumerator **I2C_SLAVE_STRETCH_CAUSE_SENDING_ACK**
Stretching SCL low when slave sending ACK

### 2.6.12 Inter-IC Sound (I2S)

**Introduction**

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32-C6 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK**: Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK**: Bit clock line. The bit clock for data line.
- **WS**: Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT**: Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

An I2S bus that communicates in PDM mode consists of the following lines:

- **CLK**: PDM clock line.
- **DIN/DOUT**: Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:
Chapter 2. API Reference

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller has separate RX and TX channels. That means they are able to work under different clocks and slot configurations with separate GPIO pins. Note that although the internal MCLKs of TX channel and RX channel are separate on a controller, the output MCLK signal can only be attached to one channel. If independent MCLK output is required for each channel, they must be allocated on different I2S controllers.

I2S File Structure

![I2S File Structure Diagram]

**Public headers that need to be included in the I2S application are as follows:**

- `i2s.h`: The header file that provides legacy I2S APIs (for apps using legacy driver).
- `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

**Note:** The legacy driver cannot coexist with the new driver. Include `i2s.h` to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

**Public headers that have been included in the headers above are as follows:**

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

I2S Clock

Clock Source
Chapter 2. API Reference

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.

**Clock Terminology**

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note**: Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to the sample rate. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

**I2S Communication Mode**

### Overview of All Modes

**Standard Mode**  In standard mode, there are always two sound channels, i.e., the left and right channels, which are called "slots". These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the following:

- **Philips Format**: Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

- **MSB Format**: Basically the same as Philips format, but without data shift.
Chapter 2. API Reference

Standard MSB Timing Diagram

- **PCM Short Format**: Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

Standard PCM Timing Diagram

**PDM Mode (TX)**  PDM (Pulse-density Modulation) mode for the TX channel can convert PCM data into PDM format which always has left and right slots. PDM TX is only supported on I2S0 and it only supports 16-bit width sample data. It needs at least a CLK pin for clock signal and a DOUT pin for data signal (i.e., the WS and SD signal in the following figure; the BCK signal is an internal bit sampling clock, which is not needed between PDM devices). This mode allows users to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by `up_sample_rate = i2s_pdm_tx_clk_config_t::up_sample_fp / i2s_pdm_tx_clk_config_t::up_sample_fs`. There are two up-sampling modes in PDM TX:

- **Fixed Clock Frequency**: In this mode, the up-sampling rate changes according to the sample rate. Setting `fp = 960` and `fs = sample_rate / 100`, then the clock frequency (Fpdm) on CLK pin will be fixed to `128 * 48 kHz = 6.144 MHz`. Note that this frequency is not equal to the sample rate (Fpcm).
- **Fixed Up-sampling Rate**: In this mode, the up-sampling rate is fixed to 2. Setting `fp = 960` and `fs = 480`, then the clock frequency (Fpdm) on CLK pin will be `128 * sample_rate`.

**TDM Mode**  TDM (Time Division Multiplexing) mode supports up to 16 slots. These slots can be enabled by `i2s_tdm_slot_config_t::slot_mask`.

But due to the hardware limitation, only up to 4 slots are supported while the slot is set to 32 bit-width, and 8 slots for 16 bit-width, 16 slots for 8 bit-width. The slot communication format of TDM is almost the same as the standard...
mode, yet with some small differences.

- **Philips Format**: Data signal has one-bit shift comparing to the WS signal. And no matter how many slots are contained in one frame, the duty of WS signal always keeps 50%.

- **MSB Format**: Basically the same as the Philips format, but without data shift.

- **PCM Short Format**: Data has one-bit shift and the WS signal becomes a pulse lasting one BCLK cycle for every frame.

- **PCM Long Format**: Data has one-bit shift and the WS signal lasts one-slot bit width for every frame. For example, the duty of WS will be 25% if there are four slots enabled, and 20% if there are five slots.

**Functional Overview**

The I2S driver offers the following services:

**Resource Management** There are three levels of resources in the I2S driver:
• **platform level**: Resources of all I2S controllers in the current target.
• **controller level**: Resources in one I2S controller.
• **channel level**: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels’ resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver guarantees that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

**Finite State Machine** There are three states for an I2S channel, namely, *registered*, *ready*, and *running*. Their relationship is shown in the following diagram:

![I2S Finite State Machine Diagram](image)

Fig. 15: I2S Finite State Machine

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the *I2S Communication Mode* section.
Data Transport  The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call \texttt{i2s\_channel\_enable()} to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the I2S\_OUT\_EOF or I2S\_IN\_SUC\_EOF interrupt will be triggered. Note that the DMA buffer size is not equal to \texttt{i2s\_chan\_config\_t::dma\_frame\_num}. One frame here refers to all the sampled data in one WS circle. Therefore, \texttt{dma\_buffer\_size = dma\_frame\_num * slot\_num * slot\_bit\_width / 8}. For the data transmitting, users can input the data by calling \texttt{i2s\_channel\_write()}. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function \texttt{i2s\_channel\_read()} waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both \texttt{i2s\_channel\_write()} and \texttt{i2s\_channel\_read()} are blocking functions. They keeps waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code \texttt{ESP\_ERR\_TIMEOUT} returns. To send or receive data asynchronously, callbacks can be registered by \texttt{i2s\_channel\_register\_event\_callback()}. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

Configuration  Users can initialize a channel by calling corresponding functions (i.e., \texttt{i2s\_channel\_init\_std\_mode()}, \texttt{i2s\_channel\_init\_pdm\_rx\_mode()}, \texttt{i2s\_channel\_init\_pdm\_tx\_mode()}, or \texttt{i2s\_channel\_init\_tdm\_mode()}) to a specific mode. If the configurations need to be updated after initialization, users have to first call \texttt{i2s\_channel\_disable()} to ensure that the channel has stopped, and then call corresponding \texttt{reconfig} functions, like \texttt{i2s\_channel\_reconfig\_std\_slot()}, \texttt{i2s\_channel\_reconfig\_std\_clock()}, and \texttt{i2s\_channel\_reconfig\_std\_gpio()}.

IRAM Safe  By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option \texttt{CONFIG\_I2S\_ISR\_IRAM\_SAFE} that:

1. Keeps the interrupt being serviced even when the cache is disabled.
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

Thread Safety  All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

Kconfig Options

- \texttt{CONFIG\_I2S\_ISR\_IRAM\_SAFE} controls whether the default ISR handler can work when the cache is disabled. See \texttt{IRAM Safe} for more information.
- \texttt{CONFIG\_I2S\_SUPPRESS\_DEPRECATE\_WARN} controls whether to suppress the compiling warning message while using the legacy I2S driver.
- \texttt{CONFIG\_I2S\_ENABLE\_DEBUG\_LOG} is used to enable the debug log output. Enable this option increases the firmware binary size.

Application Example

The examples of the I2S driver can be found in the directory \texttt{peripherals/i2s}. Here are some simple usages of each mode:
**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to [Standard Mode](#) for information about STD API. And for more details, please refer to `driver/i2s/include/driver/i2s_std.h`.

**STD TX Mode** Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

| data 0 | data 1 | data 2 | data 3 | data 4 | data 5 | data 6 | data 7 | ...
|-------|-------|-------|-------|-------|-------|-------|-------|-----
| 0x0001 | 0x0002 | 0x0003 | 0x0004 | 0x0005 | 0x0006 | 0x0007 | 0x0008 | ...

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

**Note:** Similar for 8-bit and 32-bit data widths, the type of the buffer is better to be `uint8_t` and `uint32_t`. But specially, when the data width is 24-bit, the data buffer should be aligned with 3-byte (i.e., every 3 bytes stands for a 24-bit data in one slot). Additionally, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the writing buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro. */
/* This helper macro is defined in `i2s_common.h` and shared by all the I2S communication modes. */
/* It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);

/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can be generated by the macros */
/* These two helper macros are defined in `i2s_std.h` which can only be used in STD mode */
/* They can help to specify the slot and clock configurations for initialization or updating */
i2s_std_config_t std_cfg = {
```
(continues on next page)
.clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
.slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
.GPIO_cfg = {
    .mclk = I2S_GPIO_UNUSED,
    .bclk = GPIO_NUM_4,
    .ws = GPIO_NUM_5,
    .dout = GPIO_NUM_18,
    .din = I2S_GPIO_UNUSED,
    .invert_flags = {
        .mclk_inv = false,
        .bclk_inv = false,
        .ws_inv = false,
    },
},
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_wait);

/* If the configurations of slot or clock need to be updated, * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_ resources */
i2s_del_channel(tx_handle);

STD RX Mode  Taking 16-bit data width for example, when the data on the line are:

Note: There are three line modes for PDM TX mode, i.e., `I2S_PDM_TX_ONE_LINE_CODEC`, `I2S_PDM_TX_ONE_LINE_DAC`, and `I2S_PDM_TX_TWO_LINE_DAC`. One-line codec is for the PDM codecs that require clock signal. The PDM codec can differentiate the left and right slots by the clock level. The other two modes are used to drive power amplifiers directly with a low-pass filter. They do not need the clock signal, so there are two lines to differentiate the left and right slots. Additionally, for the mono mode of one-line codec, users can force change the slot to the right by setting the clock invert flag in GPIO configuration.

```c
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);
```

**TDM TX/RX Usage** Different slot communication formats can be generated by the following helper macros for TDM mode. As described above, there are four formats in TDM mode, and their helper macros are:

- `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`
The clock config helper macro is:

- `I2S_TDM_CLK_DEFAULT_CONFIG`

Please refer to TDM Mode for information about TDM API. And for more details, please refer to driver/i2s/include/driver/i2s_tdm.h.

**Note:** Due to hardware limitation, when setting the clock configuration for a slave role, please be aware that `i2s_tdm_clk_config_t::bclk_div` should not be smaller than 8. Increasing this field can reduce the lagging of the data sent from the slave. In the high sample rate case, the data might lag behind for more than one BCLK which leads to data malposition. Users may gradually increase `i2s_tdm_clk_config_t::bclk_div` to correct it.

As `i2s_tdm_clk_config_t::bclk_div` is the division of MCLK to BCLK, increasing it also increases the MCLK frequency. Therefore, the clock calculation may fail if MCLK is too high to divide from the source clock. This means that a larger value for `i2s_tdm_clk_config_t::bclk_div` is not necessarily better.

### TDM TX Mode

```c
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO, I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(tx_handle, &tdm_cfg);
...
```

### TDM RX Mode

```c
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Set the channel mode to TDM */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_CONFIG(I2S_ROLE_MASTER, I2S_COMM_MODE_TDM, &i2s_pin);
```

(continues on next page)
Chapter 2. API Reference

i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_18,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(rx_handle, &tdm_cfg);

...
Simplex Mode  
To allocate a channel in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32-C6 are independent, so they can be configured with different modes and clocks, and are able to coexist on the same I2S port in simplex mode. PDM duplex can be realized by registering PDM TX simplex and PDM RX simplex on the same I2S port. But in this way, PDM TX/RX might work with different clocks, so take care when configuring the GPIO pins and clocks.

The following example offers a use case for the simplex mode, but note that although the internal MCLK signals for TX and RX channel are separate, the output MCLK can only be bound to one of them if they are from the same controller. If MCLK has been initialized by both channels, it will be bound to the channel that initializes later.

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_MASTER);
i2s_new_channel(chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, std_tx_cfg);
i2s_channel_enable(tx_handle);

/* RX channel will be registered on another I2S, if no other available I2S unit found *
* it will return ESP_ERR_NOT_FOUND */
i2s_new_channel(chan_cfg, NULL, &rx_handle); // Both RX and TX channel will be registered on I2S0, but they can work with different configurations.
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
};
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
.gpio_cfg = {
    .mclk = I2S_GPIO_UNUSED,
    .bclk = GPIO_NUM_6,
    .ws = GPIO_NUM_7,
    .dout = I2S_GPIO_UNUSED,
    .din = GPIO_NUM_19,
    .invert_flags = {
        .mclk_inv = false,
        .bclk_inv = false,
        .ws_inv = false,
    },
},
```

i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);

```c
i2s_channel_enable(rx_handle);
```

Application Notes

**How to Prevent Data Lost** For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```c
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}
```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

   ```latex
   \text{interrupt\_interval (unit: sec)} = \text{dma\_frame\_num} / \text{sample\_rate}
   \text{dma\_buffer\_size} = \text{dma\_frame\_num} \times \text{slot\_num} \times \text{data\_bit\_width} / 8 \leq 4092
   ```

2. Determine `dma\_desc\_num`. `dma\_desc\_num` is decided by the maximum time of `i2s\_channel\_read` polling cycle. All the received data is supposed to be stored between two `i2s\_channel\_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

   ```latex
   \text{dma\_desc\_num} > \frac{\text{polling\_cycle}}{\text{interrupt\_interval}}
   ```

3. Determine the receiving buffer size. The receiving buffer offered by users in `i2s\_channel\_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

   ```latex
   \text{recv\_buffer\_size} > \text{dma\_desc\_num} \times \text{dma\_buffer\_size}
   ```

For example, if there is an I2S application, and the known values are:
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

\[
\begin{align*}
dma_frame_num \times \text{slot_num} \times \text{data_bit_width} / 8 &= \text{dma_buffer_size} <= 4092 \\
\text{dma_frame_num} &< 511 \\
\text{interrupt_interval} &= \text{dma_frame_num} / \text{sample_rate} = 511 / 144000 = 0.003549 \text{ s} = 3.549 \text{ ms} \\
\text{dma_desc_num} > \text{polling_cycle} / \text{interrupt_interval} &= \text{cell}(10 / 3.549) = \text{cell}(2.818) \\
\text{recv_buffer_size} > \text{dma_desc_num} \times \text{dma_buffer_size} &= 3 \times 4092 = 12276 \text{ bytes}
\end{align*}
\]

### API Reference

#### Standard Mode

**Header File**

- `components/driver/i2s/include/driver/i2s_std.h`

- This header file can be included with:

  ```
  #include "driver/i2s_std.h"
  ```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

  ```
  REQUIRE driver
  ```

  or

  ```
  PRIV_REQUIRES driver
  ```

**Functions**

```
esp_err_t i2s_channel_init_std_mode(i2s_chan_handle_t handle, const i2s_std_config_t *std_cfg)
```

Initialize I2S channel to standard mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**

- `handle` -- [in] I2S channel handler
- `std_cfg` -- [in] Configurations for standard mode, including clock, slot and GPIO. The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG`. The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

**Returns**

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered
esp_err_t i2s_channel_reconfig_std_clock(i2s_chan_handle_t handle, const i2s_std_clk_config_t *clk_cfg)

Reconfigure the I2S clock for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. i2s_channel_disable should be called before calling this function if I2S has started.

**Note:** The input channel handle has to be initialized to standard mode, i.e., i2s_channel_init_std_mode has been called before reconfiguring

**Parameters**
- handle -- [in] I2S channel handler
- clk_cfg -- [in] Standard mode clock configuration, can be generated by I2S_STD_CLK_DEFAULT_CONFIG

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t i2s_channel_reconfig_std_slot(i2s_chan_handle_t handle, const i2s_std_slot_config_t *slot_cfg)

Reconfigure the I2S slot for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. i2s_channel_disable should be called before calling this function if I2S has started.

**Note:** The input channel handle has to be initialized to standard mode, i.e., i2s_channel_init_std_mode has been called before reconfiguring

**Parameters**
- handle -- [in] I2S channel handler
- slot_cfg -- [in] Standard mode slot configuration, can be generated by I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG and I2S_STD_MSB_SLOT_DEFAULT_CONFIG.

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM Nom memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t i2s_channel_reconfig_std_gpio(i2s_chan_handle_t handle, const i2s_std_gpio_config_t *gpio_cfg)

Reconfigure the I2S GPIO for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. i2s_channel_disable should be called before calling this function if I2S has started.
Chapter 2. API Reference

Note: The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

**Parameters**
- `handle` -- [in] I2S channel handler
- `gpio_cfg` -- [in] Standard mode GPIO configuration, specified by user

**Returns**
- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

**Structures**

```c
struct i2s_std_slot_config_t
```
I2S slot configuration for standard mode.

**Public Members**

```c
i2s_data_bit_width_t data_bit_width
```
I2S sample data bit width (valid data bits per sample)

```c
i2s_slot_bit_width_t slot_bit_width
```
I2S slot bit width (total bits per slot)

```c
i2s_slot_mode_t slot_mode
```
Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

```c
i2s_std_slot_mask_t slot_mask
```
Select the left, right or both slot

```c
uint32_t ws_width
```
WS signal width (i.e. the number of BCLK ticks that WS signal is high)

```c
bool ws_pol
```
WS signal polarity, set true to enable high level first

```c
bool bit_shift
```
Set to enable bit shift in Philips mode

```c
bool left_align
```
Set to enable left alignment

```c
bool big_endian
```
Set to enable big endian

```c
bool bit_order_lsb
```
Set to enable lsb first
Chapter 2. API Reference

struct i2s_std_clk_config_t
I2S clock configuration for standard mode.

Public Members

uint32_t sample_rate_hz
I2S sample rate

i2s_clock_src_t clk_src
Choose clock source, see soc_periph_i2s_clk_src_t for the supported clock sources. selected I2S_CLK_SRC_EXTERNAL (if supports) to enable the external source clock input via MCLK pin.

uint32_t ext_clk_freq_hz
External clock source frequency in Hz, only take effect when clk_src = I2S_CLK_SRC_EXTERNAL, otherwise this field will be ignored, Please make sure the frequency input is equal or greater than BCLK, i.e. sample_rate_hz * slot_bits * 2

i2s_mclk_multiple_t mclk_multiple
The multiple of MCLK to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of 3 (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct i2s_std_gpio_config_t
I2S standard mode GPIO pins configuration.

Public Members

gpio_num_t mclk
MCK pin, output by default, input if the clock source is selected to I2S_CLK_SRC_EXTERNAL

gpio_num_t bclk
BCK pin, input in slave role, output in master role

gpio_num_t ws
WS pin, input in slave role, output in master role

gpio_num_t dout
DATA pin, output

gpio_num_t din
DATA pin, input

uint32_t mclk_inv
Set 1 to invert the MCLK input/output

uint32_t bclk_inv
Set 1 to invert the BCLK input/output
Chapter 2. API Reference

```c
uint32_t ws_inv
    Set 1 to invert the WS input/output

struct i2s_std_gpio_config_t::[anonymous] invert_flags
    GPIO pin invert flags

struct i2s_std_config_t
    I2S standard mode major configuration that including clock/slot/GPIO configuration.

Public Members

i2s_std_clk_config_t clk_cfg
    Standard mode clock configuration, can be generated by macro I2S_STD_CLK_DEFAULT_CONFIG

i2s_std_slot_config_t slot_cfg
    Standard mode slot configuration, can be generated by macros I2S_STD_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

i2s_std_gpio_config_t gpio_cfg
    Standard mode GPIO configuration, specified by user

Macros

I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    Philips format in 2 slots.
    This file is specified for I2S standard communication mode Features:
    • Philips/MSB/PCM are supported in standard mode
    • Fixed to 2 slots

Parameters
    • bits_per_sample -- I2S data bit width
    • mono_or_stereo -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_PCM_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    PCM(short) format in 2 slots.
    Note: PCM(long) is same as Philips in 2 slots

Parameters
    • bits_per_sample -- I2S data bit width
    • mono_or_stereo -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
    MSB format in 2 slots.

Parameters
    • bits_per_sample -- I2S data bit width
    • mono_or_stereo -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
```
**I2S_STD_CLK_DEFAULT_CONFIG (rate)**

I2S default standard clock configuration.

**Note:** Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the BCLK division is not a integer

**Parameters**
- **rate** -- sample rate

**PDM Mode**

**Header File**
- components/driver/i2s/include/driver/i2s_pdm.h
- This header file can be included with:

```c
#include "driver/i2s_pdm.h"
```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

**Functions**

```c
esp_err_t i2s_channel_init_pdm_tx_mode (i2s_chan_handle_t handle, const i2s_pdm_tx_config_t *pdm_tx_cfg)
```

Initialize I2S channel to PDM TX mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**
- **handle** -- [in] I2S TX channel handler
- **pdm_tx_cfg** -- [in] Configurations for PDM TX mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro I2S_PDM_TX_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

**Returns**
- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

```c
esp_err_t i2s_channel_reconfig_pdm_tx_clock (i2s_chan_handle_t handle, const i2s_pdm_tx_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for PDM TX mode.
**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring.

---

**Parameters**
- `handle` -- [in] I2S TX channel handler
- `clk_cfg` -- [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_slot(i2s_chan_handle_t handle, const i2s_pdm_tx_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

**Parameters**
- `handle` -- [in] I2S TX channel handler
- `slot_cfg` -- [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_gpio(i2s_chan_handle_t handle, const i2s_pdm_tx_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S GPIO for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

**Parameters**
- `handle` -- [in] I2S TX channel handler
- `slot_cfg` -- [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_pdm_tx_gpio(i2s_chan_handle_t handle, const i2s_pdm_tx_gpio_config_t *gpio_cfg)
```
Parameters

- **handle** -- [in] I2S TX channel handler
- **gpio_cfg** -- [in] PDM TX mode GPIO configuration, specified by user

Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

`struct i2s_pdm_tx_slot_config_t`
I2S slot configuration for PDM TX mode.

Public Members

- `i2s_data_bit_width_t data_bit_width`
  I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

- `i2s_slot_bit_width_t slot_bit_width`
  I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

- `i2s_slot_mode_t line_mode`
  Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

- `uint32_t sd_prescale`
  Sigma-delta filter prescale

- `i2s_pdm_sig_scale_t sd_scale`
  Sigma-delta filter scaling value

- `i2s_pdm_sig_scale_t hp_scale`
  High pass filter scaling value

- `i2s_pdm_sig_scale_t lp_scale`
  Low pass filter scaling value

- `i2s_pdm_sig_scale_t sinc_scale`
  Sinc filter scaling value

- `i2s_pdm_tx_line_mode_t line_mode`
  PDM TX line mode, one-line codec, one-line dac, two-line dac mode can be selected

- `bool hp_en`
  High pass filter enable

- `float hp_cut_off_freq_hz`
  High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above
uint32_t sd_dither
  Sigma-delta filter dither

uint32_t sd_dither2
  Sigma-delta filter dither2

struct i2s_pdm_tx_clk_config_t
  I2S clock configuration for PDM TX mode.

Public Members

uint32_t sample_rate_hz
  I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear

i2s_clock_src_t clk_src
  Choose clock source

i2s_mclk_multiple_t mclk_multiple
  The multiple of MCLK to the sample rate

uint32_t up_sample_fp
  Up-sampling param fp

uint32_t up_sample_fs
  Up-sampling param fs, not allowed to be greater than 480

uint32_t bclk_div
  The division from MCLK to BCLK. The minimum value is I2S_PDM_TX_BCLK_DIV_MIN. It will be set to I2S_PDM_TX_BCLK_DIV_MIN by default if it is smaller than I2S_PDM_TX_BCLK_DIV_MIN

struct i2s_pdm_tx_gpio_config_t
  I2S PDM TX mode GPIO pins configuration.

Public Members

gpio_num_t clk
  PDM clk pin, output

gpio_num_t dout
  DATA pin, output

gpio_num_t dout2
  The second data pin for the DAC dual-line mode, only take effect when the line mode is I2S_PDM_TX_TWO_LINE_DAC

uint32_t clk_inv
  Set 1 to invert the clk output
struct i2s_pdm_tx_gpio_config_t::[anonymous] invert_flags
GPIO pin invert flags

struct i2s_pdm_tx_config_t
I2S PDM TX mode major configuration that including clock/slot/GPIO configuration.

Public Members

i2s_pdm_tx_clk_config_t clk_cfg
PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG

i2s_pdm_tx_slot_config_t slot_cfg
PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

i2s_pdm_tx_gpio_config_t gpio_cfg
PDM TX GPIO configurations, specified by user

Macros

I2S_PDM_TX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
PDM style in 2 slots(TX) for codec line mode.
This file is specified for I2S PDM communication mode Features:
• Only support PDM TX/RX mode
• Fixed to 2 slots
• Data bit width only support 16 bits

Parameters
• bits_per_sample -- I2S data bit width, only support 16 bits for PDM mode
• mono_or_stereo -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_SLOT_DAC_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
PDM style in 1 slots(TX) for DAC line mode.

Note: The noise might be different with different configurations, this macro provides a set of configurations that have relatively high SNR (Signal Noise Ratio), you can also adjust them to fit your case.

Parameters
• bits_per_sample -- I2S data bit width, only support 16 bits for PDM mode
• mono_or_stereo -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_PDM_TX_CLK_DEFAULT_CONFIG (rate)
I2S default PDM TX clock configuration for codec line mode.

Note: TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the PDM receiver do not care the PDM serial clock, it's recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

Parameters
**Chapter 2. API Reference**

- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

**I2S_PDM_TX_CLK_DAC_DEFAULT_CONFIG**(rate)
I2S default PDM TX clock configuration for DAC line mode.

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the PDM receiver do not care the PDM serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

**Note:** The noise might be different with different configurations, this macro provides a set of configurations that have relatively high SNR (Signal Noise Ratio), you can also adjust them to fit your case.

**Parameters**
- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

**TDM Mode**

**Header File**

- components/driver/i2s/include/driver/i2s_tdm.h
- This header file can be included with:

```c
#include "driver/i2s_tdm.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

**Functions**

```
esp_err_t i2s_channel_init_tdm_mode(i2s_chan_handle_t handle, const i2s_tdm_config_t *tdm_cfg)
```
Initialize I2S channel to TDM mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**
- **handle** -- [in] I2S channel handler
- **tdm_cfg** -- [in] Configurations for TDM mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro **I2S_TDM_CLK_DEFAULT_CONFIG** The slot configuration can be generated by the helper macro **I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG** or **I2S_TDM_MSB_SLOT_DEFAULT_CONFIG**
Returns

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

```
esp_err_t i2s_channel_reconfig_tdm_clock (i2s_chan_handle_t handle, const i2s_tdm_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for TDM mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring.

**Parameters**

- `handle` -- [in] I2S channel handler
- `clk_cfg` -- [in] Standard mode clock configuration, can be generated by `I2S_TDM_CLK_DEFAULT_CONFIG`

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```
esp_err_t i2s_channel_reconfig_tdm_slot (i2s_chan_handle_t handle, const i2s_tdm_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for TDM mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring.

**Parameters**

- `handle` -- [in] I2S channel handler
- `slot_cfg` -- [in] Standard mode slot configuration, can be generated by `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG`, or `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`.

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```
esp_err_t i2s_channel_reconfig_tdm_gpio (i2s_chan_handle_t handle, const i2s_tdm_gpio_config_t *gpio_cfg)
```

Espressif Systems

Submit Document Feedback
Reconfigure the I2S GPIO for TDM mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won’t change the state. *i2s_channel_disable* should be called before calling this function if I2S has started.

**Note:** The input channel handle has to be initialized to TDM mode, i.e., *i2s_channel_init_tdm_mode* has been called before reconfiguring

**Parameters**
- *handle* -- [in] I2S channel handler
- *gpio_cfg* -- [in] Standard mode GPIO configuration, specified by user

**Returns**
- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

**Structures**

```c
struct i2s_tdm_slot_config_t
```

I2S slot configuration for TDM mode.

**Public Members**

```c
i2s_data_bit_width_t data_bit_width
```

I2S sample data bit width (valid data bits per sample)

```c
i2s_slot_bit_width_t slot_bit_width
```

I2S slot bit width (total bits per slot)

```c
i2s_slot_mode_t slot_mode
```

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

```c
i2s_tdm_slot_mask_t slot_mask
```

Slot mask. Activating slots by setting 1 to corresponding bits. When the activated slots is not consecutive, those data in inactivated slots will be ignored

```c
uint32_t ws_width
```

WS signal width (i.e. the number of BCLK ticks that WS signal is high)

```c
bool ws_pol
```

WS signal polarity, set true to enable high lever first

```c
bool bit_shift
```

Set true to enable bit shift in Philips mode

```c
bool left_align
```

Set true to enable left alignment
bool big_endian
  Set true to enable big endian

bool bit_order_lsb
  Set true to enable lsb first

bool skip_mask
  Set true to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

uint32_t total_slot
  I2S total number of slots. If it is smaller than the biggest activated channel number, it will be set to this number automatically.

struct i2s_tdm_clk_config_t
  I2S clock configuration for TDM mode.

Public Members

uint32_t sample_rate_hz
  I2S sample rate

i2s_clock_src_t clk_src
  Choose clock source, see soc_periph_i2s_clk_src_t for the supported clock sources. selected I2S_CLK_SRC_EXTERNAL (if supports) to enable the external source clock inputted via MCLK pin, please make sure the frequency inputted is equal or greater than sample_rate_hz * mclk_multiple

uint32_t ext_clk_freq_hz
  External clock source frequency in Hz, only take effect when clk_src = I2S_CLK_SRC_EXTERNAL, otherwise this field will be ignored Please make sure the frequency inputted is equal or greater than BCLK, i.e. sample_rate_hz * slot_bits * slot_num

i2s_mclk_multiple t mclk_multiple
  The multiple of MCLK to the sample rate, only take effect for master role

uint32_t bclk_div
  The division from MCLK to BCLK, only take effect for slave role, it shouldn't be smaller than 8. Increase this field when data sent by slave lag behind

struct i2s_tdm_gpio_config_t
  I2S TDM mode GPIO pins configuration.

Public Members

gpio_num t mclk
  MCK pin, output by default, input if the clock source is selected to I2S_CLK_SRC_EXTERNAL
Chapter 2. API Reference

```c
gpio_num_t bclk
   BCK pin, input in slave role, output in master role

gpio_num_t ws
   WS pin, input in slave role, output in master role

gpio_num_t dout
   DATA pin, output

gpio_num_t din
   DATA pin, input

uint32_t mclk_inv
   Set 1 to invert the MCLK input/output

uint32_t bclk_inv
   Set 1 to invert the BCLK input/output

uint32_t ws_inv
   Set 1 to invert the WS input/output

struct i2s_tdm_gpio_config_t::[anonymous] invert_flags
   GPIO pin invert flags

struct i2s_tdm_config_t
   I2S TDM mode major configuration that including clock/slot/GPIO configuration.

Public Members

i2s_tdm_clk_config_t clk_cfg
   TDM mode clock configuration, can be generated by macro I2S_TDM_CLK_DEFAULT_CONFIG

i2s_tdm_slot_config_t slot_cfg
   TDM mode slot configuration, can be generated by macros I2S_TDM_[mode]_SLOT_DEFAULT_CONFIG,
   [mode] can be replaced with PHILIPS/MSB/PCM_SHORT/PCM_LONG

i2s_tdm_gpio_config_t gpio_cfg
   TDM mode GPIO configuration, specified by user

Macros

I2S_TDM_AUTO_SLOT_NUM
   This file is specified for I2S TDM communication mode Features:
     • More than 2 slots

I2S_TDM_AUTO_WS_WIDTH
```

Espressif Systems 1079 Release v5.2.2
Submit Document Feedback
Chapter 2. API Reference

I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG\((\text{bits\_per\_sample, mono\_or\_stereo, mask})\)

Philips format in active slot that enabled by mask.

**Parameters**

- \text{bits\_per\_sample} -- I2S data bit width
- \text{mono\_or\_stereo} -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- \text{mask} -- active slot mask

I2S_TDM_MSB_SLOT_DEFAULT_CONFIG\((\text{bits\_per\_sample, mono\_or\_stereo, mask})\)

MSB format in active slot enabled that by mask.

**Parameters**

- \text{bits\_per\_sample} -- I2S data bit width
- \text{mono\_or\_stereo} -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- \text{mask} -- active slot mask

I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG\((\text{bits\_per\_sample, mono\_or\_stereo, mask})\)

PCM(short) format in active slot that enabled by mask.

**Parameters**

- \text{bits\_per\_sample} -- I2S data bit width
- \text{mono\_or\_stereo} -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- \text{mask} -- active slot mask

I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG\((\text{bits\_per\_sample, mono\_or\_stereo, mask})\)

PCM(long) format in active slot that enabled by mask.

**Parameters**

- \text{bits\_per\_sample} -- I2S data bit width
- \text{mono\_or\_stereo} -- I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- \text{mask} -- active slot mask

I2S_TDM_CLK_DEFAULT_CONFIG\((\text{rate})\)

I2S default TDM clock configuration.

**Note:** Please set the mclk\_multiple to I2S_MCLK\_MULTIPLE\_384 while the data width in slot configuration is set to 24 bits. Otherwise the sample rate might be imprecise since the BCLK division is not a integer

**Parameters**

- \text{rate} -- sample rate

I2S Driver

**Header File**

- components/driver/i2s/include/driver/i2s_common.h
- This header file can be included with:

  ```
  #include "driver/i2s_common.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```
  REQUIRE\s driver
  ```

  or

  ```
  PRIV\_REQUIRE\s driver
  ```
Chapter 2. API Reference

Functions

```c
esp_err_t i2s_new_channel(const i2s_chan_config_t *chan_cfg, i2s_chan_handle_t *ret_tx_handle, i2s_chan_handle_t *ret_rx_handle)
```

Allocate new I2S channel(s)

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

**Note:** When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the I2S controller, otherwise driver will try to allocate the new channel on the selected port.

**Note:** If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the RX and TX channels will be allocated on a same I2S port in this case. Note that some configurations of TX/RX channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can’t guarantee TX/RX channels write/read synchronously, they can only share the clock signals for now.

**Note:** If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both RX and TX channel) will be occupied, even if only one of RX or TX channel is registered. For the other targets, another channel on this controller will still available.

**Parameters**
- `chan_cfg` -- [in] I2S controller channel configurations
- `ret_tx_handle` -- [out] I2S channel handler used for managing the sending channel(optional)
- `ret_rx_handle` -- [out] I2S channel handler used for managing the receiving channel(optional)

**Returns**
- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in i2s_chan_config_t
- ESP_ERR_NOT_FOUND No available I2S channel found

```c
esp_err_t i2s_del_channel(i2s_chan_handle_t handle)
```

Delete the I2S channel.

**Note:** Only allowed to be called when the I2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

**Note:** Resource will be free automatically if all channels in one port are deleted

**Parameters**
- `handle` -- [in] I2S channel handler
  - ESP_OK Delete successfully
  - ESP_ERR_INVALID_ARG NULL pointer

```c
esp_err_t i2s_channel_get_info(i2s_chan_handle_t handle, i2s_chan_info_t *chan_info)
```

Get I2S channel information.
### Parameters

- **handle** -- [in] I2S channel handler
- **chan_info** -- [out] I2S channel basic information

### Returns

- ESP_OK Get I2S channel information success
- ESP_ERR_NOT_FOUND The input handle doesn't match any registered I2S channels, it may not an I2S channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

**esp_err_t i2s_channel_enable (i2s_chan_handle_t handle)**

Enable the I2S channel.

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting BCLK and WS signal. For MCLK signal, it will start to output when initialization is finished

### Parameters

- **handle** -- [in] I2S channel handler

### Returns

- ESP_OK Start successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not initialized or already started

**esp_err_t i2s_channel_disable (i2s_chan_handle_t handle)**

Disable the I2S channel.

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop BCLK and WS signal but not MCLK signal

### Parameters

- **handle** -- [in] I2S channel handler

### Returns

- ESP_OK Stop successfully
- ESP_ERR_INVALID_ARG NULL pointer
- ESP_ERR_INVALID_STATE This channel has not stated

**esp_err_t i2s_channel_preload_data (i2s_chan_handle_t tx_handle, const void *src, size_t size, size_t *bytes_loaded)**

Preload the data into TX DMA buffer.

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

**Note:** As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.
Note: This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the bytes_loaded parameter to see how many bytes are loaded successfully, when the bytes_loaded is smaller than the size, it means the DMA buffers are full.

Parameters
- `tx_handle` -- [in] I2S TX channel handler
- `src` -- [in] The pointer of the source buffer to be loaded
- `size` -- [in] The source buffer size
- `bytes_loaded` -- [out] The bytes that successfully been loaded into the TX DMA buffer

Returns
- ESP_OK Load data successful
- ESP_ERR_INVALID_ARG NULL pointer or not TX direction
- ESP_ERR_INVALID_STATE This channel has not stated

```c
esp_err_t i2s_channel_write(i2s_chan_handle_t handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)
```

I2S write data.

Note: Only allowed to be called when the channel state is RUNNING, (i.e., TX channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

Parameters
- `handle` -- [in] I2S channel handler
- `src` -- [in] The pointer of sent data buffer
- `size` -- [in] Max data buffer length
- `bytes_written` -- [out] Byte number that actually be sent, can be NULL if not needed
- `timeout_ms` -- [in] Max block time

Returns
- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not TX handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

```c
esp_err_t i2s_channel_read(i2s_chan_handle_t handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)
```

I2S read data.

Note: Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

Parameters
- `handle` -- [in] I2S channel handler
- `dest` -- [in] The pointer of receiving data buffer
- `size` -- [in] Max data buffer length
- `bytes_read` -- [out] Byte number that actually be read, can be NULL if not needed
- `timeout_ms` -- [in] Max block time

Returns
- ESP_OK Read successfully
**Chapter 2. API Reference**

- ESP_ERR_INVALID_ARG NULL pointer or this handle is not RX handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

```c
esp_err_t i2s_channel_register_event_callback(i2s_chan_handle_t handle, const i2s_event_callbacks_t *callbacks, void *user_data)
```

Set event callbacks for I2S channel.

**Note:** Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the callbacks structure to NULL.

**Note:** When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

**Parameters**
- `handle` -- [in] I2S channel handler
- `callbacks` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

**Structures**

```c
struct i2s_event_callbacks_t
```

Group of I2S callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
i2s_isr_callback_t on_recv
```

Callback of data received event, only for RX channel. The event data includes DMA buffer address and size that just finished receiving data.
Chapter 2. API Reference

i2s_isr_callback_t on_recv_q_ovf
Callback of receiving queue overflowed event, only for RX channel. The event data includes buffer size that has been overwritten.

i2s_isr_callback_t on_sent
Callback of data sent event, only for TX channel. The event data includes DMA buffer address and size that just finished sending data.

i2s_isr_callback_t on_send_q_ovf
Callback of sending queue overflowed event, only for TX channel. The event data includes buffer size that has been overwritten.

struct i2s_chan_config_t
I2S controller channel configuration.

Public Members

i2s_port_t id
I2S port id

i2s_role_t role
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

uint32_t dma_desc_num
I2S DMA buffer number, it is also the number of DMA descriptor

uint32_t dma_frame_num
I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of 3 when the data bit width is 24.

bool auto_clear
Set to auto clear DMA TX buffer, I2S will always send zero automatically if no data to send

int intr_priority
I2S interrupt priority, range [0, 7], if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct i2s_chan_info_t
I2S channel information.

Public Members

i2s_port_t id
I2S port id

i2s_role_t role
I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE
### i2s_dir_t dir
I2S channel direction

### i2s_comm_mode_t mode
I2S channel communication mode

### i2s_chan_handle_t pair_chan
I2S pair channel handle in duplex mode, always NULL in simplex mode

#### Macros

**I2S_CHANNEL_DEFAULT_CONFIG** (i2s_num, i2s_role)
get default I2S property

**I2S_GPIO_UNUSED**
Used in i2s_gpio_config_t for signals which are not used

#### I2S Types

**Header File**

- components/driver/i2s/include/driver/i2s_types.h
- This header file can be included with:
  ```
  #include "driver/i2s_types.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```
  REQUIRES driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

#### Structures

**struct i2s_event_data_t**
Event structure used in I2S event queue.

#### Public Members

```
void *data

The pointer of DMA buffer that just finished sending or receiving for on_recv and on_sent callback
NULL for on_recv_q_ovf and on_send_q_ovf callback
```

```
size_t size

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when
queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when
data_bit_width is not changed.
```
Type Definitions

typedef struct i2s_channel_obj_t *i2s_chan_handle_t
I2S channel object handle, the control unit of the I2S driver

typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
I2S event callback.

Param handle [in] I2S channel handle, created from i2s_new_channel()
Param event [in] I2S event data
Param user_ctx [in] User registered context, passed from i2s_channel_register_event_callback()
Return Whether a high priority task has been waken up by this callback function

Enumerations

enum i2s_port_t
I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator I2S_NUM_0
I2S controller port 0

enumerator I2S_NUM_AUTO
Select whichever port is available

enum i2s_comm_mode_t
I2S controller communication mode.

Values:

enumerator I2S_COMM_MODE_STD
I2S controller using standard communication mode, support Philips/MSB/PCM format

enumerator I2S_COMM_MODE_PDM
I2S controller using PDM communication mode, support PDM output or input

enumerator I2S_COMM_MODE_TDM
I2S controller using TDM communication mode, support up to 16 slots per frame

enumerator I2S_COMM_MODE_NONE
Unspecified I2S controller mode

enum i2s_mclk_multiple_t
The multiple of MCLK to sample rate.

Values:

enumerator I2S_MCLK_MULTIPLE_128
MCLK = sample_rate * 128

enumerator I2S_MCLK_MULTIPLE_256
MCLK = sample_rate * 256
enumerator **I2S_MCLK_MULTIPLICITY_384**

\[ MCLK = \text{sample\_rate} \times 384 \]

enumerator **I2S_MCLK_MULTIPLICITY_512**

\[ MCLK = \text{sample\_rate} \times 512 \]

Header File

- `components/hal/include/hal/i2s_types.h`
- This header file can be included with:

```c
#include "hal/i2s_types.h"
```

Type Definitions

typedef `soc_periph_i2s_clk_src_t` **i2s_clock_src_t**

I2S clock source

Enumerations

eenum **i2s_slot_mode_t**

I2S channel slot mode.

*Values:*

- enumerator **I2S_SLOT_MODE_MONO**

  I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

- enumerator **I2S_SLOT_MODE_STEREO**

  I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

eenum **i2s_dir_t**

I2S channel direction.

*Values:*

- enumerator **I2S_DIR_RX**

  I2S channel direction RX

- enumerator **I2S_DIR_TX**

  I2S channel direction TX

eenum **i2s_role_t**

I2S controller role.

*Values:*

- enumerator **I2S_ROLE_MASTER**

  I2S controller master role, belk and ws signal will be set to output
enumerator **I2S_ROLE_SLAVE**
I2S controller slave role, bclk and ws signal will be set to input

enum **i2s_data_bit_width_t**
Available data bit width in one slot.

Values:

enumerator **I2S_DATA_BIT_WIDTH_8BIT**
I2S channel data bit-width: 8

enumerator **I2S_DATA_BIT_WIDTH_16BIT**
I2S channel data bit-width: 16

enumerator **I2S_DATA_BIT_WIDTH_24BIT**
I2S channel data bit-width: 24

enumerator **I2S_DATA_BIT_WIDTH_32BIT**
I2S channel data bit-width: 32

enum **i2s_slot_bit_width_t**
Total slot bit width in one slot.

Values:

enumerator **I2S_SLOT_BIT_WIDTH_AUTO**
I2S channel slot bit-width equals to data bit-width

enumerator **I2S_SLOT_BIT_WIDTH_8BIT**
I2S channel slot bit-width: 8

enumerator **I2S_SLOT_BIT_WIDTH_16BIT**
I2S channel slot bit-width: 16

enumerator **I2S_SLOT_BIT_WIDTH_24BIT**
I2S channel slot bit-width: 24

enumerator **I2S_SLOT_BIT_WIDTH_32BIT**
I2S channel slot bit-width: 32

enum **i2s_pcm_compress_t**
A/U-law decompress or compress configuration.

Values:

enumerator **I2S_PCM_DISABLE**
Disable A/U law decompress or compress

enumerator **I2S_PCM_A_DECOMPRESS**
A-law decompress
Chapter 2. API Reference

enumerator **I2S_PCM_A_COMPRESS**
A-law compress

enumerator **I2S_PCM_U_DECOMPRESS**
U-law decompress

enumerator **I2S_PCM_U_COMPRESS**
U-law compress

enum **i2s_pdm_sig_scale_t**
pdm tx signal scaling mode
Values:

enumerator **I2S_PDM_SIG_SCALING_DIV_2**
I2S TX PDM signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**
I2S TX PDM signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**
I2S TX PDM signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**
I2S TX PDM signal scaling: x4

enum **i2s_pdm_tx_line_mode_t**
PDM TX line mode.

**Note:** For the standard codec mode, PDM pins are connect to a codec which requires both clock signal and data signal For the DAC output mode, PDM data signal can be connected to a power amplifier directly with a low-pass filter, normally, DAC output mode doesn’t need the clock signal.

Values:

enumerator **I2S_PDM_TX_ONE_LINE_CODEC**
Standard PDM format output, left and right slot data on a single line

enumerator **I2S_PDM_TX_ONE_LINE_DAC**
PDM DAC format output, left or right slot data on a single line

enumerator **I2S_PDM_TX_TWO_LINE_DAC**
PDM DAC format output, left and right slot data on separated lines

enum **i2s_std_slot_mask_t**
I2S slot select in standard mode.

**Note:** It has different meanings in tx/rx/mono/stereo mode, and it may have differen behaviors on different targets For the details, please refer to the I2S API reference
Chapter 2. API Reference

Values:

enumerator **I2S_STD_SLOT_LEFT**

I2S transmits or receives left slot

enumerator **I2S_STD_SLOT_RIGHT**

I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**

I2S transmits or receives both left and right slot

enum **i2s_pdm_slot_mask_t**

I2S slot select in PDM mode.

Values:

enumerator **I2S_PDM_SLOT_RIGHT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled up

enumerator **I2S_PDM_SLOT_LEFT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled down

enumerator **I2S_PDM_SLOT_BOTH**

I2S PDM transmits or receives both two slots

enum **i2s_tdm_slot_mask_t**

tdm slot number

**Note:** Multiple slots in TDM mode. For TX module, only the active slot send the audio data, the inactive slot send a constant or will be skipped if 'skip_msk' is set. For RX module, only receive the audio data in active slots, the data in inactive slots will be ignored. the bit map of active slot can not exceed (0x1<<total_slot_num). e.g: slot_mask = (I2S_TDM_SLOT0 | I2S_TDM_SLOT3), here the active slot number is 2 and total_slot is not supposed to be smaller than 4.

Values:

enumerator **I2S_TDM_SLOT0**

I2S slot 0 enabled

enumerator **I2S_TDM_SLOT1**

I2S slot 1 enabled

enumerator **I2S_TDM_SLOT2**

I2S slot 2 enabled

enumerator **I2S_TDM_SLOT3**

I2S slot 3 enabled

enumerator **I2S_TDM_SLOT4**

I2S slot 4 enabled
2.6.13 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/RGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

enumerator **I2S_TDM_SLOT5**
I2S slot 5 enabled

enumerator **I2S_TDM_SLOT6**
I2S slot 6 enabled

enumerator **I2S_TDM_SLOT7**
I2S slot 7 enabled

enumerator **I2S_TDM_SLOT8**
I2S slot 8 enabled

enumerator **I2S_TDM_SLOT9**
I2S slot 9 enabled

enumerator **I2S_TDM_SLOT10**
I2S slot 10 enabled

enumerator **I2S_TDM_SLOT11**
I2S slot 11 enabled

enumerator **I2S_TDM_SLOT12**
I2S slot 12 enabled

enumerator **I2S_TDM_SLOT13**
I2S slot 13 enabled

enumerator **I2S_TDM_SLOT14**
I2S slot 14 enabled

enumerator **I2S_TDM_SLOT15**
I2S slot 15 enabled
• Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller’s internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g., ST7789, SSD1306). More Controller Based LCD Drivers are maintained in the Espressif Component Registry.

• SPI Interfaced LCD describes the steps to install the SPI LCD IO driver and then get the panel handle.

• I2C Interfaced LCD describes the steps to install the I2C LCD IO driver and then get the panel handle.

• LCD Panel IO Operations - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

SPI Interfaced LCD

1. Create an SPI bus. Please refer to SPI Master API doc for more details.

```c
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), // transfer 80 lines of pixels (assume pixel is RGB565) at most in one SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

• `esp_lcd_panel_io_spi_config_t::dc_gpio_num` Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver uses this GPIO to switch between sending command and sending data.

• `esp_lcd_panel_io_spi_config_t::cs_gpio_num` Sets the gpio number for the CS signal line. The LCD driver uses this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e., this LCD), you can set the gpio number to -1 to occupy the bus exclusively.

• `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.

• `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver uses this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the SPI Master API doc.

• `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

• `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```c
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
```

(continues on next page)
3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- **esp_lcd_panel_dev_config_t::reset_gpio_num** sets the LCD’s hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- **esp_lcd_panel_dev_config_t::rgb_ele_order** sets the R-G-B element order of each color data.
- **esp_lcd_panel_dev_config_t::bits_per_pixel** sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- **esp_lcd_panel_dev_config_t::data_endian** specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```c
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &panel_handle));
```

### I2C Interfaced LCD

1. Create I2C bus. Please refer to [I2C API doc](#) for more details.

```c
i2c_master_bus_config_t bus_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .glitch_ignore_cnt = 7,
    .i2c_port = I2C_BUS_PORT,
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .flags.enable_internal_pullup = true,
};
ESP_ERROR_CHECK(i2c_new_master_bus(&bus_config, &i2c_bus));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- **esp_lcd_panel_io_i2c_config_t::dev_addr** sets the I2C device address of the LCD controller chip. The LCD driver uses this address to communicate with the LCD controller chip.
- **esp_lcd_panel_io_i2c_config_t::scl_speed_hz** sets the I2C clock frequency in Hz. The value should not exceed the range recommended in the LCD spec.
- **esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits** and **esp_lcd_panel_io_i2c_config_t::lcd_param_bits** set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```c
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .scl_speed_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
};
```
3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD’s hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bitwidth of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

```c
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &panel_handle));
```

**More Controller Based LCD Drivers**

More LCD panel drivers and touch drivers are available in ESP-IDF Component Registry. The list of available and planned drivers with links is in this table.

**LCD Panel IO Operations**

- `esp_lcd_panel_reset()` can reset the LCD panel.
- `esp_lcd_panel_init()` performs a basic initialization of the panel. To perform more manufacture specific initialization, please go to Steps to Add Manufacture Specific Initialization.
- Through combined use of `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen by cutting down the output path from the frame buffer to the LCD screen.
- `esp_lcd_panel_disp_sleep()` can reduce the power consumption of the LCD screen by entering the sleep mode. The internal frame buffer is still retained.
- `esp_lcd_panel_draw_bitmap()` is the most significant function, which does the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

**Steps to Add Manufacture Specific Initialization**

The LCD controller drivers (e.g., st7789) in esp-idf only provide basic initialization in the `esp_lcd_panel_init()`, leaving the vast majority of settings to the default values. Some LCD modules need to set a bunch of manufacture specific configurations before it can display normally. These configurations usually include gamma, power voltage and so on. If you want to add manufacture specific initialization, please follow the steps below:

```c
esp_lcd_panel_reset(panel_handle);
esp_lcd_panel_init(panel_handle);
// set extra configurations e.g., gamma control
// with the underlying IO handle
// please consult your manufacture for special commands and corresponding values
esp_lcd_panel_io_tx_param(io_handle, GAMMA_CMD, (uint8_t[]){
```
GAMMA_ARRAY
}, N);
// turn on the display
esp_lcd_panel_disp_on_off(panel_handle, true);

Application Example

LCD examples are located under: peripherals/lcd:

- Universal SPI LCD example with SPI touch - peripherals/lcd/spi_lcd_touch
- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- I2C interfaced OLED display scrolling text - peripherals/lcd/i2c_oled

Type Definitions

typedef lcd_rgb_element_order_t lcd_color_rgb_endian_t
for backward compatible

Enumerations

enum lcd_rgb_element_order_t
RGB color endian.

Values:

- enumerator LCD_RGB_ELEMENT_ORDER_RGB
  RGB element order: RGB

- enumerator LCD_RGB_ELEMENT_ORDER_BGR
  RGB element order: BGR

enum lcd_rgb_data_endian_t
RGB data endian.

Values:
Chapter 2. API Reference

enumerator LCD_RGB_DATA_ENDIAN_BIG
    RGB data endian: MSB first

enumerator LCD_RGB_DATA_ENDIAN_LITTLE
    RGB data endian: LSB first

enum lcd_color_space_t
    LCD color space.
    Values:
    enumerator LCD_COLOR_SPACE_RGB
        Color space: RGB
    enumerator LCD_COLOR_SPACE_YUV
        Color space: YUV

enum lcd_color_range_t
    LCD color range.
    Values:
    enumerator LCD_COLOR_RANGE_LIMIT
        Limited color range
    enumerator LCD_COLOR_RANGE_FULL
        Full color range

enum lcd_yuv_sample_t
    YUV sampling method.
    Values:
    enumerator LCD_YUV_SAMPLE_422
        YUV 4:2:2 sampling
    enumerator LCD_YUV_SAMPLE_420
        YUV 4:2:0 sampling
    enumerator LCD_YUV_SAMPLE_411
        YUV 4:1:1 sampling

enum lcd_yuv_conv_std_t
    The standard used for conversion between RGB and YUV.
    Values:
    enumerator LCD_YUV_CONV_STD_BT601
        YUV<>RGB conversion standard: BT.601
    enumerator LCD_YUV_CONV_STD_BT709
        YUV<>RGB conversion standard: BT.709

Functions

```
esp_err_t esp_lcd_panel_io_rx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)
```

Transmit LCD command and receive corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- `io` -- [in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- `lcd_cmd` -- [in] The specific LCD command, set to -1 if no command needed
- `param` -- [out] Buffer for the command data
- `param_size` -- [in] Size of `param` buffer

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NOT_SUPPORTED if read is not supported by transport
• ESP_OK on success

\texttt{esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)}

Transmit LCD command and corresponding parameters.

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by \texttt{esp_lcd_panel_io_tx_color()} are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

**Parameters**
- \texttt{io} -- [in] LCD panel IO handle, which is created by other factory API like \texttt{esp_lcd_new_panel_io_spi()}
- \texttt{lcd_cmd} -- [in] The specific LCD command, set to -1 if no command needed
- \texttt{param} -- [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- \texttt{param_size} -- [in] Size of \texttt{param} in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

\texttt{esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)}

Transmit LCD RGB data.

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the \texttt{color} buffer. Recycling of color buffer should be done in the callback \texttt{on_color_trans_done()}.  

**Parameters**
- \texttt{io} -- [in] LCD panel IO handle, which is created by factory API like \texttt{esp_lcd_new_panel_io_spi()}
- \texttt{lcd_cmd} -- [in] The specific LCD command, set to -1 if no command needed
- \texttt{color} -- [in] Buffer that holds the RGB color data
- \texttt{color_size} -- [in] Size of \texttt{color} in memory, in bytes

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

\texttt{esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)}

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters**
- \texttt{io} -- [in] LCD panel IO handle, which is created by factory API like \texttt{esp_lcd_new_panel_io_spi()}

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

\texttt{esp_err_t esp_lcd_panel_io_register_event_callbacks(esp_lcd_panel_io_handle_t io, const esp_lcd_panel_io_callbacks_t *cbs, void *user_ctx)}

Register LCD panel IO callbacks.
Parameters
• **io** — [in] LCD panel IO handle, which is created by factory API like
  
  ```c
  esp_lcd_new_panel_io_spi()
  ```
• **cbs** — [in] structure with all LCD panel IO callbacks
• **user_ctx** — [in] User private data, passed directly to callback’s user_ctx

Returns
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for SPI interface.

Parameters
• **bus** — [in] SPI bus handle
• **io_config** — [in] IO configuration, for SPI interface
• **ret_io** — [out] Returned IO handle

Returns
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i2c_v1(uint32_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO handle, for I2C interface in legacy implementation.

Note: Please don’t call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

Parameters
• **bus** — [in] I2C bus handle, (in uint32_t)
• **io_config** — [in] IO configuration, for I2C interface
• **ret_io** — [out] Returned IO handle

Returns
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i2c_v2(i2c_master_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_i2c_config_t *io_config,
  esp_lcd_panel_io_i2c_config_t *ret_io)
```

Create LCD panel IO handle, for I2C interface in new implementation.

Note: Please don’t call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.
Structures

struct `esp_lcd_panel_io_event_data_t`
Type of LCD panel IO event data.

struct `esp_lcd_panel_io_callbacks_t`
Type of LCD panel IO callbacks.

Public Members

`esp_lcd_panel_io_color_trans_done_cb_t` **on_color_trans_done**
Callback invoked when color data transfer has finished

struct `esp_lcd_panel_io_spi_config_t`
Panel IO configuration structure, for SPI interface.

Public Members

int **cs_gpio_num**
GPIO used for CS line

int **dc_gpio_num**
GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi_mode**
Traditional SPI mode (0~3)

unsigned int **pclk_hz**
Frequency of pixel clock

size_t **trans_queue_depth**
Size of internal transaction queue

`esp_lcd_panel_io_color_trans_done_cb_t` **on_color_trans_done**
Callback invoked when color data transfer has finished

void **user_ctx**
User private data, passed directly to on_color_trans_done's user_ctx

int **lcd_cmd_bits**
Bit-width of LCD command

int **lcd_param_bits**
Bit-width of LCD parameter

unsigned int **dc_high_on_cmd**
If enabled, DC level = 1 indicates command transfer
unsigned int **dc_low_on_data**

If enabled, DC level = 0 indicates color data transfer

unsigned int **dc_low_on_param**

If enabled, DC level = 0 indicates parameter transfer

unsigned int **octal_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb_first**

transmit LSB bit first

unsigned int **cs_high_active**

CS line is high active

struct **esp_lcd_panel_io_spi_config_t**

Extra flags to fine-tune the SPI device

struct **esp_lcd_panel_io_i2c_config_t**

Panel IO configuration structure, for I2C interface.

**Public Members**

uint32_t **dev_addr**
I2C device address

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**
Callback invoked when color data transfer has finished

void *user_ctx
User private data, passed directly to on_color_trans_done's user_ctx

size_t **control_phase_bytes**
I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**
Offset of the D/C selection bit in control phase

int **lcd_cmd_bits**
Bit-width of LCD command
int `lcd_param_bits`
   Bit-width of LCD parameter

unsigned int `dc_low_on_data`
   If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int `disable_control_phase`
   If this flag is enabled, the control phase isn't used

struct `esp_lcd_panel_io_i2c_config_t`::[anonymous] `flags`
   Extra flags to fine-tune the I2C device

uint32_t `scl_speed_hz`
   I2C LCD SCL frequency (hz)

**Macros**

`esp_lcd_new_panel_io_i2c` (bus, io_config, ret_io)
   Create LCD panel IO handle.
     **Parameters**
     - `bus` -- [in] I2C bus handle
     - `io_config` -- [in] IO configuration, for I2C interface
     - `ret_io` -- [out] Returned IO handle
     **Returns**
     - ESP_ERR_INVALID_ARG if parameter is invalid
     - ESP_ERR_NO_MEM if out of memory
     - ESP_OK on success

**Type Definitions**

typedef void *`esp_lcd_spi_bus_handle_t`
   Type of LCD SPI bus handle

typedef uint32_t `esp_lcd_i2c_bus_handle_t`
   Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t *`esp_lcd_i80_bus_handle_t`
   Type of LCD intel 8080 bus handle

typedef bool (*`esp_lcd_panel_io_color_trans_done_cb_t`)(esp_lcd_panel_io_handle_t panel_io, esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
   Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.
     **Param panel_io** [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
     **Param edata** [in] Panel IO event data, fed by driver
     **Param user_ctx** [in] User data, passed from esp_lcd_panel_io_xxx_config_t
     **Return** Whether a high priority task has been waken up by this function

**Header File**

- `components/esp_lcd/include/esp_lcd_panel_ops.h`
- This header file can be included with:
#include "esp_lcd_panel_ops.h"

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES esp_lcd
```

or

```cmake
PRIV_REQUIRES esp_lcd
```

## Functions

### `esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)`
Reset LCD panel.

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**
- ESP_OK on success

### `esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)`
Initialize LCD panel.

**Note:** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**
- ESP_OK on success

### `esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)`
Deinitialize the LCD panel.

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**
- ESP_OK on success

### `esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)`
Draw bitmap on LCD panel.

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `x_start` -- [in] Start index on x-axis (x_start included)
- `y_start` -- [in] Start index on y-axis (y_start included)
- `x_end` -- [in] End index on x-axis (x_end not included)
- `y_end` -- [in] End index on y-axis (y_end not included)
- `color_data` -- [in] RGB color data that will be dumped to the specific window range

**Returns**
- ESP_OK on success
**esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)**

Mirror the LCD panel on specific axis.

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation.

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `mirror_x` -- [in] Whether the panel will be mirrored about the x axis
- `mirror_y` -- [in] Whether the panel will be mirrored about the y axis

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_swap_xy (esp_lcd_panel_handle_t panel, bool swap_axes)**

Swap/Exchange x and y axis.

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation.

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `swap_axes` -- [in] Whether to swap the x and y axis

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_set_gap (esp_lcd_panel_handle_t panel, int x_gap, int y_gap)**

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `x_gap` -- [in] Extra gap on x axis, in pixels
- `y_gap` -- [in] Extra gap on y axis, in pixels

**Returns**
- ESP_OK on success

**esp_err_t esp_lcd_panel_invert_color (esp_lcd_panel_handle_t panel, bool invert_color_data)**

Invert the color (bit-wise invert the color data line)

**Parameters**
- `panel` -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `invert_color_data` -- [in] Whether to invert the color data

**Returns**
- ESP_OK on success
**esp_err_t esp_lcd_panel_disp_on_off** *(esp_lcd_panel_handle_t panel, bool on_off)*

Turn on or off the display.

**Parameters**
- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** -- [in] True to turns on display, False to turns off display

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_disp_off** *(esp_lcd_panel_handle_t panel, bool off)*

Turn off the display.

**Parameters**
- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** -- [in] Whether to turn off the screen

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**esp_err_t esp_lcd_panel_disp_sleep** *(esp_lcd_panel_handle_t panel, bool sleep)*

Enter or exit sleep mode.

**Parameters**
- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **sleep** -- [in] True to enter sleep mode, False to wake up

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Header File**

Functions

`esp_err_t esp_lcd_new_panel_st7789` (const `esp_lcd_panel_io_handle_t` io, const `esp_lcd_panel_dev_config_t` *panel_dev_config, `esp_lcd_panel_handle_t` *ret_panel)

Create LCD panel for model ST7789.

**Parameters**

- `io` -- [in] LCD panel IO handle
- `panel_dev_config` -- [in] general panel device configuration
- `ret_panel` -- [out] Returned LCD panel handle

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

`esp_err_t esp_lcd_new_panel_nt35510` (const `esp_lcd_panel_io_handle_t` io, const `esp_lcd_panel_dev_config_t` *panel_dev_config, `esp_lcd_panel_handle_t` *ret_panel)

Create LCD panel for model NT35510.

**Parameters**

- `io` -- [in] LCD panel IO handle
- `panel_dev_config` -- [in] general panel device configuration
- `ret_panel` -- [out] Returned LCD panel handle

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

`esp_err_t esp_lcd_new_panel_ssd1306` (const `esp_lcd_panel_io_handle_t` io, const `esp_lcd_panel_dev_config_t` *panel_dev_config, `esp_lcd_panel_handle_t` *ret_panel)

Create LCD panel for model SSD1306.

**Parameters**

- `io` -- [in] LCD panel IO handle
- `panel_dev_config` -- [in] general panel device configuration
- `ret_panel` -- [out] Returned LCD panel handle

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct `esp_lcd_panel_dev_config_t`

Configuration structure for panel device.

Public Members

`int reset_gpio_num`

GPIO used to reset the LCD panel, set to -1 if it's not used
lcd_rgb_element_order_t color_space

Deprecated:
Set RGB color space, please use rgb_ele_order instead

lcd_rgb_element_order_t rgb_endian

Deprecated:
Set RGB data endian, please use rgb_ele_order instead

lcd_rgb_element_order_t rgb_ele_order

Set RGB element order, RGB or BGR

lcd_rgb_data_endian_t data_endian

Set the data endian for color data larger than 1 byte

unsigned int bits_per_pixel
Color depth, in bpp

unsigned int reset_active_high
Setting this if the panel reset is high level active

struct esp_lcd_panel_dev_config_t::[anonymous] flags
LCD panel config flags

void *vendor_config
vendor specific configuration, optional, left as NULL if not used

2.6.14 LED Control (LEDC)

Introduction
The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview
Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C6 only supports configuring channels in "low speed" mode.

1. Timer Configuration by specifying the PWM signal's frequency and duty cycle resolution.
2. Channel Configuration by associating it with the timer and GPIO to output the PWM signal.
3. Change PWM Signal that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware fading functions.
As an optional step, it is also possible to set up an interrupt on fade end.

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling `ledc_timer_config()`), and then for the channels (by calling `ledc_channel_config()`). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency in Hz
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section *Supported Range of Frequency and Duty Resolutions*.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

<table>

<td>~ 20 MHz</td>
<td>Dynamic Frequency Scaling compatible, Light sleep compatible</td>
</tr>
<tr>
<td>XTAL_CLK</td>
<td>40 MHz</td>
<td>Dynamic Frequency Scaling compatible</td>
</tr>
</tbody>
</table>

**Note:**
Chapter 2. API Reference

1. On ESP32-C6, if RC_FAST_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

2. For ESP32-C6, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.

The LEDC driver offers a helper function `ledc_find_suitable_duty_resolution()` to find the maximum possible resolution for the timer, given the source clock frequency and the desired PWM signal frequency.

When a timer is no longer needed by any channel, it can be deconfigured by calling the same function `ledc_timer_config()`. The configuration structure `ledc_timer_config_t` passes in should be:

- `ledc_timer_config_t::speed_mode` The speed mode of the timer which wants to be deconfigured belongs to `ledc_mode_t`
- `ledc_timer_config_t::timer_num` The ID of the timers which wants to be deconfigured (`ledc_timer_t`)
- `ledc_timer_config_t::deconfigure` Set this to true so that the timer specified can be deconfigured

Channel Configuration When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

Note: All the timers and channels in the ESP32-C6’s LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

Change PWM Duty Cycle Using Software To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding _get_ function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Channel Configuration.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to \((2 ^ {** duty_resolution})\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of ~0.1%.

Warning: On ESP32-C6, when channel's binded timer selects its maximum duty resolution, the duty cycle value cannot be set to \((2 ^ {** duty_resolution})\). Otherwise, the internal duty counter in the hardware will overflow and be messed up.

Change PWM Duty Cycle Using Hardware The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:
Chapter 2. API Reference

- **ledc_set_fade_with_time()**
- **ledc_set_fade_with_step()**
- **ledc_set_fade()**

On ESP32-C6, the hardware additionally allows to perform up to 16 consecutive linear fades without CPU intervention. This feature can be useful if you want to do a fade with gamma correction.

The luminance perceived by human eyes does not have a linear relationship with the PWM duty cycle. In order to make human feel the LED is dimming or lightening linearly, the change in duty cycle should be non-linear, which is the so-called gamma correction. The LED controller can simulate a gamma curve fading by piecewise linear approximation.

**ledc_fill_multi_fade_param_list()** is a function that can help to construct the parameters for the piecewise linear fades. First, you need to allocate a memory block for saving the fade parameters, then by providing start/end PWM duty cycle values, gamma correction function, and the total number of desired linear segments to the helper function, it will fill the calculation results into the allocated space. You can also construct the array of **ledc_fade_param_config_t** manually. Once the fade parameter structs are prepared, a consecutive fading can be configured by passing the pointer to the prepared **ledc_fade_param_config_t** list and the total number of fade ranges to **ledc_set_multi_fade()**.

Start fading with **ledc_fade_start()**. A fade can be operated in blocking or non-blocking mode, please check **ledc_fade_mode_t** for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. **ledc_fade_stop()** has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling **ledc_cb_register()** after the fade service being installed. The fade end callback prototype is defined in **ledc_cb_t**, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. **ledc_cb_register()** will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with **ledc_fade_func_uninstall()**.

**Change PWM Frequency**  
The LEDC API provides several ways to change the PWM frequency "on the fly":

- Set the frequency by calling **ledc_set_freq()**. There is a corresponding function **ledc_get_freq()** to check the current frequency.
- Change the frequency and the duty resolution by calling **ledc_bind_channel_timer()** to bind some other timer to the channel.
- Change the channel's timer by calling **ledc_channel_config()**.

**More Control Over PWM**  
There are several lower level timer-specific functions that can be used to change PWM settings:

- **ledc_timer_set()**
- **ledc_timer_rst()**
- **ledc_timer_pause()**
- **ledc_timer_resume()**

The first two functions are called "behind the scenes" by **ledc_channel_config()** to provide a startup of a timer after it is configured.

**Use Interrupts**  
When configuring an LEDC channel, one of the parameters selected within **ledc_channel_config_t** is **ledc_intr_type_t** which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call **ledc_isr_register()**.
Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the ESP32-C6 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits results in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try...
       → reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 resolves this issue and makes it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver also captures and reports attempts to configure frequency/duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try...
       → increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

Application Example

The LEDC basic example: peripherals/ledc/ledc_basic.
The LEDC change duty cycle and fading control example: peripherals/ledc/ledc_fade.
The LEDC color control with Gamma correction on RGB LED example: peripherals/ledc/ledc_gamma_curve_fade.

API Reference

Header File

- components/driver/ledc/include/driver/ledc.h
- This header file can be included with:

  ```
  #include "driver/ledc.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```
  REQUIRES driver
  ```

  or

  ```
  PRIV_REQUIRES driver
  ```
**esp_err_t ledc_channel_config** (const ledc_channel_config_t *ledc_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty.

**Parameters**
- **ledc_conf** -- Pointer of LEDC channel configure struct

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**uint32_t ledc_find_suitable_duty_resolution** (uint32_t src_clk_freq, uint32_t timer_freq)

Helper function to find the maximum possible duty resolution in bits for ledc_timer_config()

**Parameters**
- **src_clk_freq** -- LEDC timer source clock frequency (Hz) (See doxygen comments of ledc_clk_cfg_t or get from esp_clk_tree_src_get_freq_hz)
- **timer_freq** -- Desired LEDC timer frequency (Hz)

**Returns**
- 0 The timer frequency cannot be achieved
- Others The largest duty resolution value to be set

**esp_err_t ledc_timer_config** (const ledc_timer_config_t *timer_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

**Parameters**
- **timer_conf** -- Pointer of LEDC timer configure struct

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Cannot find a proper pre-divider number base on the given frequency and the current duty_resolution.
- ESP_ERR_INVALID_STATE Timer cannot be de-configured because timer is not configured or is not paused

**esp_err_t ledc_update_duty** (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC update channel parameters.

**Note:** Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

**Note:** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Note:** If CONFIG_LEDC_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

**Note:** This function is allowed to run within ISR context.

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t ledc_set_pin** (int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)

Set LEDC output gpio.

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

**Parameters**
- **gpio_num** -- The LEDC output gpio
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc_channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

**Returns**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error

**esp_err_t ledc_stop** (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

**Note:** If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

**Note:** This function is allowed to run within ISR context.

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **idle_level** -- Set output idle level after LEDC stops.

**Returns**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error

**esp_err_t ledc_set_freq** (ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** -- LEDC timer index (0-3), select from `ledc_timer_t`
- **freq_hz** -- Set the LEDC frequency

**Returns**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_FAIL** Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

**uint32_t ledc_get_freq** (ledc_mode_t speed_mode, ledc_timer_t timer_num)

LEDC get channel frequency (Hz)

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
timer_num -- LEDC timer index (0-3), select from ledc_timer_t

**Returns**
- 0 error
- Others Current LEDC frequency

```c
esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDC set duty and hpoint value. Only after calling `ledc_update_duty` will the duty update.

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

**Returns**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty. This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
**channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**duty** -- Set the LEDC duty, the range of duty setting is \([0, (2^{**duty\_resolution})]\)

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```

**LEDG get duty**
This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn’t take effect until the next cycle.

**Parameters**

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

```c
esp_err_t ledc_set_fade (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)
```

**LEDG set gradient**
Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** -- Set the start of the gradient duty, the range of duty setting is \([0, (2^{**duty\_resolution})]\)
- **fade_direction** -- Set the direction of the gradient
- **step_num** -- Set the number of the gradient
- **duty_cycle_num** -- Set how many LEDC tick each time the gradient lasts
- **duty_scale** -- Set gradient change amplitude

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_isr_register (void (*fn)(void*), void *arg, int intr_alloc_flags, ledc_isr_handle_t *handle)
```

**Register LEDC interrupt handler,** the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** -- Interrupt handler function.
- **arg** -- User-supplied argument passed to the handler function.
- **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Failed to find available interrupt source

`esp_err_t ledc_timer_set (ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider,
                         uint32_t duty_resolution, ledc_clk_src_t clk_src)`

Configure LEDC settings.

Parameters

• `speed_mode` -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• `timer_sel` -- Timer index (0-3), there are 4 timers in LEDC module
• `clock_divider` -- Timer clock divide value, the timer clock is divided from the selected clock source
• `duty_resolution` -- Resolution of duty setting in number of bits. The range is \([1, SOC_LEDC_TIMER_BIT_WIDTH]\)
• `clk_src` -- Select LEDC source clock.

Returns

• (-1) Parameter error
• Other Current LEDC duty

`esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Reset LEDC timer.

Parameters

• `speed_mode` -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• `timer_sel` -- LEDC timer index (0-3), select from `ledc_timer_t`

Returns

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

`esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Pause LEDC timer counter.

Parameters

• `speed_mode` -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• `timer_sel` -- LEDC timer index (0-3), select from `ledc_timer_t`

Returns

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

`esp_err_t ledc_timer_resume (ledc_mode_t speed_mode, ledc_timer_t timer_sel)`

Resume LEDC timer.

Parameters

• `speed_mode` -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• `timer_sel` -- LEDC timer index (0-3), select from `ledc_timer_t`

Returns

• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

`esp_err_t ledc_bind_channel_timer (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)`

Bind LEDC channel with the selected timer.

Parameters

• `speed_mode` -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
Chapter 2. API Reference

- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **timer_sel** -- LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

`esp_err_t ledc_set_fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)`

Set LEDC fade function.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle_num** -- increase or decrease the duty every cycle_num cycles

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

`esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)`

Set LEDC fade function, with a limited time.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.
Parameters

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** -- Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** -- The maximum time of the fading (ms).

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_fade_func_install (int intr_alloc_flags)
```
Install LEDC fade function. This function will occupy interrupt of LEDC module.

Parameters **intr_alloc_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source
- ESP_ERR_INVALID_STATE Fade function already installed

```c
void ledc_fade_func_uninstall (void)
```
Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```
Start LEDC fading.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note:** Starting fade operation with this API is not thread-safe, use with care.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

```c
esp_err_t ledc_fade_stop (ledc_mode_t speed_mode, ledc_channel_t channel)
```
Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.
Note: This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

Note: Call this API will abort the fading operation only if it was started by calling ledc_fade_start with LEDC_FADE_NO_WAIT mode.

Note: If a fade was started with LEDC_FADE_WAIT_DONE mode, calling this API afterwards has no use in stopping the fade. Fade will continue until it reaches the target duty.

**Parameters**

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_duty_and_update(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_time_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note:** Call ledc_fade_func_install() once, before calling this function.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.
**Parameters**

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading \([0, (2^{*duty\_resolution})]\)
- **max_fade_time_ms** -- The maximum time of the fading (ms).
- **fade_mode** -- choose blocking or non-blocking mode

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note:** Call `ledc_fade_func_install()` once before calling this function.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** -- Target duty of fading \([0, (2^{*duty\_resolution})]\)
- **scale** -- Controls the increase or decrease step scale.
- **cycle_num** -- Increase or decrease the duty every cycle_num cycles
- **fade_mode** -- choose blocking or non-blocking mode

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_cb_register(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

**Parameters**

- **speed_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **cbs** -- Group of LEDC callback functions
- **user_arg** -- user registered data for the callback function
Chapter 2. API Reference

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

\texttt{esp_err_t ledc\_set\_multi\_fade(ledc\_mode\_t speed\_mode, ledc\_channel\_t channel, uint32\_t start\_duty, const ledc\_fade\_param\_config\_t *fade\_params\_list, uint32\_t list\_len)}

Set a LEDC multi-fade.

\textbf{Note:} Call \texttt{ledc\_fade\_func\_install()} once before calling this function. Call \texttt{ledc\_fade\_start()} after this to start fading.

\textbf{Note:} This function is not thread-safe, do not call it to control one LEDC channel in different tasks at the same time. A thread-safe version of API is \texttt{ledc\_set\_multi\_fade\_and\_start}

\textbf{Note:} This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

Parameters
- \texttt{speed\_mode} -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- \texttt{channel} -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from \texttt{ledc\_channel\_t}
- \texttt{start\_duty} -- Set the start of the gradient duty, the range of duty setting is \([0, (2^{**\text{duty\_resolution}})]\)
- \texttt{fade\_params\_list} -- Pointer to the array of fade parameters for a multi-fade
- \texttt{list\_len} -- Length of the fade\_params\_list, i.e. number of fade ranges for a multi-fade (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

\texttt{esp_err_t ledc\_set\_multi\_fade\_and\_start(ledc\_mode\_t speed\_mode, ledc\_channel\_t channel, uint32\_t start\_duty, const ledc\_fade\_param\_config\_t *fade\_params\_list, uint32\_t list\_len, ledc\_fade\_mode\_t fade\_mode)}

A thread-safe API to set and start LEDC multi-fade function.

\textbf{Note:} Call \texttt{ledc\_fade\_func\_install()} once before calling this function.

\textbf{Note:} Fade will always begin from the current duty cycle. Make sure it is stable and synchronized to the desired initial value before calling this function. Otherwise, you may see unexpected duty change.

\textbf{Note:} This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100\% duty cycle to 0\%, or the other way around.
Parameters

- speed_mode -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel -- LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- start_duty -- Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- fade_params_list -- Pointer to the array of fade parameters for a multi-fade
- list_len -- Length of the fade_params_list, i.e. number of fade ranges for a multi-fade (1 - SOC LEDC GAMMA CURVE FADE RANGE_MAX)
- fade_mode -- Choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```
esp_err_t ledc_fill_multi_fade_param_list (ledc_mode_t speed_mode, ledc_channel_t channel,
uint32_t start_duty, uint32_t end_duty, uint32_t
linear_phase_num, uint32_t max_fade_time_ms,
uint32_t (*gamma_correction_operator)(uint32_t),
uint32_t fade_params_list_size,
ledc_fade_param_config_t *fade_params_list, uint32_t
*hw_fade_range_num)
```

Helper function to fill the fade params for a multi-fade. Useful if desires a gamma curve fading.

**Note:** The fade params are calculated based on the given start_duty and end_duty. If the duty is not at the start duty (gamma-corrected) when the fade begins, you may see undesired brightness change. Therefore, please always remember that when passing the fade_params to either ledc_set_multi_fade or ledc_set_multi_fade_and_start, the start_duty argument has to be the gamma-corrected start_duty.

Parameters

- speed_mode -- [in] Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel -- [in] LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- start_duty -- [in] Duty cycle [0, (2**duty_resolution)] where the multi-fade begins with. This value should be a non-gamma-corrected duty cycle.
- end_duty -- [in] Duty cycle [0, (2**duty_resolution)] where the multi-fade ends with. This value should be a non-gamma-corrected duty cycle.
- linear_phase_num -- [in] Number of linear fades to simulate a gamma curved fade (1 - SOC LEDC GAMMA CURVE FADE RANGE_MAX)
- max_fade_time_ms -- [in] The maximum time of the fading (ms).
- gamma_correction_operator -- [in] User provided gamma correction function. The function argument should be able to take any value within [0, (2**duty_resolution)]. And returns the gamma-corrected duty cycle.
- fade_params_list_size -- [in] The size of the fade_params_list user allocated (1 - SOC LEDC GAMMA CURVE FADE RANGE_MAX)
- fade_params_list -- [out] Pointer to the array of ledc_fade_param_config_t structure
- hw_fade_range_num -- [out] Number of fade ranges for this multi-fade

Returns
### ledc_read_fade_param

```c
esp_err_t ledc_read_fade_param(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t range,
                                  uint32_t *dir, uint32_t *cycle, uint32_t *scale, uint32_t *step)
```

Get the fade parameters that are stored in gamma ram for a certain fade range.

Gamma ram is where saves the fade parameters for each fade range. The fade parameters are written in during fade configuration. When fade begins, the duty will change according to the parameters in gamma ram.

**Parameters**

- **speed_mode** — [in] Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** — [in] LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`.
- **range** — [in] Range index (0 - (SOC_LEDC_GAMMA_CURVE_FADE_RANGE_MAX-1)), it specifies to which range in gamma ram to read.
- **dir** — [out] Pointer to accept fade direction value
- **cycle** — [out] Pointer to accept fade cycle value
- **scale** — [out] Pointer to accept fade scale value
- **step** — [out] Pointer to accept fade step value

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized

**Structures**

```c
struct ledc_channel_config_t
```

Configuration parameters of LEDC channel for `ledc_channel_config` function.

**Public Members**

```c
int gpio_num
```

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

```c
ledc_mode_t speed_mode
```

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

```c
ledc_channel_t channel
```

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

```c
ledc_intr_type_t intr_type
```

configure interrupt, Fade interrupt enable or Fade interrupt disable

```c
ledc_timer_t timer_sel
```

Select the timer source of channel (0 - LEDC TIMER_MAX-1)

```c
uint32_t duty
```

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]
int hpoint
LEDC channel hpoint value, the range is \([0, (2^{*}duty\_resolution)-1]\)

unsigned int output_invert
Enable (1) or disable (0) gpio output invert

struct ledc_channel_config_t::{anonymous} flags
LEDC flags

struct ledc_timer_config_t
Configuration parameters of LEDC timer for lede_timer_config function.

Public Members

ledc_mode_t speed_mode
LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_timer_bit_t duty_resolution
LEDC channel duty resolution

ledc_timer_t timer_num
The timer source of channel (0 - LEDC_TIMER_MAX-1)

uint32_t freq_hz
LEDC timer frequency (Hz)

ledc_clk_cfg_t clk_cfg
Configure LEDC source clock from ledc_clk_cfg_t. Note that LEDC_USE_RC_FAST_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You cannot have one LEDC timer uses RC_FAST_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

bool deconfigure
Set this field to de-configure a LEDC timer which has been configured before. Note that it will not check whether the timer wants to be de-configured is binded to any channel. Also, the timer has to be paused first before it can be de-configured. When this field is set, duty_resolution, freq_hz, clk_cfg fields are ignored.

struct ledc_cb_param_t
LEDC callback parameter.

Public Members

ledc_cb_event_t event
Event name

uint32_t speed_mode
Speed mode of the LEDC channel group
uart32_t **channel**
   LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uart32_t **duty**
   LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution)]

**struct ledc_cbs_t**
   Group of supported LEDC callbacks.

**Note:** The callbacks are all running under ISR environment

**Public Members**

**ledc_cb_t fade_cb**
   LEDC fade_end callback function

**struct ledc_fade_param_config_t**
   Structure for the fade parameters for one hardware fade to be written to gamma wr register.

(continues on next page)
Note: Be aware of the maximum value available on each element

Public Members

uint32_t dir
   Duty change direction. Set 1 as increase, 0 as decrease

uint32_t cycle_num
   Number of PWM cycles of each step [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

uint32_t scale
   Duty change of each step [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

uint32_t step_num
   Total number of steps in one hardware fade [0, 2**SOC_LEDC_FADE_PARAMS_BIT_WIDTH-1]

Macros

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions
typedef `intr_handle_t` **ledc_isr_handle_t**

typedef bool (*`ledc_cb_t`)(const `ledc_cb_param_t` *param, void *user_arg)

Type of LEDC event callback.

**Param** param LEDC callback parameter  
**Param** user_arg User registered data  
**Return** Whether a high priority task has been waken up by this function

**Enumerations**

enum **`ledc_cb_event_t`**  
LEDC callback event type.  

**Values:**

enumerator **LED_C_FADE_END_EVT**  
LEDC fade end event

**Header File**

- components/hal/include/hal/ledc_types.h  
- This header file can be included with:

```
#include "hal/ledc_types.h"
```

**Type Definitions**

typedef `soc_periph_ledc_clk_src_legacy_t` **`ledc_clk_cfg_t`**  
LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

**Enumerations**

enum **`ledc_mode_t`**  

**Values:**

enumerator **LED_C_LOW_SPEED_MODE**  
LEDC low speed speed_mode

enumerator **LED_C_SPEED_MODE_MAX**  
LEDC speed limit

enum **`ledc_intr_type_t`**  

**Values:**

enumerator **LED_C_INTR_DISABLE**  
Disable LEDC interrupt
Chapter 2. API Reference

enumerator **LEDC_INTR_FADE_END**
Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**
*Values:*

enumerator **LEDC_DUTY_DIR_DECREASE**
LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**
LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**
LEDC global clock sources.
*Values:*

enumerator **LEDC_SLOW_CLK_RC_FAST**
LEDC low speed timer clock source is RC_FAST clock

enumerator **LEDC_SLOW_CLK_PLL_DIV**
LEDC low speed timer clock source is a PLL_DIV clock

enumerator **LEDC_SLOW_CLK_XTAL**
LEDC low speed timer clock source XTAL clock

enumerator **LEDC_SLOW_CLK_RTC8M**
Alias of ’LEDC_SLOW_CLK_RC_FAST’

enum **ledc_clk_src_t**
LEDC timer-specific clock sources.
*Note:* Setting numeric values to match ledc_clk_cfg_t values are a hack to avoid collision with LEDC_AUTO_CLK in the driver, as these enums have very similar names and user may pass one of these by mistake.
*Values:*

enumerator **LEDC_SCLK**
Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_CLK_SEL

enum **ledc_timer_t**
*Values:*

enumerator **LEDC_TIMER_0**
LEDC timer 0
Chapter 2. API Reference

enumerator LEDC_TIMER_1
    LEDC timer 1

enumerator LEDC_TIMER_2
    LEDC timer 2

enumerator LEDC_TIMER_3
    LEDC timer 3

enumerator LEDC_TIMER_MAX

enum ledc_channel_t
    Values:

enumerator LEDC_CHANNEL_0
    LEDC channel 0

enumerator LEDC_CHANNEL_1
    LEDC channel 1

enumerator LEDC_CHANNEL_2
    LEDC channel 2

enumerator LEDC_CHANNEL_3
    LEDC channel 3

enumerator LEDC_CHANNEL_4
    LEDC channel 4

enumerator LEDC_CHANNEL_5
    LEDC channel 5

enumerator LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
    Values:

enumerator LEDC_TIMER_1_BIT
    LEDC PWM duty resolution of 1 bits

enumerator LEDC_TIMER_2_BIT
    LEDC PWM duty resolution of 2 bits

enumerator LEDC_TIMER_3_BIT
    LEDC PWM duty resolution of 3 bits

enumerator LEDC_TIMER_4_BIT
    LEDC PWM duty resolution of 4 bits
enumerator **LEDC_TIMER_5_BIT**
   LEDC PWM duty resolution of 5 bits

enumerator **LEDC_TIMER_6_BIT**
   LEDC PWM duty resolution of 6 bits

enumerator **LEDC_TIMER_7_BIT**
   LEDC PWM duty resolution of 7 bits

enumerator **LEDC_TIMER_8_BIT**
   LEDC PWM duty resolution of 8 bits

enumerator **LEDC_TIMER_9_BIT**
   LEDC PWM duty resolution of 9 bits

enumerator **LEDC_TIMER_10_BIT**
   LEDC PWM duty resolution of 10 bits

enumerator **LEDC_TIMER_11_BIT**
   LEDC PWM duty resolution of 11 bits

enumerator **LEDC_TIMER_12_BIT**
   LEDC PWM duty resolution of 12 bits

enumerator **LEDC_TIMER_13_BIT**
   LEDC PWM duty resolution of 13 bits

enumerator **LEDC_TIMER_14_BIT**
   LEDC PWM duty resolution of 14 bits

enumerator **LEDC_TIMER_15_BIT**
   LEDC PWM duty resolution of 15 bits

enumerator **LEDC_TIMER_16_BIT**
   LEDC PWM duty resolution of 16 bits

enumerator **LEDC_TIMER_17_BIT**
   LEDC PWM duty resolution of 17 bits

enumerator **LEDC_TIMER_18_BIT**
   LEDC PWM duty resolution of 18 bits

enumerator **LEDC_TIMER_19_BIT**
   LEDC PWM duty resolution of 19 bits

enumerator **LEDC_TIMER_20_BIT**
   LEDC PWM duty resolution of 20 bits
Chapter 2. API Reference

enumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**

Values:

enumerator **LEDC_FADE_NO_WAIT**

LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

2.6.15 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power, and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g., brushed/brushless DC motor, RC servo motor
- Switch mode-based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog values like speed, distance
- Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

![MCPWM Overview Diagram](image)

Fig. 17: MCPWM Overview

- **MCPWM Timer**: The time base of the final PWM signal. It also determines the event timing of other submodules.
- **MCPWM Operator**: The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead time, and carrier modulator.
- **MCPWM Comparator**: The compare module takes the time-base count value as input, and continuously compares it to the threshold value configured. When the timer is equal to any of the threshold values, a compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator**: One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered by other submodules like MCPWM Timer and MCPWM Comparator.
**MCPWM Fault**: The fault module is used to detect the fault condition from outside, mainly via the GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state to protect the system from damage.

**MCPWM Sync**: The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from the GPIO matrix or from an MCPWM Timer event.

**Dead Time**: This submodule is used to insert extra delay to the existing PWM edges generated in the previous steps.

**Carrier Modulation**: The carrier submodule can modulate a high-frequency carrier signal into PWM waveforms by the generator and dead time submodules. This capability is mandatory for controlling the power-switching elements.

**Brake**: MCPWM operator can set how to brake the generators when a particular fault is detected. You can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depending on how critical the fault is.

**MCPWM Capture**: This is a standalone submodule that can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels, with each channel connected to the GPIO. A pulse on the GPIO triggers the capture timer to store the time-base count value and then notify you by an interrupt. Using this feature, you can measure a pulse width precisely. What is more, the capture timer can also be synchronized by the MCPWM Sync submodule.

**Functional Overview**

Description of the MCPWM functionality is divided into the following sections:

- **Resource Allocation and Initialization** - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.
- **Timer Operations and Events** - describes control functions and event callbacks supported by the MCPWM timer.
- **Comparator Operations and Events** - describes control functions and event callbacks supported by the MCPWM comparator.
- **Generator Actions on Events** - describes how to set actions for MCPWM generators on particular events that are generated by the MCPWM timer and comparators.
- **Generator Configurations for Classical PWM Waveforms** - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.
- **Dead Time** - describes how to set dead time for MCPWM generators.
- **Dead Time Configurations for Classical PWM Waveforms** - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.
- **Carrier Modulation** - describes how to set and modulate a high frequency onto the final PWM waveforms.
- **Faults and Brake Actions** - describes how to set brake actions for MCPWM operators on particular fault events.
- **Generator Force Actions** - describes how to control the generator output level asynchronously in a forceful way.
- **Synchronization** - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.
- **Capture** - describes how to use the MCPWM capture module to measure the pulse width of a signal.
- **ETM Event and Task** - describes what the events and tasks can be connected to the ETM channel.
- **Power Management** - describes how different source clocks affects power consumption.
- **IRAM Safe** - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization**  As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers**  You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:
### Chapter 2. API Reference

- **mcpwm_timer_config_t::group_id** specifies the MCPWM group ID. The ID should belong to [0, \(SOC\_MCPWM\_GROUPS - 1\)] range. Please note, timers located in different groups are totally independent.
- **mcpwm_timer_config_t::intr_priority** sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- **mcpwm_timer_config_t::clk_src** sets the clock source of the timer.
- **mcpwm_timer_config_t::resolution_hz** sets the expected resolution of the timer. The driver internally sets a proper divider based on the clock source and the resolution.
- **mcpwm_timer_config_t::count_mode** sets the count mode of the timer.
- **mcpwm_timer_config_t::period_ticks** sets the period of the timer, in ticks (the tick resolution is set in the mcpwm_timer_config_t::resolution_hz).
- **mcpwm_timer_config_t::update_period_on_empty** sets whether to update the period value when the timer counts to zero.
- **mcpwm_timer_config_t::update_period_on_sync** sets whether to update the period value when the timer takes a sync signal.

The **mcpwm_new_timer()** will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free timers in the MCPWM group, this function will return the **ESP_ERR_NOT_FOUND** error.\(^1\)

On the contrary, calling the **mcpwm_del_timer()** function will free the allocated timer object.

### MCPWM Operators

You can allocate a MCPWM operator object by calling **mcpwm_new_operator()** function, with a configuration structure **mcpwm_operator_config_t** as the parameter. The configuration structure is defined as:

- **mcpwm_operator_config_t::group_id** specifies the MCPWM group ID. The ID should belong to [0, \(SOC\_MCPWM\_GROUPS - 1\)] range. Please note, operators located in different groups are totally independent.
- **mcpwm_operator_config_t::intr_priority** sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- **mcpwm_operator_config_t::update_gen_action_on_tez** sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by **mcpwm_operator_connect_timer()**.
- **mcpwm_operator_config_t::update_gen_action_on_tep** sets whether to update the generator action when the timer counts to peak.
- **mcpwm_operator_config_t::update_gen_action_on_sync** sets whether to update the generator action when the timer takes a sync signal.
- **mcpwm_operator_config_t::update_dead_time_on_tez** sets whether to update the dead time when the timer counts to zero.
- **mcpwm_operator_config_t::update_dead_time_on_tep** sets whether to update the dead time when the timer counts to the peak.
- **mcpwm_operator_config_t::update_dead_time_on_sync** sets whether to update the dead time when the timer takes a sync signal.

The **mcpwm_new_operator()** will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free operators in the MCPWM group, this function will return the **ESP_ERR_NOT_FOUND** error.\(^1\)

On the contrary, calling **mcpwm_del_operator()** function will free the allocated operator object.

### MCPWM Comparators

You can allocate a MCPWM comparator object by calling the **mcpwm_new_comparator()** function, with a MCPWM operator handle and configuration structure **mcpwm_comparator_config_t** as the parameter. The operator handle is created by **mcpwm_new_operator()**. The configuration structure is defined as:

- **mcpwm_comparator_config_t::intr_priority** sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

\(^1\) Different ESP chip series might have a different number of MCPWM resources (e.g., groups, timers, comparators, operators, generators, triggers and so on). Please refer to the [TRM] for details. The driver does not forbid you from applying for more MCPWM resources, but it returns an error when there are no hardware resources available. Please always check the return value when doing **Resource Allocation and Initialization**.
• `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.
• `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to the peak.
• `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

The `mcpwm_new_comparator()` function will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1134.

On the contrary, calling the `mcpwm_del_comparator()` function will free the allocated comparator object.

**MCPWM Generators** You can allocate a MCPWM generator object by calling the `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

• `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
• `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
• `mcpwm_generator_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.
• `mcpwm_generator_config_t::io_od_mode` configures the PWM GPIO as open-drain output.
• `mcpwm_generator_config_t::pull_up` and `mcpwm_generator_config_t::pull_down` controls whether to enable the internal pull-up and pull-down resistors accordingly.

The `mcpwm_new_generator()` function will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1134.

On the contrary, calling the `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults** There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software.

To allocate a GPIO fault object, you can call the `mcpwm_new_gpio_fault()` function, with the configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

• `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, GPIO faults located in different groups are totally independent, i.e., GPIO faults in group 0 can not be detected by the operator in group 1.
• `mcpwm_gpio_fault_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
• `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
• `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
• `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
• `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loopback mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1134.

Software fault object can be used to trigger a fault by calling the function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling the `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently, this configuration structure is left for future purposes.
The `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the fault object, this function will return the `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, the returned fault handle is of the same type.

On the contrary, calling the `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

### MCPWM Sync Sources

The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There are three types of sync sources: a sync source reflected from the GPIO, a sync source generated by software, and a sync source generated by an MCPWM timer event.

To allocate a GPIO sync source, you can call the `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, the GPIO sync sources located in different groups are totally independent, i.e., GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edges.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.

To allocate a timer event sync source, you can call the `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e., the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, if a sync source has been allocated from the same timer before, this function will return the `ESP_ERR_INVALID_STATE` error.

Last but not least, to allocate a software sync source, you can call the `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

The `mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the sync source object, this function will return the `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, do not forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling the `mcpwm_del_sync_src()` function will free the allocated sync source object. This function works for all types of sync sources.

### MCPWM Capture Timer and Channels

The MCPWM group has a dedicated timer which is used to capture the timestamp when a specific event occurred. The capture timer is connected to several independent channels, each channel is assigned a GPIO.

To allocate a capture timer, you can call the `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:
• `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to \([0, SOC_MCPWM_GROUPS - 1]\) range.
• `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.
• `mcpwm_capture_timer_config_t::resolution_hz` The driver internally will set a proper divider based on the clock source and the resolution. If it is set to 0, the driver will pick an appropriate resolution on its own, and you can subsequently view the current timer resolution via `mcpwm_capture_timer_get_resolution()`.

The `mcpwm_new_capture_timer()` function will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture timer left in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.\(^1\)

Next, to allocate a capture channel, you can call the `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

• `mcpwm_capture_channel_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
• `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
• `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
• `mcpwm_capture_channel_config_t::pos_edge` and `mcpwm_capture_channel_config_t::neg_edge` set whether to capture on the positive and/or falling edge of the input signal.
• `mcpwm_capture_channel_config_t::pull_up` and `mcpwm_capture_channel_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
• `mcpwm_capture_channel_config_t::invert_cap_signal` sets whether to invert the capture signal.
• `mcpwm_capture_channel_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_capture_channel()` function will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture channel left in the capture timer, this function will return the `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` will free the allocated capture channel and timer object accordingly.

**MCPWM Interrupt Priority** MCPWM allows configuring interrupts separately for timer, operator, comparator, fault, and capture events. The interrupt priority is determined by the respective `config_t::intr_priority`. Additionally, events within the same MCPWM group share a common interrupt source. When registering multiple interrupt events, the interrupt priorities need to remain consistent.

**Note:** When registering multiple interrupt events within an MCPWM group, the driver will use the interrupt priority of the first registered event as the MCPWM group's interrupt priority.

**Timer Operations and Events**

**Update Period** The timer period is initialized by the `mcpwm_timer_config_t::period_ticks` parameter in `mcpwm_timer_config_t`. You can update the period at runtime by calling `mcpwm_timer_set_period()` function. The new period will take effect based on how you set the `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` parameters in `mcpwm_timer_config_t`. If none of them are set, the timer period will take effect immediately.
Register Timer Event Callbacks

The MCPWM timer can generate different events at runtime. If you have some function that should be called when a particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets the callback function for the timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets the callback function for the timer when it counts to zero.
- `mcpwm_timer_event_callbacks_t::on_stop` sets the callback function for the timer when it is stopped.

The callback functions above are called within the ISR context, so they should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_timer_register_event_callbacks()` function is used to save your own context. It is passed to each callback function directly.

This function will lazy the install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also Enable and Disable timer for more information.

Enable and Disable Timer

Before doing IO control to the timer, you need to enable the timer first, by calling `mcpwm_timer_enable()`. This function:

- switches the timer state from `init` to `enable`.
- enables the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
- acquire a proper power management lock if a specific clock source (e.g., PLL_160M clock) is selected. See also Power management for more information.

On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to the `init` state, disable the interrupt service and release the power management lock.

Start and Stop Timer

The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What is more, you can even start the timer for only one round, which means, the timer will count to peak value or zero, and then stop itself.

Connect Timer with Operator

The allocated MCPWM timer should be connected with an MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Please make sure the MCPWM timer and operator are in the same group. Otherwise, this function will return the `ESP_ERR_INVALID_ARG` error.

Comparator Operations and Events

Register Comparator Event Callbacks

The MCPWM comparator can inform you when the timer counter equals the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

- `mcpwm_comparator_event_callbacks_t::on_reach` sets the callback function for the comparator when the timer counter equals the compare value.

The callback function provides event-specific data of type `mcpwm_compare_event_data_t` to you. The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.
The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the installation of interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

**Set Compare Value**  You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There are a few points to note:

- A new compare value might not take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp_on_sync`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return the error code `ESP_ERR_INVALID_STATE`.
- The compare value should not exceed the timer’s count peak, otherwise, the compare event will never get triggered.

**Generator Actions on Events**

**Set Generator Action on Timer Event**  One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

You can also set the timer action one by one by calling `mcpwm_generator_set_action_on_timer_event()` without varargs.

**Set Generator Action on Compare Event**  One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See `MCPWM Comparators` for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

You can also set the compare action one by one by calling `mcpwm_generator_set_action_on_compare_event()` without varargs.
Set Generator Action on Fault Event  One generator can set action on fault based trigger events, by calling `mcpwm_generator_set_action_on_fault_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_fault_event_action_t`:

- `mcpwm_gen_fault_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_fault_event_action_t::fault` specifies the fault used for the trigger. See MCPWM Faults for how to allocate a fault.
- `mcpwm_gen_fault_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1134.

The trigger only support GPIO fault. When the input is not a GPIO fault, this function will return the `ESP_ERR_NOT_SUPPORTED` error.

There is a helper macro `MCPWM_GEN_FAULT_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, fault event does not have variadic function like `mcpwm_generator_set_actions_on_fault_event()`.

Set Generator Action on Sync Event  One generator can set action on sync based trigger events, by calling `mcpwm_generator_set_action_on_sync_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_sync_event_action_t`:

- `mcpwm_gen_sync_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_sync_event_action_t::sync` specifies the sync source used for the trigger. See MCPWM Sync Sources for how to allocate a sync source.
- `mcpwm_gen_sync_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. Page 1134.

The trigger only support one sync action, regardless of the kinds. When set sync actions more than once, this function will return the `ESP_ERR_INVALID_STATE` error.

There is a helper macro `MCPWM_GEN_SYNC_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, sync event does not have variadic function like `mcpwm_generator_set_actions_on_sync_event()`.

Generator Configurations for Classical PWM Waveforms  This section will demonstrate the classical PWM waveforms that can be generated by the pair of generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The **Symmetric** or **Asymmetric** of the waveforms is determined by the count mode of the MCPWM timer.
- The **active level** of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer’s period and count mode.
- The duty cycle of the PWM waveform is determined by the generator’s various action combinations.

        MCPWM_GEN_ACTION_HIGH),
        MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_DOWN, cmpa,
        MCPWM_GEN_ACTION_LOW),
        MCPWM_GEN_COMPARE_EVENT_ACTION_END()));
    ESP_ERROR_CHECK(mcpwm_generator_set_actions_on_compare_event(genb,
        MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpb,
        MCPWM_GEN_ACTION_LOW),
        MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_DOWN, cmpb,
        MCPWM_GEN_ACTION_HIGH),
        MCPWM_GEN_COMPARE_EVENT_ACTION_END()));
}
```

**Dead Time** In power electronics, the rectifier and inverter are commonly used. This requires the use of a rectifier bridge and an inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm cannot conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave generated by setting *Generator Actions on Events*.

The dead time driver works like a **decorator**. This is also reflected in the function parameters of `mcpwm_generator_set_dead_time()`, where it takes the primary generator handle (`in_generator`), and returns a new generator (`out_generator`) after applying the dead time. Please note, if the `out_generator` and `in_generator` are the same, it means you are adding the time delay to the PWM waveform in an "in-place" fashion. In turn, if the `out_generator` and `in_generator` are different, it means you are deriving a new PWM waveform from the existing `in_generator`.

Dead time specific configuration is listed in the `mcpwm_dead_time_config_t` structure:

- `mcpwm_dead_time_config_t::posedge_delay_ticks` and `mcpwm_dead_time_config_t::negedge_delay_ticks` set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means bypassing the dead time module. The resolution of the dead time tick is the same as the timer that is connected with the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_dead_time_config_t::invert_output` sets whether to invert the signal after applying the dead time, which can be used to control the delay edge polarity.

**Warning:** Due to the hardware limitation, one delay module (either *posedge delay* or *negedge delay*) cannot be applied to multiple MCPWM generators at the same time. e.g., the following configuration is **invalid**:

```c
mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,
};
// Set posedge delay to generator A
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: This is invalid, you can not apply the posedge delay to another generator
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);
```

However, you can apply *posedge delay* to generator A and *negedge delay* to generator B. You can also set both *posedge delay* and *negedge delay* for generator A, while letting generator B bypass the dead time module.

**Note:** It is also possible to generate the required dead time by setting *Generator Actions on Events*, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time
with polarity control is required, then the dead time submodule should be used.

**Dead Time Configurations for Classical PWM Waveforms**

This section demonstrates the classical PWM waveforms that can be generated by the dead time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.

![Active High, Complementary](image)

```c
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb) {
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena, MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, MCPWM_GEN_ACTION_HIGH)));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_compare_event(gena, MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpa, MCPWM_GEN_ACTION_LOW)));
}

static void dead_time_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb) {
    mcpwm_dead_time_config_t dead_time_config = {
        .posedge_delay_ticks = 50,
        .negedge_delay_ticks = 0
    };
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, gena, &dead_time_config));
    dead_time_config.posedge_delay_ticks = 0;
    dead_time_config.negedge_delay_ticks = 100;
    dead_time_config.flags.invert_output = true;
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(gena, genb, &dead_time_config));
}
```

![Active Low, Complementary](image)

```c
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb, mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb) {
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena, MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWM_TIMER_EVENT_EMPTY, MCPWM_GEN_ACTION_HIGH)));
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_compare_event(gena, MCPWM_GEN_COMPARE_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, cmpa, MCPWM_GEN_ACTION_LOW)));
}"

(continues on next page)
static void dead_time_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb)
{
    mcpwm_dead_time_config_t dead_time_config = {
        .posedge_delay_ticks = 50,

}

Carrier Modulation  The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g., isolated digital power application) by passing the PWM output signals through transformers. Any of the PWM output signals may be at 100% duty and not changing whenever a motor is required to run steadily at the full load. Coupling with non-alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call `mcpwm_operator_apply_carrier()`, and provide configuration structure `mcpwm_carrier_config_t`:

- `mcpwm_carrier_config_t::clk_src` sets the clock source of the carrier.
- `mcpwm_carrier_config_t::frequency_hz` indicates carrier frequency in Hz.
- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver searches for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can not be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a NULL configuration.

Faults and Brake Actions  The MCPWM operator is able to sense external signals with information about the failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

You should determine possible failure modes of the motor and what action should be performed on detection of a
particular fault, e.g., drive all outputs low for a brushed motor, lock current state for a stepper motor, etc. Because of this action, the motor should be put into a safe state to reduce the likelihood of damage caused by the fault.

**Set Operator Brake Mode on Fault**  The way that MCPWM operator reacts to the fault is called Brake. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Specific brake configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` sets which fault the operator should react to.
- `mcpwm_brake_config_t::brake_mode` sets the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator recovers itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST` mode, the operator can not recover even though the fault disappears. You have to call `mcpwm_operator_recover_from_fault()` to manually recover it.

**Set Generator Action on Brake Event**  One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:

- `mcpwm_gen_brake_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`.
- `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

**Register Fault Event Callbacks**  The MCPWM fault detector can inform you when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such an event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

- `mcpwm_fault_event_callbacks_t::on_fault_enter` sets the callback function that will be called when a fault is detected.
- `mcpwm_fault_event_callbacks_t::on_fault_exit` sets the callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks**  The MCPWM operator can inform you when it is going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback
function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets the callback function that will be called when the operator is going to take a CBC action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets the callback function that will be called when the operator is going to take an OST action.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_operator_register_event_callbacks()` function is used to save your own context. It will be passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

Generator Force Actions Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g. `mcpwm_generator_set_actions_on_timer_event()`.

- Set the level to -1 means to disable the force action, and the generator's output level will be controlled by the event actions again.
- Set the hold_on to true, and the force output level will keep alive until it is removed by assigning level to -1.
- Set the hole_on to false, the force output level will only be active for a short time, and any upcoming event can override it.

Synchronization When a sync signal is taken by the MCPWM timer, the timer will be forced into a pre-defined phase, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See MCPWM Sync Sources for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the MCPWM Capture Timer can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See MCPWM Sync Sources for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: MCPWM_TIMER_DIRECTION_UP.

Sync Timers by GPIO

```c
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        // Configuration
    }
}
(continues on next page)
```
The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantities like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, you can use the capture submodule to sense the rotor position from the Hall sensor.

The capture timer is usually connected to several capture channels. Please refer to MCPWM Capture Timer and Channels for more information about resource allocation.

Register Capture Event Callbacks The MCPWM capture channel can inform you when there is a valid edge detected on the signal. You have to register a callback function to get the timer count value of the captured mo-
ment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets the callback function for the capture channel when a valid edge is detected.

The callback function provides event-specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into a timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save your context. It is passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

**Enable and Disable Capture Channel** The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

**Enable and Disable Capture Timer** Before doing IO control to the capture timer, you need to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function:

- switches the capture timer state from `init` to `enable`.  

![Fig. 19: MCPWM BLDC with Hall Sensor](image-url)
• acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also
  Power management for more information.

On the contrary, calling \texttt{mcpwm_capture_timer_disable()} will put the timer driver back to \texttt{init} state, and
release the power management lock.

**Start and Stop Capture Timer**  The basic IO operation of a capture timer is to start and stop. Calling
\texttt{mcpwm_capture_timer_start()} can start the timer and calling \texttt{mcpwm_capture_timer_stop()} can
stop the timer immediately.

**Trigger a Software Capture Event**  Sometimes, the software also wants to trigger a "fake" capture event. The
\texttt{mcpwm_capture_channel_trigger_soft_catch()} is provided for that purpose. Please note that, even
though it is a "fake" capture event, it can still cause an interrupt, thus your capture event callback function gets invoked
as well.

**ETM Event and Task**  MCPWM comparator is able to generate events that can interact with the \texttt{ETM}
module. The supported events are listed in the \texttt{mcpwm_comparator_etm_event_type_t}. You can call
\texttt{mcpwm_comparator_new_etm_event()} to get the corresponding ETM event handle.

For how to connect the event and task to an ETM channel, please refer to the \texttt{ETM} documentation.

**Power Management**  When power management is enabled (i.e., \texttt{CONFIG_PM_ENABLE} is on), the system will
adjust the PLL and APB frequency before going into Light-sleep, thus potentially changing the period of an MCPWM
timers' counting step and leading to inaccurate time-keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock
of type \texttt{ESP_PM_APB_FREQ_MAX}. Whenever the driver creates an MCPWM timer instance that has selected
\texttt{MCPWM_TIMER_CLK_SRC_PLL160M} as its clock source, the driver guarantees that the power management lock
is acquired when enabling the timer by \texttt{mcpwm_timer_enable()}. On the contrary, the driver releases the lock
when \texttt{mcpwm_timer_disable()} is called for that timer.

Likewise, whenever the driver creates an MCPWM capture timer instance that has selected
\texttt{MCPWM_CAPTURE_CLK_SRC_APB} as its clock source, the driver guarantees that the power management
lock is acquired when enabling the timer by \texttt{mcpwm_capture_timer_enable()}. And releases the lock in
\texttt{mcpwm_capture_timer_disable()}.  

**IRAM Safe**  By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option \texttt{CONFIG_MCPWM_ISR_IRAM_SAFE} that:

• enables the interrupt to be serviced even when the cache is disabled
• places all functions used by the ISR into IRAM\textsuperscript{2}
• places the driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option \texttt{CONFIG_MCPWM_CTRL_FUNC_IN_IRAM} that can put commonly used IO control
functions into IRAM as well. So, these functions can also be executable when the cache is disabled. The IO control
function is as follows:

• \texttt{mcpwm_comparator_set_compare_value()}
• \texttt{mcpwm_timer_set_period()}

\textsuperscript{2} The callback function and the sub-functions invoked by itself should also be placed in IRAM. You need to take care of this by yourself.
**Thread Safety**  The factory functions like `mcpwm_new_timer()` are guaranteed to be thread-safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following function is allowed to run under the ISR context, as the driver uses a critical section to prevent them from being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()
- `mcpwm_timer_set_period()

Other functions that are not related to *Resource Allocation and Initialization*, are not thread-safe. Thus, you should avoid calling them in different tasks without mutex protection.

**Kconfig Options**

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see [IRAM Safe](#) for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see [IRAM Safe](#) for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option will increase the firmware binary size.

**Application Examples**

- Brushed DC motor speed control by PID algorithm: peripherals/mcpwm/mcpwm_bdc_speed_control
- BLDC motor control with hall sensor feedback: peripherals/mcpwm/mcpwm_bldc_hall_control
- Ultrasonic sensor (HC-SR04) distance measurement: peripherals/mcpwm/mcpwm_capture_hc_sr04
- Servo motor angle control: peripherals/mcpwm/mcpwm_servo_control
- MCPWM synchronization between timers: peripherals/mcpwm/mcpwm_sync

**API Reference**

**Header File**

- components/driver/mcpwm/include/driver/mcpwm_timer.h
- This header file can be included with:

  ```
  #include "driver/mcpwm_timer.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```
  REQUIRES driver
  ```
  or

  ```
  PRIV_REQUIRES driver
  ```

**Functions**

```c
esp_err_t mcpwm_new_timer(const mcpwm_timer_config_t *config, mcpwm_timer_handle_t *ret_timer)
```

Create MCPWM timer.

**Parameters**

- `config` -- [in] MCPWM timer configuration
- `ret_timer` -- [out] Returned MCPWM timer handle

**Returns**

- ESP_OK: Create MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM timer failed because out of memory
Chapter 2. API Reference

• ESP_ERR_NOT_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one
• ESP_FAIL: Create MCPWM timer failed because of other error

```c
void mcpwm_del_timer(mcpwm_timer_handle_t timer);
```

Delete MCPWM timer.

**Parameters**
- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**
- ESP_OK: Delete MCPWM timer successfully
- ESP_FAIL: Create MCPWM timer failed because of invalid argument
- ESP_FAIL: Delete MCPWM timer failed because timer is not in init state
- ESP_FAIL: Delete MCPWM timer failed because of other error

```c
void mcpwm_timer_set_period(mcpwm_timer_handle_t timer, uint32_t period_ticks);
```

Set a new period for MCPWM timer.

**Note:** If `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` are not set, the new period will take effect immediately. Otherwise, the new period will take effect when timer counts to zero or on sync event.

**Note:** You may need to use `mcpwm_comparator_set_compare_value` to set a new compare value for MCPWM comparator in order to keep the same PWM duty cycle.

**Parameters**
- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `period_ticks` -- [in] New period in count ticks

**Returns**
- ESP_OK: Set new period for MCPWM timer successfully
- ESP_FAIL: Set new period for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set new period for MCPWM timer failed because of other error

```c
void mcpwm_timer_enable(mcpwm_timer_handle_t timer);
```

Enable MCPWM timer.

**Parameters**
- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**
- ESP_OK: Enable MCPWM timer successfully
- ESP_FAIL: Enable MCPWM timer failed because of invalid argument
- ESP_FAIL: Enable MCPWM timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM timer failed because of other error

```c
void mcpwm_timer_disable(mcpwm_timer_handle_t timer);
```

Disable MCPWM timer.

**Parameters**
- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**
- ESP_OK: Disable MCPWM timer successfully
- ESP_FAIL: Disable MCPWM timer failed because of invalid argument
- ESP_FAIL: Disable MCPWM timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM timer failed because of other error

```c
void mcpwm_timer_start_stop(mcpwm_timer_handle_t timer, mcpwm_timer_start_stop_cmd_t command);
```
Send specific start/stop commands to MCPWM timer.

Parameters
- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **command** -- [in] Supported command list for MCPWM timer

Returns
- ESP_OK: Start or stop MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Start or stop MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start or stop MCPWM timer failed because timer is not enabled
- ESP_FAIL: Start or stop MCPWM timer failed because of other error

```c
esp_err_t mcpwm_timer_register_event_callbacks(mcpwm_timer_handle_t timer, const mcpwm_timer_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for MCPWM timer.

**Note:** The first call to this function needs to be before the call to `mcpwm_timer_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

```c
esp_err_t mcpwm_timer_set_phase_on_sync(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_phase_config_t *config)
```

Set sync phase for MCPWM timer.

Parameters
- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** -- [in] MCPWM timer sync phase configuration

Returns
- ESP_OK: Set sync phase for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM timer failed because of other error

**Structures**

```c
struct mcpwm_timer_event_callbacks_t
```

Group of supported MCPWM timer event callbacks.

**Note:** The callbacks are all running under ISR environment
Public Members

`mcpwm_timer_event_cb_t on_full`
callback function when MCPWM timer counts to peak value

`mcpwm_timer_event_cb_t on_empty`
callback function when MCPWM timer counts to zero

`mcpwm_timer_event_cb_t on_stop`
callback function when MCPWM timer stops

struct `mcpwm_timer_config_t`
MCPWM timer configuration.

Public Members

int `group_id`
Specify from which group to allocate the MCPWM timer

`mcpwm_timer_clock_source_t clk_src`
MCPWM timer clock source

`uint32_t resolution_hz`
Counter resolution in Hz. The step size of each count tick equals to \((1 / \text{resolution}\_hz)\) seconds

`mcpwm_timer_count_mode_t count_mode`
Count mode

`uint32_t period_ticks`
Number of count ticks within a period

int `intr_priority`
MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1, 2, 3)

`uint32_t update_period_on_empty`
Whether to update period when timer counts to zero

`uint32_t update_period_on_sync`
Whether to update period on sync event

struct `mcpwm_timer_config_t`: [anonymous] `flags`
Extra configuration flags for timer

struct `mcpwm_timer_sync_phase_config_t`
MCPWM Timer sync phase configuration.
Public Members

mcpwm_sync_handle_t sync_src
The sync event source. Set to NULL will disable the timer being synced by others

uint32_t count_value
The count value that should lock to upon sync event

mcpwm_timer_direction_t direction
The count direction that should lock to upon sync event

Header File

- components/driver/mcpwm/include/driver/mcpwm_oper.h
- This header file can be included with:

```c
#include "driver/mcpwm_oper.h"
```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

Functions

esp_err_t mcpwm_new_operator (const mcpwm_operator_config_t *config, mcpwm_oper_handle_t *ret_oper)
Create MCPWM operator.

Parameters
- config -- [in] MCPWM operator configuration
- ret_oper -- [out] Returned MCPWM operator handle

Returns
- ESP_OK: Create MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM operator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM operator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM operator failed because can't find free resource
- ESP_FAIL: Create MCPWM operator failed because of other error

esp_err_t mcpwm_del_operator (mcpwm_oper_handle_t oper)
Delete MCPWM operator.

Parameters oper -- [in] MCPWM operator, allocated by mcpwm_new_operator()

Returns
- ESP_OK: Delete MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM operator failed because of invalid argument
- ESP_FAIL: Delete MCPWM operator failed because of other error

esp_err_t mcpwm_operator_connect_timer (mcpwm_oper_handle_t oper, mcpwm_timer_handle_t timer)
Connect MCPWM operator and timer, so that the operator can be driven by the timer.

Parameters
- oper -- [in] MCPWM operator handle, allocated by mcpwm_new_operator()
- timer -- [in] MCPWM timer handle, allocated by mcpwm_new_timer()
Returns

- ESP_OK: Connect MCPWM operator and timer successfully
- ESP_ERR_INVALID_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP_FAIL: Connect MCPWM operator and timer failed because of other error

**esp_err_t mcpwm_operator_set_brake_on_fault (mcpwm_oper_handle_t oper, const mcpwm_brake_config_t *config)**

Set brake method for MCPWM operator.

**Parameters**

- **oper** -- [in] MCPWM operator, allocated by mcpwm_new_operator()
- **config** -- [in] MCPWM brake configuration

**Returns**

- ESP_OK: Set trip for operator successfully
- ESP_ERR_INVALID_ARG: Set trip for operator failed because of invalid argument
- ESP_FAIL: Set trip for operator failed because of other error

**esp_err_t mcpwm_operator_recover_from_fault (mcpwm_oper_handle_t oper, mcpwm_fault_handle_t fault)**

Try to make the operator recover from fault.

**Note:** To recover from fault or escape from trip, you make sure the fault signal has dissappeared already. Otherwise the recovery can't succeed.

**Parameters**

- **oper** -- [in] MCPWM operator, allocated by mcpwm_new_operator()
- **fault** -- [in] MCPWM fault handle

**Returns**

- ESP_OK: Recover from fault successfully
- ESP_ERR_INVALID_ARG: Recover from fault failed because of invalid argument
- ESP_ERR_INVALID_STATE: Recover from fault failed because the fault source is still active
- ESP_FAIL: Recover from fault failed because of other error

**esp_err_t mcpwm_operator_register_event_callbacks (mcpwm_oper_handle_t oper, const mcpwm_operator_event_callbacks_t *cbs, void *user_data)**

Set event callbacks for MCPWM operator.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the cbs structure to NULL.

**Parameters**

- **oper** -- [in] MCPWM operator handle, allocated by mcpwm_new_operator()
- **cbs** -- [in] Group of callback functions
- **user_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**esp_err_t mcpwm_operator_apply_carrier (mcpwm_oper_handle_t oper, const mcpwm_carrier_config_t *config)**

Apply carrier feature for MCPWM operator.
Chapter 2. API Reference

Parameters

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM carrier specific configuration

Returns

- ESP_OK: Set carrier for operator successfully
- ESP_ERR_INVALID_ARG: Set carrier for operator failed because of invalid argument
- ESP_FAIL: Set carrier for operator failed because of other error

Structures

```c
struct mcpwm_operator_config_t

MCPWM operator configuration.
```

Public Members

```c
int group_id

Specify from which group to allocate the MCPWM operator
```

```c
int intr_priority

MCPWM operator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1, 2, 3)
```

```c
uint32_t update_gen_action_on_te

Whether to update generator action when timer counts to zero
```

```c
uint32_t update_gen_action_on_te

Whether to update generator action when timer counts to peak
```

```c
uint32_t update_gen_action_on_sync
