

# ESP32-P4

## ESP-IDF Programming Guide

Release v5.2.2  
Espressif Systems  
Jun 03, 2024

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 Get Started</b>	<b>3</b>
1.1 Introduction	3
1.2 What You Need	3
1.2.1 Hardware	3
1.2.2 Software	3
1.3 Installation	4
1.3.1 IDE	4
1.3.2 Manual Installation	4
1.4 Build Your First Project	35
1.5 Uninstall ESP-IDF	35
<b>2 API Reference</b>	<b>37</b>
2.1 API Conventions	37
2.1.1 Error Handling	37
2.1.2 Configuration Structures	37
2.1.3 Private APIs	39
2.1.4 Components in Example Projects	39
2.1.5 API Stability	39
2.2 Application Protocols	40
2.2.1 ASIO Port	40
2.2.2 ESP-Modbus	41
2.2.3 ESP-MQTT	41
2.2.4 ESP-TLS	59
2.2.5 ESP HTTP Client	77
2.2.6 ESP Local Control	94
2.2.7 ESP Serial Slave Link	104
2.2.8 ESP x509 Certificate Bundle	118
2.2.9 HTTP Server	121
2.2.10 HTTPS Server	149
2.2.11 ICMP Echo	153
2.2.12 mDNS Service	158
2.2.13 Mbed TLS	159
2.2.14 IP Network Layer	160
2.3 Error Codes Reference	161
2.4 Networking APIs	167
2.4.1 Ethernet	167
2.4.2 Thread	203
2.4.3 ESP-NETIF	213
2.4.4 IP Network Layer	248
2.4.5 Application Layer	250
2.5 Peripherals API	250
2.5.1 Analog Comparator	251
2.5.2 Clock Tree	261
2.5.3 Elliptic Curve Digital Signature Algorithm (ECDSA)	274
2.5.4 Event Task Matrix (ETM)	276

2.5.5	GPIO & RTC GPIO	286
2.5.6	General Purpose Timer (GPTimer)	306
2.5.7	Hash-Based Message Authentication Code (HMAC)	322
2.5.8	Digital Signature (DS)	326
2.5.9	Inter-Integrated Circuit (I2C)	332
2.5.10	Inter-IC Sound (I2S)	356
2.5.11	LCD	403
2.5.12	LED Control (LEDC)	419
2.5.13	Motor Control Pulse Width Modulator (MCPWM)	443
2.5.14	Parallel IO	498
2.5.15	Pulse Counter (PCNT)	505
2.5.16	Remote Control Transceiver (RMT)	521
2.5.17	SD Pull-up Requirements	549
2.5.18	SDMMC Host Driver	549
2.5.19	SD SPI Host Driver	556
2.5.20	SPI Flash API	562
2.5.21	SPI Master Driver	593
2.5.22	SPI Slave Driver	616
2.5.23	Universal Asynchronous Receiver/Transmitter (UART)	622
2.6	Project Configuration	648
2.6.1	Introduction	648
2.6.2	Project Configuration Menu	648
2.6.3	Using <code>sdkconfig.defaults</code>	648
2.6.4	Kconfig Format Rules	649
2.6.5	Backward Compatibility of Kconfig Options	649
2.6.6	Configuration Options Reference	649
2.7	Provisioning API	962
2.7.1	Protocol Communication	962
2.8	Storage API	978
2.8.1	FAT Filesystem Support	978
2.8.2	Manufacturing Utility	987
2.8.3	Non-Volatile Storage Library	992
2.8.4	NVS Encryption	1016
2.8.5	NVS Partition Generator Utility	1022
2.8.6	NVS Partition Parser Utility	1028
2.8.7	SD/SDIO/MMC Driver	1029
2.8.8	Partitions API	1044
2.8.9	SPIFFS Filesystem	1053
2.8.10	Virtual Filesystem Component	1058
2.8.11	Wear Levelling API	1074
2.9	System API	1077
2.9.1	App Image Format	1077
2.9.2	Bootloader Image Format	1083
2.9.3	Application Level Tracing	1085
2.9.4	Call Function with External Stack	1091
2.9.5	Chip Revision	1092
2.9.6	Console	1096
2.9.7	eFuse Manager	1104
2.9.8	Error Code and Helper Functions	1134
2.9.9	ESP HTTPS OTA	1137
2.9.10	Event Loop Library	1144
2.9.11	FreeRTOS Overview	1157
2.9.12	FreeRTOS (IDF)	1159
2.9.13	FreeRTOS (Supplemental Features)	1275
2.9.14	Heap Memory Allocation	1303
2.9.15	Memory Management for MMU Supported Memory	1316
2.9.16	Memory Synchronization	1322
2.9.17	Heap Memory Debugging	1328

2.9.18	High Resolution Timer (ESP Timer)	1341
2.9.19	Internal and Unstable APIs	1348
2.9.20	Inter-Processor Call (IPC)	1349
2.9.21	Interrupt Allocation	1354
2.9.22	Logging library	1361
2.9.23	Miscellaneous System APIs	1370
2.9.24	Over The Air Updates (OTA)	1387
2.9.25	Power Management	1399
2.9.26	POSIX Threads Support	1405
2.9.27	Random Number Generation	1410
2.9.28	Sleep Modes	1413
2.9.29	SoC Capabilities	1424
2.9.30	System Time	1440
2.9.31	Asynchronous Memory Copy	1446
2.9.32	Watchdogs	1450
<b>3</b>	<b>Hardware Reference</b>	<b>1457</b>
<b>4</b>	<b>API Guides</b>	<b>1459</b>
4.1	Application Level Tracing Library	1459
4.1.1	Overview	1459
4.1.2	Modes of Operation	1459
4.1.3	Configuration Options and Dependencies	1460
4.1.4	How to Use This Library	1461
4.2	Application Startup Flow	1469
4.2.1	First Stage Bootloader	1470
4.2.2	Second Stage Bootloader	1470
4.2.3	Application Startup	1471
4.3	Bootloader	1472
4.3.1	Bootloader Compatibility	1473
4.3.2	Log Level	1473
4.3.3	Factory Reset	1473
4.3.4	Boot from Test Firmware	1474
4.3.5	Rollback	1474
4.3.6	Watchdog	1475
4.3.7	Bootloader Size	1475
4.3.8	Fast Boot from Deep-Sleep	1475
4.3.9	Custom Bootloader	1475
4.4	Build System	1476
4.4.1	Overview	1476
4.4.2	Using the Build System	1476
4.4.3	Example Project	1478
4.4.4	Project CMakeLists File	1479
4.4.5	Component CMakeLists Files	1480
4.4.6	Component Configuration	1483
4.4.7	Preprocessor Definitions	1483
4.4.8	Component Requirements	1483
4.4.9	Overriding Parts of the Project	1487
4.4.10	Configuration-Only Components	1489
4.4.11	Debugging CMake	1489
4.4.12	Example Component CMakeLists	1489
4.4.13	Custom Sdkconfig Defaults	1493
4.4.14	Flash Arguments	1494
4.4.15	Building the Bootloader	1494
4.4.16	Writing Pure CMake Components	1495
4.4.17	Using Third-Party CMake Projects with Components	1495
4.4.18	Using Prebuilt Libraries with Components	1496
4.4.19	Using ESP-IDF in Custom CMake Projects	1496

4.4.20	ESP-IDF CMake Build System API	1497
4.4.21	File Globbing & Incremental Builds	1501
4.4.22	Build System Metadata	1502
4.4.23	Build System Internals	1502
4.4.24	Migrating from ESP-IDF GNU Make System	1504
4.5	Core Dump	1505
4.5.1	Overview	1505
4.5.2	Configurations	1505
4.5.3	Core Dump to Flash	1506
4.5.4	Core Dump to UART	1507
4.5.5	Core Dump Commands	1508
4.5.6	ROM Functions in Backtraces	1508
4.5.7	Dumping Variables on Demand	1509
4.5.8	Running <code>idf.py coredump-info</code> and <code>idf.py coredump-debug</code>	1509
4.6	C++ Support	1511
4.6.1	<code>esp-idf-cxx</code> Component	1512
4.6.2	C++ Language Standard	1512
4.6.3	Multithreading	1512
4.6.4	Exception Handling	1512
4.6.5	Runtime Type Information (RTTI)	1513
4.6.6	Developing in C++	1513
4.6.7	Limitations	1514
4.6.8	What to Avoid	1514
4.7	Current Consumption Measurement of Modules	1515
4.7.1	Notes to Measurement	1515
4.7.2	Hardware Connection	1515

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#), [ESP32-C](#), [ESP32-H](#) and [ESP32-P](#) Series SoCs.

This document describes using ESP-IDF with the ESP32-P4 SoC.

		
<a href="#">Get Started</a>	<a href="#">API Reference</a>	<a href="#">API Guides</a>

# Chapter 1

## Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-P4 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-P4 board.

---

**Note:** This is documentation for stable version v5.2.2 of ESP-IDF. Other *ESP-IDF Versions* are also available.

---

### 1.1 Introduction

ESP32-P4 is a system on a chip that integrates the following features:

Powered by 40 nm technology, ESP32-P4 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-P4 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

#### 1.2.1 Hardware

- An **ESP32-P4** board.
- **USB cable** - USB A / micro USB B.
- **Computer** running Windows, Linux, or macOS.

---

**Note:** Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

---

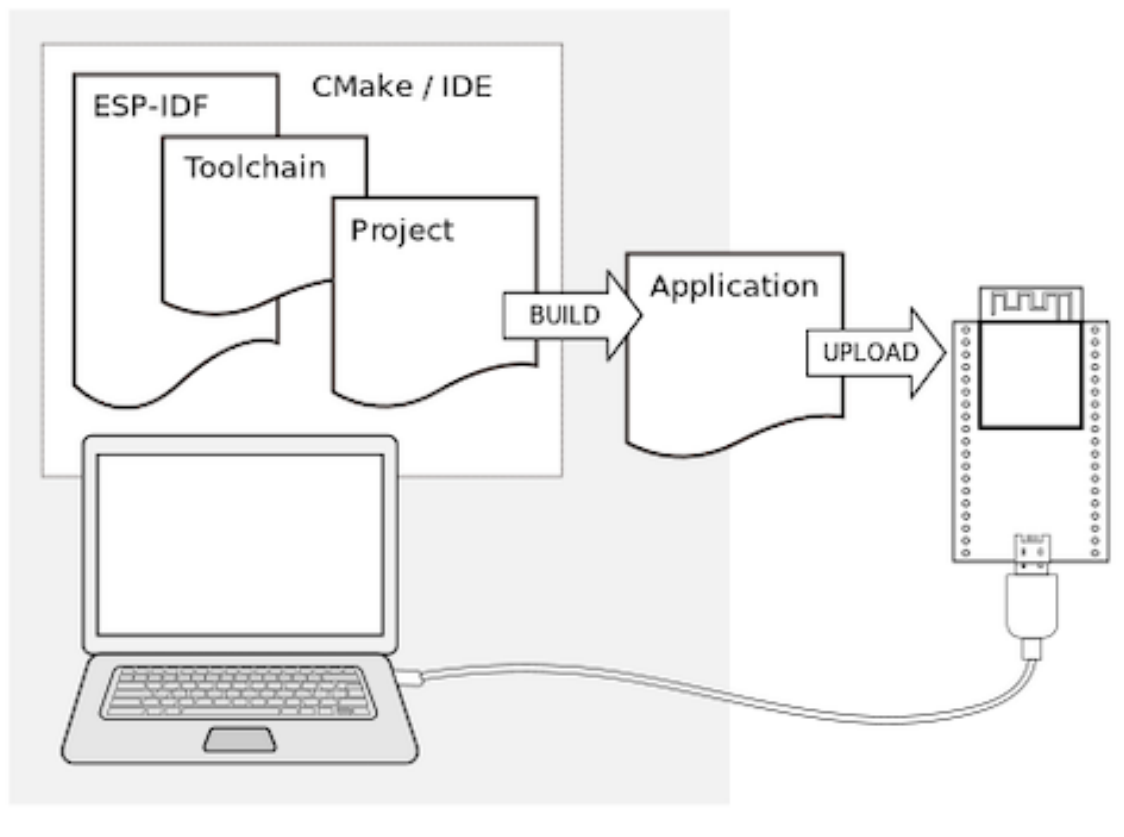

If you have one of ESP32-P4 official development boards listed below, you can click on the link to learn more about the hardware.

#### 1.2.2 Software

To start using ESP-IDF on **ESP32-P4**, install the following software:

- **Toolchain** to compile code for ESP32-P4
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-P4
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-P4 and scripts to operate the **Toolchain**

## 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

### 1.3.1 IDE

---

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

---

- [Eclipse Plugin](#)
- [VSCode Extension](#)

### 1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

## Standard Setup of Toolchain for Windows

**Introduction** ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we are going to use the Command Prompt, but after ESP-IDF is installed you can use [Eclipse Plugin](#) or another graphical IDE with CMake support instead.

---

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via Control Panel > Change date, time, or number formats > Administrative tab > Change system locale > check the option Beta: Use Unicode UTF-8 for worldwide language support > Ok > reboot the computer.

---

**ESP-IDF Tools Installer** The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers.

**What Is the Usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer downloads only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\.espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#) .

**Components of the Installation** The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option `Run ESP-IDF PowerShell Environment` or `Run ESP-IDF Command Prompt (cmd.exe)`. The installer launches ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Fig. 1: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

**Using the Command Prompt** For the remaining Getting Started steps, we are going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

**First Steps on ESP-IDF** Now since all requirements are met, the next topic guides you on how to start your first project.

```
ESP-IDF PowerShell

Using Python in C:/Users/developer/.espressif/python_env/idf4.1_py3.8_env/scripts
Python 3.8.7

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
```

Fig. 4: ESP-IDF Command Prompt

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-P4 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-P4. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-P4 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-P4](#) for full details.

---

**Note:** Keep the port name handy as it is needed in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-P4 as the target, and run the project configuration utility `menuconfig`.

## Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32p4
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32p4`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for "hello\_word", since this example runs with default configuration.

---

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

Fig. 5: Project configuration - Home window

**Build the Project** Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_esp component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-P4 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace PORT with your ESP32-P4 board's USB port name. If the PORT is not defined, the *idf.py* will try to connect automatically using the available USB ports.

For more information on *idf.py* arguments, see [idf.py](#).

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to [Flashing Troubleshooting](#) page or [Establish Serial Connection with ESP32-P4](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

If there are no issues by the end of the flash process, the board will reboot and start up the "hello\_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if "hello\_world" is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
This is esp32p4 chip with 2 CPU core(s), [NEEDS TO BE UPDATED]
Minimum free heap size: [NEEDS TO BE UPDATED] bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

---

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

---

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

**That is all that you need to get started with ESP32-P4!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-P4 because required hardware is not included in ESP32-P4 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-P4 target, or the table does not exist at all, the example will work on ESP32-P4.

---

### Additional Tips

**Permission Denied Issue** With some Linux distributions, you may get the error message similar to `Could not open port <PORT>: Permission denied: '<PORT>'` when flashing the ESP32-P4. *This can be solved by adding the current user to the specific group*, such as `dialout` or `uucp` group.

**Python Compatibility** ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Related Documents** For advanced users who want to customize the install process:

- [Updating ESP-IDF Tools on Windows](#)
- [Establish Serial Connection with ESP32-P4](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF Monitor](#)

### Updating ESP-IDF Tools on Windows

**Install ESP-IDF Tools Using a Script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This downloads and installs the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF Tools to PATH Using an Export Script** ESP-IDF tools installer creates a Start menu shortcut for "ESP-IDF Command Prompt". This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which was not started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

### Establish Serial Connection with ESP32-P4

Establishing a serial connection with the ESP32-P4 target device could be done using a USB-to-UART bridge.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

**USB-to-UART Bridge on Development Board** For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32-P4 is UART.

Fig. 6: Development Board with USB-to-UART Bridge

**External USB-to-UART Bridge** Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.

Fig. 7: External USB-to-UART Bridge

**Flash Using UART** This section provides guidance on how to establish a serial connection between ESP32-P4 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32-P4 to PC** Connect the ESP32-P4 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32-P4 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-P4 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

You can change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

---

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the BOOT button and then press the RESET button once. After that release the BOOT button.

---

**Check Port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-P4 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check Port on Linux and macOS** To check the device name for the serial port of your ESP32-P4 board (or external converter dongle), run this command two times, first with the board/dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

---

**Note:** macOS users: if you do not see the serial port then check you have the USB/serial drivers installed. See Section [Connect ESP32-P4 to PC](#) for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

---

**Adding User to dialout or uucp on Linux** The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```
sudo usermod -a -G dialout $USER
```

Fig. 8: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Fig. 9: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify Serial Connection** Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-P4.

The default console baud rate on ESP32-P4 is 115200.

**Windows and Linux** In this example, we use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Fig. 10: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32-P4. The log contents depend on application loaded to ESP32-P4, see [Example Output](#). Reset the board if no log has been printed out.

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

**Note:** If there is no log output, check

Fig. 11: Setting Serial Communication in PuTTY on Linux

- if the required power is supplied to ESP32-P4
- if the board was reset after starting the terminal program
- if the selected serial port is the correct one by using the method stated in [Check Port on Windows](#) and [Check Port on Linux and macOS](#)
- if the serial port is not being used by another program
- if the identified port has been selected in serial terminal programs you are using, as stated in [Windows and Linux](#)
- if settings of the serial port in serial terminal programs are applicable to corresponding applications
- if the correct USB connector (UART) is used on the development board
- if your application is expected to output some log
- if the log output has not been disabled (use [hello world application](#) to test)

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the **screen** command.

- As discussed in [Check port on Linux and macOS](#), run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↪USBtoUART7
```

- The output varies depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change "115200" to the default baud rate of the chip in use):

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the **screen**. The log contents depend on application loaded to ESP32-P4, see [Example Output](#). To exit the current **screen** session, type `Ctrl-A + K`.

**Note:** Do not forget to **exit the current screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32-P4.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-P4 booting and producing serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

If you got here from [Step 5. First Steps on ESP-IDF](#) when installing s/w for ESP32-P4 development, then you can continue with [Step 5. First Steps on ESP-IDF](#).

## Flashing Troubleshooting

**Failed to Connect** If you run the given command and see errors such as "Failed to connect", there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the [esptool troubleshooting](#) page.

`esptool.py` resets ESP32-P4 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-P4](#)). The DTR and RTS control lines are in turn connected to `[NEEDS TO BE UPDATED]` and `CHIP_PU` (EN) pins of ESP32-P4, thus changes in the voltage levels of DTR and RTS will boot ESP32-P4 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `[NEEDS TO BE UPDATED]` and `CHIP_PU`.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-P4 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the `BOOT` button (`[NEEDS TO BE UPDATED]`) and press the `EN` button (`CHIP_PU`).
- For other types of hardware, try pulling `[NEEDS TO BE UPDATED]` down.

## IDF Monitor

IDF Monitor uses the [esp-idf-monitor](#) package as a serial terminal program which relays serial data to and from the target device's serial port. It also provides some ESP-IDF-specific features.

IDF Monitor can be launched from an ESP-IDF project by running `idf.py monitor`.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table. These keyboard shortcuts can be customized, for more details see [Configuration File](#) section.

Keyboard Shortcut	Action	Description
Ctrl + ]	Exit the program	
Ctrl + T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl + T	Send the menu character itself to remote	
• Ctrl + ]	Send the exit character itself to remote	
• Ctrl + P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl + R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl + F	Build and flash the project	Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl + A (or A)	Build and flash the app only	Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl + Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl + L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl + I (or I)	Stop/resume printing timestamps	IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.
• Ctrl + H (or H)	Display all keyboard shortcuts	
• Ctrl + X (or X)	Exit the program	
Ctrl + C	Interrupt running application	Pauses IDF Monitor and runs GDB project debugger to debug the application at runtime. This requires CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

### ESP-IDF-specific Features

**Automatic Address Decoding** Whenever the chip outputs a hexadecimal address that points to executable code, IDF monitor looks up the location in the source code (file name and line number) and prints the location on the next line in yellow.

If an ESP-IDF app crashes and panics, a register dump and backtrace are produced, such as the following:

```
abort() was called at PC 0x42067cd5 on core 0
```

(continues on next page)

(continued from previous page)

```

```

To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

If an address is not matched in the app source code, IDF monitor also checks the ROM code. Instead of printing the source file name and line number, only the function name followed by in ROM is displayed:

```

abort() was called at PC 0x400481c1 on core 0
0x400481c1: ets_rsa_pss_verify in ROM

```

The ROM ELF file is automatically loaded from a location based on the `IDF_PATH` and `ESP_ROM_ELF_DIR` environment variables. This can be overridden by calling `esp_idf_monitor` and providing a path to a specific ROM ELF file: `python -m esp_idf_monitor --rom-elf-file [path to ROM ELF file]`.

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `esp_idf_monitor` with specific command line option: `python -m esp_idf_monitor --disable-address-decoding` to disable address decoding.

**Target Reset on Connection** By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the `--no-reset` option (e.g., `idf.py monitor --no-reset`).

**Note:** The `--no-reset` option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., `idf.py monitor --no-reset -p [PORT]`).

**Launching GDB with GDBStub** GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME`. GDBStub will run in the background until a `Ctrl+C` message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the `Ctrl+C` message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board's Reset button).

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↵
↵interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**Output Filtering** IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed. Filtering can also be configured using the `ESP_IDF_MONITOR_PRINT_FILTER` environment variable.

**Note:** When using both the environment variable `ESP_IDF_MONITOR_PRINT_FILTER` and the argument `--print-filter`, the setting from the CLI argument will take precedence.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set {N, E, W, I, D, V, \*} referring to a level for *logging*.

For example, `--print_filter="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e., `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to a Verbose level.

---

**Note:** Use primary logging to disable at compilation the outputs you do not need through the *logging library*. Output filtering with the IDF monitor is a secondary solution that can be useful for adjusting the filtering options without recompiling the application.

---

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples of Filtering Rules:

- `*` can be used to match any tags. However, the string `--print_filter="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example** The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `--print_filter="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `--print_filter="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

**Configuration File** `esp-idf-monitor` is using **C0 control codes** to interact with the console. Characters from the config file are converted to their C0 control codes. Available characters include the English alphabet (A-Z) and special symbols: `[, ], \, ^, _`.

**Warning:** Please note that some characters may not work on all platforms or can be already reserved as a shortcut for something else. Use this feature with caution!

**File Location** The default name for a configuration file is `esp-idf-monitor.cfg`. First, the same directory `esp-idf-monitor` is being run if is inspected.

If a configuration file is not found here, the current user's OS configuration directory is inspected next:

- Linux: `/home/<user>/.config/esp-idf-monitor/`
- MacOS `/Users/<user>/.config/esp-idf-monitor/`
- Windows: `c:\Users\<user>\AppData\Local\esp-idf-monitor\`

If a configuration file is still not found, the last inspected location is the home directory:

- Linux: `/home/<user>/`
- MacOS `/Users/<user>/`
- Windows: `c:\Users\<user>\`

On Windows, the home directory can be set with the `HOME` or `USERPROFILE` environment variables. Therefore, the Windows configuration directory location also depends on these.

A different location for the configuration file can be specified with the `ESP_IDF_MONITOR_CFGFILE` environment variable, e.g., `ESP_IDF_MONITOR_CFGFILE = ~/custom_config.cfg`. This overrides the search priorities described above.

`esp-idf-monitor` will read settings from other usual configuration files if no other configuration file is used. It automatically reads from `setup.cfg` or `tox.ini` if they exist.

**Configuration Options** Below is a table listing the available configuration options:

Option Name	Description	Default Value
<code>menu_key</code>	Key to access the main menu.	T
<code>exit_key</code>	Key to exit the monitor.	]
<code>chip_reset_key</code>	Key to initiate a chip reset.	R
<code>recompile_upload_key</code>	Key to recompile and upload.	F
<code>recompile_upload_app_key</code>	Key to recompile and upload just the application.	A
<code>toggle_output_key</code>	Key to toggle the output display.	Y
<code>toggle_log_key</code>	Key to toggle the logging feature.	L
<code>toggle_timestamp_key</code>	Key to toggle timestamp display.	I
<code>chip_reset_bootloader_key</code>	Key to reset the chip to bootloader mode.	P
<code>exit_menu_key</code>	Key to exit the monitor from the menu.	X
<code>skip_menu_key</code>	Pressing the menu key can be skipped for menu commands.	False

**Syntax** The configuration file is in `.ini` file format: it must be introduced by an `[esp-idf-monitor]` header to be recognized as valid. This section then contains `name = value` entries. Lines beginning with `#` or `;` are ignored as comments.

```
# esp-idf-monitor.cfg file to configure internal settings of esp-idf-monitor
[esp-idf-monitor]
menu_key = T
exit_key = ]
chip_reset_key = R
recompile_upload_key = F
recompile_upload_app_key = A
toggle_output_key = Y
toggle_log_key = L
toggle_timestamp_key = I
chip_reset_bootloader_key = P
exit_menu_key = X
skip_menu_key = False
```

## Known Issues with IDF Monitor

### Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when "idf.py" exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When "gdb" is run, it might stall for a short time before it begins communicating with the GDBStub.

## Standard Toolchain Setup for Linux and macOS

**Installation Step by Step** This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment** These are the steps for setting up the ESP-IDF for your ESP32-P4.

- [Step 1. Install Prerequisites](#)
- [Step 2. Get ESP-IDF](#)
- [Step 3. Set up the Tools](#)
- [Step 4. Set up the Environment Variables](#)
- [Step 5. First Steps on ESP-IDF](#)

**Step 1. Install Prerequisites** In order to use ESP-IDF with the ESP32-P4, you need to install some software packages based on your Operating System. This setup guide helps you on getting everything installed on Linux and macOS based systems.

**For Linux Users** To compile using ESP-IDF, you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja_
↳ccache dfu-util libusb
```

**Note:**

- CMake version 3.16 or newer is required for use with ESP-IDF. Run "tools/idf\_tools.py install cmake" to install a suitable version if your OS versions does not have one.
  - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
- 

**For macOS Users** ESP-IDF uses the version of Python installed by default on macOS.

- Install CMake & Ninja build:
  - If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```
  - If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```
  - Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.
- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

---

**Note:** If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools),_
↳missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Apple M1 Users** If you use Apple M1 platform and see an error like this:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is_
↳present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to_
↳install it.
```

or:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-_
↳patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

**Installing Python 3** Based on [macOS Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 is not included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 is not already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

**Step 2. Get ESP-IDF** To build applications for the ESP32-P4, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v5.2.2 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF is downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the Tools** Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-P4.

```
cd ~/esp/esp-idf
./install.sh esp32p4
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32p4
```

The above commands install tools for ESP32-P4 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```

**Note:** For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable_
↳to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see [Download Error While Installing ESP-IDF Tools](#).

---

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it does not change the URLs used to access any Git repositories.

---

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Note:** For users in China, we recommend using our download server located in China for faster download speed.

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.cn/github_assets"
./install.sh
```

**Customizing the Tools Installation Path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

**Step 4. Set up the Environment Variables** The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use `esp-idf` frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-P4 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-P4. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-P4 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-P4](#) for full details.

---

**Note:** Keep the port name handy as it is needed in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-P4 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32p4
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32p4`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See *Select the Target Chip: set-target* for additional information.

If the previous steps have been done correctly, the following menu appears:

```
(Top)
      Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                   [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

Fig. 12: Project configuration - Home window

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for "hello\_world", since this example runs with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project** Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
```

(continues on next page)

(continued from previous page)

```

../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↔-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↔bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↔partition-table.bin
or run 'idf.py -p PORT flash'

```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-P4 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace `PORT` with your ESP32-P4 board's USB port name. If the `PORT` is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to [Flashing Troubleshooting](#) page or [Establish Serial Connection with ESP32-P4](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

If there are no issues by the end of the flash process, the board will reboot and start up the "hello\_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if "hello\_world" is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↔world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```

...
Hello world!
Restarting in 10 seconds...
This is esp32p4 chip with 2 CPU core(s), [NEEDS TO BE UPDATED]
Minimum free heap size: [NEEDS TO BE UPDATED] bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

```

To exit IDF monitor use the shortcut `Ctrl+]`.

---

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

---

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

**That is all that you need to get started with ESP32-P4!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-P4 because required hardware is not included in ESP32-P4 so it cannot be supported.

If building an example, please check the README file for the `Supported Targets` table. If this is present including ESP32-P4 target, or the table does not exist at all, the example will work on ESP32-P4.

---

### Additional Tips

**Permission Denied Issue** With some Linux distributions, you may get the error message similar to `Could not open port <PORT>: Permission denied: '<PORT>' when flashing the ESP32-P4. This can be solved by adding the current user to the specific group, such as dialout or uucp group.`

**Python Compatibility** ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see [ESP-IDF Versions](#).

The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the Tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the Environment Variables](#).

## 1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the [Start a Project on Windows](#) or [Start a Project on Linux and macOS](#).

## 1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow [Uninstall ESP-IDF](#).

# Chapter 2

## API Reference

### 2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures, and types.
- Build system functions, predefined variables, and options. These are documented in the [ESP-IDF CMake Build System API](#).
- *Kconfig* options can be used in code and in the build system (`CMakeLists.txt`) files.
- *Host tools* and their command line parameters are also part of the ESP-IDF interfaces.

ESP-IDF is made up of multiple components where these components either contain code specifically written for ESP chips, or contain a third-party library (i.e., a third-party component). In some cases, third-party components contain an "ESP-IDF specific" wrapper in order to provide an interface that is either simpler or better integrated with the rest of ESP-IDF's features. In other cases, third-party components present the original API of the underlying library directly.

The following sections explain some of the aspects of ESP-IDF APIs and their usage.

#### 2.1.1 Error Handling

Most ESP-IDF APIs return error codes defined with the `esp_err_t` type. See [Error Handling](#) section for more information about error handling approaches. [Error Codes Reference](#) contains the list of error codes returned by ESP-IDF components.

#### 2.1.2 Configuration Structures

---

**Important:** Correct initialization of configuration structures is an important part of making the application compatible with future versions of ESP-IDF.

---

Most initialization, configuration, and installation functions in ESP-IDF (typically named `..._init()`, `..._config()`, and `..._install()`) take a configuration structure pointer as an argument. For example:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

These functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

The C++ language supports designated initializer syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero-
↳initialized */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = &my_arg,
};

/**/
/* Incorrect, .arg is declared after .callback in esp_timer_create_args_t */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

For more information on designated initializers, see [Designated Initializers](#). Note that C++ language versions older than C++20, which are not the default in the current version of ESP-IDF, do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

## Default Initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. Now all fields are_
↳set to the default values, and any field can still be modified: */
config.server_port = 8081;
```

(continues on next page)

```
httpd_handle_t server;  
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code rather than by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in Example Projects

ESP-IDF examples contain a variety of projects demonstrating the usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Before using, take time to read the code and understand if it is applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the [Versioning Scheme](#).

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source-level Compatibility

ESP-IDF guarantees source-level compatibility of C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Source-level compatibility implies that the application source code can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source-level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however, this is not mandatory. Deprecated functions and files can be removed from major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system's [backward compatibility](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files, and source code.

## Lack of Binary Compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source-level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See *Configuration Structures* for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

## Other Exceptions from Compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issuing reports about any unintended breaking changes that do not fall into the categories below.

- *Private APIs*.
- *Components in Example Projects*.
- Features clearly marked as "beta", "preview", or "experimental".
- Changes made to mitigate security issues or to replace insecure default behaviors with secure ones.
- Features that were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features that depend on non-functional chip hardware features.
- Unexpected or undefined behavior that is not documented explicitly may be fixed/changed, such as due to missing validation of argument ranges.
- Location of *Kconfig* options in `menuconfig`.
- Location and names of example projects.

## 2.2 Application Protocols

### 2.2.1 ASIO Port

ASIO is a cross-platform C++ library, see <https://think-async.com/Asio/>. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component `ASIO` has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ASIO component on GitHub](#)

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`.

### Hosted Documentation

The documentation can be found on the link below:

- [ASIO documentation \(English\)](#)

## 2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, and Ethernet interfaces. Since ESP-IDF version v5.0, the component `freemodbus` has been moved from ESP-IDF to a separate repository:

- [ESP-Modbus component on GitHub](#)

### Hosted Documentation

The documentation can be found through the link below:

- [ESP-Modbus documentation \(English\)](#)

### Application Example

The examples below demonstrate the ESP-Modbus library of serial and TCP ports for both slave and master implementations respectively.

- [protocols/modbus/serial/mb\\_slave](#)
- [protocols/modbus/serial/mb\\_master](#)
- [protocols/modbus/tcp/mb\\_tcp\\_slave](#)
- [protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the `README.md` documents of each specific example for details.

### Protocol References

- For the detailed protocol specifications, see [The Modbus Organization](#).

## 2.2.3 ESP-MQTT

### Overview

ESP-MQTT is an implementation of [MQTT](#) protocol client, which is a lightweight publish/subscribe messaging protocol. Now ESP-MQTT supports [MQTT v5.0](#).

### Features

- Support MQTT over TCP, SSL with Mbed TLS, MQTT over WebSocket, and MQTT over WebSocket Secure
- Easy to setup with URI
- Multiple instances (multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings, and all 3 Quality of Service (QoS) levels (it should be a fully functional client)

### Application Examples

- [protocols/mqtt/tcp](#): MQTT over TCP, default port 1883
- [protocols/mqtt/ssl](#): MQTT over TLS, default port 8883
- [protocols/mqtt/ssl\\_ds](#): MQTT over TLS using digital signature peripheral for authentication, default port 8883
- [protocols/mqtt/ssl\\_mutual\\_auth](#): MQTT over TLS using certificates for authentication, default port 8883

- `protocols/mqtt/ssl_psk`: MQTT over TLS using pre-shared keys for authentication, default port 8883
- `protocols/mqtt/ws`: MQTT over WebSocket, default port 80
- `protocols/mqtt/wss`: MQTT over WebSocket Secure, default port 443
- `protocols/mqtt5`: Uses ESP-MQTT library to connect to broker with MQTT v5.0

### MQTT Message Retransmission

A new MQTT message is created by calling `esp_mqtt_client_publish` or its non blocking counterpart `esp_mqtt_client_enqueue`.

Messages with QoS 0 is sent only once. QoS 1 and 2 have different behaviors since the protocol requires extra steps to complete the process.

The ESP-MQTT library opts to always retransmit unacknowledged QoS 1 and 2 publish messages to avoid losses in faulty connections, even though the MQTT specification requires the re-transmission only on reconnect with Clean Session flag been set to 0 (set `disable_clean_session` to true for this behavior).

QoS 1 and 2 messages that may need retransmission are always enqueued, but first transmission try occurs immediately if `esp_mqtt_client_publish` is used. A transmission retry for unacknowledged messages will occur after `message_retransmit_timeout`. After `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` messages will expire and be deleted. If `CONFIG_MQTT_REPORT_DELETED_MESSAGES` is set, an event will be sent to notify the user.

### Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `esp_mqtt_client_config_t::broker_t` - Allow to set address and security verification.
- `esp_mqtt_client_config_t::credentials_t` - Client credentials for authentication.
- `esp_mqtt_client_config_t::session_t` - Configuration for MQTT session aspects.
- `esp_mqtt_client_config_t::network_t` - Networking related configuration.
- `esp_mqtt_client_config_t::task_t` - Allow to configure FreeRTOS task.
- `esp_mqtt_client_config_t::buffer_t` - Buffer size for input and output.

In the following sections, the most common aspects are detailed.

### Broker

**Address** Broker address can be set by usage of `address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in WebSocket connections.

The `uri` field is used in the format `scheme://hostname:port/path`.

- Currently support `mqtt`, `mqtt5`, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtt5s://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
  - `mqtt5s://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over WebSocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over WebSocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);

```

**Note:** By default MQTT client uses event loop library to post related MQTT events (connected, subscribed, published, etc.).

**Verification** For secure connections with TLS used, and to guarantee Broker's identity, the *verification* struct must be set. The broker certificate may be set in PEM or DER format. To select DER, the equivalent *certificate\_len* field must be set. Otherwise, a null-terminated string in PEM format should be provided to *certificate* field.

- Get certificate from server, example: `mqtt.eclipseprojects.io`

```

openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/
↪null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem

```

- Check the sample application: [protocols/mqtt/ssl](#)
- Configuration:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};

```

For details about other fields, please check the [API Reference](#) and [TLS Server Verification](#).

**Client Credentials** All client related credentials are under the *credentials* field.

- *username*: pointer to the username used for connecting to the broker, can also be set by URI
- *client\_id*: pointer to the client ID, defaults to ESP32\_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format

**Authentication** It is possible to set authentication parameters through the *authentication* field. The client supports the following authentication methods:

- *password*: use a password by setting
- *certificate* and *key*: mutual authentication with TLS, and both can be provided in PEM or DER format
- *use\_secure\_element*: use secure element available in ESP32-WROOM-32SE
- *ds\_data*: use Digital Signature Peripheral available in some Espressif devices

**Session** For MQTT session related configurations, *session* fields should be used.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the *last\_will* struct.

- *topic*: pointer to the LWT message topic
- *msg*: pointer to the LWT message
- *msg\_len*: length of the LWT message, required if *msg* is not null-terminated

- *qos*: quality of service for the LWT message
- *retain*: specifies the retain flag of the LWT message

**Change Settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menu-config`, under Component `config` > ESP-MQTT Configuration.

The following settings are available:

- *CONFIG\_MQTT\_PROTOCOL\_311*: enable 3.1.1 version of MQTT protocol
- *CONFIG\_MQTT\_TRANSPORT\_SSL* and *CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET*: enable specific MQTT transport layer, such as SSL, WEBSOCKET, and WEBSOCKET\_SECURE
- *CONFIG\_MQTT\_CUSTOM\_OUTBOX*: disable default implementation of `mqtt_outbox`, so a specific implementation can be supplied

## Events

The following events may be posted by the MQTT client:

- *MQTT\_EVENT\_BEFORE\_CONNECT*: The client is initialized and about to start connecting to the broker.
- *MQTT\_EVENT\_CONNECTED*: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- *MQTT\_EVENT\_DISCONNECTED*: The client has aborted the connection due to being unable to read or write data, e.g., because the server is unavailable.
- *MQTT\_EVENT\_SUBSCRIBED*: The broker has acknowledged the client's subscribe request. The event data contains the message ID of the subscribe message.
- *MQTT\_EVENT\_UNSUBSCRIBED*: The broker has acknowledged the client's unsubscribe request. The event data contains the message ID of the unsubscribe message.
- *MQTT\_EVENT\_PUBLISHED*: The broker has acknowledged the client's publish message. This is only posted for QoS level 1 and 2, as level 0 does not use acknowledgements. The event data contains the message ID of the publish message.
- *MQTT\_EVENT\_DATA*: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer, multiple *MQTT\_EVENT\_DATA* events are posted and *current\_data\_offset* and *total\_data\_len* from event data updated to keep track of the fragmented message.
- *MQTT\_EVENT\_ERROR*: The client has encountered an error. The field *error\_handle* in the event data contains *error\_type* that can be used to identify the error. The type of error determines which parts of the *error\_handle* struct is filled.

## API Reference

### Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`
- This header file can be included with:

```
#include "mqtt_client.h"
```

- This header file is a part of the API provided by the `mqtt` component. To declare that your component depends on `mqtt`, add the following to your `CMakeLists.txt`:

```
REQUIRES mqtt
```

or

```
PRIV_REQUIRES mqtt
```

### Functions

*esp\_mqtt\_client\_handle\_t* **esp\_mqtt\_client\_init** (const *esp\_mqtt\_client\_config\_t* \*config)

Creates *MQTT* client handle based on the configuration.

**Parameters** **config** -- *MQTT* configuration structure

**Returns** *mqtt\_client\_handle* if successfully created, NULL on error

*esp\_err\_t* **esp\_mqtt\_client\_set\_uri** (*esp\_mqtt\_client\_handle\_t* client, const char \*uri)

Sets *MQTT* connection URI. This API is usually used to overrides the URI configured in *esp\_mqtt\_client\_init*.

**Parameters**

- **client** -- *MQTT* client handle
- **uri** --

**Returns** ESP\_FAIL if URI parse error, ESP\_OK on success

*esp\_err\_t* **esp\_mqtt\_client\_start** (*esp\_mqtt\_client\_handle\_t* client)

Starts *MQTT* client with already created client handle.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL on other error

*esp\_err\_t* **esp\_mqtt\_client\_reconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force reconnection upon a specific event.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

*esp\_err\_t* **esp\_mqtt\_client\_disconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force disconnection from the broker.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization

*esp\_err\_t* **esp\_mqtt\_client\_stop** (*esp\_mqtt\_client\_handle\_t* client)

Stops *MQTT* client tasks.

- Notes:
- Cannot be called from the *MQTT* event handler

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

int **esp\_mqtt\_client\_subscribe\_single** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- *esp\_mqtt\_client\_subscribe* could be used to call this function.

**Parameters**

- **client** -- *MQTT* client handle
- **topic** -- topic filter to subscribe
- **qos** -- Max qos level of the subscription

**Returns** *message\_id* of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_subscribe\_multiple** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_topic\_t* \*topic\_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

#### Parameters

- **client** -- *MQTT* client handle
- **topic\_list** -- List of topics to subscribe
- **size** -- size of topic\_list

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe_single` for details

#### Parameters

- **client** -- *MQTT* client handle
- **topic** --

**Returns** message\_id of the subscribe message on success -1 on failure

int **esp\_mqtt\_client\_publish** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

#### Parameters

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag

**Returns** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success. -1 on failure, -2 in case of full outbox.

int **esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the `mqtt-task` context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

#### Parameters

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag
- **store** -- if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** `message_id` if queued successfully, -1 on failure, -2 in case of full outbox.

`esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)`

Destroys the client handle.

Notes:

- Cannot be called from the *MQTT* event handler

**Parameters** **client** -- *MQTT* client handle

**Returns** `ESP_OK` `ESP_ERR_INVALID_ARG` on wrong initialization

`esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)`

Set configuration structure, typically used when updating the config (i.e. on "before\_connect" event).

Notes:

- When calling this function make sure to have all the intended configurations set, otherwise default values are set.

#### Parameters

- **client** -- *MQTT* client handle
- **config** -- *MQTT* configuration structure

**Returns** `ESP_ERR_NO_MEM` if failed to allocate `ESP_ERR_INVALID_ARG` if conflicts on transport configuration. `ESP_OK` on success

`esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)`

Registers *MQTT* event.

#### Parameters

- **client** -- *MQTT* client handle
- **event** -- event type
- **event\_handler** -- handler callback
- **event\_handler\_arg** -- handlers context

**Returns** `ESP_ERR_NO_MEM` if failed to allocate `ESP_ERR_INVALID_ARG` on wrong initialization `ESP_OK` on success

`esp_err_t esp_mqtt_client_unregister_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler)`

Unregisters mqtt event.

#### Parameters

- **client** -- mqtt client handle
- **event** -- event ID
- **event\_handler** -- handler to unregister

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on invalid event ID ESP\_OK on success

int **esp\_mqtt\_client\_get\_outbox\_size** (*esp\_mqtt\_client\_handle\_t* client)

Get outbox size.

**Parameters** **client** -- *MQTT* client handle

**Returns** outbox size 0 on wrong initialization

*esp\_err\_t* **esp\_mqtt\_dispatch\_custom\_event** (*esp\_mqtt\_client\_handle\_t* client, *esp\_mqtt\_event\_t* \*event)

Dispatch user event to the mqtt internal event loop.

**Parameters**

- **client** -- *MQTT* client handle
- **event** -- *MQTT* event handle structure

**Returns** ESP\_OK on success ESP\_ERR\_TIMEOUT if the event couldn't be queued (ref also CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE)

## Structures

struct **esp\_mqtt\_error\_codes**

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp\_tls\_last\_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp\_tls\_last\_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking error\_type first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	connect_return_code	Internal error reported from <i>MQTT</i> broker on connection

## Public Members

*esp\_err\_t* **esp\_tls\_last\_esp\_err**

last esp\_err code reported from esp-tls component

int **esp\_tls\_stack\_err**

tls specific error code reported from underlying tls stack

int **esp\_tls\_cert\_verify\_flags**

tls flags reported from underlying tls stack during certificate verification

*esp\_mqtt\_error\_type\_t* **error\_type**

error type referring to the source of the error

*esp\_mqtt\_connect\_return\_code\_t* **connect\_return\_code**

connection refused error code reported from MQTT\* broker on connection

int **esp\_transport\_sock\_errno**

errno from the underlying socket

struct **esp\_mqtt\_event\_t**

*MQTT* event configuration structure

## Public Members

*esp\_mqtt\_event\_id\_t* **event\_id**

*MQTT* event type

*esp\_mqtt\_client\_handle\_t* **client**

*MQTT* client handle for this event

char \***data**

Data associated with this event

int **data\_len**

Length of the data for this event

int **total\_data\_len**

Total length of the data (longer data are supplied with multiple events)

int **current\_data\_offset**

Actual offset for the data associated with this event

char \***topic**

Topic associated with this event

int **topic\_len**

Length of the topic for this event associated with this event

int **msg\_id**

*MQTT* message id of message

int **session\_present**

*MQTT* session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* \***error\_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection, defaults to value from menuconfig

struct **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t* **broker**

Broker address and security verification

struct *esp\_mqtt\_client\_config\_t::credentials\_t* **credentials**

User credentials for broker

struct *esp\_mqtt\_client\_config\_t::session\_t* **session**

*MQTT* session configuration.

struct *esp\_mqtt\_client\_config\_t::network\_t* **network**

Network configuration

struct *esp\_mqtt\_client\_config\_t::task\_t* **task**

FreeRTOS task configuration.

struct *esp\_mqtt\_client\_config\_t::buffer\_t* **buffer**

Buffer size configuration.

struct *esp\_mqtt\_client\_config\_t::outbox\_config\_t* **outbox**

Outbox configuration.

struct **broker\_t**

Broker related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t::address\_t* **address**

Broker address configuration

struct *esp\_mqtt\_client\_config\_t::broker\_t::verification\_t* **verification**

Security verification of the broker

struct **address\_t**

Broker address

- uri have precedence over other fields
- If uri isn't set at least hostname, transport and port should.

### Public Members

const char **\*uri**

Complete *MQTT* broker URI

const char **\*hostname**

Hostname, to set ipv4 pass it as string)

*esp\_mqtt\_transport\_t* **transport**

Selects transport

const char **\*path**

Path in the URI

uint32\_t **port**

*MQTT* server port

struct **verification\_t**

Broker identity verification

If fields are not set broker's identity isn't verified. it's recommended to set the options in this struct for security reasons.

### Public Members

bool **use\_global\_ca\_store**

Use a global ca\_store, look esp-tls documentation for details.

*esp\_err\_t* (**\*cert\_bundle\_attach**)(void \*conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles. Client only attach the bundle, the clean up must be done by the user.

const char **\*certificate**

Certificate data, default is NULL. It's not copied nor freed by the client, user needs to clean up.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const struct *psk\_key\_hint* **\*psk\_hint\_key**

Pointer to PSK struct defined in esp\_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker. It's not copied nor freed by the client, user needs to clean up.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char **\*\*alpn\_protos**

NULL-terminated list of supported application protocols to be used for ALPN.

const char \***common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname. This is ignored if skip\_cert\_common\_name\_check=true. It's not copied nor freed by the client, user needs to clean up.

struct **buffer\_t**

Client buffer size configuration

Client have two buffers for input and output respectively.

### Public Members

int **size**

size of *MQTT* send/receive buffer

int **out\_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by `buffer_size`

struct **credentials\_t**

Client related credentials for authentication.

### Public Members

const char \***username**

*MQTT* username

const char \***client\_id**

Set *MQTT* client identifier. Ignored if set\_null\_client\_id == true If NULL set the default client id. Default client id is ESP32\_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool **set\_null\_client\_id**

Selects a NULL client id

struct *esp\_mqtt\_client\_config\_t::credentials\_t::authentication\_t* **authentication**

Client authentication

struct **authentication\_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

### Public Members

const char \***password**

*MQTT* password

const char \***certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with `key`. It's not copied nor freed by the client, user needs to clean up.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const char \***key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also `certificate` has to be provided. It's not copied nor freed by the client, user needs to clean up.

size\_t **key\_len**

Length of the buffer pointed to by key.

const char \***key\_password**

Client key decryption password, not PEM nor DER, if provided `key_password_len` must be correctly set.

int **key\_password\_len**

Length of the password pointed to by `key_password`

bool **use\_secure\_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void \***ds\_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices. It's not copied nor freed by the client, user needs to clean up.

struct **network\_t**

Network related configuration

### Public Members

int **reconnect\_timeout\_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh\_connection\_after\_ms**

Refresh connection after this value (in milliseconds)

bool **disable\_auto\_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

esp\_transport\_handle\_t **transport**

Custom transport handle to use. Warning: The transport should be valid during the client lifetime and is destroyed when `esp_mqtt_client_destroy` is called.

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

struct **outbox\_config\_t**

Client outbox configuration options.

### Public Members

uint64\_t **limit**

Size limit for the outbox in bytes.

struct **session\_t**

*MQTT* Session related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::session\_t::last\_will\_t* **last\_will**

Last will configuration

bool **disable\_clean\_session**

*MQTT* clean session, default `clean_session` is true

int **keepalive**

*MQTT* keepalive, default is 120 seconds When configuring this value, keep in mind that the client attempts to communicate with the broker at half the interval that is actually set. This conservative approach allows for more attempts before the broker's timeout occurs

bool **disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection.

int **message\_retransmit\_timeout**

timeout for retransmitting of failed packet

struct **last\_will\_t**

Last Will and Testament message configuration.

### Public Members

const char **\*topic**

LWT (Last Will and Testament) message topic

const char **\*msg**

LWT message, may be NULL terminated

int **msg\_len**

LWT message length, if msg isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

struct **task\_t**

Client task configuration

### Public Members

int **priority**

*MQTT* task priority

int **stack\_size**

*MQTT* task stack size

struct **topic\_t**

Topic definition struct

### Public Members

const char **\*filter**

Topic filter to subscribe

int **qos**

Max QoS level of the subscription

### Macros

**MQTT\_ERROR\_TYPE\_ESP\_TLS**

MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT\_ERROR\_TYPE\_ESP\_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

**esp\_mqtt\_client\_subscribe** (client\_handle, topic\_type, qos\_or\_size)

Convenience macro to select subscribe function to use.

Notes:

- Usage of `esp_mqtt_client_subscribe_single` is the same as previous `esp_mqtt_client_subscribe`, refer to it for details.

#### Parameters

- **client\_handle** -- *MQTT* client handle
- **topic\_type** -- Needs to be `char*` for single subscription or `esp_mqtt_topic_t` for multiple topics
- **qos\_or\_size** -- It's either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.

**Returns** `message_id` of the subscribe message on success -1 on failure -2 in case of full outbox.

### Type Definitions

```
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
```

```
typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t
```

*MQTT* event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- client - *MQTT* client handle
- various other data depending on event type

```
typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t
```

*MQTT* connection error codes propagated via ERROR event

```
typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t
```

*MQTT* connection error codes propagated via ERROR event

```
typedef enum esp_mqtt_transport_t esp_mqtt_transport_t
```

```
typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t
```

*MQTT* protocol version used for connection

```
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from `tcp_transport/esp-tls` | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from *MQTT* broker on connection |

```
typedef struct esp_mqtt_event_t esp_mqtt_event_t
```

*MQTT* event configuration structure

typedef *esp\_mqtt\_event\_t* \***esp\_mqtt\_event\_handle\_t**

typedef struct *esp\_mqtt\_client\_config\_t* **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

typedef struct *topic\_t* **esp\_mqtt\_topic\_t**

Topic definition struct

## Enumerations

enum **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

*Values:*

enumerator **MQTT\_EVENT\_ANY**

enumerator **MQTT\_EVENT\_ERROR**

on error event, additional context: connection return code, error handle from esp\_tls (if supported)

enumerator **MQTT\_EVENT\_CONNECTED**

connected event, additional context: session\_present flag

enumerator **MQTT\_EVENT\_DISCONNECTED**

disconnected event

enumerator **MQTT\_EVENT\_SUBSCRIBED**

subscribed event, additional context:

- msg\_id message id
- error\_handle *error\_type* in case subscribing failed
- data pointer to broker response, check for errors.
- data\_len length of the data for this event

enumerator **MQTT\_EVENT\_UNSUBSCRIBED**

unsubscribed event, additional context: msg\_id

enumerator **MQTT\_EVENT\_PUBLISHED**

published event, additional context: msg\_id

enumerator **MQTT\_EVENT\_DATA**

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received
- retain retain flag of the message
- `qos` QoS level of the message
- `dup` dup flag of the message Note: Multiple `MQTT_EVENT_DATA` could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

enumerator **MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

enumerator **MQTT\_USER\_EVENT**

Custom event used to queue tasks into mqtt event handler All fields from the `esp_mqtt_event_t` type could be used to pass an additional context data to the handler.

enum **esp\_mqtt\_connect\_return\_code\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_CONNECTION\_ACCEPTED**

Connection accepted

enumerator **MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

*MQTT* connection refused reason: Wrong protocol

enumerator **MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

*MQTT* connection refused reason: ID rejected

enumerator **MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

*MQTT* connection refused reason: Server unavailable

enumerator **MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

*MQTT* connection refused reason: Wrong user

enumerator **MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

*MQTT* connection refused reason: Wrong username or password

enum **esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_ERROR\_TYPE\_NONE**

enumerator **MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT**

enumerator **MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED**

enumerator **MQTT\_ERROR\_TYPE\_SUBSCRIBE\_FAILED**

enum **esp\_mqtt\_transport\_t**

*Values:*

enumerator **MQTT\_TRANSPORT\_UNKNOWN**

enumerator **MQTT\_TRANSPORT\_OVER\_TCP**

*MQTT over TCP, using scheme: MQTT*

enumerator **MQTT\_TRANSPORT\_OVER\_SSL**

*MQTT over SSL, using scheme: MQTTS*

enumerator **MQTT\_TRANSPORT\_OVER\_WS**

*MQTT over WebSocket, using scheme:: ws*

enumerator **MQTT\_TRANSPORT\_OVER\_WSS**

*MQTT over WebSocket Secure, using scheme: wss*

enum **esp\_mqtt\_protocol\_ver\_t**

*MQTT protocol version used for connection*

*Values:*

enumerator **MQTT\_PROTOCOL\_UNDEFINED**

enumerator **MQTT\_PROTOCOL\_V\_3\_1**

enumerator **MQTT\_PROTOCOL\_V\_3\_1\_1**

enumerator **MQTT\_PROTOCOL\_V\_5**

## 2.2.4 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functions. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, and non-blocking connection among others. All the configurations can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2, etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree Structure for ESP-TLS Component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
├── private_include
│   ├── esp_tls_mbedtls.h
│   └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contains the public API headers for the component. Internally, the ESP-TLS component operates using either MbedTLS or WolfSSL, which are SSL/TLS libraries. APIs specific to MbedTLS are present in `esp-tls/private_include/esp_tls_mbedtls.h` and APIs specific to WolfSSL are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server Verification

ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected, the client will return a fatal error by default during the TLS connection setup.

- **ca\_cert\_buf** and **ca\_cert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS uses the CA certificate present in the buffer to verify the server. The following variables in the `esp_tls_cfg_t` structure must be set.
  - `ca_cert_buf` - pointer to the buffer which contains the CA certification.
  - `ca_cert_bytes` - the size of the CA certificate in bytes.
- **use\_global\_ca\_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See the API Reference section below for information regarding different APIs used for initializing and setting up the `global_ca_store`.
- **cert\_bundle\_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#).
- **psk\_hint\_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to the PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purposes. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option

is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure.

**Warning:** Enabling this option comes with a potential risk of establishing a TLS connection with a server that has a fake identity, provided that the server certificate is not provided either through API or other mechanisms like `ca_store` etc.

### ESP-TLS Server Cert Selection Hook

The ESP-TLS component provides an option to set the server certification selection hook when using the MbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake. The callback helps to select a certificate to present to the client based on the TLS extensions supplied in the client hello message, such as ALPN and SNI. To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig.

The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

### Underlying SSL/TLS Library Options

The ESP-TLS component offers the option to use MbedTLS or WolfSSL as its underlying SSL/TLS library. By default, only MbedTLS is available and used, WolfSSL SSL/TLS library is also available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides the WolfSSL component in binary format, and it also provides a few examples that are useful for understanding the API. Please refer to the repository `README.md` for information on licensing and other options. Please see the below section for instructions on how to use WolfSSL in your project.

---

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

---

### How to Use WolfSSL with ESP-IDF

There are two ways to use WolfSSL in your project:

- 1) Directly add WolfSSL as a component in your project with the following three commands:

```
(First, change the directory (cd) to your project directory)
mkdir components
cd components
git clone --recursive https://github.com/espressif/esp-wolfssl.git
```

- 2) Add WolfSSL as an extra component in your project.

- Download WolfSSL with:

```
git clone --recursive https://github.com/espressif/esp-wolfssl.git
```

- Include ESP-WolfSSL in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in `CMakeLists.txt` of your project as done in [wolfssl/examples](#). For reference see *Optional Project Variables* in *build-system*.

After the above steps, you will have the option to choose WolfSSL as the underlying SSL/TLS library in the configuration menu of your project as follows:

```
idf.py menuconfig > ESP-TLS > SSL/TLS Library > Mbedtls/Wolfssl
```

### Comparison Between MbedTLS and WolfSSL

The following table shows a typical comparison between WolfSSL and MbedTLS when the [protocols/https\\_request](#) example (which includes server authentication) is running with both SSL/TLS libraries and with all respective configurations set to default. For MbedTLS, the IN\_CONTENT length and OUT\_CONTENT length are set to 16384 bytes and 4096 bytes respectively.

Property	WolfSSL	MbedTLS
Total Heap Consumed	~ 19 KB	~ 37 KB
Task Stack Used	~ 2.2 KB	~ 3.6 KB
Bin size	~ 858 KB	~ 736 KB

**Note:** These values can vary based on configuration options and version of respective libraries.

### Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-P4. Use of the DS for TLS is supported only when ESP-TLS is used with MbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature \(DS\)](#). The technical details of Digital Signature such as how to calculate private key parameters can be found in [ESP32-P4 Technical Reference Manual > Digital Signature \(DS\) \[PDF\]](#). The DS peripheral must be configured before it can be used to perform Digital Signature, see [Configure the DS peripheral for a TLS connection](#).

The DS peripheral must be initialized with the required encrypted private key parameters, which are obtained when the DS peripheral is configured. ESP-TLS internally initializes the DS peripheral when provided with the required DS context, i.e., DS parameters. Please see the below code snippet for passing the DS context to the ESP-TLS context. The DS context passed to the ESP-TLS context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from...
→the nvs or provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client certification */,
    .clientcert_bytes = /* length of the client certification */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client certification (*clientcert\_buf*) and the DS params (*ds\_data*) are required and the client key (*clientkey\_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

## ECDSA Peripheral with ESP-TLS

ESP-TLS provides support for using the ECDSA peripheral with ESP32-P4. The use of ECDSA peripheral is supported only when ESP-TLS is used with MbedTLS as its underlying SSL/TLS stack. The ECDSA private key should be present in the eFuse for using the ECDSA peripheral. Please refer to [espefuse.py](#) documentation for programming the ECDSA key in the efuse. To use ECDSA peripheral with ESP-TLS, set `esp_tls_cfg_t::use_ecdsa_peripheral` to `true`, and set `esp_tls_cfg_t::ecdsa_key_efuse_blk` to the eFuse block ID in which ECDSA private key is stored. This will enable the use of ECDSA peripheral for private key operations. As the client private key is already present in the eFuse, it needs not be supplied to the `esp_tls_cfg_t` structure.

```
#include "esp_tls.h"
esp_tls_cfg_t cfg = {
    .use_ecdsa_peripheral = true,
    .ecdsa_key_efuse_blk = /* efuse block with ecdsa private key */,
};
```

---

**Note:** When using ECDSA peripheral with TLS, only `MBEDTLS_TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256` ciphersuite is supported. If using TLS v1.3, `MBEDTLS_TLS1_3_AES_128_GCM_SHA256` ciphersuite is supported.

---

## TLS Ciphersuites

ESP-TLS provides the ability to set a ciphersuites list in client mode. The TLS ciphersuites list informs the server about the supported ciphersuites for the specific TLS connection regardless of the TLS stack configuration. If the server supports any ciphersuite from this list, then the TLS connection will succeed; otherwise, it will fail.

You can set `ciphersuites_list` in the `esp_tls_cfg_t` structure during client connection as follows:

```
/* ciphersuites_list must end with 0 and must be available in the memory scope.
↳active during the entire TLS connection */
static const int ciphersuites_list[] = {MBEDTLS_TLS_ECDHE_ECDSA_WITH_AES_256_GCM_
↳SHA384, MBEDTLS_TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384, 0};
esp_tls_cfg_t cfg = {
    .ciphersuites_list = ciphersuites_list,
};
```

ESP-TLS will not check the validity of `ciphersuites_list` that was set, you should call `esp_tls_get_ciphersuites_list()` to get ciphersuites list supported in the TLS stack and cross-check it against the supplied list.

---

**Note:** This feature is supported only in the MbedTLS stack.

---

## API Reference

### Header File

- [components/esp-tls/esp\\_tls.h](#)
- This header file can be included with:

```
#include "esp_tls.h"
```

- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp-tls
```

or

```
PRIV_REQUIRES esp-tls
```

## Functions

*esp\_tls\_t* \***esp\_tls\_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Returns** *tls* Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

*esp\_tls\_t* \***esp\_tls\_conn\_http\_new** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp\_tls\_conn\_http\_new\_sync* (and its asynchronous version *esp\_tls\_conn\_http\_new\_async*)

### Parameters

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp\_tls\_cfg\_t'. At a minimum, this structure should be zero-initialized.

**Returns** pointer to *esp\_tls\_t*, or NULL if connection couldn't be opened.

int **esp\_tls\_conn\_new\_sync** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

### Parameters

- **hostname** -- **[in]** Hostname of the host.
- **hostlen** -- **[in]** Length of hostname.
- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.
- **tls** -- **[in]** Pointer to esp-tls as esp-tls handle.

### Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_http\_new\_sync** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as *esp\_tls\_conn\_new\_sync*() API. However this API accepts host's url.

### Parameters

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp\_tls\_cfg\_t'. At a minimum, this structure should be zero-initialized.
- **tls** -- **[in]** Pointer to esp-tls as esp-tls handle.

### Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_new\_async** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn't wait for the connection to get established.

#### Parameters

- **hostname** -- [in] Hostname of the host.
- **hostlen** -- [in] Length of hostname.
- **port** -- [in] Port number of the host.
- **cfg** -- [in] TLS configuration as *esp\_tls\_cfg\_t*. `non_block` member of this structure should be set to be true.
- **tls** -- [in] pointer to esp-tls as esp-tls handle.

#### Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp\_tls\_conn\_http\_new\_async** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as `esp_tls_conn_new_async()` API. However this API accepts host's url.

#### Parameters

- **url** -- [in] url of host.
- **cfg** -- [in] TLS configuration as *esp\_tls\_cfg\_t*.
- **tls** -- [in] pointer to esp-tls as esp-tls handle.

#### Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize\_t **esp\_tls\_conn\_write** (*esp\_tls\_t* \*tls, const void \*data, size\_t datalen)

Write from buffer 'data' into specified tls connection.

#### Parameters

- **tls** -- [in] pointer to esp-tls as esp-tls handle.
- **data** -- [in] Buffer from which data will be written.
- **datalen** -- [in] Length of data buffer.

#### Returns

- $\geq 0$  if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- $< 0$  if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize\_t **esp\_tls\_conn\_read** (*esp\_tls\_t* \*tls, void \*data, size\_t datalen)

Read from specified tls connection into the buffer 'data'.

#### Parameters

- **tls** -- [in] pointer to esp-tls as esp-tls handle.
- **data** -- [in] Buffer to hold read data.
- **datalen** -- [in] Length of data buffer.

#### Returns

- $> 0$  if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- $< 0$  if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

int **esp\_tls\_conn\_destroy** (*esp\_tls\_t* \*tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new_sync()` (or `esp_tls_conn_http_new_sync()`) and `esp_tls_conn_new_async()` (or `esp_tls_conn_http_new_async()`) APIs.

**Parameters** **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns** - 0 on success

- -1 if socket error or an invalid argument

ssize\_t **esp\_tls\_get\_bytes\_avail** (*esp\_tls\_t* \*tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's `mbedtls_ssl_get_bytes_avail()` API.

**Parameters** **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 in case of invalid arg
- bytes available in the application data record read buffer

*esp\_err\_t* **esp\_tls\_get\_conn\_sockfd** (*esp\_tls\_t* \*tls, int \*sockfd)

Returns the connection socket file descriptor from esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **sockfd** -- **[out]** int pointer to sockfd value.

**Returns** - ESP\_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd == NULL)

*esp\_err\_t* **esp\_tls\_set\_conn\_sockfd** (*esp\_tls\_t* \*tls, int sockfd)

Sets the connection socket file descriptor for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **sockfd** -- **[in]** sockfd value to set.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd < 0)

*esp\_err\_t* **esp\_tls\_get\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* \*conn\_state)

Gets the connection state for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **conn\_state** -- **[out]** pointer to the connection state value.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG (Invalid arguments)

*esp\_err\_t* **esp\_tls\_set\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* conn\_state)

Sets the connection state for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **conn\_state** -- **[in]** connection state value to set.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG (Invalid arguments)

void \***esp\_tls\_get\_ssl\_context** (*esp\_tls\_t* \*tls)

Returns the ssl context.

**Parameters** **tls** -- **[in]** handle to esp\_tls context

- Returns** - ssl\_ctx pointer to ssl context of underlying TLS layer on success
- NULL in case of error

*esp\_err\_t* **esp\_tls\_init\_global\_ca\_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

**Returns**

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* **esp\_tls\_set\_global\_ca\_store** (const unsigned char \*cacert\_pem\_buf, const unsigned int cacert\_pem\_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

**Parameters**

- **cacert\_pem\_buf** -- [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert\_pem\_bytes** -- [in] Length of the buffer.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_tls\_free\_global\_ca\_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_last\_error** (*esp\_tls\_error\_handle\_t* h, int \*esp\_tls\_code, int \*esp\_tls\_flags)

Returns last error in esp\_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Parameters**

- **h** -- [in] esp-tls error handle.
- **esp\_tls\_code** -- [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code
- **esp\_tls\_flags** -- [out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

**Returns**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK (0) if no error occurred
- specific error code (based on ESP\_ERR\_ESP\_TLS\_BASE) otherwise

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_error\_type** (*esp\_tls\_error\_handle\_t* h, *esp\_tls\_error\_type\_t* err\_type, int \*error\_code)

Returns the last error captured in esp\_tls of a specific type The error information is cleared internally upon return.

**Parameters**

- **h** -- [in] esp-tls error handle.
- **err\_type** -- [in] specific error type
- **error\_code** -- [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

**Returns**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK if a valid error returned and was cleared

*esp\_err\_t* **esp\_tls\_get\_error\_handle** (*esp\_tls\_t* \*tls, *esp\_tls\_error\_handle\_t* \*error\_handle)

Returns the ESP-TLS error\_handle.

**Parameters**

- **tls** -- [in] handle to esp\_tls context
- **error\_handle** -- [out] pointer to the error handle.

**Returns**

- ESP\_OK on success and error\_handle will be updated with the ESP-TLS error handle.
- ESP\_ERR\_INVALID\_ARG if (tls == NULL || error\_handle == NULL)

*MBEDTLS\_X509\_CRT* \***esp\_tls\_get\_global\_ca\_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

---

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

---

**Returns**

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

const int \***esp\_tls\_get\_ciphersuites\_list** (void)

Get supported TLS ciphersuites list.

See <https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4> for the list of ciphersuites

**Returns** Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites.

*esp\_err\_t* **esp\_tls\_plain\_tcp\_connect** (const char \*host, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_error\_handle\_t* error\_handle, int \*sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**

- **host** -- [in] Hostname of the host.
- **hostlen** -- [in] Length of hostname.
- **port** -- [in] Port number of the host.
- **cfg** -- [in] ESP-TLS configuration as *esp\_tls\_cfg\_t*.
- **error\_handle** -- [out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** -- [out] Socket descriptor if successfully connected on TCP layer

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG if invalid output parameters ESP-TLS based error codes on failure

**Structures**

struct **psk\_key\_hint**

ESP-TLS preshared key and hint structure.

**Public Members**

const uint8\_t \***key**  
key in PSK authentication mode in binary format

const size\_t **key\_size**  
length of the key

const char \***hint**  
hint in PSK authentication mode in string format

struct **tls\_keep\_alive\_cfg**  
esp-tls client session ticket ctx  
Keep alive parameters structure

### Public Members

bool **keep\_alive\_enable**  
Enable keep-alive timeout

int **keep\_alive\_idle**  
Keep-alive idle time (second)

int **keep\_alive\_interval**  
Keep-alive interval time (second)

int **keep\_alive\_count**  
Keep-alive packet retry send count

struct **esp\_tls\_cfg**  
ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

### Public Members

const char \*\***alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char \*\*alpn\_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char **\*cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support  
This buffer should be NULL terminated in case of PEM

const unsigned char **\*cacert\_pem\_buf**

CA certificate buffer legacy name

unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char **\*clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*clientcert\_pem\_buf**

Client certificate legacy name

unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

const unsigned char **\*clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*clientkey\_pem\_buf**

Client key legacy name

unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

const unsigned char **\*clientkey\_password**

Client key decryption password string

unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **use\_ecdsa\_peripheral**

Use the ECDSA peripheral for the private key operations

uint8\_t **ecdsa\_key\_efuse\_blk**

The efuse block where the ECDSA key is stored

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use\_secure\_element**

Enable this option to use secure element or atec608a chip ( Integrated with ESP32-WROOM-32SE )

int **timeout\_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32\_MAX

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

const char \***common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

*tls\_keep\_alive\_cfg\_t* \***keep\_alive\_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk\_hint\_key\_t* \***psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void \***ds\_data**

Pointer for digital signature peripheral context

bool **is\_plain\_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp\_tls\_plain\_tcp\_connect() API

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

*esp\_tls\_addr\_family\_t* **addr\_family**

The address family to use when connecting to a host.

const int \***ciphersuites\_list**

Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites. Please check the list validity by `esp_tls_get_ciphersuites_list()` API

*esp\_tls\_proto\_ver\_t* **tls\_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

### Type Definitions

typedef enum *esp\_tls\_conn\_state* **esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

typedef enum *esp\_tls\_role* **esp\_tls\_role\_t**

typedef struct *psk\_key\_hint* **psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls\_keep\_alive\_cfg* **tls\_keep\_alive\_cfg\_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef enum *esp\_tls\_addr\_family* **esp\_tls\_addr\_family\_t**

typedef struct *esp\_tls\_cfg* **esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

typedef struct esp\_tls **esp\_tls\_t**

### Enumerations

enum **esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

enumerator **ESP\_TLS\_INIT**

enumerator **ESP\_TLS\_CONNECTING**

enumerator **ESP\_TLS\_HANDSHAKE**

enumerator **ESP\_TLS\_FAIL**

enumerator **ESP\_TLS\_DONE**

enum **esp\_tls\_role**

*Values:*

enumerator **ESP\_TLS\_CLIENT**

enumerator **ESP\_TLS\_SERVER**

enum **esp\_tls\_addr\_family**

*Values:*

enumerator **ESP\_TLS\_AF\_UNSPEC**

Unspecified address family.

enumerator **ESP\_TLS\_AF\_INET**

IPv4 address family.

enumerator **ESP\_TLS\_AF\_INET6**

IPv6 address family.

enum **esp\_tls\_proto\_ver\_t**

*Values:*

enumerator **ESP\_TLS\_VER\_ANY**

enumerator **ESP\_TLS\_VER\_TLS\_1\_2**

enumerator **ESP\_TLS\_VER\_TLS\_1\_3**

enumerator **ESP\_TLS\_VER\_TLS\_MAX**

### Header File

- [components/esp-tls/esp\\_tls\\_errors.h](#)
- This header file can be included with:

```
#include "esp_tls_errors.h"
```

- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp-tls
```

or

```
PRIV_REQUIRES esp-tls
```

## Structures

struct **esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

### Public Members

*esp\_err\_t* **last\_error**

error code (based on ESP\_ERR\_ESP\_TLS\_BASE) of the last occurred error

int **esp\_tls\_error\_code**

esp\_tls error code from last esp\_tls failed api

int **esp\_tls\_flags**

last certification verification flags

## Macros

**ESP\_ERR\_ESP\_TLS\_BASE**

Starting number of ESP-TLS error codes

**ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME**

Error if hostname couldn't be resolved upon tls connection

**ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET**

Failed to create socket

**ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY**

Unsupported protocol family

**ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST**

Failed to connect to host

**ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED**

failed to set/get socket option

**ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT**

new connection in esp\_tls\_low\_level\_conn connection timeouted

**ESP\_ERR\_ESP\_TLS\_SE\_FAILED**

**ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN**

**ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK**

mbedtls parse certificates was partly successful

**ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED**

wolfSSL api returned failed

**ESP\_TLS\_ERR\_SSL\_WANT\_READ**

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- esp\_tls\_conn\_read()
- esp\_tls\_conn\_write()

**ESP\_TLS\_ERR\_SSL\_WANT\_WRITE****ESP\_TLS\_ERR\_SSL\_TIMEOUT**

### Type Definitions

```
typedef struct esp_tls_last_error *esp_tls_error_handle_t
```

```
typedef struct esp_tls_last_error esp_tls_last_error_t
```

Error structure containing relevant errors in case tls error occurred.

### Enumerations

```
enum esp_tls_error_type_t
```

Definition of different types/sources of error codes reported from different components

*Values:*

enumerator **ESP\_TLS\_ERR\_TYPE\_UNKNOWN**

enumerator **ESP\_TLS\_ERR\_TYPE\_SYSTEM**

System error –errno

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS\_CERT\_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP\_TLS\_ERR\_TYPE\_ESP**

ESP-IDF error type –esp\_err\_t

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL\_CERT\_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP\_TLS\_ERR\_TYPE\_MAX**

Last err type –invalid entry

## 2.2.5 ESP HTTP Client

### Overview

`esp_http_client` component provides a set of APIs for making HTTP/S requests from ESP-IDF applications. The steps to use these APIs are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_handle_t` instance, i.e., an HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values are assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data, and closing the connection (as required), while blocking the current task before its completion. All related events are invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests can be found at [protocols/esp\\_http\\_client](#).

### Basic HTTP Request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

### Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance. Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

### HTTPS Request

ESP HTTP client supports SSL connections using **mbedTLS**, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

**Note:** While making HTTPS requests, if server verification is needed, an additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in the `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

---

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example for implementation details of the above note.

## HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle.
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional).
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection.
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`.
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream.
- `esp_http_client_close()`: Close the connection.
- `esp_http_client_cleanup()`: Release allocated resources.

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

## HTTP Authentication

### ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only one perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes two perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

### Examples of Authentication Configuration

- Authentication with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

## Event Handling

ESP HTTP Client supports event handling by triggering an event handler corresponding to the event which takes place. `esp_http_client_event_id_t` contains all the events which could occur while performing an HTTP request using the ESP HTTP Client.

To enable event handling, you just need to set a callback function using the `esp_http_client_config_t::event_handler` member.

## ESP HTTP Client Diagnostic Information

Diagnostic information could be helpful to gain insights into a problem. In the case of ESP HTTP Client, the diagnostic information can be collected by registering an event handler with *the Event Loop library*. This feature has been added by keeping in mind the [ESP Insights](#) framework which collects the diagnostic information. However, this feature can also be used without any dependency on the ESP Insights framework for the diagnostic purpose. Event handler can be registered to the event loop using the `esp_event_handler_register()` function.

Expected data types for different HTTP Client events in the event loop are as follows:

- `HTTP_EVENT_ERROR`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_CONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_HEADERS_SENT`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_HEADER`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_DATA`: `esp_http_client_on_data_t`
- `HTTP_EVENT_ON_FINISH`: `esp_http_client_handle_t`
- `HTTP_EVENT_DISCONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_REDIRECT`: `esp_http_client_redirect_event_data_t`

The `esp_http_client_handle_t` received along with the event data will be valid until `HTTP_EVENT_DISCONNECTED` is not received. This handle has been sent primarily to differentiate between different client connections and must not be used for any other purpose, as it may change based on client connection state.

## API Reference

### Header File

- `components/esp_http_client/include/esp_http_client.h`
- This header file can be included with:

```
#include "esp_http_client.h"
```

- This header file is a part of the API provided by the `esp_http_client` component. To declare that your component depends on `esp_http_client`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_http_client
```

or

```
PRIV_REQUIRES esp_http_client
```

## Functions

*esp\_http\_client\_handle\_t* **esp\_http\_client\_init** (const *esp\_http\_client\_config\_t* \*config)

Start a HTTP session This function must be the first function to call, and it returns a *esp\_http\_client\_handle\_t* that you must use as input to other functions in the interface. This call MUST have a corresponding call to *esp\_http\_client\_cleanup* when the operation is complete.

**Parameters** **config** -- [in] The configurations, see *http\_client\_config\_t*

### Returns

- *esp\_http\_client\_handle\_t*
- NULL if any errors

*esp\_err\_t* **esp\_http\_client\_perform** (*esp\_http\_client\_handle\_t* client)

Invoke this function after *esp\_http\_client\_init* and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same *esp\_http\_client\_handle\_t* as input as the *esp\_http\_client\_init* call returned. *esp\_http\_client\_perform* performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking *esp\_http\_client\_perform*(), *is\_async* member of *esp\_http\_client\_config\_t* must be set while making a call to *esp\_http\_client\_init*() API. You can do any amount of calls to *esp\_http\_client\_perform* while using the same *esp\_http\_client\_handle\_t*. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. *esp\_http\_client* will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use *esp\_http\_client\_set\_\*\** between the invokes to set options for the following *esp\_http\_client\_perform*.

---

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several *esp\_http\_client\_handle\_t*. This function include *esp\_http\_client\_open* -> *esp\_http\_client\_write* -> *esp\_http\_client\_fetch\_headers* -> *esp\_http\_client\_read* (and option) *esp\_http\_client\_close*.

---

**Parameters** **client** -- The *esp\_http\_client* handle

### Returns

- ESP\_OK on successful
- ESP\_FAIL on error

*esp\_err\_t* **esp\_http\_client\_cancel\_request** (*esp\_http\_client\_handle\_t* client)

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same *esp\_http\_client* context.

**Parameters** **client** -- The *esp\_http\_client* handle

### Returns

- ESP\_OK on successful
- ESP\_FAIL on error
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_INVALID\_STATE

*esp\_err\_t* **esp\_http\_client\_set\_url** (*esp\_http\_client\_handle\_t* client, const char \*url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

### Parameters

- **client** -- [in] The *esp\_http\_client* handle
- **url** -- [in] The url

### Returns

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_set\_post\_field** (*esp\_http\_client\_handle\_t* client, const char \*data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **data** -- **[in]** post data pointer
- **len** -- **[in]** post length

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_get\_post\_field** (*esp\_http\_client\_handle\_t* client, char \*\*data)

Get current post field information.

**Parameters**

- **client** -- **[in]** The client
- **data** -- **[out]** Point to post data pointer

**Returns** Size of post data

*esp\_err\_t* **esp\_http\_client\_set\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, const char \*value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **key** -- **[in]** The header key
- **value** -- **[in]** The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, char \*\*value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **key** -- **[in]** The header key
- **value** -- **[out]** The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_username** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **value** -- **[out]** The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_username** (*esp\_http\_client\_handle\_t* client, const char \*username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle

- **username** -- **[in]** The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **value** -- **[out]** The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* client, const char \*password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **password** -- **[in]** The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_auth\_type\_t* auth\_type)

Set http request `auth_type`.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **auth\_type** -- **[in]** The `esp_http_client` auth type

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*\*data)

Get http request `user_data`. The value stored from the `esp_http_client_config_t` will be written to the address passed into data.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **data** -- **[out]** A pointer to the pointer that will be set to `user_data`.

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*data)

Set http request `user_data`. The value passed in +data+ will be available during event callbacks. No memory management will be performed on the user's behalf.

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **data** -- **[in]** The pointer to the user data

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

int **esp\_http\_client\_get\_errno** (*esp\_http\_client\_handle\_t* client)

Get HTTP client session `errno`.

**Parameters** **client** -- **[in]** The esp\_http\_client handle

**Returns**

- (-1) if invalid argument
- errno

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_method\_t* method)

Set http request method.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **method** -- **[in]** The method

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_timeout\_ms** (*esp\_http\_client\_handle\_t* client, int timeout\_ms)

Set http request timeout.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **timeout\_ms** -- **[in]** The timeout value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* client, const char \*key)

Delete http request header.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **key** -- **[in]** The key

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* client, int write\_len)

This function will be open the connection, write all header strings and return.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **write\_len** -- **[in]** HTTP Content length need to write to the server

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* client, const char \*buffer, int len)

This function will write data to the HTTP connection previously opened by esp\_http\_client\_open()

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **buffer** -- The buffer
- **len** -- **[in]** This value must not be larger than the write\_len parameter provided to esp\_http\_client\_open()

**Returns**

- (-1) if any errors
- Length of data written

int64\_t **esp\_http\_client\_fetch\_headers** (*esp\_http\_client\_handle\_t* client)

This function need to call after esp\_http\_client\_open, it will read from http stream, process all receive headers.

**Parameters** **client** -- **[in]** The esp\_http\_client handle

**Returns**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked_response`)
- (-1: `ESP_FAIL`) if any errors
- (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) if call is timed-out before any data was ready
- Download data length defined by content-length header

bool `esp_http_client_is_chunked_response` (*esp\_http\_client\_handle\_t* client)

Check response data is chunked.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns** true or false

int `esp_http_client_read` (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Read data from http stream.

---

**Note:** (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) is returned when call is timed-out before any data was ready

---

**Parameters**

- `client` -- [in] The `esp_http_client` handle
- `buffer` -- The buffer
- `len` -- [in] The length

**Returns**

- (-1) if any errors
- Length of data was read

int `esp_http_client_get_status_code` (*esp\_http\_client\_handle\_t* client)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns** Status code

int64\_t `esp_http_client_get_content_length` (*esp\_http\_client\_handle\_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- (-1) Chunked transfer
- Content-Length value as bytes

*esp\_err\_t* `esp_http_client_close` (*esp\_http\_client\_handle\_t* client)

Close http connection, still kept all http request resources.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- `ESP_OK`
- `ESP_FAIL`

*esp\_err\_t* `esp_http_client_cleanup` (*esp\_http\_client\_handle\_t* client)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- `ESP_OK`
- `ESP_FAIL`

*esp\_http\_client\_transport\_t* **esp\_http\_client\_get\_transport\_type** (*esp\_http\_client\_handle\_t* client)

Get transport type.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

*esp\_err\_t* **esp\_http\_client\_set\_redirection** (*esp\_http\_client\_handle\_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_set\_auth\_data** (*esp\_http\_client\_handle\_t* client, const char \*auth\_data, int len)

On receiving a custom authentication header, this API can be invoked to set the authentication information from the header. This API can be called from the event handler.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **auth\_data** -- [in] The authentication data received in the header
- **len** -- [in] length of auth\_data.

**Returns**

- ESP\_ERR\_INVALID\_ARG
- ESP\_OK

void **esp\_http\_client\_add\_auth** (*esp\_http\_client\_handle\_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

---

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

---

**Parameters** **client** -- [in] The esp\_http\_client handle

bool **esp\_http\_client\_is\_complete\_data\_received** (*esp\_http\_client\_handle\_t* client)

Checks if entire data in the response has been read without any error.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- true
- false

int **esp\_http\_client\_read\_response** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **buffer** -- The buffer
- **len** -- [in] The buffer length

**Returns**

- Length of data was read

*esp\_err\_t* **esp\_http\_client\_flush\_response** (*esp\_http\_client\_handle\_t* client, int \*len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

#### Parameters

- **client** -- [in] The `esp_http_client` handle
- **len** -- Length of data discarded

#### Returns

- `ESP_OK` If successful, len will have discarded length
- `ESP_FAIL` If failed to read response
- `ESP_ERR_INVALID_ARG` If the client is NULL

*esp\_err\_t* **esp\_http\_client\_get\_url** (*esp\_http\_client\_handle\_t* client, char \*url, const int len)

Get URL from client.

#### Parameters

- **client** -- [in] The `esp_http_client` handle
- **url** -- [inout] The buffer to store URL
- **len** -- [in] The buffer length

#### Returns

- `ESP_OK`
- `ESP_FAIL`

*esp\_err\_t* **esp\_http\_client\_get\_chunk\_length** (*esp\_http\_client\_handle\_t* client, int \*len)

Get Chunk-Length from client.

#### Parameters

- **client** -- [in] The `esp_http_client` handle
- **len** -- [out] Variable to store length

#### Returns

- `ESP_OK` If successful, len will have length of current chunk
- `ESP_FAIL` If the server is not a chunked server
- `ESP_ERR_INVALID_ARG` If the client or len are NULL

## Structures

struct **esp\_http\_client\_event**

HTTP Client events data.

### Public Members

*esp\_http\_client\_event\_id\_t* **event\_id**

event\_id, to know the cause of the event

*esp\_http\_client\_handle\_t* **client**

`esp_http_client_handle_t` context

void \***data**

data of the event

int **data\_len**

data length of data

void **\*user\_data**

user\_data context, from *esp\_http\_client\_config\_t* user\_data

char **\*header\_key**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header key

char **\*header\_value**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header value

struct **esp\_http\_client\_on\_data**

Argument structure for HTTP\_EVENT\_ON\_DATA event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int64\_t **data\_process**

Total data processed

struct **esp\_http\_client\_redirect\_event\_data**

Argument structure for HTTP\_EVENT\_REDIRECT event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int **status\_code**

Status Code

struct **esp\_http\_client\_config\_t**

HTTP configuration.

### Public Members

const char **\*url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char **\*host**

Domain or IP as string

int **port**

Port to connect, default depend on esp\_http\_client\_transport\_t (80 or 443)

const char **\*username**

Using for Http authentication

const char **\*password**

Using for Http authentication

*esp\_http\_client\_auth\_type\_t* **auth\_type**

Http authentication type, see *esp\_http\_client\_auth\_type\_t*

const char **\*path**

HTTP Path, if not set, default is /

const char **\*query**

HTTP query

const char **\*cert\_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size\_t **cert\_len**

Length of the buffer pointed to by *cert\_pem*. May be 0 for null-terminated pem

const char **\*client\_cert\_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size\_t **client\_cert\_len**

Length of the buffer pointed to by *client\_cert\_pem*. May be 0 for null-terminated pem

const char **\*client\_key\_pem**

SSL client key, PEM format as string, if the server requires to verify client

size\_t **client\_key\_len**

Length of the buffer pointed to by *client\_key\_pem*. May be 0 for null-terminated pem

const char **\*client\_key\_password**

Client key decryption password string

size\_t **client\_key\_password\_len**

String length of the password pointed to by *client\_key\_password*

*esp\_http\_client\_proto\_ver\_t* **tls\_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

const char **\*user\_agent**

The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**

HTTP Method

int **timeout\_ms**

Network timeout in milliseconds

bool **disable\_auto\_redirect**

Disable HTTP automatic redirects

int **max\_redirection\_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max\_authorization\_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http\_event\_handle\_cb* **event\_handler**

HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**

HTTP transport type, see *esp\_http\_client\_transport\_t*

int **buffer\_size**

HTTP receive buffer size

int **buffer\_size\_tx**

HTTP transmit buffer size

void **\*user\_data**

HTTP user\_data context

bool **is\_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

const char **\*common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

*esp\_err\_t* (**\*crt\_bundle\_attach**)(void \*conf)

Function pointer to *esp\_cert\_bundle\_attach*. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

void **\*ds\_data**

Pointer for digital signature peripheral context, see ESP-TLS Documentation for more details

## Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**

Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**

The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**

Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of errno EAGAIN to esp\_err\_t

**ESP\_ERR\_HTTP\_CONNECTION\_CLOSED**

Read FIN from peer and the connection closed

## Type Definitions

typedef struct esp\_http\_client **\*esp\_http\_client\_handle\_t**

typedef struct *esp\_http\_client\_event* **\*esp\_http\_client\_event\_handle\_t**

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef struct esp_http_client_on_data esp_http_client_on_data_t
```

Argument structure for HTTP\_EVENT\_ON\_DATA event.

```
typedef struct esp_http_client_redirect_event_data esp_http_client_redirect_event_data_t
```

Argument structure for HTTP\_EVENT\_REDIRECT event.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

## Enumerations

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

*Values:*

enumerator **HTTP\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_EVENT\_ON\_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

enumerator **HTTP\_EVENT\_HEADERS\_SENT**

After sending all the headers to the server

enumerator **HTTP\_EVENT\_HEADER\_SENT**

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

enumerator **HTTP\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the server

enumerator **HTTP\_EVENT\_ON\_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP\_EVENT\_ON\_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_EVENT\_REDIRECT**

Intercepting HTTP redirects to handle them manually

```
enum esp_http_client_transport_t
```

HTTP Client transport.

*Values:*

enumerator **HTTP\_TRANSPORT\_UNKNOWN**

Unknown

enumerator **HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator **HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

enum **esp\_http\_client\_proto\_ver\_t**

*Values:*

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_ANY**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_TLS\_1\_2**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_TLS\_1\_3**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_MAX**

enum **esp\_http\_client\_method\_t**

HTTP method.

*Values:*

enumerator **HTTP\_METHOD\_GET**

HTTP GET Method

enumerator **HTTP\_METHOD\_POST**

HTTP POST Method

enumerator **HTTP\_METHOD\_PUT**

HTTP PUT Method

enumerator **HTTP\_METHOD\_PATCH**

HTTP PATCH Method

enumerator **HTTP\_METHOD\_DELETE**

HTTP DELETE Method

enumerator **HTTP\_METHOD\_HEAD**

HTTP HEAD Method

enumerator **HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP\_METHOD\_COPY**

HTTP COPY Method

enumerator **HTTP\_METHOD\_MOVE**

HTTP MOVE Method

enumerator **HTTP\_METHOD\_LOCK**

HTTP LOCK Method

enumerator **HTTP\_METHOD\_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP\_METHOD\_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP\_METHOD\_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP\_METHOD\_MKCOL**

HTTP MKCOL Method

enumerator **HTTP\_METHOD\_MAX**

enum **esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:*

enumerator **HTTP\_AUTH\_TYPE\_NONE**

No authentication

enumerator **HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

enumerator **HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

enum **HttpStatus\_Code**

Enum for the HTTP status codes.

*Values:*

enumerator **HttpStatus\_Ok**

enumerator `HttpStatus_MultipleChoices`

enumerator `HttpStatus_MovedPermanently`

enumerator `HttpStatus_Found`

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

## 2.2.6 ESP Local Control

### Overview

ESP Local Control (`esp_local_ctrl`) component in ESP-IDF provides capability to control an ESP device over HTTPS or Bluetooth® Low Energy. It provides access to application defined **properties** that are available for reading/writing via a set of configurable handlers.

Initialization of the `esp_local_ctrl` service over Bluetooth Low Energy transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = &(protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    }
};
```

(continues on next page)

(continued from previous page)

```

},
.handlers = {
    /* User defined handler functions */
    .get_prop_values = get_property_values,
    .set_prop_values = set_property_values,
    .usr_ctx         = NULL,
    .usr_ctx_free_fn = NULL
},
/* Maximum number of properties that may be set */
.max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[]   asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]   asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. `PROTOCOLCOM_SEC2`: specifies that SRP6a-based key exchange and end-to-end encryption based on AES-GCM are used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol, i.e., SRP6a.
2. `PROTOCOLCOM_SEC1`: specifies that Curve25519-based key exchange and end-to-end encryption based on AES-CTR are used.
3. `PROTOCOLCOM_SEC0`: specifies that data will be exchanged as a plain text (no security).
4. `PROTOCOLCOM_SEC_CUSTOM`: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocol security version section in *Protocol Communication* for more details.

## Creating a Property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique `name` (string), a `type` (e.g., enum), `flags` (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g., if it is a string or bytestream). For data types with fixed-length property value, like int, float, etc., setting the `size` field to the right value helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally upto the application, hence they may be used as enumerations, bitfields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get/set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value. This is_
→essential because the value has to be valid even after this function_
→returns. Alternative is to use dynamic allocation and set (continues on next page)
→field */
```

(continued from previous page)

```

        static int32_t ts = func_get_time();
        prop_values[i].data = &ts;
    }
}
return ESP_OK;
}

```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    const esp_local_ctrl_prop_val_t
↳*prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
↳props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#).

### Client Side Implementation

The client side implementation establishes a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service translates these messages into requests and then call the appropriate handlers (set/get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count`: This should simply return the total number of properties supported by the service.
2. `get_prop_values`: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices.
3. `set_prop_values`: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices.

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index-to-name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index-to-name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

Table 1: Endpoints provided by ESP Local Control

Endpoint Name (Bluetooth Low Energy + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl_version	https://<mdns-hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl_control	https://<mdns-hostname>.local/esp_local_ctrl/control	Endpoint used for sending or receiving control messages

## API Reference

### Header File

- [components/esp\\_local\\_ctrl/include/esp\\_local\\_ctrl.h](#)
- This header file can be included with:

```
#include "esp_local_ctrl.h"
```

- This header file is a part of the API provided by the `esp_local_ctrl` component. To declare that your component depends on `esp_local_ctrl`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_local_ctrl
```

or

```
PRIV_REQUIRES esp_local_ctrl
```

### Functions

`const esp_local_ctrl_transport_t* esp_local_ctrl_get_transport_ble` (void)

Function for obtaining BLE transport mode.

`const esp_local_ctrl_transport_t* esp_local_ctrl_get_transport_httpd` (void)

Function for obtaining HTTPD transport mode.

`esp_err_t esp_local_ctrl_start` (const `esp_local_ctrl_config_t`\*config)

Start local control service.

**Parameters** `config` -- [in] Pointer to configuration structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

`esp_err_t esp_local_ctrl_stop` (void)

Stop local control service.

`esp_err_t esp_local_ctrl_add_property` (const `esp_local_ctrl_prop_t`\*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

**Parameters** `prop` -- [in] Property description structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_remove\_property** (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters** **name** -- [in] Name of the property to remove

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

const *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (const char \*name)

Get property description structure by name.

This API may be used to get a property's context structure *esp\_local\_ctrl\_prop\_t* when its name is known

**Parameters** **name** -- [in] Name of the property to find

**Returns**

- Pointer to property
- NULL if not found

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

---

**Note:** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the *protocomm\_ble\_config\_t* structure set in *esp\_local\_ctrl\_config\_t*, and passed to *esp\_local\_ctrl\_start()*.

---

**Parameters**

- **ep\_name** -- [in] Name of the endpoint
- **handler** -- [in] Endpoint handler function
- **user\_ctx** -- [in] User data

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

## Unions

union **esp\_local\_ctrl\_transport\_config\_t**

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

### Public Members

*esp\_local\_ctrl\_transport\_config\_ble\_t* \***ble**

This is same as *protocomm\_ble\_config\_t*. See *protocomm\_ble.h* for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \***httpd**

This is same as *httpd\_ssl\_config\_t*. See *esp\_https\_server.h* for available configuration parameters.

## Structures

### struct **esp\_local\_ctrl\_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

#### Public Members

char \***name**

Unique name of property

uint32\_t **type**

Type of property. This may be set to application defined enums

size\_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32\_t **flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void \***ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (\***ctx\_free\_fn**)(void \*ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

### struct **esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

#### Public Members

void \***data**

Pointer to memory holding property value

size\_t **size**

Size of property value

```
void (*free_fn)(void *data)
```

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

```
struct esp_local_ctrl_handlers
```

Handlers for receiving and responding to local control commands for getting and setting properties.

### Public Members

```
esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],  
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```

Handler function to be implemented for retrieving current values of properties.

---

**Note:** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the current values for which have been requested by the client

**Param prop\_values [out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

```
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const  
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```

Handler function to be implemented for changing values of properties.

---

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop\_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

void **\*usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (**\*usr\_ctx\_free\_fn**)(void \*usr\_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp\_local\_ctrl\_proto\_sec\_cfg**

Protocom security configs

### Public Members

*esp\_local\_ctrl\_proto\_sec\_t* **version**

This sets protocom security version, `sec0/sec1` or `custom`. If `custom`, user must provide handle via `proto_sec_custom_handle` below

void **\*custom\_handle**

Custom security handle if security is set `custom` via `proto_sec` above. This handle must follow `protocomm_security_t` signature

const void **\*pop**

Proof of possession to be used for local control. Could be `NULL`.

const void **\*sec\_params**

Pointer to security params (`NULL` if not needed). This is not needed for `protocomm` security 0. This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for `protocomm` security 1 and `esp_local_ctrl_security2_params_t` for `protocomm` security 2 respectively. Could be `NULL`.

struct **esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

### Public Members

const *esp\_local\_ctrl\_transport\_t* **\*transport**

Transport layer over which service will be provided

*esp\_local\_ctrl\_transport\_config\_t* **transport\_config**

Transport layer over which service will be provided

*esp\_local\_ctrl\_proto\_sec\_cfg\_t* **proto\_sec**

Security version and POP

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties

size\_t **max\_properties**

This limits the number of properties that are available at a time

## Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

## Type Definitions

typedef struct *esp\_local\_ctrl\_prop* **esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp\_local\_ctrl\_prop\_val* **esp\_local\_ctrl\_prop\_val\_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp\_local\_ctrl\_handlers* **esp\_local\_ctrl\_handlers\_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp\_local\_ctrl\_transport* **esp\_local\_ctrl\_transport\_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm\_ble\_config* **esp\_local\_ctrl\_transport\_config\_ble\_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd\_config* **esp\_local\_ctrl\_transport\_config\_httpd\_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t` (for HTTPS) or `httpd_config_t` (for HTTP)

typedef enum *esp\_local\_ctrl\_proto\_sec* **esp\_local\_ctrl\_proto\_sec\_t**

Security types for `esp_local_control`.

typedef *protocomm\_security1\_params\_t* **esp\_local\_ctrl\_security1\_params\_t**

typedef *protocomm\_security2\_params\_t* **esp\_local\_ctrl\_security2\_params\_t**

typedef struct *esp\_local\_ctrl\_proto\_sec\_cfg* **esp\_local\_ctrl\_proto\_sec\_cfg\_t**

Protocom security configs

typedef struct *esp\_local\_ctrl\_config* **esp\_local\_ctrl\_config\_t**

Configuration structure to pass to `esp_local_ctrl_start()`

## Enumerations

enum **esp\_local\_ctrl\_proto\_sec**

Security types for esp\_local\_control.

*Values:*

enumerator **PROTOCOLCOM\_SEC0**

enumerator **PROTOCOLCOM\_SEC1**

enumerator **PROTOCOLCOM\_SEC2**

enumerator **PROTOCOLCOM\_SEC\_CUSTOM**

## 2.2.7 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

---

**Note:** The ESP-IDF component `esp_serial_slave_link` has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ESSL component on GitHub](#)

To add ESSL component in your project, please run `idf.py add-dependency espressif/esp_serial_slave_link`.

---

### Espressif Device Protocols

For more details about Espressif device protocols, see the following documents.

#### ESP SPI Slave HD (Half Duplex) Mode Protocol

##### SPI Slave Capabilities of Espressif Chips

	ESP32	ESP32-S2	ESP32-C3	ESP32-S3	ESP32-C2	ESP32-C6	ESP32-H2
SPI Slave HD	N	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)
Tohost intr		N	N	N	N	N	N
Frhost intr		2 *	2 *	2 *	2 *	2 *	2 *
TX DMA		Y	Y	Y	Y	Y	Y
RX DMA		Y	Y	Y	Y	Y	Y
Shared registers		72	64	64	64	64	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (listed by the order they should exist):

- **Command:** 8-bit, master to slave  
This phase determines the rest phases of the transactions. See *Supported Commands*.
- **Address:** 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of the shared register to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional  
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The **direction** means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number (WN) used in corresponding modes.

Mode	Command WN	Address WN	Dummy cycles	Data WN
1-bit	1	1	1	1
DOOUT	1	1	4	2
DIO	1	2	4	2
QOOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it is not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

### Supported Commands

**Note:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, and RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave loads onto the DMA, the master is allowed to read or write in segments. In this way, the master does not have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR\_DONE (0x07) for WRDMA and CMD8 (0x08) for RDDMA.

Here is an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA.
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave.

3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave.
5. The slave loads another 4092 bytes of data onto the RDDMA.
6. The master can start new reading transactions after it sends the CMD8.

### Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the `esp_serial_slave_link` component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  - The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services Provided by ESP Slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. TX FIFO (master to slave): The slave can receive data from the master in units of receiving buffers. The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. RX FIFO (slave to master): The slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line. The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: The master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif Chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the SDMMC component. It includes the usage of communicating with ESP SDIO Slave device via the SDMMC Host or SDSPI Host feature. The ESSL device should be initialized as below:

1. Initialize a SDMMC card (see `:doc:` Document of SDMMC driver </api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.

3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

### ESP SPI Slave

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Has not been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (Optional)

1. Call `essl_get_intr_ena()` to know which events trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it tries to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

#### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it updates the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset Counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

### Application Example

The example below shows how ESP32-P4 SDIO host and slave communicate with each other. The host uses the ESSL SDIO:

[peripherals/sdio](#)

Please refer to the specific example README.md for details.

## API Reference

### Header File

- `components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

### Functions

`esp_err_t` **essl\_init** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Initialize the slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK`: If success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl\_wait\_for\_ready** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Wait for interrupt of an ESSL slave device.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK`: If success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_tx\_buffer\_num** (`essl_handle_t` handle, `uint32_t` \*out\_tx\_num, `uint32_t` wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Parameters

- **handle** -- Handle of a ESSL device.
- **out\_tx\_num** -- Output of buffer num that host can send data to ESSL slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_get\_rx\_data\_size** (`essl_handle_t` handle, `uint32_t` \*out\_rx\_size, `uint32_t` wait\_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### Parameters

- **handle** -- Handle of an ESSL device.
- **out\_rx\_size** -- Output of data size to read from slave, in bytes
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_reset\_cnt** (`essl_handle_t` handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**Parameters** **handle** -- Handle of an ESSL device.

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Parameters

- **handle** -- Handle of an ESSL device.
- **start** -- Start address of the packet to send
- **length** -- Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init or other argument is not valid.
- `ESP_ERR_TIMEOUT`: No buffer to use, or error from SDMMC host controller.
- `ESP_ERR_NOT_FOUND`: Slave is not ready for receiving.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESSL slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **out\_data** -- **[out]** Data output address
- **size** -- The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out\_length** -- **[out]** Output of length the data actually received from slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK` Success: All the data has been read from the slave.
- `ESP_ERR_INVALID_ARG`: Invalid argument, The handle is not initialized or the other arguments are invalid.
- `ESP_ERR_NOT_FINISHED`: Read was successful, but there is still data remaining.
- `ESP_ERR_NOT_FOUND`: Slave is not ready to send data.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.

---

#### Parameters

- **handle** -- Handle of an ESSL device.
- **addr** -- Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** -- Value to write to the register.
- **value\_o** -- Output of the returned written value.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**

- **handle** -- Handle of a `essl` device.
- **add** -- Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value\_o** -- Output value read from the register.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_wait\_int** (`essl_handle_t` handle, `uint32_t` wait\_ms)

wait for an interrupt of the slave

**Parameters**

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: If interrupt is triggered.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- `ESP_ERR_TIMEOUT`: No interrupts before timeout.

`esp_err_t` **essl\_clear\_intr** (`essl_handle_t` handle, `uint32_t` intr\_mask, `uint32_t` wait\_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **intr\_mask** -- Mask of interrupt bits to clear.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_intr** (`essl_handle_t` handle, `uint32_t` \*intr\_raw, `uint32_t` \*intr\_st, `uint32_t` wait\_ms)

Get interrupt bits of ESSL slave.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **intr\_raw** -- Output of the raw interrupt bits. Set to `NULL` if only masked bits are read.
- **intr\_st** -- Output of the masked interrupt bits. set to `NULL` if only raw bits are read.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: Success
- `ESP_INVALID_ARG`: If both `intr_raw` and `intr_st` are `NULL`.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_set\_intr\_ena** (`essl_handle_t` handle, `uint32_t` ena\_mask, `uint32_t` wait\_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **ena\_mask** -- Mask of the interrupt bits to enable.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t \*ena\_mask\_o, uint32\_t wait\_ms)

Get interrupt enable bits of ESSL slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **ena\_mask\_o** -- Output of interrupt bit enable mask.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_send\_slave\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **intr\_mask** -- Mask of interrupt bits to send to slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

## Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

## Header File

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

## Functions

*esp\_err\_t* **essl\_sdio\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_sdio\_config\_t* \*config)

Initialize the ESSL SDIO device and get its handle.

#### Parameters

- **out\_handle** -- Output of the handle.
- **config** -- Configuration for the ESSL SDIO device.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters** **handle** -- Handle of the ESSL SDIO device to deinit.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

## Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

## Public Members

*sdmmc\_card\_t* \***card**

The initialized sdmmc card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated recv buffer size used by both the host and the slave.

## Header File

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_spi.h](#)

## Functions

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

### Parameters

- **out\_handle** -- [out] Output of the handle
- **init\_config** -- Configuration for the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

**Parameters** **handle** -- Handle of the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see *rx\_sync\_reg* in *essl\_spi\_config\_t*)

---

### Parameters

- **arg** -- Context of the component. (Member *arg* from *essl\_handle\_t*)
- **addr** -- Address of the shared registers. (Valid: 0 ~ SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE, registers for M/S sync are reserved, see note1).
- **out\_value** -- [out] Read buffer for the shared registers.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

### Returns

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI has not been initialized.
- ESP\_ERR\_INVALID\_ARG: The address argument is not valid. See note 1.
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_get\_packet** (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

**Parameters**

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **out\_data** -- **[out]** Output data address
- **size** -- The size of the output data.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl\_spi\_write\_reg** (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

---

---

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

---

**Parameters**

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** -- Buffer for data to send, should be align to 4.
- **out\_value** -- **[out]** Not supported, should be set to `NULL`.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl\_spi\_send\_packet** (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

**Parameters**

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **data** -- Address of the data to send
- **size** -- Size of the data to send.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl\_spi\_reset\_cnt** (void \*arg)

Reset the counter in Master context.

---

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

**Parameters** **arg** -- Context of the component. (Member **arg** from `essl_handle_t`)

*esp\_err\_t* **essl\_spi\_rdbuf** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in ISR way.

---

**Note:** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

---

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rdbuf\_polling** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrbuf** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in ISR way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` `essl_spi_wrbuf_polling` (`spi_device_handle_t` spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

`esp_err_t` `essl_spi_rddma` (`spi_device_handle_t` spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** -- Total length of data to receive.
- **seg\_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_seg** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

---

**Note:** To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg\_len** -- Length of this segment
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

---

**Note:** This is required only when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **len** -- Total length of data to send.
- **seg\_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

---

**Note:** To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

---

**Parameters**

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **seg\_len** -- Length of this segment
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the wrdma\_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**Note:** This is required only when the slave is working in segment mode.

---

**Parameters**

- **spi** -- SPI device handle representing the slave
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Structures**

struct **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \***spi**

Pointer to SPI device handle.

uint32\_t **tx\_buf\_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8\_t **tx\_sync\_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8\_t **rx\_sync\_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

## 2.2.8 ESP x509 Certificate Bundle

## Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**Note:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility, the certificates' subject name and public key are stored in a file and embedded in the ESP32-P4 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jan 10 04:12:06 2023 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition, it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacrt_all.pem`.

---

## Configuration

Most configuration is done through `menuconfig`. CMake generates the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root certificate list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

## Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#)

The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of [curl](#).

Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech's [SSL Survey](#).

These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in [Generating the List of Root Certificates](#).

### Application Examples

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

### API Reference

#### Header File

- `components/mbedtls/esp_cert_bundle/include/esp_cert_bundle.h`
- This header file can be included with:

```
#include "esp_cert_bundle.h"
```

- This header file is a part of the API provided by the `mbedtls` component. To declare that your component depends on `mbedtls`, add the following to your `CMakeLists.txt`:

```
REQUIRES mbedtls
```

or

```
PRIV_REQUIRES mbedtls
```

#### Functions

`esp_err_t esp_cert_bundle_attach` (void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in `menuconfig` and embedded in the binary.

**Parameters** `conf` -- [in] The config struct for the SSL connection.

**Returns**

- `ESP_OK` if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void `esp_cert_bundle_detach` (mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters** `conf` -- [in] The config struct for the SSL connection.

`esp_err_t esp_cert_bundle_set` (const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

#### Parameters

- **x509\_bundle** -- [in] A pointer to the certificate bundle.
- **bundle\_size** -- [in] Size of the certificate bundle in bytes.

#### Returns

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

## 2.2.9 HTTP Server

### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-P4. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task closes all open connections, removes registered URI handlers and resets all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including uri name, method type (eg. HTTPD\_GET/HTTPD\_POST/HTTPD\_PUT etc.), function pointer of type `esp_err_t *handler` (`httpd_req_t *req`) and `user_ctx` pointer to user context data.

### Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
  
```

(continues on next page)

(continued from previous page)

```
    * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}
```

(continues on next page)

(continued from previous page)

```

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

```

**Simple HTTP Server Example** Check HTTP server example under [protocols/http\\_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

### Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

### Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↪data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↪context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http\\_server/persistent\\_sockets](#).

### Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the [protocols/http\\_server/ws\\_echo\\_server](#) example which demonstrates usage of the websocket feature.

## Event Handling

ESP HTTP server has various events for which a handler can be triggered by *the Event Loop library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP server.

`esp_http_server_event_id_t` has all the events which can happen for ESP HTTP server.

Expected data type for different ESP HTTP server events in event loop:

- `HTTP_SERVER_EVENT_ERROR`: `httpd_err_code_t`
- `HTTP_SERVER_EVENT_START`: `NULL`
- `HTTP_SERVER_EVENT_ON_CONNECTED`: `int`
- `HTTP_SERVER_EVENT_ON_HEADER`: `int`
- `HTTP_SERVER_EVENT_HEADERS_SENT`: `int`
- `HTTP_SERVER_EVENT_ON_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_SENT_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_DISCONNECTED`: `int`
- `HTTP_SERVER_EVENT_STOP`: `NULL`

## API Reference

### Header File

- `components/esp_http_server/include/esp_http_server.h`
- This header file can be included with:

```
#include "esp_http_server.h"
```

- This header file is a part of the API provided by the `esp_http_server` component. To declare that your component depends on `esp_http_server`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_http_server
```

or

```
PRIV_REQUIRES esp_http_server
```

### Functions

`esp_err_t httpd_register_uri_handler` (`httpd_handle_t` handle, const `httpd_uri_t` \*uri\_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}
```

(continues on next page)

```

}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
// If failed to register handler
    ....
}

```

---

**Note:** URI handlers can be registered in real time as long as the server handle is valid.

---

#### Parameters

- **handle** -- **[in]** handle to HTTPD server instance
- **uri\_handler** -- **[in]** pointer to handler that needs to be registered

#### Returns

- **ESP\_OK** : On successfully registering the handler
- **ESP\_ERR\_INVALID\_ARG** : Null arguments
- **ESP\_ERR\_HTTPD\_HANDLERS\_FULL** : If no slots left for new handler
- **ESP\_ERR\_HTTPD\_HANDLER\_EXISTS** : If handler with same URI and method is already registered

*esp\_err\_t* **httpd\_unregister\_uri\_handler** (*httpd\_handle\_t* handle, const char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

#### Parameters

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** URI string
- **method** -- **[in]** HTTP method

#### Returns

- **ESP\_OK** : On successfully deregistering the handler
- **ESP\_ERR\_INVALID\_ARG** : Null arguments
- **ESP\_ERR\_NOT\_FOUND** : Handler with specified URI and method not found

*esp\_err\_t* **httpd\_unregister\_all\_uri\_handlers** (*httpd\_handle\_t* handle, const char \*uri)

Unregister all URI handlers with the specified uri string.

#### Parameters

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** uri string specifying all handlers that need to be deregistered

#### Returns

- **ESP\_OK** : On successfully deregistering all such handlers
- **ESP\_ERR\_INVALID\_ARG** : Null arguments
- **ESP\_ERR\_NOT\_FOUND** : No handler registered with specified uri string

*esp\_err\_t* **httpd\_sess\_set\_recv\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where `sockfd` is a valid parameter
  - a URI handler where `sockfd` is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **recv\_func** -- **[in]** The receive function to be set for this session

**Returns**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_send\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where `sockfd` is a valid parameter
  - a URI handler where `sockfd` is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **send\_func** -- **[in]** The send function to be set for this session

**Returns**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_pending\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_pending\_func\_t* pending\_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where `sockfd` is a valid parameter
  - a URI handler where `sockfd` is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **pending\_func** -- **[in]** The receive function to be set for this session

**Returns**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_req\_async\_handler\_begin** (*httpd\_req\_t* \*r, *httpd\_req\_t* \*\*out)

Start an asynchronous request. This function can be called in a request handler to get a request copy that can be used on a async thread.

---

**Note:**

- This function is necessary in order to handle multiple requests simultaneously. See examples/async\_requests for example usage.
  - You must call `httpd_req_async_handler_complete()` when you are done with the request.
- 

**Parameters**

- **r** -- [in] The request to create an async copy of
- **out** -- [out] A newly allocated request which can be used on an async thread

**Returns**

- ESP\_OK : async request object created

*esp\_err\_t* **httpd\_req\_async\_handler\_complete** (*httpd\_req\_t* \*r)

Mark an asynchronous request as completed. This will.

- free the request memory
  - relinquish ownership of the underlying socket, so it can be reused.
  - allow the http server to close our socket if needed (`lru_purge_enable`)
- 

**Note:** If async requests are not marked completed, eventually the server will no longer accept incoming connections. The server will log a "httpd\_accept\_conn: error in accept (23)" message if this happens.

---

**Parameters** **r** -- [in] The request to mark async work as completed

**Returns**

- ESP\_OK : async request was marked completed

int **httpd\_req\_to\_sockfd** (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

---

**Note:** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

---

**Parameters** **r** -- [in] The request whose socket descriptor should be found

**Returns**

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd\_req\_recv** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf\_len' number of bytes, while the pointer to content data is incremented internally by the same number.

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  - Presently Chunked Encoding is not supported
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that the data will be read into
- **buf\_len** -- **[in]** Length of the buffer

**Returns**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `recv()`

`size_t httpd_req_get_hdr_value_len` (*httpd\_req\_t* \*r, const char \*field)

Search for a field in request headers and return the string length of it's value.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The header field to be searched in the request

**Returns**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

*esp\_err\_t* `httpd_req_get_hdr_value_str` (*httpd\_req\_t* \*r, const char \*field, char \*val, size\_t val\_size)

Get the value string of a field from the request headers.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
  - Use `httpd_req_get_hdr_value_len()` to know the right buffer length
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The field to be searched in the header
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the field is found
- **val\_size** -- **[in]** Size of the user buffer "val"

**Returns**

- ESP\_OK : Field found in the request header and value string copied
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

size\_t **httpd\_req\_get\_url\_query\_len** (*httpd\_req\_t* \*r)

Get Query string length from the request URL.

---

**Note:** This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t\** request pointer is valid

---

**Parameters** *r* -- **[in]** The request being responded to

**Returns**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

---

**Note:**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
  - This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t\** request pointer is valid
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
  - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
- 

**Parameters**

- *r* -- **[in]** The request being responded to
- *buf* -- **[out]** Pointer to the buffer into which the query string will be copied (if found)
- *buf\_len* -- **[in]** Length of output buffer

**Returns**

- ESP\_OK : Query is found in the request URL and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Query not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Query string truncated

*esp\_err\_t* **httpd\_query\_key\_value** (const char \*qry, const char \*key, char \*val, size\_t val\_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

---

**Note:**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.

- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
- 

**Parameters**

- **qry** -- **[in]** Pointer to query string
- **key** -- **[in]** The key to be searched in the query string
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the key is found
- **val\_size** -- **[in]** Size of the user buffer "val"

**Returns**

- `ESP_OK` : Key is found in the URL query string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

*esp\_err\_t* **httpd\_req\_get\_cookie\_val** (*httpd\_req\_t* \*req, const char \*cookie\_name, char \*val, size\_t \*val\_size)

Get the value string of a cookie value from the "Cookie" request headers by cookie name.

**Parameters**

- **req** -- **[in]** Pointer to the HTTP request
- **cookie\_name** -- **[in]** The cookie name to be searched in the request
- **val** -- **[out]** Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val\_size** -- **[inout]** Pointer to size of the user buffer "val". This variable will contain cookie length if `ESP_OK` is returned and required buffer length incase `ESP_ERR_HTTPD_RESULT_TRUNC` is returned.

**Returns**

- `ESP_OK` : Key is found in the cookie string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated
- `ESP_ERR_NO_MEM` : Memory allocation failure

bool **httpd\_uri\_match\_wildcard** (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "\*" for a wildcard match, and "?\*" to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters "?" and "\*" anywhere else in the template will be taken literally.

**Parameters**

- **uri\_template** -- **[in]** URI template (pattern)
- **uri\_to\_match** -- **[in]** URI to be matched
- **match\_upto** -- **[in]** how many characters of the URI buffer to test (there may be trailing query string etc.)

**Returns** true if a match was found

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()`

instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, the request has been responded to.
  - No additional data can then be sent for the request.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the content is to be fetched
- **buf\_len** -- **[in]** Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

*esp\_err\_t* `httpd_resp_send_chunk` (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that stores the data
- **buf\_len** -- **[in]** Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

**Returns**

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_sendstr** (*httpd\_req\_t* \*r, const char \*str)

API to send a complete string as HTTP response.

This API simply calls `http_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

#### Parameters

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body

#### Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

static inline *esp\_err\_t* **httpd\_resp\_sendstr\_chunk** (*httpd\_req\_t* \*r, const char \*str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

#### Parameters

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body (NULL to finish response packet)

#### Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

*esp\_err\_t* **httpd\_resp\_set\_status** (*httpd\_req\_t* \*r, const char \*status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the '200 OK' response is sent as the response.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the status to this value. The status isn't sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the status string is valid till send function is called.
- 

#### Parameters

- **r** -- **[in]** The request being responded to
- **status** -- **[in]** The HTTP status code of this response

#### Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_type** (*httpd\_req\_t* \*r, const char \*type)

API to set the HTTP content type.

This API sets the 'Content Type' field of the response. The default content type is 'text/html'.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the content type to this value. The type isn't sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the type string is valid till send function is called.
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **type** -- **[in]** The Content Type of the response

**Returns**

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_hdr** (*httpd\_req\_t* \*r, const char \*field, const char \*value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - The header isn't sent out until any of the send APIs is executed.
  - The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
  - Make sure that the lifetime of the field value strings are valid till send function is called.
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The field name of the HTTP header
- **value** -- **[in]** The value of this HTTP header

**Returns**

- `ESP_OK` : On successfully appending new header
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_HDR` : Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_send\_err** (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error, const char \*msg)

For sending out error code in response to HTTP request.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
- 

**Parameters**

- **req** -- **[in]** Pointer to the HTTP request for which the response needs to be sent
- **error** -- **[in]** Error type to send
- **msg** -- **[in]** Error message string (pass NULL for default message)

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline [esp\\_err\\_t httpd\\_resp\\_send\\_404](#) ([httpd\\_req\\_t](#) \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

---

**Parameters** `r` -- [in] The request being responded to

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline [esp\\_err\\_t httpd\\_resp\\_send\\_408](#) ([httpd\\_req\\_t](#) \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

---

**Parameters** `r` -- [in] The request being responded to

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline [esp\\_err\\_t httpd\\_resp\\_send\\_500](#) ([httpd\\_req\\_t](#) \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters** **r** -- **[in]** The request being responded to

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

int **httpd\_send** (*httpd\_req\_t* \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : *httpd\_resp\_send()*, *httpd\_resp\_send\_chunk()*
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the fully constructed packet is to be read
- **buf\_len** -- **[in]** Length of the buffer

**Returns**

- Bytes : Number of bytes that were sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket send()

int **httpd\_socket\_send** (*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by *httpd\_sess\_set\_send\_override()*.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

---

**Parameters**

- **hd** -- **[in]** server instance
- **sockfd** -- **[in]** session socket file descriptor
- **buf** -- **[in]** buffer with bytes to send
- **buf\_len** -- **[in]** data size
- **flags** -- **[in]** flags for the send() function

**Returns**

- Bytes : The number of bytes sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()

- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_recv` (*httpd\_handle\_t* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

#### Parameters

- **hd** -- [in] server instance
- **sockfd** -- [in] session socket file descriptor
- **buf** -- [in] buffer with bytes to send
- **buf\_len** -- [in] data size
- **flags** -- [in] flags for the send() function

#### Returns

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCKET_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCKET_ERR_TIMEOUT` : Timeout/interrupted while calling socket recv()
- `HTTPD_SOCKET_ERR_FAIL` : Unrecoverable error while calling socket recv()

*esp\_err\_t* `httpd_register_err_handler` (*httpd\_handle\_t* handle, *httpd\_err\_code\_t* error, *httpd\_err\_handler\_func\_t* handler\_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

#### Parameters

- **handle** -- [in] HTTP server handle
- **error** -- [in] Error type
- **handler\_fn** -- [in] User implemented handler function (Pass NULL to unset any previously set handler)

#### Returns

- `ESP_OK` : handler registered successfully
- `ESP_ERR_INVALID_ARG` : invalid error code or server handle

*esp\_err\_t* `httpd_start` (*httpd\_handle\_t* \*handle, const *httpd\_config\_t* \*config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
// Generate default configuration
httpd_config_t config = HTTPD_DEFAULT_CONFIG();

// Empty handle to http_server
    httpd_handle_t server = NULL;

// Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
```

(continues on next page)

(continued from previous page)

```

// Register URI handlers
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
}
// If server failed to start, handle will be NULL
return server;
}

```

**Parameters**

- **config** -- **[in]** Configuration for new instance of the server
- **handle** -- **[out]** Handle to newly created instance of the server. NULL on error

**Returns**

- ESP\_OK : Instance created successfully
- ESP\_ERR\_INVALID\_ARG : Null argument(s)
- ESP\_ERR\_HTTPD\_ALLOC\_MEM : Failed to allocate memory for instance
- ESP\_ERR\_HTTPD\_TASK : Failed to launch server task

*esp\_err\_t* **httpd\_stop** (*httpd\_handle\_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```

// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
// Ensure handle is non NULL
if (server != NULL) {
// Stop the httpd server
    httpd_stop(server);
}
}

```

**Parameters** **handle** -- **[in]** Handle to server returned by `httpd_start`

**Returns**

- ESP\_OK : Server stopped successfully
- ESP\_ERR\_INVALID\_ARG : Handle argument is Null

*esp\_err\_t* **httpd\_queue\_work** (*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

---

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

---

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **work** -- **[in]** Pointer to the function to be executed in the HTTPD's context
- **arg** -- **[in]** Pointer to the arguments that should be passed to this function

**Returns**

- ESP\_OK : On successfully queueing the work
- ESP\_FAIL : Failure in ctrl socket
- ESP\_ERR\_INVALID\_ARG : Null arguments

void **httpd\_sess\_get\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Context object to assign to the session
- **free\_fn** -- **[in]** Function that should be called to free the context

void **httpd\_sess\_get\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See also:**

`httpd_sess_get_ctx()`

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session 'transport' context by socket descriptor.

**See also:**

`httpd_sess_set_ctx()`

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Transport context object to assign to the session
- **free\_fn** -- **[in]** Function that should be called to free the transport context

void **httpd\_get\_global\_user\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global user context (it was set in the server config struct)

**Parameters** **handle** -- **[in]** Handle to server returned by `httpd_start`

**Returns** global user context

void **\*httpd\_get\_global\_transport\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

**Parameters** **handle** -- **[in]** Handle to server returned by httpd\_start

**Returns** global transport context

*esp\_err\_t* **httpd\_sess\_trigger\_close** (*httpd\_handle\_t* handle, int sockfd)

Trigger an httpd session close externally.

---

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

---

#### Parameters

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **sockfd** -- **[in]** The socket descriptor of the session to be closed

#### Returns

- ESP\_OK : On successfully initiating closure
- ESP\_FAIL : Failure to queue work
- ESP\_ERR\_NOT\_FOUND : Socket fd not found
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

---

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

#### Parameters

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **sockfd** -- **[in]** The socket descriptor of the session for which LRU counter is to be updated

#### Returns

- ESP\_OK : Socket found and LRU counter updated
- ESP\_ERR\_NOT\_FOUND : Socket not found
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_get\_client\_list** (*httpd\_handle\_t* handle, size\_t \*fds, int \*client\_fds)

Returns list of current socket descriptors of active sessions.

---

**Note:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max\_open\_sockets field in httpd\_config\_t structure.

---

#### Parameters

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **fds** -- **[inout]** In: Size of provided client\_fds array Out: Number of valid client fds returned in client\_fds,
- **client\_fds** -- **[out]** Array of client fds

**Returns**

- ESP\_OK : Successfully retrieved session list
- ESP\_ERR\_INVALID\_ARG : Wrong arguments or list is longer than provided array

**Structures**struct **esp\_http\_server\_event\_data**

Argument structure for HTTP\_SERVER\_EVENT\_ON\_DATA and HTTP\_SERVER\_EVENT\_SENT\_DATA event

**Public Members**int **fd**

Session socket file descriptor

int **data\_len**

Data length

struct **httpd\_config**

HTTP Server Configuration Structure.

---

**Note:** Use HTTPD\_DEFAULT\_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

**Public Members**unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

 BaseType\_t **core\_id**

The core the HTTP server task will run on

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16\_t **max\_uri\_handlers**

Maximum allowed uri handlers

uint16\_t **max\_resp\_headers**

Maximum allowed additional headers in HTTP response

uint16\_t **backlog\_conn**

Number of backlog connections

bool **lru\_purge\_enable**

Purge "Least Recently Used" connection

uint16\_t **recv\_wait\_timeout**

Timeout for recv function (in seconds)

uint16\_t **send\_wait\_timeout**

Timeout for send function (in seconds)

void \***global\_user\_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **global\_user\_ctx\_free\_fn**

Free function for global user context

void \***global\_transport\_ctx**

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **global\_transport\_ctx\_free\_fn**

Free function for global transport context

bool **enable\_so\_linger**

bool to enable/disable linger

int **linger\_timeout**

linger timeout (in seconds)

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

*httpd\_open\_func\_t* **open\_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

*httpd\_close\_func\_t* **close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

*httpd\_uri\_match\_func\_t* **uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct **httpd\_req**

HTTP Request Data Structure.

### Public Members

*httpd\_handle\_t* **handle**

Handle to server instance

int **method**

The type of HTTP request, -1 if unsupported method

const char **uri**[HTTPD\_MAX\_URI\_LEN + 1]

The URI of this request (1 byte extra for null termination)

size\_t **content\_len**

Length of the request body

void \***aux**

Internally used members

void \***user\_ctx**

User context pointer passed during URI registration.

void \***sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free\_ctx function is set.

[httpd\\_free\\_ctx\\_fn\\_t](#) **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling free() on the sess\_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the sess\_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess\_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free\_ctx or free()) only if the socket gets closed.

struct **httpd\_uri**

Structure for URI handler.

### Public Members

const char \***uri**

The URI to handle

[httpd\\_method\\_t](#) **method**

Method supported by the URI

[esp\\_err\\_t](#) (\***handler**)([httpd\\_req\\_t](#) \*r)

Handler to call for supported request method. This must return ESP\_OK, or else the underlying socket will be closed.

void \***user\_ctx**

Pointer to user context data which will be available to handler

### Macros

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD\_SOCK\_ERR\_FAIL**

**HTTPD\_SOCK\_ERR\_INVALID**

**HTTPD\_SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**ESP\_HTTPD\_DEF\_CTRL\_PORT**

HTTP Server control socket port

**HTTPD\_DEFAULT\_CONFIG ()**

**ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN****Type Definitions**

```
typedef struct httpd_req httpd_req_t
```

HTTP Request Data Structure.

```
typedef struct httpd_uri httpd_uri_t
```

Structure for URI handler.

```
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level send function.

---

**Note:** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_codes`, which will eventually be conveyed as return value of `httpd_send()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param `buf_len` [in]** data size

**Param `flags` [in]** flags for the `send()` function

**Return**

- Bytes : The number of bytes sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket send()

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level recv function.

---

**Note:** User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param `buf_len` [in]** data size

**Param `flags` [in]** flags for the send() function

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level "get pending bytes" function.

---

**Note:** User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Return**

- Bytes : The number of bytes waiting to be received
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

---

**Note:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.

- The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.
- 

**Param req [in]** HTTP request for which the error needs to be handled

**Param error [in]** Error type

**Return**

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

typedef void **\*httpd\_handle\_t**

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http\_method **httpd\_method\_t**

HTTP Method Type wrapper over "enum http\_method" available in "http\_parser" library.

typedef void (**\*httpd\_free\_ctx\_fn\_t**)(void \*ctx)

Prototype for freeing context data (if any)

**Param ctx [in]** object to free

typedef *esp\_err\_t* (**\*httpd\_open\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/rcv functions and other parameters of the socket.

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- `ESP_OK` : On success
- Any value other than `ESP_OK` will signal the server to close the socket immediately

typedef void (**\*httpd\_close\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for closing a session.

---

**Note:** It's possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

typedef bool (**\*httpd\_uri\_match\_func\_t**)(const char \*reference\_uri, const char \*uri\_to\_match, size\_t match\_upto)

Function prototype for URI matching.

**Param reference\_uri [in]** URI/template with respect to which the other URI is matched

**Param uri\_to\_match [in]** URI/template being matched to the reference URI/template

**Param match\_upto [in]** For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**Return** true on match

typedef struct *httpd\_config* **httpd\_config\_t**

HTTP Server Configuration Structure.

---

**Note:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

typedef void (\***httpd\_work\_fn\_t**)(void \*arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

**Param arg [in]** The arguments for this work function

### Enumerations

enum **httpd\_err\_code\_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

enumerator **HTTPD\_500\_INTERNAL\_SERVER\_ERROR**

enumerator **HTTPD\_501\_METHOD\_NOT\_IMPLEMENTED**

enumerator **HTTPD\_505\_VERSION\_NOT\_SUPPORTED**

enumerator **HTTPD\_400\_BAD\_REQUEST**

enumerator **HTTPD\_401\_UNAUTHORIZED**

enumerator **HTTPD\_403\_FORBIDDEN**

enumerator **HTTPD\_404\_NOT\_FOUND**

enumerator **HTTPD\_405\_METHOD\_NOT\_ALLOWED**

enumerator **HTTPD\_408\_REQ\_TIMEOUT**

enumerator **HTTPD\_411\_LENGTH\_REQUIRED**

enumerator **HTTPD\_414\_URI\_TOO\_LONG**

enumerator **HTTPD\_431\_REQ\_HDR\_FIELDS\_TOO\_LARGE**

enumerator **HTTPD\_ERR\_CODE\_MAX**

enum **esp\_http\_server\_event\_id\_t**

HTTP Server events id.

*Values:*

enumerator **HTTP\_SERVER\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_SERVER\_EVENT\_START**

This event occurs when HTTP Server is started

enumerator **HTTP\_SERVER\_EVENT\_ON\_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP\_SERVER\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP\_SERVER\_EVENT\_HEADERS\_SENT**

After sending all the headers to the client

enumerator **HTTP\_SERVER\_EVENT\_ON\_DATA**

Occurs when receiving data from the client

enumerator **HTTP\_SERVER\_EVENT\_SENT\_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP\_SERVER\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_SERVER\_EVENT\_STOP**

This event occurs when HTTP Server is stopped

## 2.2.10 HTTPS Server

### Overview

This component is built on top of *HTTP Server*. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for *HTTP Server* applies also to a server you create this way.

### Used APIs

The following APIs of *HTTP Server* should not be used with *HTTPS Server*, as they are used internally to handle secure sessions and to maintain internal state:

- "send", "receive" and "pending" callback registration functions - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_rcv_override()`
  - `httpd_sess_set_pending_override()`
- "transport context" - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context

- `httpd_config::global_transport_ctx`
- `httpd_config::global_transport_ctx_free_fn`
- `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

## Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

## Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## API Reference

### Header File

- `components/esp_https_server/include/esp_https_server.h`
- This header file can be included with:

```
#include "esp_https_server.h"
```

- This header file is a part of the API provided by the `esp_https_server` component. To declare that your component depends on `esp_https_server`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_https_server
```

or

```
PRIV_REQUIRES esp_https_server
```

### Functions

`esp_err_t httpd_ssl_start` (`httpd_handle_t` \*handle, `httpd_ssl_config_t` \*config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

#### Parameters

- **config** -- [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** -- [out] - storage for the server handle, must be a valid pointer

**Returns** success

`esp_err_t httpd_ssl_stop` (`httpd_handle_t` handle)

Stop the server. Blocks until the server is shut down.

**Parameters** **handle** -- [in]

#### Returns

- ESP\_OK: Server stopped successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_FAIL: Failure to shut down server

## Structures

struct **esp\_https\_server\_user\_cb\_arg**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

### Public Members

*httpd\_ssl\_user\_cb\_state\_t* **user\_cb\_state**

State of user callback

*esp\_tls\_t* \***tls**

ESP-TLS connection handle

struct **httpd\_ssl\_config**

HTTPS server config struct

Please use HTTPD\_SSL\_CONFIG\_DEFAULT() to initialize it.

### Public Members

*httpd\_config\_t* **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8\_t \***servercert**

Server certificate

size\_t **servercert\_len**

Server certificate byte length

const uint8\_t \***cacert\_pem**

CA certificate ((CA used to sign clients, or client cert itself)

size\_t **cacert\_len**

CA certificate byte length

const uint8\_t \***prvtkey\_pem**

Private key

size\_t **prvtkey\_len**

Private key byte length

bool **use\_ecdsa\_peripheral**

Use ECDSA peripheral to use private key

uint8\_t **ecdsa\_key\_efuse\_blk**

The efuse block where ECDSA key is stored

*httpd\_ssl\_transport\_mode\_t* **transport\_mode**

Transport Mode (default secure)

uint16\_t **port\_secure**

Port used when transport mode is secure (default 443)

uint16\_t **port\_insecure**

Port used when transport mode is insecure (default 80)

bool **session\_tickets**

Enable tls session tickets

bool **use\_secure\_element**

Enable secure element for server session

*esp\_https\_server\_user\_cb* \***user\_cb**

User callback for esp\_https\_server

void \***ssl\_userdata**

user data to add to the ssl context

esp\_tls\_handshake\_callback **cert\_select\_cb**

Certificate selection callback to use

const char \*\***alpn\_protos**

Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself!

## Macros

**HTTPD\_SSL\_CONFIG\_DEFAULT** ( )

Default config struct init

(http\_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport\_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

## Type Definitions

typedef struct *esp\_https\_server\_user\_cb\_arg* **esp\_https\_server\_user\_cb\_arg\_t**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef void **esp\_https\_server\_user\_cb** (*esp\_https\_server\_user\_cb\_arg\_t* \*user\_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

**Param user\_cb** Callback data struct

```
typedef struct httpd_ssl_config httpd_ssl_config_t
```

### Enumerations

```
enum httpd_ssl_transport_mode_t
```

*Values:*

```
enumerator HTTPD_SSL_TRANSPORT_SECURE
```

```
enumerator HTTPD_SSL_TRANSPORT_INSECURE
```

```
enum httpd_ssl_user_cb_state_t
```

Indicates the state at which the user callback is executed, i.e at session creation or session close.

*Values:*

```
enumerator HTTPD_SSL_USER_CB_SESS_CREATE
```

```
enumerator HTTPD_SSL_USER_CB_SESS_CLOSE
```

## 2.2.11 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g., packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending or parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a New Ping Session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
```

(continues on next page)

(continued from previous page)

```

    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttn, sizeof(ttn));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttn, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,
↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted,
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
}

```

(continues on next page)

(continued from previous page)

```

    cbs.cb_args = "foo"; // arguments that feeds to all callback functions, can
↳ be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop Ping Session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session does not start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a Ping Session** If a ping session will not be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e., you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get Runtime Statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

### Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

## API Reference

### Header File

- `components/lwip/include/apps/ping/ping_sock.h`
- This header file can be included with:

```
#include "ping/ping_sock.h"
```

- This header file is a part of the API provided by the `lwip` component. To declare that your component depends on `lwip`, add the following to your `CMakeLists.txt`:

```
REQUIRES lwip
```

or

```
PRIV_REQUIRES lwip
```

### Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` \*config, const `esp_ping_callbacks_t` \*cbs, `esp_ping_handle_t` \*hdl\_out)

Create a ping session.

#### Parameters

- **config** -- ping configuration
- **cbs** -- a bunch of callback functions invoked by internal ping task
- **hdl\_out** -- handle of ping session

#### Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)

- ESP\_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

*esp\_err\_t* **esp\_ping\_delete\_session** (*esp\_ping\_handle\_t* hdl)

Delete a ping session.

**Parameters** **hdl** -- handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: delete ping session successfully

*esp\_err\_t* **esp\_ping\_start** (*esp\_ping\_handle\_t* hdl)

Start the ping session.

**Parameters** **hdl** -- handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: start ping session successfully

*esp\_err\_t* **esp\_ping\_stop** (*esp\_ping\_handle\_t* hdl)

Stop the ping session.

**Parameters** **hdl** -- handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: stop ping session successfully

*esp\_err\_t* **esp\_ping\_get\_profile** (*esp\_ping\_handle\_t* hdl, *esp\_ping\_profile\_t* profile, void \*data, uint32\_t size)

Get runtime profile of ping session.

**Parameters**

- **hdl** -- handle of ping session
- **profile** -- type of profile
- **data** -- profile data
- **size** -- profile data size

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_ERR\_INVALID\_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP\_OK: get profile successfully

## Structures

struct **esp\_ping\_callbacks\_t**

Type of "ping" callback functions.

## Public Members

void \***cb\_args**

arguments for callback functions

void (**\*on\_ping\_success**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (**\*on\_ping\_timeout**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (\***on\_ping\_end**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when a ping session is finished.

struct **esp\_ping\_config\_t**

Type of "ping" configuration.

### Public Members

uint32\_t **count**

A "ping" session contains count procedures

uint32\_t **interval\_ms**

Milliseconds between each ping procedure

uint32\_t **timeout\_ms**

Timeout value (in milliseconds) of each ping procedure

uint32\_t **data\_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip\_addr\_t **target\_addr**

Target IP address, either IPv4 or IPv6

uint32\_t **task\_stack\_size**

Stack size of internal ping task

uint32\_t **task\_prio**

Priority of internal ping task

uint32\_t **interface**

Netif index, interface=0 means NETIF\_NO\_INDEX

### Macros

**ESP\_PING\_DEFAULT\_CONFIG** ()

Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**

Set ping count to zero will ping target infinitely

### Type Definitions

typedef void \***esp\_ping\_handle\_t**

Type of "ping" session handle.

## Enumerations

enum **esp\_ping\_profile\_t**

Profile of ping session.

*Values:*

enumerator **ESP\_PING\_PROF\_SEQNO**

Sequence number of a ping procedure

enumerator **ESP\_PING\_PROF\_TOS**

Type of service of a ping procedure

enumerator **ESP\_PING\_PROF\_TTL**

Time to live of a ping procedure

enumerator **ESP\_PING\_PROF\_REQUEST**

Number of request packets sent out

enumerator **ESP\_PING\_PROF\_REPLY**

Number of reply packets received

enumerator **ESP\_PING\_PROF\_IPADDR**

IP address of replied target

enumerator **ESP\_PING\_PROF\_SIZE**

Size of received packet

enumerator **ESP\_PING\_PROF\_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP\_PING\_PROF\_DURATION**

Elapsed time of the whole ping session

### 2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component mDNS has been moved from ESP-IDF since version v5.0 to a separate repository:

- [mDNS component on GitHub](#)

To add mDNS component in your project, please run `idf.py add-dependency espressif/mdns`.

#### Hosted Documentation

The documentation can be found on the link below:

- [mDNS documentation](#)

### 2.2.13 Mbed TLS

**Mbed TLS** is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

---

**Note:** ESP-IDF uses a [fork](#) of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum` (MPI) and ECC) over vanilla Mbed TLS.

---

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

Supported TLS versions include SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, and TLS 1.3, but on the latest ESP-IDF, SSL 3.0, TLS 1.0, and TLS 1.1 have been removed from Mbed TLS. Supported DTLS versions include DTLS 1.0, DTLS 1.1, and DTLS 1.2, but on the latest ESP-IDF, DTLS 1.0 has been removed from Mbed TLS.

#### Mbed TLS Documentation

For Mbed TLS documentation please refer to the following (upstream) pointers:

- [API Reference](#)
- [Knowledge Base](#)

#### Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions presented in different branches of ESP-IDF [here](#).

---

**Note:** Please refer the [Mbed TLS](#) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

---

#### Application Examples

Examples in ESP-IDF use [ESP-TLS](#) which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples [protocols/https\\_server/simple](#) (Simple HTTPS server) and [protocols/https\\_request](#) (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example [protocols/https\\_mbedtls](#).

#### Alternatives

[ESP-TLS](#) acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at [<https://github.com/espressif/esp-wolfSSL>](https://github.com/espressif/esp-wolfSSL) with the upstream submodule pointer.

Please refer to [ESP-TLS: Underlying SSL/TLS Library Options](#) docs for more information on this and comparison of Mbed TLS and wolfSSL.

## Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedTLS`. The full list of config options can be found [here](#).

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration
- `CONFIG_MBEDTLS_HARDWARE_ECC`: Support for hardware ECC acceleration

**Note:** Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1, and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out [here](#).

## Performance and Memory Tweaks

**Reducing Heap Usage** The following table shows typical memory usage with different configs when the [protocols/https\\_request](#) example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed TLS Test	Related Configs	Heap Usage (approx.)
Default	NA	42196 B
Enable SSL Variable Length	<a href="#">CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</a>	42120 B
Disable Keep Peer Certificate	<a href="#">CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</a>	38533 B
Enable Dynamic TX/RX Buffer	<a href="#">CONFIG_MBEDTLS_DYNAMIC_BUFFER</a> <a href="#">CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</a> <a href="#">CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</a>	22013 B

**Note:** These values are subject to change with change in configuration options and versions of Mbed TLS.

**Reducing Binary Size** Under `Component Config -> mbedTLS`, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in [Minimizing Binary Size](#) docs.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

### 2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.3 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see [Error Handling](#).

*ESP\_FAIL* (-1): Generic esp\_err\_t code indicating failure

*ESP\_OK* (0): esp\_err\_t value indicating success (no error)

*ESP\_ERR\_NO\_MEM* (0x101): Out of memory

*ESP\_ERR\_INVALID\_ARG* (0x102): Invalid argument

*ESP\_ERR\_INVALID\_STATE* (0x103): Invalid state

*ESP\_ERR\_INVALID\_SIZE* (0x104): Invalid size

*ESP\_ERR\_NOT\_FOUND* (0x105): Requested resource not found

*ESP\_ERR\_NOT\_SUPPORTED* (0x106): Operation or feature not supported

*ESP\_ERR\_TIMEOUT* (0x107): Operation timed out

*ESP\_ERR\_INVALID\_RESPONSE* (0x108): Received response was invalid

*ESP\_ERR\_INVALID\_CRC* (0x109): CRC or checksum was invalid

*ESP\_ERR\_INVALID\_VERSION* (0x10a): Version was invalid

*ESP\_ERR\_INVALID\_MAC* (0x10b): MAC address was invalid

*ESP\_ERR\_NOT\_FINISHED* (0x10c): Operation has not fully completed

*ESP\_ERR\_NOT\_ALLOWED* (0x10d): Operation is not allowed

*ESP\_ERR\_NVS\_BASE* (0x1100): Starting number of error codes

*ESP\_ERR\_NVS\_NOT\_INITIALIZED* (0x1101): The storage driver is not initialized

*ESP\_ERR\_NVS\_NOT\_FOUND* (0x1102): A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS\_READONLY

*ESP\_ERR\_NVS\_TYPE\_MISMATCH* (0x1103): The type of set or get operation doesn't match the type of value stored in NVS

*ESP\_ERR\_NVS\_READ\_ONLY* (0x1104): Storage handle was opened as read only

*ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE* (0x1105): There is not enough space in the underlying storage to save the value

*ESP\_ERR\_NVS\_INVALID\_NAME* (0x1106): Namespace name doesn't satisfy constraints

*ESP\_ERR\_NVS\_INVALID\_HANDLE* (0x1107): Handle has been closed or is NULL

*ESP\_ERR\_NVS\_REMOVE\_FAILED* (0x1108): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

*ESP\_ERR\_NVS\_KEY\_TOO\_LONG* (0x1109): Key name is too long

*ESP\_ERR\_NVS\_PAGE\_FULL* (0x110a): Internal error; never returned by nvs API functions

*ESP\_ERR\_NVS\_INVALID\_STATE* (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs\_flash\_init and nvs\_open again, then retry.

*ESP\_ERR\_NVS\_INVALID\_LENGTH* (0x110c): String or blob length is not sufficient to store data

*ESP\_ERR\_NVS\_NO\_FREE\_PAGES* (0x110d): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs\_flash\_init again.

*ESP\_ERR\_NVS\_VALUE\_TOO\_LONG* (**0x110e**): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

*ESP\_ERR\_NVS\_PART\_NOT\_FOUND* (**0x110f**): Partition with specified name is not found in the partition table

*ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND* (**0x1110**): NVS partition contains data in new format and cannot be recognized by this version of code

*ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED* (**0x1111**): XTS encryption failed while writing NVS entry

*ESP\_ERR\_NVS\_XTS\_DECR\_FAILED* (**0x1112**): XTS decryption failed while reading NVS entry

*ESP\_ERR\_NVS\_XTS\_CFG\_FAILED* (**0x1113**): XTS configuration setting failed

*ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND* (**0x1114**): XTS configuration not found

*ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED* (**0x1115**): NVS encryption is not supported in this version

*ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED* (**0x1116**): NVS key partition is uninitialized

*ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART* (**0x1117**): NVS key partition is corrupt

*ESP\_ERR\_NVS\_CONTENT\_DIFFERS* (**0x1118**): Internal error; never returned by nvs API functions. NVS key is different in comparison

*ESP\_ERR\_NVS\_WRONG\_ENCRYPTION* (**0x1119**): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

*ESP\_ERR\_ULP\_BASE* (**0x1200**): Offset for ULP-related error codes

*ESP\_ERR\_ULP\_SIZE\_TOO\_BIG* (**0x1201**): Program doesn't fit into RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR* (**0x1202**): Load address is outside of RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_DUPLICATE\_LABEL* (**0x1203**): More than one label with the same number was defined

*ESP\_ERR\_ULP\_UNDEFINED\_LABEL* (**0x1204**): Branch instructions references an undefined label

*ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE* (**0x1205**): Branch target is out of range of B instruction (try replacing with BX)

*ESP\_ERR\_OTA\_BASE* (**0x1500**): Base error code for ota\_ops api

*ESP\_ERR\_OTA\_PARTITION\_CONFLICT* (**0x1501**): Error if request was to write or erase the current running partition

*ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID* (**0x1502**): Error if OTA data partition contains invalid content

*ESP\_ERR\_OTA\_VALIDATE\_FAILED* (**0x1503**): Error if OTA app image is invalid

*ESP\_ERR\_OTA\_SMALL\_SEC\_VER* (**0x1504**): Error if the firmware has a secure version less than the running firmware.

*ESP\_ERR\_OTA\_ROLLBACK\_FAILED* (**0x1505**): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

*ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE* (**0x1506**): Error if current active firmware is still marked in pending validation state (*ESP\_OTA\_IMG\_PENDING\_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

*ESP\_ERR\_EFUSE* (**0x1600**): Base error code for efuse api.

*ESP\_OK\_EFUSE\_CNT* (**0x1601**): OK the required number of bits is set.

*ESP\_ERR\_EFUSE\_CNT\_IS\_FULL* (**0x1602**): Error field is full.

*ESP\_ERR\_EFUSE\_REPEATED\_PROG* (**0x1603**): Error repeated programming of programmed bits is strictly forbidden.

*ESP\_ERR\_CODING* (**0x1604**): Error while a encoding operation.

*ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS* (**0x1605**): Error not enough unused key blocks available

**ESP\_ERR\_DAMAGED\_READING (0x1606)**: Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**ESP\_ERR\_IMAGE\_BASE (0x2000)**

**ESP\_ERR\_IMAGE\_FLASH\_FAIL (0x2001)**

**ESP\_ERR\_IMAGE\_INVALID (0x2002)**

**ESP\_ERR\_WIFI\_BASE (0x3000)**: Starting number of WiFi error codes

**ESP\_ERR\_WIFI\_NOT\_INIT (0x3001)**: WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED (0x3002)**: WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED (0x3003)**: WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF (0x3004)**: WiFi interface error

**ESP\_ERR\_WIFI\_MODE (0x3005)**: WiFi mode error

**ESP\_ERR\_WIFI\_STATE (0x3006)**: WiFi internal state error

**ESP\_ERR\_WIFI\_CONN (0x3007)**: WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS (0x3008)**: WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC (0x3009)**: MAC address is invalid

**ESP\_ERR\_WIFI\_SSID (0x300a)**: SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD (0x300b)**: Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT (0x300c)**: Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL (0x300d)**: WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK (0x300e)**: The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT (0x300f)**: Station still in disconnect status

**ESP\_ERR\_WIFI\_POST (0x3012)**: Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE (0x3013)**: Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE (0x3014)**: Returned when WiFi is stopping

**ESP\_ERR\_WIFI\_NOT\_ASSOC (0x3015)**: The WiFi connection is not associated

**ESP\_ERR\_WIFI\_TX\_DISALLOW (0x3016)**: The WiFi TX is disallowed

**ESP\_ERR\_WIFI\_TWT\_FULL (0x3017)**: no available flow id

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TIMEOUT (0x3018)**: Timeout of receiving twt setup response frame, timeout times can be set during twt setup

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TXFAIL (0x3019)**: TWT setup frame tx failed

**ESP\_ERR\_WIFI\_TWT\_SETUP\_REJECT (0x301a)**: The twt setup request was rejected by the AP

**ESP\_ERR\_WIFI\_DISCARD (0x301b)**: Discard frame

**ESP\_ERR\_WIFI\_ROC\_IN\_PROGRESS (0x301c)**: ROC op is in progress

**ESP\_ERR\_WIFI\_REGISTRAR (0x3033)**: WPS registrar is not supported

**ESP\_ERR\_WIFI\_WPS\_TYPE (0x3034)**: WPS type error

**ESP\_ERR\_WIFI\_WPS\_SM (0x3035)**: WPS state machine is not initialized

**ESP\_ERR\_ESPNOW\_BASE (0x3064)**: ESPNOW error number base.

**ESP\_ERR\_ESPNOW\_NOT\_INIT (0x3065)**: ESPNOW is not initialized.

**ESP\_ERR\_ESPNOW\_ARG (0x3066)**: Invalid argument

**ESP\_ERR\_ESPNOW\_NO\_MEM (0x3067)**: Out of memory

ESP\_ERR\_ESPNOW\_FULL (**0x3068**): ESPNOW peer list is full

ESP\_ERR\_ESPNOW\_NOT\_FOUND (**0x3069**): ESPNOW peer is not found

ESP\_ERR\_ESPNOW\_INTERNAL (**0x306a**): Internal error

ESP\_ERR\_ESPNOW\_EXIST (**0x306b**): ESPNOW peer has existed

ESP\_ERR\_ESPNOW\_IF (**0x306c**): Interface error

ESP\_ERR\_ESPNOW\_CHAN (**0x306d**): Channel error

ESP\_ERR\_DPP\_FAILURE (**0x3097**): Generic failure during DPP Operation

ESP\_ERR\_DPP\_TX\_FAILURE (**0x3098**): DPP Frame Tx failed OR not Acked

ESP\_ERR\_DPP\_INVALID\_ATTR (**0x3099**): Encountered invalid DPP Attribute

ESP\_ERR\_DPP\_AUTH\_TIMEOUT (**0x309a**): DPP Auth response was not received in time

*ESP\_ERR\_MESH\_BASE* (**0x4000**): Starting number of MESH error codes

ESP\_ERR\_MESH\_WIFI\_NOT\_START (**0x4001**)

ESP\_ERR\_MESH\_NOT\_INIT (**0x4002**)

ESP\_ERR\_MESH\_NOT\_CONFIG (**0x4003**)

ESP\_ERR\_MESH\_NOT\_START (**0x4004**)

ESP\_ERR\_MESH\_NOT\_SUPPORT (**0x4005**)

ESP\_ERR\_MESH\_NOT\_ALLOWED (**0x4006**)

ESP\_ERR\_MESH\_NO\_MEMORY (**0x4007**)

ESP\_ERR\_MESH\_ARGUMENT (**0x4008**)

ESP\_ERR\_MESH\_EXCEED\_MTU (**0x4009**)

ESP\_ERR\_MESH\_TIMEOUT (**0x400a**)

ESP\_ERR\_MESH\_DISCONNECTED (**0x400b**)

ESP\_ERR\_MESH\_QUEUE\_FAIL (**0x400c**)

ESP\_ERR\_MESH\_QUEUE\_FULL (**0x400d**)

ESP\_ERR\_MESH\_NO\_PARENT\_FOUND (**0x400e**)

ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND (**0x400f**)

ESP\_ERR\_MESH\_OPTION\_NULL (**0x4010**)

ESP\_ERR\_MESH\_OPTION\_UNKNOWN (**0x4011**)

ESP\_ERR\_MESH\_XON\_NO\_WINDOW (**0x4012**)

ESP\_ERR\_MESH\_INTERFACE (**0x4013**)

ESP\_ERR\_MESH\_DISCARD\_DUPLICATE (**0x4014**)

ESP\_ERR\_MESH\_DISCARD (**0x4015**)

ESP\_ERR\_MESH\_VOTING (**0x4016**)

ESP\_ERR\_MESH\_XMIT (**0x4017**)

ESP\_ERR\_MESH\_QUEUE\_READ (**0x4018**)

ESP\_ERR\_MESH\_PS (**0x4019**)

ESP\_ERR\_MESH\_RECV\_RELEASE (**0x401a**)

*ESP\_ERR\_ESP\_NETIF\_BASE* (**0x5000**)

*ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS* (**0x5001**)

*ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY (0x5002)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED (0x5003)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED (0x5004)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED (0x5005)*

*ESP\_ERR\_ESP\_NETIF\_NO\_MEM (0x5006)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED (0x5007)*

*ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED (0x5008)*

*ESP\_ERR\_ESP\_NETIF\_INIT\_FAILED (0x5009)*

*ESP\_ERR\_ESP\_NETIF\_DNS\_NOT\_CONFIGURED (0x500a)*

*ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED (0x500b)*

*ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED (0x500c)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED (0x500d)*

*ESP\_ERR\_FLASH\_BASE (0x6000)*: Starting number of flash error codes

*ESP\_ERR\_FLASH\_OP\_FAIL (0x6001)*

*ESP\_ERR\_FLASH\_OP\_TIMEOUT (0x6002)*

*ESP\_ERR\_FLASH\_NOT\_INITIALISED (0x6003)*

*ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST (0x6004)*

*ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP (0x6005)*

*ESP\_ERR\_FLASH\_PROTECTED (0x6006)*

*ESP\_ERR\_HTTP\_BASE (0x7000)*: Starting number of HTTP error codes

*ESP\_ERR\_HTTP\_MAX\_REDIRECT (0x7001)*: The error exceeds the number of HTTP redirects

*ESP\_ERR\_HTTP\_CONNECT (0x7002)*: Error open the HTTP connection

*ESP\_ERR\_HTTP\_WRITE\_DATA (0x7003)*: Error write HTTP data

*ESP\_ERR\_HTTP\_FETCH\_HEADER (0x7004)*: Error read HTTP header from server

*ESP\_ERR\_HTTP\_INVALID\_TRANSPORT (0x7005)*: There are no transport support for the input scheme

*ESP\_ERR\_HTTP\_CONNECTING (0x7006)*: HTTP connection hasn't been established yet

*ESP\_ERR\_HTTP\_EAGAIN (0x7007)*: Mapping of errno EAGAIN to esp\_err\_t

*ESP\_ERR\_HTTP\_CONNECTION\_CLOSED (0x7008)*: Read FIN from peer and the connection closed

*ESP\_ERR\_ESP\_TLS\_BASE (0x8000)*: Starting number of ESP-TLS error codes

*ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME (0x8001)*: Error if hostname couldn't be resolved upon  
tls connection

*ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET (0x8002)*: Failed to create socket

*ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY (0x8003)*: Unsupported protocol family

*ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST (0x8004)*: Failed to connect to host

*ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED (0x8005)*: failed to set/get socket option

*ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT (0x8006)*: new connection in esp\_tls\_low\_level\_conn connec-  
tion timeouted

*ESP\_ERR\_ESP\_TLS\_SE\_FAILED (0x8007)*

*ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN (0x8008)*

*ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK (0x8010)*: mbedtls parse certificates was partly successful

*ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED (0x8011)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED (0x8012)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED (0x8013)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED (0x8014)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED (0x8015)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED (0x8016)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED (0x8017)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED (0x8018)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED (0x8019)*: mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED (0x801a)*: mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED (0x801b)*: mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED (0x801c)*: mbedtls api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED (0x8031)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED (0x8032)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED (0x8033)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED (0x8034)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED (0x8035)*: wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED (0x8036)*: wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED (0x8037)*: wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED (0x8038)*: wolfSSL api returned failed

*ESP\_ERR\_HTTPS\_OTA\_BASE (0x9000)*

*ESP\_ERR\_HTTPS\_OTA\_IN\_PROGRESS (0x9001)*

*ESP\_ERR\_PING\_BASE (0xa000)*

*ESP\_ERR\_PING\_INVALID\_PARAMS (0xa001)*

*ESP\_ERR\_PING\_NO\_MEM (0xa002)*

*ESP\_ERR\_HTTPD\_BASE (0xb000)*: Starting number of HTTPD error codes

*ESP\_ERR\_HTTPD\_HANDLERS\_FULL (0xb001)*: All slots for registering URI handlers have been consumed

*ESP\_ERR\_HTTPD\_HANDLER\_EXISTS (0xb002)*: URI handler with same method and target URI already registered

*ESP\_ERR\_HTTPD\_INVALID\_REQ (0xb003)*: Invalid request pointer

*ESP\_ERR\_HTTPD\_RESULT\_TRUNC (0xb004)*: Result string truncated

*ESP\_ERR\_HTTPD\_RESP\_HDR (0xb005)*: Response header field larger than supported

*ESP\_ERR\_HTTPD\_RESP\_SEND (0xb006)*: Error occurred while sending response packet

*ESP\_ERR\_HTTPD\_ALLOC\_MEM (0xb007)*: Failed to dynamically allocate memory for resource

*ESP\_ERR\_HTTPD\_TASK (0xb008)*: Failed to launch server task/thread

*ESP\_ERR\_HW\_CRYPTO\_BASE (0xc000)*: Starting number of HW cryptography module error codes

*ESP\_ERR\_HW\_CRYPTO\_DS\_HMAC\_FAIL (0xc001)*: HMAC peripheral problem

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_KEY (0xc002)*

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_DIGEST (0xc004)*

ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING (**0xc005**)

*ESP\_ERR\_MEMPROT\_BASE* (**0xd000**): Starting number of Memory Protection API error codes

ESP\_ERR\_MEMPROT\_MEMORY\_TYPE\_INVALID (**0xd001**)

ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_INVALID (**0xd002**)

ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_OUT\_OF\_RANGE (**0xd003**)

ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_UNALIGNED (**0xd004**)

ESP\_ERR\_MEMPROT\_UNIMGMT\_BLOCK\_INVALID (**0xd005**)

ESP\_ERR\_MEMPROT\_WORLD\_INVALID (**0xd006**)

ESP\_ERR\_MEMPROT\_AREA\_INVALID (**0xd007**)

ESP\_ERR\_MEMPROT\_CPUID\_INVALID (**0xd008**)

ESP\_ERR\_TCP\_TRANSPORT\_BASE (**0xe000**): Starting number of TCP Transport error codes

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_TIMEOUT (**0xe001**): Connection has timed out

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_CLOSED\_BY\_FIN (**0xe002**): Read FIN from peer and the connection has closed (in a clean way)

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_FAILED (**0xe003**): Failed to connect to the peer

ESP\_ERR\_TCP\_TRANSPORT\_NO\_MEM (**0xe004**): Memory allocation failed

*ESP\_ERR\_NVS\_SEC\_BASE* (**0xf000**): Starting number of error codes

*ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_NOT\_FOUND* (**0xf001**): HMAC Key required to generate the NVS encryption keys not found

*ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_BLK\_ALREADY\_USED* (**0xf002**): Provided eFuse block for HMAC key generation is already in use

*ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_GENERATION\_FAILED* (**0xf003**): Failed to generate/write the HMAC key to eFuse

*ESP\_ERR\_NVS\_SEC\_HMAC\_XTS\_KEYS\_DERIV\_FAILED* (**0xf004**): Failed to derive the NVS encryption keys based on the HMAC-based scheme

## 2.4 Networking APIs

### 2.4.1 Ethernet

#### Ethernet

**Overview** ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc Control of Ethernet Driver*

**Basic Ethernet Concepts** Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low-power applications. However, with ubiquitous deployment, internet connectivity, high data rates, and limitless-range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, a data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling appears as shown below:

Fig. 1: Ethernet Data Frame Format

**Preamble and Start-of-Frame Delimiter** The preamble contains seven bytes of 55H. It allows the receiver to lock onto the stream of data before the actual frame arrives.

The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will be automatically generated or stripped from the packets.

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multicast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not.

Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multicast address, i.e., FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte

of the MAC address is clear, the address is a unicast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or unicast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. For more information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length** The type/length field is a 2-byte field. If the value in this field is  $\leq 1500$  (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is  $\geq 1536$ , it represents the protocol the following packet data belongs to. The followings are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets violates Ethernet standards and will be dropped by most Ethernet nodes.

This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet the IEEE 802.3 specification requirements when small data payloads are used.

The DA, SA, type, payload, and padding of an Ethernet packet must be no smaller than 60 bytes in total. If the required 4-byte FCS field is added, packets must be no smaller than 64 bytes. If the payload field is less than 46-byte long, a padding field is required.

The FCS field is a 4-byte field that contains an industry-standard 32-bit CRC calculated with the data from the DA, SA, type, payload, and padding fields. Given the complexity of calculating a CRC, the hardware normally automatically generates a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

---

**Note:** Besides the basic data frame described above, there are two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN-tagged frames. They are not supported in ESP-IDF.

---

**Configure MAC and PHY** The Ethernet driver is composed of two parts: MAC and PHY.

You need to set up the necessary parameters for MAC and PHY respectively based on your Ethernet board design, and then combine the two together to complete the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds. Typically, MAC reset should be finished within 100 ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets. These two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when the cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY devices can share the same SMI bus, so each PHY needs a unique address. Usually, this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds. Typically, PHY reset should be finished within 100 ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. The Ethernet driver starts negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connects the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** The Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of the two.

### SPI-Ethernet Module

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();           // apply default_
↪common MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();           // apply default PHY_
↪configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;                // alter the PHY_
↪address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;     // alter the GPIO_
↪used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt-driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
```

(continues on next page)

(continued from previous page)

```

        .mode = 0,
        .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
        .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
        .queue_size = 20
    };
    /* dm9051 ethernet driver is based on spi driver */
    eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
    ↪SPI_HOST, &spi_devcfg);
    dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
    esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
    esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);

```

**Note:**

- When creating MAC and PHY instances for SPI-Ethernet modules (e.g., DM9051), the constructor function must have the same suffix (e.g., `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we do not have other choices but the integrated PHY.
- The SPI device configuration (i.e., `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module's specs and the examples in ESP-IDF.

**Install Driver** To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e., not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g., `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g., `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most Ethernet IoT applications, any Ethernet frame received by a driver should be passed to the upper layer (e.g., TCP/IP stack). This field is set to a function that is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low-level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```

esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver_
↪configuration
esp_eth_handle_t eth_handle = NULL; // after the driver is installed, we will get_
↪the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver

```

The Ethernet driver also includes an event-driven model, which sends useful and important events to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to [ESP Event](#).

```

/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

```

(continues on next page)

(continued from previous page)

```

switch (event_id) {
case ETHERNET_EVENT_CONNECTED:
    esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
    ESP_LOGI(TAG, "Ethernet Link Up");
    ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
              mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
    break;
case ETHERNET_EVENT_DISCONNECTED:
    ESP_LOGI(TAG, "Ethernet Link Down");
    break;
case ETHERNET_EVENT_START:
    ESP_LOGI(TAG, "Ethernet Started");
    break;
case ETHERNET_EVENT_STOP:
    ESP_LOGI(TAG, "Ethernet Stopped");
    break;
default:
    break;
}
}

esp_event_loop_create_default(); // create a default event loop that runs in the
↳background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
↳// register Ethernet event handler (to deal with user-specific stuff when events
↳like link up/down happened)

```

**Start Ethernet Driver** After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack** Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we are still on level 2 (i.e., Data Link Layer). While we can detect link up and down events and gain MAC address in user space, it is infeasible to obtain the IP address, let alone send an HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP. For more information about it, please refer to [LwIP](#).

To connect the Ethernet driver to TCP/IP stack, follow these three steps:

1. Create a network interface for the Ethernet driver
2. Attach the network interface to the Ethernet driver
3. Register IP event handlers

For more information about the network interface, please refer to [Network Interface](#).

```

/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

```

(continues on next page)

(continued from previous page)

```

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface before registering the user's Ethernet/IP event handlers, i.e., register the event handlers as the last thing prior to starting the Ethernet driver. Such an approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface so the system is in the expected state when executing the user's handlers.

**Misc Control of Ethernet Driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```

/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
↳mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
↳addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

```

**Flow Control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. The ethernet flow control mechanism allows the receiving node to signal the sender requesting the suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After the Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```

bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);

```

One thing that should be kept in mind is that the pause frame ability is advertised to the peer end by PHY during auto-negotiation. The Ethernet driver sends a pause frame only when both sides of the link support it.

### Application Examples

- Ethernet basic example: [ethernet/basic](#)
- Ethernet iperf example: [ethernet/iperf](#)
- Ethernet to Wi-Fi AP "router": [network/eth2ap](#)
- Wi-Fi station to Ethernet "bridge": [network/sta2eth](#)
- Most protocol examples should also work for Ethernet: [protocols](#)

### Advanced Topics

**Custom PHY Driver** There are multiple PHY manufacturers with wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies the user's actual needs due to price, features, stock availability, etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in Section 22.2.4 Management Functions. It defines provisions of the so-called "MII Management Interface" to control the PHY and gather status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration, etc. This basic management functionality is addressed by [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#) in ESP-IDF and so it makes the creation of a new custom PHY chip driver quite a simple task.

---

**Note:** Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, but it just requires more effort. You will have to define all PHY management functions.

---

The majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#). However, the following may require developing chip-specific management functions:

- Link status which is almost always chip-specific
- Chip initialization, even though not strictly required, should be customized to at least ensure that the expected chip is used
- Chip-specific features configuration

#### Steps to create a custom PHY driver:

1. Define vendor-specific registry layout based on the PHY datasheet. See [esp\\_eth/src/esp\\_eth\\_phy\\_ip101.c](#) as an example.
2. Prepare derived PHY management object info structure which:
  - must contain at least parent IEEE 802.3 [phy\\_802\\_3\\_t](#) object
  - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See [esp\\_eth/src/esp\\_eth\\_phy\\_ksz80xx.c](#) as an example.
3. Define chip-specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip-specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among other users via [IDF Component Registry](#).

### API Reference

#### Header File

- [components/esp\\_eth/include/esp\\_eth.h](#)
- This header file can be included with:

```
#include "esp_eth.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Header File

- `components/esp_eth/include/esp_eth_driver.h`
- This header file can be included with:

```
#include "esp_eth_driver.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Functions

`esp_err_t esp_eth_driver_install` (const `esp_eth_config_t` \*config, `esp_eth_handle_t` \*out\_hdl)

Install Ethernet driver.

#### Parameters

- **config** -- [in] configuration of the Ethernet driver
- **out\_hdl** -- [out] handle of Ethernet driver

#### Returns

- `ESP_OK`: install `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: install `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_NO_MEM`: install `esp_eth` driver failed because there's no memory for driver
- `ESP_FAIL`: install `esp_eth` driver failed because some other error occurred

`esp_err_t esp_eth_driver_uninstall` (`esp_eth_handle_t` hdl)

Uninstall Ethernet driver.

---

**Note:** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

---

**Parameters** **hdl** -- [in] handle of Ethernet driver

#### Returns

- `ESP_OK`: uninstall `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: uninstall `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: uninstall `esp_eth` driver failed because it has more than one reference
- `ESP_FAIL`: uninstall `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

---

**Note:** This API will start driver state machine and internal software timer (for checking link status).

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

**Returns**

- **ESP\_OK**: start esp\_eth driver successfully
- **ESP\_ERR\_INVALID\_ARG**: start esp\_eth driver failed because of some invalid argument
- **ESP\_ERR\_INVALID\_STATE**: start esp\_eth driver failed because driver has started already
- **ESP\_FAIL**: start esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* hdl)

Stop Ethernet driver.

---

**Note:** This function does the oppsite operation of `esp_eth_start`.

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

**Returns**

- **ESP\_OK**: stop esp\_eth driver successfully
- **ESP\_ERR\_INVALID\_ARG**: stop esp\_eth driver failed because of some invalid argument
- **ESP\_ERR\_INVALID\_STATE**: stop esp\_eth driver failed because driver has not started yet
- **ESP\_FAIL**: stop esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* hdl, *esp\_err\_t* (\*stack\_input)(*esp\_eth\_handle\_t* hdl, uint8\_t \*buffer, uint32\_t length, void \*priv), void \*priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

---

**Note:** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

---

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **stack\_input** -- **[in]** function pointer, which does the actual process on incoming packets
- **priv** -- **[in]** private resource, which gets passed to `stack_input` callback without any modification

**Returns**

- **ESP\_OK**: update input path successfully
- **ESP\_ERR\_INVALID\_ARG**: update input path failed because of some invalid argument
- **ESP\_FAIL**: update input path failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* hdl, void \*buf, size\_t length)

General Transmit.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **buf** -- **[in]** buffer of the packet to transfer
- **length** -- **[in]** length of the buffer to transfer

**Returns**

- **ESP\_OK**: transmit frame buffer successfully

- `ESP_ERR_INVALID_ARG`: transmit frame buffer failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_transmit_vargs (esp_eth_handle_t hdl, uint32_t argc, ...)`

Special Transmit with variable number of arguments.

#### Parameters

- **hdl** -- [in] handle of Ethernet driver
- **argc** -- [in] number variable arguments
- . . . -- variable arguments

#### Returns

- `ESP_OK`: transmit successfull
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_ioctl (esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)`

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
- `ETH_CMD_S_AUTONEGO` enables or disables Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- `ETH_CMD_G_AUTONEGO` gets current configuration of the Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype to which the current configuration is to be stored.
- `ETH_CMD_S_SPEED` sets the Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- `ETH_CMD_G_SPEED` gets current Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype to which the speed is to be stored.
- `ETH_CMD_S_PROMISCUOUS` sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_S_FLOW_CTRL` sets/resets Ethernet interface flow control. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_S_DUPLEX_MODE` sets the Ethernet duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **cmd** -- **[in]** IO control command
- **data** -- **[inout]** address of data for `set` command or address where to store the data when used with `get` command

**Returns**

- `ESP_OK`: process io command successfully
- `ESP_ERR_INVALID_ARG`: process io command failed because of some invalid argument
- `ESP_FAIL`: process io command failed because some other error occurred
- `ESP_ERR_NOT_SUPPORTED`: requested feature is not supported

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

---

**Note:** Ethernet driver handle can be obtained by `os timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

**Structures**

struct **esp\_eth\_config\_t**

Configuration of Ethernet driver.

**Public Members**

*esp\_eth\_mac\_t* \***mac**

Ethernet MAC object.

*esp\_eth\_phy\_t* \***phy**

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (\***stack\_input**)(*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Param eth\_handle** **[in]** handle of Ethernet driver

**Param buffer [in]** frame buffer that will get input to upper stack

**Param length [in]** length of the frame buffer

**Return**

- ESP\_OK: input frame buffer to upper stack successfully
- ESP\_FAIL: error occurred when inputting buffer to upper stack

*esp\_err\_t* (\***on\_lowlevel\_init\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

*esp\_err\_t* (\***on\_lowlevel\_deinit\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully

- `ESP_ERR_INVALID_ARG`: read PHY register failed because of invalid argument
- `ESP_ERR_TIMEOUT`: write PHY register failed because of timeout
- `ESP_FAIL`: write PHY register failed because some other error occurred

struct `esp_eth_phy_reg_rw_data_t`

Data structure to Read/Write PHY register via ioctl API.

### Public Members

uint32\_t `reg_addr`

PHY register address

uint32\_t \*`reg_value_p`

Pointer to a memory where the register value is read/written

### Macros

`ETH_DEFAULT_CONFIG` (emac, ephy)

Default configuration for Ethernet driver.

### Type Definitions

typedef void \*`esp_eth_handle_t`

Handle of Ethernet driver.

### Enumerations

enum `esp_eth_io_cmd_t`

Command list for ioctl API.

*Values:*

enumerator `ETH_CMD_G_MAC_ADDR`

Get MAC address

enumerator `ETH_CMD_S_MAC_ADDR`

Set MAC address

enumerator `ETH_CMD_G_PHY_ADDR`

Get PHY address

enumerator `ETH_CMD_S_PHY_ADDR`

Set PHY address

enumerator `ETH_CMD_G_AUTONEGO`

Get PHY Auto Negotiation

enumerator `ETH_CMD_S_AUTONEGO`

Set PHY Auto Negotiation

enumerator **ETH\_CMD\_G\_SPEED**

Get Speed

enumerator **ETH\_CMD\_S\_SPEED**

Set Speed

enumerator **ETH\_CMD\_S\_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH\_CMD\_S\_FLOW\_CTRL**

Set flow control

enumerator **ETH\_CMD\_G\_DUPLEX\_MODE**

Get Duplex mode

enumerator **ETH\_CMD\_S\_DUPLEX\_MODE**

Set Duplex mode

enumerator **ETH\_CMD\_S\_PHY\_LOOPBACK**

Set PHY loopback

enumerator **ETH\_CMD\_READ\_PHY\_REG**

Read PHY register

enumerator **ETH\_CMD\_WRITE\_PHY\_REG**

Write PHY register

enumerator **ETH\_CMD\_CUSTOM\_MAC\_CMDS**

enumerator **ETH\_CMD\_CUSTOM\_PHY\_CMDS**

## Header File

- This header file can be included with:

```
#include "esp_eth_com.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

## Structures

struct **esp\_eth\_mediator\_s**

Ethernet mediator.

## Public Members

*esp\_err\_t* (**\*phy\_reg\_read**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

*esp\_err\_t* (**\*phy\_reg\_write**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

*esp\_err\_t* (**\*stack\_input**)(*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

**Param eth [in]** mediator of Ethernet driver

**Param buffer [in]** packet buffer

**Param length [in]** length of the packet

**Return**

- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

*esp\_err\_t* (**\*on\_state\_changed**)(*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)

Callback on Ethernet state changed.

**Param eth [in]** mediator of Ethernet driver

**Param state [in]** new state

**Param args [in]** optional argument for the new state

**Return**

- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

## Type Definitions

typedef struct *esp\_eth\_mediator\_s* **esp\_eth\_mediator\_t**

Ethernet mediator.

## Enumerations

enum **esp\_eth\_state\_t**

Ethernet driver state.

*Values:*

enumerator **ETH\_STATE\_LLINIT**

Lowlevel init done

enumerator **ETH\_STATE\_DEINIT**

Deinit done

enumerator **ETH\_STATE\_LINK**

Link status changed

enumerator **ETH\_STATE\_SPEED**

Speed updated

enumerator **ETH\_STATE\_DUPLEX**

Duplex updated

enumerator **ETH\_STATE\_PAUSE**

Pause ability updated

enum **eth\_event\_t**

Ethernet event declarations.

*Values:*

enumerator **ETHERNET\_EVENT\_START**

Ethernet driver start

enumerator **ETHERNET\_EVENT\_STOP**

Ethernet driver stop

enumerator **ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

### Header File

PRIV_REQUIRES esp_eth
```

## Unions

union **eth\_mac\_clock\_config\_t**

*#include <esp\_eth\_mac.h>* Ethernet MAC Clock Configuration.

### Public Members

struct *eth\_mac\_clock\_config\_t*::[anonymous] **mii**

EMAC MII Clock Configuration

*emac\_rmii\_clock\_mode\_t* **clock\_mode**

RMII Clock Mode Configuration

*emac\_rmii\_clock\_gpio\_t* **clock\_gpio**

RMII Clock GPIO Configuration

struct *eth\_mac\_clock\_config\_t*::[anonymous] **rmii**

EMAC RMII Clock Configuration

## Structures

struct **esp\_eth\_mac\_s**

Ethernet MAC.

### Public Members

*esp\_err\_t* (**\*set\_mediator**)(*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Param eth [in]** Ethernet mediator

**Return**

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

*esp\_err\_t* (**\*init**)(*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

*esp\_err\_t* (**\*deinit**)(*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***start**)(*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***stop**)(*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***transmit**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [in]** packet buffer to transmit

**Param length [in]** length of packet

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***transmit\_vargs**)(*esp\_eth\_mac\_t* \*mac, uint32\_t argc, va\_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

---

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

---

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param argc [in]** number variable arguments

**Param args [in]** variable arguments

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***receive**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

---

**Note:** Memory of buf is allocated in the Layer2, make sure it get free after process.

---

---

**Note:** Before this function got invoked, the value of "length" should set by user, equals the size of buffer. After the function returned, the value of "length" means the real length of received data.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [out]** packet buffer which will preserve the received frame

**Param length [out]** length of the received packet

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned "length" indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

*esp\_err\_t* (**\*read\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (**\*write\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

*esp\_err\_t* (**\*set\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [in]** MAC address

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

*esp\_err\_t* (**\*get\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [out]** MAC address

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_mac\_t* \*mac, eth\_speed\_t speed)

Set speed of MAC.

**Param ma:c [in]** Ethernet MAC instance

**Param speed [in]** MAC speed

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_mac\_t* \*mac, eth\_duplex\_t duplex)

Set duplex mode of MAC.

**Param mac [in]** Ethernet MAC instance

**Param duplex [in]** MAC duplex

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_mac\_t* \*mac, eth\_link\_t link)

Set link status of MAC.

**Param mac [in]** Ethernet MAC instance

**Param link [in]** Link status

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

*esp\_err\_t* (\***set\_promiscuous**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Set promiscuous of MAC.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

*esp\_err\_t* (\***enable\_flow\_ctrl**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Enable flow control on MAC layer or not.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable flow control; set false to disable flow control

**Return**

- ESP\_OK: set flow control successfully
- ESP\_FAIL: set flow control failed because some error occurred

*esp\_err\_t* (**set\_peer\_pause\_ability**)(*esp\_eth\_mac\_t* \*mac, uint32\_t ability)

Set the PAUSE ability of peer node.

**Param mac [in]** Ethernet MAC instance

**Param ability [in]** zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**

- ESP\_OK: set peer pause ability successfully
- ESP\_FAIL: set peer pause ability failed because some error occurred

*esp\_err\_t* (**custom\_ioctl**)(*esp\_eth\_mac\_t* \*mac, uint32\_t cmd, void \*data)

Custom IO function of MAC driver. This function is intended to extend common options of *esp\_eth\_ioctl* to cover specifics of MAC chip.

---

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

---

**Param mac [in]** Ethernet MAC instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for *set* command or address where to store the data when used with *get* command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (**del**)(*esp\_eth\_mac\_t* \*mac)

Free memory of Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

### Public Members

uint32\_t **sw\_reset\_timeout\_ms**

Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**

Stack size of the receive task

uint32\_t **rx\_task\_prio**

Priority of the receive task

uint32\_t **flags**

Flags that specify extra capability for mac driver

struct **eth\_spi\_custom\_driver\_config\_t**

Custom SPI Driver Configuration. This structure declares configuration and callback functions to access Ethernet SPI module via user's custom SPI driver.

### Public Members

void \***config**

Custom driver specific configuration data used by *init()* function.

---

**Note:** Type and its content is fully under user's control

---

void **init**(const void \*spi\_config)

Custom driver SPI Initialization.

---

**Note:** return type and its content is fully under user's control

---

**Param spi\_config [in]** Custom driver specific configuration

#### Return

- spi\_ctx: when initialization is successful, a pointer to context structure holding all variables needed for subsequent SPI access operations (e.g. SPI bus identification, mutexes, etc.)
- NULL: driver initialization failed

*esp\_err\_t* **deinit**(void \*spi\_ctx)

Custom driver De-initialization.

**Param spi\_ctx [in]** a pointer to driver specific context structure

#### Return

- ESP\_OK: driver de-initialization was successful
- ESP\_FAIL: driver de-initialization failed
- any other failure codes are allowed to be used to provide failure isolation

*esp\_err\_t* **read**(void \*spi\_ctx, uint32\_t cmd, uint32\_t addr, void \*data, uint32\_t data\_len)

Custom driver SPI read.

---

**Note:** The read function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

---

**Param spi\_ctx [in]** a pointer to driver specific context structure

**Param cmd [in]** command

**Param addr [in]** register address

**Param data [out]** read data

**Param data\_len [in]** read data length in bytes

#### Return

- ESP\_OK: read was successful
- ESP\_FAIL: read failed
- any other failure codes are allowed to be used to provide failure isolation

*esp\_err\_t* (\***write**)(void \*spi\_ctx, uint32\_t cmd, uint32\_t addr, const void \*data, uint32\_t data\_len)

Custom driver SPI write.

---

**Note:** The write function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

---

**Param spi\_ctx [in]** a pointer to driver specific context structure

**Param cmd [in]** command

**Param addr [in]** register address

**Param data [in]** data to write

**Param data\_len [in]** length of data to write in bytes

**Return**

- ESP\_OK: write was successful
- ESP\_FAIL: write failed
- any other failure codes are allowed to be used to provide failure isolation

## Macros

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG ()**

Default configuration for Ethernet MAC object.

**ETH\_DEFAULT\_SPI**

Default configuration of the custom SPI driver. Internal ESP-IDF SPI Master driver is used by default.

## Type Definitions

typedef struct *esp\_eth\_mac\_s* **esp\_eth\_mac\_t**

Ethernet MAC.

## Enumerations

enum **emac\_rmii\_clock\_mode\_t**

RMII Clock Mode Options.

*Values:*

enumerator **EMAC\_CLK\_DEFAULT**

Default values configured using Kconfig are going to be used when "Default" selected.

enumerator **EMAC\_CLK\_EXT\_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

---

**Note:** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

---

enumerator **EMAC\_CLK\_OUT**

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac\_rmii\_clock\_gpio\_t**

RMII Clock GPIO number Options.

*Values:*

enumerator **EMAC\_CLK\_IN\_GPIO**

MAC will get RMII clock from outside at this GPIO.

---

**Note:** ESP32 only supports GPIO0 to input the RMII clock.

---

enumerator **EMAC\_APPL\_CLK\_OUT\_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

---

**Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

---

enumerator **EMAC\_CLK\_OUT\_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC\_CLK\_OUT\_180\_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy.h](#)
- This header file can be included with:

```
#include "esp_eth_phy.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

## Functions

`esp_eth_phy_t *esp_eth_phy_new_ip101` (const `eth_phy_config_t *config`)

Create a PHY instance of IP101.

**Parameters** `config` -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_rt18201** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of RTL8201.

**Parameters** **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_lan87xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of LAN87xx.

**Parameters** **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_dp83848** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of DP83848.

**Parameters** **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ksz80xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters** **config** -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

## Structures

struct **esp\_eth\_phy\_s**

Ethernet PHY.

## Public Members

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_phy\_t* \*phy, *esp\_eth\_mediator\_t* \*mediator)

Set mediator for PHY.

**Param phy** [in] Ethernet PHY instance

**Param mediator** [in] mediator of Ethernet driver

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

*esp\_err\_t* (\***reset**)(*esp\_eth\_phy\_t* \*phy)

Software Reset Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***reset\_hw**)(*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

---

**Note:** Hardware reset is mostly done by pull down and up PHY's nRST pin

---

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***autonego\_ctrl**)(*esp\_eth\_phy\_t* \*phy, *eth\_phy\_autoneg\_cmd\_t* cmd, bool \*autonego\_en\_stat)

Configure auto negotiation.

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param autonego\_en\_stat [out]** Address where to store current status of auto negotiation configuration

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid command

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_phy\_t* \*phy, *eth\_link\_t* link)

Set Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Param link [in]** new link status

**Return**

- ESP\_OK: set Ethernet PHY link status successfully
- ESP\_FAIL: set Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***pwrcctl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** set true to power on Ethernet PHY; ser false to power off Ethernet PHY

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [in]** PHY chip address

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t \*addr)

Get PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** PHY chip address

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

*esp\_err\_t* (\***advertise\_pause\_ability**)(*esp\_eth\_phy\_t* \*phy, uint32\_t ability)

Advertise pause function supported by MAC layer.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** Pause ability

**Return**

- ESP\_OK: Advertise pause ability successfully
- ESP\_ERR\_INVALID\_ARG: Advertise pause ability failed because of invalid argument

*esp\_err\_t* (\***loopback**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Sets the PHY to loopback mode.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** enables or disables PHY loopback

**Return**

- ESP\_OK: PHY instance loopback mode has been configured successfully
- ESP\_FAIL: PHY instance loopback configuration failed because some error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_phy\_t* \*phy, eth\_speed\_t speed)

Sets PHY speed mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param speed [in]** Speed mode to be set

**Return**

- ESP\_OK: PHY instance speed mode has been configured successfully
- ESP\_FAIL: PHY instance speed mode configuration failed because some error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_phy\_t* \*phy, eth\_duplex\_t duplex)

Sets PHY duplex mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param duplex [in]** Duplex mode to be set

**Return**

- ESP\_OK: PHY instance duplex mode has been configured successfully
- ESP\_FAIL: PHY instance duplex mode configuration failed because some error occurred

*esp\_err\_t* (\***custom\_ioctl**)(*esp\_eth\_phy\_t* \*phy, uint32\_t cmd, void \*data)

Custom IO function of PHY driver. This function is intended to extend common options of *esp\_eth\_ioctl* to cover specifics of PHY chip.

---

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

---

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for *set* command or address where to store the data when used with *get* command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (\***del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

struct **eth\_phy\_config\_t**

Ethernet PHY configuration.

### Public Members

`int32_t phy_addr`

PHY address, set -1 to enable PHY address detection at initialization stage

`uint32_t reset_timeout_ms`

Reset timeout value (Unit: ms)

`uint32_t autonego_timeout_ms`

Auto-negotiation timeout value (Unit: ms)

`int reset_gpio_num`

Reset GPIO number, -1 means no hardware reset

### Macros

`ESP_ETH_PHY_ADDR_AUTO`

`ETH_PHY_DEFAULT_CONFIG()`

Default configuration for Ethernet PHY object.

### Type Definitions

typedef struct *esp\_eth\_phy\_s* `esp_eth_phy_t`

Ethernet PHY.

### Enumerations

enum `eth_phy_autoneg_cmd_t`

Auto-negotiation controll commands.

*Values:*

enumerator `ESP_ETH_PHY_AUTONEGO_RESTART`

enumerator `ESP_ETH_PHY_AUTONEGO_EN`

enumerator `ESP_ETH_PHY_AUTONEGO_DIS`

enumerator `ESP_ETH_PHY_AUTONEGO_G_STAT`

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy\\_802\\_3.h](#)
- This header file can be included with:

```
#include "esp_eth_phy_802_3.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

PRIV_REQUIRES esp_eth
-----------------------

**Functions**

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_mediator** (*phy\_802\_3\_t* \*phy\_802\_3, *esp\_eth\_mediator\_t* \*eth)

Set Ethernet mediator.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **eth** -- Ethernet mediator pointer

**Returns**

- ESP\_OK: Ethernet mediator set successfully
- ESP\_ERR\_INVALID\_ARG: if *eth* is NULL

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_reset** (*phy\_802\_3\_t* \*phy\_802\_3)

Reset PHY.

**Parameters** *phy\_802\_3* -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY reset successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_autonego\_ctrl** (*phy\_802\_3\_t* \*phy\_802\_3, *eth\_phy\_autoneg\_cmd\_t* cmd, bool \*autonego\_en\_stat)

Control autonegotiation mode of Ethernet PHY.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **cmd** -- autonegotiation command enumeration
- **autonego\_en\_stat** -- [out] autonegotiation enabled flag

**Returns**

- ESP\_OK: Ethernet PHY autonegotiation configured successfully
- ESP\_FAIL: Ethernet PHY autonegotiation configuration fail because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid value of *cmd*

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_pwrctl** (*phy\_802\_3\_t* \*phy\_802\_3, bool enable)

Power control of Ethernet PHY.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to power ON Ethernet PHY; set false to power OFF Ethernet PHY

**Returns**

- ESP\_OK: Ethernet PHY power down mode set successfully
- ESP\_FAIL: Ethernet PHY power up or power down failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t addr)

Set Ethernet PHY address.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **addr** -- new PHY address

**Returns**

- ESP\_OK: Ethernet PHY address set

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_get\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t \*addr)

Get Ethernet PHY address.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **addr** -- [out] Ethernet PHY address

**Returns**

- ESP\_OK: Ethernet PHY address read successfully

- `ESP_ERR_INVALID_ARG`: `addr` pointer is `NULL`

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_advertise\_pause\_ability** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t ability)

Advertise pause function ability.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **ability** -- enable or disable pause ability

#### Returns

- `ESP_OK`: pause ability set successfully
- `ESP_FAIL`: Advertise pause function ability failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_loopback** (*phy\_802\_3\_t* \*phy\_802\_3, bool enable)

Set Ethernet PHY loopback mode.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to enable loopback; set false to disable loopback

#### Returns

- `ESP_OK`: Ethernet PHY loopback mode set successfully
- `ESP_FAIL`: Ethernet PHY loopback configuration failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_speed** (*phy\_802\_3\_t* \*phy\_802\_3, eth\_speed\_t speed)

Set Ethernet PHY speed.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **speed** -- new speed of Ethernet PHY link

#### Returns

- `ESP_OK`: Ethernet PHY speed set successfully
- `ESP_FAIL`: Set Ethernet PHY speed failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_duplex** (*phy\_802\_3\_t* \*phy\_802\_3, eth\_duplex\_t duplex)

Set Ethernet PHY duplex mode.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **duplex** -- new duplex mode for Ethernet PHY link

#### Returns

- `ESP_OK`: Ethernet PHY duplex mode set successfully
- `ESP_ERR_INVALID_STATE`: unable to set duplex mode to Half if loopback is enabled
- `ESP_FAIL`: Set Ethernet PHY duplex mode failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_link** (*phy\_802\_3\_t* \*phy\_802\_3, eth\_link\_t link)

Set Ethernet PHY link status.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **link** -- new link status

#### Returns

- `ESP_OK`: Ethernet PHY link set successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_init** (*phy\_802\_3\_t* \*phy\_802\_3)

Initialize Ethernet PHY.

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

#### Returns

- `ESP_OK`: Ethernet PHY initialized successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_deinit** (*phy\_802\_3\_t* \*phy\_802\_3)

Power off Ethernet PHY.

**Parameters** `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**

- `ESP_OK`: Ethernet PHY powered off successfully

*esp\_err\_t* `esp_eth_phy_802_3_del` (*phy\_802\_3\_t* \*`phy_802_3`)

Delete Ethernet PHY infostructure.

**Parameters** `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**

- `ESP_OK`: Ethernet PHY infostructure deleted

*esp\_err\_t* `esp_eth_phy_802_3_reset_hw` (*phy\_802\_3\_t* \*`phy_802_3`, `uint32_t` `reset_assert_us`)

Performs hardware reset with specific reset pin assertion time.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object infostructure
- `reset_assert_us` -- Hardware reset pin assertion time

**Returns**

- `ESP_OK`: reset Ethernet PHY successfully

*esp\_err\_t* `esp_eth_phy_802_3_detect_phy_addr` (*esp\_eth\_mediator\_t* \*`eth`, `int` \*`detected_addr`)

Detect PHY address.

**Parameters**

- `eth` -- Mediator of Ethernet driver
- `detected_addr` -- [out] a valid address after detection

**Returns**

- `ESP_OK`: detect phy address successfully
- `ESP_ERR_INVALID_ARG`: invalid parameter
- `ESP_ERR_NOT_FOUND`: can't detect any PHY device
- `ESP_FAIL`: detect phy address failed because some error occurred

*esp\_err\_t* `esp_eth_phy_802_3_basic_phy_init` (*phy\_802\_3\_t* \*`phy_802_3`)

Performs basic PHY chip initialization.

---

**Note:** It should be called as the first function in PHY specific driver instance

---

**Parameters** `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**

- `ESP_OK`: initialized Ethernet PHY successfully
- `ESP_FAIL`: initialization of Ethernet PHY failed because some error occurred
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NOT_FOUND`: PHY device not detected
- `ESP_ERR_TIMEOUT`: MII Management read/write operation timeout
- `ESP_ERR_INVALID_STATE`: PHY is in invalid state to perform requested operation

*esp\_err\_t* `esp_eth_phy_802_3_basic_phy_deinit` (*phy\_802\_3\_t* \*`phy_802_3`)

Performs basic PHY chip de-initialization.

---

**Note:** It should be called as the last function in PHY specific driver instance

---

**Parameters** `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**

- `ESP_OK`: de-initialized Ethernet PHY successfully
- `ESP_FAIL`: de-initialization of Ethernet PHY failed because some error occurred
- `ESP_ERR_TIMEOUT`: MII Management read/write operation timeout
- `ESP_ERR_INVALID_STATE`: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_oui** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t \*oui)

Reads raw content of OUI field.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **oui** -- [out] OUI value

**Returns**

- ESP\_OK: OUI field read successfully
- ESP\_FAIL: OUI field read failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid *oui* argument
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_manufac\_info** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t \*model, uint8\_t \*rev)

Reads manufacturer's model and revision number.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **model** -- [out] Manufacturer's model number (can be NULL when not required)
- **rev** -- [out] Manufacturer's revision number (can be NULL when not required)

**Returns**

- ESP\_OK: Manufacturer's info read successfully
- ESP\_FAIL: Manufacturer's info read failed because some error occurred
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_get\_mmd\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t \*mmd\_addr)

Reads MDIO device's internal address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- [out] Current address stored in device's register

**Returns**

- ESP\_OK: Address register read successfully
- ESP\_FAIL: Address register read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_mmd\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t mmd\_addr)

Write to DIO device's internal address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- [out] New value of MDIO device's address register value

**Returns**

- ESP\_OK: Address register written to successfully
- ESP\_FAIL: Address register write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_mmd\_data** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, *esp\_eth\_phy\_802\_3\_mmd\_func\_t* function, uint32\_t \*data)

Read data of MDIO device's memory at address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data read from the device's memory

**Returns**

- ESP\_OK: Memory read successfully
- ESP\_FAIL: Memory read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_write\_mmd\_data** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, *esp\_eth\_phy\_802\_3\_mmd\_func\_t* function, uint32\_t data)

Write data to MDIO device's memory at address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data to write to the device's memory

**Returns**

- ESP\_OK: Memory written successfully
- ESP\_FAIL: Memory write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_mmd\_register** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t mmd\_addr, uint32\_t \*data)

Set MMD address to mmd\_addr with function MMD\_FUNC\_NOINCR and read contents to \*data.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- Address of MDIO device register
- **data** -- [out] Data read from the device's memory

**Returns**

- ESP\_OK: Memory read successfully
- ESP\_FAIL: Memory read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_write\_mmd\_register** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t mmd\_addr, uint32\_t data)

Set MMD address to mmd\_addr with function MMD\_FUNC\_NOINCR and write data.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- Address of MDIO device register
- **data** -- [out] Data to write to the device's memory

**Returns**

- ESP\_OK: Memory written to successfully
- ESP\_FAIL: Memory write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

inline *phy\_802\_3\_t* \***esp\_eth\_phy\_into\_phy\_802\_3** (*esp\_eth\_phy\_t* \*phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters** **phy** -- Ethernet PHY instance

**Returns** *phy\_802\_3\_t*\*

- address to parent IEEE 802.3 PHY object infostructure

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_obj\_config\_init** (*phy\_802\_3\_t* \*phy\_802\_3, const *eth\_phy\_config\_t* \*config)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

#### Parameters

- **phy\_802\_3** -- Address to IEEE 802.3 PHY object infostructure
- **config** -- Configuration of the IEEE 802.3 PHY object

#### Returns

- ESP\_OK: configuration initialized successfully
- ESP\_ERR\_INVALID\_ARG: invalid `config` argument

## Structures

struct **phy\_802\_3\_t**

IEEE 802.3 PHY object infostructure.

## Public Members

*esp\_eth\_phy\_t* **parent**

Parent Ethernet PHY instance

*esp\_eth\_mediator\_t* \***eth**

Mediator of Ethernet driver

int **addr**

PHY address

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

*eth\_link\_t* **link\_status**

Current Link status

int **reset\_gpio\_num**

Reset GPIO number, -1 means no hardware reset

## Enumerations

enum **esp\_eth\_phy\_802\_3\_mmd\_func\_t**

IEEE 802.3 MMD modes enumeration.

*Values:*

enumerator **MMD\_FUNC\_ADDRESS**

enumerator **MMD\_FUNC\_DATA\_NOINCR**

enumerator **MMD\_FUNC\_DATA\_RWINCR**

enumerator **MMD\_FUNC\_DATA\_WINCR**

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_netif\\_glue.h](#)
- This header file can be included with:

```
#include "esp_eth_netif_glue.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Functions

*esp\_eth\_netif\_glue\_handle\_t* **esp\_eth\_new\_netif\_glue** (*esp\_eth\_handle\_t* eth\_hdl)

Create a netif glue for Ethernet driver.

---

**Note:** netif glue is used to attach io driver to TCP/IP netif

---

**Parameters** **eth\_hdl** -- Ethernet driver handle

**Returns** glue object, which inherits `esp_netif_driver_base_t`

*esp\_err\_t* **esp\_eth\_del\_netif\_glue** (*esp\_eth\_netif\_glue\_handle\_t* eth\_netif\_glue)

Delete netif glue of Ethernet driver.

**Parameters** **eth\_netif\_glue** -- netif glue

**Returns** -ESP\_OK: delete netif glue successfully

### Type Definitions

typedef struct esp\_eth\_netif\_glue\_t \***esp\_eth\_netif\_glue\_handle\_t**

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

## 2.4.2 Thread

### Thread

**Introduction** [Thread](#) is an IP-based mesh networking protocol. It is based on the 802.15.4 physical and MAC layer.

**Application Examples** The `openthread` directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`
- The Thread Border Router `openthread/ot_br`
- The Thread Radio Co-Processor `openthread/ot_rcp`

**API Reference** For manipulating the Thread network, the OpenThread API shall be used. The OpenThread API docs can be found at the [OpenThread API docs](#).

ESP-IDF provides extra APIs for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

### Header File

- `components/openthread/include/esp_openthread.h`
- This header file can be included with:

```
#include "esp_openthread.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Functions

*esp\_err\_t* **esp\_openthread\_init** (const *esp\_openthread\_platform\_config\_t* \*init\_config)

Initializes the full OpenThread stack.

---

**Note:** The OpenThread instance will also be initialized in this function.

---

**Parameters** *init\_config* -- [in] The initialization configuration.

**Returns**

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed
- `ESP_ERR_INVALID_ARG` if radio or host connection mode not supported
- `ESP_ERR_INVALID_STATE` if already initialized

*esp\_err\_t* **esp\_openthread\_auto\_start** (otOperationalDatasetTlvs \*datasetTlvs)

Starts the Thread protocol operation and attaches to a Thread network.

**Parameters** *datasetTlvs* -- [in] The operational dataset (TLV encoded), if it's NULL, the function will generate the dataset based on the configurations from `kconfig`.

**Returns**

- `ESP_OK` on success
- `ESP_FAIL` on failures

*esp\_err\_t* **esp\_openthread\_launch\_mainloop** (void)

Launches the OpenThread main loop.

---

**Note:** This function will not return unless error happens when running the OpenThread stack.

---

**Returns**

- `ESP_OK` on success

- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_FAIL on other failures

*esp\_err\_t* **esp\_openthread\_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized

otInstance \***esp\_openthread\_get\_instance** (void)

This function acquires the underlying OpenThread instance.

---

**Note:** This function can be called on other tasks without lock.

---

**Returns** The OpenThread instance pointer

### Header File

- `components/openthread/include/esp_openthread_types.h`
- This header file can be included with:

```
#include "esp_openthread_types.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Structures

struct **esp\_openthread\_role\_changed\_event\_t**

OpenThread role changed event data.

#### Public Members

otDeviceRole **previous\_role**

Previous Thread role

otDeviceRole **current\_role**

Current Thread role

struct **esp\_openthread\_mainloop\_context\_t**

This structure represents a context for a `select()` based mainloop.

#### Public Members

fd\_set **read\_fds**

The read file descriptors

fd\_set **write\_fds**

The write file descriptors

fd\_set **error\_fds**

The error file descriptors

int **max\_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp\_openthread\_uart\_config\_t**

The uart port config for OpenThread.

### Public Members

[\*uart\\_port\\_t\*](#) **port**

UART port number

[\*uart\\_config\\_t\*](#) **uart\_config**

UART configuration, see [\*uart\\_config\\_t\*](#) docs

gpio\_num\_t **rx\_pin**

UART RX pin

gpio\_num\_t **tx\_pin**

UART TX pin

struct **esp\_openthread\_spi\_host\_config\_t**

The spi port config for OpenThread.

### Public Members

[\*spi\\_host\\_device\\_t\*](#) **host\_device**

SPI host device

[\*spi\\_dma\\_chan\\_t\*](#) **dma\_channel**

DMA channel

[\*spi\\_bus\\_config\\_t\*](#) **spi\_interface**

SPI bus

[\*spi\\_device\\_interface\\_config\\_t\*](#) **spi\_device**

SPI peripheral device

`gpio_num_t intr_pin`

SPI interrupt pin

struct `esp_openthread_spi_slave_config_t`

The spi slave config for OpenThread.

### Public Members

`spi_host_device_t host_device`

SPI host device

`spi_bus_config_t bus_config`

SPI bus config

`spi_slave_interface_config_t slave_config`

SPI slave config

`gpio_num_t intr_pin`

SPI interrupt pin

struct `esp_openthread_radio_config_t`

The OpenThread radio configuration.

### Public Members

`esp_openthread_radio_mode_t radio_mode`

The radio mode

`esp_openthread_uart_config_t radio_uart_config`

The uart configuration to RCP

`esp_openthread_spi_host_config_t radio_spi_config`

The spi configuration to RCP

struct `esp_openthread_host_connection_config_t`

The OpenThread host connection configuration.

### Public Members

`esp_openthread_host_connection_mode_t host_connection_mode`

The host connection mode

`esp_openthread_uart_config_t host_uart_config`

The uart configuration to host

`usb_serial_jtag_driver_config_t` **host\_usb\_config**

The usb configuration to host

*`esp_openthread_spi_slave_config_t`* **spi\_slave\_config**

The spi configuration to host

struct **esp\_openthread\_port\_config\_t**

The OpenThread port specific configuration.

### Public Members

const char \***storage\_partition\_name**

The partition for storing OpenThread dataset

uint8\_t **netif\_queue\_size**

The packet queue size for the network interface

uint8\_t **task\_queue\_size**

The task queue size

struct **esp\_openthread\_platform\_config\_t**

The OpenThread platform configuration.

### Public Members

*`esp_openthread_radio_config_t`* **radio\_config**

The radio configuration

*`esp_openthread_host_connection_config_t`* **host\_config**

The host connection configuration

*`esp_openthread_port_config_t`* **port\_config**

The port configuration

### Type Definitions

typedef void (\***esp\_openthread\_rcp\_failure\_handler**)(void)

### Enumerations

enum **esp\_openthread\_event\_t**

OpenThread event declarations.

*Values:*

enumerator **OPENTHREAD\_EVENT\_START**

OpenThread stack start

enumerator **OPENTHREAD\_EVENT\_STOP**

OpenThread stack stop

enumerator **OPENTHREAD\_EVENT\_DETACHED**

OpenThread detached

enumerator **OPENTHREAD\_EVENT\_ATTACHED**

OpenThread attached

enumerator **OPENTHREAD\_EVENT\_ROLE\_CHANGED**

OpenThread role changed

enumerator **OPENTHREAD\_EVENT\_IF\_UP**

OpenThread network interface up

enumerator **OPENTHREAD\_EVENT\_IF\_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD\_EVENT\_GOT\_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD\_EVENT\_LOST\_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_TREL\_ADD\_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_REMOVE\_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_SET\_DNS\_SERVER**

OpenThread stack set DNS server >

enumerator **OPENTHREAD\_EVENT\_PUBLISH\_MESHCOPE**

OpenThread stack start to publish meshcop-e service >

enumerator **OPENTHREAD\_EVENT\_REMOVE\_MESHCOPE**

OpenThread stack start to remove meshcop-e service >

enum **esp\_openthread\_radio\_mode\_t**

The radio mode of OpenThread.

*Values:*

enumerator **RADIO\_MODE\_NATIVE**

Use the native 15.4 radio

enumerator **RADIO\_MODE\_UART\_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_SPI\_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_MAX**

Using for parameter check

enum **esp\_openthread\_host\_connection\_mode\_t**

How OpenThread connects to the host.

*Values:*

enumerator **HOST\_CONNECTION\_MODE\_NONE**

Disable host connection

enumerator **HOST\_CONNECTION\_MODE\_CLI\_UART**

CLI UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_CLI\_USB**

CLI USB connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_UART**

RCP UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_SPI**

RCP SPI connection to the host

enumerator **HOST\_CONNECTION\_MODE\_MAX**

Using for parameter check

### Header File

- [components/openthread/include/esp\\_openthread\\_lock.h](#)
- This header file can be included with:

```
#include "esp_openthread_lock.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Functions

*esp\_err\_t* **esp\_openthread\_lock\_init** (void)

This function initializes the OpenThread API lock.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_STATE if already initialized

void **esp\_openthread\_lock\_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp\_openthread\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API lock.

---

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

---

**Parameters** **block\_ticks** -- [in] The maximum number of RTOS ticks to wait for the lock.

#### Returns

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_lock\_release** (void)

This function releases the OpenThread API lock.

bool **esp\_openthread\_task\_switching\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API task switching lock.

---

**Note:** In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it's not allowed, since the previous OpenThread API lock is not released yet. This task\_switching lock allows the OpenThread API can be called in this case.

---

---

**Note:** Please use esp\_openthread\_lock\_acquire() for normal cases.

---

**Parameters** **block\_ticks** -- [in] The maximum number of RTOS ticks to wait for the lock.

#### Returns

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_task\_switching\_lock\_release** (void)

This function releases the OpenThread API task switching lock.

### Header File

- [components/openthread/include/esp\\_openthread\\_netif\\_glue.h](#)
- This header file can be included with:

```
#include "esp_openthread_netif_glue.h"
```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Functions

void **esp\_openthread\_netif\_glue\_init** (const *esp\_openthread\_platform\_config\_t* \*config)

This function initializes the OpenThread network interface glue.

**Parameters** **config** -- [in] The platform configuration.

**Returns**

- glue pointer on success
- NULL on failure

void **esp\_openthread\_netif\_glue\_deinit** (void)

This function deinitializes the OpenThread network interface glue.

*esp\_netif\_t* \***esp\_openthread\_get\_netif** (void)

This function acquires the OpenThread netif.

**Returns** The OpenThread netif or NULL if not initialized.

void **esp\_openthread\_register\_meshcop\_e\_handler** (*esp\_event\_handler\_t* handler, bool for\_publish)

This function register a handler for meshcop-e service publish event and remove event.

**Parameters**

- **handler** -- [in] The handler.
- **for\_publish** -- [in] The usage of handler, true for publish event and false for remove event.

### Macros

**ESP\_NETIF\_INHERENT\_DEFAULT\_OPENTHREAD** ()

Default configuration reference of OpenThread esp-netif.

**ESP\_NETIF\_DEFAULT\_OPENTHREAD** ()

### Header File

- [components/openthread/include/esp\\_openthread\\_border\\_router.h](#)
- This header file can be included with:

```
#include "esp_openthread_border_router.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your CMakeLists.txt:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Functions

void **esp\_openthread\_set\_backbone\_netif** (*esp\_netif\_t* \*backbone\_netif)

Sets the backbone interface used for border routing.

---

**Note:** This function must be called before `esp_openthread_init`

---

**Parameters** `backbone_netif` -- [in] The backbone network interface (WiFi or ethernet)

*esp\_err\_t* `esp_openthread_border_router_init` (void)

Initializes the border router features of OpenThread.

---

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option `CONFIG_OPENTHREAD_BORDER_ROUTER` is required.

---

**Returns**

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if feature not supported
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_FAIL` on other failures

*esp\_err\_t* `esp_openthread_border_router_deinit` (void)

Deinitializes the border router features of OpenThread.

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized
- `ESP_FAIL` on other failures

*esp\_netif\_t* \*`esp_openthread_get_backbone_netif` (void)

Gets the backbone interface of OpenThread border router.

**Returns** The backbone interface or `NULL` if border router not initialized.

void `esp_openthread_register_rcp_failure_handler` (*esp\_openthread\_rcp\_failure\_handler* handler)

Registers the callback for RCP failure.

*esp\_err\_t* `esp_openthread_rcp_deinit` (void)

Deinitializes the connection to RCP.

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if fail to deinitialize RCP

*esp\_err\_t* `esp_openthread_rcp_init` (void)

Initializes the connection to RCP.

**Returns**

- `ESP_OK` on success
- `ESP_FAIL` if fail to initialize RCP

Thread is an IPv6-based mesh networking technology for IoT.

Code examples for the Thread API are provided in the [openthread](#) directory of ESP-IDF examples.

## 2.4.3 ESP-NETIF

### ESP-NETIF

The purpose of the ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This allows applications to choose between IP stacks in the future.
- The APIs it provides are thread-safe, even if the underlying TCP/IP stack APIs are not.

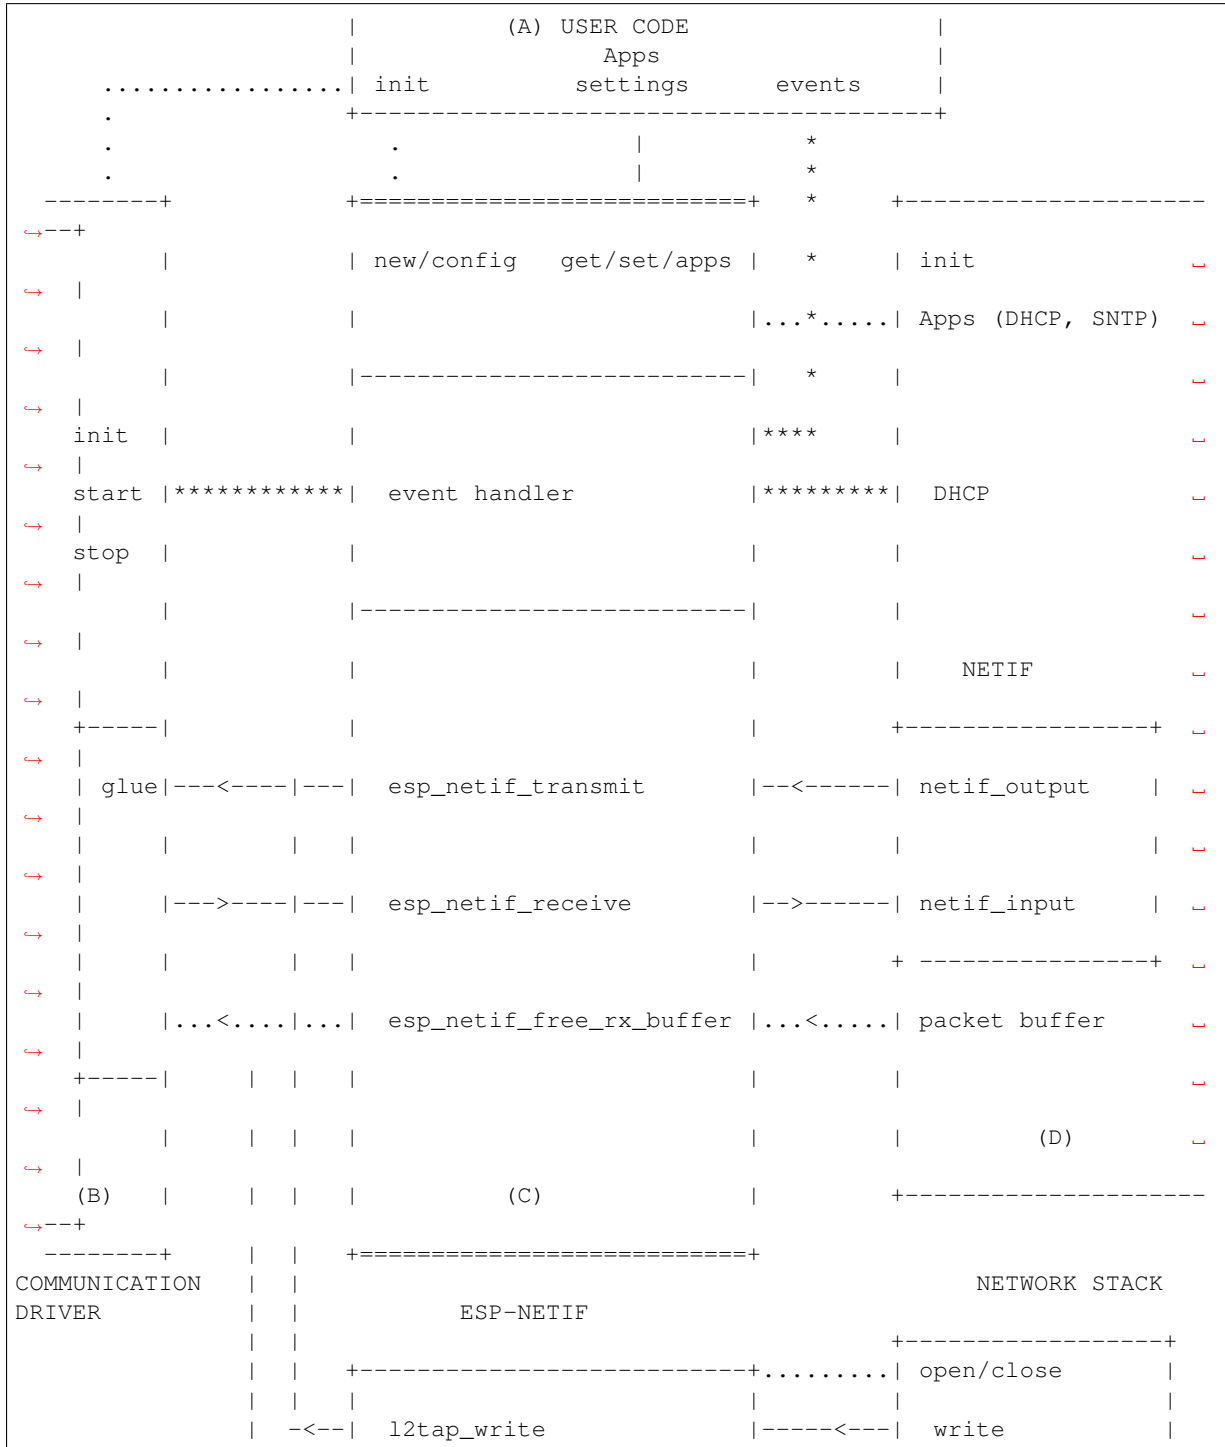

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation-agnostic and allows different implementations.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to [components/esp\\_netif\\_stack/README.md](#).

Some ESP-NETIF API functions are intended to be called by application code, for example, to get or set interface IP addresses, and configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called by the default network event handlers.

### ESP-NETIF Architecture

(continues on next page)

(continued from previous page)

### Data and Event Flow in the Diagram

- . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<---->-- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagate to the driver, user code, and network stack
- | User settings and runtime configuration

### ESP-NETIF Interaction

**A) User Code, Boilerplate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and is outlined as below:

#### A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure it with
  - ESP-NETIF specific options (flags, behavior, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - Use default handlers for common interfaces defined in IO drivers; or define a specific handler for customized behavior or new interfaces
  - Register handlers for app-related events (such as IP lost or acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- 1) Gets and sets TCP/IP-related parameters (DHCP, IP, etc)
- 2) Receives IP events (connect or disconnect)
- 3) Controls application lifecycle (set interface up or down)

**B) Communication Driver, IO Driver, and Media Driver** Communication driver plays these two important roles in relation to ESP-NETIF:

- 1) Event handlers: Defines behavior patterns of interaction with ESP-NETIF (e.g., ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input or output functions to use ESP-NETIF transmit, receive, and free receive buffer
  - Installs driver\_transmit to the appropriate ESP-NETIF object so that outgoing packets from the network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to the network stack

**C) ESP-NETIF** ESP-NETIF serves as an intermediary between an IO driver and a network stack, connecting the packet data path between the two. It provides a set of interfaces for attaching a driver to an ESP-NETIF object at runtime and configures a network stack during compiling. Additionally, a set of APIs is provided to control the network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface can be divided into six groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input or Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters API for basic network interface properties
- 5) Network stack abstraction API: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
  - [SNTP API](#)
- 6) Driver conversion utilities API

**D) Network Stack** The network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**E) ESP-NETIF L2 TAP Interface** The ESP-NETIF L2 TAP interface is a mechanism in ESP-IDF used to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from the user application. Its typical usage in the embedded world might be the implementation of non-IP-related protocols, e.g., PTP, Wake on LAN. Note that only Ethernet (IEEE 802.3) is currently supported.

From a user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS, which provides file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). To learn more, refer to [Virtual Filesystem Component](#).

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configurations can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as a generic entry point to the Layer 2 infrastructure. What is important is then the specific configuration of the particular file descriptor. It can be configured to give access to a specific Network Interface identified by `if_key` (e.g., `ETH_DEF`) and to filter only specific frames based on their type (e.g., Ethernet type in the case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with the IP stack and so the IP-related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though this option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from the perspective of the user's application, as it only gets access to the frame types it is interested in, and the remaining traffic is either passed to other L2 TAP file descriptors or to the IP stack.

### ESP-NETIF L2 TAP Interface Usage Manual

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#) first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

**open()** Once the ESP-NETIF L2 TAP is registered, it can be opened at path name `"/dev/net/tap"`. The same path name can be opened multiple times up to [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP\\_MAX\\_FDS](#) and multiple file descriptors with a different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with the `O_NONBLOCK` file status flag to make sure the `read()` does not block. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, `-1` is returned, and `errno` is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior to its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to a specific Network Interface that is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in [esp\\_netif/include/esp\\_netif\\_defaults.h](#).
- `L2TAP_S_DEVICE_DRV_HNDL` - is another way to bound the file descriptor to a specific Network Interface. In this case, the Network interface is identified directly by IO Driver handle (e.g., `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with the type to be passed to the file descriptor. In the case of Ethernet frames, the frames are to be filtered based on the Length and Ethernet type field. In case the filter value is set less than or equal to `0x05DC`, the Ethernet type field is considered to represent IEEE802.3 Length Field, and all frames with values in interval `<0, 0x05DC>` at that field are passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by the user's application. In case the filter value is set greater than `0x05DC`, the Ethernet type field is considered to represent protocol identification and only frames that are equal to the set value are to be passed to the file descriptor.

All above-set configuration options have a getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to a specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to make `L2TAP_S_RCV_FILTER` option available.

---

**Note:** VLAN-tagged frames are currently not recognized. If the user needs to process VLAN-tagged frames, they need a set filter to be equal to the VLAN tag (i.e., `0x8100` or `0x88A8`) and process the VLAN-tagged frames in the user application.

---

---

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when the user's application does not require the usage of an IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

---

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- \* `EBADF` - not a valid file descriptor.
- \* `EACCES` - options change is denied in this state (e.g., file descriptor has not been bounded to Network interface yet).
- \* `EINVAL` - invalid configuration argument. Ethernet type filter is already used by other file descriptors on that same Network interface.
- \* `ENODEV` - no such Network Interface which is tried to be assigned to the file descriptor exists.
- \* `ENOSYS` - unsupported operation, passed configuration option does not exist.

**fcntl()** `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with the file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, and the third argument is ignored.
- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- \* `EBADF` - not a valid file descriptor.
- \* `ENOSYS` - unsupported command.

**read()** Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on the actual state of the `O_NONBLOCK` file status flag. When the file status flag is set to blocking, the read operation waits until a frame is received and the context is switched to other tasks. When the file status flag is set to non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reached a configured threshold, the newly arrived frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when the size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

\* EBADF - not a valid file descriptor.

\* EAGAIN - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()** A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. The user's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of an Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header, and user data. The length of these fields is as follows:

Destination MAC	Source MAC	Type/Length	Payload (protocol header/data)
6 B	6 B	2 B	0-1486 B

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when the size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

\* EBADF - not a valid file descriptor.

\* EBADMSG - The Ethernet type of the frame is different from the file descriptor configured filter.

\* EIO - Network interface not available or busy.

**close()** Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread-safe and can be called from a different task than the file descriptor is actually used. If such a situation occurs and one task is blocked in the I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with an error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

\* EBADF - not a valid file descriptor.

**select()** Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to make the `select()` function available.

**SNTP API** You can find a brief introduction to SNTP in general, its initialization code, and basic modes in Section *SNTP Time Synchronization* in *System Time*.

This section provides more details about specific use cases of the SNTP service, with statically configured servers, or use the DHCP-provided servers, or both. The workflow is usually very simple:

- 1) Initialize and configure the service using `esp_netif_sntp_init()`.
- 2) Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It is useful to start the service explicitly after connecting if we want to use the DHCP-obtained NTP servers. Please note, this option needs to be enabled before connecting, but the SNTP service should be started after.
- 3) Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).
- 4) Stop and destroy the service using `esp_netif_sntp_deinit()`.

**Basic Mode with Statically Defined Server(s)** Initialize the module with the default configuration after connecting to the network. Note that it is possible to provide multiple NTP servers in the configuration struct:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,
    ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"
↪) );
esp_netif_sntp_init(&config);
```

**Note:** If we want to configure multiple SNTP servers, we have to update the lwIP configuration `CONFIG_LWIP_SNTP_MAX_SERVERS`.

**Use DHCP-Obtained SNTP Server(s)** First of all, we have to enable the lwIP configuration option `CONFIG_LWIP_DHCP_GET_NTP_SRV`. Then we have to initialize the SNTP module with the DHCP option and without the NTP server:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});
config.start = false; // start the SNTP service explicitly
config.server_from_dhcp = true; // accept the NTP offer from the DHCP
↪server
esp_netif_sntp_init(&config);
```

Then, once we are connected, we could start the service using:

```
esp_netif_sntp_start();
```

**Note:** It is also possible to start the service during initialization (default `config.start=true`). This would likely to cause the initial SNTP request to fail (since we are not connected yet) and lead to some back-off time for subsequent requests.

**Use Both Static and Dynamic Servers** Very similar to the scenario above (DHCP provided SNTP server), but in this configuration, we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when the DHCP-provided information gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining a DHCP lease.

The typical configuration now looks as per below, providing the specific `IP_EVENT` to update the config and index of the first server to reconfigure (for example setting `config.index_of_first_server=1` would keep the DHCP provided server at index 0, and the statically configured server at index 1).

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // start the SNTP service explicitly
↪(after connecting)
config.server_from_dhcp = true; // accept the NTP offers from DHCP
↪server
```

(continues on next page)

(continued from previous page)

```

config.renew_servers_after_new_IP = true;    // let esp-netif update the configured
↪SNTP server(s) after receiving the DHCP lease
config.index_of_first_server = 1;           // updates from server num 1, leaving
↪server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP; // IP event on which we refresh
↪the configuration

```

Then we start the service normally with `esp_netif_sntp_start()`.

**ESP-NETIF Programmer's Manual** Please refer to the following example to understand the initialization process of the default interface:

- Ethernet: [ethernet/basic/main/ethernet\\_example\\_main.c](#)
- L2 TAP: [protocols/l2tap/main/l2tap\\_main.c](#)
- Wi-Fi Access Point: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)

For more specific cases, please consult this guide: *ESP-NETIF Custom I/O Driver*.

## API Reference

### Header File

- [components/esp\\_netif/include/esp\\_netif.h](#)
- This header file can be included with:

```
#include "esp_netif.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

### Functions

*esp\_err\_t* **esp\_netif\_init** (void)

Initialize the underlying TCP/IP stack.

---

**Note:** This function should be called exactly once from application code, when the application starts up.

---

#### Returns

- `ESP_OK` on success
- `ESP_FAIL` if initializing failed

*esp\_err\_t* **esp\_netif\_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

```
Note: Deinitialization is not supported yet
```

#### Returns

- `ESP_ERR_INVALID_STATE` if `esp_netif` not initialized
- `ESP_ERR_NOT_SUPPORTED` otherwise

*esp\_netif\_t* \***esp\_netif\_new** (const *esp\_netif\_config\_t* \*esp\_netif\_config)

Creates an instance of new esp-netif object based on provided config.

**Parameters** **esp\_netif\_config** -- [in] pointer esp-netif configuration

**Returns**

- pointer to esp-netif object on success
- NULL otherwise

void **esp\_netif\_destroy** (*esp\_netif\_t* \*esp\_netif)

Destroys the esp\_netif object.

**Parameters** **esp\_netif** -- [in] pointer to the object to be deleted

*esp\_err\_t* **esp\_netif\_set\_driver\_config** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_driver\_ifconfig\_t* \*driver\_config)

Configures driver related options of esp\_netif object.

**Parameters**

- **esp\_netif** -- [inout] pointer to the object to be configured
- **driver\_config** -- [in] pointer esp-netif io driver related configuration

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

*esp\_err\_t* **esp\_netif\_attach** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_io\_driver\_handle\_t* driver\_handle)

Attaches esp\_netif instance to the io driver handle.

Calling this function enables connecting specific esp\_netif object with already initialized io driver to update esp\_netif object with driver specific configuration (i.e. calls post\_attach callback, which typically sets io driver callbacks to esp\_netif instance and starts the driver)

**Parameters**

- **esp\_netif** -- [inout] pointer to esp\_netif object to be attached
- **driver\_handle** -- [in] pointer to the driver handle

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's post\_attach callback failed

*esp\_err\_t* **esp\_netif\_receive** (*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **buffer** -- [in] Received data
- **len** -- [in] Length of the data frame
- **eb** -- [in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**

- ESP\_OK

void **esp\_netif\_action\_start** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance

- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_stop** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver stop event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_connected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver connected event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_disconnected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver disconnected event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_got\_ip** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon network got IP event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_join\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group join.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_leave\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group leave.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_add\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_remove\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

*esp\_err\_t* **esp\_netif\_set\_default\_netif** (*esp\_netif\_t* \*esp\_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route\_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route\_prio number (unless the selected netif gets destroyed).

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

**Returns** ESP\_OK on success

*esp\_netif\_t* \***esp\_netif\_get\_default\_netif** (void)

Getter function of the default netif.

This API returns the selected default netif.

**Returns** Handle to esp-netif instance of the default netif.

*esp\_err\_t* **esp\_netif\_join\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to join a IPv6 multicast group.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **addr** -- [in] The multicast group to join

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_leave\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to leave a IPv6 multicast group.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **addr** -- [in] The multicast group to leave

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Set the mac address for the interface instance.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **mac** -- [in] Desired mac address for the related network interface

**Returns**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_get\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Get the mac address for the interface instance.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **mac** -- [out] Resultant mac address for the related network interface

**Returns**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error

- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_set\_hostname** (*esp\_netif\_t* \*esp\_netif, const char \*hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **hostname** -- **[in]** New hostname for the interface. Maximum length 32 bytes.

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

*esp\_err\_t* **esp\_netif\_get\_hostname** (*esp\_netif\_t* \*esp\_netif, const char \*\*hostname)

Get interface hostname.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **hostname** -- **[out]** Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

bool **esp\_netif\_is\_netif\_up** (*esp\_netif\_t* \*esp\_netif)

Test if supplied interface is up or down.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

#### Returns

- true - Interface is up
- false - Interface is down

*esp\_err\_t* **esp\_netif\_get\_ip\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **ip\_info** -- **[out]** If successful, IP information will be returned in this argument.

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **ip\_info** -- **[out]** If successful, IP information will be returned in this argument.

#### Returns

- `ESP_OK`

- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

*esp\_err\_t* `esp_netif_set_ip_info` (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

---

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

---

---

**Note:** Calling this interface for may generate a `SYSTEM_EVENT_STA_GOT_IP` or `SYSTEM_EVENT_ETH_GOT_IP` event.

---

#### Parameters

- `esp_netif` -- [in] Handle to esp-netif instance
- `ip_info` -- [in] IP information to set on the specified interface

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED` If DHCP server or client is still running

*esp\_err\_t* `esp_netif_set_old_ip_info` (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the `SYSTEM_EVENT_STA_CONNECTED` and `SYSTEM_EVENT_ETH_CONNECTED` events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

#### Parameters

- `esp_netif` -- [in] Handle to esp-netif instance
- `ip_info` -- [in] Store the old IP information for the specified interface

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

int `esp_netif_get_netif_impl_index` (*esp\_netif\_t* \*esp\_netif)

Get net interface index from network stack implementation.

---

**Note:** This index could be used in `setsockopt ()` to bind socket with multicast interface

---

**Parameters** `esp_netif` -- [in] Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied `esp_netif`

*esp\_err\_t* **esp\_netif\_get\_netif\_impl\_name** (*esp\_netif\_t* \*esp\_netif, char \*name)

Get net interface name from network stack implementation.

---

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **name** -- **[out]** Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_napt\_enable** (*esp\_netif\_t* \*esp\_netif)

Enable NAPT on an interface.

---

**Note:** Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

#### Returns

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

*esp\_err\_t* **esp\_netif\_napt\_disable** (*esp\_netif\_t* \*esp\_netif)

Disable NAPT on an interface.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

#### Returns

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

*esp\_err\_t* **esp\_netif\_dhcps\_option** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP server option.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **opt\_op** -- **[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** -- **[in]** Option index to get or set, must be one of the supported enum values.
- **opt\_val** -- **[inout]** Pointer to the option parameter.
- **opt\_len** -- **[in]** Length of the option parameter.

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_option** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP client option.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **opt\_op** -- **[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** -- **[in]** Option index to get or set, must be one of the supported enum values.
- **opt\_val** -- **[inout]** Pointer to the option parameter.
- **opt\_len** -- **[in]** Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP client (only if enabled in interface object)

---

**Note:** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP client (only if enabled in interface object)

---

**Note:** Calling action\_netif\_stop() will also stop the DHCP Client if it is running.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP client status.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **status** -- **[out]** If successful, the status of DHCP client will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP Server status.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **status** -- **[out]** If successful, the status of the DHCP server will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcps\_get\_clients\_by\_mac** (*esp\_netif\_t* \*esp\_netif, int num,  
*esp\_netif\_pair\_mac\_ip\_t* \*mac\_ip\_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **num** -- **[in]** Number of clients with specified MAC addresses in the array of pairs
- **mac\_ip\_pair** -- **[inout]** Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS on invalid params
- ESP\_ERR\_NOT\_SUPPORTED if DHCP server not enabled

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type,  
*esp\_netif\_dns\_info\_t* \*dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **type** -- **[in]** Type of DNS Server to set: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** -- **[in]** DNS Server address to set

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type,  
*esp\_netif\_dns\_info\_t* \*dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **type** -- **[in]** Type of DNS Server to get: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** -- **[out]** DNS Server result is written here on success

#### Returns

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

`esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)`

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM\_EVENT\_GOT\_IP6 event will be sent.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

`esp_err_t esp_netif_get_ip6_linklocal (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)`

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **if\_ip6** -- **[out]** IPv6 information will be returned in this argument if successful.

#### Returns

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

`esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)`

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **if\_ip6** -- **[out]** IPv6 information will be returned in this argument if successful.

#### Returns

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

`int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])`

Get all IPv6 addresses of the specified interface.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **if\_ip6** -- **[out]** Array of IPv6 addresses will be copied to the argument

**Returns** number of returned IPv6 addresses

void **esp\_netif\_set\_ip4\_addr** (*esp\_ip4\_addr\_t* \*addr, uint8\_t a, uint8\_t b, uint8\_t c, uint8\_t d)

Sets IPv4 address to the specified octets.

**Parameters**

- **addr** -- [out] IP address to be set
- **a** -- the first octet (127 for IP 127.0.0.1)
- **b** --
- **c** --
- **d** --

char \***esp\_ip4addr\_ntoa** (const *esp\_ip4\_addr\_t* \*addr, char \*buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

**Parameters**

- **addr** -- ip address in network order to convert
- **buf** -- target buffer where the string is stored
- **buflen** -- length of buf

**Returns** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32\_t **esp\_ip4addr\_aton** (const char \*addr)

Ascii internet address interpretation routine The value returned is in network order.

**Parameters** **addr** -- IP address in ascii representation (e.g. "127.0.0.1")

**Returns** ip address in network order

*esp\_err\_t* **esp\_netif\_str\_to\_ip4** (const char \*src, *esp\_ip4\_addr\_t* \*dst)

Converts Ascii internet IPv4 address into esp\_ip4\_addr\_t.

**Parameters**

- **src** -- [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
- **dst** -- [out] Address of the target esp\_ip4\_addr\_t structure to receive converted address

**Returns**

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

*esp\_err\_t* **esp\_netif\_str\_to\_ip6** (const char \*src, *esp\_ip6\_addr\_t* \*dst)

Converts Ascii internet IPv6 address into esp\_ip4\_addr\_t Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:0:2:1" or "2001:db8::2:1")

**Parameters**

- **src** -- [in] IPv6 address in ascii representation (e.g. ""2001:0db8:85a3:0000:0000:0002:0001")
- **dst** -- [out] Address of the target esp\_ip6\_addr\_t structure to receive converted address

**Returns**

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

*esp\_netif\_iodriver\_handle* **esp\_netif\_get\_io\_driver** (*esp\_netif\_t* \*esp\_netif)

Gets media driver handle for this esp-netif instance.

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

**Returns** opaque pointer of related IO driver

*esp\_netif\_t* \***esp\_netif\_get\_handle\_from\_ifkey** (const char \*if\_key)

Searches over a list of created objects to find an instance with supplied if key.

**Parameters** **if\_key** -- Textual description of network interface

**Returns** Handle to esp-netif instance

*esp\_netif\_flags\_t* **esp\_netif\_get\_flags** (*esp\_netif\_t* \*esp\_netif)

Returns configured flags for this interface.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** Configuration flags

const char \***esp\_netif\_get\_ifkey** (*esp\_netif\_t* \*esp\_netif)

Returns configured interface key for this esp-netif instance.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** Textual description of related interface

const char \***esp\_netif\_get\_desc** (*esp\_netif\_t* \*esp\_netif)

Returns configured interface type for this esp-netif instance.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** Enumerated type of this interface, such as station, AP, ethernet

int **esp\_netif\_get\_route\_prio** (*esp\_netif\_t* \*esp\_netif)

Returns configured routing priority number.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** Integer representing the instance's route-prio, or -1 if invalid parameters

int32\_t **esp\_netif\_get\_event\_id** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_event\_type\_t* event\_type)

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **event\_type** -- (either get or lost IP)

**Returns** specific event id which is configured to be raised if the interface lost or acquired IP address  
-1 if supplied event\_type is not known

*esp\_netif\_t* \***esp\_netif\_next** (*esp\_netif\_t* \*esp\_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

---

**Note:** This API doesn't lock the list, nor the TCPIP context, as this it's usually required to get atomic access between iteration steps rather than within a single iteration. Therefore it is recommended to iterate over the interfaces inside *esp\_netif\_tcpip\_exec()*

---

---

**Note:** This API is deprecated. Please use *esp\_netif\_next\_unsafe()* directly if all the system interfaces are under your control and you can safely iterate over them. Otherwise, iterate over interfaces using *esp\_netif\_tcpip\_exec()*, or use *esp\_netif\_find\_if()* to search in the list of netifs with defined predicate.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

*esp\_netif\_t* \***esp\_netif\_next\_unsafe** (*esp\_netif\_t* \*esp\_netif)

Iterates over list of interfaces without list locking. Returns first netif if NULL given as parameter.

Used for bulk search loops within TCPIP context, e.g. using *esp\_netif\_tcpip\_exec()*, or if we're sure that the iteration is safe from our application perspective (e.g. no interface is removed between iterations)

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

*esp\_netif\_t* \***esp\_netif\_find\_if** (*esp\_netif\_find\_predicate\_t* fn, void \*ctx)

Return a netif pointer for the first interface that meets criteria defined by the callback.

**Parameters**

- **fn** -- Predicate function returning true for the desired interface
  - **ctx** -- Context pointer passed to the predicate, typically a descriptor to compare with
- Returns** valid netif pointer if found, NULL if not

size\_t **esp\_netif\_get\_nr\_of\_ifs** (void)

Returns number of registered esp\_netif objects.

**Returns** Number of esp\_netifs

void **esp\_netif\_netstack\_buf\_ref** (void \*netstack\_buf)

increase the reference counter of net stack buffer

**Parameters** **netstack\_buf** -- [in] the net stack buffer

void **esp\_netif\_netstack\_buf\_free** (void \*netstack\_buf)

free the netstack buffer

**Parameters** **netstack\_buf** -- [in] the net stack buffer

esp\_err\_t **esp\_netif\_tcpip\_exec** (esp\_netif\_callback\_fn fn, void \*ctx)

Utility to execute the supplied callback in TCP/IP context.

**Parameters**

- **fn** -- Pointer to the callback
- **ctx** -- Parameter to the callback

**Returns** The error code (esp\_err\_t) returned by the callback

## Type Definitions

typedef bool (\***esp\_netif\_find\_predicate\_t**)(esp\_netif\_t \*netif, void \*ctx)

Predicate callback for *esp\_netif\_find\_if()* used to find interface which meets defined criteria.

typedef esp\_err\_t (\***esp\_netif\_callback\_fn**)(void \*ctx)

TCPIP thread safe callback used with *esp\_netif\_tcpip\_exec()*

## Header File

- [components/esp\\_netif/include/esp\\_netif\\_sntp.h](#)
- This header file can be included with:

```
#include "esp_netif_sntp.h"
```

- This header file is a part of the API provided by the esp\_netif component. To declare that your component depends on esp\_netif, add the following to your CMakeLists.txt:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

## Functions

esp\_err\_t **esp\_netif\_sntp\_init** (const esp\_sntp\_config\_t \*config)

Initialize SNTP with supplied config struct.

**Parameters** **config** -- Config struct

**Returns** ESP\_OK on success

esp\_err\_t **esp\_netif\_sntp\_start** (void)

Start SNTP service if it wasn't started during init (config.start = false) or restart it if already started.

**Returns** ESP\_OK on success

void **esp\_netif\_sntp\_deinit** (void)

Deinitialize esp\_netif SNTP module.

*esp\_err\_t* **esp\_netif\_sntp\_sync\_wait** (TickType\_t tout)

Wait for time sync event.

**Parameters** **tout** -- Specified timeout in RTOS ticks

**Returns** ESP\_TIMEOUT if sync event didn't come within the timeout  
ESP\_ERR\_NOT\_FINISHED if the sync event came, but we're in smooth update mode  
and still in progress (SNTP\_SYNC\_STATUS\_IN\_PROGRESS) ESP\_OK if time sync'ed

## Structures

struct **esp\_sntp\_config**

SNTP configuration struct.

## Public Members

bool **smooth\_sync**

set to true if smooth sync required

bool **server\_from\_dhcp**

set to true to request NTP server config from DHCP

bool **wait\_for\_sync**

if true, we create a semaphore to signal time sync event

bool **start**

set to true to automatically start the SNTP service

*esp\_sntp\_time\_cb\_t* **sync\_cb**

optionally sets callback function on time sync event

bool **renew\_servers\_after\_new\_IP**

this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

*ip\_event\_t* **ip\_event\_to\_renew**

set the IP event id on which we refresh server list (if renew\_servers\_after\_new\_IP=true)

size\_t **index\_of\_first\_server**

refresh server list after this server (if renew\_servers\_after\_new\_IP=true)

size\_t **num\_of\_servers**

number of preconfigured NTP servers

const char \***servers**[1]

list of servers

## Macros

**ESP\_SNTP\_SERVER\_LIST** (...)

Utility macro for providing multiple servers in parentheses.

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG\_MULTIPLE** (servers\_in\_list, list\_of\_servers)

Default configuration to init SNTP with multiple servers.

### Parameters

- **servers\_in\_list** -- Number of servers in the list
- **list\_of\_servers** -- List of servers (use [ESP\\_SNTP\\_SERVER\\_LIST\(...\)](#))

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG** (server)

Default configuration with a single server.

## Type Definitions

typedef void (\***esp\_sntp\_time\_cb\_t**)(struct timeval \*tv)

Time sync notification function.

typedef struct *esp\_sntp\_config* **esp\_sntp\_config\_t**

SNTP configuration struct.

## Header File

- [components/esp\\_netif/include/esp\\_netif\\_types.h](#)
- This header file can be included with:

```
#include "esp_netif_types.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

## Structures

struct **esp\_netif\_dns\_info\_t**

DNS server info.

### Public Members

*esp\_ip\_addr\_t* **ip**

IPV4 address of DNS server

struct **esp\_netif\_ip\_info\_t**

Event structure for IP\_EVENT\_STA\_GOT\_IP, IP\_EVENT\_ETH\_GOT\_IP events

### Public Members

*esp\_ip4\_addr\_t* **ip**

Interface IPV4 address

*esp\_ip4\_addr\_t* **netmask**

Interface IPV4 netmask

*esp\_ip4\_addr\_t* **gw**

Interface IPV4 gateway address

struct **esp\_netif\_ip6\_info\_t**

IPV6 IP address information.

### Public Members

*esp\_ip6\_addr\_t* **ip**

Interface IPV6 address

struct **ip\_event\_got\_ip\_t**

Event structure for IP\_EVENT\_GOT\_IP event.

### Public Members

*esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip\_info\_t* **ip\_info**

IP address, netmask, gateway IP address

bool **ip\_changed**

Whether the assigned IP has changed or not

struct **ip\_event\_got\_ip6\_t**

Event structure for IP\_EVENT\_GOT\_IP6 event

### Public Members

*esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip6\_info\_t* **ip6\_info**

IPv6 address of the interface

int **ip\_index**

IPv6 address index

struct **ip\_event\_add\_ip6\_t**

Event structure for ADD\_IP6 event

### Public Members

*esp\_ip6\_addr\_t* **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip\_event\_ap\_staassigned\_t**

Event structure for IP\_EVENT\_AP\_STAIPASSIGNED event

### Public Members

*esp\_netif\_t* \***esp\_netif**

Pointer to the associated netif handle

*esp\_ip4\_addr\_t* **ip**

IP address which was assigned to the station

uint8\_t **mac**[6]

MAC address of the connected client

struct **bridgeif\_config**

LwIP bridge configuration

### Public Members

uint16\_t **max\_fdb\_dyn\_entries**

maximum number of entries in dynamic forwarding database

uint16\_t **max\_fdb\_sta\_entries**

maximum number of entries in static forwarding database

uint8\_t **max\_ports**

maximum number of ports the bridge can consist of

struct **esp\_netif\_inherent\_config**

ESP-netif inherent config parameters.

### Public Members

*esp\_netif\_flags\_t* **flags**

flags that define esp-netif behavior

uint8\_t **mac**[6]

initial mac address for this interface

const *esp\_netif\_ip\_info\_t* \***ip\_info**  
initial ip address for this interface

uint32\_t **get\_ip\_event**  
event id to be raised when interface gets an IP

uint32\_t **lost\_ip\_event**  
event id to be raised when interface loses its IP

const char \***if\_key**  
string identifier of the interface

const char \***if\_desc**  
textual description of the interface

int **route\_prio**  
numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route\_prio indicates a higher priority

*bridgeif\_config\_t* \***bridge\_info**  
LwIP bridge configuration

struct **esp\_netif\_driver\_base\_s**  
ESP-netif driver base handle.

### Public Members

*esp\_err\_t* (\***post\_attach**)(*esp\_netif\_t* \*netif, *esp\_netif\_iodriver\_handle* h)  
post attach function pointer

*esp\_netif\_t* \***netif**  
netif handle

struct **esp\_netif\_driver\_ifconfig**  
Specific IO driver configuration.

### Public Members

*esp\_netif\_iodriver\_handle* **handle**  
io-driver handle

*esp\_err\_t* (\***transmit**)(void \*h, void \*buffer, size\_t len)  
transmit function pointer

*esp\_err\_t* (\***transmit\_wrap**)(void \*h, void \*buffer, size\_t len, void \*netstack\_buffer)  
transmit wrap function pointer

void (**\*driver\_free\_rx\_buffer**)(void \*h, void \*buffer)  
free rx buffer function pointer

struct **esp\_netif\_config**  
Generic esp\_netif configuration.

### Public Members

const *esp\_netif\_inherent\_config\_t* \***base**  
base config

const *esp\_netif\_driver\_ifconfig\_t* \***driver**  
driver config

const *esp\_netif\_netstack\_config\_t* \***stack**  
stack config

struct **esp\_netif\_pair\_mac\_ip\_t**  
DHCP client's addr info (pair of MAC and IP address)

### Public Members

uint8\_t **mac**[6]  
Clients MAC address

*esp\_ip4\_addr\_t* **ip**  
Clients IP address

### Macros

**ESP\_ERR\_ESP\_NETIF\_BASE**  
Definition of ESP-NETIF based errors.

**ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS**

**ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED**

**ESP\_ERR\_ESP\_NETIF\_NO\_MEM**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED**

**ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_INIT\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_DNS\_NOT\_CONFIGURED**

**ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED**

**ESP\_NETIF\_BR\_FLOOD**

Definition of ESP-NETIF bridge controll.

**ESP\_NETIF\_BR\_DROP**

**ESP\_NETIF\_BR\_FDW\_CPU**

### Type Definitions

typedef struct esp\_netif\_obj **esp\_netif\_t**

typedef enum *esp\_netif\_flags* **esp\_netif\_flags\_t**

typedef enum *esp\_netif\_ip\_event\_type* **esp\_netif\_ip\_event\_type\_t**

typedef struct *bridgeif\_config* **bridgeif\_config\_t**

LwIP bridge configuration

typedef struct *esp\_netif\_inherent\_config* **esp\_netif\_inherent\_config\_t**

ESP-netif inherent config parameters.

typedef struct *esp\_netif\_config* **esp\_netif\_config\_t**

typedef void \***esp\_netif\_iodriver\_handle**

IO driver handle type.

typedef struct *esp\_netif\_driver\_base\_s* **esp\_netif\_driver\_base\_t**

ESP-netif driver base handle.

typedef struct *esp\_netif\_driver\_ifconfig* **esp\_netif\_driver\_ifconfig\_t**

typedef struct esp\_netif\_netstack\_config **esp\_netif\_netstack\_config\_t**

Specific L3 network stack configuration.

typedef *esp\_err\_t* (\***esp\_netif\_receive\_t**)(*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

ESP-NETIF Receive function type.

## Enumerations

enum **esp\_netif\_dns\_type\_t**

Type of DNS server.

*Values:*

enumerator **ESP\_NETIF\_DNS\_MAIN**

DNS main server address

enumerator **ESP\_NETIF\_DNS\_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_MAX**

enum **esp\_netif\_dhcp\_status\_t**

Status of DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_DHCP\_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP\_NETIF\_DHCP\_STARTED**

DHCP client/server has been started

enumerator **ESP\_NETIF\_DHCP\_STOPPED**

DHCP client/server has been stopped

enumerator **ESP\_NETIF\_DHCP\_STATUS\_MAX**

enum **esp\_netif\_dhcp\_option\_mode\_t**

Mode for DHCP client or DHCP server option functions.

*Values:*

enumerator **ESP\_NETIF\_OP\_START**

enumerator **ESP\_NETIF\_OP\_SET**

Set option

enumerator **ESP\_NETIF\_OP\_GET**

Get option

enumerator **ESP\_NETIF\_OP\_MAX**

enum **esp\_netif\_dhcp\_option\_id\_t**

Supported options for DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_SUBNET\_MASK**

Network mask

enumerator **ESP\_NETIF\_DOMAIN\_NAME\_SERVER**

Domain name server

enumerator **ESP\_NETIF\_ROUTER\_SOLICITATION\_ADDRESS**

Solicitation router address

enumerator **ESP\_NETIF\_REQUESTED\_IP\_ADDRESS**

Request specific IP address

enumerator **ESP\_NETIF\_IP\_ADDRESS\_LEASE\_TIME**

Request IP address lease time

enumerator **ESP\_NETIF\_IP\_REQUEST\_RETRY\_TIME**

Request IP address retry counter

enumerator **ESP\_NETIF\_VENDOR\_CLASS\_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP\_NETIF\_VENDOR\_SPECIFIC\_INFO**

Vendor Specific Information of a DHCP server

enum **ip\_event\_t**

IP event declarations

*Values:*

enumerator **IP\_EVENT\_STA\_GOT\_IP**

station got IP from connected AP

enumerator **IP\_EVENT\_STA\_LOST\_IP**

station lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_AP\_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP\_EVENT\_GOT\_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP\_EVENT\_ETH\_GOT\_IP**

ethernet got IP from connected AP

enumerator **IP\_EVENT\_ETH\_LOST\_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_PPP\_GOT\_IP**

PPP interface got IP

enumerator **IP\_EVENT\_PPP\_LOST\_IP**

PPP interface lost IP

enum **esp\_netif\_flags**

*Values:*

enumerator **ESP\_NETIF\_DHCP\_CLIENT**

enumerator **ESP\_NETIF\_DHCP\_SERVER**

enumerator **ESP\_NETIF\_FLAG\_AUTOUP**

enumerator **ESP\_NETIF\_FLAG\_GARP**

enumerator **ESP\_NETIF\_FLAG\_EVENT\_IP\_MODIFIED**

enumerator **ESP\_NETIF\_FLAG\_IS\_PPP**

enumerator **ESP\_NETIF\_FLAG\_IS\_BRIDGE**

enumerator **ESP\_NETIF\_FLAG\_MLDV6\_REPORT**

enum **esp\_netif\_ip\_event\_type**

*Values:*

enumerator **ESP\_NETIF\_IP\_EVENT\_GOT\_IP**

enumerator **ESP\_NETIF\_IP\_EVENT\_LOST\_IP**

## Functions

`esp_ip6_addr_type_t esp_netif_ip6_get_addr_type (esp_ip6_addr_t *ip6_addr)`

Get the IPv6 address type.

**Parameters** `ip6_addr` -- [in] IPv6 type

**Returns** IPv6 type in form of enum `esp_ip6_addr_type_t`

```
static inline void esp_netif_ip_addr_copy (esp_ip_addr_t *dest, const esp_ip_addr_t *src)
```

Copy IP addresses.

#### Parameters

- **dest** -- [out] destination IP
- **src** -- [in] source IP

### Structures

```
struct esp_ip6_addr
```

IPv6 address.

#### Public Members

```
uint32_t addr[4]
```

IPv6 address

```
uint8_t zone
```

zone ID

```
struct esp_ip4_addr
```

IPv4 address.

## Functions

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_register** (*l2tap\_vfs\_config\_t* \*config)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

**Parameters** *config* -- L2 TAP virtual filesystem driver configuration. Default base path `/dev/net/tap` is used when this parameter is NULL.

**Returns** *esp\_err\_t*

- **ESP\_OK** on success

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_unregister** (const char \*base\_path)

Removes L2 TAP virtual filesystem driver.

**Parameters** **base\_path** -- Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this parameter is NULL.

**Returns** *esp\_err\_t*

- ESP\_OK on success

*esp\_err\_t* **esp\_vfs\_l2tap\_eth\_filter** (*l2tap\_iodriver\_handle* driver\_handle, void \*buff, size\_t \*size)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

**Parameters**

- **driver\_handle** -- handle of driver at which the frame was received
- **buff** -- received L2 frame
- **size** -- input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

**Returns** *esp\_err\_t*

- ESP\_OK is always returned

## Structures

struct **l2tap\_vfs\_config\_t**

L2Tap VFS config parameters.

## Public Members

const char \***base\_path**  
vfs base path

## Macros

## 2.4.4 IP Network Layer

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with ESP-NETIF connection capabilities.

By convention, the I/O driver has to register itself as an ESP-NETIF driver, and thus holds a dependency on ESP-NETIF component and is responsible for providing data path functions, post-attach callback and in most cases, also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet Input/Output** According to the diagram shown in the *ESP-NETIF Architecture* part, the following three API functions for the packet data path must be defined for connecting with ESP-NETIF:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e., they get called from ESP-NETIF (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

**Post Attach Callback** A final part of the network interface initialization consists of attaching the ESP-NETIF instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to:

- post-attach function callback
- related ESP-NETIF instance

As a result, the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as...
↳esp-netif driver */
    driver_impl_t *h;                     /*!< handle of driver...
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`.

So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between ESP-NETIF and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
```

(continues on next page)

(continued from previous page)

```

const esp_netif_driver_ifconfig_t driver_ifconfig = {
    .driver_free_rx_buffer = my_free_rx_buf,
    .transmit = my_transmit,
    .handle = driver->driver_impl
};
driver->base.netif = esp_netif;
ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
my_driver_start(driver->driver_impl);
return ESP_OK;
}

```

**Default Handlers** I/O drivers also typically provide default definitions of lifecycle behavior of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc.

An example of such a default handler is provided below:

```

esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↳netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↳EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↳EVENT_STOP, esp_netif);
    return ESP_OK;
}

```

**Network Stack Connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the ESP-NETIF, specifically from its TCP/IP stack connecting layer.

Note that ESP-IDF provides several network stack configurations for the most common network interfaces, such as for the Wi-Fi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set.

The following API reference outlines these network stack interaction with the ESP-NETIF:

### Header File

- [components/esp\\_netif/include/esp\\_netif\\_net\\_stack.h](#)
- This header file can be included with:

```
#include "esp_netif_net_stack.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

### Functions

`esp_netif_t *esp_netif_get_handle_from_netif_impl` (void \*dev)

Returns esp-netif handle.

**Parameters** `dev` -- [in] opaque ptr to network interface of specific TCP/IP stack

**Returns** handle to related esp-netif instance

void **esp\_netif\_get\_netif\_impl** (*esp\_netif\_t* \*esp\_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** handle to related network stack netif handle

*esp\_err\_t* **esp\_netif\_set\_link\_speed** (*esp\_netif\_t* \*esp\_netif, uint32\_t speed)

Set link-speed for the specified network interface.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **speed** -- **[in]** Link speed in bit/s

**Returns** ESP\_OK on success

*esp\_err\_t* **esp\_netif\_transmit** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **data** -- **[in]** Data to be transmitted
- **len** -- **[in]** Length of the data frame

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

*esp\_err\_t* **esp\_netif\_transmit\_wrap** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len, void \*netstack\_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **data** -- **[in]** Data to be transmitted
- **len** -- **[in]** Length of the data frame
- **netstack\_buf** -- **[in]** net stack buffer

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

void **esp\_netif\_free\_rx\_buffer** (void \*esp\_netif, void \*buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **buffer** -- **[in]** Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

## 2.4.5 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

## 2.5 Peripherals API

## 2.5.1 Analog Comparator

### Introduction

Analog Comparator is a peripheral that can be used to compare a source signal with the internal reference voltage or an external reference signal.

It is a cost effective way to replace an amplifier comparator in some scenarios. But unlike the continuous comparing of the amplifier comparator, ESP Analog Comparator is driven by a source clock, which decides the sampling frequency.

Analog Comparator on ESP32-P4 has 2 unit(s), the channels in the unit(s) are:

#### UNIT0

- Source Channel: GPIO52
- External Reference Channel: GPIO51
- Internal Reference Channel: Range 0% ~ 70% of the VDD, the step is 10% of the VDD

#### UNIT1

- Source Channel: GPIO54
- External Reference Channel: GPIO53
- Internal Reference Channel: Range 0% ~ 70% of the VDD, the step is 10% of the VDD

### Functional Overview

The following sections of this document cover the typical steps to install and operate an Analog Comparator unit:

- *Resource Allocation* - covers which parameters should be set up to get a unit handle and how to recycle the resources when it finishes working.
- *Further Configurations* - covers the other configurations that might need to specific and what they are used for.
- *Enable and Disable Unit* - covers how to enable and disable the unit.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.
- *ETM Events* -

**Resource Allocation** An Analog Comparator unit channel is represented by `ana_cmpr_handle_t`. Each unit can support either an internal or an external reference.

To allocate the resource of the Analog Comparator unit, `ana_cmpr_new_unit()` need to be called to get the handle of the unit. Configurations `ana_cmpr_config_t` need to be specified while allocating the unit:

- `ana_cmpr_config_t::unit` selects the Analog Comparator unit.
- `ana_cmpr_config_t::clk_src` selects the source clock for Analog Comparator, it can affect the sampling frequency. Note that the clock source of the Analog Comparator comes from the io mux, it is shared with GPIO extension peripherals like SDM (Sigma-Delta Modulation) and Glitch Filter. The configuration will fail if you specific different clock sources for multiple GPIO extension peripherals. The default clock sources of these peripherals are same, typically, we select `soc_periph_ana_cmpr_clk_src_t::ANA_CMPR_CLK_SRC_DEFAULT` as the clock source.
- `ana_cmpr_config_t::ref_src` selects the reference source from internal voltage or external signal.
- `ana_cmpr_config_t::cross_type` selects which kind of cross type can trigger the interrupt.

The function `ana_cmpr_new_unit()` can fail due to various errors such as insufficient memory, invalid arguments, etc. If a previously created Analog Comparator unit is no longer required, you should recycle it by calling `ana_cmpr_del_unit()`. It allows the underlying HW channel to be used for other purposes. Before deleting an Analog Comparator unit handle, you should disable it by `ana_cmpr_unit_disable()` in advance, or make sure it has not enabled yet by `ana_cmpr_unit_enable()`.

```
#include "driver/ana_cmpr.h"

ana_cmpr_handle_t cmpr = NULL;
ana_cmpr_config_t config = {
    .unit = 0,
    .clk_src = ANA_CMPR_CLK_SRC_DEFAULT,
    .ref_src = ANA_CMPR_REF_SRC_INTERNAL,
    .cross_type = ANA_CMPR_CROSS_ANY,
};
ESP_ERROR_CHECK(ana_cmpr_new_unit(&config, &cmpr));
// ...
ESP_ERROR_CHECK(ana_cmpr_del_unit(cmpr));
```

### Further Configurations

- `ana_cmpr_set_intl_reference()` - Specify the internal reference voltage when `ana_cmpr_ref_source_t::ANA_CMPR_REF_SRC_INTERNAL` is selected as reference source.

It requires `ana_cmpr_internal_ref_config_t::ref_volt` to specify the voltage. The voltage related to the VDD power supply, which can only support a certain fixed percentage of VDD. Currently on ESP32-P4, the internal reference voltage can be range to 0 ~ 70% VDD with a step 10%.

```
#include "driver/ana_cmpr.h"

ana_cmpr_internal_ref_config_t ref_cfg = {
    .ref_volt = ANA_CMPR_REF_VOLT_50_PCT_VDD,
};
ESP_ERROR_CHECK(ana_cmpr_set_internal_reference(cmpr, &ref_cfg));
```

- `ana_cmpr_set_debounce()` - Set the debounce configuration.

It requires `ana_cmpr_debounce_config_t::wait_us` to set the interrupt waiting time. The interrupt is disabled temporarily for `ana_cmpr_debounce_config_t::wait_us` micro seconds, so that the frequent triggering can be avoid while the source signal crossing the reference signal. That is, the waiting time is supposed to be inverse ratio to the relative frequency between the source and reference. If the waiting time is set too short, it can not bypass the jitter totally, but if too long, the next crossing interrupt might be missed.

```
#include "driver/ana_cmpr.h"

ana_cmpr_debounce_config_t dbc_cfg = {
    .wait_us = 1,
};
ESP_ERROR_CHECK(ana_cmpr_set_debounce(cmpr, &dbc_cfg));
```

- `ana_cmpr_set_cross_type()` - Set the source signal cross type.

The initial cross type is set int `ana_cmpr_new_unit()`, this function can update the cross type, even in ISR context.

```
#include "driver/ana_cmpr.h"

ESP_ERROR_CHECK(ana_cmpr_set_cross_type(cmpr, ANA_CMPR_CROSS_POS));
```

- `ana_cmpr_register_event_callbacks()` - Register the callbacks.

Currently it supports `ana_cmpr_event_callbacks_t::on_cross`, it will be called when the crossing event (specified by `ana_cmpr_config_t::cross_type`) occurs.

```
#include "driver/ana_cmpr.h"

static bool IRAM_ATTR example_ana_cmpr_on_cross_callback(ana_cmpr_handle_t cmpr,
```

(continues on next page)

(continued from previous page)

```

↔data_t *edata,                                     const ana_cmpr_cross_event_
                                                    void *user_ctx)
{
    // ...
    return false;
}
ana_cmpr_event_callbacks_t cbs = {
    .on_cross = example_ana_cmpr_on_cross_callback,
};
ESP_ERROR_CHECK(ana_cmpr_register_event_callbacks(cmpr, &cbs, NULL));

```

**Note:** When `CONFIG_ANA_CMPR_ISR_IRAM_SAFE` is enabled, you should guarantee the callback context and involved data to be in internal RAM by add the attribute `IRAM_ATTR`. (See more in *IRAM Safe*)

### Enable and Disable Unit

- `ana_cmpr_enable()` - Enable the Analog Comparator unit.
- `ana_cmpr_disable()` - Disable the Analog Comparator unit.

After the Analog Comparator unit is enabled and the crossing event interrupt is enabled, a power management lock will be acquired if the power management is enabled (see *Power Management*). Under the **enable** state, only `ana_cmpr_set_int1_reference()` and `ana_cmpr_set_debounce()` can be called, other functions can only be called after the unit is disabled.

Calling `ana_cmpr_disable()` does the opposite.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the resolution of the Analog Comparator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_NO_LIGHT_SLEEP`. Whenever the driver creates a Analog Comparator unit instance that has selected the clock source like `ANA_CMPR_CLK_SRC_DEFAULT` or `ANA_CMPR_CLK_SRC_XTAL` as its clock source, the driver guarantees that the power management lock is acquired when enable the channel by `ana_cmpr_enable()`. Likewise, the driver releases the lock when `ana_cmpr_disable()` is called for that channel.

**IRAM Safe** By default, the Analog Comparator interrupt will be deferred when the Cache is disabled for reasons like programming/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_ANA_CMPR_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM<sup>1</sup>
3. Places driver object into DRAM (in case it is allocated on PSRAM)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is a Kconfig option `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `ana_cmpr_set_internal_reference()`
- `ana_cmpr_set_debounce()`

<sup>1</sup> `ana_cmpr_event_callbacks_t::on_cross` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

- `ana_cmpr_set_cross_type()`

**Thread Safety** The factory function `ana_cmpr_new_unit()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `ana_cmpr_set_internal_reference()`
- `ana_cmpr_set_debounce()`
- `ana_cmpr_set_cross_type()`

Other functions that take the `ana_cmpr_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_ANA_CMPR_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` controls where to place the Analog Comparator control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enabling this option increases the firmware binary size.

**ETM Events** To create an analog comparator cross event, you need to include `driver/ana_cmpr_etm.h` additionally, and allocate the event by `ana_cmpr_new_etm_event()`. You can refer to *ETM* for how to connect an event to a task.

### Application Example

- `peripherals/analog_comparator` shows the basic usage of the analog comparator, and other potential usages like hysteresis comparator and SPWM generator.

## API Reference

### Header File

- `components/driver/analog_comparator/include/driver/ana_cmpr.h`
- This header file can be included with:

```
#include "driver/ana_cmpr.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t ana_cmpr_new_unit` (const `ana_cmpr_config_t` \*config, `ana_cmpr_handle_t` \*ret\_cmpr)

Allocating a new analog comparator unit handle.

#### Parameters

- `config` -- [in] The config of the analog comparator unit
- `ret_cmpr` -- [out] The returned analog comparator unit handle

**Returns**

- ESP\_OK Allocate analog comparator unit handle success
- ESP\_ERR\_NO\_MEM No memory for the analog comparator structure
- ESP\_ERR\_INVALID\_ARG NULL pointer of the parameters or wrong unit number
- ESP\_ERR\_INVALID\_STATE The unit has been allocated or the clock source has been occupied

*esp\_err\_t* **ana\_cmpr\_del\_unit** (*ana\_cmpr\_handle\_t* cmpr)

Delete the analog comparator unit handle.

**Parameters** **cmpr** -- **[in]** The handle of analog comparator unit

**Returns**

- ESP\_OK Delete analog comparator unit handle success
- ESP\_ERR\_INVALID\_ARG NULL pointer of the parameters or wrong unit number
- ESP\_ERR\_INVALID\_STATE The analog comparator is not disabled yet

*esp\_err\_t* **ana\_cmpr\_set\_internal\_reference** (*ana\_cmpr\_handle\_t* cmpr, const *ana\_cmpr\_internal\_ref\_config\_t* \*ref\_cfg)

Set internal reference configuration.

---

**Note:** This function only need to be called when *ana\_cmpr\_config\_t::ref\_src* is ANA\_CMPR\_REF\_SRC\_INTERNAL.

---

---

**Note:** This function is allowed to run within ISR context including intr callbacks

---

---

**Note:** This function will be placed into IRAM if CONFIG\_ANA\_CMPR\_CTRL\_FUNC\_IN\_IRAM is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- **cmpr** -- **[in]** The handle of analog comparator unit
- **ref\_cfg** -- **[in]** Internal reference configuration

**Returns**

- ESP\_OK Set denounce configuration success
- ESP\_ERR\_INVALID\_ARG NULL pointer of the parameters
- ESP\_ERR\_INVALID\_STATE The reference source is not ANA\_CMPR\_REF\_SRC\_INTERNAL

*esp\_err\_t* **ana\_cmpr\_set\_debounce** (*ana\_cmpr\_handle\_t* cmpr, const *ana\_cmpr\_debounce\_config\_t* \*dbc\_cfg)

Set debounce configuration to the analog comparator.

---

**Note:** This function is allowed to run within ISR context including intr callbacks

---

---

**Note:** This function will be placed into IRAM if CONFIG\_ANA\_CMPR\_CTRL\_FUNC\_IN\_IRAM is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- **cmpr** -- **[in]** The handle of analog comparator unit
- **dbc\_cfg** -- **[in]** Debounce configuration

**Returns**

- ESP\_OK Set denounce configuration success
- ESP\_ERR\_INVALID\_ARG NULL pointer of the parameters

*esp\_err\_t* **ana\_cmpr\_set\_cross\_type** (*ana\_cmpr\_handle\_t* cmpr, *ana\_cmpr\_cross\_type\_t* cross\_type)

Set the source signal cross type.

---

**Note:** The initial cross type is configured in `ana_cmpr_new_unit`, this function can update the cross type

---

---

**Note:** This function is allowed to run within ISR context including intr callbacks

---

---

**Note:** This function will be placed into IRAM if `CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

#### Parameters

- **cmpr** -- **[in]** The handle of analog comparator unit
- **cross\_type** -- **[in]** The source signal cross type that can trigger the interrupt

#### Returns

- `ESP_OK` Set denounce configuration success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters

*esp\_err\_t* **ana\_cmpr\_register\_event\_callbacks** (*ana\_cmpr\_handle\_t* cmpr, const *ana\_cmpr\_event\_callbacks\_t* \*cbs, void \*user\_data)

Register analog comparator interrupt event callbacks.

---

**Note:** This function can only be called before enabling the unit

---

#### Parameters

- **cmpr** -- **[in]** The handle of analog comparator unit
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** The user data that will be passed to callback functions directly

#### Returns

- `ESP_OK` Register callbacks success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters
- `ESP_ERR_INVALID_STATE` The analog comparator has been enabled

*esp\_err\_t* **ana\_cmpr\_enable** (*ana\_cmpr\_handle\_t* cmpr)

Enable the analog comparator unit.

**Parameters** **cmpr** -- **[in]** The handle of analog comparator unit

#### Returns

- `ESP_OK` Enable analog comparator unit success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters
- `ESP_ERR_INVALID_STATE` The analog comparator has been enabled

*esp\_err\_t* **ana\_cmpr\_disable** (*ana\_cmpr\_handle\_t* cmpr)

Disable the analog comparator unit.

**Parameters** **cmpr** -- **[in]** The handle of analog comparator unit

#### Returns

- `ESP_OK` Disable analog comparator unit success
- `ESP_ERR_INVALID_ARG` NULL pointer of the parameters
- `ESP_ERR_INVALID_STATE` The analog comparator has disabled already

*esp\_err\_t* **ana\_cmpr\_get\_gpio** (*ana\_cmpr\_unit\_t* unit, *ana\_cmpr\_channel\_type\_t* chan\_type, int \*gpio\_num)

Get the specific GPIO number of the analog comparator unit.

**Parameters**

- **unit** -- **[in]** The handle of analog comparator unit
- **chan\_type** -- **[in]** The channel type of analog comparator, like source channel or reference channel
- **gpio\_num** -- **[out]** The output GPIO number of this channel

**Returns**

- ESP\_OK Get GPIO success
- ESP\_ERR\_INVALID\_ARG NULL pointer of the parameters or wrong unit number or wrong channel type

**Structures**

```
struct ana_cmpr_config_t
```

Analog comparator unit configuration.

**Public Members**

*ana\_cmpr\_unit\_t* **unit**

Analog comparator unit

*ana\_cmpr\_clk\_src\_t* **clk\_src**

The clock source of the analog comparator, which decide the resolution of the comparator

*ana\_cmpr\_ref\_source\_t* **ref\_src**

Reference signal source of the comparator, select using ANA\_CMPR\_REF\_SRC\_INTERNAL or ANA\_CMPR\_REF\_SRC\_EXTERNAL. For internal reference, the reference voltage should be set to `internal_ref_volt`, for external reference, the reference signal should be connect to ANA\_CMPRx\_EXT\_REF\_GPIO

*ana\_cmpr\_cross\_type\_t* **cross\_type**

The crossing types that can trigger interrupt

int **intr\_priority**

The interrupt priority, range 0~7, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3) otherwise the larger the higher, 7 is NMI

uint32\_t **io\_loop\_back**

Enable this field when the other signals that output on the comparison pins are supposed to be fed back. Normally used for debug/test scenario

struct *ana\_cmpr\_config\_t*::[anonymous] **flags**

Analog comparator driver flags

```
struct ana_cmpr_internal_ref_config_t
```

Analog comparator internal reference configuration.

**Public Members**

*ana\_cmpr\_ref\_voltage\_t* **ref\_volt**

The internal reference voltage. It can be specified to a certain fixed percentage of the VDD power supply, currently supports 0%~70% VDD with a step 10%

struct **ana\_cmpr\_debounce\_config\_t**

Analog comparator debounce filter configuration.

### Public Members

uint32\_t **wait\_us**

The wait time of re-enabling the interrupt after the last triggering, it is used to avoid the spurious triggering while the source signal crossing the reference signal. The value should regarding how fast the source signal changes, e.g., a rapid signal requires a small wait time, otherwise the next crosses may be missed. (Unit: micro second)

struct **ana\_cmpr\_event\_callbacks\_t**

Group of Analog Comparator callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_ANA\_CMPR\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

*ana\_cmpr\_cross\_cb\_t* **on\_cross**

The callback function on cross interrupt

### Header File

- [components/driver/analog\\_comparator/include/driver/ana\\_cmpr\\_types.h](#)
- This header file can be included with:

```
#include "driver/ana_cmpr_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Structures

struct **ana\_cmpr\_cross\_event\_data\_t**

Analog comparator cross event data.

### Public Members

***ana\_cmpr\_cross\_type\_t* cross\_type**

The cross type of the target signal to the reference signal. Will either be ANA\_CMPR\_CROSS\_POS or ANA\_CMPR\_CROSS\_NEG Always be ANA\_CMPR\_CROSS\_ANY if target does not support independent interrupt (like ESP32H2)

**Macros****ANA\_CMPR\_UNIT\_0**

*Deprecated:*

Analog comparator unit 0

**Type Definitions**

typedef int **ana\_cmpr\_unit\_t**

Analog comparator unit.

typedef struct ana\_cmpr\_t \***ana\_cmpr\_handle\_t**

Analog comparator unit handle.

typedef *soc\_periph\_ana\_cmpr\_clk\_src\_t* **ana\_cmpr\_clk\_src\_t**

Analog comparator clock source.

typedef bool (\***ana\_cmpr\_cross\_cb\_t**)(*ana\_cmpr\_handle\_t* cmpr, const *ana\_cmpr\_cross\_event\_data\_t* \*edata, void \*user\_ctx)

Prototype of Analog comparator event callback.

**Param cmpr [in]** Analog Comparator handle, created from *ana\_cmpr\_new\_unit()*

**Param edata [in]** Point to Analog Comparator event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function. (Currently not use)

**Param user\_ctx [in]** User registered context, passed from *ana\_cmpr\_register\_event\_callbacks()*

**Return** Whether a high priority task has been waken up by this callback function

**Enumerations**

enum **ana\_cmpr\_ref\_source\_t**

Analog comparator reference source.

*Values:*

enumerator **ANA\_CMPR\_REF\_SRC\_INTERNAL**

Analog Comparator internal reference source, related to VDD

enumerator **ANA\_CMPR\_REF\_SRC\_EXTERNAL**

Analog Comparator external reference source, from ANA\_CMPR0\_EXT\_REF\_GPIO

enum **ana\_cmpr\_channel\_type\_t**

Analog comparator channel type.

*Values:*

enumerator **ANA\_CMPR\_SOURCE\_CHAN**

Analog Comparator source channel, which is used to input the signal that to be compared

enumerator **ANA\_CMPR\_EXT\_REF\_CHAN**

Analog Comparator external reference channel, which is used as the reference signal

enum **ana\_cmpr\_cross\_type\_t**

Analog comparator interrupt type.

*Values:*

enumerator **ANA\_CMPR\_CROSS\_DISABLE**

Disable the cross event interrupt

enumerator **ANA\_CMPR\_CROSS\_POS**

Positive cross can trigger event interrupt

enumerator **ANA\_CMPR\_CROSS\_NEG**

Negative cross can trigger event interrupt

enumerator **ANA\_CMPR\_CROSS\_ANY**

Any cross can trigger event interrupt

enum **ana\_cmpr\_ref\_voltage\_t**

Analog comparator internal reference voltage.

*Values:*

enumerator **ANA\_CMPR\_REF\_VOLT\_0\_PCT\_VDD**

Internal reference voltage equals to 0% VDD

enumerator **ANA\_CMPR\_REF\_VOLT\_10\_PCT\_VDD**

Internal reference voltage equals to 10% VDD

enumerator **ANA\_CMPR\_REF\_VOLT\_20\_PCT\_VDD**

Internal reference voltage equals to 20% VDD

enumerator **ANA\_CMPR\_REF\_VOLT\_30\_PCT\_VDD**

Internal reference voltage equals to 30% VDD

enumerator **ANA\_CMPR\_REF\_VOLT\_40\_PCT\_VDD**

Internal reference voltage equals to 40% VDD

enumerator **ANA\_CMPR\_REF\_VOLT\_50\_PCT\_VDD**

Internal reference voltage equals to 50% VDD

enumerator **ANA\_CMPR\_REF\_VOLT\_60\_PCT\_VDD**

Internal reference voltage equals to 60% VDD

enumerator **ANA\_CMPR\_REF\_VOLT\_70\_PCT\_VDD**

Internal reference voltage equals to 70% VDD

## 2.5.2 Clock Tree

The clock subsystem of ESP32-P4 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that can be called to monitor the status of the module clocks at runtime.

### Introduction

This section lists definitions of ESP32-P4's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help select a proper source clock for the peripheral.

**Root Clocks** Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), Wi-Fi, Bluetooth, the RTC, and the peripherals.

ESP32-P4's root clocks are listed in `soc_root_clk_t`:

- **Internal 8 MHz RC Oscillator (RC\_FAST)**  
This RC oscillator generates a about 8.5 MHz clock signal output as the `RC_FAST_CLK`. The exact frequency of `RC_FAST_CLK` cannot be computed in runtime through calibration, but it is still possible to get its frequency through an oscilloscope or a logic analyzer by routing the clock signal to a GPIO pin.
- **External 40 MHz Crystal (XTAL)**
- **Internal 136 kHz RC Oscillator (RC\_SLOW)**  
This RC oscillator generates a about 136kHz clock signal output as the `RC_SLOW_CLK`. The exact frequency of this clock can be computed in runtime through calibration.
- **External 32 kHz Crystal - optional (XTAL32K)**  
The clock source for this `XTAL32K_CLK` can be either a 32 kHz crystal connecting to the `XTAL_32K_P` and `XTAL_32K_N` pins or a 32 kHz clock signal generated by an external circuit. The external signal must be connected to the `XTAL_32K_P` pin. `XTAL32K_CLK` can also be calibrated to get its exact frequency.
- **External Slow Clock - optional (OSC\_SLOW)**  
A clock signal generated by an external circuit can be connected to GPIO0 to be the clock source for the `RTC_SLOW_CLK`. This clock can also be calibrated to get its exact frequency.
- **Internal 32 kHz RC Oscillator (RC32K)**  
The exact frequency of this clock can be computed in runtime through calibration.

Typically, the frequency of the signal generated from an RC oscillator circuit is less accurate and more sensitive to the environment compared to the signal generated from a crystal. ESP32-P4 provides several clock source options for the `RTC_SLOW_CLK`, and it is possible to make the choice based on the requirements for system time accuracy and power consumption. For more details, please refer to *RTC Timer Clock Sources*.

**Module Clocks** ESP32-P4's available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

### API Usage

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, `esp_clk_tree_src_get_freq_hz()`. This function allows you to obtain the clock frequency at any

time by providing the clock name `soc_module_clk_t` and specifying the desired precision level for the returned frequency value `esp_clk_tree_src_freq_precision_t`.

## API Reference

### Header File

- `components/soc/esp32p4/include/soc/clk_tree_defs.h`
- This header file can be included with:

```
#include "soc/clk_tree_defs.h"
```

### Macros

#### **SOC\_CLK\_RC\_FAST\_FREQ\_APPROX**

Approximate RC\_FAST\_CLK frequency in Hz

#### **SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX**

Approximate RC\_SLOW\_CLK frequency in Hz

#### **SOC\_CLK\_RC32K\_FREQ\_APPROX**

Approximate RC32K\_CLK frequency in Hz

#### **SOC\_CLK\_XTAL32K\_FREQ\_APPROX**

Approximate XTAL32K\_CLK frequency in Hz

#### **SOC\_CLK\_OSC\_SLOW\_FREQ\_APPROX**

Approximate OSC\_SLOW\_CLK (external slow clock) frequency in Hz

#### **SOC\_GPTIMER\_CLKS**

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_
→t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

#### **SOC\_RMT\_CLKS**

Array initializer for all supported clock sources of RMT.

#### **SOC\_UART\_CLKS**

Array initializer for all supported clock sources of UART.

#### **SOC\_LP\_UART\_CLKS**

Array initializer for all supported clock sources of LP\_UART.

#### **SOC\_MCPWM\_TIMER\_CLKS**

Array initializer for all supported clock sources of MCPWM Timer.

**SOC\_MCPWM\_CAPTURE\_CLKS**

Array initializer for all supported clock sources of MCPWM Capture Timer.

**SOC\_MCPWM\_CARRIER\_CLKS**

Array initializer for all supported clock sources of MCPWM Carrier.

**SOC\_I2S\_CLKS**

Array initializer for all supported clock sources of I2S.

**SOC\_I2C\_CLKS**

Array initializer for all supported clock sources of I2C.

**SOC\_SPI\_CLKS**

Array initializer for all supported clock sources of SPI.

**SOC\_PSRAM\_CLKS**

Array initializer for all supported clock sources of PSRAM.

**SOC\_FLASH\_CLKS**

Array initializer for all supported clock sources of FLASH.

**SOC\_ANA\_CMPR\_CLKS**

Array initializer for all supported clock sources of Analog Comparator.

**SOC\_MWDT\_CLKS**

Array initializer for all supported clock sources of MWDT.

**SOC\_LEDC\_CLKS**

Array initializer for all supported clock sources of LEDC.

**SOC\_PARLIO\_CLKS**

Array initializer for all supported clock sources of PARLIO.

**SOC\_SDMMC\_CLKS**

Array initializer for all supported clock sources of SDMMC.

**Enumerations**

enum **soc\_root\_clk\_t**

Root clock.

*Values:*

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_FAST**

Internal 17.5MHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_SLOW**

Internal 136kHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL**

External 40MHz crystal

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL32K**

External 32kHz crystal

enumerator **SOC\_ROOT\_CLK\_INT\_RC32K**

Internal 32kHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_EXT\_OSC\_SLOW**

External slow clock signal at pin1

enum **soc\_cpu\_clk\_src\_t**

CPU\_CLK mux inputs, which are the supported clock sources for the CPU\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_CPU\_CLK\_SRC\_XTAL**

Select XTAL\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_PLL**

Select (C)PLL\_CLK as CPU\_CLK source (CPLL\_CLK is the output of 40MHz crystal oscillator frequency multiplier, 400MHz)

enumerator **SOC\_CPU\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_INVALID**

Invalid CPU\_CLK source

enum **soc\_rtc\_slow\_clk\_src\_t**

RTC\_SLOW\_CLK mux inputs, which are the supported clock sources for the RTC\_SLOW\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_SLOW**

Select RC\_SLOW\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_XTAL32K**

Select XTAL32K\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC32K**

Select RC32K\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_OSC\_SLOW**

Select OSC\_SLOW\_CLK (external slow clock) as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_INVALID**

Invalid RTC\_SLOW\_CLK source

enum **soc\_rtc\_fast\_clk\_src\_t**

RTC\_FAST\_CLK mux inputs, which are the supported clock sources for the RTC\_FAST\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL**

Select XTAL\_CLK as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_DIV**

Alias name for SOC\_RTC\_FAST\_CLK\_SRC\_XTAL

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_LP\_PLL**

Select LP\_PLL\_CLK as RTC\_FAST\_CLK source (LP\_PLL\_CLK is a 8MHz clock sourced from RC32K or XTAL32K)

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_INVALID**

Invalid RTC\_FAST\_CLK source

enum **soc\_lp\_pll\_clk\_src\_t**

LP\_PLL\_CLK mux inputs, which are the supported clock sources for the LP\_PLL\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_LP\_PLL\_CLK\_SRC\_RC32K**

Select RC32K\_CLK as LP\_PLL\_CLK source

enumerator **SOC\_LP\_PLL\_CLK\_SRC\_XTAL32K**

Select XTAL32K\_CLK as LP\_PLL\_CLK source

enumerator **SOC\_LP\_PLL\_CLK\_SRC\_INVALID**

Invalid LP\_PLL\_CLK source

enum **soc\_module\_clk\_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

---

**Note:** enum starts from 1, to save 0 for special purpose

---

*Values:*

enumerator **SOC\_MOD\_CLK\_CPU**

CPU\_CLK can be sourced from XTAL, CPLL, or RC\_FAST by configuring soc\_cpu\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_RTC\_FAST**

RTC\_FAST\_CLK can be sourced from XTAL, RC\_FAST, or LP\_PLL by configuring soc\_rtc\_fast\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_RTC\_SLOW**

RTC\_SLOW\_CLK can be sourced from RC\_SLOW, XTAL32K, RC32K, or OSC\_SLOW by configuring soc\_rtc\_slow\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_PLL\_F80M**

PLL\_F80M\_CLK is derived from SPLL (clock gating + fixed divider of 6), it has a fixed frequency of 80MHz

enumerator **SOC\_MOD\_CLK\_PLL\_F160M**

PLL\_F160M\_CLK is derived from SPLL (clock gating + fixed divider of 3), it has a fixed frequency of 160MHz

enumerator **SOC\_MOD\_CLK\_PLL\_F200M**

PLL\_F200M\_CLK is derived from SPLL (clock gating + fixed divider of 3), it has a fixed frequency of 200MHz

enumerator **SOC\_MOD\_CLK\_PLL\_F240M**

PLL\_F240M\_CLK is derived from SPLL (clock gating + fixed divider of 2), it has a fixed frequency of 240MHz

enumerator **SOC\_MOD\_CLK\_CPLL**

CPLL is from 40MHz XTAL oscillator frequency multipliers, it has a fixed frequency of 400MHz

enumerator **SOC\_MOD\_CLK\_SPLL**

SPLL is from 40MHz XTAL oscillator frequency multipliers, it has a fixed frequency of 480MHz

enumerator **SOC\_MOD\_CLK\_MPLL**

MPLL is from 40MHz XTAL oscillator frequency multipliers, it has a fixed frequency of 500MHz

enumerator **SOC\_MOD\_CLK\_XTAL32K**

XTAL32K\_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST**

RC\_FAST\_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_XTAL**

XTAL\_CLK comes from the external 40MHz crystal

enumerator **SOC\_MOD\_CLK\_APLL**

Audio PLL is sourced from PLL, and its frequency is configurable through APLL configuration registers

enumerator **SOC\_MOD\_CLK\_XTAL\_D2**

XTAL\_D2\_CLK comes from the external 40MHz crystal, passing a div of 2 to the LP peripherals

enumerator **SOC\_MOD\_CLK\_LP\_PLL**

LP\_PLL is from 32kHz XTAL oscillator frequency multipliers, it has a fixed frequency of 8MHz

enumerator **SOC\_MOD\_CLK\_INVALID**

Indication of the end of the available module clock sources

enum **soc\_periph\_systimer\_clk\_src\_t**

Type of SYSTIMER clock source.

*Values:*

enumerator **SYSTIMER\_CLK\_SRC\_XTAL**

SYSTIMER source clock is XTAL

enumerator **SYSTIMER\_CLK\_SRC\_RC\_FAST**

SYSTIMER source clock is RC\_FAST

enumerator **SYSTIMER\_CLK\_SRC\_DEFAULT**

SYSTIMER source clock default choice is XTAL

enum **soc\_periph\_gptimer\_clk\_src\_t**

Type of GPTimer clock source.

*Values:*

enumerator **GPTIMER\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M as the source clock

enumerator **GPTIMER\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **GPTIMER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER\_CLK\_SRC\_DEFAULT**

Select XTAL as the default choice

enum **soc\_periph\_tg\_clk\_src\_legacy\_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

*Values:*

enumerator **TIMER\_SRC\_CLK\_PLL\_F80M**

Timer group clock source is PLL\_F80M

enumerator **TIMER\_SRC\_CLK\_XTAL**

Timer group clock source is XTAL

enumerator **TIMER\_SRC\_CLK\_DEFAULT**

Timer group clock source default choice is XTAL

enum **soc\_periph\_rmt\_clk\_src\_t**

Type of RMT clock source.

*Values:*

enumerator **RMT\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M as the source clock

enumerator **RMT\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **RMT\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **RMT\_CLK\_SRC\_DEFAULT**

Select XTAL as the default choice

enum **soc\_periph\_rmt\_clk\_src\_legacy\_t**

Type of RMT clock source, reserved for the legacy RMT driver.

*Values:*

enumerator **RMT\_BASECLK\_PLL\_F80M**

RMT source clock is PLL\_F80M

enumerator **RMT\_BASECLK\_XTAL**

RMT source clock is XTAL

enumerator **RMT\_BASECLK\_DEFAULT**

RMT source clock default choice is XTAL

enum **soc\_periph\_uart\_clk\_src\_legacy\_t**

Type of UART clock source, reserved for the legacy UART driver.

*Values:*

enumerator **UART\_SCLK\_PLL\_F80M**

UART source clock is PLL\_F80M

enumerator **UART\_SCLK\_RTC**

UART source clock is RC\_FAST

enumerator **UART\_SCLK\_XTAL**

UART source clock is XTAL

enumerator **UART\_SCLK\_DEFAULT**

UART source clock default choice is PLL\_F80M

enum **soc\_periph\_lp\_uart\_clk\_src\_t**

Type of LP\_UART clock source.

*Values:*

enumerator **LP\_UART\_SCLK\_LP\_FAST**

LP\_UART source clock is LP(RTC)\_FAST

enumerator **LP\_UART\_SCLK\_XTAL\_D2**

LP\_UART source clock is XTAL\_D2

enumerator **LP\_UART\_SCLK\_DEFAULT**

LP\_UART source clock default choice is LP(RTC)\_FAST

enum **soc\_periph\_mcpwm\_timer\_clk\_src\_t**

Type of MCPWM timer clock source.

*Values:*

enumerator **MCPWM\_TIMER\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **MCPWM\_TIMER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MCPWM\_TIMER\_CLK\_SRC\_DEFAULT**

Select XTAL as the default choice

enum **soc\_periph\_mcpwm\_capture\_clk\_src\_t**

Type of MCPWM capture clock source.

*Values:*

enumerator **MCPWM\_CAPTURE\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **MCPWM\_CAPTURE\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MCPWM\_CAPTURE\_CLK\_SRC\_DEFAULT**

Select XTAL as the default choice

enum **soc\_periph\_mcpwm\_carrier\_clk\_src\_t**

Type of MCPWM carrier clock source.

*Values:*

enumerator **MCPWM\_CARRIER\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **MCPWM\_CARRIER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MCPWM\_CARRIER\_CLK\_SRC\_DEFAULT**

Select XTAL as the default choice

enum **soc\_periph\_i2s\_clk\_src\_t**

I2S clock source enum.

*Values:*

enumerator **I2S\_CLK\_SRC\_DEFAULT**

Select XTAL as the default source clock

enumerator **I2S\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **I2S\_CLK\_SRC\_APLL**

Select APLL as the source clock

enumerator **I2S\_CLK\_SRC\_EXTERNAL**

Select external clock as source clock

enum **soc\_periph\_i2c\_clk\_src\_t**

Type of I2C clock source.

*Values:*

enumerator **I2C\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **I2C\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **I2C\_CLK\_SRC\_DEFAULT**

Select XTAL as the default source clock

enum **soc\_periph\_spi\_clk\_src\_t**

Type of SPI clock source.

*Values:*

enumerator **SPI\_CLK\_SRC\_XTAL**

Select XTAL as SPI source clock

enumerator **SPI\_CLK\_SRC\_DEFAULT**

Select XTAL as SPI source clock

enum **soc\_periph\_psram\_clk\_src\_t**

Type of PSRAM clock source.

*Values:*

enumerator **PSRAM\_CLK\_SRC\_DEFAULT**

Select SOC\_MOD\_CLK\_SPLL as PSRAM source clock

enumerator **PSRAM\_CLK\_SRC\_XTAL**

Select SOC\_MOD\_CLK\_XTAL as PSRAM source clock

enumerator **PSRAM\_CLK\_SRC\_CPLL**

Select SOC\_MOD\_CLK\_CPLL as PSRAM source clock

enumerator **PSRAM\_CLK\_SRC\_SPLL**

Select SOC\_MOD\_CLK\_SPLL as PSRAM source clock

enumerator **PSRAM\_CLK\_SRC\_MPLL**

Select SOC\_MOD\_CLK\_MPLL as PSRAM source clock

enum **soc\_periph\_flash\_clk\_src\_t**

Type of FLASH clock source.

*Values:*

enumerator **FLASH\_CLK\_SRC\_DEFAULT**

Select SOC\_MOD\_CLK\_SPLL as FLASH source clock

enumerator **FLASH\_CLK\_SRC\_XTAL**

Select SOC\_MOD\_CLK\_XTAL as FLASH source clock

enumerator **FLASH\_CLK\_SRC\_CPLL**

Select SOC\_MOD\_CLK\_CPLL as FLASH source clock

enumerator **FLASH\_CLK\_SRC\_SPLL**

Select SOC\_MOD\_CLK\_SPLL as FLASH source clock

enum **soc\_periph\_ana\_cmpr\_clk\_src\_t**

Analog Comparator clock source.

*Values:*

enumerator **ANA\_CMPR\_CLK\_SRC\_XTAL**

Select XTAL clock as the source clock

enumerator **ANA\_CMPR\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M clock as the source clock

enumerator **ANA\_CMPR\_CLK\_SRC\_DEFAULT**

Select PLL\_F80M as the default clock choice

enum **soc\_periph\_mwdt\_clk\_src\_t**

MWDT clock source.

*Values:*

enumerator **MWDT\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MWDT\_CLK\_SRC\_PLL\_F80M**

Select PLL fixed 80 MHz as the source clock

enumerator **MWDT\_CLK\_SRC\_RC\_FAST**

Select RTC fast as the source clock

enumerator **MWDT\_CLK\_SRC\_DEFAULT**

Select XTAL 40 MHz as the default clock choice

enum **soc\_periph\_ledc\_clk\_src\_legacy\_t**

Type of LEDC clock source, reserved for the legacy LEDC driver.

*Values:*

enumerator **LEDC\_AUTO\_CLK**

LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer

enumerator **LEDC\_USE\_XTAL\_CLK**

Select XTAL as the source clock

enumerator **LEDC\_USE\_PLL\_DIV\_CLK**

Select PLL\_F80M clock as the source clock

enumerator **LEDC\_USE\_RC\_FAST\_CLK**

Select RC\_FAST as the source clock

enum **soc\_periph\_parlio\_clk\_src\_t**

PARLIO clock source.

*Values:*

enumerator **PARLIO\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **PARLIO\_CLK\_SRC\_PLL\_F160M**

Select PLL\_F160M as the source clock

enumerator **PARLIO\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **PARLIO\_CLK\_SRC\_EXTERNAL**

Select EXTERNAL clock as the source clock

enumerator **PARLIO\_CLK\_SRC\_DEFAULT**

Select XTAL as the default clock choice

enum **soc\_periph\_sdmmc\_clk\_src\_t**

Type of SDMMC clock source.

*Values:*

enumerator **SDMMC\_CLK\_SRC\_DEFAULT**

Select PLL\_160M as the default choice

enumerator **SDMMC\_CLK\_SRC\_PLL160M**

Select PLL\_160M as the source clock

enumerator **SDMMC\_CLK\_SRC\_PLL200M**

Select PLL\_200M as the source clock

### Header File

- [components/esp\\_hw\\_support/include/esp\\_clk\\_tree.h](#)
- This header file can be included with:

```
#include "esp_clk_tree.h"
```

### Functions

*esp\_err\_t* **esp\_clk\_tree\_src\_get\_freq\_hz** (*soc\_module\_clk\_t* clk\_src, *esp\_clk\_tree\_src\_freq\_precision\_t* precision, *uint32\_t* \*freq\_value)

Get frequency of module clock source.

#### Parameters

- **clk\_src** -- **[in]** Clock source available to modules, in *soc\_module\_clk\_t*
- **precision** -- **[in]** Degree of precision, one of *esp\_clk\_tree\_src\_freq\_precision\_t* values This arg only applies to the clock sources that their frequencies can vary: *SOC\_MOD\_CLK\_RTC\_FAST*, *SOC\_MOD\_CLK\_RTC\_SLOW*, *SOC\_MOD\_CLK\_RC\_FAST*, *SOC\_MOD\_CLK\_RC\_FAST\_D256*, *SOC\_MOD\_CLK\_XTAL32K* For other clock sources, this field is ignored.
- **freq\_value** -- **[out]** Frequency of the clock source, in Hz

#### Returns

- *ESP\_OK* Success
- *ESP\_ERR\_INVALID\_ARG* Parameter error
- *ESP\_FAIL* Calibration failed

### Enumerations

enum **esp\_clk\_tree\_src\_freq\_precision\_t**

Degree of precision of frequency value to be returned by *esp\_clk\_tree\_src\_get\_freq\_hz()*

*Values:*

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_CACHED**

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_APPROX**

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_EXACT**

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_INVALID**

### 2.5.3 Elliptic Curve Digital Signature Algorithm (ECDSA)

The Elliptic Curve Digital Signature Algorithm (ECDSA) offers a variant of the Digital Signature Algorithm (DSA) which uses elliptic-curve cryptography.

ESP32-P4's ECDSA peripheral provides a secure and efficient environment for computing ECDSA signatures. It offers fast computations while ensuring the confidentiality of the signing process to prevent information leakage. ECDSA private key used in the signing process is accessible only to the hardware peripheral, and it is not readable by software.

ECDSA peripheral can help to establish **Secure Device Identity** for TLS mutual authentication and similar use-cases.

#### Supported Features

- ECDSA digital signature generation and verification
- Two different elliptic curves, namely P-192 and P-256 (FIPS 186-3 specification)
- Two hash algorithms for message hash in the ECDSA operation, namely SHA-224 and SHA-256 (FIPS PUB 180-4 specification)

#### ECDSA on ESP32-P4

On ESP32-P4, the ECDSA module works with a secret key burnt into an eFuse block. This eFuse key is made completely inaccessible (default mode) for any resources outside the cryptographic modules, thus avoiding key leakage.

ECDSA key can be programmed externally through `espefuse.py` script using:

```
espefuse.py burn_key <BLOCK_NUM> </path/to/ecdsa_private_key.pem> ECDSA_KEY
```

**Note:** Six physical eFuse blocks can be used as keys for the ECDSA module: block 4 ~ block 9. E.g., for block 4 (which is the first key block), the argument should be `BLOCK_KEY0`.

Alternatively the ECDSA key can also be programmed through the application running on the target.

Following code snippet uses `esp_efuse_write_key()` to set physical key block 0 in the eFuse with key purpose as `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_ECDSA_KEY`:

```
#include "esp_efuse.h"

const uint8_t key_data[32] = { ... };

esp_err_t status = esp_efuse_write_key(EFUSE_BLK_KEY0,
                                     ESP_EFUSE_KEY_PURPOSE_ECDSA_KEY,
                                     key_data, sizeof(key_data));

if (status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

#### Dependency on TRNG

ECDSA peripheral relies on the hardware True Random Number Generator (TRNG) for its internal entropy requirement. During ECDSA signature creation, the algorithm requires a random integer to be generated as specified in the [RFC 6090](#) section 5.3.2.

Please ensure that hardware *RNG* is enabled before starting ECDSA computations (primarily signing) in the application.

## Application Outline

Please refer to the *ECDSA Peripheral with ESP-TLS* guide for details on how-to use ECDSA peripheral for establishing a mutually authenticated TLS connection.

The ECDSA peripheral in mbedTLS stack is integrated by overriding the ECDSA sign and verify APIs. Please note that, the ECDSA peripheral does not support all curves or hash algorithms and hence for cases where the requirements do not meet the hardware, implementation falls back to the software.

For a particular TLS context, additional APIs have been supplied to populate certain fields (e.g., private key ctx) to differentiate routing to hardware. ESP-TLS layer integrates these APIs internally and hence no additional work is required at the application layer. However, for custom use-cases please refer to API details below.

## API Reference

### Header File

- `components/mbedtls/port/include/ecdsa/ecdsa_alt.h`
- This header file can be included with:

```
#include "ecdsa/ecdsa_alt.h"
```

- This header file is a part of the API provided by the `mbedtls` component. To declare that your component depends on `mbedtls`, add the following to your `CMakeLists.txt`:

```
REQUIRES mbedtls
```

or

```
PRIV_REQUIRES mbedtls
```

### Functions

int `esp_ecdsa_load_pubkey` (mbedtls\_ecp\_keypair \*keypair, int efuse\_blk)

Populate the public key buffer of the `mbedtls_ecp_keypair` context.

#### Parameters

- **keypair** -- The `mbedtls` ECP key-pair structure
- **efuse\_blk** -- The efuse key block that should be used as the private key. The key purpose of this block must be `ECDSA_KEY`

#### Returns

- 0 if successful
- `MBEDTLS_ERR_ECP_BAD_INPUT_DATA` if invalid ecp group id specified
- `MBEDTLS_ERR_ECP_INVALID_KEY` if efuse block with purpose `ECDSA_KEY` is not found
- -1 if invalid efuse block is specified

int `esp_ecdsa_privkey_load_mpi` (mbedtls\_mpi \*key, int efuse\_blk)

Initialize MPI to notify `mbedtls_ecdsa_sign` to use the private key in efuse. We break the MPI struct of the private key in order to differentiate between hardware key and software key.

#### Parameters

- **key** -- The MPI in which this function stores the hardware context. This must be uninitialized
- **efuse\_blk** -- The efuse key block that should be used as the private key. The key purpose of this block must be `ECDSA_KEY`

#### Returns

- 0 if successful
- -1 otherwise

int `esp_ecdsa_privkey_load_pk_context` (mbedtls\_pk\_context \*key\_ctx, int efuse\_blk)

Initialize PK context to notify `mbedtls_ecdsa_sign` to use the private key in efuse. We break the MPI struct used to represent the private key in ECP keypair in order to differentiate between hardware key and software key.

#### Parameters

- **key\_ctx** -- The context in which this functions stores the hardware context. This must be uninitialized
- **efuse\_blk** -- The efuse key block that should be used as the private key. The key purpose of this block must be ECDSA\_KEY

**Returns** - 0 if successful

- -1 otherwise

int **esp\_ecdsa\_set\_pk\_context** (mbedtls\_pk\_context \*key\_ctx, *esp\_ecdsa\_pk\_conf\_t* \*conf)

Initialize PK context and completely populate mbedtls\_ecp\_keypair context. We break the MPI struct used to represent the private key  $d$  in ECP keypair in order to differentiate between hardware key and software key. We also populate the ECP group field present in the mbedtls\_ecp\_keypair context. If the ECDSA peripheral of the chip supports exporting the public key, we can also populate the public key buffer of the mbedtls\_ecp\_keypair context if the load\_pubkey flag is set in the *esp\_ecdsa\_pk\_conf\_t* config argument.

#### Parameters

- **key\_ctx** -- The context in which this functions stores the hardware context. This must be uninitialized
- **conf** -- ESP-ECDSA private key context initialization config structure

**Returns** - 0 if successful

- -1 otherwise

## Structures

struct **esp\_ecdsa\_pk\_conf\_t**

ECDSA private key context initialization config structure.

---

**Note:** Contains configuration information like the efuse key block that should be used as the private key, EC group ID of the private key and if the export public key operation is supported by the peripheral, a flag load\_pubkey that is used specify if the public key has to be populated

---

## Public Members

mbedtls\_ecp\_group\_id **grp\_id**

MbedTLS ECP group identifier

uint8\_t **efuse\_block**

EFuse block id for ECDSA private key

bool **load\_pubkey**

Export ECDSA public key from the hardware

## 2.5.4 Event Task Matrix (ETM)

### Introduction

Normally, if a peripheral X needs to notify peripheral Y of a particular event, this could only be done via a CPU interrupt from peripheral X, where the CPU notifies peripheral Y on behalf of peripheral X. However, in time-critical applications, the latency introduced by CPU interrupts is non-negligible.

With the help of the Event Task Matrix (ETM) module, some peripherals can directly notify other peripherals of events through pre-set connections without the intervention of CPU interrupts. This allows precise and low latency

synchronization between peripherals, and lessens the CPU's workload as the CPU no longer needs to handle these events.

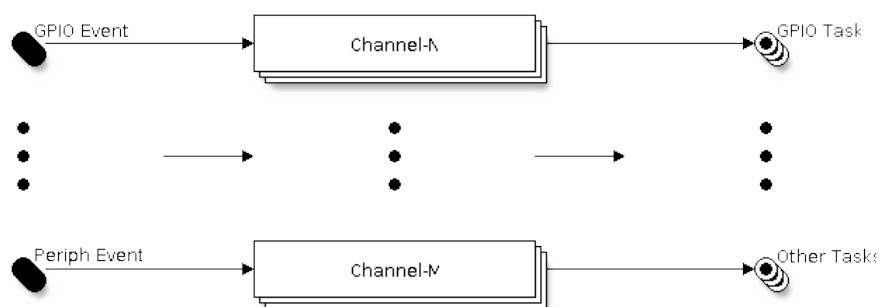

Fig. 2: ETM channels Overview

The ETM module has multiple programmable channels, they are used to connect a particular **Event** to a particular **Task**. When an event is activated, the ETM channel will trigger the corresponding task automatically.

Peripherals that support ETM functionality provide their or unique set of events and tasks to be connected by the ETM. An ETM channel can connect any event to any task, even looping back an event to a task on the same peripheral. However, an ETM channel can only connect one event to one task at a time (i.e., 1 to 1 relation). If you want to use different events to trigger the same task, you can set up more ETM channels.

Typically, with the help of the ETM module, you can implement features like:

- Toggle the GPIO when a timer alarm event happens
- Start an ADC conversion when a pulse edge is detected on a GPIO

## Functional Overview

The following sections of this document cover the typical steps to configure and use the ETM module.

- *ETM Channel Allocation* - describes how to install and uninstall the ETM channel.
- *ETM Event* - describes how to allocate a new ETM event handle or fetch an existing handle from various peripherals.
- *ETM Task* - describes how to allocate a new ETM task handle or fetch an existing handle from various peripherals.
- *ETM Channel Control* - describes common ETM channel control functions.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**ETM Channel Allocation** There are many identical ETM channels in ESP32-P4<sup>1</sup>, and each channel is represented by `esp_etm_channel_handle_t` in the software. The ETM core driver manages all available hardware resources in a pool so that you do not need to care about which channel is in use and which is not. The ETM core driver will allocate a channel for you when you call `esp_etm_new_channel()` and delete it when you call `esp_etm_del_channel()`. All requirements needed for allocating a channel are provided in `esp_etm_channel_config_t`.

Before deleting an ETM channel, please disable it by `esp_etm_channel_disable()` in advance or make sure it has not been enabled yet by `esp_etm_channel_enable()`.

<sup>1</sup> Different ESP chip series might have different numbers of ETM channels. For more details, please refer to *ESP32-P4 Technical Reference Manual > Chapter Event Task Matrix (ETM) [PDF]*. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing channel allocation (i.e., `esp_etm_new_channel()`).

**ETM Event** ETM Event abstracts the event source, masking the details of specific event sources, and is represented by `esp_etm_event_handle_t` in the software, allowing applications to handle different types of events more easily. ETM events can be generated from a variety of peripherals, thus the way to get the event handle differs from peripherals. When an ETM event is no longer used, you should call `esp_etm_channel_connect()` with a NULL event handle to disconnect it and then call `esp_etm_del_event()` to free the event resource.

**GPIO Events** GPIO edge event is the most common event type, it can be generated by any GPIO pin. You can call `gpio_new_etm_event()` to create a GPIO event handle, with the configurations provided in `gpio_etm_event_config_t`:

- `gpio_etm_event_config_t::edge` or `gpio_etm_event_config_t::edges` decides which edge(s) to trigger the event(s), supported edge types are listed in the `gpio_etm_event_edge_t`.

You need to build a connection between the GPIO ETM event handle and the GPIO number. So you should call `gpio_etm_event_bind_gpio()` afterwards. Please note, only the ETM event handle that created by `gpio_new_etm_event()` can set a GPIO number. Calling this function with other kinds of ETM events returns `ESP_ERR_INVALID_ARG` error. Needless to say, this function does not help with the GPIO initialization, you still need to call `gpio_config()` to set the property like direction, pull up/down mode separately.

### Other Peripheral Events

- Refer to *General Purpose Timer (GPTimer)* for how to get the ETM event handle from GPTimer.
- Refer to *Motor Control Pulse Width Modulator (MCPWM)* for how to get the ETM event handle from MCPWM.
- Refer to *Analog Comparator* for how to get the ETM event handle from analog comparator.

**ETM Task** ETM Task abstracts the task action and is represented by `esp_etm_task_handle_t` in the software, allowing tasks to be managed and represented in the same way. ETM tasks can be assigned to a variety of peripherals, thus the way to get the task handle differs from peripherals. When an ETM task is no longer used, you should call `esp_etm_channel_connect()` with a NULL task handle to disconnect it and then call `esp_etm_del_task()` to free the task resource.

**GPIO Tasks** GPIO task is the most common task type. One GPIO can take one or more GPIO ETM task actions, and one GPIO ETM task action can even manage multiple GPIOs. When the task gets activated by the ETM channel, all managed GPIOs can set/clear/toggle at the same time. You can call `gpio_new_etm_task()` to create a GPIO task handle, with the configurations provided in `gpio_etm_task_config_t`:

- `gpio_etm_task_config_t::action` or `gpio_etm_task_config_t::actions` decides what GPIO action(s) would be taken by the ETM task. Supported actions are listed in the `gpio_etm_task_action_t`. If one GPIO needs to take more than one actions, the action tasks have to be created in one `gpio_new_etm_task()` call with filling the actions into the array of `gpio_etm_task_config_t::actions`.

To build a connection between the GPIO ETM task and the GPIO number, you should call `gpio_etm_task_add_gpio()`. You can call this function by several times if you want the task handle to manage more GPIOs. Please note, only the ETM task handle that created by `gpio_new_etm_task()` can manage a GPIO. Calling this function with other kinds of ETM tasks returns `ESP_ERR_INVALID_ARG` error. Needless to say, this function does not help with the GPIO initialization, you still need to call `gpio_config()` to set the property like direction, pull up/down mode separately.

Before you call `esp_etm_del_task()` to delete the GPIO ETM task, make sure that all previously added GPIOs are removed by `gpio_etm_task_rm_gpio()` in advance.

### Other Peripheral Tasks

- Refer to *GPTimer* for how to get the ETM task handle from GPTimer.

### ETM Channel Control

**Connect Event and Task** An ETM event has no association with an ETM task, until they are connected to the same ETM channel by calling `esp_etm_channel_connect()`. Especially, calling the function with a NULL task/event handle means disconnecting the channel from any task or event. Note that, this function can be called either before or after the channel is enabled. But calling this function at runtime to change the connection can be dangerous, because the channel may be in the middle of a cycle, and the new connection may not take effect immediately.

**Enable and Disable Channel** You can call `esp_etm_channel_enable()` and `esp_etm_channel_disable()` to enable and disable the ETM channel from working.

**ETM Channel Profiling** To check if the ETM channels are set with proper events and tasks, you can call `esp_etm_dump()` to dump all working ETM channels with their associated events and tasks. The dumping format is like:

```
=====ETM Dump Start=====
channel 0: event 48 ==> task 17
channel 1: event 48 ==> task 90
channel 2: event 48 ==> task 94
=====ETM Dump End=====
```

The digital ID printed in the dump information is defined in the `soc/soc_etm_source.h` file.

**Thread Safety** The factory functions like `esp_etm_new_channel()` and `gpio_new_etm_task()` are guaranteed to be thread-safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

No functions are allowed to run within the ISR environment.

Other functions that take `esp_etm_channel_handle_t`, `esp_etm_task_handle_t` and `esp_etm_event_handle_t` as the first positional parameter, are not treated as thread-safe, which means you should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_ETM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size as well.

## API Reference

### Header File

- `components/esp_hw_support/include/esp_etm.h`
- This header file can be included with:

```
#include "esp_etm.h"
```

### Functions

`esp_err_t esp_etm_new_channel` (const `esp_etm_channel_config_t` \*config, `esp_etm_channel_handle_t` \*ret\_chan)

Allocate an ETM channel.

---

**Note:** The channel can later be freed by `esp_etm_del_channel`

---

### Parameters

- **config** -- [in] ETM channel configuration

- **ret\_chan** -- [out] Returned ETM channel handle

**Returns**

- ESP\_OK: Allocate ETM channel successfully
- ESP\_ERR\_INVALID\_ARG: Allocate ETM channel failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Allocate ETM channel failed because of out of memory
- ESP\_ERR\_NOT\_FOUND: Allocate ETM channel failed because all channels are used up and no more free one
- ESP\_FAIL: Allocate ETM channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_del\_channel** (*esp\_etm\_channel\_handle\_t* chan)

Delete an ETM channel.

**Parameters** **chan** -- [in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**

- ESP\_OK: Delete ETM channel successfully
- ESP\_ERR\_INVALID\_ARG: Delete ETM channel failed because of invalid argument
- ESP\_FAIL: Delete ETM channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_channel\_enable** (*esp\_etm\_channel\_handle\_t* chan)

Enable ETM channel.

---

**Note:** This function will transit the channel state from init to enable.

---

**Parameters** **chan** -- [in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**

- ESP\_OK: Enable ETM channel successfully
- ESP\_ERR\_INVALID\_ARG: Enable ETM channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable ETM channel failed because the channel has been enabled already
- ESP\_FAIL: Enable ETM channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_channel\_disable** (*esp\_etm\_channel\_handle\_t* chan)

Disable ETM channel.

---

**Note:** This function will transit the channel state from enable to init.

---

**Parameters** **chan** -- [in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**

- ESP\_OK: Disable ETM channel successfully
- ESP\_ERR\_INVALID\_ARG: Disable ETM channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable ETM channel failed because the channel is not enabled yet
- ESP\_FAIL: Disable ETM channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_channel\_connect** (*esp\_etm\_channel\_handle\_t* chan, *esp\_etm\_event\_handle\_t* event, *esp\_etm\_task\_handle\_t* task)

Connect an ETM event to an ETM task via a previously allocated ETM channel.

---

**Note:** Setting the ETM event/task handle to NULL means to disconnect the channel from any event/task

---

**Parameters**

- **chan** -- [in] ETM channel handle that created by `esp_etm_new_channel`
- **event** -- [in] ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`

- **task** -- **[in]** ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

**Returns**

- **ESP\_OK**: Connect ETM event and task to the channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Connect ETM event and task to the channel failed because of invalid argument
- **ESP\_FAIL**: Connect ETM event and task to the channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_del\_event** (*esp\_etm\_event\_handle\_t* event)

Delete ETM event.

---

**Note:** Although the ETM event comes from various peripherals, we provide the same user API to delete the event handle seamlessly.

---

**Parameters** **event** -- **[in]** ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`

**Returns**

- **ESP\_OK**: Delete ETM event successfully
- **ESP\_ERR\_INVALID\_ARG**: Delete ETM event failed because of invalid argument
- **ESP\_FAIL**: Delete ETM event failed because of other reasons

*esp\_err\_t* **esp\_etm\_del\_task** (*esp\_etm\_task\_handle\_t* task)

Delete ETM task.

---

**Note:** Although the ETM task comes from various peripherals, we provide the same user API to delete the task handle seamlessly.

---

**Parameters** **task** -- **[in]** ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

**Returns**

- **ESP\_OK**: Delete ETM task successfully
- **ESP\_ERR\_INVALID\_ARG**: Delete ETM task failed because of invalid argument
- **ESP\_FAIL**: Delete ETM task failed because of other reasons

*esp\_err\_t* **esp\_etm\_dump** (FILE \*out\_stream)

Dump ETM channel usages to the given IO stream.

**Parameters** **out\_stream** -- **[in]** IO stream (e.g. stdout)

**Returns**

- **ESP\_OK**: Dump ETM channel usages successfully
- **ESP\_ERR\_INVALID\_ARG**: Dump ETM channel usages failed because of invalid argument
- **ESP\_FAIL**: Dump ETM channel usages failed because of other reasons

## Structures

struct **esp\_etm\_channel\_config\_t**

ETM channel configuration.

## Type Definitions

typedef struct esp\_etm\_channel\_t \***esp\_etm\_channel\_handle\_t**

ETM channel handle.

typedef struct esp\_etm\_event\_t \***esp\_etm\_event\_handle\_t**  
ETM event handle.

typedef struct esp\_etm\_task\_t \***esp\_etm\_task\_handle\_t**  
ETM task handle.

### Header File

- [components/driver/gpio/include/driver/gpio\\_etm.h](#)
- This header file can be included with:

```
#include "driver/gpio_etm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **gpio\_new\_etm\_event** (const *gpio\_etm\_event\_config\_t* \*config, *esp\_etm\_event\_handle\_t* \*ret\_event, ...)

Create an ETM event object for the GPIO peripheral.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

---

**Note:** The newly created ETM event object is not bind to any GPIO, you need to call `gpio_etm_event_bind_gpio` to bind the wanted GPIO

---

---

**Note:** Every success call to this function will acquire a free GPIO ETM event channel

---

#### Parameters

- **config** -- [in] GPIO ETM event configuration
- **ret\_event** -- [out] Returned ETM event handle
- ... -- [out] Other returned ETM event handles if any (the order of the returned event handles is aligned with the array order in field `edges` in *gpio\_etm\_event\_config\_t*)

#### Returns

- `ESP_OK`: Create ETM event successfully
- `ESP_ERR_INVALID_ARG`: Create ETM event failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create ETM event failed because of out of memory
- `ESP_ERR_NOT_FOUND`: Create ETM event failed because all events are used up and no more free one
- `ESP_FAIL`: Create ETM event failed because of other reasons

*esp\_err\_t* **gpio\_etm\_event\_bind\_gpio** (*esp\_etm\_event\_handle\_t* event, int gpio\_num)

Bind the GPIO with the ETM event.

---

**Note:** Calling this function multiple times with different GPIO number can override the previous setting immediately.

---

---

**Note:** Only GPIO ETM object can call this function

---

#### Parameters

- **event** -- [in] ETM event handle that created by `gpio_new_etm_event`
- **gpio\_num** -- [in] GPIO number that can trigger the ETM event

#### Returns

- **ESP\_OK:** Set the GPIO for ETM event successfully
- **ESP\_ERR\_INVALID\_ARG:** Set the GPIO for ETM event failed because of invalid argument, e.g. GPIO is not input capable, ETM event is not of GPIO type
- **ESP\_FAIL:** Set the GPIO for ETM event failed because of other reasons

*esp\_err\_t* **gpio\_new\_etm\_task** (const *gpio\_etm\_task\_config\_t* \*config, *esp\_etm\_task\_handle\_t* \*ret\_task, ...)

Create an ETM task object for the GPIO peripheral.

---

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

---

---

**Note:** The GPIO ETM task works like a container, a newly created ETM task object doesn't have GPIO members to be managed. You need to call `gpio_etm_task_add_gpio` to put one or more GPIOs to the container.

---

---

**Note:** Every success call to this function will acquire a free GPIO ETM task channel

---

#### Parameters

- **config** -- [in] GPIO ETM task configuration
- **ret\_task** -- [out] Returned ETM task handle
- ... -- [out] Other returned ETM task handles if any (the order of the returned task handles is aligned with the array order in field `actions` in `gpio_etm_task_config_t`)

#### Returns

- **ESP\_OK:** Create ETM task successfully
- **ESP\_ERR\_INVALID\_ARG:** Create ETM task failed because of invalid argument
- **ESP\_ERR\_NO\_MEM:** Create ETM task failed because of out of memory
- **ESP\_ERR\_NOT\_FOUND:** Create ETM task failed because all tasks are used up and no more free one
- **ESP\_FAIL:** Create ETM task failed because of other reasons

*esp\_err\_t* **gpio\_etm\_task\_add\_gpio** (*esp\_etm\_task\_handle\_t* task, int gpio\_num)

Add GPIO to the ETM task.

---

**Note:** You can call this function multiple times to add more GPIOs

---

---

**Note:** Only GPIO ETM object can call this function

---

#### Parameters

- **task** -- [in] ETM task handle that created by `gpio_new_etm_task`

- **gpio\_num** -- [in] GPIO number that can be controlled by the ETM task

**Returns**

- ESP\_OK: Add GPIO to the ETM task successfully
- ESP\_ERR\_INVALID\_ARG: Add GPIO to the ETM task failed because of invalid argument, e.g. GPIO is not output capable, ETM task is not of GPIO type
- ESP\_ERR\_INVALID\_STATE: Add GPIO to the ETM task failed because the GPIO is used by other ETM task already
- ESP\_FAIL: Add GPIO to the ETM task failed because of other reasons

*esp\_err\_t* **gpio\_etm\_task\_rm\_gpio** (*esp\_etm\_task\_handle\_t* task, int gpio\_num)

Remove the GPIO from the ETM task.

---

**Note:** Before deleting the ETM task, you need to remove all the GPIOs from the ETM task by this function

---

---

**Note:** Only GPIO ETM object can call this function

---

**Parameters**

- **task** -- [in] ETM task handle that created by `gpio_new_etm_task`
- **gpio\_num** -- [in] GPIO number that to be remove from the ETM task

**Returns**

- ESP\_OK: Remove the GPIO from the ETM task successfully
- ESP\_ERR\_INVALID\_ARG: Remove the GPIO from the ETM task failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Remove the GPIO from the ETM task failed because the GPIO is not controlled by this ETM task
- ESP\_FAIL: Remove the GPIO from the ETM task failed because of other reasons

**Structures**

struct **gpio\_etm\_event\_config\_t**

GPIO ETM event configuration.

If more than one kind of ETM edge event want to be triggered on the same GPIO pin, you can configure them together. It helps to save GPIO ETM event channel resources for other GPIOs.

**Public Members**

*gpio\_etm\_event\_edge\_t* **edge**

Which kind of edge can trigger the ETM event module

*gpio\_etm\_event\_edge\_t* **edges**[GPIO\_ETM\_EVENT\_EDGE\_TYPES]

Array of kinds of edges to trigger the ETM event module on the same GPIO

struct **gpio\_etm\_task\_config\_t**

GPIO ETM task configuration.

If multiple actions wants to be added to the same GPIO pin, you have to configure all the GPIO ETM tasks together.

**Public Members**

***gpio\_etm\_task\_action\_t action***

Action to take by the ETM task module

***gpio\_etm\_task\_action\_t actions***[GPIO\_ETM\_TASK\_ACTION\_TYPES]

Array of actions to take by the ETM task module on the same GPIO

**Macros****GPIO\_ETM\_EVENT\_EDGE\_TYPES**

GPIO ETM edge events are POS/NEG/ANY

**GPIO\_ETM\_TASK\_ACTION\_TYPES**

GPIO ETM action tasks are SET/CLEAR/TOGGLE

**Enumerations**enum **gpio\_etm\_event\_edge\_t**

GPIO edges that can be used as ETM event.

*Values:*

enumerator **GPIO\_ETM\_EVENT\_EDGE\_POS**

A rising edge on the GPIO will generate an ETM event signal

enumerator **GPIO\_ETM\_EVENT\_EDGE\_NEG**

A falling edge on the GPIO will generate an ETM event signal

enumerator **GPIO\_ETM\_EVENT\_EDGE\_ANY**

Any edge on the GPIO can generate an ETM event signal

enum **gpio\_etm\_task\_action\_t**

GPIO actions that can be taken by the ETM task.

*Values:*

enumerator **GPIO\_ETM\_TASK\_ACTION\_SET**

Set the GPIO level to high

enumerator **GPIO\_ETM\_TASK\_ACTION\_CLR**

Clear the GPIO level to low

enumerator **GPIO\_ETM\_TASK\_ACTION\_TOG**

Toggle the GPIO level

**Header File**

- [components/esp\\_system/include/esp\\_systick\\_etm.h](#)
- This header file can be included with:

```
#include "esp_systick_etm.h"
```

**Functions**

`esp_err_t esp_systick_new_etm_alarm_event` (int core\_id, `esp_etm_event_handle_t` \*out\_event)

Get the ETM event handle of systick hardware's alarm/heartbeat event.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

**Parameters**

- **core\_id** -- [in] CPU core ID
- **out\_event** -- [out] Returned ETM event handle

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## 2.5.5 GPIO & RTC GPIO

**GPIO Summary**

The ESP32-P4 chip features 57 physical GPIO pins (GPIO0 ~ GPIO56). Each pin can be used as a general-purpose I/O, or to be connected to an internal peripheral signal. Through GPIO matrix and IO MUX, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32-P4 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	LP GPIO	Comments
GPIO0		LP_GPIO0	
GPIO1		LP_GPIO1	
GPIO2	TOUCH0	LP_GPIO2	
GPIO3	TOUCH1	LP_GPIO3	
GPIO4	TOUCH2	LP_GPIO4	
GPIO5	TOUCH3	LP_GPIO5

GPIO56			

**Note:**

- **Strapping pin:** GPIO34, GPIO35, GPIO36, GPIO37, and GPIO38 are strapping pins. For more information, please refer to the [Strapping Pin](#) section.
- USB-JTAG: GPIO 24 and 25 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.

GPIO driver offers a dump function `gpio_dump_io_configuration()` to show the configurations of the IOs at the moment, such as pull-up / pull-down, input / output enable, pin mapping etc. Below is an example dump:

```
=====IO DUMP Start=====
```

(continues on next page)

```

IO[4] -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigIn ID: (simple GPIO input)
  SleepSelEn: 1

IO[18] -
  Pullup: 0, Pulldown: 0, DriveCap: 2
  InputEn: 0, OutputEn: 1, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigOut ID: 256 (simple GPIO output)
  SleepSelEn: 1

IO[26] **RESERVED** -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 0 (IOMUX)
  SleepSelEn: 1

=====IO DUMP End=====

```

If an IO pin is routed to a peripheral signal through the GPIO matrix, the signal ID printed in the dump information is defined in the `soc/gpio_sig_map.h` file. The word `**RESERVED**` indicates the IO is occupied by either FLASH or PSRAM. It is strongly not recommended to reconfigure them for other application purposes.

There is also separate "RTC GPIO" support, which functions when GPIOs are routed to the "RTC" low-power, analog subsystem, and Low-Power(LP) peripherals. These pin functions can be used when:

- In Deep-sleep mode
- Analog functions such as ADC/DAC/etc are in use
- LP peripherals, such as LP\_UART, LP\_I2C, are in use

## GPIO Hysteresis Filter

ESP32-P4 support the hardware hysteresis of the input pin, which can reduce the GPIO interrupt shoot by accident due to unstable sampling when the input voltage is near the criteria of logic 0 and 1, especially when the input logic level conversion is slow or the voltage setup time is too long.

Each pin can enable hysteresis function independently. By default, the function is not enabled. You can select the hysteresis control mode by configuring `gpio_config_t::hys_ctrl_mode`. Hysteresis control mode is set along with all the other GPIO configurations in `gpio_config()`.

## Application Example

- GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

## API Reference - Normal GPIO

### Header File

- `components/driver/gpio/include/driver/gpio.h`
- This header file can be included with:

```
#include "driver/gpio.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **gpio\_config** (const *gpio\_config\_t* \*pGPIOConfig)

GPIO common configuration.

```
Configure GPIO's Mode,pull-up,PullDown,IntrType
```

**Parameters** *pGPIOConfig* -- Pointer to GPIO configure struct

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_reset\_pin** (*gpio\_num\_t* gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

---

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

---

**Parameters** *gpio\_num* -- GPIO number.

**Returns** Always return ESP\_OK.

*esp\_err\_t* **gpio\_set\_intr\_type** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

GPIO set interrupt trigger type.

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set the trigger type of e.g. of GPIO16, *gpio\_num* should be GPIO\_NUM\_16 (16);
- **intr\_type** -- Interrupt type, select from *gpio\_int\_type\_t*

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_enable** (*gpio\_num\_t* gpio\_num)

Enable GPIO module interrupt signal.

---

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue.

---

**Parameters** *gpio\_num* -- GPIO number. If you want to enable an interrupt on e.g. GPIO16, *gpio\_num* should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO module interrupt signal.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters** `gpio_num` -- GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* `gpio_set_level` (`gpio_num_t` `gpio_num`, `uint32_t` `level`)

GPIO set output level.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters**

- `gpio_num` -- GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level` -- Output level. 0: low ; 1: high

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO number error

`int` `gpio_get_level` (`gpio_num_t` `gpio_num`)

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters** `gpio_num` -- GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

*esp\_err\_t* `gpio_set_direction` (`gpio_num_t` `gpio_num`, *gpio\_mode\_t* `mode`)

GPIO set direction.

Configure GPIO direction,such as `output_only`,`input_only`,`output_and_input`

**Parameters**

- `gpio_num` -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` -- GPIO direction

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO error

*esp\_err\_t* `gpio_set_pull_mode` (`gpio_num_t` `gpio_num`, *gpio\_pull\_mode\_t* `pull`)

Configure GPIO pull-up/pull-down resistors.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** -- GPIO pull up/down mode.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_wakeup\_enable** (gpio\_num\_t gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable GPIO wake-up function.

**Parameters**

- **gpio\_num** -- GPIO number.
- **intr\_type** -- GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_wakeup\_disable** (gpio\_num\_t gpio\_num)

Disable GPIO wake-up function.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

**Parameters**

- **fn** -- Interrupt handler function.
- **arg** -- Parameter for handler function
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (gpio\_num\_t gpio\_num)

Enable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pullup\_dis** (gpio\_num\_t gpio\_num)

Disable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success

- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_pullup\_en** (gpio\_num\_t gpio\_num)

Enable pull-up on GPIO.

**Parameters** `gpio_num` -- GPIO number

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_pullup\_dis** (gpio\_num\_t gpio\_num)

Disable pull-up on GPIO.

**Parameters** `gpio_num` -- GPIO number

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the GPIO driver's `ETS_GPIO_INTR_SOURCE` ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Parameters** `intr_alloc_flags` -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` No memory to install this service
- `ESP_ERR_INVALID_STATE` ISR service already installed.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_INVALID_ARG` GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (gpio\_num\_t gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**

- `gpio_num` -- GPIO number
- `isr_handler` -- ISR handler function for the corresponding GPIO number.
- `args` -- parameter for ISR handler.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_isr\_handler\_remove** (gpio\_num\_t gpio\_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters** `gpio_num` -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* strength)

Set GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_get\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_hold\_en** (gpio\_num\_t gpio\_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the chip or system is reset, for example, when watchdog time-out or Deep-sleep events are triggered.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters** **gpio\_num** -- GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

*esp\_err\_t* **gpio\_hold\_dis** (gpio\_num\_t gpio\_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters** **gpio\_num** -- GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

void **gpio\_iomux\_in** (uint32\_t gpio\_num, uint32\_t signal\_idx)  
SOC\_GPIO\_SUPPORT\_HOLD\_SINGLE\_IO\_IN\_DSPLP.

Set pad input to a peripheral signal through the IOMUX.

#### Parameters

- **gpio\_num** -- GPIO number of the pad.
- **signal\_idx** -- Peripheral signal id to input. One of the \*\_IN\_IDX signals in soc/gpio\_sig\_map.h.

void **gpio\_iomux\_out** (uint8\_t gpio\_num, int func, bool oen\_inv)

Set peripheral output to an GPIO pad through the IOMUX.

#### Parameters

- **gpio\_num** -- gpio\_num GPIO number of the pad.
- **func** -- The function number of the peripheral pin to output pin. One of the FUNC\_X\_\* of specified pin (X) in soc/io\_mux\_reg.h.
- **oen\_inv** -- True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* **gpio\_force\_hold\_all** (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

**Warning:** This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), **MUST** be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

*esp\_err\_t* **gpio\_force\_unhold\_all** (void)

Force unhold all digital and rtc gpio pads.

*esp\_err\_t* **gpio\_sleep\_sel\_en** (gpio\_num\_t gpio\_num)

Enable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** **gpio\_num** -- GPIO number of the pad.

#### Returns

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_sel\_dis** (gpio\_num\_t gpio\_num)

Disable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** **gpio\_num** -- GPIO number of the pad.

#### Returns

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_set\_direction** (gpio\_num\_t gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction at sleep.

Configure GPIO direction, such as output\_only, input\_only, output\_and\_input

#### Parameters

- **gpio\_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** -- GPIO direction

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_sleep\_set\_pull\_mode** (gpio\_num\_t gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

#### Parameters

- **gpio\_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** -- GPIO pull up/down mode.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_enable** (gpio\_num\_t gpio\_num, *gpio\_intr\_type\_t* intr\_type)

Enable GPIO deep-sleep wake-up function.

---

**Note:** Called by the SDK. User shouldn't call this directly in the APP.

---

#### Parameters

- **gpio\_num** -- GPIO number.
- **intr\_type** -- GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_disable** (gpio\_num\_t gpio\_num)

Disable GPIO deep-sleep wake-up function.

**Parameters** **gpio\_num** -- GPIO number

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_dump\_io\_configuration** (FILE \*out\_stream, uint64\_t io\_bit\_mask)

Dump IO configuration information to console.

#### Parameters

- **out\_stream** -- IO stream (e.g. stdout)
- **io\_bit\_mask** -- IO pin bit mask, each bit maps to an IO

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **gpio\_config\_t**

Configuration parameters of GPIO pad for gpio\_config function.

## Public Members

`uint64_t pin_bit_mask`

GPIO pin: set with bit mask, each bit maps to a GPIO

`gpio_mode_t mode`

GPIO mode: set input/output mode

`gpio_pullup_t pull_up_en`

GPIO pull-up

`gpio_pulldown_t pull_down_en`

GPIO pull-down

`gpio_int_type_t intr_type`

GPIO interrupt type

`gpio_hys_ctrl_mode_t hys_ctrl_mode`

GPIO hysteresis: hysteresis filter on slope input

## Macros

`GPIO_PIN_COUNT`

`GPIO_IS_VALID_GPIO` (gpio\_num)

Check whether it is a valid GPIO number.

`GPIO_IS_VALID_OUTPUT_GPIO` (gpio\_num)

Check whether it can be a valid GPIO number of output mode.

`GPIO_IS_VALID_DIGITAL_IO_PAD` (gpio\_num)

Check whether it can be a valid digital I/O pad.

`GPIO_IS_DEEP_SLEEP_WAKEUP_VALID_GPIO` (gpio\_num)

## Type Definitions

typedef `intr_handle_t` `gpio_isr_handle_t`

typedef void (\*`gpio_isr_t`)(void \*arg)

GPIO interrupt handler.

**Param arg** User registered data

## Header File

- `components/hal/include/hal/gpio_types.h`

### Enumerations

enum `gpio_port_t`

*Values:*

enumerator `GPIO_PORT_0`

enumerator `GPIO_PORT_MAX`

enum `gpio_int_type_t`

*Values:*

enumerator `GPIO_INTR_DISABLE`

Disable GPIO interrupt

enumerator `GPIO_INTR_POSEDGE`

GPIO interrupt type : rising edge

enumerator `GPIO_INTR_NEGEDGE`

GPIO interrupt type : falling edge

enumerator `GPIO_INTR_ANYEDGE`

GPIO interrupt type : both rising and falling edge

enumerator `GPIO_INTR_LOW_LEVEL`

GPIO interrupt type : input low level trigger

enumerator **GPIO\_INTR\_HIGH\_LEVEL**

GPIO interrupt type : input high level trigger

enumerator **GPIO\_INTR\_MAX**

enum **gpio\_mode\_t**

*Values:*

enumerator **GPIO\_MODE\_DISABLE**

GPIO mode : disable input and output

enumerator **GPIO\_MODE\_INPUT**

GPIO mode : input only

enumerator **GPIO\_MODE\_OUTPUT**

GPIO mode : output only mode

enumerator **GPIO\_MODE\_OUTPUT\_OD**

GPIO mode : output only with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT\_OD**

GPIO mode : output and input with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT**

GPIO mode : output and input mode

enum **gpio\_pullup\_t**

*Values:*

enumerator **GPIO\_PULLUP\_DISABLE**

Disable GPIO pull-up resistor

enumerator **GPIO\_PULLUP\_ENABLE**

Enable GPIO pull-up resistor

enum **gpiopulldown\_t**

*Values:*

enumerator **GPIO\_PULLDOWN\_DISABLE**

Disable GPIO pull-down resistor

enumerator **GPIO\_PULLDOWN\_ENABLE**

Enable GPIO pull-down resistor

enum **gpio\_pull\_mode\_t**

*Values:*

enumerator **GPIO\_PULLUP\_ONLY**

Pad pull up

enumerator **GPIO\_PULLDOWN\_ONLY**

Pad pull down

enumerator **GPIO\_PULLUP\_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO\_FLOATING**

Pad floating

enum **gpio\_drive\_cap\_t**

*Values:*

enumerator **GPIO\_DRIVE\_CAP\_0**

Pad drive capability: weak

enumerator **GPIO\_DRIVE\_CAP\_1**

Pad drive capability: stronger

enumerator **GPIO\_DRIVE\_CAP\_2**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_DEFAULT**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_3**

Pad drive capability: strongest

enumerator **GPIO\_DRIVE\_CAP\_MAX**

enum **gpio\_hys\_ctrl\_mode\_t**

Available option for configuring hysteresis feature of GPIOs.

*Values:*

enumerator **GPIO\_HYS\_SOFT\_DISABLE**

Pad input hysteresis disable by software

enumerator **GPIO\_HYS\_SOFT\_ENABLE**

Pad input hysteresis enable by software

## API Reference - RTC GPIO

### Header File

- [components/driver/gpio/include/driver/rtc\\_io.h](#)
- This header file can be included with:

```
#include "driver/rtc_io.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

bool **rtc\_gpio\_is\_valid\_gpio** (gpio\_num\_t gpio\_num)

Determine if the specified GPIO is a valid RTC GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns** true if GPIO is valid for RTC GPIO use. false otherwise.

int **rtc\_io\_number\_get** (gpio\_num\_t gpio\_num)

Get RTC IO index number by gpio number.

**Parameters** **gpio\_num** -- GPIO number

**Returns** >=0: Index of rtcio. -1 : The gpio is not rtcio.

*esp\_err\_t* **rtc\_gpio\_init** (gpio\_num\_t gpio\_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_deinit** (gpio\_num\_t gpio\_num)

Init a GPIO as digital GPIO.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

uint32\_t **rtc\_gpio\_get\_level** (gpio\_num\_t gpio\_num)

Get the RTC IO input level.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- 1 High level
- 0 Low level
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_level** (gpio\_num\_t gpio\_num, uint32\_t level)

Set the RTC IO output level.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **level** -- output level

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction** (gpio\_num\_t gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction\_in\_sleep** (*gpio\_num\_t* gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 supports INPUT\_ONLY mode. The rest targets support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpiopulldown\_en** (*gpio\_num\_t* gpio\_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpiopulldown_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpiopulldown\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpiopulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_iomux\_func\_sel** (gpio\_num\_t gpio\_num, int func)

Select a RTC IOMUX function for the RTC IO.

**Parameters**

- **gpio\_num** -- GPIO number
- **func** -- Function to assign to the pin

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_hold\_en** (gpio\_num\_t gpio\_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_hold\_dis** (gpio\_num\_t gpio\_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_force\_hold\_en\_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a "force hold" input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

*esp\_err\_t* **rtc\_gpio\_force\_hold\_dis\_all** (void)

Disable force hold signal for all RTC IOs.

*esp\_err\_t* **rtc\_gpio\_wakeup\_enable** (gpio\_num\_t gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio\_num** -- GPIO number
- **intr\_type** -- Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO, or intr\_type is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

*esp\_err\_t* **rtc\_gpio\_wakeup\_disable** (gpio\_num\_t gpio\_num)

Disable wakeup from sleep mode using specific GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO

**Macros**

**RTC\_GPIO\_IS\_VALID\_GPIO** (gpio\_num)

**Header File**

- components/driver/gpio/include/driver/lp\_io.h
- This header file can be included with:

```
#include "driver/lp_io.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Functions**

*esp\_err\_t* **lp\_gpio\_connect\_in\_signal** (gpio\_num\_t gpio\_num, uint32\_t signal\_idx, bool inv)

Connect a RTC(LP) GPIO input with a peripheral signal, which tagged as input attribute.

---

**Note:** There's no limitation on the number of signals that a RTC(LP) GPIO can connect with

---

**Parameters**

- **gpio\_num** -- GPIO number, especially, LP\_GPIO\_MATRIX\_CONST\_ZERO\_INPUT means connect logic 0 to signal LP\_GPIO\_MATRIX\_CONST\_ONE\_INPUT means connect logic 1 to signal
- **signal\_idx** -- LP peripheral signal index (tagged as input attribute)
- **inv** -- Whether the RTC(LP) GPIO input to be inverted or not

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **lp\_gpio\_connect\_out\_signal** (gpio\_num\_t gpio\_num, uint32\_t signal\_idx, bool out\_inv, bool oen\_inv)

Connect a peripheral signal which tagged as output attribute with a RTC(LP) GPIO.

---

**Note:** There's no limitation on the number of RTC(LP) GPIOs that a signal can connect with

---

**Parameters**

- **gpio\_num** -- GPIO number
- **signal\_idx** -- LP peripheral signal index (tagged as input attribute), especially, `SIG_LP_GPIO_OUT_IDX` means disconnect RTC(LP) GPIO and other peripherals. Only the RTC GPIO driver can control the output level
- **out\_inv** -- Whether to signal to be inverted or not
- **oen\_inv** -- Whether the output enable control is inverted or not

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

**Header File**

- [components/hal/include/hal/rtc\\_io\\_types.h](#)
- This header file can be included with:

```
#include "hal/rtc_io_types.h"
```

**Enumerations**

enum `rtc_gpio_mode_t`

RTCIO output/input mode type.

*Values:*

enumerator `RTC_GPIO_MODE_INPUT_ONLY`

Pad input

enumerator `RTC_GPIO_MODE_OUTPUT_ONLY`

Pad output

enumerator `RTC_GPIO_MODE_INPUT_OUTPUT`

Pad input + output

enumerator `RTC_GPIO_MODE_DISABLED`

Pad (output + input) disable

enumerator `RTC_GPIO_MODE_OUTPUT_OD`

Pad open-drain output

enumerator `RTC_GPIO_MODE_INPUT_OUTPUT_OD`

Pad input + open-drain output

## 2.5.6 General Purpose Timer (GPTimer)

**Introduction**

GPTimer (General Purpose Timer) is the driver of ESP32-P4 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places

- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

## Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- *Resource Allocation* - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- *Set and Get Count Value* - covers how to force the timer counting from a start point and how to get the count value at anytime.
- *Set up Alarm Action* - covers the parameters that should be set up to enable the alarm event.
- *Register Event Callbacks* - covers how to hook user specific code to the alarm event callback function.
- *Enable and Disable Timer* - covers how to enable and disable the timer.
- *Start and Stop Timer* - shows some typical use cases that start the timer with different alarm behavior.
- *ETM Event and Task* - describes what the events and tasks can be connected to the ETM channel.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.<sup>1</sup>

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind manages all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section *Power Management*.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to  $1 / \text{resolution\_hz}$  seconds.
- `gptimer_config_t::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to *Interrupt Handling*.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e., all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value depends on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This allows the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

---

<sup>1</sup> Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to **ESP32-P4 Technical Reference Manual > Chapter Timer Group (TIMG) [PDF]**. The driver does forbid you from applying for more timers, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `gptimer_new_timer()`).

### Creating a GPTimer Handle with Resolution of 1 MHz

```

gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));

```

**Set and Get Count Value** When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

**Set up Alarm Action** For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that triggers the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

---

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

---

**Register Event Callbacks** After the timer starts up, it can generate a specific event (e.g., the "Alarm Event") dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function lazy installs the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section [Enable and Disable Timer](#) for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you need to enable the timer first, by calling `gptimer_enable()`. This function:

- Switches the timer driver state from **init** to **enable**.
- Enables the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See Section *Power Management* for more information.

Calling `gptimer_disable()` does the opposite, that is, put the timer driver back to the **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

Calling `gptimer_start()` transits the driver state from **enable** to **run**, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the "start protection" state (i.e., `gptimer_start()` is called but not finished).

### Start Timer as a Wall Clock

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

### Trigger Period Events

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this_
↳callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
```

(continues on next page)

(continued from previous page)

```

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

### Trigger One-Shot Event

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**Dynamic Alarm Update** Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
};

```

(continues on next page)

(continued from previous page)

```

// Optional: send the event data to other task by OS queue
xQueueSendFromISR(queue, &ele, &high_task_awoken);
// reconfigure alarm value
gptimer_alarm_config_t alarm_config = {
    .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
};
gptimer_set_alarm_action(timer, &alarm_config);
// return whether we need to yield at the end of ISR
return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

```

**ETM Event and Task** GPTimer is able to generate various events that can interact with the *ETM* module. The supported events are listed in the *gptimer\_etm\_event\_type\_t*. You can call *gptimer\_new\_etm\_event()* to get the corresponding ETM event handle. Likewise, GPTimer exposes several tasks that can be triggered by other ETM events. The supported tasks are listed in the *gptimer\_etm\_task\_type\_t*. You can call *gptimer\_new\_etm\_task()* to get the corresponding ETM task handle.

For how to connect the event and task to an ETM channel, please refer to the *ETM* documentation.

**Power Management** There are some power management strategies, which might turn off or change the frequency of GPTimer's source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver increases the reference count of that power management lock in the *gptimer\_enable()* and decrease it in the *gptimer\_disable()*. So we can ensure the clock source is stable between *gptimer\_enable()* and *gptimer\_disable()*.

**IRAM Safe** By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option *CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE* that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM<sup>2</sup>
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

There is another Kconfig option *CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM* that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

<sup>2</sup> *gptimer\_event\_callbacks\_t::on\_alarm* callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

### Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash).
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or flash).
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled, see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

- Typical use cases of GPTimer are listed in the example [peripherals/timer\\_group/gptimer](#).
- GPTimer capture external event's timestamp, with the help of ETM module: [peripherals/timer\\_group/gptimer\\_capture\\_hc\\_sr04](#).

## API Reference

### Header File

- `components/driver/gptimer/include/driver/gptimer.h`
- This header file can be included with:

```
#include "driver/gptimer.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **gptimer\_new\_timer** (const *gptimer\_config\_t* \*config, *gptimer\_handle\_t* \*ret\_timer)

Create a new General Purpose Timer, and return the handle.

---

**Note:** The newly created timer is put in the "init" state.

---

#### Parameters

- **config** -- [in] GPTimer configuration
- **ret\_timer** -- [out] Returned timer handle

#### Returns

- ESP\_OK: Create GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Create GPTimer failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPTimer failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP\_FAIL: Create GPTimer failed because of other error

*esp\_err\_t* **gptimer\_del\_timer** (*gptimer\_handle\_t* timer)

Delete the GPTimer handle.

---

**Note:** A timer must be in the "init" state before it can be deleted.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

#### Returns

- ESP\_OK: Delete GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Delete GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete GPTimer failed because the timer is not in init state
- ESP\_FAIL: Delete GPTimer failed because of other error

*esp\_err\_t* **gptimer\_set\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t value)

Set GPTimer raw count value.

---

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

---

**Note:** This function is allowed to run within ISR context

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [in] Count value to be set

#### Returns

- ESP\_OK: Set GPTimer raw count value successfully
- ESP\_ERR\_INVALID\_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP\_FAIL: Set GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer raw count value.

---

**Note:** This function will trigger a software capture event and then return the captured count value.

---

---

**Note:** With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned GPTimer count value

#### Returns

- `ESP_OK`: Get GPTimer raw count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer raw count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_resolution** (*gptimer\_handle\_t* timer, uint32\_t \*out\_resolution)

Return the real resolution of the timer.

---

**Note:** usually the timer resolution is same as what you configured in the `gptimer_config_t::resolution_hz`, but some unstable clock source (e.g. `RC_FAST`) will do a calibration, the real resolution can be different from the configured one.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **out\_resolution** -- [out] Returned timer resolution, in Hz

#### Returns

- `ESP_OK`: Get GPTimer resolution successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer resolution failed because of invalid argument
- `ESP_FAIL`: Get GPTimer resolution failed because of other error

*esp\_err\_t* **gptimer\_get\_captured\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer captured count value.

---

**Note:** The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned captured count value

**Returns**

- `ESP_OK`: Get GPTimer captured count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer captured count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer captured count value failed because of other error

*esp\_err\_t* `gptimer_register_event_callbacks` (*gptimer\_handle\_t* timer, const *gptimer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for GPTimer.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `gptimer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the timer is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `gptimer_set_alarm_action` (*gptimer\_handle\_t* timer, const *gptimer\_alarm\_config\_t* \*config)

Set alarm event actions for GPTimer.

---

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] Alarm configuration, especially, set `config` to `NULL` means disabling the alarm function

**Returns**

- ESP\_OK: Set alarm action for GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP\_FAIL: Set alarm action for GPTimer failed because of other error

*esp\_err\_t* **gptimer\_enable** (*gptimer\_handle\_t* timer)

Enable GPTimer.

---

**Note:** This function will transit the timer state from "init" to "enable".

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.

---

---

**Note:** Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP\_OK: Enable GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Enable GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable GPTimer failed because the timer is already enabled
- ESP\_FAIL: Enable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_disable** (*gptimer\_handle\_t* timer)

Disable GPTimer.

---

**Note:** This function will transit the timer state from "enable" to "init".

---

---

**Note:** This function will disable the interrupt service if it's installed.

---

---

**Note:** This function will release the PM lock if it's acquired in the `gptimer_enable`.

---

---

**Note:** Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP\_OK: Disable GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Disable GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP\_FAIL: Disable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_start** (*gptimer\_handle\_t* timer)

Start GPTimer (internal counter starts counting)

---

**Note:** This function will transit the timer state from "enable" to "run".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Start GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Start GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start GPTimer failed because the timer is not enabled or is already in running
- `ESP_FAIL`: Start GPTimer failed because of other error

*esp\_err\_t* **gptimer\_stop** (*gptimer\_handle\_t* timer)

Stop GPTimer (internal counter stops counting)

---

**Note:** This function will transit the timer state from "run" to "enable".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Stop GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Stop GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop GPTimer failed because the timer is not in running.
- `ESP_FAIL`: Stop GPTimer failed because of other error

## Structures

struct **gptimer\_config\_t**

General Purpose Timer configuration.

## Public Members

*gptimer\_clock\_source\_t* **clk\_src**

GPTimer clock source

*gptimer\_count\_direction\_t* **direction**

Count direction

uint32\_t **resolution\_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution\_hz) seconds

int **intr\_priority**

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **intr\_shared**

Set true, the timer interrupt number can be shared with other peripherals

struct *gptimer\_config\_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer\_event\_callbacks\_t**

Group of supported GPTimer callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

## Public Members

*gptimer\_alarm\_cb\_t* **on\_alarm**

Timer alarm callback

struct **gptimer\_alarm\_config\_t**

General Purpose Timer alarm configuration.

## Public Members

uint64\_t **alarm\_count**

Alarm target count value

uint64\_t **reload\_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32\_t **auto\_reload\_on\_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer\_alarm\_config\_t*::[anonymous] **flags**

Alarm config flags

## Header File

- `components/driver/gptimer/include/driver/gptimer_etm.h`
- This header file can be included with:

```
#include "driver/gptimer_etm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

`esp_err_t gptimer_new_etm_event` (*gptimer\_handle\_t* timer, const *gptimer\_etm\_event\_config\_t* \*config, *esp\_etm\_event\_handle\_t* \*out\_event)

Get the ETM event for GPTimer.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM event configuration
- **out\_event** -- [out] Returned ETM event handle

### Returns

- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

`esp_err_t gptimer_new_etm_task` (*gptimer\_handle\_t* timer, const *gptimer\_etm\_task\_config\_t* \*config, *esp\_etm\_task\_handle\_t* \*out\_task)

Get the ETM task for GPTimer.

---

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM task configuration
- **out\_task** -- [out] Returned ETM task handle

### Returns

- `ESP_OK`: Get ETM task successfully
- `ESP_ERR_INVALID_ARG`: Get ETM task failed because of invalid argument
- `ESP_FAIL`: Get ETM task failed because of other error

## Structures

struct `gptimer_etm_event_config_t`

GPTimer ETM event configuration.

## Public Members

*gptimer\_etm\_event\_type\_t* **event\_type**

GPTimer ETM event type

struct **gptimer\_etm\_task\_config\_t**

GPTimer ETM task configuration.

### Public Members

*gptimer\_etm\_task\_type\_t* **task\_type**

GPTimer ETM task type

### Header File

- `components/driver/gptimer/include/driver/gptimer_types.h`
- This header file can be included with:

```
#include "driver/gptimer_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Structures

struct **gptimer\_alarm\_event\_data\_t**

GPTimer alarm event data.

### Public Members

uint64\_t **count\_value**

Current count value

uint64\_t **alarm\_value**

Current alarm value

### Type Definitions

typedef struct gptimer\_t \***gptimer\_handle\_t**

Type of General Purpose Timer handle.

typedef bool (\***gptimer\_alarm\_cb\_t**)(*gptimer\_handle\_t* timer, const *gptimer\_alarm\_event\_data\_t* \*edata, void \*user\_ctx)

Timer alarm callback prototype.

**Param timer** [in] Timer handle created by `gptimer_new_timer`

**Param edata** [in] Alarm event data, fed by driver

**Param user\_ctx** [in] User data, passed from `gptimer_register_event_callbacks`

**Return** Whether a high priority task has been waken up by this function

### Header File

- [components/hal/include/hal/timer\\_types.h](#)
- This header file can be included with:

```
#include "hal/timer_types.h"
```

### Type Definitions

typedef *soc\_periph\_gptimer\_clk\_src\_t* **gptimer\_clock\_source\_t**  
GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

enum **gptimer\_count\_direction\_t**  
GPTimer count direction.

*Values:*

enumerator **GPTIMER\_COUNT\_DOWN**  
Decrease count value

enumerator **GPTIMER\_COUNT\_UP**  
Increase count value

enum **gptimer\_etm\_task\_type\_t**  
GPTimer specific tasks that supported by the ETM module.

*Values:*

enumerator **GPTIMER\_ETM\_TASK\_START\_COUNT**  
Start the counter

enumerator **GPTIMER\_ETM\_TASK\_STOP\_COUNT**  
Stop the counter

enumerator **GPTIMER\_ETM\_TASK\_EN\_ALARM**  
Enable the alarm

enumerator **GPTIMER\_ETM\_TASK\_RELOAD**  
Reload preset value into counter

enumerator **GPTIMER\_ETM\_TASK\_CAPTURE**  
Capture current count value into specific register

enumerator **GPTIMER\_ETM\_TASK\_MAX**  
Maximum number of tasks

enum `gptimer_etm_event_type_t`

GPTimer specific events that supported by the ETM module.

*Values:*

enumerator `GPTIMER_ETM_EVENT_ALARM_MATCH`

Count value matches the alarm target value

enumerator `GPTIMER_ETM_EVENT_MAX`

Maximum number of events

## 2.5.7 Hash-Based Message Authentication Code (HMAC)

Hash-based Message Authentication Code (HMAC) is a secure authentication technique that verifies the authenticity and integrity of a message with a pre-shared key. This module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block.

For more detailed information on the application workflow and the HMAC calculation process, see **ESP32-P4 Technical Reference Manual > HMAC Accelerator (HMAC)** [[PDF](#)].

### Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel.

To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates the HMAC of the received message itself.
- B checks whether the received and calculated HMACs match.

If they do match, the message is authentic.

However, the HMAC itself is not bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

### HMAC on ESP32-P4

On ESP32-P4, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, ESP32-P4 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called **Upstream** mode, while the last two modes are called **Downstream** modes.

**eFuse Keys for HMAC** Six physical eFuse blocks can be used as keys for the HMAC module: block 4 ~ block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ~ `HMAC_KEY5`.

Each key has a corresponding eFuse parameter **key purpose** determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the **key purpose** (see [ESP32-P4 Technical Reference Manual > eFuse Controller \(eFuse\) \[PDF\]](#)).

Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

### HMAC Generation for Software Key purpose value: 8

In this case, the HMAC is given out to the software, e.g., to authenticate a message.

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length, and the eFuse key block ID which contains the secret and has the eFuse key purpose set to Upstream mode.

### HMAC for Digital Signature Key purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. You only need to provide the eFuse key block and purpose on the HMAC side, additional parameters are required for the Digital Signature component in that case.

Neither the key nor the actual HMAC is ever exposed outside the HMAC module and DS component. The calculation of the HMAC and its handover to the DS component happen internally.

For more details, see [ESP32-P4 Technical Reference Manual > Digital Signature \(DS\) \[PDF\]](#).

### HMAC for Enabling JTAG Key purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before.

Following is the procedure to re-enable the JTAG:

#### Stage 1: Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose `HMAC_DOWN_ALL` (5) or `HMAC_DOWN_JTAG` (6). This can be done using the `esp_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read-protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the `soft_jtag_disable` bit/bits on ESP32-P4. This will permanently disable JTAG unless the correct key value is provided by the software.

---

**Note:** The API `esp_efuse_write_field_cnt(ESP_EFUSE_SOFT_DIS_JTAG, ESP_EFUSE_SOFT_DIS_JTAG[0]->bit_count)` can be used to burn `soft_jtag_disable` bits on ESP32-P4.

---

**Note:** If `DIS_PAD_JTAG` eFuse is set, then `SOFT_DIS_JTAG` functionality does not work because JTAG is permanently disabled.

---

## JTAG enables

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see [ESP32-P4 Technical Reference Manual > HMAC Accelerator \(HMAC\) \[PDF\]](#).

## Application Outline

The following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage.

We use `esp_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ESP_EFUSE_KEY_PURPOSE_HMAC_UP` (8) means that this key can only be used for HMAC generation for software usage:

```
#include "esp_efuse.h"

const uint8_t key_data[32] = { ... };

esp_err_t status = esp_efuse_write_key(EFUSE_BLK_KEY4,
                                     ESP_EFUSE_KEY_PURPOSE_HMAC_UP,
                                     key_data, sizeof(key_data));

if (status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

## API Reference

### Header File

- `components/esp_hw_support/include/esp_hmac.h`
- This header file can be included with:

```
#include "esp_hmac.h"
```

### Functions

*esp\_err\_t* **esp\_hmac\_calculate** (*hmac\_key\_id\_t* key\_id, const void \*message, size\_t message\_len, uint8\_t \*hmac)

Calculate the HMAC of a given message.

Calculate the HMAC *hmac* of a given message *message* with length *message\_len*. SHA256 is used for the calculation.

---

**Note:** Uses the HMAC peripheral in "upstream" mode.

---

#### Parameters

- **key\_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** -- the message for which to calculate the HMAC
- **message\_len** -- message length return ESP\_ERR\_INVALID\_STATE if unsuccessful
- **hmac** -- [out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

#### Returns

- ESP\_OK, if the calculation was successful,
- ESP\_ERR\_INVALID\_ARG if message or hmac is a nullptr or if key\_id out of range
- ESP\_FAIL, if the hmac calculation failed

*esp\_err\_t* **esp\_hmac\_jtag\_enable** (*hmac\_key\_id\_t* key\_id, const uint8\_t \*token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

---

**Note:** Return value of the API does not indicate the JTAG status.

---

#### Parameters

- **key\_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** -- Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

#### Returns

- ESP\_OK, if the key\_purpose of the key\_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- ESP\_FAIL, if the key\_purpose of the key\_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE\_HARD\_DIS\_JTAG eFuse parameter.
- ESP\_ERR\_INVALID\_ARG, invalid input arguments

*esp\_err\_t* **esp\_hmac\_jtag\_disable** (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp\_hmac\_jtag\_enable() API.

#### Returns

- ESP\_OK return ESP\_OK after writing the HMAC\_SET\_INVALIDATE\_JTAG\_REG with value 1.

### Enumerations

enum **hmac\_key\_id\_t**

The possible efuse keys for the HMAC peripheral

*Values:*

enumerator **HMAC\_KEY0**

enumerator **HMAC\_KEY1**

enumerator **HMAC\_KEY2**

enumerator **HMAC\_KEY3**

enumerator **HMAC\_KEY4**

enumerator **HMAC\_KEY5**

enumerator **HMAC\_KEY\_MAX**

### 2.5.8 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-P4 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

#### Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-P4 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-P4 Technical Reference Manual > Digital Signature (DS)* [PDF].

## Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-P4 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

The APIs `esp_ds_sign()` and `esp_ds_start_sign()` calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API `esp_ds_rsa_sign()` can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses `esp_ds_start_sign()` and converts the signature into PKCS#1 v1.5 format.

---

**Note:** Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

---

## Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-P4 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC\_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC\_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-P4 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the `esp-secure-cert-tool`.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the ds data from the flash which has been done through the API's provided by the `esp_secure_cert_mgr` component. Please refer the `component/README`. for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls` context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

## Example for SSL Mutual Authentication using DS

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through *ESP-MQTT*) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with *ESP-TLS*. See `example README` for more details.

## API Reference

### Header File

- `components/esp_hw_support/include/esp_ds.h`
- This header file can be included with:

```
#include "esp_ds.h"
```

### Functions

`esp_err_t esp_ds_sign` (const void \*message, const `esp_ds_data_t` \*data, `hmac_key_id_t` key\_id, void \*signature)

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \bmod M$  where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

---

**Note:** Please see note section of `esp_ds_start_sign()` for more details about the input parameters.

---

#### Parameters

- **message** -- the message to be signed; its length should be  $(data->rsa\_length + 1)*4$  bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** -- the destination of the signature, should be  $(data->rsa\_length + 1)*4$  bytes long

#### Returns

- `ESP_OK` if successful, the signature was written to the parameter `signature`.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPT_DS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPT_DS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component
- `ESP_ERR_HW_CRYPT_DS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid.
- `ESP_ERR_HW_CRYPT_DS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches.

`esp_err_t esp_ds_start_sign` (const void \*message, const `esp_ds_data_t` \*data, `hmac_key_id_t` key\_id, `esp_ds_context_t` \*\*esp\_ds\_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \bmod M$  where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

---

**Note:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner. The numbers Y, M, Rb which are a part of `esp_ds_data_t`

should be provided in little endian format and should be of length equal to the RSA private key bit length The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

---

**Parameters**

- **message** -- the message to be signed; its length should be  $(data->rsa\_length + 1)*4$  bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp\_ds\_ctx** -- the context object which is needed for finishing the signing process later

**Returns**

- ESP\_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP\_ERR\_HW\_CRYPTODS\_HMAC\_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP\_ERR\_NO\_MEM if there hasn't been enough memory to allocate the context object
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_KEY if there's a problem with passing the HMAC key to the DS component

bool **esp\_ds\_is\_busy** (void)

Return true if the DS peripheral is busy, otherwise false.

---

**Note:** Only valid if `esp_ds_start_sign()` was called before.

---

*esp\_err\_t* **esp\_ds\_finish\_sign** (void \*signature, *esp\_ds\_context\_t* \*esp\_ds\_ctx)

Finish the signing process.

**Parameters**

- **signature** -- the destination of the signature, should be  $(data->rsa\_length + 1)*4$  bytes long, the resultant signature bytes shall be written in little endian format.
- **esp\_ds\_ctx** -- the context object retrieved by `esp_ds_start_sign()`

**Returns**

- ESP\_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP\_ERR\_INVALID\_ARG if one of the parameters is NULL
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_DIGEST if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- ESP\_ERR\_HW\_CRYPTODS\_INVALID\_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

*esp\_err\_t* **esp\_ds\_encrypt\_params** (*esp\_ds\_data\_t* \*data, const void \*iv, const *esp\_ds\_p\_data\_t* \*p\_data, const void \*key)

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

---

**Note:** The numbers Y, M, Rb which are a part of `esp_ds_data_t` should be provided in little endian format and should be of length equal to the RSA private key bit length The message length in bits should also be equal to

the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

---

#### Parameters

- **data** -- Output buffer to store encrypted data, suitable for later use generating signatures.
- **iv** -- Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p\_data** -- Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** -- Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

#### Returns

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `p_data->rsa_length` is too long

### Structures

struct **esp\_digital\_signature\_data**

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

### Public Members

*esp\_digital\_signature\_length\_t* **rsa\_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

This value must match the length field encrypted and stored in 'c', or invalid results will be returned. (The DS peripheral will always use the value in 'c', not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

---

**Note:** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

---

uint32\_t **iv**[ESP\_DS\_IV\_BIT\_LEN / 32]

IV value used to encrypt 'c'

uint8\_t **c**[ESP\_DS\_C\_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp\_ds\_p\_data\_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling `esp_ds_encrypt_params()`. Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

---

**Note:** Y, M, Rb, & M\_Prime must all be in little endian format.

---

### Public Members

uint32\_t **Y**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA exponent.

uint32\_t **M**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA modulus.

uint32\_t **Rb**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA r inverse operand.

uint32\_t **M\_prime**

RSA M prime operand.

uint32\_t **length**

RSA length in words (32 bit)

### Macros

**ESP\_DS\_IV\_BIT\_LEN**

**ESP\_DS\_IV\_LEN**

**ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_MD\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_M\_PRIME\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_L\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_PADDING\_BIT\_LEN**

**ESP\_DS\_C\_LEN**

### Type Definitions

typedef struct esp\_ds\_context **esp\_ds\_context\_t**

typedef struct *esp\_digital\_signature\_data* **esp\_ds\_data\_t**

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

## Enumerations

enum `esp_digital_signature_length_t`

*Values:*

enumerator `ESP_DS_RSA_1024`

enumerator `ESP_DS_RSA_2048`

enumerator `ESP_DS_RSA_3072`

enumerator `ESP_DS_RSA_4096`

## 2.5.9 Inter-Integrated Circuit (I2C)

### Introduction

I2C is a serial, synchronous, multi-device, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. I2C uses two bidirectional open-drain lines: serial data line (SDA) and serial clock line (SCL), pulled up by resistors.

ESP32-P4 has 2 I2C controller (also called port), responsible for handling communication on the I2C bus. A single I2C controller can be a master or a slave.

Typically, an I2C slave device has a 7-bit address or 10-bit address. ESP32-P4 supports both I2C Standard-mode (Sm) and Fast-mode (Fm) which can go up to 100KHz and 400KHz respectively.

**Warning:** The clock frequency of SCL in master mode should not be larger than 400 KHz

---

**Note:** The frequency of SCL is influenced by both the pull-up resistor and the wire capacitance. Therefore, users are strongly recommended to choose appropriate pull-up resistors to make the frequency accurate. The recommended value for pull-up resistors usually ranges from 1K Ohms to 10K Ohms.

Keep in mind that the higher the frequency, the smaller the pull-up resistor should be (but not less than 1 KOhms). Indeed, large resistors will decline the current, which will increase the clock switching time and reduce the frequency. We usually recommend a range of 2 KOhms to 5 KOhms, but users may also need to make some adjustments depending on their current draw requirements.

---

### I2C Clock Configuration

- `i2c_clock_source_t::I2C_CLK_SRC_DEFAULT`: Default I2C source clock.
- `i2c_clock_source_t::I2C_CLK_SRC_XTAL`: External crystal for I2C clock source.
- `i2c_clock_source_t::I2C_CLK_RC_FAST`: Internal 20MHz rc oscillator for I2C clock source.

### I2C File Structure

#### Public headers that need to be included in the I2C application

- `i2c.h`: The header file of legacy I2C APIs (for apps using legacy driver).
- `i2c_master.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with master mode).

Fig. 3: I2C file structure

- `i2c_slave.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with slave mode).

**Note:** The legacy driver can't coexist with the new driver. Include `i2c.h` to use the legacy driver or the other two headers to use the new driver. Please keep in mind that the legacy driver is now deprecated and will be removed in future.

#### Public headers that have been included in the headers above

- `i2c_types_legacy.h`: The legacy public types that only used in the legacy driver.
- `i2c_types.h`: The header file that provides public types.

#### Functional Overview

The I2C driver offers following services:

- **Resource Allocation** - covers how to allocate I2C bus with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **I2C Master Controller** - covers behavior of I2C master controller. Introduce data transmit, data receive, and data transmit and receive.
- **I2C Slave Controller** - covers behavior of I2C slave controller. Involve data transmit and data receive.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the I2C interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation** Both I2C master bus and I2C slave bus, when supported, are represented by `i2c_bus_handle_t` in the driver. The available ports are managed in a resource pool that allocates a free port on request.

**Install I2C master bus and device** The I2C master is designed based on bus-device model. So `i2c_master_bus_config_t` and `i2c_device_config_t` are required separately to allocate the I2C master bus instance and I2C device instance.

Fig. 4: I2C master bus-device module

I2C master bus requires the configuration that specified by `i2c_master_bus_config_t`:

- `i2c_master_bus_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_master_bus_config_t::sda_io_num` sets the GPIO number for the serial data bus (SDA).
- `i2c_master_bus_config_t::scl_io_num` sets the GPIO number for the serial clock bus (SCL).
- `i2c_master_bus_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to *Power Management* section.
- `i2c_master_bus_config_t::glitch_ignore_cnt` sets the glitch period of master bus, if the glitch period on the line is less than this value, it can be filtered out, typically value is 7.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority` Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)).
- `i2c_master_bus_config_t::trans_queue_depth` Depth of internal transfer queue. Only valid in asynchronous transaction.
- `i2c_master_bus_config_t::enable_internal_pullup` Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. A suitable external pullup is recommended.

If the configurations in `i2c_master_bus_config_t` is specified, users can call `i2c_new_master_bus()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

I2C master device requires the configuration that specified by `i2c_device_config_t`:

- `i2c_device_config_t::dev_addr_length` configure the address bit length of the slave device. User can choose from enumerator `I2C_ADDR_BIT_LEN_7` or `I2C_ADDR_BIT_LEN_10` (if supported).
- `i2c_device_config_t::device_address` I2C device raw address. Please parse the device address to this member directly. For example, the device address is 0x28, then parse 0x28 to `i2c_device_config_t::device_address`, don't carry a write/read bit.
- `i2c_device_config_t::scl_speed_hz` set the scl line frequency of this device.
- `i2c_device_config_t::scl_wait_us`. SCL await time (in us). Usually this value should not be very small because slave stretch will happen in pretty long time. (It's possible even stretch for 12ms). Set 0 means use default reg value.

Once the `i2c_device_config_t` structure is populated with mandatory parameters, users can call `i2c_master_bus_add_device()` to allocate an I2C device instance and mounted to the master bus then. This function will return an I2C device handle if it runs correctly. Specifically, when the I2C bus is not initialized properly, calling this function will result in a `ESP_ERR_INVALID_ARG` error.

```
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```

**Uninstall I2C master bus and device** If a previously installed I2C bus or device is no longer needed, it's recommended to recycle the resource by calling `i2c_master_bus_rm_device()` or `i2c_del_master_bus()`, so that to release the underlying hardware.

**Install I2C slave device** I2C slave requires the configuration that specified by `i2c_slave_config_t`:

- `i2c_slave_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_slave_config_t::sda_io_num` sets the GPIO number for serial data bus (SDA).
- `i2c_slave_config_t::scl_io_num` sets the GPIO number for serial clock bus (SCL).
- `i2c_slave_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to [Power Management](#) section.
- `i2c_slave_config_t::send_buf_depth` sets the sending buffer length.
- `i2c_slave_config_t::slave_addr` sets the slave address
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `i2c_del_master_bus()` is called.
- `i2c_slave_config_t::addr_bit_len` sets true if you need the slave to have a 10-bit address.
- `i2c_slave_config_t::access_ram_en` Set true to enable the non-fifo mode. Thus the I2C data fifo can be used as RAM, and double addressing will be synchronised opened.
- `i2c_slave_config_t::slave_unmatch_en` Set true to enable the slave unmatch interrupt. If master send command address cannot match the slave address, and unmatch interrupt will be triggered.

Once the `i2c_slave_config_t` structure is populated with mandatory parameters, users can call `i2c_new_slave_device()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

```

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));

```

**Uninstall I2C slave device** If a previously installed I2C bus is no longer needed, it's recommended to recycle the resource by calling `i2c_del_slave_device()`, so that to release the underlying hardware.

**I2C Master Controller** After installing the i2c master driver by `i2c_new_master_bus()`, ESP32-P4 is ready to communicate with other I2C devices. I2C APIs allow the standard transactions. Like the wave as follows:

**I2C Master Write** After installing I2C master bus successfully, you can simply call `i2c_master_transmit()` to write data to the slave device. The principle of this function can be explained by following chart.

In order to organize the process, the driver uses a command link, that should be populated with a sequence of commands and then passed to I2C controller for execution.

Fig. 5: I2C master write to slave

Simple example for writing data to slave:

```

#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {

```

(continues on next page)

(continued from previous page)

```

        .dev_addr_length = I2C_ADDR_BIT_LEN_7,
        .device_address = 0x58,
        .scl_speed_hz = 100000,
    };

    i2c_master_dev_handle_t dev_handle;
    ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

    ESP_ERROR_CHECK(i2c_master_transmit(dev_handle, data_wr, DATA_LENGTH, -1));

```

**I2C Master Read** After installing I2C master bus successfully, you can simply call `i2c_master_receive()` to read data from the slave device. The principle of this function can be explained by following chart.

Fig. 6: I2C master read from slave

Simple example for reading data from slave:

```

#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

i2c_master_receive(dev_handle, data_rd, DATA_LENGTH, -1);

```

**I2C Master Write and Read** Some I2C device needs write configurations before reading data from it, therefore, an interface called `i2c_master_transmit_receive()` can help. The principle of this function can be explained by following chart.

Fig. 7: I2C master write to slave and read from slave

Simple example for writing and reading from slave:

```

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,

```

(continues on next page)

(continued from previous page)

```

        .device_address = 0x58,
        .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(I2C_PORT_NUM_0, &dev_cfg, &dev_handle));
uint8_t buf[20] = {0x20};
uint8_t buffer[2];
ESP_ERROR_CHECK(i2c_master_transmit_receive(i2c_bus_handle, buf, sizeof(buf),
↳buffer, 2, -1));

```

**I2C Master Probe** I2C driver can use `i2c_master_probe()` to detect whether the specific device has been connected on I2C bus. If this function return `ESP_OK`, that means the device has been detected.

**Important:** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get `ESP_ERR_TIMEOUT` while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, setting `flags.enable_internal_pullup` as true is also acceptable.

Fig. 8: I2C master probe

Simple example for probing an I2C device:

```

i2c_master_bus_config_t i2c_mst_config_1 = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config_1, &bus_handle));
ESP_ERROR_CHECK(i2c_master_probe(bus_handle, 0x22, -1));
ESP_ERROR_CHECK(i2c_del_master_bus(bus_handle));

```

**I2C Slave Controller** After installing the i2c slave driver by `i2c_new_slave_device()`, ESP32-P4 is ready to communicate with other I2C master as a slave.

**I2C Slave Write** The send buffer of the I2C slave is used as a FIFO to store the data to be sent. The data will queue up until the master requests them. You can call `i2c_slave_transmit()` to transfer data.

Simple example for writing data to FIFO:

```

uint8_t *data_wr = (uint8_t *) malloc(DATA_LENGTH);

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7, // 7-bit address
    .clk_source = I2C_CLK_SRC_DEFAULT, // set the clock source
    .i2c_port = 0, // set I2C port number

```

(continues on next page)

(continued from previous page)

```

        .send_buf_depth = 256,           // set tx buffer length
        .scl_io_num = 2,               // SCL gpio number
        .sda_io_num = 1,              // SDA gpio number
        .slave_addr = 0x58,           // slave address
    };

    i2c_bus_handle_t i2c_bus_handle;
    ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &i2c_bus_handle));
    for (int i = 0; i < DATA_LENGTH; i++) {
        data_wr[i] = i;
    }

    ESP_ERROR_CHECK(i2c_slave_transmit(i2c_bus_handle, data_wr, DATA_LENGTH, 10000));

```

**I2C Slave Read** Whenever the master writes data to the slave, the slave will automatically store data in the receive buffer. This allows the slave application to call the function `i2c_slave_receive()` as its own discretion. As `i2c_slave_receive()` is designed as a non-blocking interface. So the user needs to register callback `i2c_slave_register_event_callbacks()` to know when the receive has finished.

```

static IRAM_ATTR bool i2c_slave_rx_done_callback(i2c_slave_dev_handle_t channel,
↳const i2c_slave_rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    return high_task_wakeup == pdTRUE;
}

uint8_t *data_rd = (uint8_t *) malloc(DATA_LENGTH);
uint32_t size_rd = 0;

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));

s_receive_queue = xQueueCreate(1, sizeof(i2c_slave_rx_done_event_data_t));
i2c_slave_event_callbacks_t cbs = {
    .on_recv_done = i2c_slave_rx_done_callback,
};
ESP_ERROR_CHECK(i2c_slave_register_event_callbacks(slave_handle, &cbs, s_receive_
↳queue));

i2c_slave_rx_done_event_data_t rx_data;
ESP_ERROR_CHECK(i2c_slave_receive(slave_handle, data_rd, DATA_LENGTH));
xQueueReceive(s_receive_queue, &rx_data, pdMS_TO_TICKS(10000));
// Receive done.

```

**Put Data In I2C Slave RAM** I2C slave fifo mentioned above can be used as RAM, which means user can access the RAM directly via address fields. For example, writing data to the 3rd ram block with following graph. Before using this, please note that `i2c_slave_config_t::access_ram_en` needs to be set to true.

Fig. 9: Put data in I2C slave RAM

```
uint8_t data_rd[DATA_LENGTH_RAM] = {0};

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
    .flags.access_ram_en = true,
};

// Master write to slave.

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
ESP_ERROR_CHECK(i2c_slave_read_ram(slave_handle, 0x5, data_rd, DATA_LENGTH_RAM));
ESP_ERROR_CHECK(i2c_del_slave_device(slave_handle));
```

**Get Data From I2C Slave RAM** Data can be stored in the RAM with a specific offset by the slave controller, and the master can read this data directly via the RAM address. For example, if the data is stored in 3rd ram block, master can read this data by following graph. Before using this, please note that `i2c_slave_config_t::access_ram_en` needs to be set to true.

Fig. 10: Get data from I2C slave RAM

```
uint8_t data_wr[DATA_LENGTH_RAM] = {0};

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
    .flags.access_ram_en = true,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
ESP_ERROR_CHECK(i2c_slave_write_ram(slave_handle, 0x2, data_wr, DATA_LENGTH_RAM));
ESP_ERROR_CHECK(i2c_del_slave_device(slave_handle));
```

## Register Event Callbacks

**I2C master callbacks** When an I2C master bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some functions that need to be called when those events occurred, you can hook your functions to the ISR (Interrupt Service Routine) by calling `i2c_master_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback functions are required to return a boolean value, to tell the ISR whether a high priority task is woke up by it.

I2C master event callbacks are listed in the `i2c_master_event_callbacks_t`.

Although I2C is a synchronous communication protocol, we also support asynchronous behavior by registering above callback. In this way, I2C APIs will be non-blocking interface. But note that on the same bus, only one device can adopt asynchronous operation.

---

**Important:** I2C master asynchronous transaction is still an experimental feature. (The issue is when asynchronous transaction is very large, it will cause memory problem.)

---

- `i2c_master_event_callbacks_t::on_recv_done` sets a callback function for master "transaction-done" event. The function prototype is declared in `i2c_master_callback_t`.

**I2C slave callbacks** When an I2C slave bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `i2c_slave_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

I2C slave event callbacks are listed in the `i2c_slave_event_callbacks_t`.

- `i2c_slave_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `i2c_slave_received_callback_t`.

**Power Management** If the controller clock source is selected to `I2C_CLK_SRC_XTAL`, then the driver won't install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

**IRAMSafe** By default, the I2C interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_I2C_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety** The factory function `i2c_new_master_bus()` and `i2c_new_slave_device()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other public I2C APIs are not thread safe. which means the user should avoid calling them from multiple tasks, if user strongly needs to call them in multiple tasks, please add extra lock.

## Kconfig Options

- `CONFIG_I2C_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_I2C_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

## API Reference

### Header File

- `components/driver/i2c/include/driver/i2c_master.h`
- This header file can be included with:

```
#include "driver/i2c_master.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t i2c_new_master_bus` (const `i2c_master_bus_config_t` \*`bus_config`, `i2c_master_bus_handle_t` \*`ret_bus_handle`)

Allocate an I2C master bus.

#### Parameters

- `bus_config` -- [in] I2C master bus configuration.
- `ret_bus_handle` -- [out] I2C bus handle

#### Returns

- `ESP_OK`: I2C master bus initialized successfully.
- `ESP_ERR_INVALID_ARG`: I2C bus initialization failed because of invalid argument.
- `ESP_ERR_NO_MEM`: Create I2C bus failed because of out of memory.
- `ESP_ERR_NOT_FOUND`: No more free bus.

`esp_err_t i2c_master_bus_add_device` (`i2c_master_bus_handle_t` `bus_handle`, const `i2c_device_config_t` \*`dev_config`, `i2c_master_dev_handle_t` \*`ret_handle`)

Add I2C master BUS device.

#### Parameters

- `bus_handle` -- [in] I2C bus handle.
- `dev_config` -- [in] device config.
- `ret_handle` -- [out] device handle.

#### Returns

- `ESP_OK`: Create I2C master device successfully.
- `ESP_ERR_INVALID_ARG`: I2C bus initialization failed because of invalid argument.
- `ESP_ERR_NO_MEM`: Create I2C bus failed because of out of memory.

`esp_err_t i2c_del_master_bus` (`i2c_master_bus_handle_t` `bus_handle`)

Deinitialize the I2C master bus and delete the handle.

**Parameters** `bus_handle` -- [in] I2C bus handle.

#### Returns

- `ESP_OK`: Delete I2C bus success, otherwise, failed.
- Otherwise: Some module delete failed.

*esp\_err\_t* **i2c\_master\_bus\_rm\_device** (*i2c\_master\_dev\_handle\_t* handle)

I2C master bus delete device.

**Parameters** **handle** -- i2c device handle

**Returns**

- **ESP\_OK**: If device is successfully deleted.

*esp\_err\_t* **i2c\_master\_transmit** (*i2c\_master\_dev\_handle\_t* i2c\_dev, const uint8\_t \*write\_buffer, size\_t write\_size, int xfer\_timeout\_ms)

Perform a write transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

**Parameters**

- **i2c\_dev** -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- **write\_buffer** -- **[in]** Data bytes to send on the I2C bus.
- **write\_size** -- **[in]** Size, in bytes, of the write buffer.
- **xfer\_timeout\_ms** -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- **ESP\_OK**: I2C master transmit success
- **ESP\_ERR\_INVALID\_ARG**: I2C master transmit parameter invalid.
- **ESP\_ERR\_TIMEOUT**: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

*esp\_err\_t* **i2c\_master\_transmit\_receive** (*i2c\_master\_dev\_handle\_t* i2c\_dev, const uint8\_t \*write\_buffer, size\_t write\_size, uint8\_t \*read\_buffer, size\_t read\_size, int xfer\_timeout\_ms)

Perform a write-read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

**Parameters**

- **i2c\_dev** -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- **write\_buffer** -- **[in]** Data bytes to send on the I2C bus.
- **write\_size** -- **[in]** Size, in bytes, of the write buffer.
- **read\_buffer** -- **[out]** Data bytes received from i2c bus.
- **read\_size** -- **[in]** Size, in bytes, of the read buffer.
- **xfer\_timeout\_ms** -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- **ESP\_OK**: I2C master transmit-receive success
- **ESP\_ERR\_INVALID\_ARG**: I2C master transmit parameter invalid.
- **ESP\_ERR\_TIMEOUT**: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

*esp\_err\_t* **i2c\_master\_receive** (*i2c\_master\_dev\_handle\_t* i2c\_dev, uint8\_t \*read\_buffer, size\_t read\_size, int xfer\_timeout\_ms)

Perform a read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

#### Parameters

- **i2c\_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **read\_buffer** -- [out] Data bytes received from i2c bus.
- **read\_size** -- [in] Size, in bytes, of the read buffer.
- **xfer\_timeout\_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

#### Returns

- `ESP_OK`: I2C master receive success
- `ESP_ERR_INVALID_ARG`: I2C master receive parameter invalid.
- `ESP_ERR_TIMEOUT`: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

*esp\_err\_t* **i2c\_master\_probe** (*i2c\_master\_bus\_handle\_t* bus\_handle, uint16\_t address, int xfer\_timeout\_ms)

Probe I2C address, if address is correct and ACK is received, this function will return `ESP_OK`.

**Attention** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get `ESP_ERR_TIMEOUT` while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, `flags.enable_internal_pullup`` is also acceptable.

---

**Note:** The principle of this function is to sent device address with a write command. If the device on your I2C bus, there would be an ACK signal and function returns `ESP_OK`. If the device is not on your I2C bus, there would be a NACK signal and function returns `ESP_ERR_NOT_FOUND`. `ESP_ERR_TIMEOUT` is not an expected failure, which indicated that the i2c probe not works properly, usually caused by pull-up resistors not be connected properly. Suggestion check data on SDA/SCL line to see whether there is ACK/NACK signal is on line when i2c probe function fails.

---

---

**Note:** There are lots of I2C devices all over the world, we assume that not all I2C device support the behavior like `device_address+nack/ack`. So, if the on line data is strange and no ack/nack got respond. Please check the device datasheet.

---

#### Parameters

- **bus\_handle** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **address** -- [in] I2C device address that you want to probe.
- **xfer\_timeout\_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever (Not recommended in this function).

#### Returns

- `ESP_OK`: I2C device probe successfully
- `ESP_ERR_NOT_FOUND`: I2C probe failed, doesn't find the device with specific address you gave.

- `ESP_ERR_TIMEOUT`: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_register_event_callbacks` (*`i2c_master_dev_handle_t` i2c\_dev, const `i2c_master_event_callbacks_t` \*cbs, void \*user\_data*)

Register I2C transaction callbacks for a master device.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

---

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

---

**Note:** If the callback is used for helping asynchronous transaction. On the same bus, only one device can be used for performing asynchronous operation.

---

#### Parameters

- `i2c_dev` -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- `cbs` -- **[in]** Group of callback functions
- `user_data` -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set I2C transaction callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set I2C transaction callbacks failed because of invalid argument
- `ESP_FAIL`: Set I2C transaction callbacks failed because of other error

`esp_err_t i2c_master_bus_reset` (*`i2c_master_bus_handle_t` bus\_handle*)

Reset the I2C master bus.

**Parameters** `bus_handle` -- I2C bus handle.

#### Returns

- `ESP_OK`: Reset succeed.
- `ESP_ERR_INVALID_ARG`: I2C master bus handle is not initialized.
- Otherwise: Reset failed.

`esp_err_t i2c_master_bus_wait_all_done` (*`i2c_master_bus_handle_t` bus\_handle, int timeout\_ms*)

Wait for all pending I2C transactions done.

#### Parameters

- `bus_handle` -- **[in]** I2C bus handle
- `timeout_ms` -- **[in]** Wait timeout, in ms. Specially, -1 means to wait forever.

#### Returns

- `ESP_OK`: Flush transactions successfully
- `ESP_ERR_INVALID_ARG`: Flush transactions failed because of invalid argument
- `ESP_ERR_TIMEOUT`: Flush transactions failed because of timeout
- `ESP_FAIL`: Flush transactions failed because of other error

## Structures

struct `i2c_master_bus_config_t`

I2C master bus specific configurations.

## Public Members

### *i2c\_port\_num\_t* **i2c\_port**

I2C port number, -1 for auto selecting

### *gpio\_num\_t* **sda\_io\_num**

GPIO number of I2C SDA signal, pulled-up internally

### *gpio\_num\_t* **scl\_io\_num**

GPIO number of I2C SCL signal, pulled-up internally

### *i2c\_clock\_source\_t* **clk\_source**

Clock source of I2C master bus, channels in the same group must use the same clock source

### *uint8\_t* **glitch\_ignore\_cnt**

If the glitch period on the line is less than this value, it can be filtered out, typically value is 7 (unit: I2C module clock cycle)

### *int* **intr\_priority**

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

### *size\_t* **trans\_queue\_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background, only valid in asynchronous transaction. (Typically `max_device_num * per_transaction`)

### *uint32\_t* **enable\_internal\_pullup**

Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. Recommend proper external pull-up if possible

### *struct i2c\_master\_bus\_config\_t::[anonymous]* **flags**

I2C master config flags

### *struct* **i2c\_device\_config\_t**

I2C device configuration.

## Public Members

### *i2c\_addr\_bit\_len\_t* **dev\_addr\_length**

Select the address length of the slave device.

### *uint16\_t* **device\_address**

I2C device raw address. (The 7/10 bit address without read/write bit)

### *uint32\_t* **scl\_speed\_hz**

I2C SCL line frequency.

### *uint32\_t* **scl\_wait\_us**

Timeout value. (unit: us). Please note this value should not be so small that it can handle stretch/disturbance properly. If 0 is set, that means use the default reg value

uint32\_t **disable\_ack\_check**

Disable ACK check. If this is set false, that means ack check is enabled, the transaction will be stoped and API returns error when nack is detected.

struct *i2c\_device\_config\_t*::[anonymous] **flags**

I2C device config flags

struct **i2c\_master\_event\_callbacks\_t**

Group of I2C master callbacks, can be used to get status during transaction or doing other small things. But take care potential concurrency issues.

---

**Note:** The callbacks are all running under ISR context

---

---

**Note:** When CONFIG\_I2C\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

*i2c\_master\_callback\_t* **on\_trans\_done**

I2C master transaction finish callback

## Header File

- [components/driver/i2c/include/driver/i2c\\_slave.h](#)
- This header file can be included with:

```
#include "driver/i2c_slave.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **i2c\_new\_slave\_device** (const *i2c\_slave\_config\_t* \*slave\_config, *i2c\_slave\_dev\_handle\_t* \*ret\_handle)

Initialize an I2C slave device.

### Parameters

- **slave\_config** -- [in] I2C slave device configurations
- **ret\_handle** -- [out] Return a generic I2C device handle

### Returns

- ESP\_OK: I2C slave device initialized successfully
- ESP\_ERR\_INVALID\_ARG: I2C device initialization failed because of invalid argument.
- ESP\_ERR\_NO\_MEM: Create I2C device failed because of out of memory.

*esp\_err\_t* **i2c\_del\_slave\_device** (*i2c\_slave\_dev\_handle\_t* i2c\_slave)

Deinitialize the I2C slave device.

**Parameters** `i2c_slave` -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.

**Returns**

- `ESP_OK`: Delete I2C device successfully.
- `ESP_ERR_INVALID_ARG`: I2C device initialization failed because of invalid argument.

*esp\_err\_t* `i2c_slave_receive` (*i2c\_slave\_dev\_handle\_t* `i2c_slave`, *uint8\_t* \*`data`, *size\_t* `buffer_size`)

Read bytes from I2C internal buffer. Start a job to receive I2C data.

---

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `i2c_slave_register_event_callbacks()`.

---

**Parameters**

- `i2c_slave` -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- `data` -- **[out]** Buffer to store data from I2C fifo. Should be valid until `on_recv_done` is triggered.
- `buffer_size` -- **[in]** Buffer size of data that provided by users.

**Returns**

- `ESP_OK`: I2C slave receive success.
- `ESP_ERR_INVALID_ARG`: I2C slave receive parameter invalid.
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in fifo mode, but `I2C_SLAVE_NONFIFO` mode is configured

*esp\_err\_t* `i2c_slave_transmit` (*i2c\_slave\_dev\_handle\_t* `i2c_slave`, *const uint8\_t* \*`data`, *int* `size`, *int* `xfer_timeout_ms`)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

---

**Note:** If you connect this slave device to some master device, the data transaction direction is from slave device to master device.

---

**Parameters**

- `i2c_slave` -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- `data` -- **[in]** Buffer to write to slave fifo, can pickup by master. Can be freed after this function returns. Equal or larger than `size`.
- `size` -- **[in]** In bytes, of data buffer.
- `xfer_timeout_ms` -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- `ESP_OK`: I2C slave transmit success.
- `ESP_ERR_INVALID_ARG`: I2C slave transmit parameter invalid.
- `ESP_ERR_TIMEOUT`: Operation timeout (larger than `xfer_timeout_ms`) because the device is busy or hardware crash.
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in fifo mode, but `I2C_SLAVE_NONFIFO` mode is configured

*esp\_err\_t* `i2c_slave_register_event_callbacks` (*i2c\_slave\_dev\_handle\_t* `i2c_slave`, *const i2c\_slave\_event\_callbacks\_t* \*`cbs`, *void* \*`user_data`)

Set I2C slave event callbacks for I2C slave channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback

---

member in the `cbs` structure to `NULL`.

---

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- **`i2c_slave`** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **`cbs`** -- **[in]** Group of callback functions
- **`user_data`** -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set I2C transaction callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set I2C transaction callbacks failed because of invalid argument
- `ESP_FAIL`: Set I2C transaction callbacks failed because of other error

*esp\_err\_t* **`i2c_slave_read_ram`** (*i2c\_slave\_dev\_handle\_t* `i2c_slave`, *uint8\_t* `ram_address`, *uint8\_t* `*data`, *size\_t* `receive_size`)

Read bytes from I2C internal ram. This can be only used when `access_ram_en` in configuration structure set to true.

#### Parameters

- **`i2c_slave`** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **`ram_address`** -- **[in]** The offset of RAM (Cannot larger than I2C RAM memory)
- **`data`** -- **[out]** Buffer to store data read from I2C ram.
- **`receive_size`** -- **[in]** Received size from RAM.

#### Returns

- `ESP_OK`: I2C slave transmit success.
- `ESP_ERR_INVALID_ARG`: I2C slave transmit parameter invalid.
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in non-fifo mode, but `I2C_SLAVE_FIFO` mode is configured

*esp\_err\_t* **`i2c_slave_write_ram`** (*i2c\_slave\_dev\_handle\_t* `i2c_slave`, *uint8\_t* `ram_address`, *const uint8\_t* `*data`, *size\_t* `size`)

Write bytes to I2C internal ram. This can be only used when `access_ram_en` in configuration structure set to true.

#### Parameters

- **`i2c_slave`** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **`ram_address`** -- **[in]** The offset of RAM (Cannot larger than I2C RAM memory)
- **`data`** -- **[in]** Buffer to fill.
- **`size`** -- **[in]** Received size from RAM.

#### Returns

- `ESP_OK`: I2C slave transmit success.
- `ESP_ERR_INVALID_ARG`: I2C slave transmit parameter invalid.
- `ESP_ERR_INVALID_SIZE`: Write size is larger than
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in non-fifo mode, but `I2C_SLAVE_FIFO` mode is configured

## Structures

struct **`i2c_slave_config_t`**

I2C slave specific configurations.

## Public Members

### *i2c\_port\_num\_t* **i2c\_port**

I2C port number, -1 for auto selecting

### *gpio\_num\_t* **sda\_io\_num**

SDA IO number used by I2C bus

### *gpio\_num\_t* **scl\_io\_num**

SCL IO number used by I2C bus

### *i2c\_clock\_source\_t* **clk\_source**

Clock source of I2C bus.

### *uint32\_t* **send\_buf\_depth**

Depth of internal transfer ringbuffer, increase this value can support more transfers pending in the background

### *uint16\_t* **slave\_addr**

I2C slave address

### *i2c\_addr\_bit\_len\_t* **addr\_bit\_len**

I2C slave address in bit length

### *int* **intr\_priority**

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

### *uint32\_t* **broadcast\_en**

I2C slave enable broadcast

### *uint32\_t* **access\_ram\_en**

Can get access to I2C RAM directly

### *uint32\_t* **slave\_unmatch\_en**

Can trigger unmatch interrupt when slave address does not match what master sends

### *struct i2c\_slave\_config\_t::*[anonymous] **flags**

I2C slave config flags

### *struct* **i2c\_slave\_event\_callbacks\_t**

Group of I2C slave callbacks (e.g. get i2c slave stretch cause). But take care of potential concurrency issues.

---

**Note:** The callbacks are all running under ISR context

---

---

**Note:** When CONFIG\_I2C\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

### *i2c\_slave\_received\_callback\_t* **on\_recv\_done**

I2C slave receive done callback

## Header File

- `components/driver/i2c/include/driver/i2c_types.h`
- This header file can be included with:

```
#include "driver/i2c_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Structures

struct **i2c\_master\_event\_data\_t**

Data type used in I2C event callback.

## Public Members

### *i2c\_master\_event\_t* **event**

The I2C hardware event that I2C callback is called.

struct **i2c\_slave\_rx\_done\_event\_data\_t**

Event structure used in I2C slave.

## Public Members

uint8\_t \***buffer**

Pointer for buffer received in callback.

## Type Definitions

typedef int **i2c\_port\_num\_t**

I2C port number.

typedef struct i2c\_master\_bus\_t \***i2c\_master\_bus\_handle\_t**

Type of I2C master bus handle.

typedef struct i2c\_master\_dev\_t \***i2c\_master\_dev\_handle\_t**

Type of I2C master bus device handle.

typedef struct i2c\_slave\_dev\_t \***i2c\_slave\_dev\_handle\_t**

Type of I2C slave device handle.

```
typedef bool (*i2c_master_callback_t)(i2c_master_dev_handle_t i2c_dev, const i2c_master_event_data_t *evt_data, void *arg)
```

An callback for I2C transaction.

**Param i2c\_dev [in]** Handle for I2C device.

**Param evt\_data [out]** I2C capture event data, fed by driver

**Param arg [in]** User data, set in `i2c_master_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*i2c_slave_received_callback_t)(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_rx_done_event_data_t *evt_data, void *arg)
```

Callback signature for I2C slave.

**Param i2c\_slave [in]** Handle for I2C slave.

**Param evt\_data [out]** I2C capture event data, fed by driver

**Param arg [in]** User data, set in `i2c_slave_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

## Enumerations

```
enum i2c_master_status_t
```

Enumeration for I2C fsm status.

*Values:*

enumerator **I2C\_STATUS\_READ**

read status for current master command

enumerator **I2C\_STATUS\_WRITE**

write status for current master command

enumerator **I2C\_STATUS\_START**

Start status for current master command

enumerator **I2C\_STATUS\_STOP**

stop status for current master command

enumerator **I2C\_STATUS\_IDLE**

idle status for current master command

enumerator **I2C\_STATUS\_ACK\_ERROR**

ack error status for current master command

enumerator **I2C\_STATUS\_DONE**

I2C command done

enumerator **I2C\_STATUS\_TIMEOUT**

I2C bus status error, and operation timeout

```
enum i2c_master_event_t
```

Enumeration for I2C event.

*Values:*

enumerator **I2C\_EVENT\_ALIVE**

i2c bus in alive status.

enumerator **I2C\_EVENT\_DONE**

i2c bus transaction done

enumerator **I2C\_EVENT\_NACK**

i2c bus nack

enumerator **I2C\_EVENT\_TIMEOUT**

i2c bus timeout

### Header File

- [components/hal/include/hal/i2c\\_types.h](#)
- This header file can be included with:

```
#include "hal/i2c_types.h"
```

### Structures

struct **i2c\_hal\_clk\_config\_t**

Data structure for calculating I2C bus timing.

### Public Members

uint16\_t **clkm\_div**

I2C core clock divider

uint16\_t **scl\_low**

I2C scl low period

uint16\_t **scl\_high**

I2C scl high period

uint16\_t **scl\_wait\_high**

I2C scl wait\_high period

uint16\_t **sda\_hold**

I2C scl low period

uint16\_t **sda\_sample**

I2C sda sample time

uint16\_t **setup**

I2C start and stop condition setup period

uint16\_t **hold**

I2C start and stop condition hold period

uint16\_t **tout**

I2C bus timeout period

### Type Definitions

typedef *soc\_periph\_i2c\_clk\_src\_t* **i2c\_clock\_source\_t**

I2C group clock source.

### Enumerations

enum **i2c\_port\_t**

I2C port number, can be I2C\_NUM\_0 ~ (I2C\_NUM\_MAX-1).

*Values:*

enumerator **I2C\_NUM\_0**

I2C port 0

enumerator **I2C\_NUM\_1**

I2C port 1

enumerator **I2C\_NUM\_MAX**

I2C port max

enum **i2c\_addr\_bit\_len\_t**

Enumeration for I2C device address bit length.

*Values:*

enumerator **I2C\_ADDR\_BIT\_LEN\_7**

i2c address bit length 7

enumerator **I2C\_ADDR\_BIT\_LEN\_10**

i2c address bit length 10

enum **i2c\_mode\_t**

*Values:*

enumerator **I2C\_MODE\_SLAVE**

I2C slave mode

enumerator **I2C\_MODE\_MASTER**

I2C master mode

enumerator **I2C\_MODE\_MAX**

enum **i2c\_rw\_t**

*Values:*

enumerator **I2C\_MASTER\_WRITE**

I2C write data

enumerator **I2C\_MASTER\_READ**

I2C read data

enum **i2c\_trans\_mode\_t**

*Values:*

enumerator **I2C\_DATA\_MODE\_MSB\_FIRST**

I2C data msb first

enumerator **I2C\_DATA\_MODE\_LSB\_FIRST**

I2C data lsb first

enumerator **I2C\_DATA\_MODE\_MAX**

enum **i2c\_addr\_mode\_t**

*Values:*

enumerator **I2C\_ADDR\_BIT\_7**

I2C 7bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_10**

I2C 10bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_MAX**

enum **i2c\_ack\_type\_t**

*Values:*

enumerator **I2C\_MASTER\_ACK**

I2C ack for each byte read

enumerator **I2C\_MASTER\_NACK**

I2C nack for each byte read

enumerator **I2C\_MASTER\_LAST\_NACK**

I2C nack for the last byte

enumerator **I2C\_MASTER\_ACK\_MAX**

enum **i2c\_slave\_stretch\_cause\_t**

Enum for I2C slave stretch causes.

*Values:*

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_ADDRESS\_MATCH**

Stretching SCL low when the slave is read by the master and the address just matched

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_TX\_EMPTY**

Stretching SCL low when TX FIFO is empty in slave mode

enumerator `I2C_SLAVE_STRETCH_CAUSE_RX_FULL`

Stretching SCL low when RX FIFO is full in slave mode

enumerator `I2C_SLAVE_STRETCH_CAUSE_SENDING_ACK`

Stretching SCL low when slave sending ACK

## 2.5.10 Inter-IC Sound (I2S)

### Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32-P4 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK:** Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK:** Bit clock line. The bit clock for data line.
- **WS:** Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT:** Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

An I2S bus that communicates in PDM mode consists of the following lines:

- **CLK:** PDM clock line.
- **DIN/DOUT:** Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller has separate RX and TX channels. That means they are able to work under different clocks and slot configurations with separate GPIO pins. Note that although the internal MCLKs of TX channel and RX channel are separate on a controller, the output MCLK signal can only be attached to one channel. If independent MCLK output is required for each channel, they must be allocated on different I2S controllers.

### I2S File Structure

**Public headers that need to be included in the I2S application are as follows:**

- `i2s.h`: The header file that provides legacy I2S APIs (for apps using legacy driver).
- `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

---

**Note:** The legacy driver cannot coexist with the new driver. Include `i2s.h` to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

---

Fig. 11: I2S File Structure

### Public headers that have been included in the headers above are as follows:

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

## I2S Clock

### Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, which is more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate. However, if APLL has been occupied by EMAC or other channels, the APLL frequency cannot be changed, and the driver will try to work under this APLL frequency. If this frequency cannot meet the requirements of I2S, the clock configuration will fail.

### Clock Terminology

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note:** Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to

the sample rate. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

## I2S Communication Mode

### Overview of All Modes

Target	Standard	PDM TX	PDM RX	TDM	ADC/DAC	LCD/Camera
ESP32	I2S 0/1	I2S 0	I2S 0	none	I2S 0	I2S 0
ESP32-S2	I2S 0	none	none	none	none	I2S 0
ESP32-C3	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-C6	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	none	none
ESP32-H2	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-P4	I2S 0~2	I2S 0	I2S 0	I2S 0~2	none	none

**Standard Mode** In standard mode, there are always two sound channels, i.e., the left and right channels, which are called "slots". These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the followings:

- **Philips Format:** Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

- **MSB Format:** Basically the same as Philips format, but without data shift.

- **PCM Short Format:** Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

**PDM Mode (TX)** PDM (Pulse-density Modulation) mode for the TX channel can convert PCM data into PDM format which always has left and right slots. PDM TX is only supported on I2S0 and it only supports 16-bit width sample data. It needs at least a CLK pin for clock signal and a DOUT pin for data signal (i.e., the WS and SD signal in the following figure; the BCK signal is an internal bit sampling clock, which is not needed between PDM devices). This mode allows users to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by  $up\_sample\_rate = i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fp / i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fs$ . There are two up-sampling modes in PDM TX:

- **Fixed Clock Frequency:** In this mode, the up-sampling rate changes according to the sample rate. Setting  $fp = 960$  and  $fs = sample\_rate / 100$ , then the clock frequency (Fpdm) on CLK pin will be fixed to  $128 * 48 \text{ KHz} = 6.144 \text{ MHz}$ . Note that this frequency is not equal to the sample rate (Fpcm).
- **Fixed Up-sampling Rate:** In this mode, the up-sampling rate is fixed to 2. Setting  $fp = 960$  and  $fs = 480$ , then the clock frequency (Fpdm) on CLK pin will be  $128 * sample\_rate$ .

**PDM Mode (RX)** PDM (Pulse-density Modulation) mode for RX channel can receive PDM-format data and convert the data into PCM format. PDM RX is only supported on I2S0, and it only supports 16-bit width sample data. PDM RX needs at least a CLK pin for clock signal and a DIN pin for data signal. This mode allows users to configure the down-sampling parameter `i2s_pdm_rx_clk_config_t::dn_sample_mode`. There are two down-sampling modes in PDM RX:

- `i2s_pdm_dsr_t::I2S_PDM_DSR_8S`: In this mode, the clock frequency (Fpdm) on the WS pin is  $sample\_rate (Fpcm) * 64$ .
- `i2s_pdm_dsr_t::I2S_PDM_DSR_16S`: In this mode, the clock frequency (Fpdm) on the WS pin is  $sample\_rate (Fpcm) * 128$ .

**TDM Mode** TDM (Time Division Multiplexing) mode supports up to 16 slots. These slots can be enabled by `i2s_tdm_slot_config_t::slot_mask`.

Any data bit-width is supported no matter how many slots are enabled, which means there can be up to  $32 \text{ bit-width} * 16 \text{ slots} = 512 \text{ bit data}$  in one frame.

- **Philips Format:** Data signal has one-bit shift comparing to the WS signal. And no matter how many slots are contained in one frame, the duty of WS signal always keeps 50%.

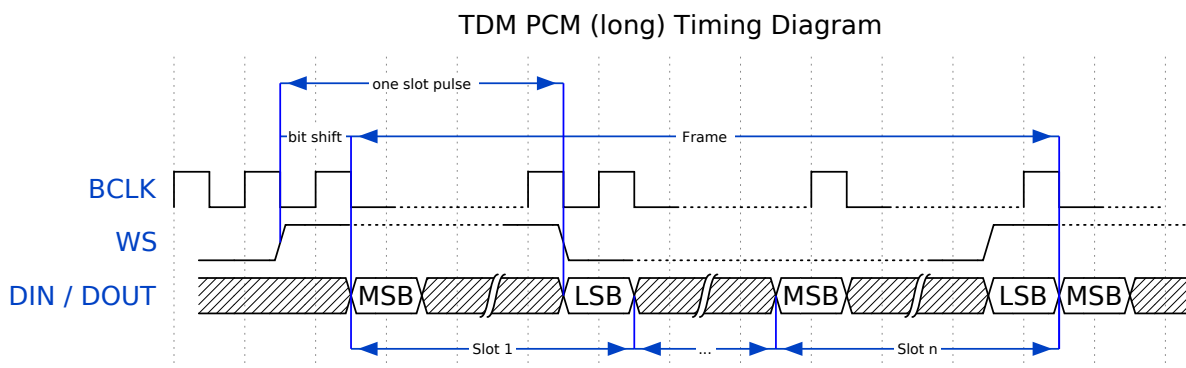

- **MSB Format:** Basically the same as the Philips format, but without data shift.

- **PCM Short Format:** Data has one-bit shift and the WS signal becomes a pulse lasting one BCLK cycle for every frame.

- **PCM Long Format:** Data has one-bit shift and the WS signal lasts one-slot bit width for every frame. For example, the duty of WS will be 25% if there are four slots enabled, and 20% if there are five slots.

### Functional Overview

The I2S driver offers the following services:

**Resource Management** There are three levels of resources in the I2S driver:

- platform level: Resources of all I2S controllers in the current target.
- controller level: Resources in one I2S controller.
- channel level: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels' resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver guarantees that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

**Finite State Machine** There are three states for an I2S channel, namely, registered, ready, and running. Their relationship is shown in the following diagram:

Fig. 12: I2S Finite State Machine

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the *I2S Communication Mode* section.

**Data Transport** The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will

be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keep waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

**Configuration** Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding reconfig functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that:

1. Keeps the interrupt being serviced even when the cache is disabled.
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

### Kconfig Options

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.

### Application Example

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`

- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to *Standard Mode* for information about STD API. And for more details, please refer to `driver/i2s/include/driver/i2s_std.h`.

**STD TX Mode** Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data bit width	slot mode	slot mask	WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high
16 bit	mono	left	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
		right	0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
		both	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
	stereo	left	0x0001	0x0000	0x0003	0x0000	0x0005	0x0000	0x0007	0x0000
		right	0x0000	0x0002	0x0000	0x0004	0x0000	0x0006	0x0000	0x0008
		both	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** Similar for 8-bit and 32-bit data widths, the type of the buffer is better to be `uint8_t` and `uint32_t`. But specially, when the data width is 24-bit, the data buffer should be aligned with 3-byte (i.e., every 3 bytes stands for a 24-bit data in one slot). Additionally, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the writing buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro.
 * This helper macro is defined in `i2s_common.h` and shared by all the I2S_
 * communication modes.
 * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can_
↳be generated by the macros
 * These two helper macros are defined in `i2s_std.h` which can only be used in_
↳STD mode.
 * They can help to specify the slot and clock configurations for initialization_
↳or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
```

(continues on next page)

(continued from previous page)

```

        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
↳wait);

/* If the configurations of slot or clock need to be updated,
 * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_
↳resources */
i2s_del_channel(tx_handle);

```

**STD RX Mode** Taking 16-bit data width for example, when the data on the line are:

WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit	slot mode	slot mask	data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7
16 bit	mono	left		0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
		right		0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
	stereo	any		0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** 8-bit, 24-bit, and 32-bit are similar as 16-bit, the data bit-width in the receiving buffer is equal to the data bit-width on the line. Additionally, when using 24-bit data width, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the receiving buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

i2s_del_channel(rx_handle);

```

**PDM TX Usage** For PDM mode in TX channel, the slot configuration helper macro is:

- [I2S\\_PDM\\_TX\\_SLOT\\_DEFAULT\\_CONFIG](#)

The clock configuration helper macro is:

- [I2S\\_PDM\\_TX\\_CLK\\_DEFAULT\\_CONFIG](#)

Please refer to [PDM Mode](#) for information about PDM TX API. And for more details, please refer to [driver/i2s/include/driver/i2s\\_pdm.h](#).

The PDM data width is fixed to 16-bit. When the data in an `int16_t` writing buffer is:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_pdm_tx_slot_config_t::slot_mode` and `i2s_pdm_tx_slot_config_t::line_mode` (The PDM format on the line is transferred to PCM format for easier comprehension).

line mode	slot mode	line	left	right	left	right	left	right	left	right
one-line Codec	mono	dout	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
	stereo	dout	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008
one-line DAC	mono	dout	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
two-line DAC	mono	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000
	stereo	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007

**Note:** There are three line modes for PDM TX mode, i.e., `I2S_PDM_TX_ONE_LINE_CODEC`, `I2S_PDM_TX_ONE_LINE_DAC`, and `I2S_PDM_TX_TWO_LINE_DAC`. One-line codec is for the PDM codecs that require clock signal. The PDM codec can differentiate the left and right slots by the clock level. The other two modes are used to drive power amplifiers directly with a low-pass filter. They do not need the clock signal, so there are two lines to differentiate the left and right slots. Additionally, for the mono mode of one-line codec, users can force change the slot to the right by setting the clock invert flag in GPIO configuration.

```
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↳MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);

...
```

**PDM RX Usage** For PDM mode in RX channel, the slot configuration helper macro is:

- `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

- `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

Please refer to [PDM Mode](#) for information about PDM RX API. And for more details, please refer to [driver/i2s/include/driver/i2s\\_pdm.h](#).

The PDM data width is fixed to 16-bit. When the data on the line (The PDM format on the line is transferred to PCM format for easier comprehension) is:

left	right	left	right	left	right	left	right	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in a `int16_t` buffer with different `i2s_pdm_rx_slot_config_t::slot_mode` and `i2s_pdm_rx_slot_config_t::slot_mask`.

```
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;

/* Allocate an I2S RX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Init the channel into PDM RX mode */
i2s_pdm_rx_config_t pdm_rx_cfg = {
    .clk_cfg = I2S_PDM_RX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_RX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_rx_mode(rx_handle, &pdm_rx_cfg);

...
```

**TDM TX/RX Usage** Different slot communication formats can be generated by the following helper macros for TDM mode. As described above, there are four formats in TDM mode, and their helper macros are:

- `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_TDM_CLK_DEFAULT_CONFIG`

Please refer to *TDM Mode* for information about TDM API. And for more details, please refer to `driver/i2s/include/driver/i2s_tdm.h`.

**Note:** Due to hardware limitation, when setting the clock configuration for a slave role, please be aware that `i2s_tdm_clk_config_t::bclk_div` should not be smaller than 8. Increasing this field can reduce the lagging of the data sent from the slave. In the high sample rate case, the data might lag behind for more than one BCLK which leads to data malposition. Users may gradually increase `i2s_tdm_clk_config_t::bclk_div` to correct it.

As `i2s_tdm_clk_config_t::bclk_div` is the division of MCLK to BCLK, increasing it also increases the MCLK frequency. Therefore, the clock calculation may fail if MCLK is too high to divide from the source clock. This means that a larger value for `i2s_tdm_clk_config_t::bclk_div` is not necessarily better.

**TDM TX Mode**

```

#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(tx_handle, &tdm_cfg);

...

```

**TDM RX Mode**

```

#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Set the channel mode to TDM */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_CONFIG(I2S_ROLE_MASTER, I2S_COMM_MODE_TDM,
↪ &i2s_pin);
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_18,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};

```

(continues on next page)

```
i2s_channel_init_tdm_mode(rx_handle, &tdm_cfg);
...
```

**Full-duplex** Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels share the BCLK and WS signals. Currently, STD and TDM communication modes supports full-duplex mode in the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate for TX and RX channel at the same time, then they will work in full-
↳duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since TX and RX channel have to
↳be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...
```

**Simplex Mode** To allocate a channel in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32-P4 are independent, so they can be configured with different modes and clocks, and are able to coexist on the same I2S port in simplex mode. PDM duplex can be realized by registering PDM TX simplex and PDM RX simplex on the same I2S port. But in this way, PDM TX/RX might work with different clocks, so take care when configuring the GPIO pins and clocks.

The following example offers a use case for the simplex mode, but note that although the internal MCLK signals for TX and RX channel are separate, the output MCLK can only be bound to one of them if they are from the same

controller. If MCLK has been initialized by both channels, it will be bound to the channel that initializes later.

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,

        },
    },
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

## Application Notes

**How to Prevent Data Lost** For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t
↳handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

$$\begin{aligned} \text{interrupt\_interval (unit: sec)} &= \text{dma\_frame\_num} / \text{sample\_rate} \\ \text{dma\_buffer\_size} &= \text{dma\_frame\_num} * \text{slot\_num} * \text{data\_bit\_width} / 8 \leq 4092 \end{aligned}$$

2. Determine `dma_desc_num`. `dma_desc_num` is decided by the maximum time of `i2s_channel_read` polling cycle. All the received data is supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

$$\text{dma\_desc\_num} > \text{polling\_cycle} / \text{interrupt\_interval}$$

3. Determine the receiving buffer size. The receiving buffer offered by users in `i2s_channel_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

$$\text{recv\_buffer\_size} > \text{dma\_desc\_num} * \text{dma\_buffer\_size}$$

For example, if there is an I2S application, and the known values are:

```

sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms

```

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

```

dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↳549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↳= 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes

```

## API Reference

### Standard Mode

#### Header File

- [components/driver/i2s/include/driver/i2s\\_std.h](#)
- This header file can be included with:

```
#include "driver/i2s_std.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **i2s\_channel\_init\_std\_mode** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_config\_t* \*std\_cfg)

Initialize I2S channel to standard mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

### Parameters

- **handle** -- [in] I2S channel handler
- **std\_cfg** -- [in] Configurations for standard mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

### Parameters

- **handle** -- [in] I2S channel handler
- **clk\_cfg** -- [in] Standard mode clock configuration, can be generated by `I2S_STD_CLK_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for standard mode.

---

**Note:** Only allowed to be called when the channel state is **READY**, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- **[in]** I2S channel handler
- **slot\_cfg** -- **[in]** Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

#### Returns

- **ESP\_OK** Set clock successfully
- **ESP\_ERR\_NO\_MEM** No memory for DMA buffer
- **ESP\_ERR\_INVALID\_ARG** NULL pointer, invalid configuration or not standard mode
- **ESP\_ERR\_INVALID\_STATE** This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S GPIO for standard mode.

---

**Note:** Only allowed to be called when the channel state is **READY**, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- **[in]** I2S channel handler
- **gpio\_cfg** -- **[in]** Standard mode GPIO configuration, specified by user

#### Returns

- **ESP\_OK** Set clock successfully
- **ESP\_ERR\_INVALID\_ARG** NULL pointer, invalid configuration or not standard mode
- **ESP\_ERR\_INVALID\_STATE** This channel is not initialized or not stopped

### Structures

struct **i2s\_std\_slot\_config\_t**

I2S slot configuration for standard mode.

### Public Members

***i2s\_data\_bit\_width\_t* data\_bit\_width**

I2S sample data bit width (valid data bits per sample)

***i2s\_slot\_bit\_width\_t* slot\_bit\_width**

I2S slot bit width (total bits per slot)

***i2s\_slot\_mode\_t* slot\_mode**

Set mono or stereo mode with I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

***i2s\_std\_slot\_mask\_t* slot\_mask**

Select the left, right or both slot

**uint32\_t ws\_width**

WS signal width (i.e. the number of BCLK ticks that WS signal is high)

**bool ws\_pol**

WS signal polarity, set true to enable high lever first

**bool bit\_shift**

Set to enable bit shift in Philips mode

**bool left\_align**

Set to enable left alignment

**bool big\_endian**

Set to enable big endian

**bool bit\_order\_lsb**

Set to enable lsb first

**struct i2s\_std\_clk\_config\_t**

I2S clock configuration for standard mode.

**Public Members****uint32\_t sample\_rate\_hz**

I2S sample rate

***i2s\_clock\_src\_t* clk\_src**

Choose clock source, see `soc_periph_i2s_clk_src_t` for the supported clock sources. selected I2S\_CLK\_SRC\_EXTERNAL (if supports) to enable the external source clock input via MCLK pin,

**uint32\_t ext\_clk\_freq\_hz**

External clock source frequency in Hz, only take effect when `clk_src = I2S_CLK_SRC_EXTERNAL`, otherwise this field will be ignored, Please make sure the frequency input is equal or greater than BCLK, i.e. `sample_rate_hz * slot_bits * 2`

***i2s\_mclk\_multiple\_t* mclk\_multiple**

The multiple of MCLK to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of 3 (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s\_std\_gpio\_config\_t**

I2S standard mode GPIO pins configuration.

**Public Members**

gpio\_num\_t **mclk**

MCK pin, output by default, input if the clock source is selected to I2S\_CLK\_SRC\_EXTERNAL

gpio\_num\_t **bclk**

BCK pin, input in slave role, output in master role

gpio\_num\_t **ws**

WS pin, input in slave role, output in master role

gpio\_num\_t **dout**

DATA pin, output

gpio\_num\_t **din**

DATA pin, input

uint32\_t **mclk\_inv**

Set 1 to invert the MCLK input/output

uint32\_t **bclk\_inv**

Set 1 to invert the BCLK input/output

uint32\_t **ws\_inv**

Set 1 to invert the WS input/output

struct *i2s\_std\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_std\_config\_t**

I2S standard mode major configuration that including clock/slot/GPIO configuration.

**Public Members**

*i2s\_std\_clk\_config\_t* **clk\_cfg**

Standard mode clock configuration, can be generated by macro I2S\_STD\_CLK\_DEFAULT\_CONFIG

*i2s\_std\_slot\_config\_t* **slot\_cfg**

Standard mode slot configuration, can be generated by macros I2S\_STD\_[mode]\_SLOT\_DEFAULT\_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

### *i2s\_std\_gpio\_config\_1* **gpio\_cfg**

Standard mode GPIO configuration, specified by user

## Macros

**I2S\_STD\_PHILIPS\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PCM(short) format in 2 slots.

---

**Note:** PCM(long) is same as Philips in 2 slots

---

### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

MSB format in 2 slots.

### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default standard clock configuration.

---

**Note:** Please set the `mclk_multiple` to `I2S_MCLK_MULTIPLE_384` while using 24 bits data width. Otherwise the sample rate might be imprecise since the BCLK division is not a integer

---

### Parameters

- **rate** -- sample rate

## PDM Mode

### Header File

- [components/driver/i2s/include/driver/i2s\\_pdm.h](#)
- This header file can be included with:

```
#include "driver/i2s_pdm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

PRIV\_REQUIRES driver

## Functions

*esp\_err\_t* **i2s\_channel\_init\_pdm\_rx\_mode** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_config\_t* \*pdm\_rx\_cfg)

Initialize I2S channel to PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

### Parameters

- **handle** -- [in] I2S RX channel handler
- **pdm\_rx\_cfg** -- [in] Configurations for PDM RX mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_PDM_RX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_rx\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

---

### Parameters

- **handle** -- [in] I2S RX channel handler
- **clk\_cfg** -- [in] PDM RX mode clock configuration, can be generated by `I2S_PDM_RX_CLK_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_rx\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- [in] I2S RX channel handler
- **slot\_cfg** -- [in] PDM RX mode slot configuration, can be generated by `I2S_PDM_RX_SLOT_DEFAULT_CONFIG`

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* `i2s_channel_reconfig_pdm_rx_gpio` (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_rx\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S GPIO for PDM RX mode.

---

**Note:** Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM RX mode, i.e., `i2s_channel_init_pdm_rx_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- [in] I2S RX channel handler
- **gpio\_cfg** -- [in] PDM RX mode GPIO configuration, specified by user

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* `i2s_channel_init_pdm_tx_mode` (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_config\_t* \*pdm\_tx\_cfg)

Initialize I2S channel to PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is `REGISTERED`, (i.e., channel has been allocated, but not initialized) and the state will be updated to `READY` if initialization success, otherwise the state will return to `REGISTERED`.

---

**Parameters**

- **handle** -- [in] I2S TX channel handler
- **pdm\_tx\_cfg** -- [in] Configurations for PDM TX mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

**Returns**

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_tx\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S TX channel handler
- **clk\_cfg** -- [in] PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

#### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_tx\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S TX channel handler
- **slot\_cfg** -- [in] PDM TX mode slot configuration, can be generated by `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

#### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_tx\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S GPIO for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., `i2s_channel_init_pdm_tx_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S TX channel handler
- **gpio\_cfg** -- [in] PDM TX mode GPIO configuration, specified by user

#### Returns

- **ESP\_OK** Set clock successfully
- **ESP\_ERR\_INVALID\_ARG** NULL pointer, invalid configuration or not PDM mode
- **ESP\_ERR\_INVALID\_STATE** This channel is not initialized or not stopped

### Structures

struct **i2s\_pdm\_rx\_slot\_config\_t**

I2S slot configuration for PDM RX mode.

#### Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot) , only support 16 bits for PDM mode

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO`

*i2s\_pdm\_slot\_mask\_t* **slot\_mask**

Choose the slots to activate

bool **hp\_en**

High pass filter enable

float **hp\_cut\_off\_freq\_hz**

High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above

uint32\_t **amplify\_num**

The amplification number of the final conversion result. The data that have converted from PDM to PCM module, will time `amplify_num` additionally to amplify the final result. Note that it's only a multiplier of the digital PCM data, not the gain of the analog signal range 1~15, default 1

struct **i2s\_pdm\_rx\_clk\_config\_t**

I2S clock configuration for PDM RX mode.

#### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of MCLK to the sample rate

*i2s\_pdm\_dsr\_t* **dn\_sample\_mode**

Down-sampling rate mode

uint32\_t **bclk\_div**

The division from MCLK to BCLK. The typical and minimum value is I2S\_PDM\_RX\_BCLK\_DIV\_MIN. It will be set to I2S\_PDM\_RX\_BCLK\_DIV\_MIN by default if it is smaller than I2S\_PDM\_RX\_BCLK\_DIV\_MIN

struct **i2s\_pdm\_rx\_gpio\_config\_t**

I2S PDM TX mode GPIO pins configuration.

### Public Members

gpio\_num\_t **clk**

PDM clk pin, output

gpio\_num\_t **din**

DATA pin 0, input

gpio\_num\_t **dins**[(4)]

DATA pins, input, only take effect when corresponding I2S\_PDM\_RX\_LINE<sub>x</sub>\_SLOT\_<sub>xxx</sub> is enabled in *i2s\_pdm\_rx\_slot\_config\_t::slot\_mask*

uint32\_t **clk\_inv**

Set 1 to invert the clk output

struct *i2s\_pdm\_rx\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_pdm\_rx\_config\_t**

I2S PDM RX mode major configuration that including clock/slot/GPIO configuration.

### Public Members

*i2s\_pdm\_rx\_clk\_config\_t* **clk\_cfg**

PDM RX clock configurations, can be generated by macro I2S\_PDM\_RX\_CLK\_DEFAULT\_CONFIG

*i2s\_pdm\_rx\_slot\_config\_t* **slot\_cfg**

PDM RX slot configurations, can be generated by macro I2S\_PDM\_RX\_SLOT\_DEFAULT\_CONFIG

*i2s\_pdm\_rx\_gpio\_config\_t* **gpio\_cfg**

PDM RX slot configurations, specified by user

struct **i2s\_pdm\_tx\_slot\_config\_t**

I2S slot configuration for PDM TX mode.

### Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

uint32\_t **sd\_prescale**

Sigma-delta filter prescale

*i2s\_pdm\_sig\_scale\_t* **sd\_scale**

Sigma-delta filter scaling value

*i2s\_pdm\_sig\_scale\_t* **hp\_scale**

High pass filter scaling value

*i2s\_pdm\_sig\_scale\_t* **lp\_scale**

Low pass filter scaling value

*i2s\_pdm\_sig\_scale\_t* **sinc\_scale**

Sinc filter scaling value

*i2s\_pdm\_tx\_line\_mode\_t* **line\_mode**

PDM TX line mode, one-line codec, one-line dac, two-line dac mode can be selected

bool **hp\_en**

High pass filter enable

float **hp\_cut\_off\_freq\_hz**

High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above

uint32\_t **sd\_dither**

Sigma-delta filter dither

uint32\_t **sd\_dither2**

Sigma-delta filter dither2

struct **i2s\_pdm\_tx\_clk\_config\_t**

I2S clock configuration for PDM TX mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of MCLK to the sample rate

uint32\_t **up\_sample\_fp**

Up-sampling param fp

uint32\_t **up\_sample\_fs**

Up-sampling param fs, not allowed to be greater than 480

uint32\_t **bclk\_div**

The division from MCLK to BCLK. The minimum value is I2S\_PDM\_TX\_BCLK\_DIV\_MIN. It will be set to I2S\_PDM\_TX\_BCLK\_DIV\_MIN by default if it is smaller than I2S\_PDM\_TX\_BCLK\_DIV\_MIN

struct **i2s\_pdm\_tx\_gpio\_config\_t**

I2S PDM TX mode GPIO pins configuration.

### Public Members

gpio\_num\_t **clk**

PDM clk pin, output

gpio\_num\_t **dout**

DATA pin, output

gpio\_num\_t **dout2**

The second data pin for the DAC dual-line mode, only take effect when the line mode is I2S\_PDM\_TX\_TWO\_LINE\_DAC

uint32\_t **clk\_inv**

Set 1 to invert the clk output

struct *i2s\_pdm\_tx\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_pdm\_tx\_config\_t**

I2S PDM TX mode major configuration that including clock/slot/GPIO configuration.

## Public Members

### *i2s\_pdm\_tx\_clk\_config\_t* **clk\_cfg**

PDM TX clock configurations, can be generated by macro I2S\_PDM\_TX\_CLK\_DEFAULT\_CONFIG

### *i2s\_pdm\_tx\_slot\_config\_t* **slot\_cfg**

PDM TX slot configurations, can be generated by macro I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG

### *i2s\_pdm\_tx\_gpio\_config\_t* **gpio\_cfg**

PDM TX GPIO configurations, specified by user

## Macros

### **I2S\_PDM\_RX\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PDM format in 2 slots(RX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM TX/RX mode
- Fixed to 2 slots
- Data bit width only support 16 bits

#### Parameters

- **bits\_per\_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

### **I2S\_PDM\_RX\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default PDM RX clock configuration.

#### Parameters

- **rate** -- sample rate

### **I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PDM style in 2 slots(TX) for codec line mode.

#### Parameters

- **bits\_per\_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

### **I2S\_PDM\_TX\_SLOT\_DAC\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PDM style in 1 slots(TX) for DAC line mode.

---

**Note:** The noise might be different with different configurations, this macro provides a set of configurations that have relatively high SNR (Signal Noise Ratio), you can also adjust them to fit your case.

---

#### Parameters

- **bits\_per\_sample** -- I2S data bit width, only support 16 bits for PDM mode
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

### **I2S\_PDM\_TX\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default PDM TX clock configuration for codec line mode.

---

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample\_rate\_hz / 100, in this case, Fpdm = 128\*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128\*Fpcm = 128\*sample\_rate\_hz If the PDM receiver do not care the PDM serial clock, it's recommended set Fpdm = 128\*48000. Otherwise, the second configuration should be adopted.

---

**Parameters**

- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

**I2S\_PDM\_TX\_CLK\_DAC\_DEFAULT\_CONFIG** (rate)

I2S default PDM TX clock configuration for DAC line mode.

---

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample\_rate\_hz / 100, in this case, Fpdm = 128\*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128\*Fpcm = 128\*sample\_rate\_hz If the PDM receiver do not care the PDM serial clock, it's recommended set Fpdm = 128\*48000. Otherwise, the second configuration should be adopted.

---

---

**Note:** The noise might be different with different configurations, this macro provides a set of configurations that have relatively high SNR (Signal Noise Ratio), you can also adjust them to fit your case.

---

**Parameters**

- **rate** -- sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

**TDM Mode****Header File**

- [components/driver/i2s/include/driver/i2s\\_tdm.h](#)
- This header file can be included with:

```
#include "driver/i2s_tdm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Functions**

[esp\\_err\\_t i2s\\_channel\\_init\\_tdm\\_mode](#) (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_config\_t* \*tdm\_cfg)

Initialize I2S channel to TDM mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **tdm\_cfg** -- **[in]** Configurations for TDM mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_TDM_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`,

I2S\_TDM\_PCM\_LONG\_SLOT\_DEFAULT\_CONFIG or  
 I2S\_TDM\_MSB\_SLOT\_DEFAULT\_CONFIG

**Returns**

- ESP\_OK Initialize successfully
- ESP\_ERR\_NO\_MEM No memory for storing the channel information
- ESP\_ERR\_INVALID\_ARG NULL pointer or invalid configuration
- ESP\_ERR\_INVALID\_STATE This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_tdm\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for TDM mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **clk\_cfg** -- **[in]** Standard mode clock configuration, can be generated by I2S\_TDM\_CLK\_DEFAULT\_CONFIG

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not TDM mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_tdm\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for TDM mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **slot\_cfg** -- **[in]** Standard mode slot configuration, can be generated by I2S\_TDM\_PHILIPS\_SLOT\_DEFAULT\_CONFIG, I2S\_TDM\_PCM\_SHORT\_SLOT\_DEFAULT\_CONFIG, I2S\_TDM\_PCM\_LONG\_SLOT\_DEFAULT\_CONFIG or I2S\_TDM\_MSB\_SLOT\_DEFAULT\_CONFIG.

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_NO\_MEM No memory for DMA buffer
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not TDM mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_tdm\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S GPIO for TDM mode.

---

**Note:** Only allowed to be called when the channel state is **READY**, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to TDM mode, i.e., `i2s_channel_init_tdm_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S channel handler
- **gpio\_cfg** -- [in] Standard mode GPIO configuration, specified by user

#### Returns

- **ESP\_OK** Set clock successfully
- **ESP\_ERR\_INVALID\_ARG** NULL pointer, invalid configuration or not TDM mode
- **ESP\_ERR\_INVALID\_STATE** This channel is not initialized or not stopped

### Structures

struct **i2s\_tdm\_slot\_config\_t**

I2S slot configuration for TDM mode.

#### Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample)

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot)

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with **I2S\_SLOT\_MODE\_MONO** or **I2S\_SLOT\_MODE\_STEREO**

*i2s\_tdm\_slot\_mask\_t* **slot\_mask**

Slot mask. Activating slots by setting 1 to corresponding bits. When the activated slots is not consecutive, those data in inactivated slots will be ignored

uint32\_t **ws\_width**

WS signal width (i.e. the number of BCLK ticks that WS signal is high)

bool **ws\_pol**

WS signal polarity, set true to enable high lever first

bool **bit\_shift**

Set true to enable bit shift in Philips mode

bool **left\_align**

Set true to enable left alignment

bool **big\_endian**

Set true to enable big endian

bool **bit\_order\_lsb**

Set true to enable lsb first

bool **skip\_mask**

Set true to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

uint32\_t **total\_slot**

I2S total number of slots. If it is smaller than the biggest activated channel number, it will be set to this number automatically.

struct **i2s\_tdm\_clk\_config\_t**

I2S clock configuration for TDM mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source, see `soc_periph_i2s_clk_src_t` for the supported clock sources. selected `I2S_CLK_SRC_EXTERNAL` (if supports) to enable the external source clock inputted via MCLK pin, please make sure the frequency inputted is equal or greater than  $\text{sample\_rate\_hz} * \text{mclk\_multiple}$

uint32\_t **ext\_clk\_freq\_hz**

External clock source frequency in Hz, only take effect when `clk_src = I2S_CLK_SRC_EXTERNAL`, otherwise this field will be ignored Please make sure the frequency inputted is equal or greater than BCLK, i.e.  $\text{sample\_rate\_hz} * \text{slot\_bits} * \text{slot\_num}$

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of MCLK to the sample rate, only take effect for master role

uint32\_t **bclk\_div**

The division from MCLK to BCLK, only take effect for slave role, it shouldn't be smaller than 8. Increase this field when data sent by slave lag behind

struct **i2s\_tdm\_gpio\_config\_t**

I2S TDM mode GPIO pins configuration.

### Public Members

`gpio_num_t mclk`

MCK pin, output by default, input if the clock source is selected to `I2S_CLK_SRC_EXTERNAL`

`gpio_num_t bclk`

BCK pin, input in slave role, output in master role

`gpio_num_t ws`

WS pin, input in slave role, output in master role

`gpio_num_t dout`

DATA pin, output

`gpio_num_t din`

DATA pin, input

`uint32_t mclk_inv`

Set 1 to invert the MCLK input/output

`uint32_t bclk_inv`

Set 1 to invert the BCLK input/output

`uint32_t ws_inv`

Set 1 to invert the WS input/output

struct `i2s_tdm_gpio_config_t`::[anonymous] `invert_flags`

GPIO pin invert flags

struct `i2s_tdm_config_t`

I2S TDM mode major configuration that including clock/slot/GPIO configuration.

### Public Members

`i2s_tdm_clk_config_t clk_cfg`

TDM mode clock configuration, can be generated by macro `I2S_TDM_CLK_DEFAULT_CONFIG`

`i2s_tdm_slot_config_t slot_cfg`

TDM mode slot configuration, can be generated by macros `I2S_TDM_[mode]_SLOT_DEFAULT_CONFIG`, [mode] can be replaced with `PHILIPS/MSB/PCM_SHORT/PCM_LONG`

`i2s_tdm_gpio_config_t gpio_cfg`

TDM mode GPIO configuration, specified by user

### Macros

`I2S_TDM_AUTO_SLOT_NUM`

This file is specified for I2S TDM communication mode Features:

- More than 2 slots

**I2S\_TDM\_AUTO\_WS\_WIDTH****I2S\_TDM\_PHILIPS\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

Philips format in active slot that enabled by mask.

**Parameters**

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** -- active slot mask

**I2S\_TDM\_MSB\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

MSB format in active slot enabled that by mask.

**Parameters**

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** -- active slot mask

**I2S\_TDM\_PCM\_SHORT\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

PCM(short) format in active slot that enabled by mask.

**Parameters**

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** -- active slot mask

**I2S\_TDM\_PCM\_LONG\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

PCM(long) format in active slot that enabled by mask.

**Parameters**

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** -- active slot mask

**I2S\_TDM\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default TDM clock configuration.

---

**Note:** Please set the `mclk_multiple` to `I2S_MCLK_MULTIPLE_384` while the data width in slot configuration is set to 24 bits Otherwise the sample rate might be imprecise since the BCLK division is not a integer

---

**Parameters**

- **rate** -- sample rate

**I2S Driver****Header File**

- [components/driver/i2s/include/driver/i2s\\_common.h](#)
- This header file can be included with:

```
#include "driver/i2s_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

PRIV\_REQUIRES driver

### Functions

*esp\_err\_t* **i2s\_new\_channel** (const *i2s\_chan\_config\_t* \*chan\_cfg, *i2s\_chan\_handle\_t* \*ret\_tx\_handle, *i2s\_chan\_handle\_t* \*ret\_rx\_handle)

Allocate new I2S channel(s)

---

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

---

---

**Note:** When the port id in channel configuration is I2S\_NUM\_AUTO, driver will allocate I2S port automatically on one of the I2S controller, otherwise driver will try to allocate the new channel on the selected port.

---

---

**Note:** If both tx\_handle and rx\_handle are not NULL, it means this I2S controller will work at full-duplex mode, the RX and TX channels will be allocated on a same I2S port in this case. Note that some configurations of TX/RX channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee TX/RX channels write/read synchronously, they can only share the clock signals for now.

---

---

**Note:** If tx\_handle OR rx\_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both RX and TX channel) will be occupied, even if only one of RX or TX channel is registered. For the other targets, another channel on this controller will still available.

---

#### Parameters

- **chan\_cfg** -- [in] I2S controller channel configurations
- **ret\_tx\_handle** -- [out] I2S channel handler used for managing the sending channel(optional)
- **ret\_rx\_handle** -- [out] I2S channel handler used for managing the receiving channel(optional)

#### Returns

- ESP\_OK Allocate new channel(s) success
- ESP\_ERR\_NOT\_SUPPORTED The communication mode is not supported on the current chip
- ESP\_ERR\_INVALID\_ARG NULL pointer or illegal parameter in *i2s\_chan\_config\_t*
- ESP\_ERR\_NOT\_FOUND No available I2S channel found

*esp\_err\_t* **i2s\_del\_channel** (*i2s\_chan\_handle\_t* handle)

Delete the I2S channel.

---

**Note:** Only allowed to be called when the I2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

---

---

**Note:** Resource will be free automatically if all channels in one port are deleted

---

#### Parameters **handle** -- [in] I2S channel handler

- ESP\_OK Delete successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer

*esp\_err\_t* **i2s\_channel\_get\_info** (*i2s\_chan\_handle\_t* handle, *i2s\_chan\_info\_t* \*chan\_info)

Get I2S channel information.

**Parameters**

- **handle** -- [in] I2S channel handler
- **chan\_info** -- [out] I2S channel basic information

**Returns**

- ESP\_OK Get I2S channel information success
- ESP\_ERR\_NOT\_FOUND The input handle doesn't match any registered I2S channels, it may not an I2S channel handle or not available any more
- ESP\_ERR\_INVALID\_ARG The input handle or chan\_info pointer is NULL

*esp\_err\_t* **i2s\_channel\_enable** (*i2s\_chan\_handle\_t* handle)

Enable the I2S channel.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

---

---

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting BCLK and WS signal. For MCLK signal, it will start to output when initialization is finished

---

**Parameters** **handle** -- [in] I2S channel handler

- ESP\_OK Start successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not initialized or already started

*esp\_err\_t* **i2s\_channel\_disable** (*i2s\_chan\_handle\_t* handle)

Disable the I2S channel.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

---

---

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop BCLK and WS signal but not MCLK signal

---

**Parameters** **handle** -- [in] I2S channel handler

**Returns**

- ESP\_OK Stop successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* **i2s\_channel\_preload\_data** (*i2s\_chan\_handle\_t* tx\_handle, const void \*src, size\_t size, size\_t \*bytes\_loaded)

Preload the data into TX DMA buffer.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

---

---

**Note:** As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted

---

immediately after the channel is enabled.

---

**Note:** This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preloaded then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

---

#### Parameters

- **tx\_handle** -- [in] I2S TX channel handler
- **src** -- [in] The pointer of the source buffer to be loaded
- **size** -- [in] The source buffer size
- **bytes\_loaded** -- [out] The bytes that successfully been loaded into the TX DMA buffer

#### Returns

- ESP\_OK Load data successful
- ESP\_ERR\_INVALID\_ARG NULL pointer or not TX direction
- ESP\_ERR\_INVALID\_STATE This channel has not started

*esp\_err\_t* **i2s\_channel\_write** (*i2s\_chan\_handle\_t* handle, const void \*src, size\_t size, size\_t \*bytes\_written, uint32\_t timeout\_ms)

I2S write data.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., TX channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

#### Parameters

- **handle** -- [in] I2S channel handler
- **src** -- [in] The pointer of sent data buffer
- **size** -- [in] Max data buffer length
- **bytes\_written** -- [out] Byte number that actually be sent, can be NULL if not needed
- **timeout\_ms** -- [in] Max block time

#### Returns

- ESP\_OK Write successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not TX handle
- ESP\_ERR\_TIMEOUT Writing timeout, no writing event received from ISR within `ticks_to_wait`
- ESP\_ERR\_INVALID\_STATE I2S is not ready to write

*esp\_err\_t* **i2s\_channel\_read** (*i2s\_chan\_handle\_t* handle, void \*dest, size\_t size, size\_t \*bytes\_read, uint32\_t timeout\_ms)

I2S read data.

---

**Note:** Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

#### Parameters

- **handle** -- [in] I2S channel handler
- **dest** -- [in] The pointer of receiving data buffer
- **size** -- [in] Max data buffer length
- **bytes\_read** -- [out] Byte number that actually be read, can be NULL if not needed
- **timeout\_ms** -- [in] Max block time

**Returns**

- ESP\_OK Read successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not RX handle
- ESP\_ERR\_TIMEOUT Reading timeout, no reading event received from ISR within ticks\_to\_wait
- ESP\_ERR\_INVALID\_STATE I2S is not ready to read

*esp\_err\_t* **i2s\_channel\_register\_event\_callback** (*i2s\_chan\_handle\_t* handle, const *i2s\_event\_callbacks\_t* \*callbacks, void \*user\_data)

Set event callbacks for I2S channel.

---

**Note:** Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

---

**Parameters**

- **handle** -- [in] I2S channel handler
- **callbacks** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

**Structures**

```
struct i2s_event_callbacks_t
```

Group of I2S callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

**Public Members**

*i2s\_isr\_callback\_t* **on\_recv**

Callback of data received event, only for RX channel The event data includes DMA buffer address and size that just finished receiving data

***i2s\_isr\_callback\_t on\_recv\_q\_ovf***

Callback of receiving queue overflowed event, only for RX channel The event data includes buffer size that has been overwritten

***i2s\_isr\_callback\_t on\_sent***

Callback of data sent event, only for TX channel The event data includes DMA buffer address and size that just finished sending data

***i2s\_isr\_callback\_t on\_send\_q\_ovf***

Callback of sending queue overflowed event, only for TX channel The event data includes buffer size that has been overwritten

struct **i2s\_chan\_config\_t**

I2S controller channel configuration.

**Public Members*****i2s\_port\_t id***

I2S port id

***i2s\_role\_t role***

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

**uint32\_t dma\_desc\_num**

I2S DMA buffer number, it is also the number of DMA descriptor

**uint32\_t dma\_frame\_num**

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of 3 when the data bit width is 24.

**bool auto\_clear**

Set to auto clear DMA TX buffer, I2S will always send zero automatically if no data to send

**int intr\_priority**

I2S interrupt priority, range [0, 7], if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct **i2s\_chan\_info\_t**

I2S channel information.

**Public Members*****i2s\_port\_t id***

I2S port id

***i2s\_role\_t role***

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

***i2s\_dir\_t* dir**

I2S channel direction

***i2s\_comm\_mode\_t* mode**

I2S channel communication mode

***i2s\_chan\_handle\_t* pair\_chan**

I2S pair channel handle in duplex mode, always NULL in simplex mode

**Macros**

**I2S\_CHANNEL\_DEFAULT\_CONFIG** (i2s\_num, i2s\_role)

get default I2S property

**I2S\_GPIO\_UNUSED**

Used in `i2s_gpio_config_t` for signals which are not used

**I2S Types****Header File**

- `components/driver/i2s/include/driver/i2s_types.h`
- This header file can be included with:

```
#include "driver/i2s_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Structures**

struct ***i2s\_event\_data\_t***

Event structure used in I2S event queue.

**Public Members**

void \***data**

The pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback  
NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

size\_t **size**

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the `dma_frame_num` and `data_bit_width`, typically it is fixed when `data_bit_width` is not changed.

## Type Definitions

typedef struct i2s\_channel\_obj\_t \***i2s\_chan\_handle\_t**

I2S channel object handle, the control unit of the I2S driver

typedef bool (\***i2s\_isr\_callback\_t**)(*i2s\_chan\_handle\_t* handle, *i2s\_event\_data\_t* \*event, void \*user\_ctx)

I2S event callback.

**Param handle [in]** I2S channel handle, created from `i2s_new_channel()`

**Param event [in]** I2S event data

**Param user\_ctx [in]** User registered context, passed from `i2s_channel_register_event_callback()`

**Return** Whether a high priority task has been waken up by this callback function

## Enumerations

enum **i2s\_port\_t**

I2S controller port number, the max port number is (SOC\_I2S\_NUM -1).

*Values:*

enumerator **I2S\_NUM\_0**

I2S controller port 0

enumerator **I2S\_NUM\_1**

I2S controller port 1

enumerator **I2S\_NUM\_AUTO**

Select whichever port is available

enum **i2s\_comm\_mode\_t**

I2S controller communication mode.

*Values:*

enumerator **I2S\_COMM\_MODE\_STD**

I2S controller using standard communication mode, support Philips/MSB/PCM format

enumerator **I2S\_COMM\_MODE\_PDM**

I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S\_COMM\_MODE\_TDM**

I2S controller using TDM communication mode, support up to 16 slots per frame

enumerator **I2S\_COMM\_MODE\_NONE**

Unspecified I2S controller mode

enum **i2s\_mclk\_multiple\_t**

The multiple of MCLK to sample rate.

*Values:*

enumerator **I2S\_MCLK\_MULTIPLE\_128**

MCLK = sample\_rate \* 128

enumerator **I2S\_MCLK\_MULTIPLE\_256**

MCLK = sample\_rate \* 256

enumerator **I2S\_MCLK\_MULTIPLE\_384**

MCLK = sample\_rate \* 384

enumerator **I2S\_MCLK\_MULTIPLE\_512**

MCLK = sample\_rate \* 512

### Header File

- `components/hal/include/hal/i2s_types.h`
- This header file can be included with:

```
#include "hal/i2s_types.h"
```

### Type Definitions

typedef `soc_periph_i2s_clk_src_t` **i2s\_clock\_src\_t**

I2S clock source

### Enumerations

enum **i2s\_slot\_mode\_t**

I2S channel slot mode.

*Values:*

enumerator **I2S\_SLOT\_MODE\_MONO**

I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S\_SLOT\_MODE\_STEREO**

I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s\_dir\_t**

I2S channel direction.

*Values:*

enumerator **I2S\_DIR\_RX**

I2S channel direction RX

enumerator **I2S\_DIR\_TX**

I2S channel direction TX

enum **i2s\_role\_t**

I2S controller role.

*Values:*

enumerator **I2S\_ROLE\_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S\_ROLE\_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s\_data\_bit\_width\_t**

Available data bit width in one slot.

*Values:*

enumerator **I2S\_DATA\_BIT\_WIDTH\_8BIT**

I2S channel data bit-width: 8

enumerator **I2S\_DATA\_BIT\_WIDTH\_16BIT**

I2S channel data bit-width: 16

enumerator **I2S\_DATA\_BIT\_WIDTH\_24BIT**

I2S channel data bit-width: 24

enumerator **I2S\_DATA\_BIT\_WIDTH\_32BIT**

I2S channel data bit-width: 32

enum **i2s\_slot\_bit\_width\_t**

Total slot bit width in one slot.

*Values:*

enumerator **I2S\_SLOT\_BIT\_WIDTH\_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S\_SLOT\_BIT\_WIDTH\_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S\_SLOT\_BIT\_WIDTH\_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S\_SLOT\_BIT\_WIDTH\_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S\_SLOT\_BIT\_WIDTH\_32BIT**

I2S channel slot bit-width: 32

enum **i2s\_pcm\_compress\_t**

A/U-law decompress or compress configuration.

*Values:*

enumerator **I2S\_PCM\_DISABLE**

Disable A/U law decompress or compress

enumerator **I2S\_PCM\_A\_DECOMPRESS**

A-law decompress

enumerator **I2S\_PCM\_A\_COMPRESS**

A-law compress

enumerator **I2S\_PCM\_U\_DECOMPRESS**

U-law decompress

enumerator **I2S\_PCM\_U\_COMPRESS**

U-law compress

enum **i2s\_pdm\_dsr\_t**

I2S PDM RX down-sampling mode.

*Values:*

enumerator **I2S\_PDM\_DSR\_8S**

downsampling number is 8 for PDM RX mode

enumerator **I2S\_PDM\_DSR\_16S**

downsampling number is 16 for PDM RX mode

enumerator **I2S\_PDM\_DSR\_MAX**

enum **i2s\_pdm\_sig\_scale\_t**

pdm tx signal scaling mode

*Values:*

enumerator **I2S\_PDM\_SIG\_SCALING\_DIV\_2**

I2S TX PDM signal scaling: /2

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_1**

I2S TX PDM signal scaling: x1

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_2**

I2S TX PDM signal scaling: x2

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_4**

I2S TX PDM signal scaling: x4

enum **i2s\_pdm\_tx\_line\_mode\_t**

PDM TX line mode.

---

**Note:** For the standard codec mode, PDM pins are connect to a codec which requires both clock signal and data signal For the DAC output mode, PDM data signal can be connected to a power amplifier directly with a low-pass filter, normally, DAC output mode doesn't need the clock signal.

---

*Values:*

enumerator **I2S\_PDM\_TX\_ONE\_LINE\_CODEC**

Standard PDM format output, left and right slot data on a single line

enumerator **I2S\_PDM\_TX\_ONE\_LINE\_DAC**

PDM DAC format output, left or right slot data on a single line

enumerator **I2S\_PDM\_TX\_TWO\_LINE\_DAC**

PDM DAC format output, left and right slot data on separated lines

enum **i2s\_std\_slot\_mask\_t**

I2S slot select in standard mode.

---

**Note:** It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference.

---

*Values:*

enumerator **I2S\_STD\_SLOT\_LEFT**

I2S transmits or receives left slot

enumerator **I2S\_STD\_SLOT\_RIGHT**

I2S transmits or receives right slot

enumerator **I2S\_STD\_SLOT\_BOTH**

I2S transmits or receives both left and right slot

enum **i2s\_pdm\_slot\_mask\_t**

I2S slot select in PDM mode.

*Values:*

enumerator **I2S\_PDM\_SLOT\_RIGHT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled up

enumerator **I2S\_PDM\_SLOT\_LEFT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled down

enumerator **I2S\_PDM\_SLOT\_BOTH**

I2S PDM transmits or receives both two slots

enumerator **I2S\_PDM\_RX\_LINE0\_SLOT\_RIGHT**

I2S PDM receives the right slot on line 0

enumerator **I2S\_PDM\_RX\_LINE0\_SLOT\_LEFT**

I2S PDM receives the left slot on line 0

enumerator **I2S\_PDM\_RX\_LINE1\_SLOT\_RIGHT**

I2S PDM receives the right slot on line 1

enumerator **I2S\_PDM\_RX\_LINE1\_SLOT\_LEFT**

I2S PDM receives the left slot on line 1

enumerator **I2S\_PDM\_RX\_LINE2\_SLOT\_RIGHT**

I2S PDM receives the right slot on line 2

enumerator **I2S\_PDM\_RX\_LINE2\_SLOT\_LEFT**

I2S PDM receives the left slot on line 2

enumerator **I2S\_PDM\_RX\_LINE3\_SLOT\_RIGHT**

I2S PDM receives the right slot on line 3

enumerator **I2S\_PDM\_RX\_LINE3\_SLOT\_LEFT**

I2S PDM receives the left slot on line 3

enumerator **I2S\_PDM\_LINE\_SLOT\_ALL**

I2S PDM receives all slots

enum **i2s\_tdm\_slot\_mask\_t**

tdm slot number

---

**Note:** Multiple slots in TDM mode. For TX module, only the active slot send the audio data, the inactive slot send a constant or will be skipped if 'skip\_msk' is set. For RX module, only receive the audio data in active slots, the data in inactive slots will be ignored. the bit map of active slot can not exceed ( $0x1 \ll \text{total\_slot\_num}$ ). e.g: slot\_mask = (I2S\_TDM\_SLOT0 | I2S\_TDM\_SLOT3), here the active slot number is 2 and total\_slot is not supposed to be smaller than 4.

---

*Values:*

enumerator **I2S\_TDM\_SLOT0**

I2S slot 0 enabled

enumerator **I2S\_TDM\_SLOT1**

I2S slot 1 enabled

enumerator **I2S\_TDM\_SLOT2**

I2S slot 2 enabled

enumerator **I2S\_TDM\_SLOT3**

I2S slot 3 enabled

enumerator **I2S\_TDM\_SLOT4**

I2S slot 4 enabled

enumerator **I2S\_TDM\_SLOT5**

I2S slot 5 enabled

enumerator **I2S\_TDM\_SLOT6**

I2S slot 6 enabled

enumerator **I2S\_TDM\_SLOT7**

I2S slot 7 enabled

enumerator **I2S\_TDM\_SLOT8**

I2S slot 8 enabled

enumerator **I2S\_TDM\_SLOT9**

I2S slot 9 enabled

enumerator **I2S\_TDM\_SLOT10**

I2S slot 10 enabled

enumerator **I2S\_TDM\_SLOT11**

I2S slot 11 enabled

enumerator **I2S\_TDM\_SLOT12**

I2S slot 12 enabled

enumerator **I2S\_TDM\_SLOT13**

I2S slot 13 enabled

enumerator **I2S\_TDM\_SLOT14**

I2S slot 14 enabled

enumerator **I2S\_TDM\_SLOT15**

I2S slot 15 enabled

## 2.5.11 LCD

### Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

### Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller's internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g., ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the [Espressif Component Registry](#).
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

## SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
    ↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one
    ↪SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
    ↪AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver uses this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver uses this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e., this LCD), you can set the gpio number to -1 to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver uses this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
    ↪HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

## I2C Interfaced LCD

1. Create I2C bus. Please refer to *I2C API doc* for more details.

```
i2c_master_bus_handle_t i2c_bus = NULL;
i2c_master_bus_config_t bus_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .glitch_ignore_cnt = 7,
    .i2c_port = I2C_BUS_PORT,
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .flags.enable_internal_pullup = true,
};
ESP_ERROR_CHECK(i2c_new_master_bus(&bus_config, &i2c_bus));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver uses this address to communicate with the LCD controller chip.
- `esp_lcd_panel_io_i2c_config_t::scl_speed_hz` sets the I2C clock frequency in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .scl_speed_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c(i2c_bus, &io_config, &io_
↪handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

```

esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↪panel_handle));

```

### More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in [ESP-IDF Component Registry](#). The list of available and planned drivers with links is in this [table](#).

### LCD Panel IO Operations

- `esp_lcd_panel_reset()` can reset the LCD panel.
- `esp_lcd_panel_init()` performs a basic initialization of the panel. To perform more manufacture specific initialization, please go to [Steps to Add Manufacture Specific Initialization](#).
- Through combined use of `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen by cutting down the output path from the frame buffer to the LCD screen.
- `esp_lcd_panel_disp_sleep()` can reduce the power consumption of the LCD screen by entering the sleep mode. The internal frame buffer is still retained.
- `esp_lcd_panel_draw_bitmap()` is the most significant function, which does the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

### Steps to Add Manufacture Specific Initialization

The LCD controller drivers (e.g., st7789) in esp-idf only provide basic initialization in the `esp_lcd_panel_init()`, leaving the vast majority of settings to the default values. Some LCD modules need to set a bunch of manufacture specific configurations before it can display normally. These configurations usually include gamma, power voltage and so on. If you want to add manufacture specific initialization, please follow the steps below:

```

esp_lcd_panel_reset(panel_handle);
esp_lcd_panel_init(panel_handle);
// set extra configurations e.g., gamma control
// with the underlying IO handle
// please consult your manufacture for special commands and corresponding values
esp_lcd_panel_io_tx_param(io_handle, GAMMA_CMD, (uint8_t[]) {
    GAMMA_ARRAY
}, N);
// turn on the display
esp_lcd_panel_disp_on_off(panel_handle, true);

```

### Application Example

LCD examples are located under: [peripherals/lcd](#):

- Universal SPI LCD example with SPI touch - [peripherals/lcd/spi\\_lcd\\_touch](#)
- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)
- I2C interfaced OLED display scrolling text - [peripherals/lcd/i2c\\_oled](#)

## API Reference

### Header File

- [components/hal/include/hal/lcd\\_types.h](#)
- This header file can be included with:

```
#include "hal/lcd_types.h"
```

### Macros

**LCD\_RGB\_ENDIAN\_RGB**

**LCD\_RGB\_ENDIAN\_BGR**

### Type Definitions

typedef *lcd\_rgb\_element\_order\_t* **lcd\_color\_rgb\_endian\_t**  
for backward compatible

### Enumerations

enum **lcd\_rgb\_element\_order\_t**

RGB color endian.

*Values:*

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_RGB**

RGB element order: RGB

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_BGR**

RGB element order: BGR

enum **lcd\_rgb\_data\_endian\_t**

RGB data endian.

*Values:*

enumerator **LCD\_RGB\_DATA\_ENDIAN\_BIG**

RGB data endian: MSB first

enumerator **LCD\_RGB\_DATA\_ENDIAN\_LITTLE**

RGB data endian: LSB first

enum **lcd\_color\_space\_t**

LCD color space.

*Values:*

enumerator **LCD\_COLOR\_SPACE\_RGB**

Color space: RGB

enumerator **LCD\_COLOR\_SPACE\_YUV**

Color space: YUV

enum **lcd\_color\_range\_t**

LCD color range.

*Values:*

enumerator **LCD\_COLOR\_RANGE\_LIMIT**

Limited color range

enumerator **LCD\_COLOR\_RANGE\_FULL**

Full color range

enum **lcd\_yuv\_sample\_t**

YUV sampling method.

*Values:*

enumerator **LCD\_YUV\_SAMPLE\_422**

YUV 4:2:2 sampling

enumerator **LCD\_YUV\_SAMPLE\_420**

YUV 4:2:0 sampling

enumerator **LCD\_YUV\_SAMPLE\_411**

YUV 4:1:1 sampling

enum **lcd\_yuv\_conv\_std\_t**

The standard used for conversion between RGB and YUV.

*Values:*

enumerator **LCD\_YUV\_CONV\_STD\_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD\_YUV\_CONV\_STD\_BT709**

YUV<->RGB conversion standard: BT.709

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_types.h](#)
- This header file can be included with:

```
#include "esp_lcd_types.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

## Type Definitions

typedef struct esp\_lcd\_panel\_io\_t \***esp\_lcd\_panel\_io\_handle\_t**

Type of LCD panel IO handle

typedef struct esp\_lcd\_panel\_t \***esp\_lcd\_panel\_handle\_t**

Type of LCD panel handle

## Header File

- `components/esp_lcd/include/esp_lcd_panel_io.h`
- This header file can be included with:

```
#include "esp_lcd_panel_io.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

PRIV_REQUIRES esp_lcd
```

## Functions

**esp\_err\_t esp\_lcd\_panel\_io\_rx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, void \*param, size\_t param\_size)

Transmit LCD command and receive corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

### Parameters

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [out] Buffer for the command data
- **param\_size** -- [in] Size of param buffer

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

**esp\_err\_t esp\_lcd\_panel\_io\_tx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*param, size\_t param\_size)

Transmit LCD command and corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

### Parameters

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param\_size** -- [in] Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)`

Transmit LCD RGB data.

---

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

---

**Parameters**

- **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **color** -- [in] Buffer that holds the RGB color data
- **color\_size** -- [in] Size of `color` in memory, in bytes

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)`

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters** **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t esp_lcd_panel_io_register_event_callbacks(esp_lcd_panel_io_handle_t io, const esp_lcd_panel_io_callbacks_t *cbs, void *user_ctx)`

Register LCD panel IO callbacks.

**Parameters**

- **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** -- [in] structure with all LCD panel IO callbacks
- **user\_ctx** -- [in] User private data, passed directly to callback's `user_ctx`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`

Create LCD panel IO handle, for SPI interface.

**Parameters**

- **bus** -- [in] SPI bus handle

- **io\_config** -- [in] IO configuration, for SPI interface
- **ret\_io** -- [out] Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c\_v1** (uint32\_t bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface in legacy implementation.

---

**Note:** Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

---

**Parameters**

- **bus** -- [in] I2C bus handle, (in uint32\_t)
- **io\_config** -- [in] IO configuration, for I2C interface
- **ret\_io** -- [out] Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c\_v2** (*i2c\_master\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface in new implementation.

---

**Note:** Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

---

**Parameters**

- **bus** -- [in] I2C bus handle, (in *i2c\_master\_dev\_handle\_t*)
- **io\_config** -- [in] IO configuration, for I2C interface
- **ret\_io** -- [out] Returned IO handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

**Structures**

struct **esp\_lcd\_panel\_io\_event\_data\_t**

Type of LCD panel IO event data.

struct **esp\_lcd\_panel\_io\_callbacks\_t**

Type of LCD panel IO callbacks.

**Public Members**

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

struct **esp\_lcd\_panel\_io\_spi\_config\_t**

Panel IO configuration structure, for SPI interface.

### Public Members

int **cs\_gpio\_num**

GPIO used for CS line

int **dc\_gpio\_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi\_mode**

Traditional SPI mode (0~3)

unsigned int **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Size of internal transaction queue

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void **\*user\_ctx**

User private data, passed directly to on\_color\_trans\_done's user\_ctx

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_high\_on\_cmd**

If enabled, DC level = 1 indicates command transfer

unsigned int **dc\_low\_on\_data**

If enabled, DC level = 0 indicates color data transfer

unsigned int **dc\_low\_on\_param**

If enabled, DC level = 0 indicates parameter transfer

unsigned int **octal\_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad\_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio\_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb\_first**

transmit LSB bit first

unsigned int **cs\_high\_active**

CS line is high active

struct *esp\_lcd\_panel\_io\_spi\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp\_lcd\_panel\_io\_i2c\_config\_t**

Panel IO configuration structure, for I2C interface.

### Public Members

uint32\_t **dev\_addr**

I2C device address

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to on\_color\_trans\_done's user\_ctx

size\_t **control\_phase\_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc\_bit\_offset**

Offset of the D/C selection bit in control phase

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable\_control\_phase**

If this flag is enabled, the control phase isn't used

struct *esp\_lcd\_panel\_io\_i2c\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

uint32\_t **scl\_speed\_hz**

I2C LCD SCL frequency (hz)

## Macros

**esp\_lcd\_new\_panel\_io\_i2c** (bus, io\_config, ret\_io)

Create LCD panel IO handle.

### Parameters

- **bus** -- [in] I2C bus handle
- **io\_config** -- [in] IO configuration, for I2C interface
- **ret\_io** -- [out] Returned IO handle

### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Type Definitions

typedef void \***esp\_lcd\_spi\_bus\_handle\_t**

Type of LCD SPI bus handle

typedef uint32\_t **esp\_lcd\_i2c\_bus\_handle\_t**

Type of LCD I2C bus handle

typedef struct esp\_lcd\_i80\_bus\_t \***esp\_lcd\_i80\_bus\_handle\_t**

Type of LCD intel 8080 bus handle

typedef bool (\***esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t**)(*esp\_lcd\_panel\_io\_handle\_t* panel\_io, *esp\_lcd\_panel\_io\_event\_data\_t* \*edata, void \*user\_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel\_io** [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Param edata** [in] Panel IO event data, fed by driver

**Param user\_ctx** [in] User data, passed from `esp_lcd_panel_io_xxx_config_t`

**Return** Whether a high priority task has been waken up by this function

## Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`
- This header file can be included with:

```
#include "esp_lcd_panel_ops.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

## Functions

*esp\_err\_t* **esp\_lcd\_panel\_reset** (*esp\_lcd\_panel\_handle\_t* panel)

Reset LCD panel.

---

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

---

**Parameters** **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* `esp_lcd_panel_init(esp_lcd_panel_handle_t panel)`

Initialize LCD panel.

---

**Note:** Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

---

**Parameters** **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* `esp_lcd_panel_del(esp_lcd_panel_handle_t panel)`

Deinitialize the LCD panel.

**Parameters** **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* `esp_lcd_panel_draw_bitmap(esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)`

Draw bitmap on LCD panel.

**Parameters**

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_start** -- **[in]** Start index on x-axis (x\_start included)
- **y\_start** -- **[in]** Start index on y-axis (y\_start included)
- **x\_end** -- **[in]** End index on x-axis (x\_end not included)
- **y\_end** -- **[in]** End index on y-axis (y\_end not included)
- **color\_data** -- **[in]** RGB color data that will be dumped to the specific window range

**Returns**

- ESP\_OK on success

*esp\_err\_t* `esp_lcd_panel_mirror(esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)`

Mirror the LCD panel on specific axis.

---

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

---

**Parameters**

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror\_x** -- **[in]** Whether the panel will be mirrored about the x axis
- **mirror\_y** -- **[in]** Whether the panel will be mirrored about the y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* `esp_lcd_panel_swap_xy(esp_lcd_panel_handle_t panel, bool swap_axes)`

Swap/Exchange x and y axis.

---

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

---

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap\_axes** -- [in] Whether to swap the x and y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_set\_gap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_gap, int y\_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

---

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

---

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_gap** -- [in] Extra gap on x axis, in pixels
- **y\_gap** -- [in] Extra gap on y axis, in pixels

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_invert\_color** (*esp\_lcd\_panel\_handle\_t* panel, bool invert\_color\_data)

Invert the color (bit-wise invert the color data line)

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert\_color\_data** -- [in] Whether to invert the color data

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_disp\_on\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool on\_off)

Turn on or off the display.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on\_off** -- [in] True to turns on display, False to turns off display

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_disp\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool off)

Turn off the display.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** -- [in] Whether to turn off the screen

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_disp\_sleep** (*esp\_lcd\_panel\_handle\_t* panel, bool sleep)

Enter or exit sleep mode.

#### Parameters

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **sleep** -- [in] True to enter sleep mode, False to wake up

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

### Header File

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`
- This header file can be included with:

```
#include "esp_lcd_panel_rgb.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your CMakeLists.txt:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

### Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`
- This header file can be included with:

```
#include "esp_lcd_panel_vendor.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your CMakeLists.txt:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

### Functions

*esp\_err\_t* **esp\_lcd\_new\_panel\_st7789** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model ST7789.

#### Parameters

- **io** -- [in] LCD panel IO handle
- **panel\_dev\_config** -- [in] general panel device configuration
- **ret\_panel** -- [out] Returned LCD panel handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_nt35510** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model NT35510.

#### Parameters

- **io** -- **[in]** LCD panel IO handle
- **panel\_dev\_config** -- **[in]** general panel device configuration
- **ret\_panel** -- **[out]** Returned LCD panel handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_ssd1306** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model SSD1306.

#### Parameters

- **io** -- **[in]** LCD panel IO handle
- **panel\_dev\_config** -- **[in]** general panel device configuration
- **ret\_panel** -- **[out]** Returned LCD panel handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Structures

struct **esp\_lcd\_panel\_dev\_config\_t**

Configuration structure for panel device.

### Public Members

int **reset\_gpio\_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

*lcd\_rgb\_element\_order\_t* **color\_space**

*Deprecated:*

Set RGB color space, please use *rgb\_ele\_order* instead

*lcd\_rgb\_element\_order\_t* **rgb\_endian**

*Deprecated:*

Set RGB data endian, please use *rgb\_ele\_order* instead

*lcd\_rgb\_element\_order\_t* **rgb\_ele\_order**

Set RGB element order, RGB or BGR

*lcd\_rgb\_data\_endian\_t* **data\_endian**

Set the data endian for color data larger than 1 byte

unsigned int **bits\_per\_pixel**

Color depth, in bpp

```

unsigned int reset_active_high
    Setting this if the panel reset is high level active

struct esp_lcd_panel_dev_config_t::[anonymous] flags
    LCD panel config flags

void *vendor_config
    vendor specific configuration, optional, left as NULL if not used

```

## 2.5.12 LED Control (LEDC)

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-P4 only supports configuring channels in "low speed" mode.

1. *Timer Configuration* by specifying the PWM signal's frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Fig. 13: Key Settings of LED PWM Controller's API

---

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling `ledc_timer_config()`), and then for the channels (by calling `ledc_channel_config()`). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

---

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency in Hz
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 3: Characteristics of ESP32-P4 LEDC source clocks

Clock name	Clock freq	Clock capabilities
PLL_80M_CLK	80 MHz	/
RC_FAST_CLK	~ 20 MHz	Dynamic Frequency Scaling compatible, Light sleep compatible
XTAL_CLK	40 MHz	Dynamic Frequency Scaling compatible

---

**Note:**

1. On ESP32-P4, if `RC_FAST_CLK` is chosen as the LEDC clock source, you may see the frequency of output PWM signal is not very accurate. This is because no internal calibration is performed to get the exact frequency of the clock due to hardware limitation, a theoretic frequency value is used.
  2. For ESP32-P4, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.
- 

The LEDC driver offers a helper function `ledc_find_suitable_duty_resolution()` to find the maximum possible resolution for the timer, given the source clock frequency and the desired PWM signal frequency.

When a timer is no longer needed by any channel, it can be deconfigured by calling the same function `ledc_timer_config()`. The configuration structure `ledc_timer_config_t` passes in should be:

- `ledc_timer_config_t::speed_mode` The speed mode of the timer which wants to be deconfigured belongs to (`ledc_mode_t`)
- `ledc_timer_config_t::timer_num` The ID of the timers which wants to be deconfigured (`ledc_timer_t`)
- `ledc_timer_config_t::deconfigure` Set this to true so that the timer specified can be deconfigured

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

---

**Note:** All the timers and channels in the ESP32-P4's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

---

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2^{**} \text{duty\_resolution})$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of ~ 0.1%.

**Warning:** On ESP32-P4, when channel's binded timer selects its maximum duty resolution, the duty cycle value cannot be set to  $(2^{**} \text{duty\_resolution})$ . Otherwise, the internal duty counter in the hardware will overflow and be messed up.

**Change PWM Duty Cycle Using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

On ESP32-P4, the hardware additionally allows to perform up to 16 consecutive linear fades without CPU intervention. This feature can be useful if you want to do a fade with gamma correction.

The luminance perceived by human eyes does not have a linear relationship with the PWM duty cycle. In order to make human feel the LED is dimming or lightening linearly, the change in duty cycle should be non-linear, which is the so-called gamma correction. The LED controller can simulate a gamma curve fading by piecewise linear approximation. `ledc_fill_multi_fade_param_list()` is a function that can help to construct the parameters for the piecewise linear fades. First, you need to allocate a memory block for saving the fade parameters, then by providing start/end PWM duty cycle values, gamma correction function, and the total number of desired linear segments to the helper function, it will fill the calculation results into the allocated space. You can also construct the array of `ledc_fade_param_config_t` manually. Once the fade parameter structs are prepared, a consecutive fading can be configured by passing the pointer to the prepared `ledc_fade_param_config_t` list and the total number of fade ranges to `ledc_set_multi_fade()`.

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency "on the fly":

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel's timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called "behind the scenes" by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

### Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ( $2^{13} = 8192$  discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the [ESP32-P4 Technical Reference Manual > LED PWM Controller \(LEDC\) \[PDF\]](#)).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits results in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 resolves this issue and makes it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver also captures and reports attempts to configure frequency/duty resolution combinations that are below the supported minimum, e.g.,:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

### Application Example

The LEDC basic example: [peripherals/ledc/ledc\\_basic](#).

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc\\_fade](#).

The LEDC color control with Gamma correction on RGB LED example: [peripherals/ledc/ledc\\_gamma\\_curve\\_fade](#).

## API Reference

### Header File

- [components/driver/ledc/include/driver/ledc.h](#)
- This header file can be included with:

```
#include "driver/ledc.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` \*ledc\_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty.

**Parameters** `ledc_conf` -- Pointer of LEDC channel configure struct

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`uint32_t ledc_find_suitable_duty_resolution` (`uint32_t` src\_clk\_freq, `uint32_t` timer\_freq)

Helper function to find the maximum possible duty resolution in bits for `ledc_timer_config()`

#### Parameters

- `src_clk_freq` -- LEDC timer source clock frequency (Hz) (See doxygen comments of `ledc_clk_cfg_t` or get from `esp_clk_tree_src_get_freq_hz`)
- `timer_freq` -- Desired LEDC timer frequency (Hz)

#### Returns

- 0 The timer frequency cannot be achieved
- Others The largest duty resolution value to be set

`esp_err_t ledc_timer_config` (const `ledc_timer_config_t` \*timer\_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

**Parameters** `timer_conf` -- Pointer of LEDC timer configure struct

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

- `ESP_FAIL` Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.
- `ESP_ERR_INVALID_STATE` Timer cannot be de-configured because timer is not configured or is not paused

*esp\_err\_t* **ledc\_update\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC update channel parameters.

---

**Note:** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

---

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

---

**Note:** If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

---

---

**Note:** This function is allowed to run within ISR context.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **ledc\_set\_pin** (int gpio\_num, *ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* ledc\_channel)

Set LEDC output gpio.

---

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

---

#### Parameters

- **gpio\_num** -- The LEDC output gpio
- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc\_channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t idle\_level)

LEDC stop. Disable LEDC output, and set idle level.

---

**Note:** If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by

---

linker, makes it possible to execute even when the Cache is disabled.

---

**Note:** This function is allowed to run within ISR context.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **idle\_level** -- Set output idle level after LEDC stops.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num, uint32\_t freq\_hz)

LEDC set channel frequency (Hz)

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`
- **freq\_hz** -- Set the LEDC frequency

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

uint32\_t **ledc\_get\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num)

LEDC get channel frequency (Hz)

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`

#### Returns

- 0 error
- Others Current LEDC frequency

*esp\_err\_t* **ledc\_set\_duty\_with\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

int **ledc\_get\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- LEDC\_ERR\_VAL if parameter error
- Others Current hpoint value of LEDC channel

*esp\_err\_t* **ledc\_set\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

uint32\_t **ledc\_get\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

*esp\_err\_t* **ledc\_set\_fade** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, *ledc\_duty\_direction\_t* fade\_direction, uint32\_t step\_num, uint32\_t duty\_cycle\_num, uint32\_t duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the ledc\_update\_duty function, the function can take effect.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_direction** -- Set the direction of the gradient
- **step\_num** -- Set the number of the gradient
- **duty\_cycle\_num** -- Set how many LEDC tick each time the gradient lasts
- **duty\_scale** -- Set gradient change amplitude

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

#### Parameters

- **fn** -- Interrupt handler function.
- **arg** -- User-supplied argument passed to the handler function.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See *esp\_intr\_alloc.h* for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Failed to find available interrupt source

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- Timer index (0-3), there are 4 timers in LEDC module
- **clock\_divider** -- Timer clock divide value, the timer clock is divided from the selected clock source
- **duty\_resolution** -- Resolution of duty setting in number of bits. The range is [1, SOC\_LEDC\_TIMER\_BIT\_WIDTH]
- **clk\_src** -- Select LEDC source clock.

#### Returns

- (-1) Parameter error
- Other Current LEDC duty

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num)

Set LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every cycle\_num cycles

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_with\_time** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_fade\_func\_install** (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters** **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Intr flag error

- `ESP_ERR_NOT_FOUND` Failed to find available interrupt source
- `ESP_ERR_INVALID_STATE` Fade function already installed

void `ledc_fade_func_uninstall` (void)

Uninstall LEDC fade function.

`esp_err_t ledc_fade_start` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `ledc_fade_mode_t` fade\_mode)

Start LEDC fading.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

---

---

**Note:** Starting fade operation with this API is not thread-safe, use with care.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number
- **fade\_mode** -- Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized or fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

`esp_err_t ledc_fade_stop` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.

---

**Note:** This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

---

---

**Note:** Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

---

---

**Note:** If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards has no use in stopping the fade. Fade will continue until it reaches the target duty.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number

#### Returns

- `ESP_OK` Success

- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

*esp\_err\_t* `ledc_set_duty_and_update` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

*esp\_err\_t* `ledc_set_fade_time_and_start` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t max\_fade\_time\_ms, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once, before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).
- **fade\_mode** -- choose blocking or non-blocking mode

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

*esp\_err\_t* `ledc_set_fade_step_and_start` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every cycle\_num cycles
- **fade\_mode** -- choose blocking or non-blocking mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_cb\_register** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_cbs\_t* \*cbs, void \*user\_arg)

LEDC callback registration function.

---

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **cbs** -- Group of LEDC callback functions
- **user\_arg** -- user registered data for the callback function

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_multi\_fade** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *uint32\_t* start\_duty, const *ledc\_fade\_param\_config\_t* \*fade\_params\_list, *uint32\_t* list\_len)

Set a LEDC multi-fade.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

**Note:** This function is not thread-safe, do not call it to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_multi_fade_and_start`

---

**Note:** This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **start\_duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_params\_list** -- Pointer to the array of fade parameters for a multi-fade
- **list\_len** -- Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

`esp_err_t ledc_set_multi_fade_and_start` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `uint32_t` start\_duty, `const ledc_fade_param_config_t` \*fade\_params\_list, `uint32_t` list\_len, `ledc_fade_mode_t` fade\_mode)

A thread-safe API to set and start LEDC multi-fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function.

---

---

**Note:** Fade will always begin from the current duty cycle. Make sure it is stable and synchronized to the desired initial value before calling this function. Otherwise, you may see unexpected duty change.

---

---

**Note:** This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **start\_duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_params\_list** -- Pointer to the array of fade parameters for a multi-fade
- **list\_len** -- Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)
- **fade\_mode** -- Choose blocking or non-blocking mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_fill\_multi\_fade\_param\_list** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t start\_duty, uint32\_t end\_duty, uint32\_t linear\_phase\_num, uint32\_t max\_fade\_time\_ms, uint32\_t (\*gamma\_correction\_operator)(uint32\_t), uint32\_t fade\_params\_list\_size, *ledc\_fade\_param\_config\_t* \*fade\_params\_list, uint32\_t \*hw\_fade\_range\_num)

Helper function to fill the fade params for a multi-fade. Useful if desires a gamma curve fading.

---

**Note:** The fade params are calculated based on the given start\_duty and end\_duty. If the duty is not at the start duty (gamma-corrected) when the fade begins, you may see undesired brightness change. Therefore, please always remember that when passing the fade\_params to either `ledc_set_multi_fade` or `ledc_set_multi_fade_and_start`, the start\_duty argument has to be the gamma-corrected start\_duty.

---

#### Parameters

- **speed\_mode** -- [in] Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- [in] LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **start\_duty** -- [in] Duty cycle [0, (2\*\*duty\_resolution)] where the multi-fade begins with. This value should be a non-gamma-corrected duty cycle.
- **end\_duty** -- [in] Duty cycle [0, (2\*\*duty\_resolution)] where the multi-fade ends with. This value should be a non-gamma-corrected duty cycle.
- **linear\_phase\_num** -- [in] Number of linear fades to simulate a gamma curved fade (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)
- **max\_fade\_time\_ms** -- [in] The maximum time of the fading ( ms ).
- **gamma\_correction\_operator** -- [in] User provided gamma correction function. The function argument should be able to take any value within [0, (2\*\*duty\_resolution)]. And returns the gamma-corrected duty cycle.
- **fade\_params\_list\_size** -- [in] The size of the fade\_params\_list user allocated (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)
- **fade\_params\_list** -- [out] Pointer to the array of *ledc\_fade\_param\_config\_t* structure
- **hw\_fade\_range\_num** -- [out] Number of fade ranges for this multi-fade

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Required number of hardware ranges exceeds the size of the *ledc\_fade\_param\_config\_t* array user allocated

*esp\_err\_t* **ledc\_read\_fade\_param** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t range, uint32\_t \*dir, uint32\_t \*cycle, uint32\_t \*scale, uint32\_t \*step)

Get the fade parameters that are stored in gamma ram for a certain fade range.

Gamma ram is where saves the fade parameters for each fade range. The fade parameters are written in during fade configuration. When fade begins, the duty will change according to the parameters in gamma ram.

#### Parameters

- **speed\_mode** -- [in] Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- [in] LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **range** -- [in] Range index (0 - (SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX-1)), it specifies to which range in gamma ram to read
- **dir** -- [out] Pointer to accept fade direction value

- **cycle** -- [out] Pointer to accept fade cycle value
- **scale** -- [out] Pointer to accept fade scale value
- **step** -- [out] Pointer to accept fade step value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized

**Structures**

struct **ledc\_channel\_config\_t**

Configuration parameters of LEDC channel for `ledc_channel_config` function.

**Public Members**

int **gpio\_num**

the LEDC output gpio\_num, if you want to use gpio16, gpio\_num = 16

*ledc\_mode\_t* **speed\_mode**

LEDC speed speed\_mode, high-speed mode (only exists on esp32) or low-speed mode

*ledc\_channel\_t* **channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

*ledc\_intr\_type\_t* **intr\_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

*ledc\_timer\_t* **timer\_sel**

Select the timer source of channel (0 - LEDC\_TIMER\_MAX-1)

uint32\_t **duty**

LEDC channel duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

int **hpoint**

LEDC channel hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

unsigned int **output\_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc\_channel\_config\_t*::[anonymous] **flags**

LEDC flags

struct **ledc\_timer\_config\_t**

Configuration parameters of LEDC timer for `ledc_timer_config` function.

**Public Members**

*ledc\_mode\_t* **speed\_mode**

LEDC speed speed\_mode, high-speed mode (only exists on esp32) or low-speed mode

***ledc\_timer\_bit\_t* duty\_resolution**

LEDC channel duty resolution

***ledc\_timer\_t* timer\_num**

The timer source of channel (0 - LEDC\_TIMER\_MAX-1)

**uint32\_t freq\_hz**

LEDC timer frequency (Hz)

***ledc\_clk\_cfg\_t* clk\_cfg**

Configure LEDC source clock from *ledc\_clk\_cfg\_t*. Note that LEDC\_USE\_RC\_FAST\_CLK and LEDC\_USE\_XTAL\_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC\_FAST\_CLK as the clock source and have another LEDC timer uses XTAL\_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

**bool deconfigure**

Set this field to de-configure a LEDC timer which has been configured before. Note that it will not check whether the timer wants to be de-configured is binded to any channel. Also, the timer has to be paused first before it can be de-configured. When this field is set, *duty\_resolution*, *freq\_hz*, *clk\_cfg* fields are ignored.

**struct ledc\_cb\_param\_t**

LEDC callback parameter.

**Public Members*****ledc\_cb\_event\_t* event**

Event name

**uint32\_t speed\_mode**

Speed mode of the LEDC channel group

**uint32\_t channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

**uint32\_t duty**

LEDC current duty of the channel, the range of duty is [0, (2\*\**duty\_resolution*)]

**struct ledc\_cbs\_t**

Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

**Public Members**

*ledc\_cb\_t* fade\_cb

LEDC fade\_end callback function

struct **ledc\_fade\_param\_config\_t**

Structure for the fade parameters for one hardware fade to be written to gamma wr register.

(continues on next page)

(continued from previous page)

**Note:** Be aware of the maximum value available on each element

### Public Members

uint32\_t **dir**

Duty change direction. Set 1 as increase, 0 as decrease

uint32\_t **cycle\_num**

Number of PWM cycles of each step [0, 2\*\*SOC\_LEDC\_FADE\_PARAMS\_BIT\_WIDTH-1]

uint32\_t **scale**

Duty change of each step [0, 2\*\*SOC\_LEDC\_FADE\_PARAMS\_BIT\_WIDTH-1]

uint32\_t **step\_num**

Total number of steps in one hardware fade [0, 2\*\*SOC\_LEDC\_FADE\_PARAMS\_BIT\_WIDTH-1]

### Macros

**LEDC\_ERR\_DUTY**

**LEDC\_ERR\_VAL**

### Type Definitions

typedef *intr\_handle\_t* **ledc\_isr\_handle\_t**

typedef bool (\***ledc\_cb\_t**)(const *ledc\_cb\_param\_t* \*param, void \*user\_arg)

Type of LEDC event callback.

**Param param** LEDC callback parameter

**Param user\_arg** User registered data

**Return** Whether a high priority task has been waken up by this function

### Enumerations

enum **ledc\_cb\_event\_t**

LEDC callback event type.

*Values:*

enumerator **LEDC\_FADE\_END\_EVT**

LEDC fade end event

### Header File

- [components/hal/include/hal/ledc\\_types.h](#)
- This header file can be included with:

```
#include "hal/ledc_types.h"
```

### Type Definitions

typedef *soc\_periph\_ledc\_clk\_src\_legacy\_t* **ledc\_clk\_cfg\_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

### Enumerations

enum **ledc\_mode\_t**

*Values:*

enumerator **LEDC\_LOW\_SPEED\_MODE**

LEDC low speed speed\_mode

enumerator **LEDC\_SPEED\_MODE\_MAX**

LEDC speed limit

enum **ledc\_intr\_type\_t**

*Values:*

enumerator **LEDC\_INTR\_DISABLE**

Disable LEDC interrupt

enumerator **LEDC\_INTR\_FADE\_END**

Enable LEDC interrupt

enumerator **LEDC\_INTR\_MAX**

enum **ledc\_duty\_direction\_t**

*Values:*

enumerator **LEDC\_DUTY\_DIR\_DECREASE**

LEDC duty decrease direction

enumerator **LEDC\_DUTY\_DIR\_INCREASE**

LEDC duty increase direction

enumerator **LEDC\_DUTY\_DIR\_MAX**

enum **ledc\_slow\_clk\_sel\_t**

LEDC global clock sources.

*Values:*

enumerator **LEDC\_SLOW\_CLK\_RC\_FAST**

LEDC low speed timer clock source is RC\_FAST clock

enumerator **LEDC\_SLOW\_CLK\_PLL\_DIV**

LEDC low speed timer clock source is a PLL\_DIV clock

enumerator **LEDC\_SLOW\_CLK\_XTAL**

LEDC low speed timer clock source XTAL clock

enumerator **LEDC\_SLOW\_CLK\_RTC8M**

Alias of 'LEDC\_SLOW\_CLK\_RC\_FAST'

enum **ledc\_clk\_src\_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match `ledc_clk_cfg_t` values are a hack to avoid collision with `LEDC_AUTO_CLK` in the driver, as these enums have very similar names and user may pass one of these by mistake.

*Values:*

enumerator **LEDC\_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_CLK_SEL`

enum **ledc\_timer\_t**

*Values:*

enumerator **LEDC\_TIMER\_0**

LEDC timer 0

enumerator **LEDC\_TIMER\_1**

LEDC timer 1

enumerator **LEDC\_TIMER\_2**

LEDC timer 2

enumerator **LEDC\_TIMER\_3**

LEDC timer 3

enumerator **LEDC\_TIMER\_MAX**

enum **ledc\_channel\_t**

*Values:*

enumerator **LEDC\_CHANNEL\_0**

LEDC channel 0

enumerator **LEDC\_CHANNEL\_1**

LEDC channel 1

enumerator **LEDC\_CHANNEL\_2**

LEDC channel 2

enumerator **LEDC\_CHANNEL\_3**

LEDC channel 3

enumerator **LEDC\_CHANNEL\_4**

LEDC channel 4

enumerator **LEDC\_CHANNEL\_5**

LEDC channel 5

enumerator **LEDC\_CHANNEL\_6**

LEDC channel 6

enumerator **LEDC\_CHANNEL\_7**

LEDC channel 7

enumerator **LEDC\_CHANNEL\_MAX**

enum **ledc\_timer\_bit\_t**

*Values:*

enumerator **LEDC\_TIMER\_1\_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC\_TIMER\_5\_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC\_TIMER\_6\_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC\_TIMER\_7\_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC\_TIMER\_8\_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC\_TIMER\_9\_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC\_TIMER\_10\_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC\_TIMER\_11\_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC\_TIMER\_12\_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC\_TIMER\_13\_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC\_TIMER\_14\_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC\_TIMER\_15\_BIT**

LEDC PWM duty resolution of 15 bits

enumerator **LEDC\_TIMER\_16\_BIT**

LEDC PWM duty resolution of 16 bits

enumerator **LEDC\_TIMER\_17\_BIT**

LEDC PWM duty resolution of 17 bits

enumerator **LEDC\_TIMER\_18\_BIT**

LEDC PWM duty resolution of 18 bits

enumerator **LEDC\_TIMER\_19\_BIT**

LEDC PWM duty resolution of 19 bits

enumerator **LEDC\_TIMER\_20\_BIT**

LEDC PWM duty resolution of 20 bits

enumerator **LEDC\_TIMER\_BIT\_MAX**

enum **ledc\_fade\_mode\_t**

*Values:*

enumerator **LEDC\_FADE\_NO\_WAIT**

LEDC fade function will return immediately

enumerator **LEDC\_FADE\_WAIT\_DONE**

LEDC fade function will block until fading to the target duty

enumerator `LEDC_FADE_MAX`

## 2.5.13 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power, and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g., brushed/brushless DC motor, RC servo motor
- Switch mode-based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog values like speed, distance
- Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

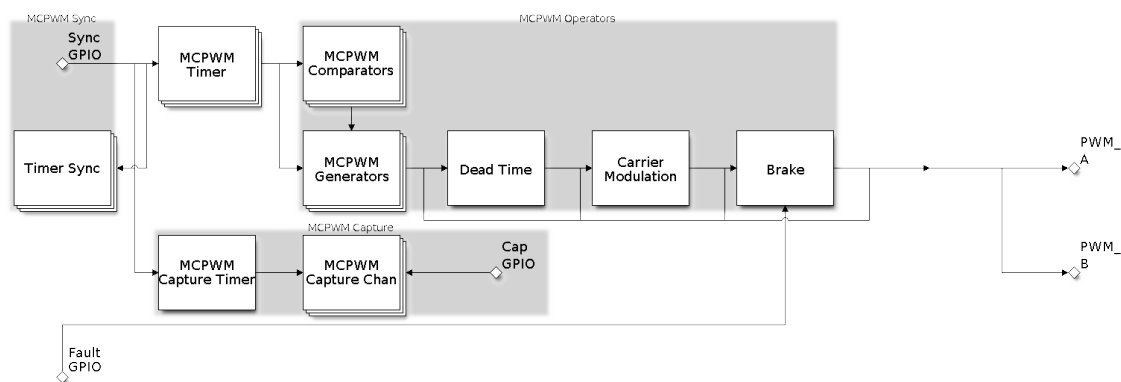

Fig. 14: MCPWM Overview

- **MCPWM Timer:** The time base of the final PWM signal. It also determines the event timing of other submodules.
- **MCPWM Operator:** The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead time, and carrier modulator.
- **MCPWM Comparator:** The compare module takes the time-base count value as input, and continuously compares it to the threshold value configured. When the timer is equal to any of the threshold values, a compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator:** One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered by other submodules like MCPWM Timer and MCPWM Comparator.
- **MCPWM Fault:** The fault module is used to detect the fault condition from outside, mainly via the GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state to protect the system from damage.
- **MCPWM Sync:** The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from the GPIO matrix or from an MCPWM Timer event.
- **Dead Time:** This submodule is used to insert extra delay to the existing PWM edges generated in the previous steps.
- **Carrier Modulation:** The carrier submodule can modulate a high-frequency carrier signal into PWM waveforms by the generator and dead time submodules. This capability is mandatory for controlling the power-switching elements.

- **Brake:** MCPWM operator can set how to brake the generators when a particular fault is detected. You can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depending on how critical the fault is.
- **MCPWM Capture:** This is a standalone submodule that can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels, with each channel connected to the GPIO. A pulse on the GPIO triggers the capture timer to store the time-base count value and then notify you by an interrupt. Using this feature, you can measure a pulse width precisely. What is more, the capture timer can also be synchronized by the MCPWM Sync submodule.

## Functional Overview

Description of the MCPWM functionality is divided into the following sections:

- *Resource Allocation and Initialization* - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.
- *Timer Operations and Events* - describes control functions and event callbacks supported by the MCPWM timer.
- *Comparator Operations and Events* - describes control functions and event callbacks supported by the MCPWM comparator.
- *Generator Actions on Events* - describes how to set actions for MCPWM generators on particular events that are generated by the MCPWM timer and comparators.
- *Generator Configurations for Classical PWM Waveforms* - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.
- *Dead Time* - describes how to set dead time for MCPWM generators.
- *Dead Time Configurations for Classical PWM Waveforms* - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.
- *Carrier Modulation* - describes how to set and modulate a high frequency onto the final PWM waveforms.
- *Faults and Brake Actions* - describes how to set brake actions for MCPWM operators on particular fault events.
- *Generator Force Actions* - describes how to control the generator output level asynchronously in a forceful way.
- *Synchronization* - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.
- *Capture* - describes how to use the MCPWM capture module to measure the pulse width of a signal.
- *ETM Event and Task* - describes what the events and tasks can be connected to the ETM channel.
- *Power Management* - describes how different source clocks affects power consumption.
- *IRAM Safe* - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization** As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers** You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, timers located in different groups are totally independent.
- `mcpwm_timer_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.
- `mcpwm_timer_config_t::resolution_hz` sets the expected resolution of the timer. The driver internally sets a proper divider based on the clock source and the resolution.
- `mcpwm_timer_config_t::count_mode` sets the count mode of the timer.
- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).

- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.
- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free timers in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

On the contrary, calling the `mcpwm_del_timer()` function will free the allocated timer object.

**MCPWM Operators** You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_operator_config_t::group_id` specifies the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, operators located in different groups are totally independent.
- `mcpwm_operator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_operator_config_t::update_gen_action_on_tez` sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_operator_config_t::update_gen_action_on_tep` sets whether to update the generator action when the timer counts to peak.
- `mcpwm_operator_config_t::update_gen_action_on_sync` sets whether to update the generator action when the timer takes a sync signal.
- `mcpwm_operator_config_t::update_dead_time_on_tez` sets whether to update the dead time when the timer counts to zero.
- `mcpwm_operator_config_t::update_dead_time_on_tep` sets whether to update the dead time when the timer counts to the peak.
- `mcpwm_operator_config_t::update_dead_time_on_sync` sets whether to update the dead time when the timer takes a sync signal.

The `mcpwm_new_operator()` will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free operators in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

On the contrary, calling `mcpwm_del_operator()` function will free the allocated operator object.

**MCPWM Comparators** You can allocate a MCPWM comparator object by calling the `mcpwm_new_comparator()` function, with a MCPWM operator handle and configuration structure `mcpwm_comparator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_comparator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.
- `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to the peak.
- `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

The `mcpwm_new_comparator()` will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

<sup>1</sup> Different ESP chip series might have a different number of MCPWM resources (e.g., groups, timers, comparators, operators, generators, triggers and so on). Please refer to the [TRM] for details. The driver does not forbid you from applying for more MCPWM resources, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation and Initialization*.

On the contrary, calling the `mcpwm_del_comparator()` function will free the allocated comparator object.

There's another kind of comparator called "Event Comparator", which **can not** control the final PWM directly but only generates the ETM events at a configurable time stamp. You can allocate an event comparator by calling the `mcpwm_new_event_comparator()` function. This function will return the same handle type as `mcpwm_new_comparator()`, but with a different configuration structure `mcpwm_event_comparator_config_t`. For more information, please refer to *ETM Event and Task*.

**MCPWM Generators** You can allocate a MCPWM generator object by calling the `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
- `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
- `mcpwm_generator_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.
- `mcpwm_generator_config_t::io_od_mode` configures the PWM GPIO as open-drain output.
- `mcpwm_generator_config_t::pull_up` and `mcpwm_generator_config_t::pull_down` controls whether to enable the internal pull-up and pull-down resistors accordingly.

The `mcpwm_new_generator()` will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return the `ESP_ERR_NOT_FOUND` error. [Page 445, 1](#)

On the contrary, calling the `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults** There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software.

To allocate a GPIO fault object, you can call the `mcpwm_new_gpio_fault()` function, with the configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO faults located in different groups are totally independent, i.e., GPIO faults in group 0 can not be detected by the operator in group 1.
- `mcpwm_gpio_fault_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
- `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
- `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loopback mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. [Page 445, 1](#)

Software fault object can be used to trigger a fault by calling the function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling the `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

The `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the fault object, this function will return the `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, the returned fault handle is of the same type.

On the contrary, calling the `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

**MCPWM Sync Sources** The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There are three types of sync sources: a sync source reflected from the GPIO, a sync source generated by software, and a sync source generated by an MCPWM timer event.

To allocate a GPIO sync source, you can call the `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, the GPIO sync sources located in different groups are totally independent, i.e., GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edges.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. [Page 445, 1](#)

To allocate a timer event sync source, you can call the `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e., the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, if a sync source has been allocated from the same timer before, this function will return the `ESP_ERR_INVALID_STATE` error.

Last but not least, to allocate a software sync source, you can call the `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently, this configuration structure is left for future purposes.

`mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no memory left for the sync source object, this function will return the `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, do not forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling the `mcpwm_del_sync_src()` function will free the allocated sync source object. This function works for all types of sync sources.

**MCPWM Capture Timer and Channels** The MCPWM group has a dedicated timer which is used to capture the timestamp when a specific event occurred. The capture timer is connected to several independent channels, each channel is assigned a GPIO.

To allocate a capture timer, you can call the `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range.
- `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.

- `mcpwm_capture_timer_config_t::resolution_hz` The driver internally will set a proper divider based on the clock source and the resolution. If it is set to 0, the driver will pick an appropriate resolution on its own, and you can subsequently view the current timer resolution via `mcpwm_capture_timer_get_resolution()`.

The `mcpwm_new_capture_timer()` will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture timer left in the MCPWM group, this function will return the `ESP_ERR_NOT_FOUND` error. Page 445, 1

Next, to allocate a capture channel, you can call the `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_channel_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
- `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
- `mcpwm_capture_channel_config_t::pos_edge` and `mcpwm_capture_channel_config_t::neg_edge` set whether to capture on the positive and/or falling edge of the input signal.
- `mcpwm_capture_channel_config_t::pull_up` and `mcpwm_capture_channel_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_capture_channel_config_t::invert_cap_signal` sets whether to invert the capture signal.
- `mcpwm_capture_channel_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_capture_channel()` will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return an error code. Specifically, when there is no free capture channel left in the capture timer, this function will return the `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` will free the allocated capture channel and timer object accordingly.

**MCPWM Interrupt Priority** MCPWM allows configuring interrupts separately for timer, operator, comparator, fault, and capture events. The interrupt priority is determined by the respective `config_t::intr_priority`. Additionally, events within the same MCPWM group share a common interrupt source. When registering multiple interrupt events, the interrupt priorities need to remain consistent.

---

**Note:** When registering multiple interrupt events within an MCPWM group, the driver will use the interrupt priority of the first registered event as the MCPWM group's interrupt priority.

---

## Timer Operations and Events

**Update Period** The timer period is initialized by the `mcpwm_timer_config_t::period_ticks` parameter in `mcpwm_timer_config_t`. You can update the period at runtime by calling `mcpwm_timer_set_period()` function. The new period will take effect based on how you set the `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` parameters in `mcpwm_timer_config_t`. If none of them are set, the timer period will take effect immediately.

**Register Timer Event Callbacks** The MCPWM timer can generate different events at runtime. If you have some function that should be called when a particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback func-

tion prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets the callback function for the timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets the callback function for the timer when it counts to zero.
- `mcpwm_timer_event_callbacks_t::on_stop` sets the callback function for the timer when it is stopped.

The callback functions above are called within the ISR context, so they should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_timer_register_event_callbacks()` function is used to save your own context. It is passed to each callback function directly.

This function will lazy the install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also *Enable and Disable timer* for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you need to enable the timer first, by calling `mcpwm_timer_enable()`. This function:

- switches the timer state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
- acquire a proper power management lock if a specific clock source (e.g., PLL\_160M clock) is selected. See also *Power management* for more information.

On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to the **init** state, disable the interrupt service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What is more, you can even start the timer for only one round, which means, the timer will count to peak value or zero, and then stop itself.

**Connect Timer with Operator** The allocated MCPWM timer should be connected with an MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Please make sure the MCPWM timer and operator are in the same group. Otherwise, this function will return the `ESP_ERR_INVALID_ARG` error.

## Comparator Operations and Events

**Register Comparator Event Callbacks** The MCPWM comparator can inform you when the timer counter equals the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

- `mcpwm_comparator_event_callbacks_t::on_reach` sets the callback function for the comparator when the timer counter equals the compare value.

The callback function provides event-specific data of type `mcpwm_compare_event_data_t` to you. The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the installation of interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

---

**Note:** It is not supported to register event callbacks for an **Event Comparator** because it can not generate any interrupt.

---

**Set Compare Value** You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There are a few points to note:

- A new compare value might not take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp_on_tez`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return the error code `ESP_ERR_INVALID_STATE`.
- The compare value should not exceed the timer's count peak, otherwise, the compare event will never get triggered.

### Generator Actions on Events

**Set Generator Action on Timer Event** One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` **must** be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

You can also set the timer action one by one by calling `mcpwm_generator_set_action_on_timer_event()` without varargs.

**Set Generator Action on Compare Event** One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See [MCPWM Comparators](#) for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` **must** be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

You can also set the compare action one by one by calling `mcpwm_generator_set_action_on_compare_event()` without varargs.

**Set Generator Action on Fault Event** One generator can set action on fault based trigger events, by calling `mcpwm_generator_set_action_on_fault_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_fault_event_action_t`:

- `mcpwm_gen_fault_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_fault_event_action_t::fault` specifies the fault used for the trigger. See *MCPWM Faults* for how to allocate a fault.
- `mcpwm_gen_fault_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. <sup>Page 445, 1</sup>

The trigger only support GPIO fault. when the input is not a GPIO fault, this function will return the `ESP_ERR_NOT_SUPPORTED` error.

There is a helper macro `MCPWM_GEN_FAULT_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, fault event does not have variadic function like `mcpwm_generator_set_actions_on_fault_event()`.

**Set Generator Action on Sync Event** One generator can set action on sync based trigger events, by calling `mcpwm_generator_set_action_on_sync_event()` with an action configurations. The action configuration is defined in `mcpwm_gen_sync_event_action_t`:

- `mcpwm_gen_sync_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_sync_event_action_t::sync` specifies the sync source used for the trigger. See *MCPWM Sync Sources* for how to allocate a sync source.
- `mcpwm_gen_sync_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

When no free trigger slot is left in the operator to which the generator belongs, this function will return the `ESP_ERR_NOT_FOUND` error. <sup>Page 445, 1</sup>

The trigger only support one sync action, regardless of the kinds. When set sync actions more than once, this function will return the `ESP_ERR_INVALID_STATE` error.

There is a helper macro `MCPWM_GEN_SYNC_EVENT_ACTION` to simplify the construction of a trigger event action entry.

Please note, sync event does not have variadic function like `mcpwm_generator_set_actions_on_sync_event()`.

**Generator Configurations for Classical PWM Waveforms** This section will demonstrate the classical PWM waveforms that can be generated by the pair of generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The **Symmetric** or **Asymmetric** of the waveforms is determined by the count mode of the MCPWM timer.
- The **active level** of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer's period and count mode.
- The duty cycle of the PWM waveform is determined by the generator's various action combinations.

}

```

**Dead Time** In power electronics, the rectifier and inverter are commonly used. This requires the use of a rectifier bridge and an inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm can not conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave generated by setting *Generator Actions on Events*.

The dead time driver works like a **decorator**. This is also reflected in the function parameters of *mcpwm\_generator\_set\_dead\_time()*, where it takes the primary generator handle (*in\_generator*), and returns a new generator (*out\_generator*) after applying the dead time. Please note, if the *out\_generator* and *in\_generator* are the same, it means you are adding the time delay to the PWM waveform in an "in-place" fashion. In turn, if the *out\_generator* and *in\_generator* are different, it means you are deriving a new PWM waveform from the existing *in\_generator*.

Dead time specific configuration is listed in the *mcpwm\_dead\_time\_config\_t* structure:

- *mcpwm\_dead\_time\_config\_t::posedge\_delay\_ticks* and *mcpwm\_dead\_time\_config\_t::negedge\_delay\_ticks* set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means bypassing the dead time module. The resolution of the dead time tick is the same as the timer that is connected with the operator by *mcpwm\_operator\_connect\_timer()*.
- *mcpwm\_dead\_time\_config\_t::invert\_output* sets whether to invert the signal after applying the dead time, which can be used to control the delay edge polarity.

**Warning:** Due to the hardware limitation, one delay module (either *posedge delay* or *negedge delay*) can not be applied to multiple MCPWM generators at the same time. e.g., the following configuration is **invalid**:

```

mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,
};
// Set posedge delay to generator A
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: This is invalid, you can not apply the posedge delay to another
↪generator
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);

```

However, you can apply *posedge delay* to generator A and *negedge delay* to generator B. You can also set both *posedge delay* and *negedge delay* for generator A, while letting generator B bypass the dead time module.

**Note:** It is also possible to generate the required dead time by setting *Generator Actions on Events*, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time

with polarity control is required, then the dead time submodule should be used.

**Dead Time Configurations for Classical PWM Waveforms** This section demonstrates the classical PWM waveforms that can be generated by the dead time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.

```
static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb,
↪mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)

    dead_time_config.posedge_delay_ticks = 50;
    ESP_ERROR_CHECK(mcpwm_generator_set_dead_time(genb, genb, &dead_time_config));
}

```

**Carrier Modulation** The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g., isolated digital power application) by passing the PWM output signals through transformers. Any of the PWM output signals may be at 100% duty and not changing whenever a motor is required to run steadily at the full load. Coupling with non-alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call `mcpwm_operator_apply_carrier()`, and provide configuration structure `mcpwm_carrier_config_t`:

- `mcpwm_carrier_config_t::clk_src` sets the clock source of the carrier.
- `mcpwm_carrier_config_t::frequency_hz` indicates carrier frequency in Hz.
- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver searches for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can not be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a NULL configuration.

**Faults and Brake Actions** The MCPWM operator is able to sense external signals with information about the failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

You should determine possible failure modes of the motor and what action should be performed on detection of a

particular fault, e.g., drive all outputs low for a brushed motor, lock current state for a stepper motor, etc. Because of this action, the motor should be put into a safe state to reduce the likelihood of damage caused by the fault.

**Set Operator Brake Mode on Fault** The way that MCPWM operator reacts to the fault is called **Brake**. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Specific brake configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` sets which fault the operator should react to.
- `mcpwm_brake_config_t::brake_mode` sets the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator recovers itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST` mode, the operator can not recover even though the fault disappears. You have to call `mcpwm_operator_recover_from_fault()` to manually recover it.

**Set Generator Action on Brake Event** One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:

- `mcpwm_gen_brake_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`.
- `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` **must** be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

**Register Fault Event Callbacks** The MCPWM fault detector can inform you when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such an event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

- `mcpwm_fault_event_callbacks_t::on_fault_enter` sets the callback function that will be called when a fault is detected.
- `mcpwm_fault_event_callbacks_t::on_fault_exit` sets the callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks** The MCPWM operator can inform you when it is going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback

function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets the callback function that will be called when the operator is going to take a **CBC** action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets the callback function that will be called when the operator is going to take an **OST** action.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_operator_register_event_callbacks()` function is used to save your own context. It will be passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

**Generator Force Actions** Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g., `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator's output level will be controlled by the event actions again.
- Set the `hold_on` to true, and the force output level will keep alive until it is removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, and any upcoming event can override it.

**Synchronization** When a sync signal is taken by the MCPWM timer, the timer will be forced into a pre-defined **phase**, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the *MCPWM Capture Timer* can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See *MCPWM Sync Sources* for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: `MCPWM_TIMER_DIRECTION_UP`.

### Sync Timers by GPIO

```
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
```

(continues on next page)

Fig. 15: GPIO Sync All MCPWM Timers

(continued from previous page)

```

    .group_id = 0, // GPIO fault should be in the same group of
    ↳the above timers
    .gpio_num = EXAMPLE_SYNC_GPIO,
    .flags.pull_down = true,
    .flags.active_neg = false, // By default, a posedge pulse can trigger a
    ↳sync event
  };
  ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

  mcpwm_timer_sync_phase_config_t sync_phase_config = {
    .count_value = 0, // sync phase: target count value
    .direction = MCPWM_TIMER_DIRECTION_UP, // sync phase: count direction
    .sync_src = gpio_sync_source, // sync source
  };
  for (int i = 0; i < 3; i++) {
    ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_
    ↳config));
  }
}

```

**Capture** The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantities like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, you can use the capture submodule to sense the rotor position from the Hall sensor.

The capture timer is usually connected to several capture channels. Please refer to [MCPWM Capture Timer and Channels](#) for more information about resource allocation.

**Register Capture Event Callbacks** The MCPWM capture channel can inform you when there is a valid edge detected on the signal. You have to register a callback function to get the timer count value of the captured mo-

Fig. 16: MCPWM BLDC with Hall Sensor

ment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets the callback function for the capture channel when a valid edge is detected.

The callback function provides event-specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into a timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should **not** attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save your context. It is passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

**Enable and Disable Capture Channel** The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

**Enable and Disable Capture Timer** Before doing IO control to the capture timer, you need to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function:

- switches the capture timer state from `init` to `enable`.

- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also [Power management](#) for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to **init** state, and release the power management lock.

**Start and Stop Capture Timer** The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

**Trigger a Software Capture Event** Sometimes, the software also wants to trigger a "fake" capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it is a "fake" capture event, it can still cause an interrupt, thus your capture event callback function gets invoked as well.

**ETM Event and Task** MCPWM comparator is able to generate events that can interact with the [ETM](#) module. The supported events are listed in the `mcpwm_comparator_etm_event_type_t`. You can call `mcpwm_comparator_new_etm_event()` to get the corresponding ETM event handle.

For how to connect the event and task to an ETM channel, please refer to the [ETM](#) documentation.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the PLL and APB frequency before going into Light-sleep, thus potentially changing the period of an MCPWM timers' counting step and leading to inaccurate time-keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an MCPWM timer instance that has selected `MCPWM_TIMER_CLK_SRC_PLL160M` as its clock source, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_timer_enable()`. On the contrary, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.

Likewise, whenever the driver creates an MCPWM capture timer instance that has selected `MCPWM_CAPTURE_CLK_SRC_APB` as its clock source, the driver guarantees that the power management lock is acquired when enabling the timer by `mcpwm_capture_timer_enable()`. And releases the lock in `mcpwm_capture_timer_disable()`.

**IRAM Safe** By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that:

- enables the interrupt to be serviced even when the cache is disabled
- places all functions used by the ISR into IRAM<sup>2</sup>
- places the driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. The IO control function is as follows:

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

---

<sup>2</sup> The callback function and the sub-functions invoked by itself should also be placed in IRAM. You need to take care of this by yourself.

**Thread Safety** The factory functions like `mcpwm_new_timer()` are guaranteed to be thread-safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following function is allowed to run under the ISR context, as the driver uses a critical section to prevent them from being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

Other functions that are not related to *Resource Allocation and Initialization*, are not thread-safe. Thus, you should avoid calling them in different tasks without mutex protection.

### Kconfig Options

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see *IRAM Safe* for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option will increase the firmware binary size.

### Application Examples

- Brushed DC motor speed control by PID algorithm: [peripherals/mcpwm/mcpwm\\_bdc\\_speed\\_control](#)
- BLDC motor control with hall sensor feedback: [peripherals/mcpwm/mcpwm\\_bldc\\_hall\\_control](#)
- Ultrasonic sensor (HC-SR04) distance measurement: [peripherals/mcpwm/mcpwm\\_capture\\_hc\\_sr04](#)
- Servo motor angle control: [peripherals/mcpwm/mcpwm\\_servo\\_control](#)
- MCPWM synchronization between timers: [peripherals/mcpwm/mcpwm\\_sync](#)

## API Reference

### Header File

- `components/driver/mcpwm/include/driver/mcpwm_timer.h`
- This header file can be included with:

```
#include "driver/mcpwm_timer.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t mcpwm_new_timer` (const `mcpwm_timer_config_t` \*config, `mcpwm_timer_handle_t` \*ret\_timer)

Create MCPWM timer.

#### Parameters

- `config` -- [in] MCPWM timer configuration
- `ret_timer` -- [out] Returned MCPWM timer handle

#### Returns

- `ESP_OK`: Create MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM timer failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM timer failed because out of memory

- `ESP_ERR_NOT_FOUND`: Create MCPWM timer failed because all hardware timers are used up and no more free one
- `ESP_FAIL`: Create MCPWM timer failed because of other error

`esp_err_t mcpwm_del_timer(mcpwm_timer_handle_t timer)`

Delete MCPWM timer.

**Parameters** `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- `ESP_OK`: Delete MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete MCPWM timer failed because timer is not in init state
- `ESP_FAIL`: Delete MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_set_period(mcpwm_timer_handle_t timer, uint32_t period_ticks)`

Set a new period for MCPWM timer.

---

**Note:** If `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` are not set, the new period will take effect immediately. Otherwise, the new period will take effect when timer counts to zero or on sync event.

---

---

**Note:** You may need to use `mcpwm_comparator_set_compare_value` to set a new compare value for MCPWM comparator in order to keep the same PWM duty cycle.

---

**Parameters**

- `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer`
- `period_ticks` -- [in] New period in count ticks

**Returns**

- `ESP_OK`: Set new period for MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Set new period for MCPWM timer failed because of invalid argument
- `ESP_FAIL`: Set new period for MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_enable(mcpwm_timer_handle_t timer)`

Enable MCPWM timer.

**Parameters** `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- `ESP_OK`: Enable MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM timer failed because timer is enabled already
- `ESP_FAIL`: Enable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_disable(mcpwm_timer_handle_t timer)`

Disable MCPWM timer.

**Parameters** `timer` -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- `ESP_OK`: Disable MCPWM timer successfully
- `ESP_ERR_INVALID_ARG`: Disable MCPWM timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable MCPWM timer failed because timer is disabled already
- `ESP_FAIL`: Disable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_start_stop(mcpwm_timer_handle_t timer, mcpwm_timer_start_stop_cmd_t command)`

Send specific start/stop commands to MCPWM timer.

**Parameters**

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **command** -- [in] Supported command list for MCPWM timer

**Returns**

- ESP\_OK: Start or stop MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Start or stop MCPWM timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Start or stop MCPWM timer failed because timer is not enabled
- ESP\_FAIL: Start or stop MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_register_event_callbacks` (*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM timer.

---

**Note:** The first call to this function needs to be before the call to `mcpwm_timer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set event callbacks failed because timer is not in init state
- ESP\_FAIL: Set event callbacks failed because of other error

`esp_err_t mcpwm_timer_set_phase_on_sync` (*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_sync\_phase\_config\_t* \*config)

Set sync phase for MCPWM timer.

**Parameters**

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** -- [in] MCPWM timer sync phase configuration

**Returns**

- ESP\_OK: Set sync phase for MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP\_FAIL: Set sync phase for MCPWM timer failed because of other error

**Structures**

struct `mcpwm_timer_event_callbacks_t`

Group of supported MCPWM timer event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_timer\_event\_cb\_t* **on\_full**

callback function when MCPWM timer counts to peak value

*mcpwm\_timer\_event\_cb\_t* **on\_empty**

callback function when MCPWM timer counts to zero

*mcpwm\_timer\_event\_cb\_t* **on\_stop**

callback function when MCPWM timer stops

struct **mcpwm\_timer\_config\_t**

MCPWM timer configuration.

### Public Members

int **group\_id**

Specify from which group to allocate the MCPWM timer

*mcpwm\_timer\_clock\_source\_t* **clk\_src**

MCPWM timer clock source

uint32\_t **resolution\_hz**

Counter resolution in Hz The step size of each count tick equals to (1 / resolution\_hz) seconds

*mcpwm\_timer\_count\_mode\_t* **count\_mode**

Count mode

uint32\_t **period\_ticks**

Number of count ticks within a period

int **intr\_priority**

MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **update\_period\_on\_empty**

Whether to update period when timer counts to zero

uint32\_t **update\_period\_on\_sync**

Whether to update period on sync event

struct *mcpwm\_timer\_config\_t*::[anonymous] **flags**

Extra configuration flags for timer

struct **mcpwm\_timer\_sync\_phase\_config\_t**

MCPWM Timer sync phase configuration.

## Public Members

### *mcpwm\_sync\_handle\_t* **sync\_src**

The sync event source. Set to NULL will disable the timer being synced by others

### uint32\_t **count\_value**

The count value that should lock to upon sync event

### *mcpwm\_timer\_direction\_t* **direction**

The count direction that should lock to upon sync event

## Header File

- `components/driver/mcpwm/include/driver/mcpwm_oper.h`
- This header file can be included with:

```
#include "driver/mcpwm_oper.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **mcpwm\_new\_operator** (const *mcpwm\_operator\_config\_t* \*config, *mcpwm\_oper\_handle\_t* \*ret\_oper)

Create MCPWM operator.

### Parameters

- **config** -- [in] MCPWM operator configuration
- **ret\_oper** -- [out] Returned MCPWM operator handle

### Returns

- `ESP_OK`: Create MCPWM operator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM operator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM operator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM operator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM operator failed because of other error

*esp\_err\_t* **mcpwm\_del\_operator** (*mcpwm\_oper\_handle\_t* oper)

Delete MCPWM operator.

**Parameters** **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`

### Returns

- `ESP_OK`: Delete MCPWM operator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM operator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM operator failed because of other error

*esp\_err\_t* **mcpwm\_operator\_connect\_timer** (*mcpwm\_oper\_handle\_t* oper, *mcpwm\_timer\_handle\_t* timer)

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

### Parameters

- **oper** -- [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP\_OK: Connect MCPWM operator and timer successfully
- ESP\_ERR\_INVALID\_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP\_FAIL: Connect MCPWM operator and timer failed because of other error

*esp\_err\_t* **mcpwm\_operator\_set\_brake\_on\_fault** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_brake\_config\_t* \*config)

Set brake method for MCPWM operator.

**Parameters**

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM brake configuration

**Returns**

- ESP\_OK: Set trip for operator successfully
- ESP\_ERR\_INVALID\_ARG: Set trip for operator failed because of invalid argument
- ESP\_FAIL: Set trip for operator failed because of other error

*esp\_err\_t* **mcpwm\_operator\_recover\_from\_fault** (*mcpwm\_oper\_handle\_t* oper, *mcpwm\_fault\_handle\_t* fault)

Try to make the operator recover from fault.

---

**Note:** To recover from fault or escape from trip, you make sure the fault signal has disappeared already. Otherwise the recovery can't succeed.

---

**Parameters**

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **fault** -- [in] MCPWM fault handle

**Returns**

- ESP\_OK: Recover from fault successfully
- ESP\_ERR\_INVALID\_ARG: Recover from fault failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Recover from fault failed because the fault source is still active
- ESP\_FAIL: Recover from fault failed because of other error

*esp\_err\_t* **mcpwm\_operator\_register\_event\_callbacks** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_operator\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM operator.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **oper** -- [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **mcpwm\_operator\_apply\_carrier** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_carrier\_config\_t* \*config)

Apply carrier feature for MCPWM operator.

**Parameters**

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- [in] MCPWM carrier specific configuration

**Returns**

- `ESP_OK`: Set carrier for operator successfully
- `ESP_ERR_INVALID_ARG`: Set carrier for operator failed because of invalid argument
- `ESP_FAIL`: Set carrier for operator failed because of other error

**Structures**

struct `mcpwm_operator_config_t`

MCPWM operator configuration.

**Public Members**

int `group_id`

Specify from which group to allocate the MCPWM operator

int `intr_priority`

MCPWM operator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t `update_gen_action_on_tez`

Whether to update generator action when timer counts to zero

uint32\_t `update_gen_action_on_tep`

Whether to update generator action when timer counts to peak

uint32\_t `update_gen_action_on_sync`

Whether to update generator action on sync event

uint32\_t `update_dead_time_on_tez`

Whether to update dead time when timer counts to zero

uint32\_t `update_dead_time_on_tep`

Whether to update dead time when timer counts to peak

uint32\_t `update_dead_time_on_sync`

Whether to update dead time on sync event

struct `mcpwm_operator_config_t::[anonymous]` **flags**

Extra configuration flags for operator

struct `mcpwm_brake_config_t`

MCPWM brake configuration structure.

**Public Members**

*mcpwm\_fault\_handle\_t* **fault**

Which fault causes the operator to brake

*mcpwm\_operator\_brake\_mode\_t* **brake\_mode**

Brake mode

uint32\_t **cbc\_recover\_on\_tez**

Recovery CBC brake state on tez event

uint32\_t **cbc\_recover\_on\_tep**

Recovery CBC brake state on tep event

struct *mcpwm\_brake\_config\_t*::[anonymous] **flags**

Extra flags for brake configuration

struct **mcpwm\_operator\_event\_callbacks\_t**

Group of supported MCPWM operator event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_brake\_event\_cb\_t* **on\_brake\_cbc**

callback function when mcpwm operator brakes in CBC

*mcpwm\_brake\_event\_cb\_t* **on\_brake\_ost**

callback function when mcpwm operator brakes in OST

struct **mcpwm\_carrier\_config\_t**

MCPWM carrier configuration structure.

### Public Members

*mcpwm\_carrier\_clock\_source\_t* **clk\_src**

MCPWM carrier clock source

uint32\_t **frequency\_hz**

Carrier frequency in Hz

uint32\_t **first\_pulse\_duration\_us**

The duration of the first PWM pulse, in us

float **duty\_cycle**

Carrier duty cycle

uint32\_t **invert\_before\_modulate**

Invert the raw signal

uint32\_t **invert\_after\_modulate**

Invert the modulated signal

struct *mcpwm\_carrier\_config\_t*::[anonymous] **flags**

Extra flags for carrier configuration

## Header File

- `components/driver/mcpwm/include/driver/mcpwm_cmpr.h`
- This header file can be included with:

```
#include "driver/mcpwm_cmpr.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **mcpwm\_new\_comparator** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_comparator\_config\_t* \*config, *mcpwm\_cmpr\_handle\_t* \*ret\_cmpr)

Create MCPWM comparator.

### Parameters

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
- **config** -- [in] MCPWM comparator configuration
- **ret\_cmpr** -- [out] Returned MCPWM comparator

### Returns

- `ESP_OK`: Create MCPWM comparator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM comparator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM comparator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM comparator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM comparator failed because of other error

*esp\_err\_t* **mcpwm\_del\_comparator** (*mcpwm\_cmpr\_handle\_t* cmpr)

Delete MCPWM comparator.

**Parameters** **cmpr** -- [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`

### Returns

- `ESP_OK`: Delete MCPWM comparator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM comparator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM comparator failed because of other error

*esp\_err\_t* **mcpwm\_new\_event\_comparator** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_event\_comparator\_config\_t* \*config, *mcpwm\_cmpr\_handle\_t* \*ret\_cmpr)

Create MCPWM event comparator.

**Parameters**

- **oper** -- [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new event comparator will be allocated from this operator
- **config** -- [in] MCPWM comparator configuration
- **ret\_cmpr** -- [out] Returned MCPWM event comparator

**Returns**

- ESP\_OK: Create MCPWM event comparator successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM event comparator failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM event comparator failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM event comparator failed because can't find free resource
- ESP\_FAIL: Create MCPWM event comparator failed because of other error

`esp_err_t mcpwm_comparator_register_event_callbacks` (*mcpwm\_cmpr\_handle\_t* cmpr, const *mcpwm\_comparator\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM comparator.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **cmpr** -- [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_FAIL: Set event callbacks failed because of other error

`esp_err_t mcpwm_comparator_set_compare_value` (*mcpwm\_cmpr\_handle\_t* cmpr, *uint32\_t* cmp\_ticks)

Set MCPWM comparator's compare value.

**Parameters**

- **cmpr** -- [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cmp\_ticks** -- [in] The new compare value

**Returns**

- ESP\_OK: Set MCPWM compare value successfully
- ESP\_ERR\_INVALID\_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the `cmp_ticks` is out of range)
- ESP\_ERR\_INVALID\_STATE: Set MCPWM compare value failed because the operator doesn't have a timer connected
- ESP\_FAIL: Set MCPWM compare value failed because of other error

**Structures**

struct `mcpwm_comparator_config_t`

MCPWM comparator configuration.

## Public Members

int **intr\_priority**

MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **update\_cmp\_on\_tez**

Whether to update compare value when timer count equals to zero (tez)

uint32\_t **update\_cmp\_on\_tep**

Whether to update compare value when timer count equals to peak (tep)

uint32\_t **update\_cmp\_on\_sync**

Whether to update compare value on sync event

struct *mcpwm\_comparator\_config\_t*::[anonymous] **flags**

Extra configuration flags for comparator

struct **mcpwm\_event\_comparator\_config\_t**

MCPWM event comparator configuration.

struct **mcpwm\_comparator\_event\_callbacks\_t**

Group of supported MCPWM compare event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

## Public Members

*mcpwm\_compare\_event\_cb\_t* **on\_reach**

ISR callback function which would be invoked when counter reaches compare value

## Header File

- `components/driver/mcpwm/include/driver/mcpwm_gen.h`
- This header file can be included with:

```
#include "driver/mcpwm_gen.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **mcpwm\_new\_generator** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_generator\_config\_t* \*config, *mcpwm\_gen\_handle\_t* \*ret\_gen)

Allocate MCPWM generator from given operator.

**Parameters**

- **oper** -- **[in]** MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** -- **[in]** MCPWM generator configuration
- **ret\_gen** -- **[out]** Returned MCPWM generator

**Returns**

- `ESP_OK`: Create MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM generator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM generator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM generator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM generator failed because of other error

*esp\_err\_t* **mcpwm\_del\_generator** (*mcpwm\_gen\_handle\_t* gen)

Delete MCPWM generator.

**Parameters** **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`

**Returns**

- `ESP_OK`: Delete MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM generator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM generator failed because of other error

*esp\_err\_t* **mcpwm\_generator\_set\_force\_level** (*mcpwm\_gen\_handle\_t* gen, int level, bool hold\_on)

Set force level for MCPWM generator.

---

**Note:** The force level will be applied to the generator immediately, regardless any other events that would change the generator's behaviour.

---

---

**Note:** If the `hold_on` is true, the force level will retain forever, until user removes the force level by setting the force level to `-1`.

---

---

**Note:** If the `hold_on` is false, the force level can be overridden by the next event action.

---

---

**Note:** The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn't equal to the final output level.

---

**Parameters**

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **level** -- **[in]** GPIO level to be applied to MCPWM generator, specially, `-1` means to remove the force level
- **hold\_on** -- **[in]** Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

**Returns**

- `ESP_OK`: Set force level for MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Set force level for MCPWM generator failed because of invalid argument
- `ESP_FAIL`: Set force level for MCPWM generator failed because of other error

*esp\_err\_t* **mcpwm\_generator\_set\_action\_on\_timer\_event** (*mcpwm\_gen\_handle\_t* gen,  
*mcpwm\_gen\_timer\_event\_action\_t*  
ev\_act)

Set generator action on MCPWM timer event.

**Parameters**

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM timer event action, can be constructed by `MCPWM_GEN_TIMER_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set generator action failed because of timer is not connected to operator
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_timer_event` (*mcpwm\_gen\_handle\_t* gen, *mcpwm\_gen\_timer\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM timer events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

---

**Parameters**

- **gen** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

**Returns**

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set generator actions failed because of timer is not connected to operator
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_compare_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_compare\_event\_action\_t* ev\_act)

Set generator action on MCPWM compare event.

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_compare_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_compare\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM compare events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

---

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`

- **ev\_act** -- **[in]** MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

**Returns**

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_brake_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_brake\_event\_action\_t* ev\_act)

Set generator action on MCPWM brake event.

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_brake_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_brake\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM brake events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

---

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

**Returns**

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_fault_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_fault\_event\_action\_t* ev\_act)

Set generator action on MCPWM Fault event.

**Parameters**

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_FAULT_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_sync_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_sync\_event\_action\_t* ev\_act)

Set generator action on MCPWM Sync event.

---

**Note:** The trigger only support one sync action, regardless of the kinds. Should not call this function more than once.

---

#### Parameters

- **generator** -- **[in]** MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** -- **[in]** MCPWM trigger event action, can be constructed by `MCPWM_GEN_SYNC_EVENT_ACTION` helper macro

#### Returns

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* **mcpwm\_generator\_set\_dead\_time** (*mcpwm\_gen\_handle\_t* in\_generator, *mcpwm\_gen\_handle\_t* out\_generator, const *mcpwm\_dead\_time\_config\_t* \*config)

Set dead time for MCPWM generator.

---

**Note:** Due to a hardware limitation, you can't set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

---

#### Parameters

- **in\_generator** -- **[in]** MCPWM generator, before adding the dead time
- **out\_generator** -- **[in]** MCPWM generator, after adding the dead time
- **config** -- **[in]** MCPWM dead time configuration

#### Returns

- `ESP_OK`: Set dead time for MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Set dead time for MCPWM generator failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)
- `ESP_FAIL`: Set dead time for MCPWM generator failed because of other error

### Structures

struct **mcpwm\_generator\_config\_t**

MCPWM generator configuration.

#### Public Members

int **gen\_gpio\_num**

The GPIO number used to output the PWM signal

uint32\_t **invert\_pwm**

Whether to invert the PWM signal (done by GPIO matrix)

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **io\_od\_mode**

Configure the GPIO as open-drain mode

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

struct *mcpwm\_generator\_config\_t*::[anonymous] **flags**

Extra configuration flags for generator

struct **mcpwm\_gen\_timer\_event\_action\_t**

Generator action on specific timer event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_timer\_event\_t* **event**

Timer event

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_compare\_event\_action\_t**

Generator action on specific comparator event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_cmpr\_handle\_t* **comparator**

Comparator handle

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_brake\_event\_action\_t**

Generator action on specific brake event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_operator\_brake\_mode\_t* **brake\_mode**

Brake mode

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_fault\_event\_action\_t**

Generator action on specific fault event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_fault\_handle\_t* **fault**

Which fault as the trigger. Only support GPIO fault

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_sync\_event\_action\_t**

Generator action on specific sync event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_sync\_handle\_t* **sync**

Which sync as the trigger

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_dead\_time\_config\_t**

MCPWM dead time configuration structure.

### Public Members

uint32\_t **posedge\_delay\_ticks**

delay time applied to rising edge, 0 means no rising delay time

uint32\_t **negedge\_delay\_ticks**

delay time applied to falling edge, 0 means no falling delay time

uint32\_t **invert\_output**

Invert the signal after applied the dead time

struct *mcpwm\_dead\_time\_config\_t*::[anonymous] **flags**

Extra flags for dead time configuration

### Macros

**MCPWM\_GEN\_TIMER\_EVENT\_ACTION** (dir, ev, act)

Help macros to construct a *mcpwm\_gen\_timer\_event\_action\_t* entry.

**MCPWM\_GEN\_TIMER\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_COMPARE\_EVENT\_ACTION** (dir, cmp, act)

Help macros to construct a *mcpwm\_gen\_compare\_event\_action\_t* entry.

**MCPWM\_GEN\_COMPARE\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_BRAKE\_EVENT\_ACTION** (dir, mode, act)

Help macros to construct a *mcpwm\_gen\_brake\_event\_action\_t* entry.

**MCPWM\_GEN\_BRAKE\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_FAULT\_EVENT\_ACTION** (dir, flt, act)

Help macros to construct a *mcpwm\_gen\_fault\_event\_action\_t* entry.

**MCPWM\_GEN\_SYNC\_EVENT\_ACTION** (dir, syn, act)

Help macros to construct a *mcpwm\_gen\_sync\_event\_action\_t* entry.

### Header File

- `components/driver/mcpwm/include/driver/mcpwm_fault.h`
- This header file can be included with:

```
#include "driver/mcpwm_fault.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **mcpwm\_new\_gpio\_fault** (const *mcpwm\_gpio\_fault\_config\_t* \*config, *mcpwm\_fault\_handle\_t* \*ret\_fault)

Create MCPWM GPIO fault.

#### Parameters

- **config** -- [in] MCPWM GPIO fault configuration
- **ret\_fault** -- [out] Returned GPIO fault handle

#### Returns

- `ESP_OK`: Create MCPWM GPIO fault successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM GPIO fault failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM GPIO fault failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM GPIO fault failed because can't find free resource

- ESP\_FAIL: Create MCPWM GPIO fault failed because of other error

*esp\_err\_t* **mcpwm\_new\_soft\_fault** (const *mcpwm\_soft\_fault\_config\_t* \*config, *mcpwm\_fault\_handle\_t* \*ret\_fault)

Create MCPWM software fault.

#### Parameters

- **config** -- [in] MCPWM software fault configuration
- **ret\_fault** -- [out] Returned software fault handle

#### Returns

- ESP\_OK: Create MCPWM software fault successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM software fault failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM software fault failed because out of memory
- ESP\_FAIL: Create MCPWM software fault failed because of other error

*esp\_err\_t* **mcpwm\_del\_fault** (*mcpwm\_fault\_handle\_t* fault)

Delete MCPWM fault.

**Parameters** **fault** -- [in] MCPWM fault handle allocated by `mcpwm_new_gpio_fault()` or `mcpwm_new_soft_fault()`

#### Returns

- ESP\_OK: Delete MCPWM fault successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM fault failed because of invalid argument
- ESP\_FAIL: Delete MCPWM fault failed because of other error

*esp\_err\_t* **mcpwm\_soft\_fault\_activate** (*mcpwm\_fault\_handle\_t* fault)

Activate the software fault, trigger the fault event for once.

**Parameters** **fault** -- [in] MCPWM soft fault, allocated by `mcpwm_new_soft_fault()`

#### Returns

- ESP\_OK: Trigger MCPWM software fault event successfully
- ESP\_ERR\_INVALID\_ARG: Trigger MCPWM software fault event failed because of invalid argument
- ESP\_FAIL: Trigger MCPWM software fault event failed because of other error

*esp\_err\_t* **mcpwm\_fault\_register\_event\_callbacks** (*mcpwm\_fault\_handle\_t* fault, const *mcpwm\_fault\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM fault.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

#### Parameters

- **fault** -- [in] MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

#### Returns

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_FAIL: Set event callbacks failed because of other error

## Structures

struct **mcpwm\_gpio\_fault\_config\_t**

MCPWM GPIO fault configuration structure.

### Public Members

int **group\_id**

In which MCPWM group that the GPIO fault belongs to

int **intr\_priority**

MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

int **gpio\_num**

GPIO used by the fault signal

uint32\_t **active\_level**

On which level the fault signal is treated as active

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

struct *mcpwm\_gpio\_fault\_config\_t*::[anonymous] **flags**

Extra configuration flags for GPIO fault

struct **mcpwm\_soft\_fault\_config\_t**

MCPWM software fault configuration structure.

struct **mcpwm\_fault\_event\_callbacks\_t**

Group of supported MCPWM fault event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_fault\_event\_cb\_t* **on\_fault\_enter**

ISR callback function that would be invoked when fault signal becomes active

*mcpwm\_fault\_event\_cb\_t* **on\_fault\_exit**

ISR callback function that would be invoked when fault signal becomes inactive

### Header File

- `components/driver/mcpwm/include/driver/mcpwm_sync.h`
- This header file can be included with:

```
#include "driver/mcpwm_sync.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

```
esp_err_t mcpwm_new_timer_sync_src(mcpwm_timer_handle_t timer, const
                                   mcpwm_timer_sync_src_config_t *config, mcpwm_sync_handle_t
                                   *ret_sync)
```

Create MCPWM timer sync source.

### Parameters

- **timer** -- [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** -- [in] MCPWM timer sync source configuration
- **ret\_sync** -- [out] Returned MCPWM sync handle

### Returns

- `ESP_OK`: Create MCPWM timer sync source successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM timer sync source failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM timer sync source failed because out of memory
- `ESP_ERR_INVALID_STATE`: Create MCPWM timer sync source failed because the timer has created a sync source before
- `ESP_FAIL`: Create MCPWM timer sync source failed because of other error

```
esp_err_t mcpwm_new_gpio_sync_src(const mcpwm_gpio_sync_src_config_t *config,
                                   mcpwm_sync_handle_t *ret_sync)
```

Create MCPWM GPIO sync source.

### Parameters

- **config** -- [in] MCPWM GPIO sync source configuration
- **ret\_sync** -- [out] Returned MCPWM GPIO sync handle

### Returns

- `ESP_OK`: Create MCPWM GPIO sync source successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM GPIO sync source failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM GPIO sync source failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM GPIO sync source failed because can't find free resource
- `ESP_FAIL`: Create MCPWM GPIO sync source failed because of other error

```
esp_err_t mcpwm_new_soft_sync_src(const mcpwm_soft_sync_config_t *config, mcpwm_sync_handle_t
                                   *ret_sync)
```

Create MCPWM software sync source.

### Parameters

- **config** -- [in] MCPWM software sync source configuration
- **ret\_sync** -- [out] Returned software sync handle

### Returns

- `ESP_OK`: Create MCPWM software sync successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM software sync failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM software sync failed because out of memory
- `ESP_FAIL`: Create MCPWM software sync failed because of other error

*esp\_err\_t* **mcpwm\_del\_sync\_src** (*mcpwm\_sync\_handle\_t* sync)

Delete MCPWM sync source.

**Parameters** **sync** -- **[in]** MCPWM sync handle, allocated by `mcpwm_new_timer_sync_src()` or `mcpwm_new_gpio_sync_src()` or `mcpwm_new_soft_sync_src()`

**Returns**

- `ESP_OK`: Delete MCPWM sync source successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM sync source failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM sync source failed because of other error

*esp\_err\_t* **mcpwm\_soft\_sync\_activate** (*mcpwm\_sync\_handle\_t* sync)

Activate the software sync, trigger the sync event for once.

**Parameters** **sync** -- **[in]** MCPWM soft sync handle, allocated by `mcpwm_new_soft_sync_src()`

**Returns**

- `ESP_OK`: Trigger MCPWM software sync event successfully
- `ESP_ERR_INVALID_ARG`: Trigger MCPWM software sync event failed because of invalid argument
- `ESP_FAIL`: Trigger MCPWM software sync event failed because of other error

## Structures

struct **mcpwm\_timer\_sync\_src\_config\_t**

MCPWM timer sync source configuration.

### Public Members

*mcpwm\_timer\_event\_t* **timer\_event**

Timer event, upon which MCPWM timer will generate the sync signal

uint32\_t **propagate\_input\_sync**

The input sync signal would be routed to its sync output

struct *mcpwm\_timer\_sync\_src\_config\_t*::[anonymous] **flags**

Extra configuration flags for timer sync source

struct **mcpwm\_gpio\_sync\_src\_config\_t**

MCPWM GPIO sync source configuration.

### Public Members

int **group\_id**

MCPWM group ID

int **gpio\_num**

GPIO used by sync source

uint32\_t **active\_neg**

Whether the sync signal is active on negedge, by default, the sync signal's posedge is treated as active

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

struct *mcpwm\_gpio\_sync\_src\_config\_t*::[anonymous] **flags**

Extra configuration flags for GPIO sync source

struct **mcpwm\_soft\_sync\_config\_t**

MCPWM software sync configuration structure.

### Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_cap.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_cap.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **mcpwm\_new\_capture\_timer** (const *mcpwm\_capture\_timer\_config\_t* \*config,  
*mcpwm\_cap\_timer\_handle\_t* \*ret\_cap\_timer)

Create MCPWM capture timer.

#### Parameters

- **config** -- **[in]** MCPWM capture timer configuration
- **ret\_cap\_timer** -- **[out]** Returned MCPWM capture timer handle

#### Returns

- `ESP_OK`: Create MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM capture timer failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM capture timer failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM capture timer failed because can't find free resource
- `ESP_FAIL`: Create MCPWM capture timer failed because of other error

*esp\_err\_t* **mcpwm\_del\_capture\_timer** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer)

Delete MCPWM capture timer.

**Parameters** **cap\_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

#### Returns

- `ESP_OK`: Delete MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM capture timer failed because of invalid argument

- `ESP_FAIL`: Delete MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_enable(mcpwm_cap_timer_handle_t cap_timer)`

Enable MCPWM capture timer.

**Parameters** `cap_timer` -- **[in]** MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Enable MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM capture timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM capture timer failed because timer is enabled already
- `ESP_FAIL`: Enable MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_disable(mcpwm_cap_timer_handle_t cap_timer)`

Disable MCPWM capture timer.

**Parameters** `cap_timer` -- **[in]** MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Disable MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Disable MCPWM capture timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable MCPWM capture timer failed because timer is disabled already
- `ESP_FAIL`: Disable MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_start(mcpwm_cap_timer_handle_t cap_timer)`

Start MCPWM capture timer.

**Parameters** `cap_timer` -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Start MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Start MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Start MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_stop(mcpwm_cap_timer_handle_t cap_timer)`

Stop MCPWM capture timer.

**Parameters** `cap_timer` -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Stop MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Stop MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Stop MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_get_resolution(mcpwm_cap_timer_handle_t cap_timer, uint32_t *out_resolution)`

Get MCPWM capture timer resolution, in Hz.

**Parameters**

- `cap_timer` -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `out_resolution` -- **[out]** Returned capture timer resolution, in Hz

**Returns**

- `ESP_OK`: Get capture timer resolution successfully
- `ESP_ERR_INVALID_ARG`: Get capture timer resolution failed because of invalid argument

- **ESP\_FAIL**: Get capture timer resolution failed because of other error

*esp\_err\_t* **mcpwm\_capture\_timer\_set\_phase\_on\_sync** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer, const *mcpwm\_capture\_timer\_sync\_phase\_config\_t* \*config)

Set sync phase for MCPWM capture timer.

**Parameters**

- **cap\_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- **config** -- **[in]** MCPWM capture timer sync phase configuration

**Returns**

- **ESP\_OK**: Set sync phase for MCPWM capture timer successfully
- **ESP\_ERR\_INVALID\_ARG**: Set sync phase for MCPWM capture timer failed because of invalid argument
- **ESP\_FAIL**: Set sync phase for MCPWM capture timer failed because of other error

*esp\_err\_t* **mcpwm\_new\_capture\_channel** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer, const *mcpwm\_capture\_channel\_config\_t* \*config, *mcpwm\_cap\_channel\_handle\_t* \*ret\_cap\_channel)

Create MCPWM capture channel.

---

**Note:** The created capture channel won't be enabled until calling `mcpwm_capture_channel_enable`

---

**Parameters**

- **cap\_timer** -- **[in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
- **config** -- **[in]** MCPWM capture channel configuration
- **ret\_cap\_channel** -- **[out]** Returned MCPWM capture channel

**Returns**

- **ESP\_OK**: Create MCPWM capture channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Create MCPWM capture channel failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create MCPWM capture channel failed because out of memory
- **ESP\_ERR\_NOT\_FOUND**: Create MCPWM capture channel failed because can't find free resource
- **ESP\_FAIL**: Create MCPWM capture channel failed because of other error

*esp\_err\_t* **mcpwm\_del\_capture\_channel** (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Delete MCPWM capture channel.

**Parameters** **cap\_channel** -- **[in]** MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- **ESP\_OK**: Delete MCPWM capture channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Delete MCPWM capture channel failed because of invalid argument
- **ESP\_FAIL**: Delete MCPWM capture channel failed because of other error

*esp\_err\_t* **mcpwm\_capture\_channel\_enable** (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Enable MCPWM capture channel.

---

**Note:** This function will transit the channel state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

---

**Parameters** `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- `ESP_OK`: Enable MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM capture channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM capture channel failed because the channel is already enabled
- `ESP_FAIL`: Enable MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_disable`(*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Disable MCPWM capture channel.

**Parameters** `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- `ESP_OK`: Disable MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Disable MCPWM capture channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable MCPWM capture channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_register_event_callbacks`(*mcpwm\_cap\_channel\_handle\_t* cap\_channel, const *mcpwm\_capture\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM capture channel.

---

**Note:** The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the channel is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_trigger_soft_catch`(*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Trigger a catch by software.

**Parameters** `cap_channel` -- [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- `ESP_OK`: Trigger software catch successfully
- `ESP_ERR_INVALID_ARG`: Trigger software catch failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Trigger software catch failed because the channel is not enabled yet
- `ESP_FAIL`: Trigger software catch failed because of other error

**Structures**

struct `mcpwm_capture_timer_config_t`

MCPWM capture timer configuration structure.

**Public Members**

int `group_id`

Specify from which group to allocate the capture timer

*`mcpwm_capture_clock_source_t`* `clk_src`

MCPWM capture timer clock source

uint32\_t `resolution_hz`

Resolution of capture timer

struct `mcpwm_capture_timer_sync_phase_config_t`

MCPWM Capture timer sync phase configuration.

**Public Members**

*`mcpwm_sync_handle_t`* `sync_src`

The sync event source

uint32\_t `count_value`

The count value that should lock to upon sync event

*`mcpwm_timer_direction_t`* `direction`

The count direction that should lock to upon sync event

struct `mcpwm_capture_channel_config_t`

MCPWM capture channel configuration structure.

**Public Members**

int `gpio_num`

GPIO used capturing input signal

int **intr\_priority**

MCPWM capture interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **prescale**

Prescale of input signal, effective frequency = cap\_input\_clk/prescale

uint32\_t **pos\_edge**

Whether to capture on positive edge

uint32\_t **neg\_edge**

Whether to capture on negative edge

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

uint32\_t **invert\_cap\_signal**

Invert the input capture signal

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **keep\_io\_conf\_at\_exit**

For debug/test, whether to keep the GPIO configuration when capture channel is deleted. By default, driver will reset the GPIO pin at exit.

struct *mcpwm\_capture\_channel\_config\_t*::[anonymous] **flags**

Extra configuration flags for capture channel

struct **mcpwm\_capture\_event\_callbacks\_t**

Group of supported MCPWM capture event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

## Public Members

*mcpwm\_capture\_event\_cb\_t* **on\_cap**

Callback function that would be invoked when capture event occurred

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_etm.h](#)
- This header file can be included with:

```
#include "driver/mcpwm_etm.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

`esp_err_t mcpwm_comparator_new_etm_event` (`mcpwm_cmpr_handle_t` cmpr, const `mcpwm_cmpr_etm_event_config_t` \*config, `esp_etm_event_handle_t` \*out\_event)

Get the ETM event for MCPWM comparator.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

### Parameters

- **cmpr** -- [in] MCPWM comparator, allocated by `mcpwm_new_comparator()` or `mcpwm_new_event_comparator()`
- **config** -- [in] MCPWM ETM comparator event configuration
- **out\_event** -- [out] Returned ETM event handle

### Returns

- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

## Structures

struct `mcpwm_cmpr_etm_event_config_t`

MCPWM event comparator ETM event configuration.

### Public Members

`mcpwm_comparator_etm_event_type_t` **event\_type**

MCPWM comparator ETM event type

## Header File

- `components/driver/mcpwm/include/driver/mcpwm_types.h`
- This header file can be included with:

```
#include "driver/mcpwm_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Structures

struct **mcpwm\_timer\_event\_data\_t**  
MCPWM timer event data.

### Public Members

uint32\_t **count\_value**  
MCPWM timer count value

*mcpwm\_timer\_direction\_t* **direction**  
MCPWM timer count direction

struct **mcpwm\_brake\_event\_data\_t**  
MCPWM brake event data.

struct **mcpwm\_fault\_event\_data\_t**  
MCPWM fault event data.

struct **mcpwm\_compare\_event\_data\_t**  
MCPWM compare event data.

### Public Members

uint32\_t **compare\_ticks**  
Compare value

*mcpwm\_timer\_direction\_t* **direction**  
Count direction

struct **mcpwm\_capture\_event\_data\_t**  
MCPWM capture event data.

### Public Members

uint32\_t **cap\_value**  
Captured value

*mcpwm\_capture\_edge\_t* **cap\_edge**  
Capture edge

## Type Definitions

typedef struct mcpwm\_timer\_t \***mcpwm\_timer\_handle\_t**  
Type of MCPWM timer handle.

typedef struct mcpwm\_oper\_t \***mcpwm\_oper\_handle\_t**  
Type of MCPWM operator handle.

typedef struct mcpwm\_cmpr\_t \***mcpwm\_cmpr\_handle\_t**

Type of MCPWM comparator handle.

typedef struct mcpwm\_gen\_t \***mcpwm\_gen\_handle\_t**

Type of MCPWM generator handle.

typedef struct mcpwm\_fault\_t \***mcpwm\_fault\_handle\_t**

Type of MCPWM fault handle.

typedef struct mcpwm\_sync\_t \***mcpwm\_sync\_handle\_t**

Type of MCPWM sync handle.

typedef struct mcpwm\_cap\_timer\_t \***mcpwm\_cap\_timer\_handle\_t**

Type of MCPWM capture timer handle.

typedef struct mcpwm\_cap\_channel\_t \***mcpwm\_cap\_channel\_handle\_t**

Type of MCPWM capture channel handle.

typedef bool (\***mcpwm\_timer\_event\_cb\_t**)(*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_event\_data\_t* \*edata, void \*user\_ctx)

MCPWM timer event callback function.

**Param timer** [in] MCPWM timer handle

**Param edata** [in] MCPWM timer event data, fed by driver

**Param user\_ctx** [in] User data, set in `mcpwm_timer_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

typedef bool (\***mcpwm\_brake\_event\_cb\_t**)(*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_brake\_event\_data\_t* \*edata, void \*user\_ctx)

MCPWM operator brake event callback function.

**Param oper** [in] MCPWM operator handle

**Param edata** [in] MCPWM brake event data, fed by driver

**Param user\_ctx** [in] User data, set in `mcpwm_operator_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

typedef bool (\***mcpwm\_fault\_event\_cb\_t**)(*mcpwm\_fault\_handle\_t* fault, const *mcpwm\_fault\_event\_data\_t* \*edata, void \*user\_ctx)

MCPWM fault event callback function.

**Param fault** MCPWM fault handle

**Param edata** MCPWM fault event data, fed by driver

**Param user\_ctx** User data, set in `mcpwm_fault_register_event_callbacks()`

**Return** whether a task switch is needed after the callback returns

typedef bool (\***mcpwm\_compare\_event\_cb\_t**)(*mcpwm\_cmpr\_handle\_t* comparator, const *mcpwm\_compare\_event\_data\_t* \*edata, void \*user\_ctx)

MCPWM comparator event callback function.

**Param comparator** MCPWM comparator handle

**Param edata** MCPWM comparator event data, fed by driver

**Param user\_ctx** User data, set in `mcpwm_comparator_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_capture_event_cb_t)(mcpwm_cap_channel_handle_t cap_channel, const  
mcpwm_capture_event_data_t *edata, void *user_ctx)
```

MCPWM capture event callback function.

**Param cap\_channel** MCPWM capture channel handle

**Param edata** MCPWM capture event data, fed by driver

**Param user\_ctx** User data, set in `mcpwm_capture_channel_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

### Header File

- `components/hal/include/hal/mcpwm_types.h`
- This header file can be included with:

```
#include "hal/mcpwm_types.h"
```

### Type Definitions

```
typedef soc_periph_mcpwm_timer_clk_src_t mcpwm_timer_clock_source_t
```

MCPWM timer clock source.

```
typedef soc_periph_mcpwm_capture_clk_src_t mcpwm_capture_clock_source_t
```

MCPWM capture clock source.

```
typedef soc_periph_mcpwm_carrier_clk_src_t mcpwm_carrier_clock_source_t
```

MCPWM carrier clock source.

### Enumerations

```
enum mcpwm_timer_direction_t
```

MCPWM timer count direction.

*Values:*

enumerator **MCPWM\_TIMER\_DIRECTION\_UP**

Counting direction: Increase

enumerator **MCPWM\_TIMER\_DIRECTION\_DOWN**

Counting direction: Decrease

```
enum mcpwm_timer_event_t
```

MCPWM timer events.

*Values:*

enumerator **MCPWM\_TIMER\_EVENT\_EMPTY**

MCPWM timer counts to zero (i.e. counter is empty)

enumerator **MCPWM\_TIMER\_EVENT\_FULL**

MCPWM timer counts to peak (i.e. counter is full)

enumerator **MCPWM\_TIMER\_EVENT\_INVALID**

MCPWM timer invalid event

enum **mcpwm\_timer\_count\_mode\_t**

MCPWM timer count modes.

*Values:*

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_PAUSE**

MCPWM timer paused

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_UP**

MCPWM timer counting up

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_DOWN**

MCPWM timer counting down

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_UP\_DOWN**

MCPWM timer counting up and down

enum **mcpwm\_timer\_start\_stop\_cmd\_t**

MCPWM timer commands, specify the way to start or stop the timer.

*Values:*

enumerator **MCPWM\_TIMER\_STOP\_EMPTY**

MCPWM timer stops when next count reaches zero

enumerator **MCPWM\_TIMER\_STOP\_FULL**

MCPWM timer stops when next count reaches peak

enumerator **MCPWM\_TIMER\_START\_NO\_STOP**

MCPWM timer starts counting, and don't stop until received stop command

enumerator **MCPWM\_TIMER\_START\_STOP\_EMPTY**

MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM\_TIMER\_START\_STOP\_FULL**

MCPWM timer starts counting and stops when next count reaches peak

enum **mcpwm\_generator\_action\_t**

MCPWM generator actions.

*Values:*

enumerator **MCPWM\_GEN\_ACTION\_KEEP**

Generator action: Keep the same level

enumerator **MCPWM\_GEN\_ACTION\_LOW**

Generator action: Force to low level

enumerator **MCPWM\_GEN\_ACTION\_HIGH**

Generator action: Force to high level

enumerator **MCPWM\_GEN\_ACTION\_TOGGLE**

Generator action: Toggle level

enum **mcpwm\_operator\_brake\_mode\_t**

MCPWM operator brake mode.

*Values:*

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_CBC**

Brake mode: CBC (cycle by cycle)

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_OST**

Brake mode: OST (one shot)

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_INVALID**

MCPWM operator invalid brake mode

enum **mcpwm\_capture\_edge\_t**

MCPWM capture edge.

*Values:*

enumerator **MCPWM\_CAP\_EDGE\_POS**

Capture on the positive edge

enumerator **MCPWM\_CAP\_EDGE\_NEG**

Capture on the negative edge

enum **mcpwm\_comparator\_etm\_event\_type\_t**

MCPWM comparator specific events that supported by the ETM module.

*Values:*

enumerator **MCPWM\_CMPR\_ETM\_EVENT\_EQUAL**

The count value equals the value of comparator

enumerator **MCPWM\_CMPR\_ETM\_EVENT\_MAX**

Maximum number of comparator events

## 2.5.14 Parallel IO

### Introduction

The Parallel IO peripheral is a general purpose parallel interface that can be used to connect to external devices such as LED matrix, LCD display, Printer and Camera. The peripheral has independent TX and RX units. Each unit can have up to 8 or 16 data signals plus 1 or 2 clock signals.<sup>1</sup>

---

<sup>1</sup> Different ESP chip series might have different numbers of PARLIO TX/RX instances, and the maximum data bus can also be different. For more details, please refer to [ESP32-P4 Technical Reference Manual](#) > Chapter [Parallel IO \(PARLIO\)](#) [PDF]. The driver does not forbid you from applying for more driver objects, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `parlio_new_tx_unit()`).

**Warning:** At the moment, the Parallel IO driver only supports TX mode. The RX feature is still working in progress.

## Application Examples

- Simple REG LED Matrix with HUB75 interface: [peripherals/parlio/simple\\_rgb\\_led\\_matrix](#).

## API Reference

### Header File

- [components/driver/parlio/include/driver/parlio\\_tx.h](#)
- This header file can be included with:

```
#include "driver/parlio_tx.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **parlio\_new\_tx\_unit** (const *parlio\_tx\_unit\_config\_t* \*config, *parlio\_tx\_unit\_handle\_t* \*ret\_unit)

Create a Parallel IO TX unit.

#### Parameters

- **config** -- [in] Parallel IO TX unit configuration
- **ret\_unit** -- [out] Returned Parallel IO TX unit handle

#### Returns

- ESP\_OK: Create Parallel IO TX unit successfully
- ESP\_ERR\_INVALID\_ARG: Create Parallel IO TX unit failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create Parallel IO TX unit failed because of out of memory
- ESP\_ERR\_NOT\_FOUND: Create Parallel IO TX unit failed because all TX units are used up and no more free one
- ESP\_ERR\_NOT\_SUPPORTED: Create Parallel IO TX unit failed because some feature is not supported by hardware, e.g. clock gating
- ESP\_FAIL: Create Parallel IO TX unit failed because of other error

*esp\_err\_t* **parlio\_del\_tx\_unit** (*parlio\_tx\_unit\_handle\_t* unit)

Delete a Parallel IO TX unit.

**Parameters** **unit** -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`

#### Returns

- ESP\_OK: Delete Parallel IO TX unit successfully
- ESP\_ERR\_INVALID\_ARG: Delete Parallel IO TX unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete Parallel IO TX unit failed because it is still in working
- ESP\_FAIL: Delete Parallel IO TX unit failed because of other error

*esp\_err\_t* **parlio\_tx\_unit\_enable** (*parlio\_tx\_unit\_handle\_t* unit)

Enable the Parallel IO TX unit.

---

**Note:** This function will transit the driver state from init to enable

---

---

**Note:** This function will acquire a PM lock that might be installed during channel allocation

---

---

**Note:** If there're transaction pending in the queue, this function will pick up the first one and start the transfer

---

**Parameters** `unit` -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`

**Returns**

- `ESP_OK`: Enable Parallel IO TX unit successfully
- `ESP_ERR_INVALID_ARG`: Enable Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable Parallel IO TX unit failed because it is already enabled
- `ESP_FAIL`: Enable Parallel IO TX unit failed because of other error

*esp\_err\_t* `parlio_tx_unit_disable` (*parlio\_tx\_unit\_handle\_t* unit)

Disable the Parallel IO TX unit.

---

**Note:** This function will transit the driver state from enable to init

---

---

**Note:** This function will release the PM lock that might be installed during channel allocation

---

---

**Note:** If one transaction is undergoing, this function will terminate it immediately

---

**Parameters** `unit` -- [in] Parallel IO TX unit that created by `parlio_new_tx_unit`

**Returns**

- `ESP_OK`: Disable Parallel IO TX unit successfully
- `ESP_ERR_INVALID_ARG`: Disable Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable Parallel IO TX unit failed because it's not enabled yet
- `ESP_FAIL`: Disable Parallel IO TX unit failed because of other error

*esp\_err\_t* `parlio_tx_unit_register_event_callbacks` (*parlio\_tx\_unit\_handle\_t* tx\_unit, const *parlio\_tx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for Parallel IO TX unit.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

---

**Note:** When `CONFIG_PARLIO_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

**Parameters**

- **tx\_unit** -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- **ESP\_OK**: Set event callbacks successfully
- **ESP\_ERR\_INVALID\_ARG**: Set event callbacks failed because of invalid argument
- **ESP\_FAIL**: Set event callbacks failed because of other error

*esp\_err\_t* **parlio\_tx\_unit\_transmit** (*parlio\_tx\_unit\_handle\_t* tx\_unit, const void \*payload, size\_t payload\_bits, const *parlio\_transmit\_config\_t* \*config)

Transmit data on by Parallel IO TX unit.

---

**Note:** After the function returns, it doesn't mean the transaction is finished. This function only constructs a transaction structure and push into a queue.

---

**Parameters**

- **tx\_unit** -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`
- **payload** -- **[in]** Pointer to the data to be transmitted
- **payload\_bits** -- **[in]** Length of the data to be transmitted, in bits
- **config** -- **[in]** Transmit configuration

**Returns**

- **ESP\_OK**: Transmit data successfully
- **ESP\_ERR\_INVALID\_ARG**: Transmit data failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE**: Transmit data failed because the Parallel IO TX unit is not enabled
- **ESP\_FAIL**: Transmit data failed because of other error

*esp\_err\_t* **parlio\_tx\_unit\_wait\_all\_done** (*parlio\_tx\_unit\_handle\_t* tx\_unit, int timeout\_ms)

Wait for all pending TX transactions done.

**Parameters**

- **tx\_unit** -- **[in]** Parallel IO TX unit that created by `parlio_new_tx_unit`
- **timeout\_ms** -- **[in]** Timeout in milliseconds, -1 means to wait forever

**Returns**

- **ESP\_OK**: All pending TX transactions is finished and recycled
- **ESP\_ERR\_INVALID\_ARG**: Wait for all pending TX transactions done failed because of invalid argument
- **ESP\_ERR\_TIMEOUT**: Wait for all pending TX transactions done timeout
- **ESP\_FAIL**: Wait for all pending TX transactions done failed because of other error

**Structures**

struct **parlio\_tx\_unit\_config\_t**

Parallel IO TX unit configuration.

**Public Members**

*parlio\_clock\_source\_t* **clk\_src**

Parallel IO internal clock source

*gpio\_num\_t* **clk\_in\_gpio\_num**

If the clock source is input from external, set the corresponding GPIO number. Otherwise, set to -1 and the driver will use the internal `clk_src` as clock source. This option has higher priority than `clk_src`

`uint32_t input_clk_src_freq_hz`

Frequency of the input clock source, valid only if `clk_in_gpio_num` is not `-1`

`uint32_t output_clk_freq_hz`

Frequency of the output clock. It's divided from either internal `clk_src` or external clock source

`size_t data_width`

Parallel IO data width, can set to 1/2/4/8/..., but can't bigger than `PARLIO_TX_UNIT_MAX_DATA_WIDTH`

`gpio_num_t data_gpio_nums[PARLIO_TX_UNIT_MAX_DATA_WIDTH]`

Parallel IO data GPIO numbers, if any GPIO is not used, you can set it to `-1`

`gpio_num_t clk_out_gpio_num`

GPIO number of the output clock signal, the clock is synced with TX data

`gpio_num_t valid_gpio_num`

GPIO number of the valid signal, which stays high when transferring data. Note that, the valid signal will always occupy the MSB data bit

`size_t trans_queue_depth`

Depth of internal transaction queue

`size_t max_transfer_size`

Maximum transfer size in one transaction, in bytes. This decides the number of DMA nodes will be used for each transaction

`parlio_sample_edge_t sample_edge`

Parallel IO sample edge

`parlio_bit_pack_order_t bit_pack_order`

Set the order of packing the bits into bytes (only works when `data_width < 8`)

`uint32_t clk_gate_en`

Enable TX clock gating, the output clock will be controlled by the MSB bit of the data bus, i.e. by `data_gpio_nums[PARLIO_TX_UNIT_MAX_DATA_WIDTH-1]`. High level to enable the clock output, low to disable

`uint32_t io_loop_back`

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct `parlio_tx_unit_config_t`::[anonymous] **flags**

Extra configuration flags

struct **parlio\_tx\_done\_event\_data\_t**

Type of Parallel IO TX done event data.

struct **parlio\_tx\_event\_callbacks\_t**

Group of Parallel IO TX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_PARLIO\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

#### *parlio\_tx\_done\_callback\_t* on\_trans\_done

Event callback, invoked when one transmission is finished

struct **parlio\_transmit\_config\_t**

Parallel IO transmit configuration.

### Public Members

#### uint32\_t **idle\_value**

The value on the data line when the parallel IO is in idle state

#### uint32\_t **queue\_nonblocking**

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *parlio\_transmit\_config\_t*::[anonymous] **flags**

Transmit specific config flags

### Type Definitions

```
typedef bool (*parlio_tx_done_callback_t)(parlio_tx_unit_handle_t tx_unit, const
parlio_tx_done_event_data_t *edata, void *user_ctx)
```

Prototype of parlio tx event callback.

**Param tx\_unit [in]** Parallel IO TX unit that created by `parlio_new_tx_unit`

**Param edata [in]** Point to Parallel IO TX event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `parlio_tx_unit_register_event_callbacks`

**Return** Whether a high priority task has been waken up by this callback function

### Header File

- [components/driver/parlio/include/driver/parlio\\_types.h](#)
- This header file can be included with:

```
#include "driver/parlio_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Type Definitions

```
typedef struct parlio_tx_unit_t *parlio_tx_unit_handle_t
```

Type of Parallel IO TX unit handle.

### Header File

- [components/hal/include/hal/parlio\\_types.h](#)
- This header file can be included with:

```
#include "hal/parlio_types.h"
```

### Macros

```
PARLIO_TX_UNIT_MAX_DATA_WIDTH
```

Maximum data width of TX unit.

### Type Definitions

```
typedef soc_periph_parlio_clk_src_t parlio_clock_source_t
```

Parallel IO clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

```
enum parlio_sample_edge_t
```

Parallel IO sample edge.

*Values:*

```
enumerator PARLIO_SAMPLE_EDGE_NEG
```

Sample data on falling edge of clock

```
enumerator PARLIO_SAMPLE_EDGE_POS
```

Sample data on rising edge of clock

```
enum parlio_bit_pack_order_t
```

Parallel IO bit packing order.

Data in memory: Byte 0: MSB < B0.7 B0.6 B0.5 B0.4 B0.3 B0.2 B0.1 B0.0 > LSB Byte 1: MSB < B1.7 B1.6 B1.5 B1.4 B1.3 B1.2 B1.1 B1.0 > LSB

Output on line (PARLIO\_BIT\_PACK\_ORDER\_LSB): Cycle 0 Cycle 1 Cycle 2 —> time GPIO 0: B0.0 B0.4 B1.0 GPIO 1: B0.1 B0.5 B1.1 GPIO 2: B0.2 B0.6 B1.2 GPIO 3: B0.3 B0.7 B1.3

Output on line (PARLIO\_BIT\_PACK\_ORDER\_MSB): Cycle 0 Cycle 1 Cycle 2 —> time GPIO 0: B0.4 B0.0 B1.4 GPIO 1: B0.5 B0.1 B1.5 GPIO 2: B0.6 B0.2 B1.6 GPIO 3: B0.7 B0.3 B1.7

*Values:*

enumerator **PARLIO\_BIT\_PACK\_ORDER\_LSB**

Bit pack order: LSB

enumerator **PARLIO\_BIT\_PACK\_ORDER\_MSB**

Bit pack order: MSB

## 2.5.15 Pulse Counter (PCNT)

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32-P4 contains multiple pulse counter units in the module.<sup>1</sup> Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of **edge** type and **level** type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit's counter on each edge. The level signal is the so-called **control signal**, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a **quadrature decoder**.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal's frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

### Functional Overview

Description of the PCNT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Set Up Channel Actions* - covers how to configure the PCNT channel to behave on different signal edges and levels.
- *Watch Points* - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- *Register Event Callbacks* - describes how to hook your specific code to the watch point event callback function.
- *Set Glitch Filter* - describes how to enable and set the timing parameters for the internal glitch filter.
- *Use External Clear Signal* - describes how to set the parameters for the external clear signal.
- *Enable and Disable Unit* - describes how to enable and disable the PCNT unit.
- *Unit IO Control* - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- *Power Management* - describes what functionality will prevent the chip from going into low power mode.
- *IRAM Safe* - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

---

<sup>1</sup> Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver does not forbid you from applying for more PCNT units and channels, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `pcnt_new_unit()`).

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there is a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter's width, which by default is 16 bit at most, defined in the hardware. See also *Compensate Overflow Loss* for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

**Note:** Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e., unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it is recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by **edge** type signal and **level** type signal. Please note, either of them can be assigned to -1 if it is not actually used, and thus it will become a **virtual IO**. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO causes that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.
- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for **edge** and **level** input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to -1.

- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.
- `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO's input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e., channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it is recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

**Set Up Channel Actions** The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to `-1` when allocating PCNT channel by `pcnt_new_channel()`.

```
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
↪DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the
↪counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
↪KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

**Watch Points** Each PCNT unit can be configured to watch several different values that you are interested in. The value to be watched is also called **Watch Point**. The watch point itself can not exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See *Register Event Callbacks* for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly-used watch points are: **zero cross**, **maximum/minimum count** and other threshold values. The number of available watch point is limited,

`pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can not find any free hardware resource to save the watch point. You can not add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

**Register Event Callbacks** When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different **counting direction** and **counting step size**.

Registering callback function results in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_
↳data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &(edata->watch_point_value), &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```

**Set Glitch Filter** The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nano seconds. If a signal pulse's width is smaller than this value, then it will be treated as noise and will not increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a NULL filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Note:** The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB\_CLK cycle (usually 12.5 ns if APB equals 80 MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter does not work as expect in that case. So the driver installs a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see [Power Management](#).

```
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

**Use External Clear Signal** The PCNT unit can receive a clear signal from the GPIO. The parameters that can be configured for the clear signal are listed in `pcnt_clear_signal_config_t`:

- `pcnt_clear_signal_config_t::clear_signal_gpio_num` specify the GPIO numbers used by **clear** signal. The default active level is high, and the input mode is pull-down enabled.
- `pcnt_clear_signal_config_t::invert_clear_signal` is used to decide whether to invert the input signal before it going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware. The input mode is pull-up enabled when the input signal is inverted.
- `pcnt_clear_signal_config_t::io_loop_back` is for debug only, which enables both the GPIO's input and output paths. This can help to simulate the clear signal by function `gpio_set_level()` for the same GPIO.

This signal acts in the same way as calling `pcnt_unit_clear_count()`, but is not subject to software latency, and is suitable for use in situations with low latency requirements. Also please note, the flip frequency of this signal can not be too high.

```
pcnt_clear_signal_config_t clear_signal_config = {
    .clear_signal_gpio_num = PCNT_CLEAR_SIGNAL_GPIO,
};
ESP_ERROR_CHECK(pcnt_unit_set_clear_signal(pcnt_unit, &clear_signal_config));
```

**Enable and Disable Unit** Before doing IO control to the PCNT unit, you need to enable it first, by calling `pcnt_unit_enable()`. Internally, this function:

- switches the PCNT driver state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed in `pcnt_unit_register_event_callbacks()`.
- acquires a proper power management lock if it has been lazy installed in `pcnt_unit_set_glitch_filter()`. See also [Power Management](#) for more information.

On the contrary, calling `pcnt_unit_disable()` will do the opposite, that is, put the PCNT driver back to the **init** state, disable the interrupts service and release the power management lock.

## Unit IO Control

**Start/Stop and Clear** Calling `pcnt_unit_start()` makes the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling `pcnt_unit_stop()` will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling `pcnt_unit_clear_count()`.

Note, `pcnt_unit_start()` and `pcnt_unit_stop()` should be called when the unit has been enabled by `pcnt_unit_enable()`. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Get Count Value** You can read current count value at any time by calling `pcnt_unit_get_count()`. The returned count value is a **signed** integer, where the sign can be used to reflect the direction.

```
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

**Compensate Overflow Loss** The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter's bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the *Watch Points*.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware's count value, but also accumulates the high/low overflow loss to it.

**Note:** `pcnt_unit_clear_count()` resets the accumulated count value as well.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever you enable the glitch filter by `pcnt_unit_set_glitch_filter()`, the driver guarantees that the power management lock is acquired after the PCNT unit is enabled by `pcnt_unit_enable()`. Likewise, the driver releases the lock after `pcnt_unit_disable()` is called.

**IRAM Safe** By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM<sup>2</sup>
3. Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety** The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

<sup>2</sup> `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enabling this option increases the firmware binary size.

### Application Examples

- Decode the quadrature signals from rotary encoder: [peripherals/pcnt/rotary\\_encoder](#).

## API Reference

### Header File

- `components/driver/pcnt/include/driver/pulse_cnt.h`
- This header file can be included with:

```
#include "driver/pulse_cnt.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t pcnt_new_unit` (const `pcnt_unit_config_t` \*config, `pcnt_unit_handle_t` \*ret\_unit)

Create a new PCNT unit, and return the handle.

---

**Note:** The newly created PCNT unit is put in the init state.

---

#### Parameters

- **config** -- [in] PCNT unit configuration
- **ret\_unit** -- [out] Returned PCNT unit handle

#### Returns

- `ESP_OK`: Create PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- `ESP_ERR_NO_MEM`: Create PCNT unit failed because out of memory

- `ESP_ERR_NOT_FOUND`: Create PCNT unit failed because all PCNT units are used up and no more free one
- `ESP_FAIL`: Create PCNT unit failed because of other error

*esp\_err\_t* `pcnt_del_unit` (*pcnt\_unit\_handle\_t* unit)

Delete the PCNT unit handle.

---

**Note:** A PCNT unit can't be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Delete the PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- `ESP_FAIL`: Delete the PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_set_glitch_filter` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_glitch\_filter\_config\_t* \*config)

Set glitch filter for PCNT unit.

---

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won't be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

---

---

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` -- [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**

- `ESP_OK`: Set glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- `ESP_ERR_INVALID_STATE`: Set glitch filter failed because the unit is not in the init state
- `ESP_FAIL`: Set glitch filter failed because of other error

*esp\_err\_t* `pcnt_unit_set_clear_signal` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_clear\_signal\_config\_t* \*config)

Set clear signal for PCNT unit.

---

**Note:** The function of clear signal is the same as `pcnt_unit_clear_count()`. High-level Active

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` -- [in] PCNT clear signal configuration, set config to NULL means disabling the clear signal

**Returns**

- ESP\_OK: Set clear signal successfully
- ESP\_ERR\_INVALID\_ARG: Set clear signal failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set clear signal failed because set clear signal repeatedly or disable clear signal before set it
- ESP\_FAIL: Set clear signal failed because of other error

*esp\_err\_t* **pcnt\_unit\_enable** (*pcnt\_unit\_handle\_t* unit)

Enable the PCNT unit.

---

**Note:** This function will transit the unit state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `pcnt_unit_register_event_callbacks()`.

---

---

**Note:** This function will acquire the PM lock if it's lazy installed in `pcnt_unit_set_glitch_filter()`.

---

---

**Note:** Enable a PCNT unit doesn't mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

---

**Parameters** **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP\_OK: Enable PCNT unit successfully
- ESP\_ERR\_INVALID\_ARG: Enable PCNT unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP\_FAIL: Enable PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_disable** (*pcnt\_unit\_handle\_t* unit)

Disable the PCNT unit.

---

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

---

---

**Note:** Disable a PCNT unit doesn't mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

---

**Parameters** **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP\_OK: Disable PCNT unit successfully
- ESP\_ERR\_INVALID\_ARG: Disable PCNT unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP\_FAIL: Disable PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_start** (*pcnt\_unit\_handle\_t* unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_stop` (*pcnt\_unit\_handle\_t* unit)

Stop PCNT from counting.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** The stop operation won't clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Stop PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Stop PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_clear_count` (*pcnt\_unit\_handle\_t* unit)

Clear PCNT pulse count value to zero.

---

**Note:** It's recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Clear PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Clear PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Clear PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_get_count` (*pcnt\_unit\_handle\_t* unit, int \*value)

Get PCNT count value.

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `value` -- [out] Returned count value

**Returns**

- `ESP_OK`: Get PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Get PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Get PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_register_event_callbacks` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for PCNT unit.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `pcnt_unit_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the unit is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* **pcnt\_unit\_add\_watch\_point** (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

**Parameters**

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** -- **[in]** Value to be watched

**Returns**

- **ESP\_OK**: Add watch point successfully
- **ESP\_ERR\_INVALID\_ARG**: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- **ESP\_ERR\_INVALID\_STATE**: Add watch point failed because the same watch point has already been added
- **ESP\_ERR\_NOT\_FOUND**: Add watch point failed because no more hardware watch point can be configured
- **ESP\_FAIL**: Add watch point failed because of other error

*esp\_err\_t* **pcnt\_unit\_remove\_watch\_point** (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Remove a watch point for PCNT unit.

**Parameters**

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** -- **[in]** Watch point value

**Returns**

- **ESP\_OK**: Remove watch point successfully
- **ESP\_ERR\_INVALID\_ARG**: Remove watch point failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE**: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- **ESP\_FAIL**: Remove watch point failed because of other error

*esp\_err\_t* **pcnt\_new\_channel** (*pcnt\_unit\_handle\_t* unit, const *pcnt\_chan\_config\_t* \*config, *pcnt\_channel\_handle\_t* \*ret\_chan)

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

---

**Note:** This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

---

**Parameters**

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **config** -- **[in]** PCNT channel configuration
- **ret\_chan** -- **[out]** Returned channel handle

**Returns**

- **ESP\_OK**: Create PCNT channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Create PCNT channel failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create PCNT channel failed because of insufficient memory
- **ESP\_ERR\_NOT\_FOUND**: Create PCNT channel failed because all PCNT channels are used up and no more free one
- **ESP\_ERR\_INVALID\_STATE**: Create PCNT channel failed because the unit is not in the init state
- **ESP\_FAIL**: Create PCNT channel failed because of other error

*esp\_err\_t* **pcnt\_del\_channel** (*pcnt\_channel\_handle\_t* chan)

Delete the PCNT channel.

**Parameters** **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`

**Returns**

- **ESP\_OK**: Delete the PCNT channel successfully

- `ESP_ERR_INVALID_ARG`: Delete the PCNT channel failed because of invalid argument
- `ESP_FAIL`: Delete the PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_edge_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_edge\_action\_t* pos\_act, *pcnt\_channel\_edge\_action\_t* neg\_act)

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

#### Parameters

- **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- **pos\_act** -- **[in]** Action on posedge signal
- **neg\_act** -- **[in]** Action on negedge signal

#### Returns

- `ESP_OK`: Set edge action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set edge action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set edge action for PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_level_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_level\_action\_t* high\_act, *pcnt\_channel\_level\_action\_t* low\_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

#### Parameters

- **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- **high\_act** -- **[in]** Action on high level signal
- **low\_act** -- **[in]** Action on low level signal

#### Returns

- `ESP_OK`: Set level action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set level action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set level action for PCNT channel failed because of other error

## Structures

struct `pcnt_watch_event_data_t`

PCNT watch event data.

## Public Members

int `watch_point_value`

Watch point value that triggered the event

*pcnt\_unit\_zero\_cross\_mode\_t* `zero_cross_mode`

Zero cross mode

struct `pcnt_event_callbacks_t`

Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_PCNT\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

### Public Members

#### *pcnt\_watch\_cb\_t* on\_reach

Called when PCNT unit counter reaches any watch point

struct **pcnt\_unit\_config\_t**

PCNT unit configuration.

### Public Members

int **low\_limit**

Low limitation of the count unit, should be lower than 0

int **high\_limit**

High limitation of the count unit, should be higher than 0

int **intr\_priority**

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **accum\_count**

Whether to accumulate the count value when overflows at the high/low limit

struct *pcnt\_unit\_config\_t*::[anonymous] **flags**

Extra flags

struct **pcnt\_chan\_config\_t**

PCNT channel configuration.

### Public Members

int **edge\_gpio\_num**

GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int **level\_gpio\_num**

GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32\_t **invert\_edge\_input**

Invert the input edge signal

uint32\_t **invert\_level\_input**

Invert the input level signal

uint32\_t **virt\_edge\_io\_level**

Virtual edge IO level, 0: low, 1: high. Only valid when `edge_gpio_num` is set to -1

uint32\_t **virt\_level\_io\_level**

Virtual level IO level, 0: low, 1: high. Only valid when `level_gpio_num` is set to -1

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt\_chan\_config\_t*::[anonymous] **flags**

Channel config flags

struct **pcnt\_glitch\_filter\_config\_t**

PCNT glitch filter configuration.

### Public Members

uint32\_t **max\_glitch\_ns**

Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

struct **pcnt\_clear\_signal\_config\_t**

PCNT clear signal configuration.

### Public Members

int **clear\_signal\_gpio\_num**

GPIO number used by the clear signal, the default active level is high, input mode with pull down enabled

uint32\_t **invert\_clear\_signal**

Invert the clear input signal and set input mode with pull up

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt\_clear\_signal\_config\_t*::[anonymous] **flags**

clear signal config flags

### Type Definitions

typedef struct *pcnt\_unit\_t* \***pcnt\_unit\_handle\_t**

Type of PCNT unit handle.

typedef struct *pcnt\_chan\_t* \***pcnt\_channel\_handle\_t**

Type of PCNT channel handle.

typedef bool (\***pcnt\_watch\_cb\_t**)(*pcnt\_unit\_handle\_t* unit, const *pcnt\_watch\_event\_data\_t* \*edata, void \*user\_ctx)

PCNT watch event callback prototype.

---

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

---

**Param unit [in]** PCNT unit handle

**Param edata [in]** PCNT event data, fed by the driver

**Param user\_ctx [in]** User data, passed from `pcnt_unit_register_event_callbacks()`

**Return** Whether a high priority task has been woken up by this function

### Header File

- [components/hal/include/hal/pcnt\\_types.h](#)
- This header file can be included with:

```
#include "hal/pcnt_types.h"
```

### Enumerations

enum `pcnt_channel_level_action_t`

PCNT channel action on control level.

*Values:*

enumerator `PCNT_CHANNEL_LEVEL_ACTION_KEEP`

Keep current count mode

enumerator `PCNT_CHANNEL_LEVEL_ACTION_INVERSE`

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator `PCNT_CHANNEL_LEVEL_ACTION_HOLD`

Hold current count value

enum `pcnt_channel_edge_action_t`

PCNT channel action on signal edge.

*Values:*

enumerator `PCNT_CHANNEL_EDGE_ACTION_HOLD`

Hold current count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_INCREASE`

Increase count value

enumerator `PCNT_CHANNEL_EDGE_ACTION_DECREASE`

Decrease count value

enum `pcnt_unit_zero_cross_mode_t`

PCNT unit zero cross mode.

*Values:*

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_ZERO**

start from positive value, end to zero, i.e. +N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_ZERO**

start from negative value, end to zero, i.e. -N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_POS**

start from negative value, end to positive value, i.e. -N->+M

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_NEG**

start from positive value, end to negative value, i.e. +N->-M

## 2.5.16 Remote Control Transceiver (RMT)

### Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-P4 contains multiple channels in the RMT peripheral<sup>1</sup>. Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols** The RMT hardware defines data in its own pattern -- the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal's duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal's logic level, i.e., high or low.

**RMT Transmitter Overview** The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver encodes the user's data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview** The data path and control path of an RMT RX channel is illustrated in the figure below:

---

<sup>1</sup> Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation*.

Fig. 17: Structure of RMT symbols (L - signal level)

Fig. 18: RMT Transmitter Overview

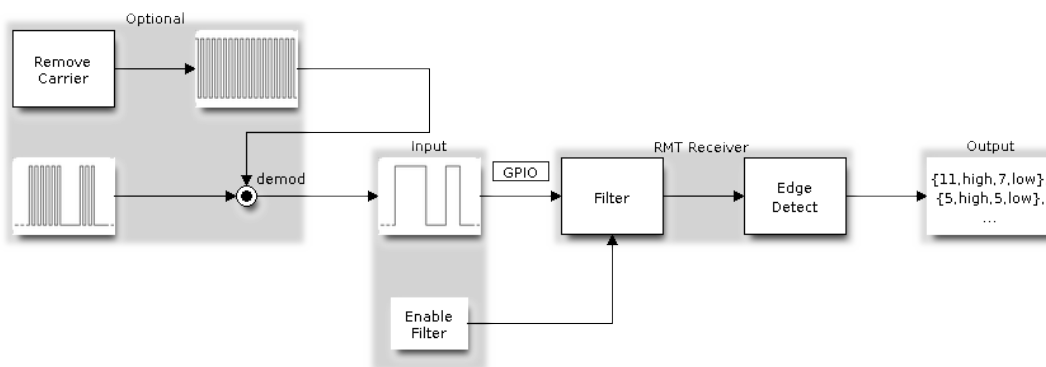

Fig. 19: RMT Receiver Overview

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal's stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

## Functional Overview

The description of the RMT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- *Carrier Modulation and Demodulation* - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- *Register Event Callbacks* - covers how to register user-provided event callbacks to receive RMT channel events.
- *Enable and Disable Channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for a TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for an RX channel.
- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- *RMT Encoder* - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- *Power Management* - describes how different clock sources affects power consumption.
- *IRAM Safe* - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation** Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel** To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the *Power Management* section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, you can set a larger value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel's assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .trans_queue_depth = 4,           // set the number of transactions that can
    ↪pend in the background
    .flags.invert_out = false,        // do not invert output signal
    .flags.with_dma = false,         // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

**Install RMT RX Channel** To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the [Power Management](#) section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form

(1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2,                    // GPIO number
    .flags.invert_in = false,         // do not invert input signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

**Note:** Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

**Uninstall RMT Channel** If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

**Carrier Modulation and Demodulation** The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal's frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

**Note:** For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,                // duty cycle 33%
    .frequency_hz = 38000,             // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_
↔level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));
```

(continues on next page)

(continued from previous page)

```

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,           // duty cycle 33%
    .frequency_hz = 25000,       // 25 KHz carrier, should be smaller than
    →the transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));

```

**Register Event Callbacks** When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver's ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the "trans-done" event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid during the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

**Enable and Disable Channel** `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`.

`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

**Initiate TX Transaction** RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to [RMT Encoder](#).

Once you created an encoder, you can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, you also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The "trans-done" event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the "trans-done" event is when the specified number of iterations have completed.

---

**Note:** The **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

---

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
- `rmt_transmit_config_t::queue_nonblocking` sets whether to wait for a free slot in the transaction queue when it is full. If this value is set to `true`, then the function will return with an error code `ESP_ERR_INVALID_STATE` when the queue is full. Otherwise, the function will block until a free slot is available in the queue.

---

**Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
  - Customize an encoder and construct an infinite loop in the encoding function. See also [RMT Encoder](#).
- 

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission** In some real-time control applications (e.g., to make two robotic arms move simultaneously), you do not want any time drift between different channels. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

**Install RMT Sync Manager** To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

Fig. 20: RMT TX Sync

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that
        ↪ can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),

```

(continues on next page)

(continued from previous page)

```
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
↳num * 3, &transmit_config));
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for_
↳tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
↳num * 3, &transmit_config));
```

**Initiate RX Transaction** As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver notifies the driver to copy away the accumulated symbols in a ping-pong way.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the buffer parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also *Register Event Callbacks* for more information.

```
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_
↳rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
```

(continues on next page)

(continued from previous page)

```

        .signal_range_min_ns = 1250, // the shortest duration for NEC signal is_
↪560 μs, 1250 ns < 560 μs, valid signal is not treated as noise
        .signal_range_max_ns = 12000000, // the longest duration for NEC signal is_
↪9000 μs, 12000000 ns > 9000 μs, the receive does not stop early
};

rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a_
↪standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
↪config));
// wait for the RX-done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

```

**RMT Encoder** An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, the driver utilizes a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also [Composite Pattern](#) for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
  - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
  - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
  - If the result contains `RMT_ENCODING_MEM_FULL`, the program needs to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
  - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

**Copy Encoder** A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

**Bytes Encoder** A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

Then you can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base;           // the base "class" declares the standard_
    ↪encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading_
    ↪and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address_
    ↪and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT_
    ↪representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT_
    ↪representation
    int state; // record the current encoding state, i.e., we are in which_
    ↪encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t_
    ↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
    ↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
    ↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
            ↪encoder->nec_leading_symbol,
                                sizeof(rmt_symbol_word_t), &
            ↪session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; // we can only switch to the next state when_
            ↪the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding_
            ↪artifacts
            }
            // fall-through
            case 1: // send address
                encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
            ↪code->address, sizeof(uint16_t), &session_state);
                if (session_state & RMT_ENCODING_COMPLETE) {
                    nec_encoder->state = 2; // we can only switch to the next state when_
            ↪the current encoder finished
                }
                if (session_state & RMT_ENCODING_MEM_FULL) {
                    state |= RMT_ENCODING_MEM_FULL;
                    goto out; // yield if there is no free space to put other encoding_
            ↪artifacts
                }
    }
}

```

(continues on next page)

```

    }
    // fall-through
    case 2: // send command
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->command, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 3; // we can only switch to the next state when
↪the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
↪artifacts
        }
    // fall-through
    case 3: // send ending code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_ending_symbol,
                                                    sizeof(rmt_symbol_word_t), &
↪session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = RMT_ENCODING_RESET; // back to the initial
↪encoding session
            state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding
↪has finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
↪artifacts
        }
    }
out:
    *ret_state = state;
    return encoded_symbols;
}

```

A full sample code can be found in [peripherals/rmt/ir\\_nec\\_transceiver](#). In the above snippet, we use a switch-case and several goto statements to implement a [Finite-state machine](#). With this pattern, users can construct much more complex IR protocols.

**Power Management** When power management is enabled, i.e., [CONFIG\\_PM\\_ENABLE](#) is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter. However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type [ESP\\_PM\\_APB\\_FREQ\\_MAX](#). Whenever the user creates an RMT channel that has selected [RMT\\_CLK\\_SRC\\_APB](#) as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by [rmt\\_enable\(\)](#). Likewise, the driver releases the lock after [rmt\\_disable\(\)](#) is called for the same channel. This also reveals that the [rmt\\_enable\(\)](#) and [rmt\\_disable\(\)](#) should appear in pairs.

If the channel clock source is selected to others like [RMT\\_CLK\\_SRC\\_XTAL](#), then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM<sup>2</sup>
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt handler to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Another Kconfig option `CONFIG_RMT_RECV_FUNC_IN_IRAM` can place `rmt_receive()` into the IRAM as well. So that the receive function can be used even when the flash cache is disabled.

**Thread Safety** The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

The following functions are allowed to use under ISR context as well.

- `rmt_receive()`

### Kconfig Options

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.
- `CONFIG_RMT_RECV_FUNC_IN_IRAM` controls where to place the RMT receive function (IRAM or Flash), see *IRAM Safe* for more information.

### Application Examples

- RMT-based RGB LED strip customized encoder: [peripherals/rmt/led\\_strip](#)
- RMT IR NEC protocol encoding and decoding: [peripherals/rmt/ir\\_nec\\_transceiver](#)
- RMT transactions in queue: [peripherals/rmt/musical\\_buzzer](#)
- RMT-based stepper motor with S-curve algorithm: [peripherals/rmt/stepper\\_motor](#)
- RMT infinite loop for driving DShot ESC: [peripherals/rmt/dshot\\_esc](#)
- RMT simulate 1-wire protocol (take DS18B20 as example): [peripherals/rmt/onewire](#)

### FAQ

- Why the RMT encoder results in more data than expected?

The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes **faster** than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 48.
- Place the encoding function in the IRAM.
- Enables the `rmt_tx_channel_config_t::with_dma` if it is available for your chip.

---

<sup>2</sup> The callback function, e.g., `rmt_tx_event_callbacks_t::on_trans_done`, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

## API Reference

### Header File

- [components/driver/rmt/include/driver/rmt\\_tx.h](#)
- This header file can be included with:

```
#include "driver/rmt_tx.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **rmt\_new\_tx\_channel** (const *rmt\_tx\_channel\_config\_t* \*config, *rmt\_channel\_handle\_t* \*ret\_chan)

Create a RMT TX channel.

#### Parameters

- **config** -- [in] TX channel configurations
- **ret\_chan** -- [out] Returned generic RMT channel handle

#### Returns

- **ESP\_OK**: Create RMT TX channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Create RMT TX channel failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create RMT TX channel failed because out of memory
- **ESP\_ERR\_NOT\_FOUND**: Create RMT TX channel failed because all RMT channels are used up and no more free one
- **ESP\_ERR\_NOT\_SUPPORTED**: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- **ESP\_FAIL**: Create RMT TX channel failed because of other error

*esp\_err\_t* **rmt\_transmit** (*rmt\_channel\_handle\_t* tx\_channel, *rmt\_encoder\_handle\_t* encoder, const void \*payload, size\_t payload\_bytes, const *rmt\_transmit\_config\_t* \*config)

Transmit data by RMT TX channel.

---

**Note:** This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there's another one under processing. Based on the setting of *rmt\_transmit\_config\_t::queue\_nonblocking*, if there're too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

---

---

**Note:** The data to be transmitted will be encoded into RMT symbols by the specific *encoder*.

---

#### Parameters

- **tx\_channel** -- [in] RMT TX channel that created by `rmt_new_tx_channel()`
- **encoder** -- [in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- **payload** -- [in] The raw data to be encoded into RMT symbols
- **payload\_bytes** -- [in] Size of the `payload` in bytes
- **config** -- [in] Transmission specific configuration

#### Returns

- **ESP\_OK**: Transmit data successfully
- **ESP\_ERR\_INVALID\_ARG**: Transmit data failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE**: Transmit data failed because channel is not enabled

- `ESP_ERR_NOT_SUPPORTED`: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- `ESP_FAIL`: Transmit data failed because of other error

*esp\_err\_t* `rmt_tx_wait_all_done` (*rmt\_channel\_handle\_t* tx\_channel, int timeout\_ms)

Wait for all pending TX transactions done.

---

**Note:** This function will block forever if the pending transaction can't be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

---

#### Parameters

- `tx_channel` -- **[in]** RMT TX channel that created by `rmt_new_tx_channel()`
- `timeout_ms` -- **[in]** Wait timeout, in ms. Specially, -1 means to wait forever.

#### Returns

- `ESP_OK`: Flush transactions successfully
- `ESP_ERR_INVALID_ARG`: Flush transactions failed because of invalid argument
- `ESP_ERR_TIMEOUT`: Flush transactions failed because of timeout
- `ESP_FAIL`: Flush transactions failed because of other error

*esp\_err\_t* `rmt_tx_register_event_callbacks` (*rmt\_channel\_handle\_t* tx\_channel, const *rmt\_tx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for RMT TX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- `tx_channel` -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()`
- `cbs` -- **[in]** Group of callback functions
- `user_data` -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `rmt_new_sync_manager` (const *rmt\_sync\_manager\_config\_t* \*config, *rmt\_sync\_manager\_handle\_t* \*ret\_synchro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

---

**Note:** All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

---

#### Parameters

- `config` -- **[in]** Synchronization manager configuration
- `ret_synchro` -- **[out]** Returned synchronization manager handle

**Returns**

- ESP\_OK: Create sync manager successfully
- ESP\_ERR\_INVALID\_ARG: Create sync manager failed because of invalid argument
- ESP\_ERR\_NOT\_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP\_ERR\_INVALID\_STATE: Create sync manager failed because not all channels are enabled
- ESP\_ERR\_NO\_MEM: Create sync manager failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP\_FAIL: Create sync manager failed because of other error

*esp\_err\_t* **rmt\_del\_sync\_manager** (*rmt\_sync\_manager\_handle\_t* synchro)

Delete synchronization manager.

**Parameters** **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- ESP\_OK: Delete the synchronization manager successfully
- ESP\_ERR\_INVALID\_ARG: Delete the synchronization manager failed because of invalid argument
- ESP\_FAIL: Delete the synchronization manager failed because of other error

*esp\_err\_t* **rmt\_sync\_reset** (*rmt\_sync\_manager\_handle\_t* synchro)

Reset synchronization manager.

**Parameters** **synchro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- ESP\_OK: Reset the synchronization manager successfully
- ESP\_ERR\_INVALID\_ARG: Reset the synchronization manager failed because of invalid argument
- ESP\_FAIL: Reset the synchronization manager failed because of other error

**Structures**

struct **rmt\_tx\_event\_callbacks\_t**

Group of RMT TX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_RMT\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

**Public Members**

*rmt\_tx\_done\_callback\_t* **on\_trans\_done**

Event callback, invoked when transmission is finished

struct **rmt\_tx\_channel\_config\_t**

RMT TX channel specific configuration.

### Public Members

`gpio_num_t` **gpio\_num**

GPIO number used by RMT TX channel. Set to -1 if unused

`rmt_clock_source_t` **clk\_src**

Clock source of RMT TX channel, channels in the same group must use the same clock source

`uint32_t` **resolution\_hz**

Channel clock resolution, in Hz

`size_t` **mem\_block\_symbols**

Size of memory block, in number of `rmt_symbol_word_t`, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

`size_t` **trans\_queue\_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background

`int` **intr\_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

`uint32_t` **invert\_out**

Whether to invert the RMT channel signal before output to GPIO pad

`uint32_t` **with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

`uint32_t` **io\_loop\_back**

The signal output from the GPIO will be fed to the input path as well

`uint32_t` **io\_od\_mode**

Configure the GPIO as open-drain mode

struct `rmt_tx_channel_config_t`::[anonymous] **flags**

TX channel config flags

struct **rmt\_transmit\_config\_t**

RMT transmit specific configuration.

### Public Members

`int` **loop\_count**

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

`uint32_t` **eot\_level**

Set the output level for the "End Of Transmission"

uint32\_t **queue\_nonblocking**

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *rmt\_transmit\_config\_t*::[anonymous] **flags**

Transmit specific config flags

struct **rmt\_sync\_manager\_config\_t**

Synchronous manager configuration.

## Public Members

const *rmt\_channel\_handle\_t*\***tx\_channel\_array**

Array of TX channels that are about to be managed by a synchronous controller

size\_t **array\_size**

Size of the *tx\_channel\_array*

## Header File

- [components/driver/rmt/include/driver/rmt\\_rx.h](#)
- This header file can be included with:

```
#include "driver/rmt_rx.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **rmt\_new\_rx\_channel** (const *rmt\_rx\_channel\_config\_t*\**config*, *rmt\_channel\_handle\_t*\**ret\_chan*)

Create a RMT RX channel.

### Parameters

- **config** -- [in] RX channel configurations
- **ret\_chan** -- [out] Returned generic RMT channel handle

### Returns

- **ESP\_OK**: Create RMT RX channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Create RMT RX channel failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create RMT RX channel failed because out of memory
- **ESP\_ERR\_NOT\_FOUND**: Create RMT RX channel failed because all RMT channels are used up and no more free one
- **ESP\_ERR\_NOT\_SUPPORTED**: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- **ESP\_FAIL**: Create RMT RX channel failed because of other error

*esp\_err\_t* **rmt\_receive** (*rmt\_channel\_handle\_t* *rx\_channel*, void\**buffer*, size\_t *buffer\_size*, const *rmt\_receive\_config\_t*\**config*)

Initiate a receive job for RMT RX channel.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

---

**Note:** This function can also be called in ISR context.

---

**Note:** If you want this function to work even when the flash cache is disabled, please enable the `CONFIG_RMT_RECV_FUNC_IN_IRAM` option.

---

#### Parameters

- **rx\_channel** -- **[in]** RMT RX channel that created by `rmt_new_rx_channel()`
- **buffer** -- **[in]** The buffer to store the received RMT symbols
- **buffer\_size** -- **[in]** size of the `buffer`, in bytes
- **config** -- **[in]** Receive specific configurations

#### Returns

- `ESP_OK`: Initiate receive job successfully
- `ESP_ERR_INVALID_ARG`: Initiate receive job failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Initiate receive job failed because channel is not enabled
- `ESP_FAIL`: Initiate receive job failed because of other error

*esp\_err\_t* `rmt_rx_register_event_callbacks` (*rmt\_channel\_handle\_t* rx\_channel, const *rmt\_rx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for RMT RX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- **rx\_channel** -- **[in]** RMT generic channel that created by `rmt_new_rx_channel()`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

#### Structures

struct `rmt_rx_event_callbacks_t`

Group of RMT RX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

#### *rmt\_rx\_done\_callback\_t* `on_recv_done`

Event callback, invoked when one RMT channel receiving transaction completes

struct **rmt\_rx\_channel\_config\_t**

RMT RX channel specific configuration.

### Public Members

#### `gpio_num_t` **gpio\_num**

GPIO number used by RMT RX channel. Set to -1 if unused

#### *rmt\_clock\_source\_t* **clk\_src**

Clock source of RMT RX channel, channels in the same group must use the same clock source

#### `uint32_t` **resolution\_hz**

Channel clock resolution, in Hz

#### `size_t` **mem\_block\_symbols**

Size of memory block, in number of *rmt\_symbol\_word\_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

#### `uint32_t` **invert\_in**

Whether to invert the incoming RMT channel signal

#### `uint32_t` **with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

#### `uint32_t` **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *rmt\_rx\_channel\_config\_t*::[anonymous] **flags**

RX channel config flags

#### `int` **intr\_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct **rmt\_receive\_config\_t**

RMT receive specific configuration.

## Public Members

uint32\_t **signal\_range\_min\_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32\_t **signal\_range\_max\_ns**

RMT will stop receiving if one symbol level has kept more than `signal_range_max_ns`

## Header File

- [components/driver/rmt/include/driver/rmt\\_common.h](#)
- This header file can be included with:

```
#include "driver/rmt_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **rmt\_del\_channel** (*rmt\_channel\_handle\_t* channel)

Delete an RMT channel.

**Parameters** **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

### Returns

- `ESP_OK`: Delete RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Delete RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete RMT channel failed because it is still in working
- `ESP_FAIL`: Delete RMT channel failed because of other error

*esp\_err\_t* **rmt\_apply\_carrier** (*rmt\_channel\_handle\_t* channel, const *rmt\_carrier\_config\_t* \*config)

Apply modulation feature for TX channel or demodulation feature for RX channel.

### Parameters

- **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** -- **[in]** Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

### Returns

- `ESP_OK`: Apply carrier configuration successfully
- `ESP_ERR_INVALID_ARG`: Apply carrier configuration failed because of invalid argument
- `ESP_FAIL`: Apply carrier configuration failed because of other error

*esp\_err\_t* **rmt\_enable** (*rmt\_channel\_handle\_t* channel)

Enable the RMT channel.

---

**Note:** This function will acquire a PM lock that might be installed during channel allocation

---

**Parameters** **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- ESP\_OK: Enable RMT channel successfully
- ESP\_ERR\_INVALID\_ARG: Enable RMT channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable RMT channel failed because it's enabled already
- ESP\_FAIL: Enable RMT channel failed because of other error

*esp\_err\_t* **rmt\_disable** (*rmt\_channel\_handle\_t* channel)

Disable the RMT channel.

---

**Note:** This function will release a PM lock that might be installed during channel allocation

---

**Parameters** **channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- ESP\_OK: Disable RMT channel successfully
- ESP\_ERR\_INVALID\_ARG: Disable RMT channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable RMT channel failed because it's not enabled yet
- ESP\_FAIL: Disable RMT channel failed because of other error

**Structures**

struct **rmt\_carrier\_config\_t**

RMT carrier wave configuration (for either modulation or demodulation)

**Public Members**

uint32\_t **frequency\_hz**

Carrier wave frequency, in Hz, 0 means disabling the carrier

float **duty\_cycle**

Carrier wave duty cycle (0~100%)

uint32\_t **polarity\_active\_low**

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32\_t **always\_on**

If set, the carrier can always exist even there's not transfer undergoing

struct *rmt\_carrier\_config\_t*::[anonymous] **flags**

Carrier config flags

**Header File**

- `components/driver/rmt/include/driver/rmt_encoder.h`
- This header file can be included with:

```
#include "driver/rmt_encoder.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **rmt\_new\_bytes\_encoder** (const *rmt\_bytes\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

### Parameters

- **config** -- [in] Bytes encoder configuration
- **ret\_encoder** -- [out] Returned encoder handle

### Returns

- ESP\_OK: Create RMT bytes encoder successfully
- ESP\_ERR\_INVALID\_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create RMT bytes encoder failed because out of memory
- ESP\_FAIL: Create RMT bytes encoder failed because of other error

*esp\_err\_t* **rmt\_bytes\_encoder\_update\_config** (*rmt\_encoder\_handle\_t* bytes\_encoder, const *rmt\_bytes\_encoder\_config\_t* \*config)

Update the configuration of the bytes encoder.

---

**Note:** The configurations of the bytes encoder is also set up by `rmt_new_bytes_encoder()`. This function is used to update the configuration of the bytes encoder at runtime.

---

### Parameters

- **bytes\_encoder** -- [in] Bytes encoder handle, created by e.g `rmt_new_bytes_encoder()`
- **config** -- [in] Bytes encoder configuration

### Returns

- ESP\_OK: Update RMT bytes encoder successfully
- ESP\_ERR\_INVALID\_ARG: Update RMT bytes encoder failed because of invalid argument
- ESP\_FAIL: Update RMT bytes encoder failed because of other error

*esp\_err\_t* **rmt\_new\_copy\_encoder** (const *rmt\_copy\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

### Parameters

- **config** -- [in] Copy encoder configuration
- **ret\_encoder** -- [out] Returned encoder handle

### Returns

- ESP\_OK: Create RMT copy encoder successfully
- ESP\_ERR\_INVALID\_ARG: Create RMT copy encoder failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create RMT copy encoder failed because out of memory
- ESP\_FAIL: Create RMT copy encoder failed because of other error

*esp\_err\_t* **rmt\_del\_encoder** (*rmt\_encoder\_handle\_t* encoder)

Delete RMT encoder.

**Parameters** **encoder** -- [in] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

### Returns

- ESP\_OK: Delete RMT encoder successfully
- ESP\_ERR\_INVALID\_ARG: Delete RMT encoder failed because of invalid argument
- ESP\_FAIL: Delete RMT encoder failed because of other error

*esp\_err\_t* **rmt\_encoder\_reset** (*rmt\_encoder\_handle\_t* encoder)

Reset RMT encoder.

**Parameters** **encoder** -- [in] RMT encoder handle, created by e.g. `rmt_new_bytes_encoder()`

**Returns**

- ESP\_OK: Reset RMT encoder successfully
- ESP\_ERR\_INVALID\_ARG: Reset RMT encoder failed because of invalid argument
- ESP\_FAIL: Reset RMT encoder failed because of other error

void \***rmt\_alloc\_encoder\_mem** (size\_t size)

A helper function to allocate a proper memory for RMT encoder.

**Parameters** **size** -- Size of memory to be allocated

**Returns** Pointer to the allocated memory if the allocation is successful, NULL otherwise

## Structures

struct **rmt\_encoder\_t**

Interface of RMT encoder.

## Public Members

size\_t (**\*encode**)(*rmt\_encoder\_t* \*encoder, *rmt\_channel\_handle\_t* tx\_channel, const void \*primary\_data, size\_t data\_size, *rmt\_encode\_state\_t* \*ret\_state)

Encode the user data into RMT symbols and write into RMT memory.

---

**Note:** The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

---

---

**Note:** It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

---

**Param encoder** [in] Encoder handle

**Param tx\_channel** [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`

**Param primary\_data** [in] App data to be encoded into RMT symbols

**Param data\_size** [in] Size of primary\_data, in bytes

**Param ret\_state** [out] Returned current encoder's state

**Return** Number of RMT symbols that the primary data has been encoded into

*esp\_err\_t* (**\*reset**)(*rmt\_encoder\_t* \*encoder)

Reset encoding state.

**Param encoder** [in] Encoder handle

**Return**

- ESP\_OK: reset encoder successfully
- ESP\_FAIL: reset encoder failed

`esp_err_t (*del)(rmt_encoder_t *encoder)`

Delete encoder object.

**Param encoder [in]** Encoder handle

**Return**

- ESP\_OK: delete encoder successfully
- ESP\_FAIL: delete encoder failed

struct **rmt\_bytes\_encoder\_config\_t**

Bytes encoder configuration.

### Public Members

`rmt_symbol_word_t bit0`

How to represent BIT0 in RMT symbol

`rmt_symbol_word_t bit1`

How to represent BIT1 in RMT symbol

`uint32_t msb_first`

Whether to encode MSB bit first

struct `rmt_bytes_encoder_config_t::[anonymous] flags`

Encoder config flag

struct **rmt\_copy\_encoder\_config\_t**

Copy encoder configuration.

### Enumerations

enum **rmt\_encode\_state\_t**

RMT encoding state.

*Values:*

enumerator **RMT\_ENCODING\_RESET**

The encoding session is in reset state

enumerator **RMT\_ENCODING\_COMPLETE**

The encoding session is finished, the caller can continue with subsequent encoding

enumerator **RMT\_ENCODING\_MEM\_FULL**

The encoding artifact memory is full, the caller should return from current encoding session

### Header File

- `components/driver/rmt/include/driver/rmt_types.h`
- This header file can be included with:

```
#include "driver/rmt_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Structures

struct **rmt\_tx\_done\_event\_data\_t**

Type of RMT TX done event data.

### Public Members

size\_t **num\_symbols**

The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct **rmt\_rx\_done\_event\_data\_t**

Type of RMT RX done event data.

### Public Members

*rmt\_symbol\_word\_t* \***received\_symbols**

Point to the received RMT symbols

size\_t **num\_symbols**

The number of received RMT symbols

## Type Definitions

typedef struct rmt\_channel\_t \***rmt\_channel\_handle\_t**

Type of RMT channel handle.

typedef struct rmt\_sync\_manager\_t \***rmt\_sync\_manager\_handle\_t**

Type of RMT synchronization manager handle.

typedef struct *rmt\_encoder\_t* \***rmt\_encoder\_handle\_t**

Type of RMT encoder handle.

typedef bool (\***rmt\_tx\_done\_callback\_t**)(*rmt\_channel\_handle\_t* tx\_chan, const *rmt\_tx\_done\_event\_data\_t* \*edata, void \*user\_ctx)

Prototype of RMT event callback.

**Param tx\_chan [in]** RMT channel handle, created from `rmt_new_tx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `rmt_tx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this callback function

```
typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const  
rmt_rx_done_event_data_t *edata, void *user_ctx)
```

Prototype of RMT event callback.

**Param rx\_chan [in]** RMT channel handle, created from `rmt_new_rx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `rmt_rx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

## Header File

- `components/hal/include/hal/rmt_types.h`
- This header file can be included with:

```
#include "hal/rmt_types.h"
```

## Unions

```
union rmt_symbol_word_t
```

`#include <rmt_types.h>` The layout of RMT symbol stored in memory, which is decided by the hardware design.

### Public Members

```
uint16_t duration0
```

Duration of level0

```
uint16_t level0
```

Level of the first part

```
uint16_t duration1
```

Duration of level1

```
uint16_t level1
```

Level of the second part

```
struct rmt_symbol_word_t::[anonymous] [anonymous]
```

```
uint32_t val
```

Equivalent unsigned value for the RMT symbol

## Type Definitions

```
typedef soc_periph_rmt_clk_src_t rmt_clock_source_t
```

RMT group clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

## 2.5.17 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products needs to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32-P4 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

This document has the following structure:

- [Overview of compatibility](#) between the default pull states on pins of Espressif's products and the states required by the SD bus
- [Solutions](#) - ideas on how to resolve compatibility issues
- [Related information](#) - other relevant information

### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

**Systems on a Chip (SoCs)** ESP32-P4 SDMMC host controller allows using any of GPIOs for any of SD interface signals. However, it is recommended to avoid using strapping GPIOs, GPIOs with internal weak pull-downs and GPIOs commonly used for other purposes to prevent conflicts:

### Systems in Packages (SIP)

### Modules

### Development Boards

### Solutions

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif's development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

### Related Information

## 2.5.18 SDMMC Host Driver

## Overview

ESP32-P4's SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device, or eMMC chip.

Both slots `SDMMC_HOST_SLOT_0` and `SDMMC_HOST_SLOT_1` support 1-, 4- and 8-line SD interfaces. The slots are connected to ESP32-P4 GPIOs using the GPIO matrix. This means that any GPIO may be used for each of the SD card signals.

## Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed (40 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed DDR (40 MHz): 4-line with 3.3 V eMMC

Speed modes not supported at present:

- High Speed DDR mode: 8-line eMMC
- UHS-I 1.8 V modes: 4-line SD cards

## Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

## Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t`, i.e., `SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`, SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

If you need a specific frequency other than standard speeds, you are free to use any value from within an appropriate range of the SD interface given (SDMMC or SDSPI). However, the real clock frequency shall be calculated by the underlying driver and the value can be different from the one required.

For the SDMMC, `max_freq_khz` works as the upper limit so the final frequency value shall be always lower or equal. For the SDSPI, the nearest fitting frequency is supplied and thus the value can be greater than/equal to/lower than `max_freq_khz`.

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

## Configuring GPIOs

ESP32-P4 SDMMC Host can be configured to use arbitrary GPIOs for each of the signals. Configuration is performed by setting members of `sdmmc_slot_config_t` structure.

For example, to use GPIOs 1-6 for CLK, CMD, and D0-D3 signals respectively:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.clk = GPIO_NUM_1;
slot.cmd = GPIO_NUM_2;
slot.d0 = GPIO_NUM_3;
slot.d1 = GPIO_NUM_4;
slot.d2 = GPIO_NUM_5;
slot.d3 = GPIO_NUM_6;
```

It is also possible to configure Card Detect and Write Protect pins. Similar to other signals, set `cd` and `wp` members of the same structure:

```
slot.cd = GPIO_NUM_7;
slot.wp = GPIO_NUM_8;
```

`SDMMC_SLOT_CONFIG_DEFAULT` sets both to `GPIO_NUM_NC`, meaning that by default the signals are not used.

Once `sdmmc_slot_config_t` structure is initialized this way, you can use it when calling `sdmmc_host_init_slot()` or one of the higher level functions (such as `esp_vfs_fat_sdmmc_mount()`).

## DDR Mode for eMMC Chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping the `SDMMC_FREQ_HIGHSPEED` frequency, clear the `SDMMC_HOST_FLAG_DDR` bit in `sdmmc_host_t::flags` field of the `sdmmc_host_t`:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

## API Reference

### Header File

- `components/driver/sdmmc/include/driver/sdmmc_host.h`
- This header file can be included with:

```
#include "driver/sdmmc_host.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

REQUIRES driver

or

PRIV\_REQUIRES driver

## Functions

*esp\_err\_t* **sdmmc\_host\_init** (void)

Initialize SDMMC host peripheral.

---

**Note:** This function is not thread safe

---

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdmmc_host_init` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated

*esp\_err\_t* **sdmmc\_host\_init\_slot** (int slot, const *sdmmc\_slot\_config\_t* \*slot\_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1\_\* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2\_\* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

---

**Note:** This function is not thread safe

---

### Parameters

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **slot\_config** -- additional configuration for the slot

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if host has not been initialized using `sdmmc_host_init`

*esp\_err\_t* **sdmmc\_host\_set\_bus\_width** (int slot, size\_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD\_APP\_SET\_BUS\_WIDTH)

---

**Note:** This function is not thread safe

---

### Parameters

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **width** -- bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if slot number or width is not valid

size\_t **sdmmc\_host\_get\_slot\_width** (int slot)

Get bus width configured in `sdmmc_host_init_slot` to be used for data transfer.

**Parameters** **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)

**Returns** configured bus width of the specified slot.

*esp\_err\_t* **sdmmc\_host\_set\_card\_clk** (int slot, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**Note:** This function is not thread safe

---

#### Parameters

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **freq\_khz** -- card clock frequency, in kHz

#### Returns

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdmmc\_host\_set\_bus\_ddr\_mode** (int slot, bool ddr\_enabled)

Enable or disable DDR mode of SD interface.

#### Parameters

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **ddr\_enabled** -- enable or disable DDR mode

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if DDR mode is not supported on this slot

*esp\_err\_t* **sdmmc\_host\_set\_cclk\_always\_on** (int slot, bool cclk\_always\_on)

Enable or disable always-on card clock. When `cclk_always_on` is false, the host controller is allowed to shut down the card clock between the commands. When `cclk_always_on` is true, the clock is generated even if no command is in progress.

#### Parameters

- **slot** -- slot number
- **cclk\_always\_on** -- enable or disable always-on clock

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the slot number is invalid

*esp\_err\_t* **sdmmc\_host\_do\_transaction** (int slot, *sdmmc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Attention** Data buffer passed in `cmdinfo->data` must be in DMA capable memory

---

**Note:** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

---

#### Parameters

- **slot** -- slot number (SDMMC\_HOST\_SLOT\_0 or SDMMC\_HOST\_SLOT\_1)
- **cmdinfo** -- pointer to structure describing command and data to transfer

#### Returns

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed

- `ESP_ERR_INVALID_RESPONSE` if the card has sent an invalid response
- `ESP_ERR_INVALID_SIZE` if the size of data transfer is not valid in SD protocol
- `ESP_ERR_INVALID_ARG` if the data buffer is not in DMA capable memory

*esp\_err\_t* `sdmmc_host_io_int_enable` (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Parameters** `slot` -- slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)

**Returns** returns `ESP_OK`, other errors possible in the future

*esp\_err\_t* `sdmmc_host_io_int_wait` (int slot, TickType\_t timeout\_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**Parameters**

- `slot` -- slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `timeout_ticks` -- number of RTOS ticks to wait for the interrupt

**Returns**

- `ESP_OK` on success (interrupt received)
- `ESP_ERR_TIMEOUT` if the interrupt did not occur within `timeout_ticks`

*esp\_err\_t* `sdmmc_host_deinit` (void)

Disable SDMMC host and release allocated resources.

---

**Note:** This function is not thread safe

---

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `sdmmc_host_init` function has not been called

*esp\_err\_t* `sdmmc_host_get_real_freq` (int slot, int \*real\_freq\_khz)

Provides a real frequency used for an SD card installed on specific slot of SD/MMC host controller.

This function calculates real working frequency given by current SD/MMC host controller setup for required slot: it reads associated host and card dividers from corresponding SDMMC registers, calculates respective frequency and stores the value into the 'real\_freq\_khz' parameter

**Parameters**

- `slot` -- slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)
- `real_freq_khz` -- [out] output parameter for the result frequency (in kHz)

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` on `real_freq_khz == NULL` or invalid slot number used

*esp\_err\_t* `sdmmc_host_set_input_delay` (int slot, *sdmmc\_delay\_phase\_t* delay\_phase)

set input delay

- This API sets delay when the SDMMC Host samples the signal from the SD Slave.
- This API will check if the given `delay_phase` is valid or not.
- This API will print out the delay time, in picosecond (ps)

---

**Note:** ESP32 doesn't support this feature, you will get an `ESP_ERR_NOT_SUPPORTED`

---

**Parameters**

- `slot` -- slot number (`SDMMC_HOST_SLOT_0` or `SDMMC_HOST_SLOT_1`)

- **delay\_phase** -- delay phase, this API will convert the phase into picoseconds and print it out

**Returns**

- ESP\_OK: ON success.
- ESP\_ERR\_INVALID\_ARG: Invalid argument.
- ESP\_ERR\_NOT\_SUPPORTED: ESP32 doesn't support this feature.

**Structures**

struct **sdmmc\_slot\_config\_t**

Extra configuration for SDMMC peripheral slot

**Public Members**

gpio\_num\_t **clk**

GPIO number of CLK signal.

gpio\_num\_t **cmd**

GPIO number of CMD signal.

gpio\_num\_t **d0**

GPIO number of D0 signal.

gpio\_num\_t **d1**

GPIO number of D1 signal.

gpio\_num\_t **d2**

GPIO number of D2 signal.

gpio\_num\_t **d3**

GPIO number of D3 signal.

gpio\_num\_t **d4**

GPIO number of D4 signal. Ignored in 1- or 4- line mode.

gpio\_num\_t **d5**

GPIO number of D5 signal. Ignored in 1- or 4- line mode.

gpio\_num\_t **d6**

GPIO number of D6 signal. Ignored in 1- or 4- line mode.

gpio\_num\_t **d7**

GPIO number of D7 signal. Ignored in 1- or 4- line mode.

gpio\_num\_t **gpio\_cd**

GPIO number of card detect signal.

gpio\_num\_t **cd**

GPIO number of card detect signal; shorter name.

`gpio_num_t` **gpio\_wp**

GPIO number of write protect signal.

`gpio_num_t` **wp**

GPIO number of write protect signal; shorter name.

`uint8_t` **width**

Bus width used by the slot (might be less than the max width supported)

`uint32_t` **flags**

Features used by this slot.

## Macros

### **SDMMC\_SLOT\_FLAG\_INTERNAL\_PULLUP**

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

### **SDMMC\_SLOT\_FLAG\_WP\_ACTIVE\_HIGH**

GPIO write protect polarity. 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

## 2.5.19 SD SPI Host Driver

### Overview

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle `sdspi_dev_handle_t`, which returns when the device is attached to an SPI bus by calling `sdspi_host_init_device()`. It is important to note that the SPI bus should be initialized beforehand by `spi_bus_initialize()`.

With the help of *SPI Master Driver* the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

### How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize the structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use the `SDSPI_HOST_DEFAULT` macro to initialize the `sdmmc_host_t` structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device SD SPI handle just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

## Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [SD/SDIO/MMC Driver](#).

---

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see [Sharing the SPI Bus Among SD Cards and Other SPI Devices](#).

## Related Docs

### Sharing the SPI Bus Among SD Cards and Other SPI Devices

The SD card has an SPI mode, enabling it to function as an SPI device, but there are some restrictions that we need to pay attention to.

**Pin Loading of Other Devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC Loading** SD cards, designed for high-speed communications, have small pin capacitors (AC loading) to work until 50 MHz. However, the other attached devices will increase the pin's AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother, i.e., the gradient of the edge is smaller. The setup timing requirements of an SD card may be violated when the card is connected to a bus with a high AC load. Even worse, high AC loads may cause the SD card and other SPI devices to fail to properly resolve clock signals from the host, affecting communication stability.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors. The larger the pin capacity, the greater the pin response time, the smaller the max frequency the SD bus can work.

To see if your pin AC loading is too heavy, you can try the following tests:

Terminology:

- **launch edge:** at which clock edge the data starts to toggle;
- **latch edge:** at which clock edge the data is supposed to be sampled by the receiver. For SD card, it is the rising edge.

1. Use an oscilloscope to see the clock and compare the data line to the clock.
  - If you see the clock is not fast enough, e.g., the rising/falling edge is longer than 1/4 of the clock cycle, it means the clock is skewed too much.
  - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

You may also observe the corresponding phenomenon that data delayed largely from the launching edge of the clock with logic analyzers. But it is not as obvious as with an oscilloscope.

2. Try to use a slower clock frequency.  
If the lower frequency can work while the higher frequency cannot, it is an indication that the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices with lower pin load or slow down the clock speed.

**DC Loading** The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700  $\mu$ A, otherwise, the device output may not be read correctly.

---

### Initialization Sequence

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed, such as setting `SDMMC_FREQ_PROBING` to 400 kHz for SD card, to avoid the influence of pin AC loading, as discussed in the previous section.

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed. Refer to [storage/sd\\_card](#) for further details.

1. Initialize the SPI bus properly by `spi_bus_initialize()`.
2. Tie the CS lines of all other devices than the SD card to idle state (by default it's high). This is to avoid conflicts with the SD card in the following step.

You can do this by either:

1. Attach devices to the SPI bus by calling `spi_bus_add_device()`. This function will by default initialize the GPIO that is used as CS to the idle level: high.
  2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
  3. Rely on the internal/external pull-up (**not recommended**) to pull up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up. For example, internal pull-down should be enabled.
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount()`.  
This step will put the SD card into the SPI mode, which **should** be done before all other SPI communications on the same bus. Otherwise, the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.  
If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before the next power cycle, i.e., powered down and powered up again.
  4. Now you can talk to other SPI devices freely!

## API Reference

### Header File

- `components/driver/spi/include/driver/sdspi_host.h`
- This header file can be included with:

```
#include "driver/sdspi_host.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **sdspi\_host\_init** (void)

Initialize SD SPI driver.

---

**Note:** This function is not thread safe

---

### Returns

- ESP\_OK on success
- other error codes may be returned in future versions

*esp\_err\_t* **sdspi\_host\_init\_device** (const *sdspi\_device\_config\_t* \*dev\_config, *sdspi\_dev\_handle\_t* \*out\_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

---

**Note:** This function is not thread safe

---

---

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

---

---

**Note:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

---

### Parameters

- **dev\_config** -- pointer to device configuration structure
- **out\_handle** -- Output of the handle to the sdspi device.

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_host_init_device` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

*esp\_err\_t* **sdspi\_host\_remove\_device** (*sdspi\_dev\_handle\_t* handle)

Remove an SD SPI device.

**Parameters** **handle** -- Handle of the SD SPI device

**Returns** Always ESP\_OK

*esp\_err\_t* **sdspi\_host\_do\_transaction** (*sdspi\_dev\_handle\_t* handle, *sdmmc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

---

**Note:** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

---

### Parameters

- **handle** -- Handle of the sdspi device
- **cmdinfo** -- pointer to structure describing command and data to transfer

### Returns

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed

- `ESP_ERR_INVALID_RESPONSE` if the card has sent an invalid response

*esp\_err\_t* **sdspi\_host\_set\_card\_clk** (*sdspi\_dev\_handle\_t* host, uint32\_t freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**Note:** This function is not thread safe

---

#### Parameters

- **host** -- Handle of the sdspi device
- **freq\_khz** -- card clock frequency, in kHz

#### Returns

- `ESP_OK` on success
- other error codes may be returned in the future

*esp\_err\_t* **sdspi\_host\_get\_real\_freq** (*sdspi\_dev\_handle\_t* handle, int \*real\_freq\_khz)

Calculate working frequency for specific device.

#### Parameters

- **handle** -- SDSPI device handle
- **real\_freq\_khz** -- [out] output parameter to hold the calculated frequency (in kHz)

#### Returns

- `ESP_ERR_INVALID_ARG` : handle is NULL or invalid or real\_freq\_khz parameter is NULL
- `ESP_OK` : Success

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using `sdspi_host_init`.

---

**Note:** This function is not thread safe

---

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (*sdspi\_dev\_handle\_t* handle)

Enable SDIO interrupt.

**Parameters** **handle** -- Handle of the sdspi device

#### Returns

- `ESP_OK` on success

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (*sdspi\_dev\_handle\_t* handle, TickType\_t timeout\_ticks)

Wait for SDIO interrupt until timeout.

#### Parameters

- **handle** -- Handle of the sdspi device
- **timeout\_ticks** -- Ticks to wait before timeout.

#### Returns

- `ESP_OK` on success

## Structures

struct **sdspi\_device\_config\_t**

Extra configuration for SD SPI device.

## Public Members

*spi\_host\_device\_t* **host\_id**

SPI host to use, SPIx\_HOST (see spi\_types.h).

gpio\_num\_t **gpio\_cs**

GPIO number of CS signal.

gpio\_num\_t **gpio\_cd**

GPIO number of card detect signal.

gpio\_num\_t **gpio\_wp**

GPIO number of write protect signal.

gpio\_num\_t **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

bool **gpio\_wp\_polarity**

GPIO write protect polarity 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

## Macros

**SDSPI\_DEFAULT\_HOST**

**SDSPI\_DEFAULT\_DMA**

**SDSPI\_HOST\_DEFAULT** ()

Default *sdmmc\_host\_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an sdspi device initialized by `sdspi_host_init_device()`.

**SDSPI\_SLOT\_NO\_CS**

indicates that card select line is not used

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_IO\_ACTIVE\_LOW**

**SDSPI\_DEVICE\_CONFIG\_DEFAULT** ()

Macro defining default configuration of SD SPI device.

## Type Definitions

```
typedef int sdspi_dev_handle_t
```

Handle representing an SD SPI device.

### 2.5.20 SPI Flash API

#### Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, and memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the *partition table*, see *Partitions API*

---

**Note:** `esp_partition_*` APIs are recommended to be used instead of the lower level `esp_flash_*` API functions when accessing the main SPI flash chip, since they conduct bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. `esp_flash_*` functions can still be used directly when accessing an external (secondary) SPI flash chip.

---

Different from the API before ESP-IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the "main" SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

---

**Note:** Instead of going through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to the limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations is also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

---

---

**Note:** Flash APIs after ESP-IDF v4.0 are no longer **atomic**. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

---

---

**Note:** Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

---

#### Support for Features of Flash Chips

**Quad/Dual Mode Chips** Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on the following chip types:

1. ISSI
2. GD

3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

---

**Note:** Only when one flash series listed above is supported by ESP32-P4, this flash series is supported by the chip driver by default. You can use `Component config > SPI Flash driver > Auto-detect flash chips` in `menuconfig` to enable/disable a flash series.

---

## Optional Features

**Optional Features for Flash** Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*
- *32-bit Address Flash Chips*

---

**Note:** When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

**Attention:** This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

**Auto Suspend & Resume** This feature is only supported on ESP32-S3, ESP32-C2, ESP32-C3, ESP32-C6, ESP32-H2 for now.

The support for ESP32-P4 may be added in the future.

**Flash Unique ID** This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM

5. Winbond
6. XMC
7. BOYA

**High Performance Mode** This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2, ESP32-P4 may be added in the future.

**OPI flash Support** This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

**32-bit Address Flash Chips** This feature is supported on all Espressif chips (with various restrictions to application).

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regrettably, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

---

**Important:** Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please enable the config `IDF_EXPERIMENTAL_FEATURES` and `BOOTLOADER_CACHE_32BIT_ADDR_FLASH` and read the limitations following:

1. This feature is valid only for 4-line flash. Octal flash supports 32-bit-addr by default
  2. This feature needs the MMU on ESP chip to be able to map to  $\geq 16$  MB physical address on the Flash. (Only ESP32S3 supports this up to now)
  3. This option is experimental, which means it can not use on all flash chips stable, for more information, please contact Espressif Business support.
- 

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- Flash unique ID - means that flash supports its unique 64-bit ID.

If you want to use these features, please ensure both ESP32-P4 and ALL flash chips in your product support these features. For more details, refer to [Optional Features for Flash](#).

You may also customise your own flash chip driver. See [Overriding Default Chip Drivers](#) for more details.

**Warning:** Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers** During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

### Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g., `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
  - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
  - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
  - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

#### Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example [storage/custom\\_flash\\_driver](#).

4. Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:

```
idf_component_register(SRCS "spi_flash_chip_drivers.c"
                       "spi_flash_chip_mychip.c" # modify as needed
                       REQUIRES hal
                       PRIV_REQUIRES spi_flash
                       LDFRAGMENTS linker.1f)
idf_component_add_link_dependency(FROM spi_flash)
```

- An example of this component `CMakeLists.txt` can be found in [storage/custom\\_flash\\_driver/components/custom\\_chip\\_driver/CMakeLists.txt](#)
5. The `linker.1f` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.
  6. Build your project, and you will see the new flash driver is used.

**Example** See also [storage/custom\\_flash\\_driver](#).

### Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This also detects the chip type, and influence the following operations.

---

**Note:** Multiple flash chips can be attached to the same bus now.

---

### SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in `menuconfig`

Generally, try to avoid using the raw SPI flash functions to the "main" SPI flash chip in favour of *partition-specific functions*.

### SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

## Concurrency Constraints for Flash on SPI1

### Concurrency Constraints for Flash on SPI1

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-P4, these caches must be disabled while reading/writing/erasing.

**When the Caches Are Disabled** Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

The way that these APIs disable the caches suspends all the other tasks. Besides, all non-IRAM-safe interrupts will be disabled. The other core will be polling in a busy loop. These will be restored until the Flash operation completes.

See also *OS Functions* and *SPI Bus Lock*.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g., IRAM, DRAM) and flash cache, please refer to the *application memory layout* documentation.

**IRAM-Safe Interrupt Handlers** For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the *interrupt handler is registered*.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See *How to Place Code in IRAM*.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

---

**Note:** When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and format string are placed into DRAM in that case.

---

**Non-IRAM-Safe Interrupt Handlers** If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users will not see the corresponding hardware event happening.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) causes significant influence to the whole system. See *Concurrency Constraints for Flash on SPI1* for more details.

## SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the *Flash Encryption documentation* for more details.

## Memory Mapping API

ESP32-P4 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when *flash encryption* is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `spi_flash_mmap.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It adjusts the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

---

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

---

## SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g., lock, delay) in different stages (1st/2nd boot, or the app).

**Host Driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-P4 memory-spi functionalities. However, due to the speed limitations of ESP32-P4, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS Functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see [SPI Bus Lock](#)) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device does not have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option `CONFIG_ESP_TASK_WDT_PANIC` is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It is pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
  - Increase `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` or decrease `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` in menuconfig.
  - You can also increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.
2. Please be aware of the consequences of enabling the `CONFIG_ESP_TASK_WDT_PANIC` option when doing long-running SPI flash operations which triggers the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.
3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

## Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation:

- In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation.
- In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals

that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

## Related Documents

- [Optional Features for Flash](#)
- [Concurrency Constraints for Flash on SPI](#)

**SPI Flash API ESP-IDF Version vs Chip-ROM Version** There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

## Feature Supported by ESP-IDF but Not in Chip-ROM

- Octal Flash chip support. See [OPI flash Support](#) for details.
- 32-bit-address support for GD25Q256. Note this feature is an optional feature, please do read [32-bit Address Flash Chips](#) for details.
- TH Flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`.
- `CONFIG_SPI_FLASH_VERIFY_WRITE`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option prints the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option checks if you are writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.
- `CONFIG_SPI_FLASH_AUTO_SUSPEND`, enabling this option to automatically suspend / resume a long Flash operation when short Flash operation happens. Note this feature is an optional feature, please do read [Auto Suspend & Resume](#) for more limitations.

## Bugfixes Introduced in ESP-IDF but Not in Chip-ROM

- Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cfd5cf684567fbdfd6fd9e)

## API Reference - SPI Flash

### Header File

- `components/spi_flash/include/esp_flash_spi_init.h`

- This header file can be included with:

```
#include "esp_flash_spi_init.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

## Functions

*esp\_err\_t* **spi\_bus\_add\_flash\_device** (*esp\_flash\_t* \*\*out\_chip, const *esp\_flash\_spi\_device\_config\_t* \*config)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

### Parameters

- **out\_chip** -- Pointer to hold the initialized chip.
- **config** -- Configuration of the chips to initialize.

### Returns

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

*esp\_err\_t* **spi\_bus\_remove\_flash\_device** (*esp\_flash\_t* \*chip)

Remove a SPI Flash device from the SPI bus.

**Parameters** **chip** -- The flash device to remove.

### Returns

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

## Structures

struct **esp\_flash\_spi\_device\_config\_t**

Configurations for the SPI Flash to init.

### Public Members

*spi\_host\_device\_t* **host\_id**

Bus to use.

int **cs\_io\_num**

GPIO pin to output the CS signal.

*esp\_flash\_io\_mode\_t* **io\_mode**

IO mode to read from the Flash.

enum *esp\_flash\_speed\_s* **speed**

Speed of the Flash clock. Replaced by `freq_mhz`.

int **input\_delay\_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs\_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq\_mhz**

The frequency of flash chip(MHZ)

### Header File

- [components/spi\\_flash/include/esp\\_flash.h](#)
- This header file can be included with:

```
#include "esp_flash.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

### Functions

*esp\_err\_t* **esp\_flash\_init** (*esp\_flash\_t* \*chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

---

**Note:** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

---

---

**Note:** If the `chip->drv` pointer is NULL, `chip chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

---

**Parameters** `chip` -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp\_flash\_chip\_driver\_initialized** (const *esp\_flash\_t* \*chip)

Check if appropriate chip driver is set.

**Parameters** `chip` -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** true if set, otherwise false.

*esp\_err\_t* **esp\_flash\_read\_id** (*esp\_flash\_t* \*chip, uint32\_t \*out\_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_id** -- [out] Pointer to receive ID value.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_size** (*esp\_flash\_t* \*chip, uint32\_t \*out\_size)

Detect flash size based on flash ID.

---

**Note:** 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

- a. The out\_size returned only stands for The out\_size stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.
- 

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_size** -- [out] Detected size in bytes, standing for the size in the binary image header.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_physical\_size** (*esp\_flash\_t* \*chip, uint32\_t \*flash\_size)

Detect flash size based on flash ID.

---

**Note:** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash\_size** -- [out] Detected size in bytes.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read\_unique\_chip\_id** (*esp\_flash\_t* \*chip, uint64\_t \*out\_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

---

**Note:** This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out\_id** -- [out] Pointer to receive unique ID value.

**Returns**

- ESP\_OK on success, or a flash error code if operation failed.
- ESP\_ERR\_NOT\_SUPPORTED if the chip doesn't support read id.

*esp\_err\_t* **esp\_flash\_erase\_chip** (*esp\_flash\_t* \*chip)

Erase flash chip contents.

---

**Parameters** **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if a read-only partition is present.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_erase\_region** (*esp\_flash\_t* \*chip, uint32\_t start, uint32\_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP\_ERR\_INVALID\_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **start** -- Address to start erasing flash. Must be sector aligned.
- **len** -- Length of region to erase. Must also be sector aligned.

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if the address range (`start + len`) overlaps with a read-only partition address space
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool \*write\_protected)

Read if the entire chip is write protected.

---

**Note:** A correct result for this flag depends on the SPI flash chip model and `chip_drv` in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **write\_protected** -- [out] Pointer to boolean, set to the value of the write protect flag.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool write\_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **write\_protect** -- Boolean value for the write protect flag

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protectable\_regions** (const *esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*\*out\_regions, uint32\_t \*out\_num\_regions)

Read the list of individually protectable regions of this SPI flash chip.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_regions** -- [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out\_num\_regions** -- [out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool \*out\_protected)

Detect if a region of the SPI flash chip is protected.

---

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **out\_protected** -- [out] Pointer to a flag which is set based on the protected status for this region.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool protect)

Update the protected status for a region of the SPI flash chip.

---

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **protect** -- Write protection flag to set.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read** (*esp\_flash\_t* \*chip, void \*buffer, uint32\_t address, uint32\_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

---

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **buffer** -- Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** -- Address on flash to read from. Must be less than `chip->size` field.
- **length** -- Length (in bytes) of data to read.

**Returns**

- ESP\_OK: success
- ESP\_ERR\_NO\_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write** (*esp\_flash\_t* \*chip, const void \*buffer, uint32\_t address, uint32\_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **address** -- Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** -- Length (in bytes) of data to write.

**Returns**

- ESP\_OK on success
- ESP\_FAIL, bad write, this will be detected only when `CONFIG_SPI_FLASH_VERIFY_WRITE` is enabled
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by `WREN = 1` after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if the address range (`address – address + length`) overlaps with a read-only partition address space
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, const void \*buffer, uint32\_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

---

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** -- Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write.
- **length** -- Length (in bytes) of data to write. 16 byte aligned.

#### Returns

- ESP\_OK: on success
- ESP\_FAIL: bad write, this will be detected only when CONFIG\_SPI\_FLASH\_VERIFY\_WRITE is enabled
- ESP\_ERR\_NOT\_SUPPORTED: encrypted write not supported for this chip.
- ESP\_ERR\_INVALID\_ARG: Either the address, buffer or length is invalid.
- ESP\_ERR\_NOT\_ALLOWED if the address range (address –address + length) overlaps with a read-only partition address space

*esp\_err\_t* **esp\_flash\_read\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, void \*out\_buffer, uint32\_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

#### Parameters

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** -- Address on flash to read from.
- **out\_buffer** -- Pointer to a buffer for the data to read to.
- **length** -- Length (in bytes) of data to read.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_NOT\_SUPPORTED: encrypted read not supported for this chip.

static inline bool **esp\_flash\_is\_quad\_mode** (const *esp\_flash\_t* \*chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, esp\_flash\_default\_chip is substituted.

**Returns** true if flash works in quad mode, otherwise false

## Structures

struct **esp\_flash\_region\_t**

Structure for describing a region of flash.

#### Public Members

uint32\_t **offset**

Start address of this region.

uint32\_t **size**

Size of the region.

struct **esp\_flash\_os\_functions\_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

*esp\_err\_t* (\***start**)(void \*arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

*esp\_err\_t* (\***end**)(void \*arg)

Called after completing any flash operation.

*esp\_err\_t* (\***region\_protected**)(void \*arg, size\_t start\_addr, size\_t size)

Called before any erase/write operations to check whether the region is limited by the OS

*esp\_err\_t* (\***delay\_us**)(void \*arg, uint32\_t us)

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

void (\***get\_temp\_buffer**)(void \*arg, size\_t request\_size, size\_t \*out\_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (\***release\_temp\_buffer**)(void \*arg, void \*temp\_buf)

Called for release temp buffer.

*esp\_err\_t* (\***check\_yield**)(void \*arg, uint32\_t chip\_status, uint32\_t \*out\_request)

Yield to other tasks. Called during erase operations.

**Return** ESP\_OK means yield needs to be called (got an event to handle), while ESP\_ERR\_TIMEOUT means skip yield.

*esp\_err\_t* (\***yield**)(void \*arg, uint32\_t \*out\_status)

Yield to other tasks. Called during erase operations.

int64\_t (\***get\_system\_time**)(void \*arg)

Called for get system time.

void (\***set\_flash\_op\_status**)(uint32\_t op\_status)

Call to set flash operation status

struct **esp\_flash\_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

## Public Members

*spi\_flash\_host\_inst\_t* \***host**

Pointer to hardware-specific "host\_driver" structure. Must be initialized before used.

const *spi\_flash\_chip\_t* \***chip\_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const *esp\_flash\_os\_functions\_t* \***os\_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void \***os\_func\_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

*esp\_flash\_io\_mode\_t* **read\_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32\_t **size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

uint32\_t **chip\_id**

Detected chip id.

uint32\_t **busy**

This flag is used to verify chip's status.

uint32\_t **hpm\_dummy\_ena**

This flag is used to verify whether flash works under HPM status.

uint32\_t **reserved\_flags**

reserved.

## Macros

**SPI\_FLASH\_YIELD\_REQ\_YIELD**

**SPI\_FLASH\_YIELD\_REQ\_SUSPEND**

**SPI\_FLASH\_YIELD\_STA\_RESUME**

**SPI\_FLASH\_OS\_IS\_ERASING\_STATUS\_FLAG**

## Type Definitions

typedef struct *spi\_flash\_chip\_t* **spi\_flash\_chip\_t**

## Header File

- `components/spi_flash/include/spi_flash_mmap.h`
- This header file can be included with:

```
#include "spi_flash_mmap.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

## Functions

`esp_err_t spi_flash_mmap` (`size_t src_addr`, `size_t size`, `spi_flash_mmap_memory_t memory`, `const void **out_ptr`, `spi_flash_mmap_handle_t *out_handle`)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if `mmap/munmap` are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use `spi_flash_mmap_dump()` function.

### Parameters

- **src\_addr** -- Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (`SPI_FLASH_MMU_PAGE_SIZE`)
- **size** -- Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** -- Address space where the region should be mapped (data or instruction)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region
- **out\_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

**Returns** `ESP_OK` on success, `ESP_ERR_NO_MEM` if pages can not be allocated

`esp_err_t spi_flash_mmap_pages` (`const int *pages`, `size_t page_count`, `spi_flash_mmap_memory_t memory`, `const void **out_ptr`, `spi_flash_mmap_handle_t *out_handle`)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as `spi_flash_mmap()` but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

### Parameters

- **pages** -- An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page\_count** -- Number of entries in the pages array
- **memory** -- Address space where the region should be mapped (instruction or data)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region
- **out\_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

### Returns

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if pages can not be allocated
- `ESP_ERR_INVALID_ARG` if pagecount is zero or pages array is not in internal memory

`void spi_flash_munmap` (`spi_flash_mmap_handle_t handle`)

Release region previously obtained using `spi_flash_mmap`.

---

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible

that memory will be unmapped partially.

---

**Parameters** **handle** -- Handle obtained from `spi_flash_mmap`

void **spi\_flash\_mmap\_dump** (void)

Display information about mapped regions.

This function lists handles obtained using `spi_flash_mmap`, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32\_t **spi\_flash\_mmap\_get\_free\_pages** (*spi\_flash\_mmap\_memory\_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual `spi_flash_mmap` (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters** **memory** -- memory type of MMU table free page

**Returns** number of free pages which can be mmaped

size\_t **spi\_flash\_cache2phys** (const void \*cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via `spi_flash_mmap()`, any address in memory mapped flash space can be looked up.

**Parameters** **cached** -- Pointer to flashed cached memory.

**Returns**

- `SPI_FLASH_CACHE2PHYS_FAIL` If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void \***spi\_flash\_phys2cache** (size\_t phys\_offs, *spi\_flash\_mmap\_memory\_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via `spi_flash_mmap()`, any address in flash can be looked up.

---

**Note:** Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

---

---

**Note:** This function doesn't impose any alignment constraints, but if memory argument is `SPI_FLASH_MMAP_INST` and `phys_offs` is not 4-byte aligned, then reading from the returned pointer will result in a crash.

---

**Parameters**

- **phys\_offs** -- Physical offset in flash memory to look up.
- **memory** -- Address space type to look up a flash cache address mapping for (instruction or data)

**Returns**

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to `phys_offs`.

## Macros

### ESP\_ERR\_FLASH\_OP\_FAIL

This file contains `spi_flash_mmap_xx` APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

### ESP\_ERR\_FLASH\_OP\_TIMEOUT

### SPI\_FLASH\_SEC\_SIZE

SPI Flash sector size

### SPI\_FLASH\_MMU\_PAGE\_SIZE

Flash cache MMU mapping page size

### SPI\_FLASH\_CACHE2PHYS\_FAIL

## Type Definitions

typedef uint32\_t **spi\_flash\_mmap\_handle\_t**

Opaque handle for memory region obtained from `spi_flash_mmap`.

## Enumerations

enum **spi\_flash\_mmap\_memory\_t**

Enumeration which specifies memory space requested in an `mmap` call.

*Values:*

enumerator **SPI\_FLASH\_MMAP\_DATA**

map to data memory, allows byte-aligned access

enumerator **SPI\_FLASH\_MMAP\_INST**

map to instruction memory, allows only 4-byte-aligned access

## Header File

- [components/hal/include/hal/spi\\_flash\\_types.h](#)
- This header file can be included with:

```
#include "hal/spi_flash_types.h"
```

## Structures

struct **spi\_flash\_trans\_t**

Definition of a common transaction. Also holds the return value.

## Public Members

uint8\_t **reserved**

Reserved, must be 0.

`uint8_t mosi_len`

Output data length, in bytes.

`uint8_t miso_len`

Input data length, in bytes.

`uint8_t address_bitlen`

Length of address in bits, set to 0 if command does not need an address.

`uint32_t address`

Address to perform operation on.

`const uint8_t *mosi_data`

Output data to salve.

`uint8_t *miso_data`

[out] Input data from slave, little endian

`uint32_t flags`

Flags for this transaction. Set to 0 for now.

`uint16_t command`

Command to send.

`uint8_t dummy_bitlen`

Basic dummy bits to use.

`uint32_t io_mode`

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct `spi_flash_sus_cmd_conf`

Configuration structure for the flash chip suspend feature.

### Public Members

`uint32_t sus_mask`

SUS/SUS1/SUS2 bit in flash register.

`uint32_t cmd_rdsr`

Read flash status register(2) command.

`uint32_t sus_cmd`

Flash suspend command.

`uint32_t res_cmd`

Flash resume command.

`uint32_t reserved`

Reserved, set to 0.

struct **spi\_flash\_encryption\_t**

Structure for flash encryption operations.

### Public Members

void (**\*flash\_encryption\_enable**)(void)

Enable the flash encryption.

void (**\*flash\_encryption\_disable**)(void)

Disable the flash encryption.

void (**\*flash\_encryption\_data\_prepare**)(uint32\_t address, const uint32\_t \*buffer, uint32\_t size)

Prepare flash encryption before operation.

---

**Note:** address and buffer must be 8-word aligned.

---

**Param address** The destination address in flash for the write operation.

**Param buffer** Data for programming

**Param size** Size to program.

void (**\*flash\_encryption\_done**)(void)

flash data encryption operation is done.

void (**\*flash\_encryption\_destroy**)(void)

Destroy encrypted result

bool (**\*flash\_encryption\_check**)(uint32\_t address, uint32\_t length)

Check if is qualified to encrypt the buffer

**Param address** the address of written flash partition.

**Param length** Buffer size.

struct **spi\_flash\_host\_inst\_t**

SPI Flash Host driver instance

### Public Members

const struct *spi\_flash\_host\_driver\_s* \***driver**

Pointer to the implementation function table.

struct **spi\_flash\_host\_driver\_s**

Host driver configuration and context structure.

### Public Members

*esp\_err\_t* (\***dev\_config**)(*spi\_flash\_host\_inst\_t* \*host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

*esp\_err\_t* (\***common\_command**)(*spi\_flash\_host\_inst\_t* \*host, *spi\_flash\_trans\_t* \*t)

Send an user-defined spi transaction to the device.

*esp\_err\_t* (\***read\_id**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t \*id)

Read flash ID.

void (\***erase\_chip**)(*spi\_flash\_host\_inst\_t* \*host)

Erase whole flash chip.

void (\***erase\_sector**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific sector by its start address.

void (\***erase\_block**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific block by its start address.

*esp\_err\_t* (\***read\_status**)(*spi\_flash\_host\_inst\_t* \*host, uint8\_t \*out\_sr)

Read the status of the flash chip.

*esp\_err\_t* (\***set\_write\_protect**)(*spi\_flash\_host\_inst\_t* \*host, bool wp)

Disable write protection.

void (\***program\_page**)(*spi\_flash\_host\_inst\_t* \*host, const void \*buffer, uint32\_t address, uint32\_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (\***supports\_direct\_write**)(*spi\_flash\_host\_inst\_t* \*host, const void \*p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (\***write\_data\_slicer**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to write

**Param len** Length request to write

**Param align\_addr** Output of the aligned address to write to

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually written in one `program_page` call

*esp\_err\_t* (\***read**)(*spi\_flash\_host\_inst\_t* \*host, void \*buffer, uint32\_t address, uint32\_t read\_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (\***supports\_direct\_read**)(*spi\_flash\_host\_inst\_t* \*host, const void \*p)

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

int (**\*read\_data\_slicer**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)

Slicer for read data. The `read` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to read

**Param len** Length request to read

**Param align\_addr** Output of the aligned address to read

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually read in one `read` call

uint32\_t (**\*host\_status**)(*spi\_flash\_host\_inst\_t* \*host)

Check the host status, 0:busy, 1:idle, 2:suspended.

*esp\_err\_t* (**\*configure\_host\_io\_mode**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t command, uint32\_t addr\_bitlen, int dummy\_bitlen\_base, *esp\_flash\_io\_mode\_t* io\_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (**\*poll\_cmd\_done**)(*spi\_flash\_host\_inst\_t* \*host)

Internal use, poll the HW until the last operation is done.

*esp\_err\_t* (**\*flush\_cache**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t addr, uint32\_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (**\*check\_suspend**)(*spi\_flash\_host\_inst\_t* \*host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (**\*resume**)(*spi\_flash\_host\_inst\_t* \*host)

Resume flash from suspend manually

void (**\*suspend**)(*spi\_flash\_host\_inst\_t* \*host)

Set flash in suspend status manually

*esp\_err\_t* (**\*sus\_setup**)(*spi\_flash\_host\_inst\_t* \*host, const *spi\_flash\_sus\_cmd\_conf* \*sus\_conf)

Suspend feature setup for setting cmd and status register mask.

## Macros

**SPI\_FLASH\_TRANS\_FLAG\_CMD16**

Send command of 16 bits.

**SPI\_FLASH\_TRANS\_FLAG\_IGNORE\_BASEIO**

Not applying the basic io mode configuration for this transaction.

**SPI\_FLASH\_TRANS\_FLAG\_BYTE\_SWAP**

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

**SPI\_FLASH\_TRANS\_FLAG\_PE\_CMD**

Indicates that this transaction is to erase/program flash chip.

**SPI\_FLASH\_CONFIG\_CONF\_BITS**

OR the `io_mode` with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

**SPI\_FLASH\_OPI\_FLAG**

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

**SPI\_FLASH\_READ\_MODE\_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

**Type Definitions**

```
typedef enum esp_flash_speed_s esp_flash_speed_t
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

```
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

**Enumerations**

```
enum esp_flash_speed_s
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

*Values:*

```
enumerator ESP_FLASH_5MHZ
```

The flash runs under 5MHz.

```
enumerator ESP_FLASH_10MHZ
```

The flash runs under 10MHz.

```
enumerator ESP_FLASH_20MHZ
```

The flash runs under 20MHz.

```
enumerator ESP_FLASH_26MHZ
```

The flash runs under 26MHz.

```
enumerator ESP_FLASH_40MHZ
```

The flash runs under 40MHz.

```
enumerator ESP_FLASH_80MHZ
```

The flash runs under 80MHz.

enumerator **ESP\_FLASH\_120MHZ**

The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP\_FLASH\_SPEED\_MAX**

The maximum frequency supported by the host is ESP\_FLASH\_SPEED\_MAX-1.

enum **esp\_flash\_io\_mode\_t**

Mode used for reading from SPI flash.

*Values:*

enumerator **SPI\_FLASH\_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI\_FLASH\_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI\_FLASH\_DOUT**

Data read using dual I/O.

enumerator **SPI\_FLASH\_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI\_FLASH\_QOUT**

Data read using quad I/O.

enumerator **SPI\_FLASH\_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI\_FLASH\_OPI\_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI\_FLASH\_OPI\_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI\_FLASH\_READ\_MODE\_MAX**

The fastest io mode supported by the host is ESP\_FLASH\_READ\_MODE\_MAX-1.

### Header File

- [components/hal/include/hal/esp\\_flash\\_err.h](#)
- This header file can be included with:

```
#include "hal/esp_flash_err.h"
```

### Macros

**ESP\_ERR\_FLASH\_NOT\_INITIALISED**

esp\_flash\_chip\_t structure not correctly initialised by esp\_flash\_init().

**ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST**

Requested operation isn't supported via this host SPI bus (chip->spi field).

**ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP**

Requested operation isn't supported by this model of SPI flash chip.

**ESP\_ERR\_FLASH\_PROTECTED**

Write operation failed due to chip's write protection being enabled.

**Enumerations**

enum [anonymous]

Values:

enumerator **ESP\_ERR\_FLASH\_SIZE\_NOT\_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP\_ERR\_FLASH\_NO\_RESPONSE**

Chip did not respond to the command, or timed out.

**Header File**

- [components/spi\\_flash/include/esp\\_spi\\_flash\\_counters.h](#)
- This header file can be included with:

```
#include "esp_spi_flash_counters.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

**Functions**

void **esp\_flash\_reset\_counters** (void)

Reset SPI flash operation counters.

void **spi\_flash\_reset\_counters** (void)

void **esp\_flash\_dump\_counters** (FILE \*stream)

Print SPI flash operation counters.

void **spi\_flash\_dump\_counters** (void)

const *esp\_flash\_counters\_t* \***esp\_flash\_get\_counters** (void)

Return current SPI flash operation counters.

**Returns** pointer to the *esp\_flash\_counters\_t* structure holding values of the operation counters

const *spi\_flash\_counters\_t* \***spi\_flash\_get\_counters** (void)

## Structures

struct **esp\_flash\_counter\_t**

Structure holding statistics for one type of operation

### Public Members

uint32\_t **count**

number of times operation was executed

uint32\_t **time**

total time taken, in microseconds

uint32\_t **bytes**

total number of bytes

struct **esp\_flash\_counters\_t**

Structure for counters of flash actions

### Public Members

*esp\_flash\_counter\_t* **read**

counters for read action, like `esp_flash_read`

*esp\_flash\_counter\_t* **write**

counters for write action, like `esp_flash_write`

*esp\_flash\_counter\_t* **erase**

counters for erase action, like `esp_flash_erase`

## Type Definitions

typedef *esp\_flash\_counter\_t* **spi\_flash\_counter\_t**

typedef *esp\_flash\_counters\_t* **spi\_flash\_counters\_t**

## API Reference - Flash Encrypt

### Header File

- `components/bootloader_support/include/esp_flash_encrypt.h`
- This header file can be included with:

```
#include "esp_flash_encrypt.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

`PRIV_REQUIRES bootloader_support`

### Functions

bool **esp\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH\_CRYPT\_CNT efuse has an odd number of bits set.

**Returns** true if flash encryption is enabled.

*esp\_err\_t* **esp\_flash\_encrypt\_check\_and\_update** (void)

bool **esp\_flash\_encrypt\_state** (void)

Returns the Flash Encryption state and prints it.

**Returns** True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp\_flash\_encrypt\_initialized\_once** (void)

Checks if the first initialization was done.

If the first initialization was done then FLASH\_CRYPT\_CNT != 0

**Returns** true - the first initialization was done false - the first initialization was NOT done

*esp\_err\_t* **esp\_flash\_encrypt\_init** (void)

The first initialization of Flash Encryption key and related eFuses.

**Returns** ESP\_OK if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_contents** (void)

Encrypts flash content.

**Returns** ESP\_OK if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_enable** (void)

Activates Flash encryption on the chip.

It burns FLASH\_CRYPT\_CNT eFuse based on the CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE option.

**Returns** ESP\_OK if all operations succeeded

bool **esp\_flash\_encrypt\_is\_write\_protected** (bool print\_error)

Returns True if the write protection of FLASH\_CRYPT\_CNT is set.

**Parameters** **print\_error** -- Print error if it is write protected

**Returns** true - if FLASH\_CRYPT\_CNT is write protected

*esp\_err\_t* **esp\_flash\_encrypt\_region** (uint32\_t src\_addr, size\_t data\_length)

Encrypt-in-place a block of flash sectors.

---

**Note:** This function resets RTC\_WDT between operations with sectors.

---

#### Parameters

- **src\_addr** -- Source offset in flash. Should be multiple of 4096 bytes.
- **data\_length** -- Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns** ESP\_OK if all operations succeeded, ESP\_ERR\_FLASH\_OP\_FAIL if SPI flash fails, ESP\_ERR\_FLASH\_OP\_TIMEOUT if flash times out.

void **esp\_flash\_write\_protect\_crypt\_cnt** (void)

Write protect FLASH\_CRYPT\_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

---

**Note:** On ESP32 V3 only, write protecting FLASH\_CRYPT\_CNT will also prevent disabling UART Download Mode. If both are wanted, call `esp_efuse_disable_rom_download_mode()` before calling this function.

---

*esp\_flash\_enc\_mode\_t* **esp\_get\_flash\_encryption\_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

#### Returns

void **esp\_flash\_encryption\_init\_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

---

**Note:** This function is called automatically during app startup, it doesn't need to be called from the app.

---

*esp\_err\_t* **esp\_flash\_encryption\_enable\_secure\_features** (void)

Set all secure eFuse features related to flash encryption.

#### Returns

- ESP\_OK - Successfully

bool **esp\_flash\_encryption\_cfg\_verify\_release\_mode** (void)

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

#### Returns

- True - all eFuses are configured correctly
- False - not all eFuses are configured correctly.

void **esp\_flash\_encryption\_set\_release\_mode** (void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- "disable encrypt in dl mode"
- set FLASH\_CRYPT\_CNT efuse to max

## Enumerations

enum **esp\_flash\_enc\_mode\_t**

*Values:*

enumerator `ESP_FLASH_ENC_MODE_DISABLED`

enumerator `ESP_FLASH_ENC_MODE_DEVELOPMENT`

enumerator `ESP_FLASH_ENC_MODE_RELEASE`

### 2.5.21 SPI Master Driver

SPI Master driver is a program that controls ESP32-P4's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a master.

For more hardware information about the GP-SPI peripheral(s), see [ESP32-P4 Technical Reference Manual > SPI Controller \[PDF\]](#).

#### Terminology

The terms used in relation to the SPI Master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32-P4 initiates SPI transmissions over the bus and acts as an SPI Master.
Device	SPI slave Device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in a daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. The oscillating signal generated by a Host keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for the data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for the data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
Assertion	The action of activating a line.
De-assertion	The action of returning the line back to inactive (back to idle) status.
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <b>launches</b> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <b>latches in</b> the signal.

## Driver Features

The SPI Master driver governs the communications between Hosts and Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

**Warning:** The SPI Master driver allows multiple Devices to be connected on a same SPI bus (sharing a single ESP32-P4 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread-safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral-related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Features

### SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock disables the cache before device operations start, and enables it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver has not supported SPI1 bus. Only the SPI Flash driver can attach to the bus.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Command	In this phase, a command (0-16 bit) is written to the bus by the Host.
Address	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
Dummy	This phase is configurable and is used to meet the timing requirements.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, Device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the Read and Write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the Read and Write phases are not simultaneous (one direction at a time). The lengths of the Write and Read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The Command and Address phases are optional, as not every SPI Device requires a command and/or address. This is reflected in the Device's configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no Command or Address phase will occur.

The Read and Write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the Read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the Write phase is skipped.

The driver supports two types of transactions: interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

**Interrupt Transactions** Interrupt transactions blocks the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver automatically handles them one by one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions are complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1  $\mu$ s to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

**Transaction Line Mode** Supported line modes for ESP32-P4 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO Setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_SPCOM- SPI_TRANS_MULTILINE_ADDRFLAG_DUAL	MON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_SPCOM- SPI_TRANS_MULTILINE_ADDRFLAG_DUAL	MON_BUSFLAG_DUAL
Quad Output	1	1	4	SPI_TRANS_MODE_SPCOM- SPI_TRANS_MULTILINE_ADDRFLAG_QUAD	MON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_SPCOM- SPI_TRANS_MULTILINE_ADDRFLAG_QUAD	MON_BUSFLAG_QUAD
Octal Output	1	1	8	SPI_TRANS_MODE_SPCOM- SPI_TRANS_MULTILINE_ADDRFLAG_OCTAL	MON_BUSFLAG_OCTAL
OPI	8	8	8	SPI_TRANS_MODE_SPCOM- SPI_TRANS_MULTILINE_ADDRFLAG_OCTAL SPI_TRANS_MULTILINE_CMD	MON_BUSFLAG_OCTAL

**Command and Address Phases** During the Command and Address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the Command and Address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the Command and Address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the Command and Address phase need to have the same number of lines as the data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the flags member in the struct `spi_transaction_t`. Also see [Transaction Line Mode](#).

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device is read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory (MALLOC\_CAP\_DMA), see [DMA-Capable Memory](#).
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data line to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member flags in the struct `spi_device_interface_config_t`. And the member flags in the struct `spi_transaction_t` should be set as described in [Transaction Line Mode](#).

---

**Note:** Half-duplex transactions with both Read and Write phases are not supported. Please use full duplex mode.

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other Devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

## Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the Device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To remove a certain Device from the bus, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver from the bus, make sure no more devices are attached and call `spi_bus_free()`.

The example code for the SPI Master driver can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

**Transactions with Integers Other than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB is first used in rare cases. If a value of fewer than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional "random" bits, so the reading must be performed correctly.

On top of that, ESP32-P4 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has a size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transaction (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

**GPIO Matrix and IO\_MUX** Most of the chip's peripheral signals have a direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via the GPIO matrix will behave the same compared to routing them via IOMUX.

The IO\_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0 <sup>1</sup>	7
SCLK	9
MISO	10
MOSI	8
QUADWP	11
QUADHD	6

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transactions.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2  $\mu$ s per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2  $\mu$ s, but the transaction length is limited to 64 bytes for both write and read.

The typical transaction duration for one byte of data is given below.

<sup>1</sup> Only the first Device attached to the bus can use the CS0 pin.

- Interrupt Transaction via DMA: N/A  $\mu$ s.
- Interrupt Transaction via CPU: N/A  $\mu$ s.
- Polling Transaction via DMA: N/A  $\mu$ s.
- Polling Transaction via CPU: N/A  $\mu$ s.

Note that these data are tested with `CONFIG_SPI_MASTER_ISR_IN_IRAM` enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

**SPI Clock Frequency** The clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to `spi_clock_source_t` to know the supported clock sources.

By default driver sets `spi_device_handle_t::cfg::clock_source` to `SPI_CLK_SRC_DEFAULT`. This usually stands for the highest frequency among GPSPI clock sources. Its value is different among chips.

The actual clock frequency of a Device may not be exactly equal to the number you set, it is re-calculated by the driver to the nearest hardware-compatible number, and not larger than the clock frequency of the clock source. You can call `spi_device_get_actual_freq()` to know the actual frequency computed by the driver.

The theoretical maximum transfer speed of the Write or Read phase can be calculated according to the table below:

Line Width of Write/Read phase	Speed (Bps)
1-Line	$SPI\ Frequency / 8$
2-Line	$SPI\ Frequency / 4$
4-Line	$SPI\ Frequency / 2$
8-Line	$SPI\ Frequency$

The transfer speed calculation of other phases (Command, Address, Dummy) is similar.

**Cache Missing** The default config puts only the ISR into the IRAM. Other SPI-related functions, including the driver itself and the callback, might suffer from cache misses and need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache missing.

**Note:** SPI driver implementation is based on FreeRTOS APIs, to use `CONFIG_SPI_MASTER_IN_IRAM`, you should not enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`.

For an interrupt transaction, the overall cost is  $20+8n/F_{spi}[MHz]$  [ $\mu$ s] for n bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/F_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval ( $\mu$ s)	Transaction Length (bytes)	Total Time ( $\mu$ s)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of the transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations

are handled by the ISR in parallel. Also note that the callback of each Device and their `callee` functions should be in IRAM, or your callback will crash due to cache missing. For more details, see [IRAM-Safe Interrupt Handlers](#).

### Application Example

The code example for using the SPI master half duplex mode to read/write an AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi\\_master/hd\\_eeprom](#) directory of ESP-IDF examples.

The code example for using the SPI master full duplex mode to drive a SPI\_LCD (e.g. ST7789V or ILI9341) can be found in the [peripherals/spi\\_master/lcd](#) directory of ESP-IDF examples.

## API Reference - SPI Common

### Header File

- [components/hal/include/hal/spi\\_types.h](#)
- This header file can be included with:

```
#include "hal/spi_types.h"
```

### Structures

struct **spi\_line\_mode\_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

#### Public Members

uint8\_t **cmd\_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8\_t **addr\_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8\_t **data\_lines**

The line width of data phase, e.g. 4-line-data-phase.

### Type Definitions

typedef *soc\_periph\_spi\_clk\_src\_t* **spi\_clock\_source\_t**

Type of SPI clock source.

### Enumerations

enum **spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

*Values:*

enumerator **SPI1\_HOST**

SPI1.

enumerator **SPI2\_HOST**

SPI2.

enumerator **SPI3\_HOST**

SPI3.

enumerator **SPI\_HOST\_MAX**

invalid host value

enum **spi\_event\_t**

SPI Events.

*Values:*

enumerator **SPI\_EV\_BUF\_TX**

The buffer has sent data to master.

enumerator **SPI\_EV\_BUF\_RX**

The buffer has received data from master.

enumerator **SPI\_EV\_SEND\_DMA\_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI\_EV\_RECV\_DMA\_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI\_EV\_CMD9**

Received CMD9 from master.

enumerator **SPI\_EV\_CMDA**

Received CMDA from master.

enumerator **SPI\_EV\_TRANS**

A transaction has done.

enum **spi\_command\_t**

SPI command.

*Values:*

enumerator **SPI\_CMD\_HD\_WRBUF**

enumerator **SPI\_CMD\_HD\_RDBUF**

enumerator `SPI_CMD_HD_WRDMA`

enumerator `SPI_CMD_HD_RDDMA`

enumerator `SPI_CMD_HD_SEG_END`

enumerator `SPI_CMD_HD_EN_QPI`

enumerator `SPI_CMD_HD_WR_END`

enumerator `SPI_CMD_HD_INT0`

enumerator `SPI_CMD_HD_INT1`

enumerator `SPI_CMD_HD_INT2`

### Header File

- This header file can be included with:

```
#include "driver/spi_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

`esp_err_t spi_bus_initialize` (*spi\_host\_device\_t* host\_id, const *spi\_bus\_config\_t* \*bus\_config, *spi\_dma\_chan\_t* dma\_chan)

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Parameters

- **host\_id** -- SPI peripheral that controls this bus
- **bus\_config** -- Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized

- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

**Returns**

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **spi\_bus\_free** (*spi\_host\_device\_t* host\_id)

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters** `host_id` -- SPI peripheral to free

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

**Structures**

struct **spi\_bus\_config\_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

---

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi\_bus\_config\_t* referring to these lines will be ignored and can thus safely be left uninitialized.

---

**Public Members**

int **mosi\_io\_num**

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

int **data0\_io\_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso\_io\_num**

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

int **data1\_io\_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk\_io\_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp\_io\_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2\_io\_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd\_io\_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3\_io\_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4\_io\_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5\_io\_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6\_io\_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7\_io\_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max\_transfer\_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32\_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

*esp\_intr\_cpu\_affinity\_t* **isr\_cpu\_id**

Select cpu core to register SPI ISR.

int **intr\_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

## Macros

**SPI\_MAX\_DMA\_LEN**

**SPI\_SWAP\_DATA\_TX** (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx\_buffer to &data.

#### Parameters

- **DATA** -- Data to be sent, can be uint8\_t, uint16\_t or uint32\_t.
- **LEN** -- Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

#### SPI\_SWAP\_DATA\_RX (DATA, LEN)

Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

#### Parameters

- **DATA** -- Data to be rearranged, can be uint8\_t, uint16\_t or uint32\_t.
- **LEN** -- Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

#### SPICOMMON\_BUSFLAG\_SLAVE

Initialize I/O in slave mode.

#### SPICOMMON\_BUSFLAG\_MASTER

Initialize I/O in master mode.

#### SPICOMMON\_BUSFLAG\_IOMUX\_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

#### SPICOMMON\_BUSFLAG\_GPIO\_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

#### SPICOMMON\_BUSFLAG\_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

#### SPICOMMON\_BUSFLAG\_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

#### SPICOMMON\_BUSFLAG\_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

#### SPICOMMON\_BUSFLAG\_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

#### SPICOMMON\_BUSFLAG\_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

#### SPICOMMON\_BUSFLAG\_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_IO4\_IO7**

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON\_BUSFLAG\_OCTAL**

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```
enum spi_common_dma_t
```

SPI DMA channels.

*Values:*

```
enumerator SPI_DMA_DISABLED
```

Do not enable DMA for SPI.

```
enumerator SPI_DMA_CH_AUTO
```

Enable DMA, channel is automatically selected by driver.

**API Reference - SPI Master****Header File**

- [components/driver/spi/include/driver/spi\\_master.h](#)
- This header file can be included with:

```
#include "driver/spi_master.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Functions**

```
esp_err_t spi_bus_add_device (spi_host_device_t host_id, const spi_device_interface_config_t *dev_config,  
                             spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

---

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

---

**Parameters**

- **host\_id** -- SPI peripheral to allocate device on
- **dev\_config** -- SPI interface protocol config for the device
- **handle** -- Pointer to variable to hold the device handle

**Returns**

- **ESP\_ERR\_INVALID\_ARG** if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn't set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- **ESP\_ERR\_INVALID\_STATE** if selected clock source is unavailable or spi bus not initialized
- **ESP\_ERR\_NOT\_FOUND** if host doesn't have any free CS slots
- **ESP\_ERR\_NO\_MEM** if out of memory
- **ESP\_OK** on success

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

**Parameters** **handle** -- Device handle to free

**Returns**

- **ESP\_ERR\_INVALID\_ARG** if parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** if device already is freed
- **ESP\_OK** on success

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use port-`MAX_DELAY` to never time out.

**Returns**

- **ESP\_ERR\_INVALID\_ARG** if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- **ESP\_ERR\_TIMEOUT** if there was no room in the queue before `ticks_to_wait` expired
- **ESP\_ERR\_NO\_MEM** if allocating DMA-capable temporary buffer failed
- **ESP\_ERR\_INVALID\_STATE** if previous transactions are not finished
- **ESP\_OK** on success

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_start** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Immediately start a polling transaction.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_end** (*spi\_device\_handle\_t* handle, TickType\_t ticks\_to\_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions of same device are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_acquire\_bus** (*spi\_device\_handle\_t* device, TickType\_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

---

**Note:** The function will wait until all the existing transactions have been sent.

---

#### Parameters

- **device** -- The device to occupy the bus.
- **wait** -- Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

#### Returns

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters** **dev** -- The device to release the bus.

*esp\_err\_t* **spi\_device\_get\_actual\_freq** (*spi\_device\_handle\_t* handle, int \*freq\_khz)

Calculate working frequency for specific device.

#### Parameters

- **handle** -- SPI device handle
- **freq\_khz** -- [out] output parameter to hold calculated frequency in kHz

**Returns**

- `ESP_ERR_INVALID_ARG` : `handle` or `freq_khz` parameter is NULL
- `ESP_OK` : Success

int **spi\_get\_actual\_clock** (int fapb, int hz, int duty\_cycle)

Calculate the working frequency that is most close to desired frequency.

**Parameters**

- **fapb** -- The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** -- Desired working frequency
- **duty\_cycle** -- Duty cycle of the spi clock

**Returns** Actual working frequency that most fit.

void **spi\_get\_timing** (bool gpio\_is\_used, int input\_delay\_ns, int eff\_clk, int \*dummy\_o, int \*cycles\_remain\_o)

Calculate the timing settings of specified frequency and settings.

---

**Note:** If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

---

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if iomux pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.
- **eff\_clk** -- Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy\_o** -- Address of dummy bits used output. Set to NULL if not needed.
- **cycles\_remain\_o** -- Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool gpio\_is\_used, int input\_delay\_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if native pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

*esp\_err\_t* **spi\_bus\_get\_max\_transaction\_len** (*spi\_host\_device\_t* host\_id, size\_t \*max\_bytes)

Get max length (in bytes) of one transaction.

**Parameters**

- **host\_id** -- SPI peripheral
- **max\_bytes** -- [out] Max length of one transaction, in bytes

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument

## Structures

struct **spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

## Public Members

### uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

### uint8\_t **address\_bits**

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

### uint8\_t **dummy\_bits**

Amount of dummy bits to insert between address and data phase.

### uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

### *spi\_clock\_source\_t* **clock\_source**

Select SPI clock source, `SPI_CLK_SRC_DEFAULT` by default.

### uint16\_t **duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

### uint16\_t **cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

### uint8\_t **cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

### int **clock\_speed\_hz**

SPI clock speed in Hz. Derived from `clock_source`.

### int **input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

### int **spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

### uint32\_t **flags**

Bitwise OR of `SPI_DEVICE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction\_cb\_t* pre\_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction\_cb\_t* post\_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members****uint32\_t flags**

Bitwise OR of `SPI_TRANS_*` flags.

**uint16\_t cmd**

Command data, of which the length is set in the `command_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

**uint64\_t addr**

Address data, of which the length is set in the `address_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

**size\_t length**

Total data length, in bits.

**size\_t rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

const void **\*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8\_t **tx\_data**[4]

If SPI\_TRANS\_USE\_TXDATA is set, data set here is sent directly from this variable.

void **\*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8\_t **rx\_data**[4]

If SPI\_TRANS\_USE\_RXDATA is set, data is received directly to this variable.

struct **spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI\_TRANS\_VARIABLE\_CMD\_ADR to use the bit length here.

### Public Members

struct *spi\_transaction\_t* **base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

uint8\_t **command\_bits**

The command length in this transaction, in bits.

uint8\_t **address\_bits**

The address length in this transaction, in bits.

uint8\_t **dummy\_bits**

The dummy length in this transaction, in bits.

### Macros

**SPI\_MASTER\_FREQ\_8M**

SPI common used frequency (in Hz)

---

**Note:** SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

---

**SPI\_MASTER\_FREQ\_9M**

8.89MHz

**SPI\_MASTER\_FREQ\_10M**

10MHz

**SPI\_MASTER\_FREQ\_11M**

11.43MHz

**SPI\_MASTER\_FREQ\_13M**

13.33MHz

**SPI\_MASTER\_FREQ\_16M**

16MHz

**SPI\_MASTER\_FREQ\_20M**

20MHz

**SPI\_MASTER\_FREQ\_26M**

26.67MHz

**SPI\_MASTER\_FREQ\_40M**

40MHz

**SPI\_MASTER\_FREQ\_80M**

80MHz

**SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK**

**SPI\_DEVICE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use `post_cb` to notify instead)

**SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into `rx_data` member of *spi\_transaction\_t* instead into memory at `rx_buffer`.

**SPI\_TRANS\_USE\_TXDATA**

Transmit `tx_data` member of *spi\_transaction\_t* instead of data at `tx_buffer`. Do not set `tx_buffer` when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by `SPI_MODE_DIO/SPI_MODE_QIO`.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the `command_bits` in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the `address_bits` in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the `dummy_bits` in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_CS\_KEEP\_ACTIVE**

Keep CS active after data transfer.

**SPI\_TRANS\_MULTILINE\_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI\_TRANS\_MODE\_OCT**

Transmit/receive data in 8-bit mode.

**SPI\_TRANS\_MULTILINE\_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

**SPI\_TRANS\_DMA\_BUFFER\_ALIGN\_MANUAL**

By default driver will automatically re-alloc dma buffer if it doesn't meet hardware alignment or `dma_capable` requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error `ESP_ERR_INVALID_ARG`.

## Type Definitions

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

### 2.5.22 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-P4's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a slave.

For more hardware information about the GP-SPI peripheral(s), see [ESP32-P4 Technical Reference Manual > SPI Controller \[PDF\]](#).

#### Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-P4 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <b>de-assertion</b> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <b>launches</b> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <b>latches in</b> the signal.

#### Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only

accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

### Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

### Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO\_MUX** Most of chip's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same compared to routing them via IO\_MUX.

The IO\_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0	N/A
SCLK	N/A
MISO	N/A
MOSI	N/A
QUADWP	N/A
QUADHD	N/A

### Speed and Timing Considerations

**Transaction Interval** The ESP32-P4 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

### Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.  
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

### Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

### API Reference

#### Header File

- [components/driver/spi/include/driver/spi\\_slave.h](#)
- This header file can be included with:

```
#include "driver/spi_slave.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **spi\_slave\_initialize** (*spi\_host\_device\_t* host, const *spi\_bus\_config\_t* \*bus\_config, const *spi\_slave\_interface\_config\_t* \*slave\_config, *spi\_dma\_chan\_t* dma\_chan)

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

### Parameters

- **host** -- SPI peripheral to use as a SPI slave interface
- **bus\_config** -- Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **slave\_config** -- Pointer to a *spi\_slave\_interface\_config\_t* struct specifying the details for the slave interface
- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

### Returns

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_free** (*spi\_host\_device\_t* host)

Free a SPI bus claimed as a SPI slave interface.

**Parameters** **host** -- SPI peripheral to free

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_queue\_trans** (*spi\_host\_device\_t* host, const *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on

the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

#### Parameters

- **host** -- SPI peripheral that is acting as a slave
- **trans\_desc** -- Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_get\_trans\_result** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

#### Parameters

- **host** -- SPI peripheral to that is acting as a slave
- **trans\_desc** -- [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_SLAVE_NO_RETURN_RESULT` is set
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_transmit** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

#### Parameters

- **host** -- SPI peripheral to that is acting as a slave
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

## Structures

struct **spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

## Public Members

int **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of SPI\_SLAVE\_\* flags.

int **queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi\_slave\_queue\_trans but not yet finished using spi\_slave\_get\_trans\_result) at the same time.

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

*slave\_transaction\_cb\_t* **post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

*slave\_transaction\_cb\_t* **post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

struct **spi\_slave\_transaction\_t**

This structure describes one SPI transaction

## Public Members

size\_t **length**

Total data length, in bits.

size\_t **trans\_len**

Transaction data length, in bits.

const void \***tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

void \***rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void **\*user**

User-defined variable. Can be used to store eg transaction ID.

### Macros

**SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_SLAVE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

### Type Definitions

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

## 2.5.23 Universal Asynchronous Receiver/Transmitter (UART)

### Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-P4 chip has 5 UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit, etc. All the regular UART controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

Additionally, the ESP32-P4 chip has one low-power (LP) UART controller. It is the cut-down version of regular UART. Usually, the LP UART controller only support basic UART functionality with a much smaller RAM size, and does not support IrDA or RS485 protocols. For a full list of difference between UART and LP UART, please refer to the **ESP32-P4 Technical Reference Manual > UART Controller (UART) > Features** [\[PDF\]](#).

### Functional Overview

The overview describes how to establish communication between an ESP32-P4 and other UART devices using the functions and data types of the UART driver. A typical programming workflow is broken down into the sections provided below:

1. *Set Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Set Communication Pins* - Assigning pins for connection to a device
3. *Install Drivers* - Allocating ESP32-P4's resources for the UART driver
4. *Run UART Communication* - Sending/receiving data
5. *Use Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional. Additionally, when using the LP UART Controller you need to pay attention to [Use LP UART Controller with HP Core](#).

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Set Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart\\_echo](#).

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 4: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Set Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the TX, RX, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro `UART_PIN_NO_CHANGE` should be specified for pins that will not be used.

```
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

**Install Drivers** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of TX ring buffer
- Size of RX ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function allocates the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Run UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into TX FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into RX FIFO buffer
3. Read the data from RX FIFO buffer

Therefore, an application only writes and reads data from a specific buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM does the rest.

**Transmit Data** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function copies the data to the TX ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the TX FIFO buffer, an interrupt service routine (ISR) moves the data from the TX ring buffer to the TX FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the TX line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the TX FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function does not block until space is available. Instead, it writes all data which can immediately fit into the hardware TX FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the TX FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receive Data** Once the data is received by the UART and saved in the RX FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the RX FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the RX FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver handles the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Use Interrupts** There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-P4 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver's internal interrupt handler to manage the TX and RX ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Install Drivers*. An example of using Event detection can be found in [peripherals/uart/uart\\_events](#).
- **FIFO space threshold or transmission timeout reached:** The TX and RX FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly. This functionality is demonstrated in the example [peripherals/uart/uart\\_events](#). It can be used,

e.g., to detect a command string with a specific number of identical characters (the 'pattern') at the end. The following functions are available:

- Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
- Disable the interrupt using `uart_disable_pattern_det_intr()`

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Macros** The API also defines several macros. For example, `UART_HW_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Use LP UART Controller with HP Core** The UART driver also supports to control the LP UART controller when the chip is in active mode. The configuration steps for the LP UART are the same as the steps for a normal UART controller, except:

- The port number for the LP UART controller is defined by `LP_UART_NUM_0`.
- The available clock sources for the LP UART controller can be found in `lp_uart_sclk_t`.
- The size of the hardware FIFO for the LP UART controller is much smaller, which is defined in `SOC_LP_UART_FIFO_LEN`.
- The GPIO pins for the LP UART controller can only be selected from the LP GPIO pins.

## Overview of RS485 Specific Communication Options

---

**Note:** The following section uses `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see **ESP32-P4 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]**. Use the register name to navigate to the register description and then find the field/bit.

---

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-P4's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section [Interface Connection Options](#)). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-P4 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the TX FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32-P4's RS485 interface connection.

**Note:**

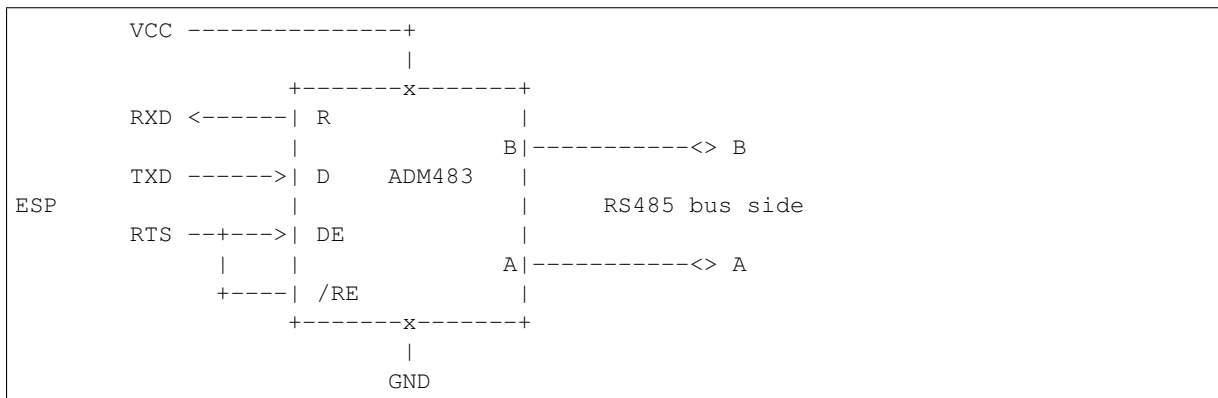

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

**Circuit A: Collision Detection Circuit**

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

(continues on next page)

(continued from previous page)

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

## Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

Code Example	Description
<code>peripherals/uart/uart_echo</code>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<code>peripherals/uart/uart_events</code>	Reporting various communication events, using pattern detection interrupts.
<code>peripherals/uart/uart_async_rxtxtasks</code>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<code>peripherals/uart/uart_select</code>	Using synchronous I/O multiplexing for UART file descriptors.
<code>peripherals/uart/uart_echo_rs485</code>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <code>peripherals/uart/uart_echo</code> but allows communication through an RS485 interface chip connected to ESP32-P4 pins.
<code>peripherals/uart/nmea0183_parser</code>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

## API Reference

### Header File

- `components/driver/uart/include/driver/uart.h`
- This header file can be included with:

```
#include "driver/uart.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

PRIV\_REQUIRES driver

## Functions

*esp\_err\_t* **uart\_driver\_install** (*uart\_port\_t* uart\_num, int rx\_buffer\_size, int tx\_buffer\_size, int queue\_size, *QueueHandle\_t* \*uart\_queue, int intr\_alloc\_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

---

**Note:** Rx\_buffer\_size should be greater than UART\_HW\_FIFO\_LEN(uart\_num). Tx\_buffer\_size should be either zero or greater than UART\_HW\_FIFO\_LEN(uart\_num).

---

### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **rx\_buffer\_size** -- UART RX ring buffer size.
- **tx\_buffer\_size** -- UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue\_size** -- UART event queue size/depth.
- **uart\_queue** -- UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* uart\_num)

Uninstall UART driver.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

bool **uart\_is\_driver\_installed** (*uart\_port\_t* uart\_num)

Checks whether the driver is installed or not.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

### Returns

- true driver is installed
- false driver is not installed

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* data\_bit)

Set UART data bits.

### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- UART data bits

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* \*data\_bit)

Get the UART data bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- Pointer to accept value of UART data bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* stop\_bits)

Set UART stop bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- UART stop bits

**Returns**

- ESP\_OK Success
- ESP\_FAIL Fail

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* \*stop\_bits)

Get the UART stop bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- Pointer to accept value of UART stop bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*stop\_bit)

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* parity\_mode)

Set UART parity mode.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- the enum of uart parity configuration

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* \*parity\_mode)

Get the UART parity mode configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- Pointer to accept value of UART parity mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

*esp\_err\_t* **uart\_get\_sclk\_freq** (*uart\_sclk\_t* sclk, uint32\_t \*out\_freq\_hz)

Get the frequency of a clock source for the HP UART port.

**Parameters**

- **sclk** -- Clock source
- **out\_freq\_hz** -- [out] Output of frequency, in Hz

**Returns**

- ESP\_ERR\_INVALID\_ARG: if the clock source is not supported
- otherwise ESP\_OK

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t baudrate)

Set UART baud rate.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- UART baud rate.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t \*baudrate)

Get the UART baud rate configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- Pointer to accept value of UART baud rate

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*baudrate)

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* uart\_num, uint32\_t inverse\_mask)

Set UART line inverse mode.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **inverse\_mask** -- Choose the wires that need to be inverted. Using the ORred mask of *uart\_signal\_inv\_t*

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* flow\_ctrl, uint8\_t rx\_thresh)

Set hardware flow control.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Hardware flow control mode
- **rx\_thresh** -- Threshold of Hardware RX flow control (0 ~ UART\_HW\_FIFO\_LEN(uart\_num)). Only when UART\_HW\_FLOWCTRL\_RTS is set, will the rx\_thresh value be set.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* uart\_num, bool enable, uint8\_t rx\_thresh\_xon, uint8\_t rx\_thresh\_xoff)

Set software flow control.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **enable** -- switch on or off
- **rx\_thresh\_xon** -- low water mark
- **rx\_thresh\_xoff** -- high water mark

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* \*flow\_ctrl)

Get the UART hardware flow control configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Option for different flow control mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*flow\_ctrl)

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* uart\_num, uint32\_t clr\_mask)

Clear UART interrupt status.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **clr\_mask** -- Bit mask of the interrupt status to be cleared.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t enable\_mask)

Set UART interrupt enable.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable\_mask** -- Bit mask of the enable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t disable\_mask)

Clear UART interrupt enable bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **disable\_mask** -- Bit mask of the disable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* uart\_num)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* uart\_num)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* uart\_num)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* uart\_num, int enable, int thresh)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable** -- 1: enable; 0: disable
- **thresh** -- Threshold of TX interrupt, 0 ~ UART\_HW\_FIFO\_LEN(uart\_num)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* uart\_num, int tx\_io\_num, int rx\_io\_num, int rts\_io\_num, int cts\_io\_num)

Assign signals of a UART peripheral to GPIO pins.

---

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

---

---

**Note:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **tx\_io\_num** -- UART TX pin GPIO number.
- **rx\_io\_num** -- UART RX pin GPIO number.
- **rts\_io\_num** -- UART RTS pin GPIO number.
- **cts\_io\_num** -- UART CTS pin GPIO number.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* uart\_num, int level)

Manually set the UART RTS pin level.

---

**Note:** UART must be configured with hardware flow control disabled.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: RTS output low (active); 0: RTS output high (block)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* uart\_num, int level)

Manually set the UART DTR pin level.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: DTR output low; 0: DTR output high

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_tx\_idle\_num** (*uart\_port\_t* uart\_num, uint16\_t idle\_num)

Set UART idle interval after tx FIFO is empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

- **idle\_num** -- idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_param\_config** (*uart\_port\_t* uart\_num, const *uart\_config\_t* \*uart\_config)

Set UART configuration parameters.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **uart\_config** -- UART parameter settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_intr\_config** (*uart\_port\_t* uart\_num, const *uart\_intr\_config\_t* \*intr\_conf)

Configure UART interrupts.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **intr\_conf** -- UART interrupt settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_wait\_tx\_done** (*uart\_port\_t* uart\_num, TickType\_t ticks\_to\_wait)

Wait until UART TX FIFO is empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **ticks\_to\_wait** -- Timeout, count in RTOS ticks

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

int **uart\_tx\_chars** (*uart\_port\_t* uart\_num, const char \*buffer, uint32\_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

---

**Note:** This function should only be used when UART TX buffer is not enabled.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buffer** -- data buffer address
- **len** -- data length to send

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes** (*uart\_port\_t* uart\_num, const void \*src, size\_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* uart\_num, const void \*src, size\_t size, int brk\_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send
- **brk\_len** -- break signal duration(unit: the time it takes to send one bit at current baudrate)

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_read\_bytes** (*uart\_port\_t* uart\_num, void \*buf, uint32\_t length, TickType\_t ticks\_to\_wait)

UART read bytes from UART buffer.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buf** -- pointer to the buffer.
- **length** -- data length
- **ticks\_to\_wait** -- sTimeout, count in RTOS ticks

**Returns**

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* uart\_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

---

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* uart\_num)

Clear input buffer, discard all the data is in the ring-buffer.

---

**Note:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_buffered\_data\_len** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get RX ring buffer cached data length.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept cached data length

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_tx\_buffer\_free\_size** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get TX ring buffer free space size.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept the free space size

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_disable\_pattern\_det\_intr** (*uart\_port\_t* uart\_num)

UART disable pattern detect function. Designed for applications like 'AT commands'. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_pattern\_det\_baud\_intr** (*uart\_port\_t* uart\_num, char pattern\_chr, uint8\_t chr\_num, int chr\_tout, int post\_idle, int pre\_idle)

UART enable pattern detect function. Designed for applications like 'AT commands'. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**

- **uart\_num** -- UART port number.
- **pattern\_chr** -- character of the pattern.
- **chr\_num** -- number of the character, 8bit value.
- **chr\_tout** -- timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at\_cmd char.
- **post\_idle** -- idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at\_cmd char
- **pre\_idle** -- idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at\_cmd char.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

int **uart\_pattern\_pop\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos`. It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int `uart_pattern_get_pos` (*uart\_port\_t* `uart_num`)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos`. It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

*esp\_err\_t* `uart_pattern_queue_reset` (*uart\_port\_t* `uart_num`, int `queue_length`)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).
- `queue_length` -- Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

*esp\_err\_t* `uart_set_mode` (*uart\_port\_t* `uart_num`, *uart\_mode\_t* `mode`)

UART set communication mode.

---

**Note:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

---

**Parameters**

- `uart_num` -- Uart number to configure, the max port number is (`UART_NUM_MAX` -1).
- `mode` -- UART UART mode to set

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_rx\_full\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold value for RX fifo full.

---

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **threshold** -- Threshold value above which RX fifo full interrupt is generated

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_tx\_empty\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold values for TX fifo empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **threshold** -- Threshold value below which TX fifo empty interrupt is generated

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* uart\_num, const uint8\_t tout\_thresh)

UART set threshold timeout for TOUT feature.

**Parameters**

- **uart\_num** -- Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **tout\_thresh** -- This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout\_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If tout\_thresh == 0, the TOUT feature is disabled.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* uart\_num, bool \*collision\_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision\_flag. \*collision\_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart\_write\_bytes()).

**Parameters**

- **uart\_num** -- Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- **collision\_flag** -- Pointer to variable of type bool to return collision flag.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int wakeup\_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set wakeup\_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

---

**Note:** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as function\_1 to wake up UART0, GPIO9 should be configured as function\_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

---

#### Parameters

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **wakeup\_threshold** -- number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if uart\_num is incorrect or wakeup\_threshold is outside of [3, 0x3ff] range.

*esp\_err\_t* **uart\_get\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int \*out\_wakeup\_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

#### Parameters

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **out\_wakeup\_threshold** -- [out] output, set to the current value of wakeup threshold for the given UART.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if out\_wakeup\_threshold is NULL

*esp\_err\_t* **uart\_wait\_tx\_idle\_polling** (*uart\_port\_t* uart\_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters** **uart\_num** -- UART number

*esp\_err\_t* **uart\_set\_loop\_back** (*uart\_port\_t* uart\_num, bool loop\_back\_en)

Configure TX signal loop back to RX module, just for the test usage.

•

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- **uart\_num** -- UART number
- **loop\_back\_en** -- Set true to enable the loop back function, else set it false.

void **uart\_set\_always\_rx\_timeout** (*uart\_port\_t* uart\_num, bool always\_rx\_timeout\_en)

Configure behavior of UART RX timeout interrupt.

When always\_rx\_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- **uart\_num** -- UART number
- **always\_rx\_timeout\_en** -- Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

struct **uart\_config\_t**

UART configuration parameters for `uart_param_config` function.

**Public Members**

int **baud\_rate**

UART baud rate

*uart\_word\_length\_t* **data\_bits**

UART byte size

*uart\_parity\_t* **parity**

UART parity mode

*uart\_stop\_bits\_t* **stop\_bits**

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

*lp\_uart\_sclk\_t lp\_source\_clk*

LP\_UART source clock selection

struct **uart\_intr\_config\_t**

UART interrupt configuration parameters for `uart_intr_config` function.

### Public Members

uint32\_t **intr\_enable\_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8\_t **rx\_timeout\_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8\_t **txfifo\_empty\_intr\_thresh**

UART TX empty interrupt threshold.

uint8\_t **rxfifo\_full\_thresh**

UART RX full interrupt threshold.

struct **uart\_event\_t**

Event structure used in UART event queue.

### Public Members

*uart\_event\_type\_t type*

UART event type

size\_t **size**

UART data size for `UART_DATA` event

bool **timeout\_flag**

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

### Macros

**UART\_PIN\_NO\_CHANGE**

**UART\_FIFO\_LEN**

Length of the HP UART HW FIFO.

**UART\_HW\_FIFO\_LEN** (uart\_num)

Length of the UART HW FIFO.

**UART\_BITRATE\_MAX**

Maximum configurable bitrate.

## Type Definitions

```
typedef intr_handle_t uart_isr_handle_t
```

## Enumerations

```
enum uart_event_type_t  
    UART event types used in the ring buffer.
```

*Values:*

```
enumerator UART_DATA  
    UART data event
```

```
enumerator UART_BREAK  
    UART break event
```

```
enumerator UART_BUFFER_FULL  
    UART RX buffer full event
```

```
enumerator UART_FIFO_OVF  
    UART FIFO overflow event
```

```
enumerator UART_FRAME_ERR  
    UART RX frame error event
```

```
enumerator UART_PARITY_ERR  
    UART RX parity event
```

```
enumerator UART_DATA_BREAK  
    UART TX data and break event
```

```
enumerator UART_PATTERN_DET  
    UART pattern detected
```

```
enumerator UART_WAKEUP  
    UART wakeup event
```

```
enumerator UART_EVENT_MAX  
    UART event max index
```

## Header File

- [components/hal/include/hal/uart\\_types.h](#)
- This header file can be included with:

```
#include "hal/uart_types.h"
```

## Structures

```
struct uart_at_cmd_t  
    UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.
```

### Public Members

uint8\_t **cmd\_char**

UART AT cmd char

uint8\_t **char\_num**

AT cmd char repeat number

uint32\_t **gap\_tout**

gap time(in baud-rate) between AT cmd char

uint32\_t **pre\_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32\_t **post\_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

### Public Members

uint8\_t **xon\_char**

Xon flow control char

uint8\_t **xoff\_char**

Xoff flow control char

uint8\_t **xon\_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

uint8\_t **xoff\_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

### Type Definitions

typedef *soc\_periph\_uart\_clk\_src\_legacy\_t* **uart\_sclk\_t**

UART source clock.

typedef *soc\_periph\_lp\_uart\_clk\_src\_t* **lp\_uart\_sclk\_t**

LP\_UART source clock.

### Enumerations

enum **uart\_port\_t**

UART port number, can be UART\_NUM\_0 ~ (UART\_NUM\_MAX -1).

*Values:*

enumerator **UART\_NUM\_0**

UART port 0

enumerator **UART\_NUM\_1**

UART port 1

enumerator **UART\_NUM\_2**

UART port 2

enumerator **UART\_NUM\_3**

UART port 3

enumerator **UART\_NUM\_4**

UART port 4

enumerator **LP\_UART\_NUM\_0**

LP UART port 0

enumerator **UART\_NUM\_MAX**

UART port max

enum **uart\_mode\_t**

UART mode selection.

*Values:*

enumerator **UART\_MODE\_UART**

mode: regular UART mode

enumerator **UART\_MODE\_RS485\_HALF\_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART\_MODE\_IRDA**

mode: IRDA UART mode

enumerator **UART\_MODE\_RS485\_COLLISION\_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART\_MODE\_RS485\_APP\_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart\_word\_length\_t**

UART word length constants.

*Values:*

enumerator **UART\_DATA\_5\_BITS**

word length: 5bits

enumerator **UART\_DATA\_6\_BITS**

word length: 6bits

enumerator **UART\_DATA\_7\_BITS**

word length: 7bits

enumerator **UART\_DATA\_8\_BITS**

word length: 8bits

enumerator **UART\_DATA\_BITS\_MAX**

enum **uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

enumerator **UART\_STOP\_BITS\_1**

stop bit: 1bit

enumerator **UART\_STOP\_BITS\_1\_5**

stop bit: 1.5bits

enumerator **UART\_STOP\_BITS\_2**

stop bit: 2bits

enumerator **UART\_STOP\_BITS\_MAX**

enum **uart\_parity\_t**

UART parity constants.

*Values:*

enumerator **UART\_PARITY\_DISABLE**

Disable UART parity

enumerator **UART\_PARITY\_EVEN**

Enable UART even parity

enumerator **UART\_PARITY\_ODD**

Enable UART odd parity

enum **uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

enumerator **UART\_HW\_FLOWCTRL\_DISABLE**

disable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_RTS**

enable RX hardware flow control (rts)

enumerator **UART\_HW\_FLOWCTRL\_CTS**

enable TX hardware flow control (cts)

enumerator **UART\_HW\_FLOWCTRL\_CTS\_RTS**

enable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_MAX**

enum **uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

enumerator **UART\_SIGNAL\_INV\_DISABLE**

Disable UART signal inverse

enumerator **UART\_SIGNAL\_IRDA\_TX\_INV**

inverse the UART irda\_tx signal

enumerator **UART\_SIGNAL\_IRDA\_RX\_INV**

inverse the UART irda\_rx signal

enumerator **UART\_SIGNAL\_RXD\_INV**

inverse the UART rxd signal

enumerator **UART\_SIGNAL\_CTS\_INV**

inverse the UART cts signal

enumerator **UART\_SIGNAL\_DSR\_INV**

inverse the UART dsr signal

enumerator **UART\_SIGNAL\_TXD\_INV**

inverse the UART txd signal

enumerator **UART\_SIGNAL\_RTS\_INV**

inverse the UART rts signal

enumerator **UART\_SIGNAL\_DTR\_INV**

inverse the UART dtr signal

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro returns the matching counterpart for you. See some examples below.

---

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)

2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via `IO_MUX` (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via `IO_MUX` (this is `UART_NUM_0`). It is similar to the above macro but specifies the pin function which is also part of the `IO_MUX` assignment.

### Header File

- `components/soc/esp32p4/include/soc/uart_channel.h`
- This header file can be included with:

```
#include "soc/uart_channel.h"
```

### Macros

`UART_GPIO37_DIRECT_CHANNEL`

`UART_NUM_0_TXD_DIRECT_GPIO_NUM`

`UART_GPIO38_DIRECT_CHANNEL`

`UART_NUM_0_RXD_DIRECT_GPIO_NUM`

`UART_GPIO8_DIRECT_CHANNEL`

`UART_NUM_0_RTS_DIRECT_GPIO_NUM`

`UART_GPIO9_DIRECT_CHANNEL`

`UART_NUM_0_CTS_DIRECT_GPIO_NUM`

`UART_TXD_GPIO37_DIRECT_CHANNEL`

`UART_RXD_GPIO38_DIRECT_CHANNEL`

`UART_RTS_GPIO8_DIRECT_CHANNEL`

`UART_CTS_GPIO9_DIRECT_CHANNEL`

`UART_GPIO10_DIRECT_CHANNEL`

`UART_NUM_1_TXD_DIRECT_GPIO_NUM`

`UART_GPIO11_DIRECT_CHANNEL`

`UART_NUM_1_RXD_DIRECT_GPIO_NUM`

`UART_GPIO12_DIRECT_CHANNEL`

`UART_NUM_1_RTS_DIRECT_GPIO_NUM`

`UART_GPIO13_DIRECT_CHANNEL`

`UART_NUM_1_CTS_DIRECT_GPIO_NUM`

`UART_TXD_GPIO10_DIRECT_CHANNEL`

`UART_RXD_GPIO11_DIRECT_CHANNEL`

`UART_RTS_GPIO12_DIRECT_CHANNEL`

`UART_CTS_GPIO13_DIRECT_CHANNEL`

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

## 2.6 Project Configuration

### 2.6.1 Introduction

The `esp-idf-kconfig` package that ESP-IDF uses is based on `kconfiglib`, which is a Python extension to the `Kconfig` system. `Kconfig` provides a compile-time project configuration mechanism and offers configuration options of several types (e.g., integers, strings, and booleans). `Kconfig` files specify dependencies between options, default values of options, the way options are grouped together, etc.

For the full list of available features, please see [Kconfig](#) and [kconfiglib extentions](#).

### 2.6.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved in the `sdkconfig` file under the project root directory. Based on `sdkconfig`, application build targets will generate the `sdkconfig.h` file under the build directory, and will make the `sdkconfig` options available to the project build system and source files.

### 2.6.3 Using `sdkconfig.defaults`

In some cases, for example, when the `sdkconfig` file is under revision control, it may be inconvenient for the build system to change the `sdkconfig` file. The build system offers a solution to prevent it from happening, which is to create the `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It contains all the options which matter to the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configuration, or it can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted or added to the ignore list of the revision control system (e.g., the `.gitignore` file for `git`). Project build targets will automatically create the `sdkconfig` file, populate it with the settings from the `sdkconfig.defaults` file, and configure the rest of the settings to

their default values. Note that during the build process, settings from `sdkconfig.defaults` will not override those already in `sdkconfig`. For more information, see [Custom Sdkconfig Defaults](#).

## 2.6.4 Kconfig Format Rules

Format rules for Kconfig files are as follows:

- Option names in any menus should have consistent prefixes. The prefix currently should have at least 3 characters.
- The unit of indentation should be 4 spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 spaces, `config menu` by 4 spaces, `help in config` by 8 spaces, and the text under `help` by 12 spaces.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is 50 characters.
- The maximum length of lines is 120 characters.

---

**Note:** The `help` section of each config in the menu is treated as `reStructuredText` to generate the reference documentation for each option.

---

### Format Checker

`kconfcheck` tool in `esp-idf-kconfig` package is provided for checking Kconfig files against the above format rules. The checker checks all Kconfig and `Kconfig.projbuild` files given as arguments, and generates a new file with suffix `.new` with some suggestions about how to fix issues (if there are any). Please note that the checker cannot correct all format issues and the responsibility of the developer is to final check and make corrections in order to pass the tests. For example, indentations will be corrected if there is not any misleading formatting, but it cannot come up with a common prefix for options inside a menu.

The `esp-idf-kconfig` package is available in ESP-IDF environments, where the checker tool can be invoked by running command `python -m kconfcheck <path_to_kconfig_file>`.

For more information, please refer to [esp-idf-kconfig package documentation](#).

## 2.6.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases, then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `kconfgen` is used by the tool chain to pre-process `sdkconfig` files before anything else. For example, `menuconfig` would read them, so the settings for old options is kept and not ignored.
2. `kconfgen` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target-specific rename file `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g., `sdkconfig.rename.esp32s2`.
3. `kconfgen` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, and `auto.conf`) by adding a list of compatibility statements, i.e., the values of old options are set for new options after modification. If users still use old options in their code, this will prevent it from breaking.
4. *Deprecated options and their replacements* are automatically generated by `kconfgen`.

## 2.6.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from Kconfig files. Note that due to dependencies between options, some options listed here may not be visible by default in `menuconfig`.

By convention, all option names are upper-case letters with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in `menuconfig`, then the `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In the following sections, option names are also prefixed with `CONFIG_`, same as in the source code.

## Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

## CONFIG\_APP\_BUILD\_TYPE

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when `APP_BUILD_TYPE_RAM` is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A `gdbinit` file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this `gdbinit` file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example `gdbinit` files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the `load_ram` in `esptool.py` to load the generated `.bin` file into ram and execute.

**Example:** `esptool.py --chip {chip} -p {port} -b {baud} --no-stub load_ram {app.bin}`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_RAM` is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS= CON-
FIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (CONFIG\_APP\_BUILD\_TYPE\_APP\_2NDBOOT)
- Build app runs entirely in RAM (EXPERIMENTAL) (CONFIG\_APP\_BUILD\_TYPE\_RAM)

### CONFIG\_APP\_BUILD\_TYPE\_PURE\_RAM\_APP

Build app without SPI\_FLASH/PSRAM support (saves ram)

*Found in: Build type*

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the spi\_flash component will also be unavailable, such as app\_update, etc. When this option is enabled, about 26KB of RAM space can be saved.

### CONFIG\_APP\_REPRODUCIBLE\_BUILD

Enable reproducible build

*Found in: Build type*

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

**Default value:**

- No (disabled)

### CONFIG\_APP\_NO\_BLOBS

No Binary Blobs

*Found in: Build type*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**

- No (disabled)

### Bootloader config

Contains:

- *CONFIG\_BOOTLOADER\_LOG\_LEVEL*
- *Bootloader manager*
- *CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION*
- *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*
- *CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE*
- *CONFIG\_BOOTLOADER\_APP\_TEST*
- *CONFIG\_BOOTLOADER\_FACTORY\_RESET*
- *CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO*
- *CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC*
- *Serial Flash Configurations*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON*
- *CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP*
- *CONFIG\_BOOTLOADER\_WDT\_ENABLE*
- *CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST*

**Bootloader manager** Contains:

- `CONFIG_BOOTLOADER_PROJECT_VER`
- `CONFIG_BOOTLOADER_COMPILE_TIME_DATE`

### **CONFIG\_BOOTLOADER\_COMPILE\_TIME\_DATE**

Use time/date stamp for bootloader

*Found in: `Bootloader config` > `Bootloader manager`*

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

### **CONFIG\_BOOTLOADER\_PROJECT\_VER**

Project version

*Found in: `Bootloader config` > `Bootloader manager`*

Project version. It is placed in "version" field of the `esp_bootloader_desc` structure. The type of this field is "uint32\_t".

**Range:**

- from 0 to 4294967295

**Default value:**

- 1

### **CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION**

Bootloader optimization Level

*Found in: `Bootloader config`*

This option sets compiler optimization level (gcc `-O` argument) for the bootloader.

- The default "Size" setting will add the `-Os` flag to CFLAGS.
- The "Debug" setting will add the `-Og` flag to CFLAGS.
- The "Performance" setting will add the `-O2` flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (`-Os`) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_SIZE`)
- Debug (`-Og`) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for performance (`-O2`) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (`-O0`) (Deprecated, will be removed in IDF v6.0) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_NONE`)

### **CONFIG\_BOOTLOADER\_LOG\_LEVEL**

Bootloader log verbosity

*Found in: `Bootloader config`*

Specify how much output to see in bootloader logs.

Available options:

- No output (`CONFIG_BOOTLOADER_LOG_LEVEL_NONE`)

- Error (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

**Serial Flash Configurations** Contains:

- [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#)
- [CONFIG\\_BOOTLOADER\\_FLASH\\_XMC\\_SUPPORT](#)

### **CONFIG\_BOOTLOADER\_FLASH\_DC\_AWARE**

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

### **CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT**

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

### **CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST**

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_8V)
- 1.9V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_9V)

### **CONFIG\_BOOTLOADER\_FACTORY\_RESET**

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Default value:**

- 4 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LEVEL

Factory reset GPIO level

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low ([CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET\\_PIN\\_LOW](#))
- Reset on GPIO high ([CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET\\_PIN\\_HIGH](#))

### CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE

Clear OTA data on factory reset (select factory partition)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

### CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET

Comma-separated names of partitions to clear on factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy\_init, ...") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

**Default value:**

- "nvs" if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_APP\_TEST

GPIO triggers boot from test app partition

*Found in: [Bootloader config](#)*

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

### CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST

Number of the GPIO input to boot TEST partition

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if *CONFIG\_BOOTLOADER\_APP\_TEST*

**Default value:**

- 18 if *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LEVEL

App test GPIO level

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_TEST*

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low (*CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LOW*)
- Enter test app on GPIO high (*CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_HIGH*)

### CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: *Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if *CONFIG\_BOOTLOADER\_FACTORY\_RESET* || *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE

Enable protection for unmapped memory regions

Found in: *Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_ENABLE

Use RTC watchdog in start code

Found in: *Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC\_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow\_clk - and ends calling app\_main. Re-set timeout is needed due to WDT uses a SLOW\_CLK

clock source. After changing a frequency `slow_clk` a time of WDT needs to re-set for new frequency. `slow_clk` depends on `RTC_CLK_SRC` (`INTERNAL_RC` or `EXTERNAL_CRYSTAL`).

**Default value:**

- Yes (enabled)

### **CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE**

Allows RTC watchdog disable in user code

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE](#)*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the `rtc_wdt` in the app's own code. If this option is not set (default), then `rtc_wdt` will be disabled by ESP-IDF before calling the `app_main()` function.

Use function `rtc_wdt_feed()` for resetting counter of `rtc_wdt`. Use function `rtc_wdt_disable()` for disabling `rtc_wdt`.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_WDT\_TIME\_MS**

Timeout for RTC watchdog (ms)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE](#)*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: `RTC_WDT` will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

### **CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE**

Enable app rollback support

*Found in: [Bootloader config](#)*

After updating the app, the bootloader runs a new app with the "ESP\_OTA\_IMG\_PENDING\_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK**

Enable app anti-rollback support

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**

- No (disabled) if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`

### **CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION**

eFuse secure version of app

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see `BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with `ota_0 + ota_1` (without factory).

**Default value:**

- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### **CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD**

Size of the efuse secure version field

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**

- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**

- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### **CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE**

Emulate operations with efuse secure version(only test)

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

**Default value:**

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP**

Skip image validation when exiting deep sleep

*Found in:* `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if "allow insecure options" is enabled, however it's strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT` && `CONFIG_SECURE_BOOT_INSECURE`

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON**

Skip image validation from power on reset (READ HELP FIRST)

*Found in: [Bootloader config](#)*

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it's not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it's not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: [Bootloader config](#)*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting "Skip image validation from power on reset" instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: [Bootloader config](#)*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through `PRO_CPU`.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_IN\_CRC

Include custom memory in the CRC calculation

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)*

This option allows the customer to use the legacy bootloader behavior when the RTC FAST memory CRC calculation takes place. When this option is enabled, the allocated user custom data will be taken into account in the CRC calculation. This means that any change to the custom data would need a CRC update to prevent the bootloader from marking this data as corrupted. If this option is disabled, the custom data will not be taken into account when calculating the RTC FAST memory CRC. The user custom data can be changed freely, without the need to update the CRC. THIS OPTION MUST BE THE SAME FOR BOTH THE BOOTLOADER AND THE APPLICATION BUILDS.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

### CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE

Size in bytes for custom purposes

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (`rtc_retain_mem_t`) is reserved and has access from the bootloader and an application.

**Default value:**

- 0 if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

### Security features

Contains:

- [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#)
- [CONFIG\\_SECURE\\_SIGNED\\_APPS\\_SCHEME](#)

- [CONFIG\\_SECURE\\_SIGNED\\_ON\\_UPDATE\\_NO\\_SECURE\\_BOOT](#)

### CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT

Require signed app images

*Found in: [Security features](#)*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

## CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
  - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
  - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
  - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_SCHEME)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (CONFIG\_SECURE\_SIGNED\_APPS\_RSA\_SCHEME)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_V2\_SCHEME)  
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

## CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_192\_BITS)
- Using ECC curve NISTP256 (Recommended) (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_256\_BITS)

## CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME`

**CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

**CONFIG\_SECURE\_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**

- No (disabled)

**CONFIG\_SECURE\_BOOT\_VERSION**

Select secure boot version

*Found in: Security features > CONFIG\_SECURE\_BOOT*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (CONFIG\_SECURE\_BOOT\_V1\_ENABLED)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (CONFIG\_SECURE\_BOOT\_V2\_ENABLED)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

### CONFIG\_SECURE\_BOOTLOADER\_MODE

Secure bootloader mode

*Found in: Security features*

Available options:

- One-time flash (CONFIG\_SECURE\_BOOTLOADER\_ONE\_TIME\_FLASH)  
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.  
Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (CONFIG\_SECURE\_BOOTLOADER\_REFLASHABLE)  
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.  
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.  
This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

### CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

### CONFIG\_SECURE\_BOOT\_SIGNING\_KEY

Secure boot private signing key

*Found in: Security features > CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

**Default value:**

- "secure\_boot\_signing\_key.pem" if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

### CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

### CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

### CONFIG\_SECURE\_BOOT\_FLASH\_BOOTLOADER\_DEFAULT

Flash bootloader along with other artifacts when using the default flash command

*Found in: Security features*

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be separately flashed using the command `idf.py bootloader flash`, whereas, the application and partition table can be flashed using the command `idf.py flash` itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command `idf.py flash`.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_V2_ENABLED` && `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

### CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

### **CONFIG\_SECURE\_BOOT\_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

### **CONFIG\_SECURE\_FLASH\_ENC\_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**

- No (disabled)

### **CONFIG\_SECURE\_FLASH\_ENCRYPTION\_KEYSIZE**

Size of generated XTS-AES key

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES128_DERIVED`)
- AES-128 (256-bit key) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES128`)

- AES-256 (512-bit key) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES256`)

## **CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE**

Enable usage mode

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When `EFUSE_VIRTUAL` is enabled, `SECURE_FLASH_ENCRYPTION_MODE_RELEASE` is not available. For CI tests we use `IDF_CI_BUILD` to bypass it ("export `IDF_CI_BUILD=1`"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (`CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`)
- Release (`CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE`)

### **Potentially insecure options** Contains:

- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`
- `CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE`

## **CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG**

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

## **CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary)

have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

### **CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS**

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR\_DIS\_RD\_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE\_RD\_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK\_KEY0-BLOCK\_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If "UART ROM download mode (Permanently disabled (recommended))" or "UART ROM download mode (Permanently switch to Secure mode (recommended))" is set, then it is `__NOT__` possible to read/write efuses using `espefuse.py` utility. However, efuse can be read/written from the application

### **CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS**

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

### **CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

## CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

## CONFIG\_SECURE\_FLASH\_SKIP\_WRITE\_PROTECTION\_CACHE

Skip write-protection of DIS\_CACHE (DIS\_ICACHE, DIS\_DCACHE)

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS\_CACHE(for ESP32) or DIS\_ICACHE/DIS\_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these `SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`, `SECURE_BOOT_ALLOW_JTAG` or `SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE` options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: `MAC`, `MAC_CRC`, `DISABLE_APP_CPU`, `DISABLE_BT`, `DIS_CACHE`, `VOL_LEVEL_HP_INV`.

ESP32-C3: `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-C6: `SWAP_UART_SDIO_EN`, `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-H2: `DIS_ICACHE`, `DIS_USB_JTAG`, `POWERGLITCH_EN`, `DIS_FORCE_DOWNLOAD`, `SPI_DOWNLOAD_MSPI_DIS`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S2: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB`, `DIS_TWAI`, `DIS_BOOT_REMAP`, `SOFT_DIS_JTAG`, `HARD_DIS_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S3: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB_OTG`, `DIS_TWAI`, `DIS_APP_CPU`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`, `DIS_USB_JTAG`, `DIS_USB_SERIAL_JTAG`, `STRAP_JTAG_SEL`, `USB_PHY_SEL`.

### CONFIG\_SECURE\_FLASH\_ENCRYPT\_ONLY\_IMAGE\_LEN\_IN\_APP\_PART

Encrypt only the app image that is present in the partition of type app

*Found in: Security features*

If set, optimise encryption time for the partition of type APP, by only encrypting the app image that is present in the partition, instead of the whole partition. The image length used for encryption is derived from the image metadata, which includes the size of the app image, checksum, hash and also the signature sector when secure boot is enabled.

If not set (default), the whole partition of type APP would be encrypted, which increases the encryption time but might be useful if there is any custom data appended to the firmware image.

### CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

### CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

*Found in: Security features*

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (`CONFIG_SECURE_DISABLE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools.  
Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.  
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.  
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`CONFIG_SECURE_ENABLE_SECURE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.  
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).  
Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.  
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the

benefits of the security features, but it increases the potential "attack surface" for an attacker to try and bypass them with a successful physical attack.

It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`

Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (`CONFIG_SECURE_INSECURE_ALLOW_DL_MODE`)

This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option **SHOULD NOT BE ENABLED** for production use cases.

## Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

### `CONFIG_APP_COMPILE_TIME_DATE`

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

### `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`

Exclude `PROJECT_VER` from firmware image

*Found in: Application manager*

The `PROJECT_VER` variable from the build system will not affect the firmware image. This value will not be contained in the `esp_app_desc` structure.

**Default value:**

- No (disabled)

### `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`

Exclude `PROJECT_NAME` from firmware image

*Found in: Application manager*

The `PROJECT_NAME` variable from the build system will not affect the firmware image. This value will not be contained in the `esp_app_desc` structure.

**Default value:**

- No (disabled)

### `CONFIG_APP_PROJECT_VER_FROM_CONFIG`

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

**CONFIG\_APP\_PROJECT\_VER**

Project version

*Found in: Application manager > CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

Project version

**Default value:**

- 1 if *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

**CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is APP\_RETRIEVE\_LEN\_ELF\_SHA plus the null terminator. Changing this value will change the size of this buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 9

**Boot ROM Behavior**

Contains:

- *CONFIG\_BOOT\_ROM\_LOG\_SCHEME*

**CONFIG\_BOOT\_ROM\_LOG\_SCHEME**

Permanently change Boot ROM output

*Found in: Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (CONFIG\_BOOT\_ROM\_LOG\_ALWAYS\_ON)  
Always print ROM logs, this is the default behavior.
- Permanently disable logging (CONFIG\_BOOT\_ROM\_LOG\_ALWAYS\_OFF)  
Don't print ROM logs.
- Log on GPIO High (CONFIG\_BOOT\_ROM\_LOG\_ON\_GPIO\_HIGH)  
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (CONFIG\_BOOT\_ROM\_LOG\_ON\_GPIO\_LOW)  
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

## Serial flasher config

Contains:

- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`

### **CONFIG\_ESPTOOLPY\_NO\_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

### **CONFIG\_ESPTOOLPY\_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (`CONFIG_ESPTOOLPY_FLASHMODE_QIO`)
- QOUT (`CONFIG_ESPTOOLPY_FLASHMODE_QOUT`)
- DIO (`CONFIG_ESPTOOLPY_FLASHMODE_DIO`)
- DOUT (`CONFIG_ESPTOOLPY_FLASHMODE_DOUT`)
- OPI (`CONFIG_ESPTOOLPY_FLASHMODE_OPI`)

### **CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

Available options:

- STR Mode (`CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_STR`)
- DTR Mode (`CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR`)

### **CONFIG\_ESPTOOLPY\_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

Available options:

- 120 MHz (READ DOCS FIRST) (`CONFIG_ESPTOOLPY_FLASHFREQ_120M`)

- Optional feature for QSPI Flash. Read docs and enable `CONFIG_SPI_FLASH_HPM_ENA` first!
- Flash 120 MHz SDR mode is stable.
- Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.

**Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.

- 80 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_80M`)
- 64 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_64M`)
- 60 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_60M`)
- 48 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_48M`)
- 40 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_40M`)
- 32 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_32M`)
- 30 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_30M`)
- 26 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_26M`)
- 24 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_24M`)
- 20 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_20M`)
- 16 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_16M`)
- 15 MHz (`CONFIG_ESPTOOLPY_FLASHFREQ_15M`)

## **CONFIG\_ESPTOOLPY\_FLASHSIZE**

Flash size

*Found in: [Serial flasher config](#)*

SPI flash size, in megabytes

Available options:

- 1 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_1MB`)
- 2 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_2MB`)
- 4 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_4MB`)
- 8 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_8MB`)
- 16 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_16MB`)
- 32 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_32MB`)
- 64 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_64MB`)
- 128 MB (`CONFIG_ESPTOOLPY_FLASHSIZE_128MB`)

## **CONFIG\_ESPTOOLPY\_HEADER\_FLASHSIZE\_UPDATE**

Detect flash size when flashing bootloader

*Found in: [Serial flasher config](#)*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

## **CONFIG\_ESPTOOLPY\_BEFORE**

Before flashing

*Found in: [Serial flasher config](#)*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG\_ESPTOOLPY\_BEFORE\_RESET)
- No reset (CONFIG\_ESPTOOLPY\_BEFORE\_NORESET)

### CONFIG\_ESPTOOLPY\_AFTER

After flashing

*Found in: [Serial flasher config](#)*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG\_ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (CONFIG\_ESPTOOLPY\_AFTER\_NORESET)

### Partition Table

Contains:

- [CONFIG\\_PARTITION\\_TABLE\\_CUSTOM\\_FILENAME](#)
- [CONFIG\\_PARTITION\\_TABLE\\_MD5](#)
- [CONFIG\\_PARTITION\\_TABLE\\_OFFSET](#)
- [CONFIG\\_PARTITION\\_TABLE\\_TYPE](#)

### CONFIG\_PARTITION\_TABLE\_TYPE

Partition Table

*Found in: [Partition Table](#)*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. These are mostly intended for example and development use, it's expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP)  
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE)  
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.

The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large.csv`

This partition table is not suitable for an app that needs OTA (over the air update) capability.

- **Factory app, two OTA definitions (CONFIG\_PARTITION\_TABLE\_TWO\_OTA)**  
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota.csv`
- **Custom partition table CSV (CONFIG\_PARTITION\_TABLE\_CUSTOM)**  
Specify the path to the partition table CSV to use for your project. Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- **Single factory app, no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)**  
This is a variation of the default "Single factory app, no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_encr_nvs.csv`
- **Single factory app (large), no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE\_ENC\_NVS)**  
This is a variation of the "Single factory app (large), no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large_encr_nvs.csv`
- **Factory app, two OTA definitions, encrypted NVS (CONFIG\_PARTITION\_TABLE\_TWO\_OTA\_ENCRYPTED\_NVS)**  
This is a variation of the "Factory app, two OTA definitions" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information. The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota_encr_nvs.csv`

### CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME

Custom partition CSV file

*Found in:* [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "partitions.csv"

### CONFIG\_PARTITION\_TABLE\_OFFSET

Offset of partition table

*Found in:* [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION\_TABLE\_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- "0x8000"

**CONFIG\_PARTITION\_TABLE\_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled)

**Compiler options**

Contains:

- *CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL*
- *CONFIG\_COMPILER\_FLOAT\_LIB\_FROM*
- *CONFIG\_COMPILER\_RT\_LIB*
- *CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT*
- *CONFIG\_COMPILER\_DISABLE\_GCC12\_WARNINGS*
- *CONFIG\_COMPILER\_DISABLE\_GCC13\_WARNINGS*
- *CONFIG\_COMPILER\_DUMP\_RTL\_FILES*
- *CONFIG\_COMPILER\_SAVE\_RESTORE\_LIBCALLS*
- *CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS*
- *CONFIG\_COMPILER\_CXX\_EXCEPTIONS*
- *CONFIG\_COMPILER\_CXX\_RTTI*
- *CONFIG\_COMPILER\_OPTIMIZATION*
- *CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS*
- *CONFIG\_COMPILER\_STACK\_CHECK\_MODE*

**CONFIG\_COMPILER\_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Size" setting will add the -Os flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

The "Size" setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The "Performance" setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

"None" with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER\_COMPILER\_OPTIMIZATION setting.

Available options:

- Debug (-Og) (CONFIG\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for size (-Os) (CONFIG\_COMPILER\_OPTIMIZATION\_SIZE)
- Optimize for performance (-O2) (CONFIG\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (CONFIG\_COMPILER\_OPTIMIZATION\_NONE)

### CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to "silent" to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_ENABLE)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_SILENT)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_DISABLE)  
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

### CONFIG\_COMPILER\_FLOAT\_LIB\_FROM

Compiler float lib source

*Found in: Compiler options*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is "fast", but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_GCCLIB)
- librvfp (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_RVFPLIB)

### CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT

Disable messages in ESP\_RETURN\_ON\_\* and ESP\_EXIT\_ON\_\* macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros: -  
ESP\_RETURN\_ON\_ERROR - ESP\_EXIT\_ON\_ERROR - ESP\_RETURN\_ON\_FALSE -  
ESP\_EXIT\_ON\_FALSE

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS

Replace ESP-IDF and project paths in binaries

*Found in: [Compiler options](#)*

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string "IDF", and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-macro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-macro-prefix-map` or `-file-prefix-map` arguments.

**Default value:**

- Yes (enabled)

## CONFIG\_COMPILER\_CXX\_EXCEPTIONS

Enable C++ exceptions

*Found in: [Compiler options](#)*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any `libstdc++` code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#)

## CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE

Emergency Pool Size

*Found in: [Compiler options](#) > [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)

## CONFIG\_COMPILER\_CXX\_RTTI

Enable C++ run-time type info (RTTI)

*Found in: [Compiler options](#)*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_STACK\_CHECK\_MODE

Stack smashing protection mode

*Found in: [Compiler options](#)*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected -- those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NONE)
- Normal (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NORM)
- Strong (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_STRONG)
- Overall (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_ALL)

## CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable `-Wwrite-strings` warning flag

*Found in: [Compiler options](#)*

Adds `-Wwrite-strings` flag for the C/C++ compilers.

For C, this gives string constants the type `const char []` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_SAVE\_RESTORE\_LIBCALLS

Enable `-msave-restore` flag to reduce code size

*Found in: [Compiler options](#)*

Adds `-msave-restore` to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

### CONFIG\_COMPILER\_DISABLE\_GCC12\_WARNINGS

Disable new warnings introduced in GCC 12

*Found in: [Compiler options](#)*

Enable this option if use GCC 12 or newer, and want to disable warnings which don't appear with GCC 11.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DISABLE\_GCC13\_WARNINGS

Disable new warnings introduced in GCC 13

*Found in: [Compiler options](#)*

Enable this option if use GCC 13 or newer, and want to disable warnings which don't appear with GCC 12.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

*Found in: [Compiler options](#)*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

### CONFIG\_COMPILER\_RT\_LIB

Compiler runtime library

*Found in: [Compiler options](#)*

Select runtime library to be used by compiler. - GCC toolchain supports libgcc only. - Clang allows to choose between libgcc or libclang\_rt. - For host builds ("linux" target), uses the default library.

Available options:

- libgcc (CONFIG\_COMPILER\_RT\_LIB\_GCCLIB)
- libclang\_rt (CONFIG\_COMPILER\_RT\_LIB\_CLANGRT)
- Host (CONFIG\_COMPILER\_RT\_LIB\_HOST)

### Component config

- *CONFIG\_APPTRACE\_DESTINATION2*
- *FreeRTOS System View Tracing*
- *CONFIG\_APPTRACE\_GCOV\_ENABLE*
- *CONFIG\_APPTRACE\_BUF\_SIZE*
- *CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX*
- *CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH*
- *CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO*
- *CONFIG\_APPTRACE\_UART\_BAUDRATE*
- *CONFIG\_APPTRACE\_UART\_RX\_GPIO*
- *CONFIG\_APPTRACE\_UART\_RX\_BUFF\_SIZE*

- [CONFIG\\_APPTRACE\\_UART\\_TASK\\_PRIO](#)
- [CONFIG\\_APPTRACE\\_UART\\_TX\\_MSG\\_SIZE](#)
- [CONFIG\\_APPTRACE\\_UART\\_TX\\_GPIO](#)
- [CONFIG\\_APPTRACE\\_UART\\_TX\\_BUFF\\_SIZE](#)

### **CONFIG\_APPTRACE\_DESTINATION1**

Data Destination 1

*Found in: [Component config](#) > [Application Level Tracing](#)*

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG ([CONFIG\\_APPTRACE\\_DEST\\_JTAG](#))
- None ([CONFIG\\_APPTRACE\\_DEST\\_NONE](#))

### **CONFIG\_APPTRACE\_DESTINATION2**

Data Destination 2

*Found in: [Component config](#) > [Application Level Tracing](#)*

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 ([CONFIG\\_APPTRACE\\_DEST\\_UART0](#))
- UART1 ([CONFIG\\_APPTRACE\\_DEST\\_UART1](#))
- UART2 ([CONFIG\\_APPTRACE\\_DEST\\_UART2](#))
- USB\_CDC ([CONFIG\\_APPTRACE\\_DEST\\_USB\\_CDC](#))
- None ([CONFIG\\_APPTRACE\\_DEST\\_UART\\_NONE](#))

### **CONFIG\_APPTRACE\_UART\_TX\_GPIO**

UART TX on GPIO#

*Found in: [Component config](#) > [Application Level Tracing](#)*

This GPIO is used for UART TX pin.

### **CONFIG\_APPTRACE\_UART\_RX\_GPIO**

UART RX on GPIO#

*Found in: [Component config](#) > [Application Level Tracing](#)*

This GPIO is used for UART RX pin.

### **CONFIG\_APPTRACE\_UART\_BAUDRATE**

UART baud rate

*Found in: [Component config](#) > [Application Level Tracing](#)*

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided

from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

#### **CONFIG\_APPTRACE\_UART\_RX\_BUFF\_SIZE**

UART RX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

#### **CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE**

UART TX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

#### **CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE**

UART TX message size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Maximum size of the single message to transfer.

#### **CONFIG\_APPTRACE\_UART\_TASK\_PPIO**

UART Task Priority

*Found in: [Component config](#) > [Application Level Tracing](#)*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX\_PRIORITIES-1).

**Range:**

- from 1 to 32

**Default value:**

- 1

#### **CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO**

Timeout for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

#### **CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG\_APPTRACE\_BUF\_SIZE**

Size of the apptrace buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the memory buffer for trace data in bytes.

**CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX**

Size of the pending data buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- [CONFIG\\_APPTRACE\\_SV\\_CPU](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_ENTER\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_EXIT\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_ISR\\_TO\\_SCHED\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_MAX\\_TASKS](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_IDLE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_CREATE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_START\\_EXEC\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_START\\_READY\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_STOP\\_EXEC\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_STOP\\_READY\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TASK\\_TERMINATE\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_ENTER\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_TIMER\\_EXIT\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_TS\\_SOURCE](#)
- [CONFIG\\_APPTRACE\\_SV\\_EVT\\_OVERFLOW\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_SV\\_BUF\\_WAIT\\_TMO](#)

**CONFIG\_APPTRACE\_SV\_ENABLE**

SystemView Tracing Enable

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG\_APPTRACE\_SV\_DEST**

SystemView destination

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

SystemView will transfer data through defined interface.

Available options:

- Data destination JTAG ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_JTAG](#))  
Send SEGGER SystemView events through JTAG interface.
- Data destination UART ([CONFIG\\_APPTRACE\\_SV\\_DEST\\_UART](#))  
Send SEGGER SystemView events through UART interface.

### CONFIG\_APPTRACE\_SV\_CPU

CPU to trace

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Define the CPU to trace by SystemView.

Available options:

- CPU0 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_0)  
Send SEGGER SystemView events for Pro CPU.
- CPU1 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_1)  
Send SEGGER SystemView events for App CPU.

### CONFIG\_APPTRACE\_SV\_TS\_SOURCE

Timer to use as timestamp source

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_CCOUNT)
- General Purpose Timer (Timer Group) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_GPTIMER)
- esp\_timer high resolution timer (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

### CONFIG\_APPTRACE\_SV\_MAX\_TASKS

Maximum supported tasks

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures maximum supported tasks in sysview debug

### CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO

Trace buffer wait timeout

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

### CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE

Trace Buffer Overflow Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Trace Buffer Overflow" event.

### CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE

ISR Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "ISR Exit" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "ISR to Scheduler" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Start Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Stop Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Start Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Stop Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Create" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Terminate" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE**

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "System Idle" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE**

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Timer Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE**

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Timer Exit" event.

### **CONFIG\_APPTRACE\_GCOV\_ENABLE**

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

### **CONFIG\_APPTRACE\_GCOV\_DUMP\_TASK\_STACK\_SIZE**

Gcov dump task stack size

*Found in: Component config > Application Level Tracing > CONFIG\_APPTRACE\_GCOV\_ENABLE*

Configures stack size of Gcov dump task

**Default value:**

- 2048 if *CONFIG\_APPTRACE\_GCOV\_ENABLE*

**Bluetooth** Contains:

- *Bluedroid Options*
- *CONFIG\_BT\_ENABLED*
- *Common Options*
- *Controller Options*
- *CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN*
- *NimBLE Options*
- *CONFIG\_BT\_RELEASE\_IRAM*

### **CONFIG\_BT\_ENABLED**

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

## CONFIG\_BT\_HOST

Host

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode (CONFIG\_BT\_BLUEDROID\_ENABLED)**  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (CONFIG\_BT\_NIMBLE\_ENABLED)**  
This option is recommended for BLE only usecases to save on memory
- **Disabled (CONFIG\_BT\_CONTROLLER\_ONLY)**  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

## CONFIG\_BT\_CONTROLLER

Controller

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth controller stack

Available options:

- **Enabled (CONFIG\_BT\_CONTROLLER\_ENABLED)**  
This option is recommended for Bluetooth controller usecases
- **Disabled (CONFIG\_BT\_CONTROLLER\_DISABLED)**  
This option is recommended for Bluetooth Host only usecases

**Bluedroid Options** Contains:

- *CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK*
- *CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG*

- *CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE*

- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_TIMEOUT`
- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`
- `CONFIG_BT_HFP_WBS_ENABLE`

### **CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluebird Options*

This select btc task stack size

**Default value:**

- 3072 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which Bluebird run

*Found in: Component config > Bluetooth > Bluebird Options*

Which the cpu core to run Bluebird. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE**

Bluetooth Bluebird Host Stack task stack size

*Found in: Component config > Bluetooth > Bluebird Options*

This select btu task stack size

**Default value:**

- 4352 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG**

Bluebird memory debug

*Found in: Component config > Bluetooth > Bluebird Options*

Bluebird memory debug

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_ESP\_COEX\_VSC**

Enable Espressif Vendor-specific HCI commands for coexist status configuration

*Found in: Component config > Bluetooth > Bluebird Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_CLASSIC\_ENABLED

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluebird Options*

For now this option needs "SMP\_ENABLE" to be set to yes

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEBIRD_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BT_CLASSIC_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED) && CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_CLASSIC\_BQB\_ENABLED

Host Qualification support for Classic Bluetooth

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_A2DP\_ENABLE

A2DP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

Advanced Audio Distribution Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_SPP\_ENABLED

SPP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables the Serial Port Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_L2CAP\_ENABLED

BT L2CAP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_HFP\_ENABLE

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED*

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Contains:

- `CONFIG_BT_HFP_AG_ENABLE`
- `CONFIG_BT_HFP_AUDIO_DATA_PATH`
- `CONFIG_BT_HFP_CLIENT_ENABLE`

### CONFIG\_BT\_HFP\_CLIENT\_ENABLE

Hands Free Unit

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

**Default value:**

- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_HFP\_AG\_ENABLE

Audio Gateway

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

**Default value:**

- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API "esp\_bredr\_sco\_datapath\_set" in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

Available options:

- PCM (`CONFIG_BT_HFP_AUDIO_DATA_PATH_PCM`)
- HCI (`CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI`)

### CONFIG\_BT\_HFP\_WBS\_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**

- Yes (enabled) if `CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_HID\_ENABLED**

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Contains:

- `CONFIG_BT_HID_DEVICE_ENABLED`
- `CONFIG_BT_HID_HOST_ENABLED`

### **CONFIG\_BT\_HID\_HOST\_ENABLED**

Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Host

**Default value:**

- No (disabled) if `CONFIG_BT_HID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_HID\_DEVICE\_ENABLED**

Classic BT HID Device

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Device

### **CONFIG\_BT\_BLE\_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATTS\_ENABLE**

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This enables "Peripheral Preferred Connection Parameters" characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 8 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 100 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MANUAL)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_AUTO)  
Let Bluetooth handle the service change indication internally

### CONFIG\_BT\_GATTS\_ROBUST\_CACHING\_ENABLED

Enable Robust Caching on Server Side

*Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTS\\_ENABLE](#)*

This option enables the GATT robust caching feature on the server. If turned on, the Client Supported Features characteristic, Database Hash characteristic, and Server Supported Features characteristic will be included in the GAP SERVICE.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_GATTS\\_ENABLE](#) && [CONFIG\\_BT\\_BLUEDROID\\_ENABLED](#)

### CONFIG\_BT\_GATTS\_DEVICE\_NAME\_WRITABLE

Allow to write device name by GATT clients

*Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTS\\_ENABLE](#)*

Enabling this option allows remote GATT clients to write device name

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_GATTS\\_ENABLE](#) && [CONFIG\\_BT\\_BLUEDROID\\_ENABLED](#)

### CONFIG\_BT\_GATTS\_APPEARANCE\_WRITABLE

Allow to write appearance by GATT clients

*Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#) > [CONFIG\\_BT\\_GATTS\\_ENABLE](#)*

Enabling this option allows remote GATT clients to write appearance

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_GATTS\\_ENABLE](#) && [CONFIG\\_BT\\_BLUEDROID\\_ENABLED](#)

### CONFIG\_BT\_GATTC\_ENABLE

Include GATT client module(GATTC)

*Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG\\_BT\\_BLE\\_ENABLED](#)*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_BLE\\_ENABLED](#) && [CONFIG\\_BT\\_BLUEDROID\\_ENABLED](#)

### CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 40 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_NOTIF\_REG\_MAX

Max gattc notify(indication) register number

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC notify(indication) register number

**Range:**

- from 1 to 64 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 5 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 255 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 3 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLE\_SMP\_ENABLE

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_STACK\_NO\_LOG

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### BT DEBUG LOG LEVEL

 Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

### CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

Available options:

- NONE (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_ERROR`)

- WARNING (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL**

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL**

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL**

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL**

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL**

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL**

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL**

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

Available options:

- NONE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL**

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

Available options:

- NONE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL**

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL**

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL**

AVRC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL**

MCA layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for MCA layer

Available options:

- NONE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL**

HID layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HID layer

Available options:

- NONE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)

- DEBUG (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL

APPL layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for APPL layer

Available options:

- NONE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL

GATT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GATT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL

SMP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL**

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL**

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL**

OSI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for OSI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL**

BLUFI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BLUFI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_ACL\_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 4 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluebird Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_SMP\_MAX BONDS

BT/BLE maximum bond device count

*Found in: Component config > Bluetooth > Bluebird Options*

The number of security records for peer devices.

### CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluebird Options*

Originally, when doing BLE active scan, Bluebird will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluebird will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEBIRD_ENABLED` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, `ESP_GATTC_OPEN_EVT` or `ESP_GATTS_OPEN_EVT` is triggered.

**Range:**

- from 1 to 60 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if `CONFIG_BT_BLUEBIRD_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**Default value:**

- 32 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

#### Default value:

- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_TIMEOUT

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

#### Range:

- from 1 to 3600 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

#### Default value:

- 900 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

Enabling this option activates BLE 5.0 features. This option is universally supported in chips that support BLE, except for ESP32.

#### Default value:

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_50_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

#### Default value:

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH

Enable create sync enhancements(reporting disable and duplicate filtering enable support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the create sync enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### NimBLE Options

 Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- `BLE Services`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`

- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_DYNAMIC_SERVICE`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_VS_SUPPORT`
- `CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN`
- `CONFIG_BT_NIMBLE_ENC_ADV_DATA`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- *GAP Service*
- *Host-controller Transport*
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- *Memory Settings*
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVS_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`

### **CONFIG\_BT\_NIMBLE\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)  
Allows to use IRAM memory region as 8bit accessible region.  
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_BT\_NIMBLE\_LOG\_LEVEL**

NimBLE Host log verbosity

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in "Component config --> Log output --> Default log verbosity".

Available options:

- No logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_NONE)
- Error logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_ERROR)
- Warning logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_WARNING)
- Info logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_INFO)
- Debug logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_DEBUG)

### CONFIG\_BT\_NIMBLE\_MAX\_CONNECTIONS

Maximum number of concurrent connections

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

**Range:**

- from 1 to 9 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 3 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MAX BONDS

Maximum number of bonds to save across reboots

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MAX\_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_L2CAP\_COC\_MAX\_NUM

Maximum number of connection oriented channels

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_NIMBLE\_HOST\_TASK\_STACK\_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 4096 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ROLE\_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ROLE\_PERIPHERAL**

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ROLE\_BROADCASTER**

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_OBSERVER

Enable BLE Observer role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enables observer role

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_NVS\_PERSIST

Persist the BLE Bonding keys in NVS

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE

Enable BLE SM feature

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE sm feature

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_ENCRYPTION](#)
- [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC\\_LVL](#)
- [CONFIG\\_BT\\_NIMBLE\\_SM\\_LEGACY](#)
- [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#)

### CONFIG\_BT\_NIMBLE\_SM\_LEGACY

Security manager legacy pairing

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_SM\_SC

Security manager secure connections (4.2)

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)*

Enable security manager secure connections

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_SM\_SC\_DEBUG\_KEYS

Use predefined public-private key pair

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) > [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#)

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_ENCRYPTION

Enable LE encryption

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)

Enable encryption connection

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_SM\_SC\_LVL

Security level

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)

LE Security Mode 1 Levels: 1. No Security 2. Unauthenticated pairing with encryption 3. Authenticated pairing with encryption 4. Authenticated LE Secure Connections pairing with encryption using a 128-bit strength encryption key.

**Default value:**

- 0 if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_DEBUG

Enable extra runtime asserts and host debugging

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_DYNAMIC\_SERVICE

Enable dynamic services

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This enables user to add/remove Gatt services at runtime

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_DEVICE\_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- "nimble" if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_GAP\_DEVICE\_NAME\_MAX\_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ATT\_PREFERRED\_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### Memory Settings

 Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE`

### CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT

MSYS\_1 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 24 if SOC\_ESP\_NIMBLE\_CONTROLLER && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_SIZE

MSYS\_1 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory size of block 1

**Default value:**

- 128 if SOC\_ESP\_NIMBLE\_CONTROLLER && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_COUNT

MSYS\_2 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory count

**Default value:**

- 24 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_SIZE

MSYS\_2 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

Dynamic memory size of block 2

**Default value:**

- 320 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_BUF\_FROM\_HEAP

Get Msys Mbuf from heap

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This option sets the source of the shared msys mbuf memory between the Host and the Controller. Allocate the memory from the heap if this option is sets, from the mempool otherwise.

**Default value:**

- Yes (enabled) if BT\_LE\_MSYS\_INIT\_IN\_CONTROLLER && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_FROM\_LL\_COUNT

ACL Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

The number of ACL data buffers allocated for host.

**Default value:**

- 24 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_SIZE**

Transport ACL Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_SIZE**

Transport Event Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 70 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_COUNT**

Transport Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**

- 30 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_DISCARD\_COUNT**

Discardable Transport Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**

- 8 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_GATT\_MAX\_PROCS**

Maximum number of GATT client procedures

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Maximum number of GATT client procedures that can be executed.

**Default value:**

- 4 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Host flow control interval in msec

**Default value:**

- 1000 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_TX\_ON\_DISCONNECT**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_RPA\_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change.

**Range:**

- from 1 to 41400 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH

Enable BLE mesh functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./doc/esp32/api-guides/esp-ble-mesh/ble-mesh-index`

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

### CONFIG\_BT\_NIMBLE\_MESH\_PROXY

Enable mesh proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > `CONFIG_BT_NIMBLE_MESH`*

Enable proxy. This is automatically set whenever `NIMBLE_MESH_PB_GATT` or `NIMBLE_MESH_GATT_PROXY` is set

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PROV

Enable BLE mesh provisioning

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > `CONFIG_BT_NIMBLE_MESH`*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_ADV

Enable mesh provisioning over advertising bearer

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > `CONFIG_BT_NIMBLE_MESH` > `CONFIG_BT_NIMBLE_MESH_PROV`*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_GATT

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH > CONFIG\_BT\_NIMBLE\_MESH\_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_RELAY

Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Support for acting as a Mesh Relay Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_FRIEND

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

- "nimble-mesh-node" if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT**

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Defines mesh node count.

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER**

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioner.

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_CRYPTOSTACK\_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HS\_STOP\_TIMEOUT\_MS**

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

- 2000 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT**

Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**

- Yes (enabled) if `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_CONN\_REATTEMPT**

Maximum number connection reattempts

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#)

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 255 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 3 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT**

Enable BLE 5 feature

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE 5 feature

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [SOC\\_BLE\\_50\\_SUPPORTED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_2M\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_CODED\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)
- [CONFIG\\_BT\\_NIMBLE\\_BLE\\_POWER\\_CONTROL](#)
- [CONFIG\\_BT\\_NIMBLE\\_MAX\\_PERIODIC\\_ADVERTISER\\_LIST](#)
- [CONFIG\\_BT\\_NIMBLE\\_MAX\\_PERIODIC\\_SYNC](#)
- [CONFIG\\_BT\\_NIMBLE\\_PERIODIC\\_ADV\\_ENH](#)

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_2M\_PHY**

Enable 2M Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable 2M-PHY

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_CODED\_PHY**

Enable coded Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable coded-PHY

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_EXT\_ADV

Enable extended advertising

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES

Maximum number of extended advertising instances.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**

- from 0 to 4 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_EXT\_ADV\_MAX\_SIZE

Maximum length of the advertising data.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**

- from 0 to 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV

Enable periodic advertisement.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable Transer Sync Events

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#)

This enables controller transfer periodic sync events to host

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_SYNCS**

Maximum number of periodic advertising syncs

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**

- from 0 to 8 if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_PERIODIC\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_ADVERTISER\_LIST**

Maximum number of periodic advertiser list

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Set this option to set the upper limit for number of periodic advertiser list.

**Range:**

- from 1 to 5 if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [SOC\\_ESP\\_NIMBLE\\_CONTROLLER](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 5 if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [SOC\\_ESP\\_NIMBLE\\_CONTROLLER](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_BLE\_POWER\_CONTROL**

Enable support for BLE Power Control

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Set this option to enable the Power Control feature

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [SOC\\_BLE\\_POWER\\_CONTROL\\_SUPPORTED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_ENH

Periodic adv enhancements(adi support)

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable the periodic advertising enhancements

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING

Enable GATT caching

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable GATT caching

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_CONNS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_CHRS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_DSCS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_SVCS](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CONNS

Maximum connections to be cached

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of connections to be cached.

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_SVCS

Maximum number of services per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of services per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CHRS

Maximum number of characteristics per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of characteristics per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_DSCS

Maximum number of descriptors per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of descriptors per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_WHITELIST\_SIZE

BLE white list size

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE list size

**Range:**

- from 1 to 15 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 12 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_TEST\_THROUGHPUT\_TEST

Throughput Test Mode enable

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable the throughput test mode

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_BLUFI\_ENABLE

Enable blufi functionality

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to enable blufi functionality.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_USE\_ESP\_TIMER

Enable Esp Timer for Nimble

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_BLE\_GATT\_BLOB\_TRANSFER

Blob transfer

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT needs to be increased according to the need.

**GAP Service** Contains:

- *GAP Appearance write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION*
- *GAP device name write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO*

**GAP Appearance write permissions** Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE**

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_ENC**

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHEN**

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION

GAP Characteristic - Central Address Resolution

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Whether or not Central Address Resolution characteristic is supported on the device, and if supported, whether or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported
- Central Address Resolution not supported
- Central Address Resolution supported

Available options:

- Characteristic not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_CHAR\_NOT\_SUPP)
- Central Address Resolution not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_NOT\_SUPP)
- Central Address Resolution supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_SUPP)

**GAP device name write permissions** Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_ENC

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHEN

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHOR

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL

PPCP Connection Interval Max (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL

PPCP Connection Interval Min (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY

PPCP Slave Latency

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Slave Latency

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO

PPCP Supervision Timeout (Unit: 10 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value \* 10 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

**BLE Services** Contains:

- `CONFIG_BT_NIMBLE_HID_SERVICE`

### CONFIG\_BT\_NIMBLE\_HID\_SERVICE

HID service

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services*

Enable HID service support

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_SVC_HID_MAX_RPTS`
- `CONFIG_BT_NIMBLE_SVC_HID_MAX_INSTANCES`

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_INSTANCES

Maximum HID service instances

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of HID service instances

**Default value:**

- 2 if `CONFIG_BT_NIMBLE_HID_SERVICE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_RPTS

Maximum HID Report characteristics per service instance

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of report characteristics per service instance

**Default value:**

- 3 if `CONFIG_BT_NIMBLE_HID_SERVICE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_VS\_SUPPORT

Enable support for VSC and VSE

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

### CONFIG\_BT\_NIMBLE\_OPTIMIZE\_MULTI\_CONN

Enable the optimization of multi-connection

*Found in: Component config > Bluetooth > NimBLE Options*

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

**Default value:**

- No (disabled) if `SOC_BLE_MULTI_CONN_OPTIMIZATION` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA**

Encrypted Advertising Data

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable encrypted advertising data.

**CONFIG\_BT\_NIMBLE\_MAX\_EADS**

Maximum number of EAD devices to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA*

Defines maximum number of encrypted advertising data key material to save

**Default value:**

- 10 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HIGH\_DUTY\_ADV\_ITVL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > NimBLE Options*

This enable BLE high duty advertising interval feature

**CONFIG\_BT\_NIMBLE\_HOST\_QUEUE\_CONG\_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > NimBLE Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Host-controller Transport** Contains:

- *CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*
- *CONFIG\_BT\_NIMBLE\_HCI\_UART\_CTS\_PIN*
- *CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_FLOW\_CTRL*
- *CONFIG\_BT\_NIMBLE\_HCI\_UART\_RTS\_PIN*

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART**

Enable Uart Transport

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Use UART transport

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_CONTROLLER\_DISABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART\_PORT

Uart port

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart port

**Default value:**

- 1 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HCI\_USE\_UART\_BAUDRATE

Uart Hci Baud Rate

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart Baud Rate

Available options:

- 115200 (`CONFIG_UART_BAUDRATE_115200`)
- 230400 (`CONFIG_UART_BAUDRATE_230400`)
- 460800 (`CONFIG_UART_BAUDRATE_460800`)
- 921600 (`CONFIG_UART_BAUDRATE_921600`)

### CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_PARITY

Uart PARITY

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart Parity

Available options:

- None (`CONFIG_UART_PARITY_NONE`)
- Odd (`CONFIG_UART_PARITY_ODD`)
- Even (`CONFIG_UART_PARITY_EVEN`)

### CONFIG\_BT\_NIMBLE\_UART\_RX\_PIN

UART Rx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Rx pin for Nimble Transport

**Default value:**

- 5 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_UART\_TX\_PIN

UART Tx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Tx pin for Nimble Transport

**Default value:**

- 4 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_FLOW\_CTRL

Uart Flow Control

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Uart Flow Control

Available options:

- Disable (`CONFIG_UART_HW_FLOWCTRL_DISABLE`)
- Enable hardware flow control (`CONFIG_UART_HW_FLOWCTRL_CTS_RTS`)

### CONFIG\_BT\_NIMBLE\_HCI\_UART\_RTS\_PIN

UART Rts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI RTS pin

**Default value:**

- 19 if `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HCI\_UART\_CTS\_PIN

UART Cts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI CTS pin

**Default value:**

- 23 if `CONFIG_BT_NIMBLE_ENABLED`

## Controller Options

### CONFIG\_BT\_RELEASE\_IRAM

Release Bluetooth text (READ DOCS FIRST)

*Found in: Component config > Bluetooth*

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when `esp_bt_mem_release` is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (`ESP_SYSTEM_PMP_IDRAM_SPLIT`)

**Default value:**

- No (disabled) if `CONFIG_BT_ENABLED` && `BT_LE_RELEASE_IRAM_SUPPORTED`

### CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN

Enable Bluetooth HCI debug mode

*Found in:* [Component config](#) > [Bluetooth](#)

This option is used to enable bluetooth debug mode, which saves the hci layer data stream.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_BLUEDROID\\_ENABLED](#) || [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_HCI\_LOG\_DATA\_BUFFER\_SIZE

Size of the cache used for HCI data in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

This option is to configure the buffer size of the hci data steam cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Default value:**

- 5 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

### CONFIG\_BT\_HCI\_LOG\_ADV\_BUFFER\_SIZE

Size of the cache used for adv report in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

This option is to configure the buffer size of the hci adv report cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Default value:**

- 8 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Common Options** Contains:

- [CONFIG\\_BT\\_ALARM\\_MAX\\_NUM](#)

### CONFIG\_BT\_ALARM\_MAX\_NUM

Maximum number of Bluetooth alarms

*Found in:* [Component config](#) > [Bluetooth](#) > [Common Options](#)

This option decides the maximum number of alarms which could be used by Bluetooth host.

**Default value:**

- 50

### CONFIG\_BLE\_MESH

ESP BLE Mesh Support

*Found in:* [Component config](#)

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*
- *BLE Mesh NET BUF DEBUG LOG LEVEL*
- *CONFIG\_BLE\_MESH\_PROV*
- *CONFIG\_BLE\_MESH\_PROXY*
- *BLE Mesh specific test option*
- *BLE Mesh STACK DEBUG LOG LEVEL*
- *CONFIG\_BLE\_MESH\_NO\_LOG*
- *CONFIG\_BLE\_MESH\_IVU\_DIVIDER*
- *CONFIG\_BLE\_MESH\_FAST\_PROV*
- *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*
- *CONFIG\_BLE\_MESH\_EXPERIMENTAL*
- *CONFIG\_BLE\_MESH\_CRPL*
- *CONFIG\_BLE\_MESH\_RX\_SDU\_MAX*
- *CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT*
- *CONFIG\_BLE\_MESH\_LABEL\_COUNT*
- *CONFIG\_BLE\_MESH\_SUBNET\_COUNT*
- *CONFIG\_BLE\_MESH\_TX\_SEG\_MAX*
- *CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT*
- *CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT*
- *CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE*
- *CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE*
- *CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG*
- *CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT*
- *CONFIG\_BLE\_MESH\_PB\_GATT*
- *CONFIG\_BLE\_MESH\_PB\_ADV*
- *CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI*
- *CONFIG\_BLE\_MESH\_RELAY*
- *CONFIG\_BLE\_MESH\_SAR\_ENHANCEMENT*
- *CONFIG\_BLE\_MESH\_SETTINGS*
- *CONFIG\_BLE\_MESH\_ACTIVE\_SCAN*
- *CONFIG\_BLE\_MESH\_DEINIT*
- *CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN*
- *Support for BLE Mesh Client/Server models*
- *Support for BLE Mesh Foundation models*
- *CONFIG\_BLE\_MESH\_NODE*
- *CONFIG\_BLE\_MESH\_PROVISIONER*
- *CONFIG\_BLE\_MESH\_FRIEND*
- *CONFIG\_BLE\_MESH\_LOW\_POWER*
- *CONFIG\_BLE\_MESH\_HCI\_5\_0*
- *CONFIG\_BLE\_MESH\_RANDOM\_ADV\_INTERVAL*
- *CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST*
- *CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT*

### **CONFIG\_BLE\_MESH\_HCI\_5\_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG\_BLE\_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_RANDOM\_ADV\_INTERVAL**

Support using random adv interval for mesh packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow using random advertising interval for mesh packets. And this could help avoid collision of advertising packets.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is "Scan Duplicate By Device Address and Advertising Data".

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_ACTIVE\_SCAN**

Support Active Scan in BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow using BLE Active Scan for BLE Mesh.

### **CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM ([CONFIG\\_BLE\\_MESH\\_MEM\\_ALLOC\\_MODE\\_INTERNAL](#))
- External SPIRAM ([CONFIG\\_BLE\\_MESH\\_MEM\\_ALLOC\\_MODE\\_EXTERNAL](#))
- Default alloc mode ([CONFIG\\_BLE\\_MESH\\_MEM\\_ALLOC\\_MODE\\_DEFAULT](#))  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM ([CONFIG\\_BLE\\_MESH\\_MEM\\_ALLOC\\_MODE\\_IRAM\\_8BIT](#))  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if `ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY` && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_MODE

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (*CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_EXTERNAL*)  
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when `SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` is enabled. See the SPIRAM options for more details.
- Internal IRAM (*CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_IRAM\_8BIT*)  
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

### CONFIG\_BLE\_MESH\_DEINIT

Support de-initialize BLE Mesh stack

Found in: *Component config* > *CONFIG\_BLE\_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### BLE Mesh and BLE coexistence support

 Contains:

- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN*
- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV

Support sending normal BLE advertising packets

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BLE\_ADV\_BUF\_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support > CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FAST\_PROV

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NODE

Support for BLE Mesh Node

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

### CONFIG\_BLE\_MESH\_PROVISIONER

Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

### CONFIG\_BLE\_MESH\_WAIT\_FOR\_PROV\_MAX\_DEV\_NUM

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**

- from 1 to 100 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**

- from 1 to 10 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBG\_SAME\_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**

- from 1 to 5 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB\_FILTER\_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER > CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PROV

BLE Mesh Provisioning support

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PROV\_EPA

BLE Mesh enhanced provisioning authentication

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PROV](#)

Enable this option to support BLE Mesh enhanced provisioning authentication functionality. This option can increase the security level of provisioning. It is recommended to enable this option.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH\\_PROV](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_CERT\_BASED\_PROV

Support Certificate-based provisioning

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PROV](#)

Enable this option to support BLE Mesh Certificate-Based Provisioning.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_PROV](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_RECORD\_FRAG\_MAX\_SIZE

Maximum size of the provisioning record fragment that Provisioner can receive

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PROV](#) > [CONFIG\\_BLE\\_MESH\\_CERT\\_BASED\\_PROV](#)

This option sets the maximum size of the provisioning record fragment that the Provisioner can receive. The range depends on provisioning bearer.

**Range:**

- from 1 to 57 if [CONFIG\\_BLE\\_MESH\\_CERT\\_BASED\\_PROV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 56 if [CONFIG\\_BLE\\_MESH\\_CERT\\_BASED\\_PROV](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PB\_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_UNPROVISIONED\_BEACON\_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#)*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE\_MESH\_FAST\_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 5 if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)
- 3 if [CONFIG\\_BLE\\_MESH\\_FAST\\_PROV](#) && [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PB\_GATT

Provisioning support using GATT (PB-GATT)

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

### CONFIG\_BLE\_MESH\_PROXY

BLE Mesh Proxy protocol support

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER

BLE Mesh GATT Proxy Server

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_NODE\_ID\_TIMEOUT

Node Identity advertising timeout

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_SERVER](#)*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully

and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROXY\_FILTER\_SIZE**

Maximum number of filter entries per Proxy Client

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_GATT_PROXY_SERVER`

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

- from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROXY\_PRIVACY**

Support Proxy Privacy

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_GATT_PROXY_SERVER`

The Proxy Privacy parameter controls the privacy of the Proxy Server over the connection. The value of the Proxy Privacy parameter is controlled by the type of proxy connection, which is dependent on the bearer used by the proxy connection.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_PRB_SRV` && `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_RX**

Support receiving Proxy Solicitation PDU

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_GATT_PROXY_SERVER`

Enable this option to support receiving Proxy Solicitation PDU.

**CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_RX\_CRPL**

Maximum capacity of solicitation replay protection list

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_GATT_PROXY_SERVER` > `CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX`

This option specifies the maximum capacity of the solicitation replay protection list. The solicitation replay protection list is used to reject Solicitation PDUs that were already processed by a node, which will store the solicitation src and solicitation sequence number of the received Solicitation PDU message.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT

BLE Mesh GATT Proxy Client

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_PDU\_TX

Support sending Proxy Solicitation PDU

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_CLIENT](#)

Enable this option to support sending Proxy Solicitation PDU.

### CONFIG\_BLE\_MESH\_PROXY\_SOLIC\_TX\_SRC\_COUNT

Maximum number of SSRC that can be used by Proxy Client

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_GATT\\_PROXY\\_CLIENT](#) > [CONFIG\\_BLE\\_MESH\\_PROXY\\_SOLIC\\_PDU\\_TX](#)

This option specifies the maximum number of Solicitation Source (SSRC) that can be used by Proxy Client for sending a Solicitation PDU. A Proxy Client may use the primary address or any of the secondary addresses as the SSRC for a Solicitation PDU. So for a Proxy Client, it's better to choose the value based on its own element count.

**Range:**

- from 1 to 16 if [CONFIG\\_BLE\\_MESH\\_PROXY\\_SOLIC\\_PDU\\_TX](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 2 if [CONFIG\\_BLE\\_MESH\\_PROXY\\_SOLIC\\_PDU\\_TX](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SETTINGS

Store BLE Mesh configuration persistently

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_STORE\_TIMEOUT

Delay (in seconds) before storing anything persistently

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SEQ\_STORE\_RATE**

How often the sequence number gets updated in storage

*Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_RPL\_STORE\_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SETTINGS\_BACKWARD\_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of "mesh/role" in nvs. In the new version mesh stack, key of "mesh/role" is added in nvs, recovering node information needs to check "mesh/role" key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of "mesh/role" because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PARTITION\_NAME

Name of the NVS partition for BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) > [CONFIG\\_BLE\\_MESH\\_SPECIFIC\\_PARTITION](#)*

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- "ble\_mesh" if [CONFIG\\_BLE\\_MESH\\_SPECIFIC\\_PARTITION](#) && [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE

Support using multiple NVS namespaces by Provisioner

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) && [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_MAX\_NVS\_NAMESPACE

Maximum number of NVS namespaces

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) > [CONFIG\\_BLE\\_MESH\\_USE\\_MULTIPLE\\_NAMESPACE](#)*

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if [CONFIG\\_BLE\\_MESH\\_USE\\_MULTIPLE\\_NAMESPACE](#) && [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 2 if [CONFIG\\_BLE\\_MESH\\_USE\\_MULTIPLE\\_NAMESPACE](#) && [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SUBNET\_COUNT

Maximum number of mesh subnets per network

Found in: *Component config* > *CONFIG\_BLE\_MESH*

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT

Maximum number of application keys per network

Found in: *Component config* > *CONFIG\_BLE\_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT

Maximum number of application keys per model

Found in: *Component config* > *CONFIG\_BLE\_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT

Maximum number of group address subscriptions per model

Found in: *Component config* > *CONFIG\_BLE\_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LABEL\_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

Found in: *Component config* > *CONFIG\_BLE\_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_CRPL**

Maximum capacity of the replay protection list

*Found in: `Component config` > `CONFIG_BLE_MESH`*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**

- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG**

Not relay replayed messages in a mesh network

*Found in: `Component config` > `CONFIG_BLE_MESH`*

There may be many expired messages in a complex mesh network that would be considered replayed messages. Enable this option will refuse to relay such messages, which could help to reduce invalid packets in the mesh network. However, it should be noted that enabling this option may result in packet loss in certain environments. Therefore, users need to decide whether to enable this option according to the actual usage situation.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_EXPERIMENTAL` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE**

Network message cache size

*Found in: `Component config` > `CONFIG_BLE_MESH`*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**

- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT**

Number of advertising buffers

*Found in: `Component config` > `CONFIG_BLE_MESH`*

Number of advertising buffers available. The transport layer reserves `ADV_BUF_COUNT` - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size

is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**

- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_IVU\_DIVIDER

Divider for IV Update state refresh timer

*Found in:* `Component config` > `CONFIG_BLE_MESH`

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**

- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**

- 4 if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI

Recovery the IV index when the latest whole IV update procedure is missed

*Found in:* `Component config` > `CONFIG_BLE_MESH`

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_SAR\_ENHANCEMENT

Segmentation and reassembly enhancement

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to use the enhanced segmentation and reassembly mechanism introduced in Bluetooth Mesh Protocol 1.1.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT

Maximum number of simultaneous outgoing segmented messages

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 1 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT

Maximum number of simultaneous incoming segmented messages

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to 255 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 1 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_RX\_SDU\_MAX

Maximum incoming Upper Transport Access PDU length

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**

- from 36 to 384 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 384 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_TX\_SEG\_MAX

Maximum number of segments in outgoing messages

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers ([BLE\\_MESH\\_ADV\\_BUF\\_COUNT](#)) as there are outgoing segments.

**Range:**

- from 2 to 32 if `CONFIG_BLE_MESH`

**Default value:**

- 32 if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_RELAY

Relay support

*Found in:* `Component config > CONFIG_BLE_MESH`

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF

Use separate advertising buffers for relay packets

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY`

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF\_COUNT

Number of advertising buffers for relay packets

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF`

Number of advertising buffers for relay packets available.

**Range:**

- from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LOW\_POWER

Support for Low Power features

*Found in:* `Component config > CONFIG_BLE_MESH`

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

### CONFIG\_BLE\_MESH\_LPN\_ESTABLISHMENT

Perform Friendship establishment using low power

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up

Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_AUTO\_TIMEOUT

Time from last received message before going to LPN mode

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER` > `CONFIG_BLE_MESH_LPN_AUTO`

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**

- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RETRY\_TIMEOUT

Retry timeout for Friend requests

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RSSI\_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_RECV\_WIN\_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_MIN\_QUEUE\_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The MinQueueSizeLog field is defined as  $\log_2(N)$ , where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**

- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_RECV\_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**

- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_POLL\_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**

- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 300 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_INIT\_POLL\_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**

- from 10 to if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SCAN\_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**

- from 0 to 50 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**

- from 0 to 16384 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 8 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SUB\_ALL\_NODES\_ADDR

Automatically subscribe all nodes address

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND

Support for Friend feature

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to be able to act as a Friend Node.

### CONFIG\_BLE\_MESH\_FRIEND\_RECV\_WIN

Friend Receive Window

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_QUEUE\_SIZE

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**

- from 2 to 65536 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SUB\_LIST\_SIZE

Friend Subscription List Size

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**

- from 0 to 1023 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_LPN\_COUNT

Number of supported LPN nodes

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SEG\_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_NO\_LOG**

Disable BLE Mesh debug logs (minimize bin size)

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL** Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

**CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL**

BLE\_MESH\_STACK

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `BLE Mesh STACK DEBUG LOG LEVEL`

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (`CONFIG_BLE_MESH_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BLE_MESH_TRACE_LEVEL_ERROR`)
- WARNING (`CONFIG_BLE_MESH_TRACE_LEVEL_WARNING`)
- INFO (`CONFIG_BLE_MESH_TRACE_LEVEL_INFO`)
- DEBUG (`CONFIG_BLE_MESH_TRACE_LEVEL_DEBUG`)
- VERBOSE (`CONFIG_BLE_MESH_TRACE_LEVEL_VERBOSE`)

**BLE Mesh NET BUF DEBUG LOG LEVEL** Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL**

BLE\_MESH\_NET\_BUF

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `BLE Mesh NET BUF DEBUG LOG LEVEL`

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR`)
- WARNING (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING`)
- INFO (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_INFO`)
- DEBUG (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG`)
- VERBOSE (`CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE`)

## CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT

Timeout(ms) for client message response

*Found in: Component config > CONFIG\_BLE\_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

### Range:

- from 100 to 1200000 if *CONFIG\_BLE\_MESH*

### Default value:

- 4000 if *CONFIG\_BLE\_MESH*

## Support for BLE Mesh Foundation models Contains:

- *CONFIG\_BLE\_MESH\_BRC\_CLI*
- *CONFIG\_BLE\_MESH\_BRC\_SRV*
- *CONFIG\_BLE\_MESH\_CFG\_CLI*
- *CONFIG\_BLE\_MESH\_DF\_CLI*
- *CONFIG\_BLE\_MESH\_DF\_SRV*
- *CONFIG\_BLE\_MESH\_HEALTH\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_SRV*
- *CONFIG\_BLE\_MESH\_LCD\_CLI*
- *CONFIG\_BLE\_MESH\_LCD\_SRV*
- *CONFIG\_BLE\_MESH\_PRB\_CLI*
- *CONFIG\_BLE\_MESH\_PRB\_SRV*
- *CONFIG\_BLE\_MESH\_ODP\_CLI*
- *CONFIG\_BLE\_MESH\_ODP\_SRV*
- *CONFIG\_BLE\_MESH\_AGG\_CLI*
- *CONFIG\_BLE\_MESH\_AGG\_SRV*
- *CONFIG\_BLE\_MESH\_RPR\_CLI*
- *CONFIG\_BLE\_MESH\_RPR\_SRV*
- *CONFIG\_BLE\_MESH\_SAR\_CLI*
- *CONFIG\_BLE\_MESH\_SAR\_SRV*
- *CONFIG\_BLE\_MESH\_SRPL\_CLI*
- *CONFIG\_BLE\_MESH\_SRPL\_SRV*
- *CONFIG\_BLE\_MESH\_COMP\_DATA\_1*
- *CONFIG\_BLE\_MESH\_COMP\_DATA\_128*
- *CONFIG\_BLE\_MESH\_MODELS\_METADATA\_0*

## CONFIG\_BLE\_MESH\_CFG\_CLI

Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

## CONFIG\_BLE\_MESH\_HEALTH\_CLI

Health Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

### CONFIG\_BLE\_MESH\_HEALTH\_SRV

Health Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BRC\_CLI

Bridge Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Client model.

### CONFIG\_BLE\_MESH\_BRC\_SRV

Bridge Configuration Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Server model.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_BRIDGING\_TABLE\_ENTRY\_COUNT

Maximum number of Bridging Table entries

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_BRC\_SRV*

Maximum number of Bridging Table entries that the Bridge Configuration Server can support.

**Range:**

- from 16 to 65535 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BRIDGE\_CRPL

Maximum capacity of bridge replay protection list

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_BRC\_SRV*

This option specifies the maximum capacity of the bridge replay protection list. The bridge replay protection list is used to prevent a bridged subnet from replay attack, which will store the source address and sequence number of the received bridge messages.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 5 if *CONFIG\_BLE\_MESH\_BRC\_SRV* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_PRB\_CLI**

Mesh Private Beacon Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Mesh Private Beacon Client model.

### **CONFIG\_BLE\_MESH\_PRB\_SRV**

Mesh Private Beacon Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Mesh Private Beacon Server model.

### **CONFIG\_BLE\_MESH\_ODP\_CLI**

On-Demand Private Proxy Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for On-Demand Private Proxy Client model.

### **CONFIG\_BLE\_MESH\_ODP\_SRV**

On-Demand Private Proxy Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for On-Demand Private Proxy Server model.

### **CONFIG\_BLE\_MESH\_SRPL\_CLI**

Solicitation PDU RPL Configuration Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Solicitation PDU RPL Configuration Client model.

### **CONFIG\_BLE\_MESH\_SRPL\_SRV**

Solicitation PDU RPL Configuration Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Solicitation PDU RPL Configuration Server model. Note: This option depends on the functionality of receiving Solicitation PDU. If the device doesn't support receiving Solicitation PDU, then there is no need to enable this server model.

### **CONFIG\_BLE\_MESH\_AGG\_CLI**

Opcodes Aggregator Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Opcodes Aggregator Client model.

### **CONFIG\_BLE\_MESH\_AGG\_SRV**

Opcodes Aggregator Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Opcodes Aggregator Server model.

### **CONFIG\_BLE\_MESH\_SAR\_CLI**

SAR Configuration Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for SAR Configuration Client model.

### **CONFIG\_BLE\_MESH\_SAR\_SRV**

SAR Configuration Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for SAR Configuration Server model.

### **CONFIG\_BLE\_MESH\_COMP\_DATA\_1**

Support Composition Data Page 1

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Composition Data Page 1 contains information about the relationships among models. Each model either can be a root model or can extend other models.

### **CONFIG\_BLE\_MESH\_COMP\_DATA\_128**

Support Composition Data Page 128

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Composition Data Page 128 is used to indicate the structure of elements, features, and models of a node after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Composition Data Page 128 shall be present if the node supports the Remote Provisioning Server model; otherwise it is optional.

### **CONFIG\_BLE\_MESH\_MODELS\_METADATA\_0**

Support Models Metadata Page 0

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

The Models Metadata state contains metadata of a node's models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 0 shall be present if the node supports the Large Composition Data Server model.

### **CONFIG\_BLE\_MESH\_MODELS\_METADATA\_128**

Support Models Metadata Page 128

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_MODELS\\_METADATA\\_0](#)*

The Models Metadata state contains metadata of a node's models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 128 contains metadata for the node's models after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Models Metadata Page 128 shall be present if the node supports the Remote Provisioning Server model and the node supports the Large Composition Data Server model.

**CONFIG\_BLE\_MESH\_LCD\_CLI**

Large Composition Data Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Client model.

**CONFIG\_BLE\_MESH\_LCD\_SRV**

Large Composition Data Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Server model.

**CONFIG\_BLE\_MESH\_RPR\_CLI**

Remote Provisioning Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Client model

**CONFIG\_BLE\_MESH\_RPR\_CLI\_PROV\_SAME\_TIME**

Maximum number of PB-Remote running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_CLI*

This option specifies how many devices can be provisioned at the same time using PB-REMOTE. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-REMOTE at the same time.

**Range:**

- from 1 to 5 if *CONFIG\_BLE\_MESH\_RPR\_CLI* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_RPR\_CLI* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_RPR\_SRV**

Remote Provisioning Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Server model

**CONFIG\_BLE\_MESH\_RPR\_SRV\_MAX\_SCANNED\_ITEMS**

Maximum number of device information can be scanned

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_RPR\_SRV*

This option specifies how many device information can a Remote Provisioning Server store each time while scanning.

**Range:**

- from 4 to 255 if *CONFIG\_BLE\_MESH\_RPR\_SRV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_RPR\_SRV* && *CONFIG\_BLE\_MESH*

**CONFIG\_BLE\_MESH\_RPR\_SRV\_ACTIVE\_SCAN**

Support Active Scan for remote provisioning

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_RPR\\_SRV](#)*

Enable this option to support Active Scan for remote provisioning.

**CONFIG\_BLE\_MESH\_RPR\_SRV\_MAX\_EXT\_SCAN**

Maximum number of extended scan procedures

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_RPR\\_SRV](#)*

This option specifies how many extended scan procedures can be started by the Remote Provisioning Server.

**Range:**

- from 1 to 10 if [CONFIG\\_BLE\\_MESH\\_RPR\\_SRV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 1 if [CONFIG\\_BLE\\_MESH\\_RPR\\_SRV](#) && [CONFIG\\_BLE\\_MESH](#)

**CONFIG\_BLE\_MESH\_DF\_CLI**

Directed Forwarding Configuration Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Directed Forwarding Configuration Client model.

**CONFIG\_BLE\_MESH\_DF\_SRV**

Directed Forwarding Configuration Server model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#)*

Enable support for Directed Forwarding Configuration Server model.

**CONFIG\_BLE\_MESH\_MAX\_DISC\_TABLE\_ENTRY\_COUNT**

Maximum number of discovery table entries in a given subnet

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_DF\\_SRV](#)*

Maximum number of Discovery Table entries supported by the node in a given subnet.

**Range:**

- from 2 to 255 if [CONFIG\\_BLE\\_MESH\\_DF\\_SRV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 2 if [CONFIG\\_BLE\\_MESH\\_DF\\_SRV](#) && [CONFIG\\_BLE\\_MESH](#)

**CONFIG\_BLE\_MESH\_MAX\_FORWARD\_TABLE\_ENTRY\_COUNT**

Maximum number of forward table entries in a given subnet

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Foundation models](#) > [CONFIG\\_BLE\\_MESH\\_DF\\_SRV](#)*

Maximum number of Forward Table entries supported by the node in a given subnet.

**Range:**

- from 2 to 64 if [CONFIG\\_BLE\\_MESH\\_DF\\_SRV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 2 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MAX\_DEPS\_NODES\_PER\_PATH**

Maximum number of dependent nodes per path

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Maximum size of dependent nodes list supported by each forward table entry.

**Range:**

- from 2 to 64 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PATH\_MONITOR\_TEST**

Enable Path Monitoring test mode

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

The option only removes the Path Use timer; all other behavior of the device is not changed. If Path Monitoring test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SUPPORT\_DIRECTED\_PROXY**

Enable Directed Proxy functionality

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models > CONFIG\_BLE\_MESH\_DF\_SRV*

Support Directed Proxy functionality.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH_DF_SRV` && `CONFIG_BLE_MESH`

**Support for BLE Mesh Client/Server models** Contains:

- `CONFIG_BLE_MESH_MBT_CLI`
- `CONFIG_BLE_MESH_MBT_SRV`
- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`

- [\*CONFIG\\_BLE\\_MESH\\_SCENE\\_CLI\*](#)
- [\*CONFIG\\_BLE\\_MESH\\_SCHEDULER\\_CLI\*](#)
- [\*CONFIG\\_BLE\\_MESH\\_SENSOR\\_CLI\*](#)
- [\*CONFIG\\_BLE\\_MESH\\_SENSOR\\_SERVER\*](#)
- [\*CONFIG\\_BLE\\_MESH\\_TIME\\_SCENE\\_SERVER\*](#)
- [\*CONFIG\\_BLE\\_MESH\\_TIME\\_CLI\*](#)

#### **CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI**

Generic Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.

#### **CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI**

Generic Location Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Location Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI**

Generic Property Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Property Client model.

### **CONFIG\_BLE\_MESH\_SENSOR\_CLI**

Sensor Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor Client model.

### **CONFIG\_BLE\_MESH\_TIME\_CLI**

Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time Client model.

### **CONFIG\_BLE\_MESH\_SCENE\_CLI**

Scene Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scene Client model.

### **CONFIG\_BLE\_MESH\_SCHEDULER\_CLI**

Scheduler Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI**

Light Lightness Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light Lightness Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI**

Light CTL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light CTL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI**

Light HSL Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light HSL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI**

Light XYL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light XYL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI**

Light LC Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light LC Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_SERVER**

Generic server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_SENSOR\_SERVER**

Sensor server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER**

Time and Scenes server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_LIGHTING\_SERVER**

Lighting server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_MBT\_CLI

BLOB Transfer Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Client model.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_BLOB\_RECEIVERS

Maximum number of simultaneous blob receivers

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models > CONFIG\_BLE\_MESH\_MBT\_CLI*

Maximum number of BLOB Transfer Server models that can participating in the BLOB transfer with a BLOB Transfer Client model.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_MBT\_CLI* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_MBT\_CLI* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MBT\_SRV

BLOB Transfer Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for BLOB Transfer Server model.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG\_BLE\_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### BLE Mesh specific test option

 Contains:

- *CONFIG\_BLE\_MESH\_DEBUG*
- *CONFIG\_BLE\_MESH\_SHELL*
- *CONFIG\_BLE\_MESH\_BQB\_TEST*
- *CONFIG\_BLE\_MESH\_SELF\_TEST*
- *CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK*
- *CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST*

### CONFIG\_BLE\_MESH\_SELF\_TEST

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_BQB\_TEST**

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST**

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_DEBUG**

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_DEBUG\_NET**

Network layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Network layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_TRANS**

Transport layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Transport layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_BEACON**

Beacon debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Beacon-related debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_CRYPTO**

Crypto debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable cryptographic debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROV**

Provisioning debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Provisioning debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ACCESS**

Access layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Access layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_MODEL**

Foundation model debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Foundation Models debug logs for the BLE Mesh functionality.

**CONFIG\_BLE\_MESH\_DEBUG\_ADV**

Advertising debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable advertising debug logs for the BLE Mesh functionality.

**CONFIG\_BLE\_MESH\_DEBUG\_LOW\_POWER**

Low Power debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Low Power debug logs for the BLE Mesh functionality.

**CONFIG\_BLE\_MESH\_DEBUG\_FRIEND**

Friend debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Friend debug logs for the BLE Mesh functionality.

**CONFIG\_BLE\_MESH\_DEBUG\_PROXY**

Proxy debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Proxy protocol debug logs for the BLE Mesh functionality.

**CONFIG\_BLE\_MESH\_EXPERIMENTAL**

Make BLE Mesh experimental features visible

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Make BLE Mesh Experimental features visible. Experimental features list: - [CONFIG\\_BLE\\_MESH\\_NOT\\_RELAY\\_REPLAY\\_MSG](#)

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

**Driver Configurations** Contains:

- [Analog Comparator Configuration](#)
- [DAC Configuration](#)
- [GPIO Configuration](#)
- [GPTimer Configuration](#)
- [I2C Configuration](#)
- [I2S Configuration](#)
- [LEDC Configuration](#)
- [Legacy ADC Configuration](#)
- [MCPWM Configuration](#)
- [Parallel IO Configuration](#)
- [PCNT Configuration](#)
- [RMT Configuration](#)
- [Sigma Delta Modulator Configuration](#)

- [SPI Configuration](#)
- [Temperature sensor Configuration](#)
- [TWAI Configuration](#)
- [UART Configuration](#)
- [USB Serial/JTAG Configuration](#)

**Legacy ADC Configuration** Contains:

- [CONFIG\\_ADC\\_DISABLE\\_DAC](#)
- [Legacy ADC Calibration Configuration](#)
- [CONFIG\\_ADC\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_ADC\_DISABLE\_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled) if SOC\_DAC\_SUPPORTED

### **CONFIG\_ADC\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**Legacy ADC Calibration Configuration** Contains:

- [CONFIG\\_ADC\\_CALI\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_ADC\_CALI\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Legacy ADC Configuration](#) > [Legacy ADC Calibration Configuration](#)*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp\_adc\_cal.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**SPI Configuration** Contains:

- [\*CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_SLAVE\\_ISR\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_SLAVE\\_IN\\_IRAM\*](#)

### **CONFIG\_SPI\_MASTER\_IN\_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won't be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.

During unit test, this is enabled to measure the ideal case of api.

### **CONFIG\_SPI\_MASTER\_ISR\_IN\_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

### **CONFIG\_SPI\_SLAVE\_IN\_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

### **CONFIG\_SPI\_SLAVE\_ISR\_IN\_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

**TWAI Configuration** Contains:

- [CONFIG\\_TWAI\\_ISR\\_IN\\_IRAM](#)

**CONFIG\_TWAI\_ISR\_IN\_IRAM**

Place TWAI ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP\_INTR\_FLAG\_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI\_ALERT\_AND\_LOG flag) will have no effect.

**Default value:**

- No (disabled) if SOC\_TWAI\_SUPPORTED

**Temperature sensor Configuration** Contains:

- [CONFIG\\_TEMP\\_SENSOR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_TEMP\\_SENSOR\\_SUPPRESS\\_DEPRECATED\\_WARN](#)
- [CONFIG\\_TEMP\\_SENSOR\\_ISR\\_IRAM\\_SAFE](#)

**CONFIG\_TEMP\_SENSOR\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp\_sensor.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_TEMP\_SENSOR\_SUPPORTED

**CONFIG\_TEMP\_SENSOR\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_TEMP\_SENSOR\_SUPPORTED

**CONFIG\_TEMP\_SENSOR\_ISR\_IRAM\_SAFE**

Temperature sensor ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if `SOC_TEMPERATURE_SENSOR_INTR_SUPPORT` && `SOC_TEMP_SENSOR_SUPPORTED`

**UART Configuration** Contains:

- [\*CONFIG\\_UART\\_ISR\\_IN\\_IRAM\*](#)

### **CONFIG\_UART\_ISR\_IN\_IRAM**

Place UART ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [UART Configuration](#)*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**GPIO Configuration** Contains:

- [\*CONFIG\\_GPIO\\_CTRL\\_FUNC\\_IN\\_IRAM\*](#)

### **CONFIG\_GPIO\_CTRL\_FUNC\_IN\_IRAM**

Place GPIO control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPIO Configuration](#)*

Place GPIO control functions (like `intr_disable/set_level`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**Sigma Delta Modulator Configuration** Contains:

- [\*CONFIG\\_SDM\\_ENABLE\\_DEBUG\\_LOG\*](#)
- [\*CONFIG\\_SDM\\_CTRL\\_FUNC\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SDM\\_SUPPRESS\\_DEPRECATED\\_WARN\*](#)

### **CONFIG\_SDM\_CTRL\_FUNC\_IN\_IRAM**

Place SDM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Place SDM control functions (like `set_duty`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if `SOC_SDM_SUPPORTED`

### **CONFIG\_SDM\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_SDM\_SUPPORTED

### **CONFIG\_SDM\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_SDM\_SUPPORTED

### **Analog Comparator Configuration** Contains:

- [CONFIG\\_ANA\\_CMPR\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_ANA\\_CMPR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_ANA\\_CMPR\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### **CONFIG\_ANA\_CMPR\_ISR\_IRAM\_SAFE**

Analog comparator ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### **CONFIG\_ANA\_CMPR\_CTRL\_FUNC\_IN\_IRAM**

Place Analog Comparator control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Place Analog Comparator control functions (like `ana_cmpr_set_internal_reference`) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### **CONFIG\_ANA\_CMPR\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Whether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**GPTimer Configuration** Contains:

- [CONFIG\\_GPTIMER\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_GPTIMER\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GPTIMER\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_ISR\\_HANDLER\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_GPTIMER\_ISR\_HANDLER\_IN\_IRAM**

Place GPTimer ISR handler into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

**Default value:**

- Yes (enabled)

**CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM**

Place GPTimer control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

**CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE**

GPTimer ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG\_GPTIMER\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**CONFIG\_GPTIMER\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**PCNT Configuration** Contains:

- [CONFIG\\_PCNT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PCNT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_PCNT\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_PCNT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_PCNT\_CTRL\_FUNC\_IN\_IRAM**

Place PCNT control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### **CONFIG\_PCNT\_ISR\_IRAM\_SAFE**

PCNT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### **CONFIG\_PCNT\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### **CONFIG\_PCNT\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**RMT Configuration** Contains:

- [CONFIG\\_RMT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_RMT\\_RECV\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_RMT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### **CONFIG\_RMT\_ISR\_IRAM\_SAFE**

RMT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### **CONFIG\_RMT\_RECV\_FUNC\_IN\_IRAM**

Place RMT receive function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Place RMT receive function into IRAM, so that the receive function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### **CONFIG\_RMT\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### **CONFIG\_RMT\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**MCPWM Configuration** Contains:

- [CONFIG\\_MCPWM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_MCPWM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_MCPWM\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_MCPWM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_MCPWM\_ISR\_IRAM\_SAFE

Place MCPWM ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**

- No (disabled)

### CONFIG\_MCPWM\_CTRL\_FUNC\_IN\_IRAM

Place MCPWM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Place MCPWM control functions (like `set_compare_value`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_MCPWM\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (`driver/mcpwm.h`). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_MCPWM\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**I2S Configuration** Contains:

- [CONFIG\\_I2S\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2S\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_I2S\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_I2S\_ISR\_IRAM\_SAFE

I2S ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG\_I2S\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**

- No (disabled)

**CONFIG\_I2S\_ENABLE\_DEBUG\_LOG**

Enable I2S debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**

- No (disabled)

**DAC Configuration** Contains:

- [CONFIG\\_DAC\\_DMA\\_AUTO\\_16BIT\\_ALIGN](#)
- [CONFIG\\_DAC\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_DAC\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_DAC\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_DAC\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_DAC\_CTRL\_FUNC\_IN\_IRAM**

Place DAC control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Place DAC control functions (e.g. 'dac\_oneshot\_output\_voltage') into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

**CONFIG\_DAC\_ISR\_IRAM\_SAFE**

DAC ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_DMA\_AUTO\_16BIT\_ALIGN

Align the continuous data to 16 bit automatically

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to left shift the continuous data to align every bytes to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

**Default value:**

- Yes (enabled) if SOC\_DAC\_DMA\_16BIT\_ALIGN && SOC\_DAC\_SUPPORTED

### USB Serial/JTAG Configuration

 Contains:

- [CONFIG\\_USJ\\_NO\\_AUTO\\_LS\\_ON\\_CONNECTION](#)

### CONFIG\_USJ\_NO\_AUTO\_LS\_ON\_CONNECTION

Don't enter the automatic light sleep when USB Serial/JTAG port is connected

*Found in: [Component config](#) > [Driver Configurations](#) > [USB Serial/JTAG Configuration](#)*

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP\_PM\_NO\_LIGHT\_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If esp\_light\_sleep\_start() is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

### Parallel IO Configuration

 Contains:

- [CONFIG\\_PARLIO\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PARLIO\\_ISR\\_IRAM\\_SAFE](#)

### CONFIG\_PARLIO\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Whether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_PARLIO\_ISR\_IRAM\_SAFE

Parallel IO ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### LEDC Configuration

 Contains:

- [CONFIG\\_LEDC\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_LEDC\_CTRL\_FUNC\_IN\_IRAM

Place LEDC control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [LEDC Configuration](#)*

Place LEDC control functions (ledc\_update\_duty and ledc\_stop) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### I2C Configuration

 Contains:

- [CONFIG\\_I2C\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2C\\_ISR\\_IRAM\\_SAFE](#)

### CONFIG\_I2C\_ISR\_IRAM\_SAFE

I2C ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [I2C Configuration](#)*

Ensure the I2C interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). note: This cannot be used in the I2C legacy driver.

**Default value:**

- No (disabled)

### CONFIG\_I2C\_ENABLE\_DEBUG\_LOG

Enable I2C debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [I2C Configuration](#)*

Whether to enable the debug log message for I2C driver. Note that this option only controls the I2C driver log, will not affect other drivers.

note: This cannot be used in the I2C legacy driver.

**Default value:**

- No (disabled)

### eFuse Bit Manager Contains:

- [CONFIG\\_EFUSE\\_VIRTUAL](#)
- [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### CONFIG\_EFUSE\_CUSTOM\_TABLE

Use custom eFuse table

*Found in: [Component config](#) > [eFuse Bit Manager](#)*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**

- No (disabled)

### CONFIG\_EFUSE\_CUSTOM\_TABLE\_FILENAME

Custom eFuse CSV file

*Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "main/esp\_efuse\_custom\_table.csv" if [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### CONFIG\_EFUSE\_VIRTUAL

Simulate eFuse operations in RAM

*Found in: [Component config](#) > [eFuse Bit Manager](#)*

If "n" - No virtual mode. All eFuse operations are real and use eFuse registers. If "y" - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is "y", then `SECURE_FLASH_ENCRYPTION_MODE_RELEASE` cannot be used. Because the EFUSE VIRT mode is for testing only.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**

- No (disabled)

## CONFIG\_EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH

Keep eFuses in flash

*Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG\\_EFUSE\\_VIRTUAL](#)*

In addition to the "Simulate eFuse operations in RAM" option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition\_table should have the *efuse* partition. partition.csv: "efuse\_em, data, efuse, , 0x2000,"

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure\_boot and flash\_encryption).

## CONFIG\_EFUSE\_VIRTUAL\_LOG\_ALL\_WRITES

Log all virtual writes

*Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG\\_EFUSE\\_VIRTUAL](#)*

If enabled, log efuse burns. This shows changes that would be made.

## ESP-TLS Contains:

- [CONFIG\\_ESP\\_TLS\\_INSECURE](#)
- [CONFIG\\_ESP\\_TLS\\_LIBRARY\\_CHOOSE](#)
- [CONFIG\\_ESP\\_TLS\\_CLIENT\\_SESSION\\_TICKETS](#)
- [CONFIG\\_ESP\\_DEBUG\\_WOLFSSL](#)
- [CONFIG\\_ESP\\_TLS\\_SERVER](#)
- [CONFIG\\_ESP\\_TLS\\_PSK\\_VERIFICATION](#)
- [CONFIG\\_ESP\\_WOLFSSL\\_SMALL\\_CERT\\_VERIFY](#)
- [CONFIG\\_ESP\\_TLS\\_USE\\_DS\\_PERIPHERAL](#)

## CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: [Component config](#) > [ESP-TLS](#)*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS ([CONFIG\\_ESP\\_TLS\\_USING\\_MBEDTLS](#))
- wolfSSL (License info in [wolfSSL directory](#) [README](#)) ([CONFIG\\_ESP\\_TLS\\_USING\\_WOLFSSL](#))

## CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

### Default value:

- Yes (enabled)

### CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS

Enable client session tickets

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable session ticket support as specified in RFC5077.

### CONFIG\_ESP\_TLS\_SERVER

Enable ESP-TLS Server

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKETS

Enable server session tickets

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

Enable session ticket support as specified in RFC5077

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKET\_TIMEOUT

Server session ticket timeout in seconds

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#) > [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

Sets the session ticket timeout used in the tls server.

**Default value:**

- 86400 if [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

### CONFIG\_ESP\_TLS\_SERVER\_CERT\_SELECT\_HOOK

Certificate selection hook

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

### CONFIG\_ESP\_TLS\_SERVER\_MIN\_AUTH\_MODE\_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

### CONFIG\_ESP\_TLS\_PSK\_VERIFICATION

Enable PSK verification

Found in: *Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_INSECURE

Allow potentially insecure options

Found in: *Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

### CONFIG\_ESP\_TLS\_SKIP\_SERVER\_CERT\_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP-TLS > CONFIG\_ESP\_TLS\_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `crt_bundle_attach`, `use_global_ca_store` etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

### CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY

Enable SMALL\_CERT\_VERIFY

Found in: *Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_TLS\_USING\_WOLFSSL*

### CONFIG\_ESP\_DEBUG\_WOLFSSL

Enable debug logs for wolfSSL

Found in: *Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

### ADC and ADC Calibration

 Contains:

- *ADC Calibration Configurations*
- *CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE*
- *CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT*
- *CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM*

### CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM

Place ISR version ADC oneshot mode read function into IRAM

*Found in: [Component config > ADC and ADC Calibration](#)*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**

- No (disabled)

### CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE

ADC continuous mode driver ISR IRAM-Safe

*Found in: [Component config > ADC and ADC Calibration](#)*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**

- No (disabled) if SOC\_ADC\_DMA\_SUPPORTED

### ADC Calibration Configurations

#### CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT

Disable DAC when ADC2 is in use

*Found in: [Component config > ADC and ADC Calibration](#)*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**

- Yes (enabled) if SOC\_DAC\_SUPPORTED

#### Wireless Coexistence Contains:

- [CONFIG\\_ESP\\_COEX\\_EXTERNAL\\_COEXIST\\_ENABLE](#)
- [CONFIG\\_ESP\\_COEX\\_SW\\_COEXIST\\_ENABLE](#)

#### CONFIG\_ESP\_COEX\_SW\_COEXIST\_ENABLE

Software controls WiFi/Bluetooth coexistence

*Found in: [Component config > Wireless Coexistence](#)*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if [CONFIG\\_IEEE802154\\_ENABLED](#) && [CONFIG\\_BT\\_ENABLED](#)

## CONFIG\_ESP\_COEX\_EXTERNAL\_COEXIST\_ENABLE

External Coexistence

*Found in: [Component config](#) > [Wireless Coexistence](#)*

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we do not support external coex and internal coex simultaneously.

**Common ESP-related** Contains:

- [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#)

## CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP

Enable lookup of error code strings

*Found in: [Component config](#) > [Common ESP-related](#)*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**

- Yes (enabled)

**Ethernet** Contains:

- [CONFIG\\_ETH\\_TRANSMIT\\_MUTEX](#)
- [CONFIG\\_ETH\\_USE\\_OPENETH](#)
- [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)

## CONFIG\_ETH\_USE\_SPI\_ETHERNET

Support SPI to Ethernet Module

*Found in: [Component config](#) > [Ethernet](#)*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_DM9051](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_KSZ8851SNL](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_W5500](#)

## CONFIG\_ETH\_SPI\_ETHERNET\_DM9051

Use DM9051

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_W5500

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_KSZ8851SNL

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

### CONFIG\_ETH\_USE\_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM*
- *CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM*

### CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if *CONFIG\_ETH\_USE\_OPENETH*

**Default value:**

- 4 if *CONFIG\_ETH\_USE\_OPENETH*

### CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if *CONFIG\_ETH\_USE\_OPENETH*

**Default value:**

- 1 if *CONFIG\_ETH\_USE\_OPENETH*

### CONFIG\_ETH\_TRANSMIT\_MUTEX

Enable Transmit Mutex

*Found in: [Component config](#) > [Ethernet](#)*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**

- No (disabled)

**Event Loop Library** Contains:

- [CONFIG\\_ESP\\_EVENT\\_LOOP\\_PROFILING](#)
- [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

### CONFIG\_ESP\_EVENT\_LOOP\_PROFILING

Enable event loop profiling

*Found in: [Component config](#) > [Event Loop Library](#)*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR

Support posting events from ISRs

*Found in: [Component config](#) > [Event Loop Library](#)*

Enable posting events from interrupt handlers.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

Support posting events from ISRs placed in IRAM

*Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**Default value:**

- Yes (enabled)

**GDB Stub** Contains:

- [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)
- [CONFIG\\_ESP\\_SYSTEM\\_GDBSTUB\\_RUNTIME](#)

## CONFIG\_ESP\_SYSTEM\_GDBSTUB\_RUNTIME

GDBStub at runtime

*Found in: [Component config](#) > [GDB Stub](#)*

Enable builtin GDBStub. This allows to debug the target device using serial port: - Run 'idf.py monitor'.  
- Wait for the device to initialize. - Press Ctrl+C to interrupt the execution and enter GDB attached to your device for debugging. NOTE: all UART input will be handled by GDBStub.

## CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS

Enable listing FreeRTOS tasks through GDB Stub

*Found in: [Component config](#) > [GDB Stub](#)*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_GDBSTUB\_MAX\_TASKS

Maximum number of tasks supported by GDB Stub

*Found in: [Component config](#) > [GDB Stub](#) > [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)*

Set the number of tasks which GDB Stub will support.

**Default value:**

- 32

**ESP HTTP client** Contains:

- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_BASIC\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_DIGEST\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#)

## CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS

Enable https

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH

Enable HTTP Basic Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

## CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_DIGEST\_AUTH

Enable HTTP Digest Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

## HTTP Server

 Contains:

- [CONFIG\\_HTTPD\\_QUEUE\\_WORK\\_BLOCKING](#)
- [CONFIG\\_HTTPD\\_PURGE\\_BUF\\_LEN](#)
- [CONFIG\\_HTTPD\\_LOG\\_PURGE\\_DATA](#)
- [CONFIG\\_HTTPD\\_MAX\\_REQ\\_HDR\\_LEN](#)
- [CONFIG\\_HTTPD\\_MAX\\_URI\\_LEN](#)
- [CONFIG\\_HTTPD\\_ERR\\_RESP\\_NO\\_DELAY](#)
- [CONFIG\\_HTTPD\\_WS\\_SUPPORT](#)

## CONFIG\_HTTPD\_MAX\_REQ\_HDR\_LEN

Max HTTP Request Header Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512

## CONFIG\_HTTPD\_MAX\_URI\_LEN

Max HTTP URI Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**

- 512

## CONFIG\_HTTPD\_ERR\_RESP\_NO\_DELAY

Use TCP\_NODELAY socket option when sending HTTP error responses

*Found in: [Component config](#) > [HTTP Server](#)*

Using TCP\_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**

- Yes (enabled)

### CONFIG\_HTTPD\_PURGE\_BUF\_LEN

Length of temporary buffer for purging data

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**

- 32

### CONFIG\_HTTPD\_LOG\_PURGE\_DATA

Log purged content data at Debug level

*Found in: [Component config](#) > [HTTP Server](#)*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_WS\_SUPPORT

WebSocket server support

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the WebSocket server support.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_QUEUE\_WORK\_BLOCKING

httpd\_queue\_work as blocking API

*Found in: [Component config](#) > [HTTP Server](#)*

This makes httpd\_queue\_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to `LWIP_UDP_RECVMBOX_SIZE` to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

### ESP HTTPS OTA

 Contains:

- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_ALLOW\\_HTTP](#)
- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_DECRYPT\\_CB](#)

### CONFIG\_ESP\_HTTPS\_OTA\_DECRYPT\_CB

Provide decryption callback

*Found in: [Component config](#) > [ESP HTTPS OTA](#)*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**

- No (disabled)

## CONFIG\_ESP\_HTTPS\_OTA\_ALLOW\_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

### Default value:

- No (disabled)

## ESP HTTPS server Contains:

- *CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE*

## CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE

Enable ESP\_HTTPS\_SERVER component

Found in: *Component config > ESP HTTPS server*

Enable ESP HTTPS server component

## Hardware Settings Contains:

- *Chip revision*
- *Crypto DPA Protection*
- *ESP\_SLEEP\_WORKAROUND*
- *ETM Configuration*
- *GDMA Configuration*
- *MAC Config*
- *Main XTAL Config*
- *Peripheral Control*
- *RTC Clock Config*
- *Sleep Config*

## Chip revision Contains:

- *CONFIG\_ESP\_REV\_NEW\_CHIP\_TEST*
- *CONFIG\_ESP32P4\_REV\_MIN*

## CONFIG\_ESP32P4\_REV\_MIN

Minimum Supported ESP32-P4 Revision

Found in: *Component config > Hardware Settings > Chip revision*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

Available options:

- Rev v0.0 (CONFIG\_ESP32P4\_REV\_MIN\_0)

### CONFIG\_ESP\_REV\_NEW\_CHIP\_TEST

Internal test mode

*Found in: Component config > Hardware Settings > Chip revision*

For internal chip testing, a small number of new versions chips didn't update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

**Default value:**

- No (disabled)

### MAC Config

 Contains:

- [CONFIG\\_ESP\\_MAC\\_USE\\_CUSTOM\\_MAC\\_AS\\_BASE\\_MAC](#)
- [CONFIG\\_ESP32P4\\_UNIVERSAL\\_MAC\\_ADDRESSES](#)

### CONFIG\_ESP32P4\_UNIVERSAL\_MAC\_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

TODO IDF-6514

Available options:

- Two (CONFIG\_ESP32P4\_UNIVERSAL\_MAC\_ADDRESSES\_TWO)

### CONFIG\_ESP\_MAC\_USE\_CUSTOM\_MAC\_AS\_BASE\_MAC

Enable using custom mac as base mac

*Found in: Component config > Hardware Settings > MAC Config*

When this configuration is enabled, the user can invoke `esp_read_mac` to obtain the desired type of MAC using a custom MAC as the base MAC.

**Default value:**

- No (disabled)

### Sleep Config

 Contains:

- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_ENABLE\\_INTERNAL\\_RESISTORS](#)
- [CONFIG\\_ESP\\_SLEEP\\_CACHE\\_SAFE\\_ASSERTION](#)
- [CONFIG\\_ESP\\_SLEEP\\_EVENT\\_CALLBACKS](#)
- [CONFIG\\_ESP\\_SLEEP\\_DEBUG](#)
- [CONFIG\\_ESP\\_SLEEP\\_WAIT\\_FLASH\\_READY\\_EXTRA\\_DELAY](#)
- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_RESET\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_POWER\\_DOWN\\_FLASH](#)
- [CONFIG\\_ESP\\_SLEEP\\_MSPI\\_NEED\\_ALL\\_IO\\_PU](#)
- [CONFIG\\_ESP\\_SLEEP\\_FLASH\\_LEAKAGE\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_PSRAM\\_LEAKAGE\\_WORKAROUND](#)

### CONFIG\_ESP\_SLEEP\_POWER\_DOWN\_FLASH

Power down flash in light sleep when there is no SPIRAM

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set `ESP_PD_DOMAIN_VDDSDIO` to `ESP_PD_OPTION_OFF`. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

### CONFIG\_ESP\_SLEEP\_FLASH\_LEAKAGE\_WORKAROUND

Pull-up Flash CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external SPI Flash CS pin pullups.)

### CONFIG\_ESP\_SLEEP\_PSRAM\_LEAKAGE\_WORKAROUND

Pull-up PSRAM CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external PSRAM CS pin pullups.)

#### Default value:

- Yes (enabled) if `CONFIG_SPIRAM`

### CONFIG\_ESP\_SLEEP\_MSPI\_NEED\_ALL\_IO\_PU

Pull-up all SPI pins in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

### CONFIG\_ESP\_SLEEP\_GPIO\_RESET\_WORKAROUND

light sleep GPIO reset workaround

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

esp32c2, esp32c3, esp32s3, esp32c6 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only

- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

### **CONFIG\_ESP\_SLEEP\_WAIT\_FLASH\_READY\_EXTRA\_DELAY**

Extra delay (in us) after flash powerdown sleep wakeup to wait flash ready

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When the chip exits sleep, the CPU and the flash chip are powered on at the same time. CPU will run rom code (deepsleep) or ram code (lightsleep) first, and then load or execute code from flash.

Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

(!!! Please adjust this value according to the Data Sheet of SPI Flash used in your project.) In Flash Data Sheet, the parameters that define the Flash ready timing after power-up (minimum time from Vcc(min) to CS activeare) usually named tVSL in ELECTRICAL CHARACTERISTICS chapter, and the configuration value here should be: ESP\_SLEEP\_WAIT\_FLASH\_READY\_EXTRA\_DELAY = tVSL - 900

For esp32 and esp32s3, the default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing "flash read err, 1000" message printed to the console after deep sleep reset on esp32, or triggered RTC\_WDT/LP\_WDT after lightsleep wakeup, try increasing this value. (For esp32, the delay will be executed in both deep sleep and light sleep wake up flow. For chips after esp32, the delay will be executed only in light sleep flow, the delay controlled by the EFUSE\_FLASH\_TPUW in ROM will be executed in deepsleep wake up flow.)

**Range:**

- from 0 to 5000

**Default value:**

- 0

### **CONFIG\_ESP\_SLEEP\_CACHE\_SAFE\_ASSERTION**

Check the cache safety of the sleep wakeup code in sleep process

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM\_SLP\_IRAM\_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_SLEEP\_DEBUG**

esp sleep debug

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enable esp sleep debug.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_SLEEP\_GPIO\_ENABLE\_INTERNAL\_RESISTORS**

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_SLEEP\_EVENT\_CALLBACKS**

Enable registration of sleep event callbacks

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM\_LIGHT\_SLEEP\_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

### **ESP\_SLEEP\_WORKAROUND**

**RTC Clock Config** Contains:

- [CONFIG\\_RTC\\_CLK\\_CAL\\_CYCLES](#)
- [CONFIG\\_RTC\\_CLK\\_SRC](#)

### **CONFIG\_RTC\_CLK\_SRC**

RTC clock source

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

Choose which clock is used as RTC clock source.

Available options:

- Internal 150 kHz RC oscillator ([CONFIG\\_RTC\\_CLK\\_SRC\\_INT\\_RC](#))
- External 32kHz crystal ([CONFIG\\_RTC\\_CLK\\_SRC\\_EXT\\_CRYST](#))
- External 32kHz oscillator at 32K\_XP pin ([CONFIG\\_RTC\\_CLK\\_SRC\\_EXT\\_OSC](#))
- Internal 32kHz RC oscillator ([CONFIG\\_RTC\\_CLK\\_SRC\\_INT\\_RC32K](#))

### **CONFIG\_RTC\_CLK\_CAL\_CYCLES**

Number of cycles for RTC\_SLOW\_CLK calibration

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

When the startup code initializes RTC\_SLOW\_CLK, it can perform calibration by comparing the RTC\_SLOW\_CLK frequency with main XTAL frequency. This option sets the number of

RTC\_SLOW\_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 8190 if `CONFIG_RTC_CLK_SRC_EXT_CRYST` || `CONFIG_RTC_CLK_SRC_INT_RC32K`
- from 0 to 32766

**Default value:**

- 3000 if `CONFIG_RTC_CLK_SRC_EXT_CRYST` || `CONFIG_RTC_CLK_SRC_EXT_OSC` || `RTC_CLK_SRC_INT_8MD256`
- 1024

**Peripheral Control** Contains:

- `CONFIG_PERIPH_CTRL_FUNC_IN_IRAM`

**CONFIG\_PERIPH\_CTRL\_FUNC\_IN\_IRAM**

Place peripheral control functions into IRAM

*Found in: Component config > Hardware Settings > Peripheral Control*

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**ETM Configuration** Contains:

- `CONFIG_ETM_ENABLE_DEBUG_LOG`

**CONFIG\_ETM\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: Component config > Hardware Settings > ETM Configuration*

Whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**GDMA Configuration** Contains:

- `CONFIG_GDMA_ENABLE_DEBUG_LOG`
- `CONFIG_GDMA_ISR_IRAM_SAFE`
- `CONFIG_GDMA_CTRL_FUNC_IN_IRAM`

### CONFIG\_GDMA\_CTRL\_FUNC\_IN\_IRAM

Place GDMA control functions into IRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_GDMA\_ISR\_IRAM\_SAFE

GDMA ISR IRAM-Safe

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_GDMA\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

Whether to enable the debug log message for GDMA driver. Note that, this option only controls the GDMA driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**Main XTAL Config** Contains:

- [CONFIG\\_XTAL\\_FREQ\\_SEL](#)

### CONFIG\_XTAL\_FREQ\_SEL

Main XTAL frequency

*Found in: [Component config](#) > [Hardware Settings](#) > [Main XTAL Config](#)*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL\_FREQ\_AUTO option allows the ESP target to automatically estimating XTAL clock's operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator's frequency being temperature dependent, usage of the XTAL\_FREQ\_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

Available options:

- 24 MHz (CONFIG\_XTAL\_FREQ\_24)
- 26 MHz (CONFIG\_XTAL\_FREQ\_26)
- 32 MHz (CONFIG\_XTAL\_FREQ\_32)
- 40 MHz (CONFIG\_XTAL\_FREQ\_40)
- Autodetect (CONFIG\_XTAL\_FREQ\_AUTO)

**Crypto DPA Protection** Contains:

- [CONFIG\\_ESP\\_CRYPTODPA\\_PROTECTION\\_AT\\_STARTUP](#)

### **CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_AT\_STARTUP**

Enable crypto DPA protection at startup

*Found in:* [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#)

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

**Default value:**

- Yes (enabled) if SOC\_CRYPTODPA\_PROTECTION\_SUPPORTED

### **CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL**

DPA protection level

*Found in:* [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#) > [CONFIG\\_ESP\\_CRYPTODPA\\_PROTECTION\\_AT\\_STARTUP](#)

Configure the DPA protection security level

Available options:

- Security level low (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_LOW)
- Security level medium (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_MEDIUM)
- Security level high (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_HIGH)

**LCD and Touch Panel** Contains:

- [LCD Peripheral Configuration](#)

**LCD Peripheral Configuration** Contains:

- [CONFIG\\_LCD\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_LCD\\_PANEL\\_IO\\_FORMAT\\_BUF\\_SIZE](#)
- [CONFIG\\_LCD\\_RGB\\_RESTART\\_IN\\_VSYNC](#)
- [CONFIG\\_LCD\\_RGB\\_ISR\\_IRAM\\_SAFE](#)

### **CONFIG\_LCD\_PANEL\_IO\_FORMAT\_BUF\_SIZE**

LCD panel io format buffer size

*Found in:* [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**

- 32

### CONFIG\_LCD\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_LCD\_RGB\_ISR\_IRAM\_SAFE

RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### CONFIG\_LCD\_RGB\_RESTART\_IN\_VSYNC

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can't deliver data as fast as the LCD consumes it.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### ESP NETIF Adapter

 Contains:

- [CONFIG\\_ESP\\_NETIF\\_BRIDGE\\_EN](#)
- [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)
- [CONFIG\\_ESP\\_NETIF\\_IP\\_LOST\\_TIMER\\_INTERVAL](#)
- [CONFIG\\_ESP\\_NETIF\\_USE\\_TCPIP\\_STACK\\_LIB](#)
- [CONFIG\\_ESP\\_NETIF\\_RECEIVE\\_REPORT\\_ERRORS](#)

### CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM\_EVENT\_STA\_LOST\_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

### CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB

TCP/IP Stack Library

*Found in:* [Component config](#) > [ESP NETIF Adapter](#)

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

Available options:

- LwIP (CONFIG\_ESP\_NETIF\_TCPIP\_LWIP)  
LwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (CONFIG\_ESP\_NETIF\_LOOPBACK)  
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

### CONFIG\_ESP\_NETIF\_RECEIVE\_REPORT\_ERRORS

Use esp\_err\_t to report errors from esp\_netif\_receive

*Found in:* [Component config](#) > [ESP NETIF Adapter](#)

Enable if esp\_netif\_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_NETIF\_L2\_TAP

Enable netif L2 TAP support

*Found in:* [Component config](#) > [ESP NETIF Adapter](#)

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

### CONFIG\_ESP\_NETIF\_L2\_TAP\_MAX\_FDS

Maximum number of opened L2 TAP File descriptors

*Found in:* [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

Maximum number of opened File descriptors (FD's) associated with ESP TAP device. ESP TAP FD's take up a certain amount of memory, and allowing fewer FD's to be opened at the same time conserves memory.

**Range:**

- from 1 to 10 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

**Default value:**

- 5 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

### CONFIG\_ESP\_NETIF\_L2\_TAP\_RX\_QUEUE\_SIZE

Size of L2 TAP Rx queue

*Found in:* [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**Range:**

- from 1 to 100 if `CONFIG_ESP_NETIF_L2_TAP`

**Default value:**

- 20 if `CONFIG_ESP_NETIF_L2_TAP`

### CONFIG\_ESP\_NETIF\_BRIDGE\_EN

Enable LwIP IEEE 802.1D bridge

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that "Number of clients store data in netif" (`LWIP_NUM_NETIF_CLIENT_DATA`) option needs to be properly configured to be LwIP bridge available!

**Default value:**

- No (disabled)

### Partition API Configuration

#### Power Management Contains:

- `CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL`
- `CONFIG_PM_SLP_DISABLE_GPIO`
- `CONFIG_PM_LIGHT_SLEEP_CALLBACKS`
- `CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP`
- `CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP`
- `CONFIG_PM_SLP_IRAM_OPT`
- `CONFIG_PM_RTOS_IDLE_OPT`
- `CONFIG_PM_ENABLE`

### CONFIG\_PM\_ENABLE

Support for power management

*Found in: [Component config](#) > [Power Management](#)*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**

- No (disabled) if `__DOXYGEN__`

### CONFIG\_PM\_DFS\_INIT\_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to `DEFAULT_CPU_FREQ_MHZ` setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using `esp_pm_configure` function.

**Default value:**

- No (disabled) if `CONFIG_PM_ENABLE`

## CONFIG\_PM\_PROFILING

Enable profiling counters for PM locks

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, esp\_pm\_\* functions will keep track of the amount of time each of the power management locks has been held, and esp\_pm\_dump\_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_TRACE

Enable debug tracing of PM using GPIOs

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm\_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

## CONFIG\_PM\_SLP\_IRAM\_OPT

Put lightsleep related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 2.1KB of lightsleep related source code would be in IRAM and chip would sleep longer for 310us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

## CONFIG\_PM\_RTOS\_IDLE\_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 180Bytes of RTOS\_IDLE related source code would be in IRAM and chip would sleep longer for 20us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

## CONFIG\_PM\_SLP\_DISABLE\_GPIO

Disable all GPIO when chip at sleep

*Found in: [Component config](#) > [Power Management](#)*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio\_sleep\_sel\_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio\_sleep\_set\_direction' and 'gpio\_sleep\_set\_pull\_mode' to have a different GPIO configuration at sleep. Waring: If you want to enable this option on ESP32, you should enable [GPIO\\_ESP32\\_SUPPORT\\_SWITCH\\_SLP\\_PULL](#) at first, otherwise you will not be able to switch pullup/pulldown mode.

### CONFIG\_PM\_LIGHTSLEEP\_RTC\_OSC\_CAL\_INTERVAL

Calibrate the RTC\_FAST/SLOW clock every N times of light sleep

*Found in: [Component config > Power Management](#)*

The value of this option determines the calibration interval of the RTC\_FAST/SLOW clock during sleep when power management is enabled. When it is configured as N, the RTC\_FAST/SLOW clock will be calibrated every N times of lightsleep. Decreasing this value will increase the time the chip is in the active state, thereby increasing the average power consumption of the chip. Increasing this value can reduce the average power consumption, but when the external environment changes drastically and the chip RTC\_FAST/SLOW oscillator frequency drifts, it may cause system instability.

**Range:**

- from 1 to 128 if [CONFIG\\_PM\\_ENABLE](#)

**Default value:**

- 1 if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_POWER\_DOWN\_CPU\_IN\_LIGHT\_SLEEP

Power down CPU in light sleep

*Found in: [Component config > Power Management](#)*

If enabled, the CPU will be powered down in light sleep, ESP chips supports saving and restoring CPU's running context before and after light sleep, the feature provides applications with seamless CPU powered-down lightsleep without user awareness. But this will takes up some internal memory. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**

- Yes (enabled)

### CONFIG\_PM\_POWER\_DOWN\_PERIPHERAL\_IN\_LIGHT\_SLEEP

Power down Digital Peripheral in light sleep (EXPERIMENTAL)

*Found in: [Component config > Power Management](#)*

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

Note1: Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in `power_management.rst`

Note2: When this option is enabled simultaneously with `FREERTOS_USE_TICKLESS_IDLE`, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase `FREERTOS_IDLE_TIME_BEFORE_SLEEP` threshold in `menuconfig`.

**Default value:**

- No (disabled) if `SOC_PAU_SUPPORTED`

## CONFIG\_PM\_LIGHT\_SLEEP\_CALLBACKS

Enable registration of pm light sleep callbacks

*Found in: [Component config](#) > [Power Management](#)*

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

### Default value:

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**ESP PSRAM** Contains:

- [CONFIG\\_SPIRAM](#)

## CONFIG\_SPIRAM

Support for external PSRAM

*Found in: [Component config](#) > [ESP PSRAM](#)*

This enables support for an external PSRAM chip, connected in parallel with the main SPI flash chip.

**PSRAM config** Contains:

- [CONFIG\\_SPIRAM\\_ALLOW\\_BSS\\_SEG\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_ALLOW\\_STACK\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_ECC\\_ENABLE](#)
- [CONFIG\\_SPIRAM\\_BOOT\\_INIT](#)
- [CONFIG\\_SPIRAM\\_MODE](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_ALWAYSINTERNAL](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_RESERVE\\_INTERNAL](#)
- [CONFIG\\_SPIRAM\\_MEMTEST](#)
- [CONFIG\\_SPIRAM\\_SPEED](#)
- [CONFIG\\_SPIRAM\\_USE](#)
- [CONFIG\\_SPIRAM\\_TRY\\_ALLOCATE\\_WIFI\\_LWIP](#)

## CONFIG\_SPIRAM\_MODE

Line Mode of PSRAM chip in use

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [PSRAM config](#)*

Available options:

- 16-Line-Mode PSRAM ([CONFIG\\_SPIRAM\\_MODE\\_HEX](#))

## CONFIG\_SPIRAM\_SPEED

Set PSRAM clock speed

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [PSRAM config](#)*

Select the speed for the PSRAM chip.

Available options:

- 20MHz clock speed (CONFIG\_SPIRAM\_SPEED\_20M)

### CONFIG\_SPIRAM\_ECC\_ENABLE

Enable PSRAM ECC

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > PSRAM config*

Enable Error-Correcting Code function when accessing PSRAM.

If enabled, 1/8 of the PSRAM total size will be reserved for error-correcting code.

### CONFIG\_SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > PSRAM config*

Accessing memory in PSRAM has certain restrictions, so task stacks allocated by xTaskCreate are by default allocated from internal RAM.

This option allows for passing memory allocated from PSRAM to be passed to xTaskCreateStatic. This should only be used for tasks where the stack is never accessed while the L2Cache is disabled, e.g. during SPI Flash operations

### CONFIG\_SPIRAM\_BOOT\_INIT

Initialize SPI RAM during startup

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > PSRAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you'll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

### CONFIG\_SPIRAM\_IGNORE\_NOTFOUND

Ignore PSRAM when not found

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > PSRAM config > CONFIG\_SPIRAM\_BOOT\_INIT*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available. If PSRAM failed to initialize, the following configs may be affected and may need to be corrected manually. SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP will affect some LWIP and WiFi buffer default values and range values. Enable SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP, ESP\_WIFI\_AMSDU\_TX\_ENABLED, ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM and use static WiFi Tx buffer may cause potential memory exhaustion issues. Suggest disable SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP. Suggest disable ESP\_WIFI\_AMSDU\_TX\_ENABLED. Suggest disable ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM, need clear CONFIG\_FEATURE\_CACHE\_TX\_BUF\_BIT of config->feature\_caps. Suggest change ESP\_WIFI\_TX\_BUFFER from static to dynamic. Also suggest to adjust some buffer numbers to the values used without PSRAM case. Such as, ESP\_WIFI\_STATIC\_TX\_BUFFER\_NUM, ESP\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM.

### CONFIG\_SPIRAM\_USE

SPI RAM access method

*Found in: Component config > ESP PSRAM > CONFIG\_SPIRAM > PSRAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU's memory map, by integrating it in the heap as 'special' memory needing `heap_caps_malloc` to allocate, or by fully integrating it making `malloc()` also able to return SPI RAM pointers.

Available options:

- Integrate RAM into memory map (`CONFIG_SPIRAM_USE_MEMMAP`)
- Make RAM allocatable using `heap_caps_malloc(..., MALLOC_CAP_SPIRAM)` (`CONFIG_SPIRAM_USE_CAPS_ALLOC`)
- Make RAM allocatable using `malloc()` as well (`CONFIG_SPIRAM_USE_MALLOC`)

### **CONFIG\_SPIRAM\_MEMTEST**

Run memory test on SPI RAM initialization

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [PSRAM config](#)*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

### **CONFIG\_SPIRAM\_MALLOC\_ALWAYSINTERNAL**

Maximum `malloc()` size, in bytes, to always put in internal memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [PSRAM config](#)*

If `malloc()` is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so `malloc()` will not suddenly fail when either internal or external memory is full.

### **CONFIG\_SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP**

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [PSRAM config](#)*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

### **CONFIG\_SPIRAM\_MALLOC\_RESERVE\_INTERNAL**

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: [Component config](#) > [ESP PSRAM](#) > [CONFIG\\_SPIRAM](#) > [PSRAM config](#)*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that's also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal `malloc()` is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

## CONFIG\_SPIRAM\_ALLOW\_BSS\_SEG\_EXTERNAL\_MEMORY

Allow .bss segment placed in external memory

Found in: *Component config > ESP PSRAM > CONFIG\_SPIRAM > PSRAM config*

If enabled, variables with EXT\_RAM\_BSS\_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of *lwip*, *net80211*, *pp*, *bt* libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme *extram\_bss*.

Note that the variables placed in SPIRAM using EXT\_RAM\_BSS\_ATTR will be zero initialized.

**ESP Ringbuf** Contains:

- *CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH*

## CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place non-ISR ringbuf functions into flash

Found in: *Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like *xRingbufferCreate*/*xRingbufferSend*) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

## CONFIG\_RINGBUF\_PLACE\_ISR\_FUNCTIONS\_INTO\_FLASH

Place ISR ringbuf functions into flash

Found in: *Component config > ESP Ringbuf > CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH*

Place ISR ringbuf functions (like *xRingbufferSendFromISR*/*xRingbufferReceiveFromISR*) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. *CONFIG\_UART\_ISR\_IN\_IRAM*.

**Default value:**

- No (disabled) if *CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH*

**ESP System Settings** Contains:

- *CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES*
- *Cache config*
- *CONFIG\_ESP\_CONSOLE\_UART*
- *CONFIG\_ESP\_CONSOLE\_SECONDARY*
- *CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ*
- *CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP*
- *CONFIG\_ESP\_TASK\_WDT\_EN*
- *CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_SYSTEM\_USE\_EH\_FRAME*
- *CONFIG\_ESP\_SYSTEM\_HW\_STACK\_GUARD*
- *CONFIG\_ESP\_XT\_WDT*
- *CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL*
- *CONFIG\_ESP\_INT\_WDT*
- *CONFIG\_ESP\_MAIN\_TASK\_AFFINITY*
- *CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_DEBUG\_OCDAWARE*

- *Memory protection*
- *CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE*
- *CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE*
- *CONFIG\_ESP\_SYSTEM\_PANIC*
- *CONFIG\_ESP\_SYSTEM\_PANIC\_REBOOT\_DELAY\_SECONDS*
- *CONFIG\_ESP\_PANIC\_HANDLER\_IRAM*
- *CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE*
- *CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE*
- *CONFIG\_ESP\_CONSOLE\_UART\_NUM*
- *CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO*
- *CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO*

### **CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

Available options:

- 40 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_40)
- 80 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_80)
- 120 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_120)
- 160 MHz (CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ\_160)

**Cache config** Contains:

- *CONFIG\_CACHE\_L2\_CACHE\_LINE\_SIZE*
- *CONFIG\_CACHE\_L2\_CACHE\_SIZE*

### **CONFIG\_CACHE\_L2\_CACHE\_SIZE**

L2 cache size

*Found in: Component config > ESP System Settings > Cache config*

L2 cache size to be set on application startup.

Available options:

- 128KB (CONFIG\_CACHE\_L2\_CACHE\_128KB)
- 256KB (CONFIG\_CACHE\_L2\_CACHE\_256KB)
- 512KB (CONFIG\_CACHE\_L2\_CACHE\_512KB)

### **CONFIG\_CACHE\_L2\_CACHE\_LINE\_SIZE**

L2 cache line size

*Found in: Component config > ESP System Settings > Cache config*

L2 cache line size to be set on application startup.

Available options:

- 64 Bytes (CONFIG\_CACHE\_L2\_CACHE\_LINE\_64B)
- 128 Bytes (CONFIG\_CACHE\_L2\_CACHE\_LINE\_128B)

## CONFIG\_ESP\_SYSTEM\_PANIC

Panic handler behaviour

*Found in: [Component config](#) > [ESP System Settings](#)*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

Available options:

- Print registers and halt (CONFIG\_ESP\_SYSTEM\_PANIC\_PRINT\_HALT)  
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (CONFIG\_ESP\_SYSTEM\_PANIC\_PRINT\_REBOOT)  
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (CONFIG\_ESP\_SYSTEM\_PANIC\_SILENT\_REBOOT)  
Just resets the processor without outputting anything
- GDBStub on panic (CONFIG\_ESP\_SYSTEM\_PANIC\_GDBSTUB)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

## CONFIG\_ESP\_SYSTEM\_PANIC\_REBOOT\_DELAY\_SECONDS

Panic reboot delay (Seconds)

*Found in: [Component config](#) > [ESP System Settings](#)*

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

**Range:**

- from 0 to 99

**Default value:**

- 0

## CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES

Bootstrap cycles for external 32kHz crystal

*Found in: [Component config](#) > [ESP System Settings](#)*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger "Number of cycles for RTC\_SLOW\_CLK calibration" (about 3000).

## CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP

Enable RTC fast memory for dynamic allocations

*Found in: [Component config](#) > [ESP System Settings](#)*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_SYSTEM\_USE\_EH\_FRAME**

Generate and use eh\_frame for backtracing

*Found in: [Component config](#) > [ESP System Settings](#)*

Generate DWARF information for each function of the project. These information will be parsed and used to perform backtracing when panics occur. Activating this option will activate asynchronous frame unwinding and generation of both .eh\_frame and .eh\_frame\_hdr sections, resulting in a bigger binary size (20% to 100% larger). The main purpose of this option is to be able to have a backtrace parsed and printed by the program itself, regardless of the serial monitor used. This option shall NOT be used for production.

**Default value:**

- No (disabled)

### **Memory protection** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_PMP\\_IDRAM\\_SPLIT](#)
- [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### **CONFIG\_ESP\_SYSTEM\_PMP\_IDRAM\_SPLIT**

Enable IRAM/DRAM split protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE**

Enable memory protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if SOC\_MEMPROT\_SUPPORTED

### **CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE\_LOCK**

Lock memory protection settings

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#) > [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled) if `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`

**CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE**

System event queue size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event queue size in different application.

**Default value:**

- 32

**CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE**

Event loop task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event task stack size in different application.

**Default value:**

- 2304

**CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE**

Main task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**

- 3584

**CONFIG\_ESP\_MAIN\_TASK\_AFFINITY**

Main task core affinity

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

Available options:

- CPU0 (`CONFIG_ESP_MAIN_TASK_AFFINITY_CPU0`)
- CPU1 (`CONFIG_ESP_MAIN_TASK_AFFINITY_CPU1`)
- No affinity (`CONFIG_ESP_MAIN_TASK_AFFINITY_NO_AFFINITY`)

**CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE**

Minimal allowed size for shared stack

*Found in: [Component config](#) > [ESP System Settings](#)*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**

- 2048

## CONFIG\_ESP\_CONSOLE\_UART

Channel for console output

*Found in: [Component config](#) > [ESP System Settings](#)*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If "Custom" is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If "None" is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, "USB CDC" option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:

- Default: UART0 (CONFIG\_ESP\_CONSOLE\_UART\_DEFAULT)
- USB CDC (CONFIG\_ESP\_CONSOLE\_USB\_CDC)
- USB Serial/JTAG Controller (CONFIG\_ESP\_CONSOLE\_USB\_SERIAL\_JTAG)
- Custom UART (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM)
- None (CONFIG\_ESP\_CONSOLE\_NONE)

## CONFIG\_ESP\_CONSOLE\_SECONDARY

Channel for console secondary output

*Found in: [Component config](#) > [ESP System Settings](#)*

This secondary option supports output through other specific port like USB\_SERIAL\_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

Available options:

- No secondary console (CONFIG\_ESP\_CONSOLE\_SECONDARY\_NONE)
- USB\_SERIAL\_JTAG PORT (CONFIG\_ESP\_CONSOLE\_SECONDARY\_USB\_SERIAL\_JTAG)  
This option supports output through USB\_SERIAL\_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB\_SERIAL\_JTAG port, please change the primary config to ESP\_CONSOLE\_USB\_SERIAL\_JTAG above.

## CONFIG\_ESP\_CONSOLE\_UART\_NUM

UART peripheral to use for console output (0-1)

*Found in: [Component config](#) > [ESP System Settings](#)*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

Available options:

- UART0 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_0)
- UART1 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_1)

### CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 56 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

**Default value:**

- 37 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*
- 43 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

### CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 56 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

**Default value:**

- 38 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*
- 44 if *CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM*

### CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 1200 to 1000000 if *CONFIG\_PM\_ENABLE*

**Default value:**

- 115200

### CONFIG\_ESP\_INT\_WDT

Interrupt watchdog

*Found in: [Component config](#) > [ESP System Settings](#)*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS

Interrupt watchdog timeout (ms)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 300

### CONFIG\_ESP\_INT\_WDT\_CHECK\_CPU1

Also watch CPU1 tick interrupt

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

Also detect if interrupts on CPU 1 are disabled for too long.

### CONFIG\_ESP\_TASK\_WDT\_EN

Enable Task Watchdog Timer

*Found in: [Component config](#) > [ESP System Settings](#)*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_INIT

Initialize Task Watchdog Timer on startup

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#)*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_PANIC

Invoke panic handler on Task Watchdog timeout

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)

**CONFIG\_ESP\_TASK\_WDT\_TIMEOUT\_S**

Task Watchdog timeout period (seconds)

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**

- from 1 to 60

**Default value:**

- 5

**CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU0**

Watch CPU0 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU1**

Watch CPU1 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**CONFIG\_ESP\_XT\_WDT**

Initialize XTAL32K watchdog timer on startup

*Found in:* [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect oscillation failure of the XTAL32K\_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K\_CLK and generate an interrupt.

**CONFIG\_ESP\_XT\_WDT\_TIMEOUT**

XTAL32K watchdog timeout period

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_XT\\_WDT](#)

Timeout period configuration for the XTAL32K watchdog timer based on RTC\_CLK.

**Range:**

- from 1 to 255 if *CONFIG\_ESP\_XT\_WDT*

**Default value:**

- 200 if *CONFIG\_ESP\_XT\_WDT*

**CONFIG\_ESP\_XT\_WDT\_BACKUP\_CLK\_ENABLE**

Automatically switch to BACKUP32K\_CLK when timer expires

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_XT\_WDT*

Enable this to automatically switch to BACKUP32K\_CLK as the source of RTC\_SLOW\_CLK when the watchdog timer expires.

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_XT\_WDT*

**CONFIG\_ESP\_PANIC\_HANDLER\_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE**

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**CONFIG\_ESP\_DEBUG\_OCDAWARE**

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL**

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog, IPC\_ISR and other system checks.

Available options:

- Level 5 interrupt (`CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_5`)  
Using level 5 interrupt for Interrupt Watchdog, IPC\_ISR and other system checks.
- Level 4 interrupt (`CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_4`)  
Using level 4 interrupt for Interrupt Watchdog, IPC\_ISR and other system checks.

### **CONFIG\_ESP\_SYSTEM\_HW\_STACK\_GUARD**

Hardware stack guard

*Found in: Component config > ESP System Settings*

This config allows to trigger a panic interrupt when Stack Pointer register goes out of allocated stack memory bounds.

**Default value:**

- Yes (enabled) if `SOC_ASSIST_DEBUG_SUPPORTED`

### **IPC (Inter-Processor Call)** Contains:

- `CONFIG_ESP_IPC_TASK_STACK_SIZE`
- `CONFIG_ESP_IPC_USES_CALLERS_PRIORITY`

### **CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE**

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**

- from 512 to 65536

**Default value:**

- 1024

### **CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY**

IPC runs at caller's priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at  $(\text{configMAX\_PRIORITIES} - 1)$  priority.

### **High resolution timer (esp\_timer)** Contains:

- `CONFIG_ESP_TIMER_PROFILING`
- `CONFIG_ESP_TIMER_TASK_AFFINITY`
- `CONFIG_ESP_TIMER_TASK_STACK_SIZE`
- `CONFIG_ESP_TIMER_INTERRUPT_LEVEL`
- `CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL`
- `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD`
- `CONFIG_ESP_TIMER_ISR_AFFINITY`

### CONFIG\_ESP\_TIMER\_PROFILING

Enable esp\_timer profiling features

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

If enabled, esp\_timer\_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE

High-resolution timer task stack size

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

Configure the stack size of "timer\_task" task. This task is used to dispatch callbacks of timers created using ets\_timer and esp\_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see "FreeRTOS timer task stack size" option in "FreeRTOS".

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

### CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL

Interrupt level

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

It sets the interrupt level for esp\_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp\_timer latency.

**Range:**

- from 1 to 1

**Default value:**

- 1

### CONFIG\_ESP\_TIMER\_SHOW\_EXPERIMENTAL

show esp\_timer's experimental features

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

This shows some hidden features of esp\_timer. Note that they may break other features, use them with care.

### CONFIG\_ESP\_TIMER\_TASK\_AFFINITY

esp\_timer task core affinity

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) esp\_timer task is processed by CPU0. - "CPU1": esp\_timer task is processed by CPU1. - "No affinity": esp\_timer task can be processed by any CPU.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_NO\_AFFINITY)

### CONFIG\_ESP\_TIMER\_ISR\_AFFINITY

timer interrupt core affinity

*Found in: Component config > High resolution timer (esp\_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) timer interrupt is processed by CPU0. - "CPU1": timer interrupt is processed by CPU1. - "No affinity": timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_NO\_AFFINITY)

### CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp\_timer)*

Allows using ESP\_TIMER\_ISR dispatch method (ESP\_TIMER\_TASK dispatch method is also available). - ESP\_TIMER\_TASK - Timer callbacks are dispatched from a high-priority esp\_timer task. - ESP\_TIMER\_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**

- No (disabled)

**Wi-Fi** Contains:

- CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS
- CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR
- CONFIG\_ESP\_WIFI\_11KV\_SUPPORT

- `CONFIG_ESP_WIFI_TASK_CORE_ID`
- *WPS Configuration Options*

### **CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM**

Max number of WiFi static RX buffers

*Found in: [Component config > Wi-Fi](#)*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 128 if `SOC_WIFI_HE_SUPPORT`

**Default value:**

- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

### **CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM**

Max number of WiFi dynamic RX buffers

*Found in: [Component config > Wi-Fi](#)*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**

- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 32

## CONFIG\_ESP\_WIFI\_TX\_BUFFER

Type of WiFi TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi TX buffers:

If "Static" is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If "Dynamic" is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, "Static" should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, "Dynamic" should be selected to improve the utilization of RAM.

Available options:

- Static (`CONFIG_ESP_WIFI_STATIC_TX_BUFFER`)
- Dynamic (`CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER`)

## CONFIG\_ESP\_WIFI\_STATIC\_TX\_BUFFER\_NUM

Max number of WiFi static TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 64 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`

**Default value:**

- 16 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`

## CONFIG\_ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM

Max number of WiFi cache TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the

uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**Range:**

- from 16 to 128 if `CONFIG_SPIRAM`

**Default value:**

- 32 if `CONFIG_SPIRAM`

### **CONFIG\_ESP\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM**

Max number of WiFi dynamic TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 128

**Default value:**

- 32

### **CONFIG\_ESP\_WIFI\_MGMT\_RX\_BUFFER**

Type of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi RX MGMT buffers:

If "Static" is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If "Dynamic" is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:

- Static (`CONFIG_ESP_WIFI_STATIC_RX_MGMT_BUFFER`)
- Dynamic (`CONFIG_ESP_WIFI_DYNAMIC_RX_MGMT_BUFFER`)

### **CONFIG\_ESP\_WIFI\_RX\_MGMT\_BUF\_NUM\_DEF**

Max number of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi RX\_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**

- from 1 to 10

**Default value:**

- 5

### CONFIG\_ESP\_WIFI\_CSI\_ENABLED

WiFi CSI(Channel State Information)

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled) if SOC\_WIFI\_CSI\_SUPPORT

### CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED

WiFi AMPDU TX

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_TX\_BA\_WIN

WiFi AMPDU TX BA window size

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 64 if SOC\_WIFI\_HE\_SUPPORT && [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)

**Default value:**

- 6

### CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

WiFi AMPDU RX

Found in: [Component config](#) > [Wi-Fi](#)

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_RX\_BA\_WIN

WiFi AMPDU RX BA window size

Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_AMPDU\\_RX\\_ENABLED](#)

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 64 if `SOC_WIFI_HE_SUPPORT` && `CONFIG_ESP_WIFI_AMPDU_RX_ENABLED`

**Default value:**

- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP_WIFI_AMPDU_RX_ENABLED`

**CONFIG\_ESP\_WIFI\_AMSDU\_TX\_ENABLED**

WiFi AMSDU TX

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable AMSDU TX feature

**Default value:**

- No (disabled) if `CONFIG_SPIRAM`

**CONFIG\_ESP\_WIFI\_NVS\_ENABLED**

WiFi NVS flash

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable WiFi NVS flash

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_TASK\_CORE\_ID**

WiFi Task Core ID

*Found in:* [Component config > Wi-Fi](#)

Pinned WiFi task to core 0 or core 1.

Available options:

- Core 0 (`CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_0`)
- Core 1 (`CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_1`)

**CONFIG\_ESP\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN**

Max length of WiFi SoftAP Beacon

*Found in:* [Component config > Wi-Fi](#)

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36\*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

- from 752 to 1256

**Default value:**

- 752

**CONFIG\_ESP\_WIFI\_MGMT\_SBUF\_NUM**

WiFi mgmt short buffer number

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi management short buffer.

**Range:**

- from 6 to 32

**Default value:**

- 32

**CONFIG\_ESP\_WIFI\_IRAM\_OPT**

WiFi IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_EXTRA\_IRAM\_OPT**

WiFi EXTRA IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_RX\_IRAM\_OPT**

WiFi RX IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_SAE**

Enable WPA3-Personal

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_ENABLE\_SAE\_PK**

Enable SAE-PK

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)*

Select this option to enable SAE-PK

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_SOFTAP\_SAE\_SUPPORT**

Enable WPA3 Personal(SAE) SoftAP

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)*

Select this option to enable SAE support in softAP mode.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_OWE\_STA**

Enable OWE STA

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish OWE connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the [Wi-Fi Driver API Guide](#) for details.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT**

WiFi SLP IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by `ESP_WIFI_IRAM_OPT` and `ESP_WIFI_RX_IRAM_OPT`, or this one. If already enabled `ESP_WIFI_IRAM_OPT`, the other 7.3KB IRAM memory would be taken by this option. If already enabled `ESP_WIFI_RX_IRAM_OPT`, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME**

Minimum active time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**

- from 8 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 50 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME**

Maximum keep alive time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The maximum time that wifi keep alive, unit: seconds.

**Range:**

- from 10 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 10 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**CONFIG\_ESP\_WIFI\_FTM\_ENABLE**

WiFi FTM

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**

- No (disabled) if [SOC\\_WIFI\\_FTM\\_SUPPORT](#)

**CONFIG\_ESP\_WIFI\_FTM\_INITIATOR\_SUPPORT**

FTM Initiator support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**CONFIG\_ESP\_WIFI\_FTM\_RESPONDER\_SUPPORT**

FTM Responder support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE**

Power Management for station at disconnected

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable power\_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT**

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**

- No (disabled) if [SOC\\_WIFI\\_GCMP\\_SUPPORT](#)

### CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT

WiFi GMAC Support(GMAC128 and GMAC256)

Found in: *Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT

WiFi SoftAP Support

Found in: *Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENHANCED\_LIGHT\_SLEEP

WiFi modem automatically receives the beacon

Found in: *Component config > Wi-Fi*

The wifi modem automatically receives the beacon frame during light sleep.

**Default value:**

- No (disabled) if ESP\_PHY\_MAC\_BB\_PD && SOC\_PM\_SUPPORT\_BEACON\_WAKEUP

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT

Wifi sleep optimize when beacon lost

Found in: *Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_TIMEOUT

Beacon loss timeout

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**

- from 5 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 10 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_THRESHOLD

Maximum number of consecutive lost beacons allowed

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 3 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG\_ESP\_WIFI\_SLP\_PHY\_ON\_DELTA\_EARLY\_TIME**

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**

- from 0 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT` &&  
SOC\_WIFI\_SUPPORT\_VARIABLE\_BEACON\_WINDOW

**Default value:**

- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT` &&  
SOC\_WIFI\_SUPPORT\_VARIABLE\_BEACON\_WINDOW

**CONFIG\_ESP\_WIFI\_SLP\_PHY\_OFF\_DELTA\_TIMEOUT\_TIME**

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**

- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT` &&  
SOC\_WIFI\_SUPPORT\_VARIABLE\_BEACON\_WINDOW

**Default value:**

- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT` &&  
SOC\_WIFI\_SUPPORT\_VARIABLE\_BEACON\_WINDOW

**CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM**

Maximum espnow encrypt peers number

*Found in: Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

**Range:**

- from 0 to 17

**Default value:**

- 7

**CONFIG\_ESP\_WIFI\_NAN\_ENABLE**

WiFi Aware

*Found in: Component config > Wi-Fi*

Enable WiFi Aware (NAN) feature.

**Default value:**

- No (disabled) if `SOC_WIFI_NAN_SUPPORT`

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_TX\_STATS

Enable Wi-Fi transmission statistics

*Found in:* [Component config](#) > [Wi-Fi](#)

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.

**Default value:**

- Yes (enabled) if SOC\_WIFI\_HE\_SUPPORT

### CONFIG\_ESP\_WIFI\_MBEDTLS\_CRYPTO

Use MbedTLS crypto APIs

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_MBEDTLS\_TLS\_CLIENT

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in:* [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_MBEDTLS\\_CRYPTO](#)

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. In case your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_WAPI\_PSK

Enable WAPI PSK support

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled) if SOC\_WIFI\_WAPI\_SUPPORT

### CONFIG\_ESP\_WIFI\_SUITE\_B\_192

Enable NSA suite B support with 192 bit key

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**

- No (disabled) if SOC\_WIFI\_GCMP\_SUPPORT

### CONFIG\_ESP\_WIFI\_11KV\_SUPPORT

Enable 802.11k, 802.11v APIs Support

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_SCAN\_CACHE

Keep scan results in cache

*Found in:* [Component config > Wi-Fi > CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)

### CONFIG\_ESP\_WIFI\_MBO\_SUPPORT

Enable Multi Band Operation Certification Support

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable WiFi Multiband operation certification support.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_DPP\_SUPPORT

Enable DPP support

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable WiFi Easy Connect Support.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_11R\_SUPPORT

Enable 802.11R (Fast Transition) Support

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable WiFi Fast Transition Support.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR

Add WPS Registrar support in SoftAP mode

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WPS registrar support in softAP mode.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_STATS

Enable Wi-Fi reception statistics

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

**Default value:**

- Yes (enabled) if SOC\_WIFI\_HE\_SUPPORT

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_MU\_STATS

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)*

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)

### WPS Configuration Options

 Contains:

- [CONFIG\\_ESP\\_WIFI\\_WPS\\_PASSPHRASE](#)
- [CONFIG\\_ESP\\_WIFI\\_WPS\\_STRICT](#)

### CONFIG\_ESP\_WIFI\_WPS\_STRICT

Strictly validate all WPS attributes

*Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_WPS\_PASSPHRASE

Get WPA2 passphrase in WPS config

*Found in: [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)*

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_DEBUG\_PRINT

Print debug messages from WPA Supplicant

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS

Add DPP testing code

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT

Enable enterprise option

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable/disable enterprise connection support.

disabling this will reduce binary size. disabling this will disable the use of any esp\_wifi\_sta\_wpa2\_ent\_\* (as APIs will be meaningless)

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENT\_FREE\_DYNAMIC\_BUFFER

Free dynamic buffers during WiFi enterprise connection

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENTERPRISE\\_SUPPORT](#)*

Select this configuration to free dynamic buffers during WiFi enterprise connection. This will enable chip to reduce heap consumption during WiFi enterprise connection.

**Default value:**

- No (disabled)

**Core dump** Contains:

- [CONFIG\\_ESP\\_COREDUMP\\_CHECK\\_BOOT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_CHECKSUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_TO\\_FLASH\\_OR\\_UART](#)
- [CONFIG\\_ESP\\_COREDUMP\\_UART\\_DELAY](#)
- [CONFIG\\_ESP\\_COREDUMP\\_LOGS](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DECODE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_MAX\\_TASKS\\_NUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_SUMMARY\\_STACKDUMP\\_SIZE](#)

## CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART

Data destination

*Found in: [Component config](#) > [Core dump](#)*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the `components/partition_table` directory.

Available options:

- Flash (CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_FLASH)
- UART (CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_UART)
- None (CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_NONE)

## CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT

Core dump data format

*Found in: [Component config](#) > [Core dump](#)*

Select the data format for core dump.

Available options:

- Binary format (CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT\_BIN)
- ELF format (CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT\_ELF)

## CONFIG\_ESP\_COREDUMP\_CHECKSUM

Core dump data integrity check

*Found in: [Component config](#) > [Core dump](#)*

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (CONFIG\_ESP\_COREDUMP\_CHECKSUM\_CRC32)
- Use SHA256 for integrity verification (CONFIG\_ESP\_COREDUMP\_CHECKSUM\_SHA256)

## CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT

Check core dump data integrity on boot

*Found in: [Component config](#) > [Core dump](#)*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

### CONFIG\_ESP\_COREDUMP\_LOGS

Enable coredump logs for debugging

*Found in:* [Component config](#) > [Core dump](#)

Enable/disable coredump logs. Logs strings from `espcoredump` component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

### CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM

Maximum number of tasks

*Found in:* [Component config](#) > [Core dump](#)

Maximum number of tasks snapshots in core dump.

### CONFIG\_ESP\_COREDUMP\_UART\_DELAY

Delay before print to UART

*Found in:* [Component config](#) > [Core dump](#)

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**

- 0 if [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_UART](#)

### CONFIG\_ESP\_COREDUMP\_STACK\_SIZE

Reserved stack size

*Found in:* [Component config](#) > [Core dump](#)

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

### CONFIG\_ESP\_COREDUMP\_SUMMARY\_STACKDUMP\_SIZE

Size of the stack dump buffer

*Found in:* [Component config](#) > [Core dump](#)

Size of the buffer that would be reserved for extracting backtrace info summary. This buffer will contain the stack dump of the crashed task. This dump is useful in generating backtrace

**Range:**

- from 512 to 4096 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#) && [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_FLASH](#)

**Default value:**

- 1024 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#) && [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_FLASH](#)

### CONFIG\_ESP\_COREDUMP\_DECODE

Handling of UART core dumps in IDF Monitor

*Found in:* [Component config](#) > [Core dump](#)

Available options:

- Decode and show summary (info\_corefile) (CONFIG\_ESP\_COREDUMP\_DECODE\_INFO)
- Don't decode (CONFIG\_ESP\_COREDUMP\_DECODE\_DISABLE)

**FAT Filesystem support** Contains:

- *CONFIG\_FATFS\_API\_ENCODING*
- *CONFIG\_FATFS\_VFS\_FSTAT\_BLKSIZE*
- *CONFIG\_FATFS\_IMMEDIATE\_FSYNC*
- *CONFIG\_FATFS\_USE\_FASTSEEK*
- *CONFIG\_FATFS\_LONG\_FILENAMES*
- *CONFIG\_FATFS\_MAX\_LFN*
- *CONFIG\_FATFS\_FS\_LOCK*
- *CONFIG\_FATFS\_VOLUME\_COUNT*
- *CONFIG\_FATFS\_CHOOSE\_CODEPAGE*
- *CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM*
- *CONFIG\_FATFS\_SECTOR\_SIZE*
- *CONFIG\_FATFS\_TIMEOUT\_MS*
- *CONFIG\_FATFS\_PER\_FILE\_CACHE*

**CONFIG\_FATFS\_VOLUME\_COUNT**

Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**

- from 1 to 10

**Default value:**

- 2

**CONFIG\_FATFS\_LONG\_FILENAMES**

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (CONFIG\_FATFS\_LFN\_NONE)
- Long filename buffer in heap (CONFIG\_FATFS\_LFN\_HEAP)
- Long filename buffer on stack (CONFIG\_FATFS\_LFN\_STACK)

**CONFIG\_FATFS\_SECTOR\_SIZE**

Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

Available options:

- 512 (CONFIG\_FATFS\_SECTOR\_512)
- 4096 (CONFIG\_FATFS\_SECTOR\_4096)

## CONFIG\_FATFS\_CHOOSE\_CODEPAGE

OEM Code Page

*Found in: [Component config](#) > [FAT Filesystem support](#)*

OEM code page used for file name encodings.

If "Dynamic" is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (CONFIG\_FATFS\_CODEPAGE\_DYNAMIC)
- US (CP437) (CONFIG\_FATFS\_CODEPAGE\_437)
- Arabic (CP720) (CONFIG\_FATFS\_CODEPAGE\_720)
- Greek (CP737) (CONFIG\_FATFS\_CODEPAGE\_737)
- KBL (CP771) (CONFIG\_FATFS\_CODEPAGE\_771)
- Baltic (CP775) (CONFIG\_FATFS\_CODEPAGE\_775)
- Latin 1 (CP850) (CONFIG\_FATFS\_CODEPAGE\_850)
- Latin 2 (CP852) (CONFIG\_FATFS\_CODEPAGE\_852)
- Cyrillic (CP855) (CONFIG\_FATFS\_CODEPAGE\_855)
- Turkish (CP857) (CONFIG\_FATFS\_CODEPAGE\_857)
- Portuguese (CP860) (CONFIG\_FATFS\_CODEPAGE\_860)
- Icelandic (CP861) (CONFIG\_FATFS\_CODEPAGE\_861)
- Hebrew (CP862) (CONFIG\_FATFS\_CODEPAGE\_862)
- Canadian French (CP863) (CONFIG\_FATFS\_CODEPAGE\_863)
- Arabic (CP864) (CONFIG\_FATFS\_CODEPAGE\_864)
- Nordic (CP865) (CONFIG\_FATFS\_CODEPAGE\_865)
- Russian (CP866) (CONFIG\_FATFS\_CODEPAGE\_866)
- Greek 2 (CP869) (CONFIG\_FATFS\_CODEPAGE\_869)
- Japanese (DBCS) (CP932) (CONFIG\_FATFS\_CODEPAGE\_932)
- Simplified Chinese (DBCS) (CP936) (CONFIG\_FATFS\_CODEPAGE\_936)
- Korean (DBCS) (CP949) (CONFIG\_FATFS\_CODEPAGE\_949)
- Traditional Chinese (DBCS) (CP950) (CONFIG\_FATFS\_CODEPAGE\_950)

## CONFIG\_FATFS\_MAX\_LFN

Max long filename length

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Maximum long filename length. Can be reduced to save RAM.

## CONFIG\_FATFS\_API\_ENCODING

API character encoding

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

- API uses ANSI/OEM encoding (CONFIG\_FATFS\_API\_ENCODING\_ANSI\_OEM)
- API uses UTF-8 encoding (CONFIG\_FATFS\_API\_ENCODING\_UTF\_8)

### CONFIG\_FATFS\_FS\_LOCK

Number of simultaneously open files protected by lock function

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

\* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

\* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

### CONFIG\_FATFS\_TIMEOUT\_MS

Timeout for acquiring a file lock, ms

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**

- 10000

### CONFIG\_FATFS\_PER\_FILE\_CACHE

Use separate cache for each file

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)

### CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM

Prefer external RAM when allocating FATFS buffers

*Found in: [Component config](#) > [FAT Filesystem support](#)*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM_USE_CAPS_ALLOC` || `CONFIG_SPIRAM_USE_MALLOC`

### **CONFIG\_FATFS\_USE\_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: [Component config](#) > [FAT Filesystem support](#)*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**

- No (disabled)

### **CONFIG\_FATFS\_FAST\_SEEK\_BUFFER\_SIZE**

Fast seek CLMT buffer size

*Found in: [Component config](#) > [FAT Filesystem support](#) > [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if `CONFIG_FATFS_USE_FASTSEEK`

### **CONFIG\_FATFS\_VFS\_FSTAT\_BLKSIZE**

Default block size

*Found in: [Component config](#) > [FAT Filesystem support](#)*

If set to 0, the 'newlib' library's default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

NOTE: The block size value is shared by all the filesystem functions accessing target media for given file descriptor! See 'Improving I/O performance' section of 'Maximizing Execution Speed' documentation page for more details.

**Default value:**

- 0

### **CONFIG\_FATFS\_IMMEDIATE\_FSYNC**

Enable automatic f\_sync

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Enables automatic calling of f\_sync() to flush recent file changes after each call of vfs\_fat\_write(), vfs\_fat\_pwrite(), vfs\_fat\_link(), vfs\_fat\_truncate() and vfs\_fat\_ftruncate() functions. This feature improves file-consistency and size reporting accuracy for the FatFS, at a price on decreased performance due to frequent disk operations

**Default value:**

- No (disabled)

**FreeRTOS** Contains:

- [Kernel](#)
- [Port](#)

**Kernel** Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_STACKOVERFLOW](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_BACKWARD\\_COMPATIBILITY](#)
- [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)
- [CONFIG\\_FREERTOS\\_MAX\\_TASK\\_NAME\\_LEN](#)
- [CONFIG\\_FREERTOS\\_IDLE\\_TASK\\_STACKSIZE](#)
- [CONFIG\\_FREERTOS\\_THREAD\\_LOCAL\\_STORAGE\\_POINTERS](#)
- [CONFIG\\_FREERTOS\\_QUEUE\\_REGISTRY\\_SIZE](#)
- [CONFIG\\_FREERTOS\\_TASK\\_NOTIFICATION\\_ARRAY\\_ENTRIES](#)
- [CONFIG\\_FREERTOS\\_HZ](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_QUEUE\\_LENGTH](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_SERVICE\\_TASK\\_NAME](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_TASK\\_PRIORITY](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_TASK\\_STACK\\_DEPTH](#)
- [CONFIG\\_FREERTOS\\_USE\\_APPLICATION\\_TASK\\_TAG](#)
- [CONFIG\\_FREERTOS\\_USE\\_IDLE\\_HOOK](#)
- [CONFIG\\_FREERTOS\\_OPTIMIZED\\_SCHEDULER](#)
- [CONFIG\\_FREERTOS\\_USE\\_TICK\\_HOOK](#)
- [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)
- [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)
- [CONFIG\\_FREERTOS\\_UNICORE](#)

**CONFIG\_FREERTOS\_UNICORE**

Run FreeRTOS only on first core

*Found in:* [Component config](#) > [FreeRTOS](#) > [Kernel](#)

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

**CONFIG\_FREERTOS\_HZ**

configTICK\_RATE\_HZ

*Found in:* [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK\_RATE\_HZ documentation for more details).

**Range:**

- from 1 to 1000

**Default value:**

- 100

**CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER**

configUSE\_PORT\_OPTIMISED\_TASK\_SELECTION

*Found in:* [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see configUSE\_PORT\_OPTIMISED\_TASK\_SELECTION documentation for more details).

**Default value:**

- Yes (enabled) if `CONFIG_FREERTOS_UNICORE`

**CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW**`configCHECK_FOR_STACK_OVERFLOW`*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables FreeRTOS to check for stack overflows (see `configCHECK_FOR_STACK_OVERFLOW` documentation for more details).

Note: If users do not provide their own `vApplicationStackOverflowHook()` function, a default function will be provided by ESP-IDF.

Available options:

- No checking (`CONFIG_FREERTOS_CHECK_STACKOVERFLOW_NONE`)  
Do not check for stack overflows (`configCHECK_FOR_STACK_OVERFLOW = 0`)
- Check by stack pointer value (Method 1) (`CONFIG_FREERTOS_CHECK_STACKOVERFLOW_PTRVAL`)  
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (`configCHECK_FOR_STACK_OVERFLOW = 1`)
- Check using canary bytes (Method 2) (`CONFIG_FREERTOS_CHECK_STACKOVERFLOW_CANARY`)  
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (`configCHECK_FOR_STACK_OVERFLOW = 2`)

**CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS**`configNUM_THREAD_LOCAL_STORAGE_POINTERS`*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the number of thread local storage pointers in each task (see `configNUM_THREAD_LOCAL_STORAGE_POINTERS` documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**

- from 1 to 256

**Default value:**

- 1

**CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE**`configMINIMAL_STACK_SIZE` (Idle task stack size)*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the idle task stack size in bytes (see `configMINIMAL_STACK_SIZE` documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.
- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.

- Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

**Range:**

- from 768 to 32768

**Default value:**

- 1536

**CONFIG\_FREERTOS\_USE\_IDLE\_HOOK**

configUSE\_IDLE\_HOOK

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

Note:

- The application must provide the hook function `void vApplicationIdleHook( void ) ;`
- `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_USE\_TICK\_HOOK**

configUSE\_TICK\_HOOK

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the tick hook (see configUSE\_TICK\_HOOK documentation for more details).

Note:

- The application must provide the hook function `void vApplicationTickHook( void ) ;`
- `vApplicationTickHook()` is called from FreeRTOS's tick handling function `xTaskIncrementTick()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN**

configMAX\_TASK\_NAME\_LEN

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the maximum number of characters for task names (see configMAX\_TASK\_NAME\_LEN documentation for more details).

Note: For most uses, the default of 16 characters is sufficient.

**Range:**

- from 1 to 256

**Default value:**

- 16

### CONFIG\_FREERTOS\_ENABLE\_BACKWARD\_COMPATIBILITY

configENABLE\_BACKWARD\_COMPATIBILITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE\_BACKWARD\_COMPATIBILITY documentation for more details).

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_TIMER\_SERVICE\_TASK\_NAME

configTIMER\_SERVICE\_TASK\_NAME

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the timer task's name (see configTIMER\_SERVICE\_TASK\_NAME documentation for more details).

**Default value:**

- "Tmr Svc"

### CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY

configTIMER\_TASK\_PRIORITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the timer task's priority (see configTIMER\_TASK\_PRIORITY documentation for more details).

**Range:**

- from 1 to 25

**Default value:**

- 1

### CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH

configTIMER\_TASK\_STACK\_DEPTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's stack size (see configTIMER\_TASK\_STACK\_DEPTH documentation for more details).

**Range:**

- from 1536 to 32768

**Default value:**

- 2048

### CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH

configTIMER\_QUEUE\_LENGTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's command queue length (see configTIMER\_QUEUE\_LENGTH documentation for more details).

**Range:**

- from 5 to 20

**Default value:**

- 10

### CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE

configQUEUE\_REGISTRY\_SIZE

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the size of the queue registry (see configQUEUE\_REGISTRY\_SIZE documentation for more details).

Note: A value of 0 will disable queue registry functionality

**Range:**

- from 0 to 20

**Default value:**

- 0

### CONFIG\_FREERTOS\_TASK\_NOTIFICATION\_ARRAY\_ENTRIES

configTASK\_NOTIFICATION\_ARRAY\_ENTRIES

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more light weight compared to alternatives such as semaphores.

**Range:**

- from 1 to 32

**Default value:**

- 1

### CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY

configUSE\_TRACE\_FACILITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE\_TRACE\_FACILITY documentation for more details).

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS

configUSE\_STATS\_FORMATTING\_FUNCTIONS

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)*

Set configUSE\_TRACE\_FACILITY and configUSE\_STATS\_FORMATTING\_FUNCTIONS to 1 to include the vTaskList() and vTaskGetRunTimeStats() functions in the build (see configUSE\_STATS\_FORMATTING\_FUNCTIONS documentation for more details).

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)

### CONFIG\_FREERTOS\_VTASKLIST\_INCLUDE\_COREID

Enable display of xCoreID in vTaskList

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#) > [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)

**CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS**`configGENERATE_RUN_TIME_STATS`

*Found in:* [Component config](#) > [FreeRTOS](#) > [Kernel](#)

Enables collection of run time statistics for each task (see `configGENERATE_RUN_TIME_STATS` documentation for more details).

Note: The clock used for run time statistics can be configured in `FREERTOS_RUN_TIME_STATS_CLK`.

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE**`configRUN_TIME_COUNTER_TYPE`

*Found in:* [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)

Sets the data type used for the FreeRTOS run time stats. A larger data type can be used to reduce the frequency of the counter overflowing.

Available options:

- `uint32_t` (`CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE_U32`)  
`configRUN_TIME_COUNTER_TYPE` is set to `uint32_t`
- `uint64_t` (`CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE_U64`)  
`configRUN_TIME_COUNTER_TYPE` is set to `uint64_t`

**CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE**`configUSE_TICKLESS_IDLE`

*Found in:* [Component config](#) > [FreeRTOS](#) > [Kernel](#)

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using `FREERTOS_IDLE_TIME_BEFORE_SLEEP` option. This feature is also known as "automatic light sleep".

Note that timers created using `esp_timer` APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the "skip\_unhandled\_events" option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

**CONFIG\_FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP**`configEXPECTED_IDLE_TIME_BEFORE_SLEEP`

*Found in:* [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable `PM_PROFILING` feature in `esp_pm` components and dump the sleep status with `esp_pm_dump_locks`, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency

**Range:**

- from 2 to 4294967295 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Default value:**

- 3 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

## CONFIG\_FREERTOS\_USE\_APPLICATION\_TASK\_TAG

configUSE\_APPLICATION\_TASK\_TAG

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables task tagging functionality and its associated API (see configUSE\_APPLICATION\_TASK\_TAG documentation for more details).

**Default value:**

- No (disabled)

**Port** Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_MUTEX\\_GIVEN\\_BY\\_OWNER](#)
- [CONFIG\\_FREERTOS\\_RUN\\_TIME\\_STATS\\_CLK](#)
- [CONFIG\\_FREERTOS\\_INTERRUPT\\_BACKTRACE](#)
- [CONFIG\\_FREERTOS\\_WATCHPOINT\\_END\\_OF\\_STACK](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_STATIC\\_TASK\\_CLEAN\\_UP](#)
- [CONFIG\\_FREERTOS\\_TASK\\_PRE\\_DELETION\\_HOOK](#)
- [CONFIG\\_FREERTOS\\_TLSP\\_DELETION\\_CALLBACKS](#)
- [CONFIG\\_FREERTOS\\_ISR\\_STACKSIZE](#)
- [CONFIG\\_FREERTOS\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)
- [CONFIG\\_FREERTOS\\_CHECK\\_PORT\\_CRITICAL\\_COMPLIANCE](#)
- [CONFIG\\_FREERTOS\\_CORETIMER](#)
- [CONFIG\\_FREERTOS\\_TASK\\_FUNCTION\\_WRAPPER](#)

## CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER

Wrap task functions

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**

- Yes (enabled)

## CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK

Enable stack overflow debug watchpoint

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See [FREERTOS\\_CHECK\\_STACKOVERFLOW](#) for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panicking) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_TLSP\_DELETION\_CALLBACKS**

Enable thread local storage pointers deletion callbacks

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**

- Yes (enabled)

### **CONFIG\_FREERTOS\_TASK\_PRE\_DELETION\_HOOK**

Enable task pre-deletion hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Enable this option to make FreeRTOS call a user provided hook function right before it deletes a task (i.e., frees/releases a dynamically/statically allocated task's memory). This is useful if users want to know when a task is actually deleted (in case the task's deletion is delegated to the IDLE task).

If this config option is enabled, users must define a `void vTaskPreDeletionHook( void \* pxtcb )` hook function in their application.

### **CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP**

Enable static task clean up hook (DEPRECATED)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

THIS OPTION IS DEPRECATED. Use `FREERTOS_TASK_PRE_DELETION_HOOK` instead.

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void \*pxTCB )` callback

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER**

Check that mutex semaphore is given by owner task

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**

- Yes (enabled)

**CONFIG\_FREERTOS\_ISR\_STACKSIZE**

ISR stack size

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**

- from 2096 to 32768 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#)
- from 1536 to 32768

**Default value:**

- 2096 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#)
- 1536

**CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**

- Yes (enabled)

**CONFIG\_FREERTOS\_CORETIMER**

Tick timer source (Xtensa Only)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

Available options:

- Timer 0 (int 6, level 1) ([CONFIG\\_FREERTOS\\_CORETIMER\\_0](#))  
Select this to use timer 0
- Timer 1 (int 15, level 3) ([CONFIG\\_FREERTOS\\_CORETIMER\\_1](#))  
Select this to use timer 1
- SYSTIMER 0 (level 1) ([CONFIG\\_FREERTOS\\_CORETIMER\\_SYSTIMER\\_LVL1](#))  
Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) ([CONFIG\\_FREERTOS\\_CORETIMER\\_SYSTIMER\\_LVL3](#))  
Select this to use systimer with the 3 interrupt priority.

**CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK**

Choose the clock source for run time stats

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

Available options:

- Use ESP TIMER for run time stats (`CONFIG_FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER`)  
ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (`CONFIG_FREERTOS_RUN_TIME_STATS_USING_CPU_CLK`)  
CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on `ESP_DEFAULT_CPU_FREQ_MHZ` and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

### **CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH**

Place FreeRTOS functions into Flash

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE**

Tests compliance with Vanilla FreeRTOS `port*_CRITICAL` calls

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, context of `port*_CRITICAL` calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling `port*_CRITICAL` from ISR context would cause assert failure

**Default value:**

- No (disabled)

**Hardware Abstraction Layer (HAL) and Low Level (LL)** Contains:

- [CONFIG\\_HAL\\_DEFAULT\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_HAL\\_LOG\\_LEVEL](#)
- [CONFIG\\_HAL\\_SYSTIMER\\_USE\\_ROM\\_IMPL](#)
- [CONFIG\\_HAL\\_WDT\\_USE\\_ROM\\_IMPL](#)

### **CONFIG\_HAL\_DEFAULT\_ASSERTION\_LEVEL**

Default HAL assertion level

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can't exceed the system assertion level. e.g. If the system assertion is disabled, then the

HAL assertion can't be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

Available options:

- Same as system assertion level (CONFIG\_HAL\_ASSERTION\_EQUALS\_SYSTEM)
- Disabled (CONFIG\_HAL\_ASSERTION\_DISABLE)
- Silent (CONFIG\_HAL\_ASSERTION\_SILENT)
- Enabled (CONFIG\_HAL\_ASSERTION\_ENABLE)

### CONFIG\_HAL\_LOG\_LEVEL

HAL layer log verbosity

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.

Available options:

- No output (CONFIG\_HAL\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_HAL\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_HAL\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_HAL\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_HAL\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_HAL\_LOG\_LEVEL\_VERBOSE)

### CONFIG\_HAL\_SYSTIMER\_USE\_ROM\_IMPL

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled)

### CONFIG\_HAL\_WDT\_USE\_ROM\_IMPL

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled)

**Heap memory debugging** Contains:

- [CONFIG\\_HEAP\\_ABORT\\_WHEN\\_ALLOCATION\\_FAILS](#)
- [CONFIG\\_HEAP\\_TASK\\_TRACKING](#)
- [CONFIG\\_HEAP\\_PLACE\\_FUNCTION\\_INTO\\_FLASH](#)
- [CONFIG\\_HEAP\\_CORRUPTION\\_DETECTION](#)
- [CONFIG\\_HEAP\\_TRACING\\_DEST](#)
- [CONFIG\\_HEAP\\_TRACING\\_STACK\\_DEPTH](#)
- [CONFIG\\_HEAP\\_USE\\_HOOKS](#)
- [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)
- [CONFIG\\_HEAP\\_TLSF\\_USE\\_ROM\\_IMPL](#)

**CONFIG\_HEAP\_CORRUPTION\_DETECTION**

Heap corruption detection

*Found in:* [Component config > Heap memory debugging](#)

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the "Heap Memory Debugging" page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) ([CONFIG\\_HEAP\\_POISONING\\_DISABLED](#))
- Light impact ([CONFIG\\_HEAP\\_POISONING\\_LIGHT](#))
- Comprehensive ([CONFIG\\_HEAP\\_POISONING\\_COMPREHENSIVE](#))

**CONFIG\_HEAP\_TRACING\_DEST**

Heap tracing

*Found in:* [Component config > Heap memory debugging](#)

Enables the heap tracing API defined in `esp_heap_trace.h`.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it's best to keep it disabled unless tracing is being used.

Available options:

- Disabled ([CONFIG\\_HEAP\\_TRACING\\_OFF](#))
- Standalone ([CONFIG\\_HEAP\\_TRACING\\_STANDALONE](#))
- Host-based ([CONFIG\\_HEAP\\_TRACING\\_TOHOST](#))

**CONFIG\_HEAP\_TRACING\_STACK\_DEPTH**

Heap tracing stack depth

*Found in:* [Component config > Heap memory debugging](#)

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

### CONFIG\_HEAP\_USE\_HOOKS

Use allocation and free hooks

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable the user to implement function hooks triggered for each successful allocation and free.

### CONFIG\_HEAP\_TASK\_TRACKING

Enable heap task tracking

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

### CONFIG\_HEAP\_TRACE\_HASH\_MAP

Use hash map mechanism to access heap trace records

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use a hash map to increase performance in handling heap trace records.

Heap trace standalone supports storing records as a list, or a list + hash map.

Using only a list takes less memory, but calls to 'free' will get slower as the list grows. This is particularly affected when using HEAP\_TRACE\_ALL mode.

By using a list + hash map, calls to 'free' remain fast, at the cost of additional memory to store the hash map.

**Default value:**

- No (disabled) if [CONFIG\\_HEAP\\_TRACING\\_STANDALONE](#)

### CONFIG\_HEAP\_TRACE\_HASH\_MAP\_IN\_EXT\_RAM

Place hash map in external RAM

*Found in: [Component config](#) > [Heap memory debugging](#) > [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)*

When enabled this configuration forces the hash map to be placed in external RAM.

**Default value:**

- No (disabled) if [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)

### CONFIG\_HEAP\_TRACE\_HASH\_MAP\_SIZE

The number of entries in the hash map

*Found in: [Component config](#) > [Heap memory debugging](#) > [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)*

Defines the number of entries in the heap trace hashmap. Each entry takes 8 bytes. The bigger this number is, the better the performance. Recommended range: 200 - 2000.

**Default value:**

- 512 if [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)

### CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS

Abort if memory allocation fails

*Found in: [Component config](#) > [Heap memory debugging](#)*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

### CONFIG\_HEAP\_TLSF\_USE\_ROM\_IMPL

Use ROM implementation of heap tlsf library

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP\_ROM\_HAS\_HEAP\_TLSF

### CONFIG\_HEAP\_PLACE\_FUNCTION\_INTO\_FLASH

Force the entire heap component to be placed in flash memory

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to save up RAM space by placing the heap component in the flash memory

Note that it is only safe to enable this configuration if no functions from `esp_heap_caps.h` or `esp_heap_trace.h` are called from ISR.

### IEEE 802.15.4 Contains:

- [CONFIG\\_IEEE802154\\_ENABLED](#)

### CONFIG\_IEEE802154\_ENABLED

IEEE802154 Enable

*Found in: [Component config](#) > [IEEE 802.15.4](#)*

**Default value:**

- Yes (enabled) if SOC\_IEEE802154\_SUPPORTED

### CONFIG\_IEEE802154\_RX\_BUFFER\_SIZE

The number of 802.15.4 receive buffers

*Found in: [Component config](#) > [IEEE 802.15.4](#) > [CONFIG\\_IEEE802154\\_ENABLED](#)*

The number of 802.15.4 receive buffers

**Range:**

- from 2 to 100 if [CONFIG\\_IEEE802154\\_ENABLED](#)

**Default value:**

- 20 if [CONFIG\\_IEEE802154\\_ENABLED](#)

### CONFIG\_IEEE802154\_CCA\_MODE

Clear Channel Assessment (CCA) mode

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

configure the CCA mode

Available options:

- Carrier sense only (CONFIG\_IEEE802154\_CCA\_CARRIER)  
configure the CCA mode to Energy above threshold
- Energy above threshold (CONFIG\_IEEE802154\_CCA\_ED)  
configure the CCA mode to Energy above threshold
- Carrier sense OR energy above threshold (CONFIG\_IEEE802154\_CCA\_CARRIER\_OR\_ED)  
configure the CCA mode to Carrier sense OR energy above threshold
- Carrier sense AND energy above threshold (CONFIG\_IEEE802154\_CCA\_CARRIER\_AND\_ED)  
configure the CCA mode to Carrier sense AND energy above threshold

### CONFIG\_IEEE802154\_CCA\_THRESHOLD

CCA detection threshold

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

set the CCA threshold, in dB

**Range:**

- from -120 to 0 if *CONFIG\_IEEE802154\_ENABLED*

**Default value:**

- "-60" if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_PENDING\_TABLE\_SIZE

Pending table size

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

set the pending table size

**Range:**

- from 1 to 100 if *CONFIG\_IEEE802154\_ENABLED*

**Default value:**

- 20 if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_MULTI\_PAN\_ENABLE

Enable multi-pan feature for frame filter

Found in: *Component config* > *IEEE 802.15.4* > *CONFIG\_IEEE802154\_ENABLED*

Enable IEEE802154 multi-pan

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_TIMING\_OPTIMIZATION

Enable throughput optimization

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option increases throughput by ~5% at the expense of ~2.1k IRAM code size increase.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_SLEEP\_ENABLE

Enable IEEE802154 light sleep

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows the IEEE802.15.4 module to be powered down during automatic light sleep, which reduces current consumption.

**Default value:**

- No (disabled) if *CONFIG\_PM\_ENABLE* && *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_DEBUG

Enable IEEE802154 Debug

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows different kinds of IEEE802154 debug output. All IEEE802154 debug features increase the size of the final binary.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

Contains:

- *CONFIG\_IEEE802154\_RECORD\_ABORT*
- *CONFIG\_IEEE802154\_RECORD\_CMD*
- *CONFIG\_IEEE802154\_RECORD\_EVENT*
- *CONFIG\_IEEE802154\_RECORD\_STATE*
- *CONFIG\_IEEE802154\_TXRX\_STATISTIC*
- *CONFIG\_IEEE802154\_ASSERT*

### CONFIG\_IEEE802154\_ASSERT

Enrich the assert information with IEEE802154 state and event

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED > CONFIG\_IEEE802154\_DEBUG*

Enabling this option to add some probe codes in the driver, and these informations will be printed when assert.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_DEBUG*

### CONFIG\_IEEE802154\_RECORD\_EVENT

Enable record event information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED > CONFIG\_IEEE802154\_DEBUG*

Enabling this option to record event, when assert, the recorded event will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG\_IEEE802154\_RECORD\_EVENT\_SIZE**

Record event table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_EVENT`

set the record event table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_EVENT`

**Default value:**

- 30 if `CONFIG_IEEE802154_RECORD_EVENT`

**CONFIG\_IEEE802154\_RECORD\_STATE**

Enable record state information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record state, when assert, the recorded state will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG\_IEEE802154\_RECORD\_STATE\_SIZE**

Record state table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_STATE`

set the record state table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_STATE`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_STATE`

**CONFIG\_IEEE802154\_RECORD\_CMD**

Enable record command information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the command, when assert, the recorded command will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**CONFIG\_IEEE802154\_RECORD\_CMD\_SIZE**

Record command table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_CMD`

set the record command table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_CMD`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_CMD`

### **CONFIG\_IEEE802154\_RECORD\_ABORT**

Enable record abort information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the abort, when assert, the recorded abort will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### **CONFIG\_IEEE802154\_RECORD\_ABORT\_SIZE**

Record abort table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_ABORT`

set the record abort table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_ABORT`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_ABORT`

### **CONFIG\_IEEE802154\_TXRX\_STATISTIC**

Enable record tx/rx packets information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the tx and rx

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

**Log output** Contains:

- `CONFIG_LOG_DEFAULT_LEVEL`
- `CONFIG_LOG_MASTER_LEVEL`
- `CONFIG_LOG_TIMESTAMP_SOURCE`
- `CONFIG_LOG_MAXIMUM_LEVEL`
- `CONFIG_LOG_COLORS`

### **CONFIG\_LOG\_DEFAULT\_LEVEL**

Default log verbosity

*Found in:* `Component config > Log output`

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting "Warning" would mean that changing log level to "Debug" at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

Available options:

- No output (CONFIG\_LOG\_DEFAULT\_LEVEL\_NONE)
- Error (CONFIG\_LOG\_DEFAULT\_LEVEL\_ERROR)
- Warning (CONFIG\_LOG\_DEFAULT\_LEVEL\_WARN)
- Info (CONFIG\_LOG\_DEFAULT\_LEVEL\_INFO)
- Debug (CONFIG\_LOG\_DEFAULT\_LEVEL\_DEBUG)
- Verbose (CONFIG\_LOG\_DEFAULT\_LEVEL\_VERBOSE)

### CONFIG\_LOG\_MAXIMUM\_LEVEL

Maximum log verbosity

*Found in: [Component config](#) > [Log output](#)*

This config option sets the highest log verbosity that it's possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate "Bootloader log verbosity" setting.

Available options:

- Same as default (CONFIG\_LOG\_MAXIMUM\_EQUALS\_DEFAULT)
- Error (CONFIG\_LOG\_MAXIMUM\_LEVEL\_ERROR)
- Warning (CONFIG\_LOG\_MAXIMUM\_LEVEL\_WARN)
- Info (CONFIG\_LOG\_MAXIMUM\_LEVEL\_INFO)
- Debug (CONFIG\_LOG\_MAXIMUM\_LEVEL\_DEBUG)
- Verbose (CONFIG\_LOG\_MAXIMUM\_LEVEL\_VERBOSE)

### CONFIG\_LOG\_MASTER\_LEVEL

Enable global master log level

*Found in: [Component config](#) > [Log output](#)*

Enables an additional global "master" log level check that occurs before a log tag cache lookup. This is useful if you want to compile in a lot of logs that are selectable at runtime, but avoid the performance hit during periods where you don't want log output. Examples include remote log forwarding, or disabling logs during a time-critical or CPU-intensive section and re-enabling them later. Results in larger program size depending on number of logs compiled in.

If enabled, defaults to `LOG_DEFAULT_LEVEL` and can be set using `esp_log_set_level_master()`. This check takes precedence over `ESP_LOG_LEVEL_LOCAL`.

**Default value:**

- No (disabled)

### CONFIG\_LOG\_COLORS

Use ANSI terminal colors in log output

*Found in: [Component config](#) > [Log output](#)*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

**CONFIG\_LOG\_TIMESTAMP\_SOURCE**

Log Timestamps

Found in: *Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip's RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

Available options:

- Milliseconds Since Boot (CONFIG\_LOG\_TIMESTAMP\_SOURCE\_RTOS)
- System Time (CONFIG\_LOG\_TIMESTAMP\_SOURCE\_SYSTEM)

**LWIP** Contains:

- *CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY*
- *Checksums*
- *CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS*
- *DHCP server*
- *CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN*
- *CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID*
- *CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID*
- *CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK*
- *CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP*
- *DNS*
- *CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT*
- *CONFIG\_LWIP\_L2\_TO\_L3\_COPY*
- *CONFIG\_LWIP\_IPV6\_DHCP6*
- *CONFIG\_LWIP\_IP4\_FRAG*
- *CONFIG\_LWIP\_IP6\_FRAG*
- *CONFIG\_LWIP\_IP\_FORWARD*
- *CONFIG\_LWIP\_NETBUF\_RECVINFO*
- *CONFIG\_LWIP\_IPV4*
- *CONFIG\_LWIP\_AUTOIP*
- *CONFIG\_LWIP\_IPV6*
- *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*
- *CONFIG\_LWIP\_ESP\_LWIP\_ASSERT*
- *CONFIG\_LWIP\_DEBUG*
- *CONFIG\_LWIP\_IRAM\_OPTIMIZATION*
- *CONFIG\_LWIP\_EXTRA\_IRAM\_OPTIMIZATION*
- *CONFIG\_LWIP\_ENABLE*
- *CONFIG\_LWIP\_STATS*
- *CONFIG\_LWIP\_TIMERS\_ONDEMAND*
- *CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES*
- *CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT*

- `CONFIG_LWIP_PPP_PAP_SUPPORT`
- `CONFIG_LWIP_PPP_DEBUG_ON`
- `CONFIG_LWIP_PPP_SUPPORT`

- `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`
- `CONFIG_LWIP_IP_REASS_MAX_PBUFS`
- `CONFIG_LWIP_IP_DEFAULT_TTL`
- *UDP*
- `CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS`

### **CONFIG\_LWIP\_ENABLE**

Enable LwIP stack

*Found in: [Component config](#) > [LWIP](#)*

Builds normally if selected. Excludes LwIP from build if unselected, even if it is a dependency of a component or application. Some applications can switch their IP stacks, e.g., when switching between chip and Linux targets (LwIP stack vs. Linux IP stack). Since the LwIP dependency cannot easily be excluded based on a Kconfig option, it has to be a dependency in all cases. This switch allows the LwIP stack to be built selectively, even if it is a dependency.

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_LOCAL\_HOSTNAME**

Local netif hostname

*Found in: [Component config](#) > [LWIP](#)*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

- "espressif"

**CONFIG\_LWIP\_NETIF\_API**

Enable usage of standard POSIX APIs in LWIP

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as `esp_netif_get_netif_impl_name()`)

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_TCPIP\_TASK\_PRIO**

LWIP TCP/IP Task Priority

*Found in: [Component config](#) > [LWIP](#)*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (`config-MAX_PRIORITIES-1`).

**Range:**

- from 1 to 24

**Default value:**

- 18

**CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING**

Enable tcpip core locking

*Found in: [Component config](#) > [LWIP](#)*

If Enable tcpip core locking, Creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See `LOCK_TCPIP_CORE()` and `UNLOCK_TCPIP_CORE()`.

If disable tcpip core locking, TCP IP will perform tasks through context switching

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING\_INPUT**

Enable tcpip core locking input

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)*

when `LWIP_TCPIP_CORE_LOCKING` is enabled, this lets `tcpip_input()` grab the mutex for input packets as well, instead of allocating a message and passing it to `tcpip_thread`.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)

**CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY**

Checks that lwip API runs in expected context

*Found in: [Component config](#) > [LWIP](#)*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES

Enable mDNS queries in resolving host name

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard API such as `gethostbyname` support .local addresses by sending one shot multicast mDNS query

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_L2\_TO\_L3\_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_EXTRA\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization for TCP part

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some tcp part functions relating to RX/TX in LWIP will be put into IRAM, it can improve TCP throughput. On the other hand, it needs about 17KB IRAM for these optimizations.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TIMERS\_ONDEMAND

Enable LWIP Timers on demand

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_ND6

LWIP NDP6 Enable/Disable

*Found in: [Component config](#) > [LWIP](#)*

This option is used to disable the Network Discovery Protocol (NDP) if it is not required. Please use this option with caution, as the NDP is essential for IPv6 functionality within a local network.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_FORCE\_ROUTER\_FORWARDING

LWIP Force Router Forwarding Enable/Disable

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ND6](#)*

This option is used to set the the router flag for the NA packets. When enabled, the router flag in NA packet will always set to 1, otherwise, never set router flag for NA packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_MAX\_SOCKETS

Max number of open sockets

*Found in: [Component config](#) > [LWIP](#)*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**

- from 1 to 16

**Default value:**

- 10

### CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: [Component config](#) > [LWIP](#)*

This option is deprecated. Do not use this option, use VFS\_SUPPORT\_SELECT instead.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_LINGER

Enable SO\_LINGER processing

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows SO\_LINGER processing. `l_onoff = 1`, `l_linger` can set the timeout.

If `l_linger=0`, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If `l_linger!=0`, Then `closesocket()` calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_REUSE

Enable SO\_REUSEADDR option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows binding to a port which remains in TIME\_WAIT.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_REUSE\_RXTOALL

SO\_REUSEADDR copies broadcast/multicast to all matches

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SO\\_REUSE](#)*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO\_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_RCVBUF

Enable SO\_RCVBUF option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETBUF\_RECVINFO

Enable IP\_PKTINFO option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_IP\_DEFAULT\_TTL**

The value for Time-To-Live used by transport layers

*Found in: [Component config](#) > [LWIP](#)*

Set value for Time-To-Live used by transport layers.

**Range:**

- from 1 to 255

**Default value:**

- 64

**CONFIG\_LWIP\_IP4\_FRAG**

Enable fragment outgoing IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_IP6\_FRAG**

Enable fragment outgoing IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_IP4\_REASSEMBLY**

Enable reassembly incoming fragmented IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_IP6\_REASSEMBLY**

Enable reassembly incoming fragmented IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_IP\_REASS\_MAX\_PBUFS**

The maximum amount of pbufs waiting to be reassembled

*Found in: [Component config](#) > [LWIP](#)*

Set the maximum amount of pbufs waiting to be reassembled.

**Range:**

- from 10 to 100

**Default value:**

- 10

### **CONFIG\_LWIP\_IP\_FORWARD**

Enable IP forwarding

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_IPV4\_NAPT**

Enable NAT (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#)*

Enabling this option allows Network Address and Port Translation.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IP\\_FORWARD](#)

### **CONFIG\_LWIP\_IPV4\_NAPT\_PORTMAP**

Enable NAT Port Mapping (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#) > [CONFIG\\_LWIP\\_IPV4\\_NAPT](#)*

Enabling this option allows Port Forwarding or Port mapping.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_IPV4\\_NAPT](#)

### **CONFIG\_LWIP\_STATS**

Enable LWIP statistics

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows LWIP statistics

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP**

Send gratuitous ARP periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_GARP\_TMR\_INTERVAL

GARP timer interval(seconds)

*Found in: Component config > LWIP > CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

### CONFIG\_LWIP\_ESP\_MLDV6\_REPORT

Send mldv6 report periodically

*Found in: Component config > LWIP*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MLDV6\_TMR\_INTERVAL

mldv6 report timer interval(seconds)

*Found in: Component config > LWIP > CONFIG\_LWIP\_ESP\_MLDV6\_REPORT*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**

- 40

### CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 1024 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 32

### CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID

DHCP: Disable Use of HW address as client identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to "y" in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID

DHCP: Disable Use of vendor class identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client vendor class identification. Set this option to "y" in order to exclude option 60 from DHCP packets.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP

DHCP: Restore last IP obtained from DHCP server

*Found in: [Component config](#) > [LWIP](#)*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN

DHCP total option length

*Found in: [Component config](#) > [LWIP](#)*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP\_ASSERT due to option value is too long. Please increase the LWIP\_DHCP\_OPTIONS\_LEN value.

**Range:**

- from 68 to 255

**Default value:**

- 68

### CONFIG\_LWIP\_NUM\_NETIF\_CLIENT\_DATA

Number of clients store data in netif

*Found in: [Component config](#) > [LWIP](#)*

Number of clients that may store data in client\_data member array of struct netif.

**Range:**

- from 0 to 256

**Default value:**

- 0

### CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS

DHCP coarse timer interval(s)

Found in: *Component config > LWIP*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**

- from 1 to 10

**Default value:**

- 1

### DHCP server

 Contains:

- *CONFIG\_LWIP\_DHCPS*

### CONFIG\_LWIP\_DHCPS

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

Found in: *Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCPS\_LEASE\_UNIT

Multiplier for lease time, in seconds

Found in: *Component config > LWIP > DHCP server > CONFIG\_LWIP\_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

### CONFIG\_LWIP\_DHCPS\_MAX\_STATION\_NUM

Maximum number of stations

Found in: *Component config > LWIP > DHCP server > CONFIG\_LWIP\_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it's address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

### CONFIG\_LWIP\_DHCPS\_STATIC\_ENTRIES

Enable ARP static entries

Found in: *Component config > LWIP > DHCP server > CONFIG\_LWIP\_DHCPS*

Enabling this option allows DHCP server to support temporary static ARP entries for DHCP Client. This will help the DHCP server to send the DHCP OFFER and DHCP ACK using IP unicast.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_AUTOIP\\_TRIES](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_MAX\\_CONFLICTS](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_RATE\\_LIMIT\\_INTERVAL](#)

**CONFIG\_LWIP\_AUTOIP\_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: "This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP." (In the case of ESP-IDF, this means multiple SYSTEM\_EVENT\_STA\_GOT\_IP events.)

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 2 if [CONFIG\\_LWIP\\_AUTOIP](#)

**CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 9 if [CONFIG\\_LWIP\\_AUTOIP](#)

**CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL**

Rate limited interval (seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**

- from 5 to 120 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 20 if `CONFIG_LWIP_AUTOIP`

### **CONFIG\_LWIP\_IPV4**

Enable IPv4

*Found in: `Component config > LWIP`*

Enable IPv4 stack. If you want to use IPv6 only TCP/IP stack, disable this.

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_IPV6**

Enable IPv6

*Found in: `Component config > LWIP`*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP\_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_IPV6\_AUTOCONFIG**

Enable IPV6 stateless address autoconfiguration (SLAAC)

*Found in: `Component config > LWIP > CONFIG_LWIP_IPV6`*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_IPV6\_NUM\_ADDRESSES**

Number of IPv6 addresses on each network interface

*Found in: `Component config > LWIP > CONFIG_LWIP_IPV6`*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**

- 3

### **CONFIG\_LWIP\_IPV6\_FORWARD**

Enable IPv6 forwarding between interfaces

*Found in: `Component config > LWIP > CONFIG_LWIP_IPV6`*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_RDNSS\_MAX\_DNS\_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: [Component config](#) > [LWIP](#)*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**

- 0 if [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#)

### CONFIG\_LWIP\_IPV6\_DHCP6

Enable DHCPv6 stateless address autoconfiguration

*Found in: [Component config](#) > [LWIP](#)*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IPV6\\_AUTOCONFIG](#)

### CONFIG\_LWIP\_NETIF\_STATUS\_CALLBACK

Enable status callback for network interfaces

*Found in: [Component config](#) > [LWIP](#)*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETIF\_LOOPBACK

Support per-interface loopback

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will "loop back" and be received by this interface. Disabling this option disables support of loopback interface in lwIP

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_LWIP\\_LOOPBACK\\_MAX\\_PBUFS](#)

### CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS

Max queued loopback packets per interface

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_NETIF\\_LOOPBACK](#)*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

- from 0 to 16

**Default value:**

- 8

**TCP** Contains:

- [CONFIG\\_LWIP\\_TCP\\_WND\\_DEFAULT](#)
- [CONFIG\\_LWIP\\_TCP\\_SND\\_BUF\\_DEFAULT](#)
- [CONFIG\\_LWIP\\_TCP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_RTO\\_TIME](#)
- [CONFIG\\_LWIP\\_MAX\\_ACTIVE\\_TCP](#)
- [CONFIG\\_LWIP\\_TCP\\_FIN\\_WAIT\\_TIMEOUT](#)
- [CONFIG\\_LWIP\\_MAX\\_LISTENING\\_TCP](#)
- [CONFIG\\_LWIP\\_TCP\\_MAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_SYNMAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_MSL](#)
- [CONFIG\\_LWIP\\_TCP\\_MSS](#)
- [CONFIG\\_LWIP\\_TCP\\_OVERSIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)
- [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- [CONFIG\\_LWIP\\_TCP\\_HIGH\\_SPEED\\_RETRANSMISSION](#)
- [CONFIG\\_LWIP\\_TCP\\_TMR\\_INTERVAL](#)

**CONFIG\_LWIP\_MAX\_ACTIVE\_TCP**

Maximum active TCP Connections

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_MAX\_LISTENING\_TCP**

Maximum listening TCP Connections

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION**

TCP high speed retransmissions

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_TCP\_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of data segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

**CONFIG\_LWIP\_TCP\_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of SYN segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

**CONFIG\_LWIP\_TCP\_MSS**

Maximum Segment Size (MSS)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP\_MSS Range: 576 <= TCP\_MSS <= 1460 IPv6 TCP\_MSS Range: 1220<= TCP\_MSS <= 1440

**Range:**

- from 536 to 1460

**Default value:**

- 1440

**CONFIG\_LWIP\_TCP\_TMR\_INTERVAL**

TCP timer interval(ms)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

- 250

**CONFIG\_LWIP\_TCP\_MSL**

Maximum segment lifetime (MSL)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

**CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT**

Maximum FIN segment lifetime

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 20000

**CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT**

Default send buffer size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

**CONFIG\_LWIP\_TCP\_WND\_DEFAULT**

Default receive window size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

**CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE**

Default TCP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is:  $LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2$ , e.g. if  $LWIP\_TCP\_WND\_DEFAULT=14360$ ,  $TCP\_MSS=1436$ , then the recommended receive mail box size is  $(14360/1436 + 2) = 12$ .

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum  $LWIP\_TCP\_RECCVMBOX\_SIZE$  packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is  $LWIP\_TCP\_RECCVMBOX\_SIZE$  multiplies the maximum TCP socket number. In other words, the bigger  $LWIP\_TCP\_RECCVMBOX\_SIZE$  means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 1024 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_OOSEQ\_TIMEOUT

Timeout for each pbuf queued in TCP OOSEQ, in RTOs.

*Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ*

The timeout value is  $TCP\_OOSEQ\_TIMEOUT * RTO$ .

**Range:**

- from 1 to 30

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_OOSEQ\_MAX\_PBUFS

The maximum number of pbufs queued on OOSEQ per pcb

*Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ*

If  $LWIP\_TCP\_OOSEQ\_MAX\_PBUFS = 0$ , TCP will not control the number of OOSEQ pbufs.

In a poor network environment, many out-of-order tcp pbufs will be received. These out-of-order pbufs will be cached in the TCP out-of-order queue which will cause Wi-Fi/Ethernet fail to release RX buffer in time. It is possible that all RX buffers for MAC layer are used by OOSEQ.

Control the number of out-of-order pbufs to ensure that the MAC layer has enough RX buffer to receive packets.

In the Wi-Fi scenario, recommended OOSEQ PBUFS Range:  $0 \leq TCP\_OOSEQ\_MAX\_PBUFS \leq CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM/(MAX\_TCP\_NUMBER + 1)$

In the Ethernet scenario, recommended Ethernet OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ETH\_DMA\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

Within the recommended value range, the larger the value, the better the performance.

MAX\_TCP\_NUMBER represent Maximum number of TCP connections in Wi-Fi(STA+SoftAP) and Ethernet scenario.

**Range:**

- from 0 to 12

**Default value:**

- 0 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_LWIP_TCP_QUEUE_OOSEQ`

### CONFIG\_LWIP\_TCP\_SACK\_OUT

Support sending selective acknowledgements

*Found in:* `Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ`

TCP will support sending selective acknowledgements (SACKs).

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCP\_OVERSIZE

Pre-allocate transmit PBUF size

*Found in:* `Component config > LWIP > TCP`

Allows enabling "oversize" allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle's algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

Available options:

- MSS (`CONFIG_LWIP_TCP_OVERSIZE_MSS`)
- 25% MSS (`CONFIG_LWIP_TCP_OVERSIZE_QUARTER_MSS`)
- Disabled (`CONFIG_LWIP_TCP_OVERSIZE_DISABLE`)

### CONFIG\_LWIP\_WND\_SCALE

Support TCP window scale

*Found in:* `Component config > LWIP > TCP`

Enable this feature to support TCP window scaling.

**Default value:**

- No (disabled) if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

### CONFIG\_LWIP\_TCP\_RCV\_SCALE

Set TCP receiving window scaling factor

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_WND\\_SCALE](#)*

Enable this feature to support TCP window scaling.

**Range:**

- from 0 to 14 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 0 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

### CONFIG\_LWIP\_TCP\_RTO\_TIME

Default TCP rto time

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**

- 1500

**UDP** Contains:

- [CONFIG\\_LWIP\\_UDP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_MAX\\_UDP\\_PCBS](#)

### CONFIG\_LWIP\_MAX\_UDP\_PCBS

Maximum active UDP control blocks

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

The maximum number of active UDP "connections" (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE

Default UDP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum [UDP\\_RECCVMBOX\\_SIZE](#) packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is [UDP\\_RECCVMBOX\\_SIZE](#) multiplies the maximum UDP socket number. In other words, the bigger [UDP\\_RECVMBOX\\_SIZE](#) means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64

**Default value:**

- 6

**Checksums** Contains:

- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_ICMP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_IP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_UDP](#)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_IP**

Enable LWIP IP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received IP messages

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_UDP**

Enable LWIP UDP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received UDP messages

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_ICMP**

Enable LWIP ICMP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received ICMP messages

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_TCPIP\_TASK\_STACK\_SIZE**

TCP/IP Task Stack Size

*Found in: [Component config](#) > [LWIP](#)*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**

- from 2048 to 65536

**Default value:**

- 3072

### **CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY**

TCP/IP task affinity

*Found in: [Component config](#) > [LWIP](#)*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to "TCP/IP" task and "Ping" task.

Available options:

- No affinity (`CONFIG_LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY`)
- CPU0 (`CONFIG_LWIP_TCPIP_TASK_AFFINITY_CPU0`)
- CPU1 (`CONFIG_LWIP_TCPIP_TASK_AFFINITY_CPU1`)

### **CONFIG\_LWIP\_PPP\_SUPPORT**

Enable PPP support

*Found in: [Component config](#) > [LWIP](#)*

Enable PPP stack. Now only PPP over serial is possible.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_PPP\\_ENABLE\\_IPV6](#)

### **CONFIG\_LWIP\_PPP\_ENABLE\_IPV6**

Enable IPV6 support for PPP connections (IPV6CP)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)*

Enable IPV6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPV6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPV6 support.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#) && [CONFIG\\_LWIP\\_IPV6](#)

### **CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE**

Max number of IPv6 packets to queue during MAC resolution

*Found in: [Component config](#) > [LWIP](#)*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

### **CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS**

Max number of entries in IPv6 neighbor cache

*Found in: [Component config](#) > [LWIP](#)*

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

### **CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT**

Enable Notify Phase Callback

*Found in: [Component config](#) > [LWIP](#)*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_PAP\_SUPPORT**

Enable PAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Password Authentication Protocol (PAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT**

Enable CHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT**

Enable MSCHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT**

Enable MPPE support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_ENABLE\_LCP\_ECHO**

Enable LCP ECHO

*Found in: [Component config](#) > [LWIP](#)*

Enable LCP echo keepalive requests

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_LCP\_ECHOINTERVAL

Echo interval (s)

*Found in: Component config > LWIP > CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**

- from 0 to 1000000 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

**Default value:**

- 3 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

### CONFIG\_LWIP\_LCP\_MAXECHOFAILS

Maximum echo failures

*Found in: Component config > LWIP > CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**

- from 0 to 100000 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

**Default value:**

- 3 if *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*

### CONFIG\_LWIP\_PPP\_DEBUG\_ON

Enable PPP debug log output

*Found in: Component config > LWIP*

Enable PPP debug log output

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_PPP\_SUPPORT*

### CONFIG\_LWIP\_SLIP\_SUPPORT

Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_LWIP\_SLIP\_DEBUG\_ON*

### CONFIG\_LWIP\_SLIP\_DEBUG\_ON

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG\_LWIP\_SLIP\_SUPPORT*

Enable SLIP debug log output

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_SLIP\_SUPPORT*

**ICMP** Contains:

- [CONFIG\\_LWIP\\_ICMP](#)
- [CONFIG\\_LWIP\\_BROADCAST\\_PING](#)
- [CONFIG\\_LWIP\\_MULTICAST\\_PING](#)

### **CONFIG\_LWIP\_ICMP**

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_MULTICAST\_PING**

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_BROADCAST\_PING**

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

**LWIP RAW API** Contains:

- [CONFIG\\_LWIP\\_MAX\\_RAW\\_PCBS](#)

### **CONFIG\_LWIP\_MAX\_RAW\_PCBS**

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**SNTP** Contains:

- [CONFIG\\_LWIP\\_SNTP\\_MAX\\_SERVERS](#)
- [CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY](#)
- [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_MAX\_SERVERS

Maximum number of NTP servers

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#)*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

**Range:**

- from 1 to 16

**Default value:**

- 1

### CONFIG\_LWIP\_DHCP\_GET\_NTP\_SRV

Request NTP servers from DHCP

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#)*

If enabled, LWIP will add 'NTP' to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_MAX\_NTP\_SERVERS

Maximum number of NTP servers acquired via DHCP

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#) > [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to "Maximum number of NTP servers", any extra servers would be just ignored.

**Range:**

- from 1 to 16 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

**Default value:**

- 1 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY

Request interval to update time (ms)

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#)*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**

- from 15000 to 4294967295

**Default value:**

- 3600000

**DNS** Contains:

- [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)
- [CONFIG\\_LWIP\\_DNS\\_MAX\\_SERVERS](#)

### CONFIG\_LWIP\_DNS\_MAX\_SERVERS

Maximum number of DNS servers

*Found in: Component config > LWIP > DNS*

Set maximum number of DNS servers. If fallback DNS servers are supported, the number of DNS servers needs to be greater than or equal to 3.

**Range:**

- from 1 to 4

**Default value:**

- 3

### CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT

Enable DNS fallback server support

*Found in: Component config > LWIP > DNS*

Enable this feature to support DNS fallback server.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_ADDRESS

DNS fallback server address

*Found in: Component config > LWIP > DNS > CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT*

This option allows you to config dns fallback server address.

**Default value:**

- "114.114.114.114" if *CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT*

### CONFIG\_LWIP\_BRIDGEIF\_MAX\_PORTS

Maximum number of bridge ports

*Found in: Component config > LWIP*

Set maximum number of ports a bridge can consists of.

**Range:**

- from 1 to 63

**Default value:**

- 7

### CONFIG\_LWIP\_ESP\_LWIP\_ASSERT

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Hooks** Contains:

- *CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW*
- *CONFIG\_LWIP\_HOOK\_IP6\_INPUT*
- *CONFIG\_LWIP\_HOOK\_IP6\_ROUTE*
- *CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR*

- [CONFIG\\_LWIP\\_HOOK\\_NETCONN\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_TCP\\_ISN](#)

### CONFIG\_LWIP\_HOOK\_TCP\_ISN

TCP ISN Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (*tcp\_next\_iss*) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`CONFIG_LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_TCP_ISN_CUSTOM`)

### CONFIG\_LWIP\_HOOK\_IP6\_ROUTE

IPv6 route Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_CUSTOM`)

### CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW

IPv6 get gateway Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_ND6_GET_GW_CUSTOM`)

## CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR

IPv6 source address selection Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 source address selection. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR\_CUSTOM)

## CONFIG\_LWIP\_HOOK\_NETCONN\_EXTERNAL\_RESOLVE

Netconn external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_CUSTOM)

## CONFIG\_LWIP\_HOOK\_IP6\_INPUT

IPv6 packet input

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 packet input. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_CUSTOM)

## CONFIG\_LWIP\_DEBUG

Enable LWIP Debug

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**

- No (disabled)

Contains:

- `CONFIG_LWIP_API_LIB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FDB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FW_DEBUG`

### **CONFIG\_LWIP\_DEBUG\_ESP\_LOG**

Route LWIP debugs through ESP\_LOG interface

*Found in:* `Component config > LWIP > CONFIG_LWIP_DEBUG`

Enabling this option routes all enabled LWIP debugs through ESP\_LOGD.

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_NETIF\_DEBUG**

Enable netif debug messages

*Found in:* `Component config > LWIP > CONFIG_LWIP_DEBUG`

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_PBUF\_DEBUG**

Enable pbuf debug messages

*Found in:* `Component config > LWIP > CONFIG_LWIP_DEBUG`

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_ETHARP\_DEBUG**

Enable etharp debug messages

*Found in:* `Component config > LWIP > CONFIG_LWIP_DEBUG`

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

### **CONFIG\_LWIP\_API\_LIB\_DEBUG**

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_SOCKETS\_DEBUG**

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP\_DEBUG**

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP\_DEBUG**

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_ICMP*

### **CONFIG\_LWIP\_DHCP\_STATE\_DEBUG**

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DHCP\_DEBUG**

Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP6\_DEBUG**

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP6\_DEBUG**

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_TCP\_DEBUG**

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_UDP\_DEBUG**

Enable UDP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_SNTP\_DEBUG**

Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DNS\_DEBUG**

Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_NAPT\_DEBUG**

Enable NAPT debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_IPV4\_NAPT*

### **CONFIG\_LWIP\_BRIDGEIF\_DEBUG**

Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FDB\_DEBUG**

Enable bridge FDB debug messages

Found in: *Component config* > *LWIP* > *CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_BRIDGEIF\_FW\_DEBUG**

Enable bridge forwarding debug messages

Found in: *Component config* > *LWIP* > *CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**MBEDTLS** Contains:

- *CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN*
- *Certificate Bundle*
- *Certificates*
- *CONFIG\_MBEDTLS\_CHACHA20\_C*
- *CONFIG\_MBEDTLS\_DHM\_C*

- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

### **CONFIG\_MBEDTLS\_MEM\_ALLOC\_MODE**

Memory allocation strategy

Found in: *Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using `mbedtls_platform_set_calloc_free()` function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal memory (`CONFIG_MBEDTLS_INTERNAL_MEM_ALLOC`)
- External SPIRAM (`CONFIG_MBEDTLS_EXTERNAL_MEM_ALLOC`)
- Default alloc mode (`CONFIG_MBEDTLS_DEFAULT_MEM_ALLOC`)
- Custom alloc mode (`CONFIG_MBEDTLS_CUSTOM_MEM_ALLOC`)
- Internal IRAM (`CONFIG_MBEDTLS_IRAM_8BIT_MEM_ALLOC`)

Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_MBEDTLS\_SSL\_MAX\_CONTENT\_LEN**

TLS maximum message content length

Found in: *Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (`max_fragment_length`, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of `MBEDTLS_ERR_SSL_INVALID_RECORD` (-0x7200).

### **CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN**

Asymmetric in/out fragment length

*Found in: [Component config](#) > [mbedtls](#)*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SSL\_IN\_CONTENT\_LEN**

TLS maximum incoming fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum incoming fragment length, overriding default maximum content length (`MBEDTLS_SSL_MAX_CONTENT_LEN`).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### **CONFIG\_MBEDTLS\_SSL\_OUT\_CONTENT\_LEN**

TLS maximum outgoing fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum outgoing fragment length, overriding default maximum content length (`MBEDTLS_SSL_MAX_CONTENT_LEN`).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

### **CONFIG\_MBEDTLS\_DYNAMIC\_BUFFER**

Using dynamic TX/RX buffer

*Found in: [Component config](#) > [mbedtls](#)*

Using dynamic TX/RX buffer. After enabling this option, mbedtls will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedtls also allocate TX and RX buffer with the default value of "`MBEDTLS_SSL_OUT_CONTENT_LEN`" or "`MBEDTLS_SSL_IN_CONTENT_LEN`", so to save more heap, users can set the options to be an appropriate value.

### CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CONFIG\_DATA

Free private key and DHM data after its usage

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

### CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CA\_CERT

Free SSL CA certificate after its usage

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)

### CONFIG\_MBEDTLS\_DEBUG

Enable mbedtls debugging

*Found in:* [Component config](#) > [mbedtls](#)

Enable mbedtls debugging functions at compile time.

If this option is enabled, you can include "mbedtls/esp\_debug.h" and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedtls debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_DEBUG\_LEVEL

Set mbedtls debugging level

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DEBUG](#)

Set mbedtls debugging level

Available options:

- Warning ([CONFIG\\_MBEDTLS\\_DEBUG\\_LEVEL\\_WARN](#))
- Info ([CONFIG\\_MBEDTLS\\_DEBUG\\_LEVEL\\_INFO](#))
- Debug ([CONFIG\\_MBEDTLS\\_DEBUG\\_LEVEL\\_DEBUG](#))
- Verbose ([CONFIG\\_MBEDTLS\\_DEBUG\\_LEVEL\\_VERBOSE](#))

**MBEDTLS v3.x related** Contains:

- *DTLS-based configurations*
- *CONFIG\_MBEDTLS\_PKCS7\_C*
- *CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION*
- *CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK*
- *CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE*
- *CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY*
- *CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3*
- *CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT*
- *CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH*

**CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3**

Support TLS 1.3 protocol

*Found in: Component config > mbedtls > mbedtls v3.x related*

**TLS 1.3 related configurations** Contains:

- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_EPHEMERAL*
- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_COMPATIBILITY\_MODE*
- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK\_EPHEMERAL*
- *CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK*

**CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_COMPATIBILITY\_MODE**

TLS 1.3 middlebox compatibility mode

*Found in: Component config > mbedtls > mbedtls v3.x related > CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3 > TLS 1.3 related configurations*

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3*

**CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK**

TLS 1.3 PSK key exchange mode

*Found in: Component config > mbedtls > mbedtls v3.x related > CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3 > TLS 1.3 related configurations*

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3*

**CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_EPHEMERAL**

TLS 1.3 ephemeral key exchange mode

*Found in: Component config > mbedtls > mbedtls v3.x related > CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3 > TLS 1.3 related configurations*

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3*

**CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK\_EPHEMERAL**

TLS 1.3 PSK ephemeral key exchange mode

*Found in: Component config > mbedtls > mbedtls v3.x related > CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3 > TLS 1.3 related configurations*

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

**CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH**

Variable SSL buffer length

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT**

Use a backward compatible ECDH context (Experimental)

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Use the legacy ECDH context format. Define this option only if you enable `MBEDTLS_ECP_RESTARTABLE` or if you want to access ECDH context fields directly.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

**CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK**

Enable trusted certificate callbacks

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION**

Enable serialization of the TLS context structures

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_PKCS7\_C**

Enable PKCS #7

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY**

Record plaintext padding

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**

- 16 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**DTLS-based configurations** Contains:

- `CONFIG_MBEDTLS_SSL_DTLS_SRTP`
- `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_CID\_IN\_LEN\_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_CID\_OUT\_LEN\_MAX**

Maximum length of CIDs used for outgoing DTLS messages

*Found in:* [Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_DTLS\_SRTP**

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in:* [Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations](#)

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the `use_srtp` extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Certificate Bundle** Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

**CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE**

Enable trusted root certificate bundle

*Found in:* [Component config > mbedTLS > Certificate Bundle](#)

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DEFAULT\_CERTIFICATE\_BUNDLE**

Default certificate bundle options

*Found in:* [Component config > mbedTLS > Certificate Bundle > CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

Available options:

- Use the full default certificate bundle (`CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL`)

- Use only the most common certificates from the default bundles (CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_CMN)  
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_NONE)

### CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE

Add custom certificates to the default bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE\_PATH

Custom certificate bundle path

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#) > [CONFIG\\_MBEDTLS\\_CUSTOM\\_CERTIFICATE\\_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

### CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_MAX\_CERTS

Maximum no of certificates allowed in certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- 200

### CONFIG\_MBEDTLS\_ECP\_RESTARTABLE

Enable mbedtls ecp restartable

*Found in:* [Component config](#) > [mbedtls](#)

Enable "non-blocking" ECC operations that can return early and be resumed.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CMAC\_C

Enable CMAC mode for block ciphers

*Found in:* [Component config](#) > [mbedtls](#)

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HARDWARE\_AES

Enable hardware AES acceleration

*Found in:* [Component config > mbedTLS](#)

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

### CONFIG\_MBEDTLS\_AES\_USE\_INTERRUPT

Use interrupt for long AES operations

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

### CONFIG\_MBEDTLS\_AES\_INTERRUPT\_LEVEL

AES hardware interrupt level

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_HARDWARE\\_AES > CONFIG\\_MBEDTLS\\_AES\\_USE\\_INTERRUPT](#)

This config helps to set the interrupt priority level for the AES peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

**Range:**

- from 0 to 3 if [CONFIG\\_MBEDTLS\\_AES\\_USE\\_INTERRUPT](#)

**Default value:**

- 0 if [CONFIG\\_MBEDTLS\\_AES\\_USE\\_INTERRUPT](#)

### CONFIG\_MBEDTLS\_HARDWARE\_GCM

Enable partially hardware accelerated GCM

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS\_HARDWARE\_GCM is disabled and MBEDTLS\_HARDWARE\_AES is enabled then mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**

- Yes (enabled) if [SOC\\_AES\\_SUPPORT\\_GCM](#) && [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

### CONFIG\_MBEDTLS\_GCM\_SUPPORT\_NON\_AES\_CIPHER

Enable support for non-AES ciphers in GCM operation

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

Enable this config to support fallback to software definitions for a non-AES cipher GCM operation as we support hardware acceleration only for AES cipher. Some of the non-AES ciphers used in a GCM operation are DES, ARIA, CAMELLIA, CHACHA20, BLOWFISH.

If this config is disabled, performing a non-AES cipher GCM operation with the config `MBEDTLS_HARDWARE_AES` enabled will result in calculation of an AES-GCM operation instead for the given input values and thus could lead to failure in certificate validation which would ultimately lead to a SSL handshake failure.

This config being by-default enabled leads to an increase in binary size footprint of ~2.5KB. In case you are sure that your use case (for example, client and server configurations in case of a TLS handshake) would not involve any GCM operations using a non-AES cipher, you can safely disable this config, leading to reduction in binary size footprint.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_HARDWARE_AES`

### **CONFIG\_MBEDTLS\_HARDWARE\_MPI**

Enable hardware MPI (bignum) acceleration

*Found in:* [Component config](#) > [mbedtls](#)

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to `SOC_RSA_MAX_BIT_LEN` bit results.

These operations are used by RSA.

### **CONFIG\_MBEDTLS\_LARGE\_KEY\_SOFTWARE\_MPI**

Fallback to software implementation for larger MPI values

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)

Fallback to software implementation for RSA key lengths larger than `SOC_RSA_MAX_BIT_LEN`. If this is not active then the ESP will be unable to process keys greater than `SOC_RSA_MAX_BIT_LEN`.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_MPI\_USE\_INTERRUPT**

Use interrupt for MPI exp-mod operations

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_MPI\_INTERRUPT\_LEVEL**

MPI hardware interrupt level

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#) > [CONFIG\\_MBEDTLS\\_MPI\\_USE\\_INTERRUPT](#)

This config helps to set the interrupt priority level for the MPI peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

**Range:**

- from 0 to 3

**Default value:**

- 0

**CONFIG\_MBEDTLS\_HARDWARE\_SHA**

Enable hardware SHA acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**CONFIG\_MBEDTLS\_HARDWARE\_ECC**

Enable hardware ECC acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedtls

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECC\_OTHER\_CURVES\_SOFT\_FALLBACK**

Fallback to software implementation for curves not supported in hardware

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ROM\_MD5**

Use MD5 implementation in ROM

*Found in: [Component config](#) > [mbedtls](#)*

Use ROM MD5 in mbedtls.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_SIGN**

Enable ECDSA signing using on-chip ECDSA peripheral

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedtls.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA\_KEY. If no key is burnt, it will report an error

The key should be burnt in little endian format. `espefuse.py` utility handles it internally but care needs to be taken while burning using `esp_efuse` APIs

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_VERIFY**

Enable ECDSA signature verification using on-chip ECDSA peripheral

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedtls.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY**

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_HAVE\_TIME**

Enable mbedtls time support

*Found in: [Component config](#) > [mbedtls](#)*

Enable use of `time.h` functions (`time()` and `gmtime()`) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PLATFORM\_TIME\_ALT

Enable mbedtls time support: platform-specific

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enabling this config will provide users with a function "mbedtls\_platform\_set\_time()" that allows to set an alternative time function pointer.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME\_DATE

Enable mbedtls certificate expiry check

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS\_X509\_BADCERT\_FUTURE or MBEDTLS\_X509\_BADCERT\_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC

Enable deterministic ECDSA

*Found in: [Component config](#) > [mbedtls](#)*

Standard ECDSA is "fragile" in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SHA512\_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: [Component config](#) > [mbedtls](#)*

Enable MBEDTLS\_SHA512\_C adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

## CONFIG\_MBEDTLS\_TLS\_MODE

TLS Protocol Role

Found in: *Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (CONFIG\_MBEDTLS\_TLS\_SERVER\_AND\_CLIENT)
- Server (CONFIG\_MBEDTLS\_TLS\_SERVER\_ONLY)
- Client (CONFIG\_MBEDTLS\_TLS\_CLIENT\_ONLY)
- None (CONFIG\_MBEDTLS\_TLS\_DISABLED)

## TLS Key Exchange Methods Contains:

- *CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA*
- *CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE*
- *CONFIG\_MBEDTLS\_PSK\_MODES*
- *CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA*
- *CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE*

## CONFIG\_MBEDTLS\_PSK\_MODES

Enable pre-shared-key ciphersuites

Found in: *Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_PSK

Enable PSK based ciphersuite modes

Found in: *Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\_MBEDTLS\_PSK\_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if *CONFIG\_MBEDTLS\_PSK\_MODES*

## CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_PSK

Enable DHE-PSK based ciphersuite modes

Found in: *Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\_MBEDTLS\_PSK\_MODES*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_PSK\_MODES* && *CONFIG\_MBEDTLS\_DHM\_C*

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA\_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA

Enable RSA-only based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA

Enable DHE-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE

Support Elliptic Curve based ciphersuites

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA

Enable ECDH-RSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP256R1\\_ENABLED](#)

### CONFIG\_MBEDTLS\_SSL\_RENEGOTIATION

Support TLS renegotiation

*Found in: [Component config](#) > [mbedtls](#)*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_2

Support TLS 1.2 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_GMTSSL1\_1

Support GM/T SSL 1.1 protocol

*Found in: [Component config](#) > [mbedtls](#)*

Provisions for GM/T SSL 1.1 support

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_DTLS

Support DTLS protocol (all versions)

*Found in: [Component config](#) > [mbedtls](#)*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_ALPN

Support ALPN (Application Layer Protocol Negotiation)

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this option will save some code size if it is not needed.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CLIENT\_SSL\_SESSION\_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

## CONFIG\_MBEDTLS\_SERVER\_SSL\_SESSION\_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

## Symmetric Ciphers Contains:

- [CONFIG\\_MBEDTLS\\_AES\\_C](#)
- [CONFIG\\_MBEDTLS\\_BLOWFISH\\_C](#)
- [CONFIG\\_MBEDTLS\\_CAMELLIA\\_C](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_DES\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_NIST\\_KW\\_C](#)
- [CONFIG\\_MBEDTLS\\_XTEA\\_C](#)

## CONFIG\_MBEDTLS\_AES\_C

AES block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- Yes (enabled)

## CONFIG\_MBEDTLS\_CAMELLIA\_C

Camellia block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_DES\_C

DES block cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_BLOWFISH\_C

Blowfish block cipher (read help)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_XTEA\_C**

XTEA block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_CCM\_C**

CCM (Counter with CBC-MAC) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_GCM\_C**

GCM (Galois/Counter) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_NIST\_KW\_C**

NIST key wrapping (KW) and KW padding (KWP)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_RIPEMD160\_C**

Enable RIPEMD-160 hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

- No (disabled)

**Certificates** Contains:

- [CONFIG\\_MBEDTLS\\_PEM\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_PEM\\_WRITE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CRL\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CSR\\_PARSE\\_C](#)

### **CONFIG\_MBEDTLS\_PEM\_PARSE\_C**

Read & Parse PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_PEM\_WRITE\_C**

Write PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C**

X.509 CRL parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Revocation Lists.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C**

X.509 CSR parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Signing Requests

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECP\_C**

Elliptic Curve Ciphers

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DHM\_C**

Diffie-Hellman-Merkle key exchange (DHM)

*Found in: [Component config](#) > [mbedtls](#)*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file *mbedtls/dhm.h* file.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECDH\_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECDSA\_C**

Elliptic Curve DSA

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECJPAKE\_C**

Elliptic curve J-PAKE

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP192R1\_ENABLED**

Enable SECP192R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192R1 Elliptic Curve.

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP224R1\_ENABLED**

Enable SECP224R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256R1\_ENABLED**

Enable SECP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP384R1\_ENABLED**

Enable SECP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP384R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP521R1\_ENABLED**

Enable SECP521R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP521R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192K1\_ENABLED**

Enable SECP192K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224K1\_ENABLED**

Enable SECP224K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for CURVE25519 Elliptic Curve.

**CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM**

NIST 'modulo p' optimisations

*Found in: [Component config](#) > [mbedtls](#)*

NIST 'modulo p' optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_FIXED\_POINT\_OPTIM**

Enable fixed-point multiplication optimisations

*Found in: [Component config](#) > [mbedtls](#)*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curve selected) in the application binary.

# end of Elliptic Curve options

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_POLY1305\_C**

Poly1305 MAC algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for Poly1305 MAC algorithm.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHA20\_C**

Chacha20 stream cipher

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for Chacha20 stream cipher.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CHACHAPOLY\_C

ChaCha20-Poly1305 AEAD algorithm

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#)*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#) && [CONFIG\\_MBEDTLS\\_POLY1305\\_C](#)

### CONFIG\_MBEDTLS\_HKDF\_C

HKDF algorithm (RFC 5869)

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_C

Enable the threading abstraction layer

*Found in: [Component config](#) > [mbedtls](#)*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_THREADING\_ALT

Enable threading alternate implementation

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

### CONFIG\_MBEDTLS\_THREADING\_PTHREAD

Enable threading pthread implementation

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)*

Enable the pthread wrapper layer for the threading layer.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

### CONFIG\_MBEDTLS\_ERROR\_STRINGS

Enable error code to error string conversion

*Found in: [Component config](#) > [mbedtls](#)*

Enables mbedtls\_strerror() for converting error codes to error strings. Disabling this config can save some code/rodata size as the error string conversion implementation is replaced with an empty stub.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_USE\_CRYPTO\_ROM\_IMPL**

Use ROM implementation of the crypto algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable this flag to use mbedtls crypto algorithm from ROM instead of ESP-IDF.

This configuration option saves flash footprint in the application binary. Note that the version of mbedtls crypto algorithm library in ROM is v2.16.12. We have done the security analysis of the mbedtls revision in ROM (v2.16.12) and ensured that affected symbols have been patched (removed). If in the future mbedtls revisions there are security issues that also affects the version in ROM (v2.16.12) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

**Default value:**

- No (disabled) if `ESP_ROM_HAS_MBEDTLS_CRYPTO_LIB` && `CONFIG_IDF_EXPERIMENTAL_FEATURES`

**ESP-MQTT Configurations** Contains:

- [CONFIG\\_MQTT\\_CUSTOM\\_OUTBOX](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_311](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_5](#)
- [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)
- [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_EXPIRED\\_TIMEOUT\\_MS](#)
- [CONFIG\\_MQTT\\_REPORT\\_DELETED\\_MESSAGES](#)
- [CONFIG\\_MQTT\\_SKIP\\_PUBLISH\\_IF\\_DISCONNECTED](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_DATA\\_ON\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_MQTT\\_MSG\\_ID\\_INCREMENTAL](#)

**CONFIG\_MQTT\_PROTOCOL\_311**

Enable MQTT protocol 3.1.1

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

**CONFIG\_MQTT\_PROTOCOL\_5**

Enable MQTT protocol 5.0

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will not support MQTT 5.0

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TRANSPORT\_SSL

Enable MQTT over SSL

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET

Enable MQTT over Websocket

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE

Enable MQTT over Websocket Secure

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)*

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

### CONFIG\_MQTT\_MSG\_ID\_INCREMENTAL

Use Incremental Message Id

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED

Skip publish if disconnected

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_REPORT\_DELETED\_MESSAGES

Report deleted messages

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG

MQTT Using custom configurations

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Custom MQTT configurations.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TCP\_DEFAULT\_PORT

Default MQTT over TCP port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over TCP port

**Default value:**

- 1883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_SSL\_DEFAULT\_PORT

Default MQTT over SSL port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over SSL port

**Default value:**

- 8883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)

### CONFIG\_MQTT\_WS\_DEFAULT\_PORT

Default MQTT over Websocket port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket port

**Default value:**

- 80 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)

### CONFIG\_MQTT\_WSS\_DEFAULT\_PORT

Default MQTT over Websocket Secure port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket Secure port

**Default value:**

- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

### **CONFIG\_MQTT\_BUFFER\_SIZE**

Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

This buffer size using for both transmit and receive

**Default value:**

- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### **CONFIG\_MQTT\_TASK\_STACK\_SIZE**

MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task stack size

**Default value:**

- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### **CONFIG\_MQTT\_DISABLE\_API\_LOCKS**

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### **CONFIG\_MQTT\_TASK\_PRIORITY**

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### **CONFIG\_MQTT\_POLL\_READ\_TIMEOUT\_MS**

MQTT transport poll read timeout

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Timeout when polling underlying transport for read.

**Default value:**

- 1000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE

Number of queued events.

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

A value higher than 1 enables multiple queued events.

**Default value:**

- 1 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED

Enable MQTT task core selection

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

This will enable core selection

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION

Core to use ?

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)

Available options:

- Core 0 ([CONFIG\\_MQTT\\_USE\\_CORE\\_0](#))
- Core 1 ([CONFIG\\_MQTT\\_USE\\_CORE\\_1](#))

### CONFIG\_MQTT\_OUTBOX\_DATA\_ON\_EXTERNAL\_MEMORY

Use external memory for outbox data

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set to true to use external memory for outbox data.

**Default value:**

- No (disabled) if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_CUSTOM\_OUTBOX

Enable custom outbox implementation

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources: `idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)`

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_OUTBOX\_EXPIRED\_TIMEOUT\_MS

Outbox message expired timeout[ms]

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib** Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_TIME_SYSCALL`

**CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING**

Line ending for UART output

*Found in:* [Component config](#) > [Newlib](#)

This option allows configuring the desired line endings sent to UART when a newline ('n', LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (`drivers/uart.h`).

Available options:

- CRLF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_CRLF`)
- LF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_LF`)
- CR (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_CR`)

**CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING**

Line ending for UART input

*Found in:* [Component config](#) > [Newlib](#)

This option allows configuring which input sequence on UART produces a newline ('n', LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (`drivers/uart.h`).

Available options:

- CRLF (`CONFIG_NEWLIB_STDIN_LINE_ENDING_CRLF`)
- LF (`CONFIG_NEWLIB_STDIN_LINE_ENDING_LF`)
- CR (`CONFIG_NEWLIB_STDIN_LINE_ENDING_CR`)

**CONFIG\_NEWLIB\_NANO\_FORMAT**

Enable 'nano' formatting options for printf/scanf family

*Found in:* [Component config](#) > [Newlib](#)

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for '--enable-newlib-nano-formatted-io': <https://sourceware.org/newlib/README>

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP\_ROM\_HAS\_NEWLIB\_NANO\_FORMAT and ESP\_ROM\_HAS\_NEWLIB\_NORMAL\_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

## CONFIG\_NEWLIB\_TIME\_SYSCALL

Timers used for gettimeofday function

*Found in: [Component config > Newlib](#)*

This setting defines which hardware timers are used to implement 'gettimeofday' and 'time' functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used,** timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC\_STORE registers are** used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC\_HRT)
- RTC (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC)
- High-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_HRT)
- None (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_NONE)

**NVS** Contains:

- [CONFIG\\_NVS\\_LEGACY\\_DUP\\_KEYS\\_COMPATIBILITY](#)
- [CONFIG\\_NVS\\_ENCRYPTION](#)
- [CONFIG\\_NVS\\_COMPATIBLE\\_PRE\\_V4\\_3\\_ENCRYPTION\\_FLAG](#)
- [CONFIG\\_NVS\\_ASSERT\\_ERROR\\_CHECK](#)

## CONFIG\_NVS\_ENCRYPTION

Enable NVS encryption

*Found in: [Component config > NVS](#)*

This option enables encryption for NVS. When enabled, XTS-AES is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition (enabling flash encryption is mandatory here) or to be derived from an HMAC key burnt in eFuse.

**Default value:**

- Yes (enabled) if [CONFIG\\_SECURE\\_FLASH\\_ENC\\_ENABLED](#)

**CONFIG\_NVS\_COMPATIBLE\_PRE\_V4\_3\_ENCRYPTION\_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in:* [Component config](#) > [NVS](#)

Enabling this will ignore "encrypted" flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have "encrypted" flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**CONFIG\_NVS\_ASSERT\_ERROR\_CHECK**

Use assertions for error checking

*Found in:* [Component config](#) > [NVS](#)

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**

- No (disabled)

**CONFIG\_NVS\_LEGACY\_DUP\_KEYS\_COMPATIBILITY**

Enable legacy nvs\_set function behavior when same key is reused with different data types

*Found in:* [Component config](#) > [NVS](#)

Enabling this option will switch the nvs\_set() family of functions to the legacy mode: when called repeatedly with the same key but different data type, the existing value in the NVS remains active and the new value is just stored, actually not accessible through corresponding nvs\_get() call for the key given. Use this option only when your application relies on such NVS API behaviour.

**Default value:**

- No (disabled)

**NVS Security Provider** Contains:

- [CONFIG\\_NVS\\_SEC\\_HMAC\\_EFUSE\\_KEY\\_ID](#)
- [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECTION\\_SCHEME](#)

**CONFIG\_NVS\_SEC\_KEY\_PROTECTION\_SCHEME**

NVS Encryption: Key Protection Scheme

*Found in:* [Component config](#) > [NVS Security Provider](#)

This choice defines the default NVS encryption keys protection scheme; which will be used for the default NVS partition. Users can use the corresponding scheme registration APIs to register other schemes for the default as well as other NVS partitions.

Available options:

- Using Flash Encryption (`CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC`)  
Protect the NVS Encryption Keys using Flash Encryption Requires a separate 'nvs\_keys' partition (which will be encrypted by flash encryption) for storing the NVS encryption keys
- Using HMAC peripheral (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`)  
Derive and protect the NVS Encryption Keys using the HMAC peripheral Requires the specified eFuse block (`NVS_SEC_HMAC_EFUSE_KEY_ID` or the v2 API argument) to be empty or pre-written with a key with the purpose `ESP_EFUSE_KEY_PURPOSE_HMAC_UP`

### **CONFIG\_NVS\_SEC\_HMAC\_EFUSE\_KEY\_ID**

eFuse key ID storing the HMAC key

*Found in: [Component config](#) > [NVS Security Provider](#)*

eFuse block key ID storing the HMAC key for deriving the NVS encryption keys

Note: The eFuse block key ID required by the HMAC scheme (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`) is set using this config when the default NVS partition is initialized with `nvs_flash_init()`. The eFuse block key ID can also be set at runtime by passing the appropriate value to the NVS security scheme registration APIs.

**Range:**

- from 0 to 6 if [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#)

**Default value:**

- 6 if [CONFIG\\_NVS\\_SEC\\_KEY\\_PROTECT\\_USING\\_HMAC](#)

**OpenThread** Contains:

- [CONFIG\\_OPENTHREAD\\_PLATFORM\\_MSGPOOL\\_MANAGEMENT](#)
- [CONFIG\\_OPENTHREAD\\_DEVICE\\_TYPE](#)
- [CONFIG\\_OPENTHREAD\\_RADIO\\_TYPE](#)
- [CONFIG\\_OPENTHREAD\\_BORDER\\_ROUTER](#)

- [CONFIG\\_OPENTHREAD\\_SPINEL\\_RX\\_FRAME\\_BUFFER\\_SIZE](#)

- [CONFIG\\_OPENTHREAD\\_UART\\_BUFFER\\_SIZE](#)
- [Thread Address Query Config](#)
- [Thread Operational Dataset](#)
- [CONFIG\\_OPENTHREAD\\_DNS64\\_CLIENT](#)

### CONFIG\_OPENTHREAD\_ENABLED

OpenThread

*Found in:* [Component config](#) > [OpenThread](#)

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**

- No (disabled)

### CONFIG\_OPENTHREAD\_LOG\_LEVEL\_DYNAMIC

Enable dynamic log level control

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select this option to enable dynamic log level control for OpenThread

**Default value:**

- Yes (enabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_CONSOLE\_TYPE

OpenThread console type

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select OpenThread console type

Available options:

- OpenThread console type UART ([CONFIG\\_OPENTHREAD\\_CONSOLE\\_TYPE\\_UART](#))
- OpenThread console type USB Serial/JTAG Controller ([CONFIG\\_OPENTHREAD\\_CONSOLE\\_TYPE\\_USB\\_SERIAL\\_JTAG](#))

### CONFIG\_OPENTHREAD\_LOG\_LEVEL

OpenThread log verbosity

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select OpenThread log level.

Available options:

- No logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_NONE](#))
- Error logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_CRIT](#))
- Warning logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_WARN](#))
- Notice logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_NOTE](#))
- Info logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_INFO](#))
- Debug logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_DEBUG](#))

**Thread Operational Dataset** Contains:

- `CONFIG_OPENTHREAD_NETWORK_EXTPANID`
- `CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX`
- `CONFIG_OPENTHREAD_NETWORK_CHANNEL`
- `CONFIG_OPENTHREAD_NETWORK_MASTERKEY`
- `CONFIG_OPENTHREAD_NETWORK_NAME`
- `CONFIG_OPENTHREAD_NETWORK_PANID`
- `CONFIG_OPENTHREAD_NETWORK_PSKC`

**CONFIG\_OPENTHREAD\_NETWORK\_NAME**

OpenThread network name

*Found in: Component config > OpenThread > Thread Operational Dataset*

**Default value:**

- "OpenThread-ESP"

**CONFIG\_OPENTHREAD\_MESH\_LOCAL\_PREFIX**

OpenThread mesh local prefix, format <address>/<plen>

*Found in: Component config > OpenThread > Thread Operational Dataset*

A string in the format "<address>/<plen>", where <address> is an IPv6 address and <plen> is a prefix length. For example "fd00:db8:a0:0::/64"

**Default value:**

- "fd00:db8:a0:0::/64"

**CONFIG\_OPENTHREAD\_NETWORK\_CHANNEL**

OpenThread network channel

*Found in: Component config > OpenThread > Thread Operational Dataset*

**Range:**

- from 11 to 26

**Default value:**

- 15

**CONFIG\_OPENTHREAD\_NETWORK\_PANID**

OpenThread network pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

**Range:**

- from 0 to 0xFFFFE

**Default value:**

- "0x1234"

**CONFIG\_OPENTHREAD\_NETWORK\_EXTPANID**

OpenThread extended pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread network extended pan id in hex string format

**Default value:**

- dead00beef00cafe

### CONFIG\_OPENTHREAD\_NETWORK\_MASTERKEY

OpenThread network key

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread network network key in hex string format

**Default value:**

- 00112233445566778899aabbccddeeff

### CONFIG\_OPENTHREAD\_NETWORK\_PSKC

OpenThread pre-shared commissioner key

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread pre-shared commissioner key in hex string format

**Default value:**

- 104810e2315100afd6bc9215a6bfac53

### CONFIG\_OPENTHREAD\_RADIO\_TYPE

Config the Thread radio type

*Found in: [Component config](#) > [OpenThread](#)*

Configure how OpenThread connects to the 15.4 radio

Available options:

- Native 15.4 radio (CONFIG\_OPENTHREAD\_RADIO\_NATIVE)  
Select this to use the native 15.4 radio.
- Connect via UART (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_UART)  
Select this to connect to a Radio Co-Processor via UART.
- Connect via SPI (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_SPI)  
Select this to connect to a Radio Co-Processor via SPI.

### CONFIG\_OPENTHREAD\_DEVICE\_TYPE

Config the Thread device type

*Found in: [Component config](#) > [OpenThread](#)*

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (CONFIG\_OPENTHREAD\_FTD)  
Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (CONFIG\_OPENTHREAD\_MTD)  
Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (CONFIG\_OPENTHREAD\_RADIO)  
Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

### CONFIG\_OPENTHREAD\_RCP\_TRANSPORT

The RCP transport type

*Found in: [Component config](#) > [OpenThread](#)*

Available options:

- UART RCP (CONFIG\_OPENTHREAD\_RCP\_UART)  
Select this to enable UART connection to host.
- SPI RCP (CONFIG\_OPENTHREAD\_RCP\_SPI)  
Select this to enable SPI connection to host.

### CONFIG\_OPENTHREAD\_NCP\_VENDOR\_HOOK

Enable vendor command for RCP

*Found in: [Component config](#) > [OpenThread](#)*

Select this to enable OpenThread NCP vendor commands.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_RADIO](#)

### CONFIG\_OPENTHREAD\_CLI

Enable Openthread Command-Line Interface

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**

- Yes (enabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_DIAG

Enable diag

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_COMMISSIONER

Enable Commissioner

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_COMM\_MAX\_JOINER\_ENTRIES

The size of max commissioning joiner entries

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_COMMISSIONER*

**Default value:**

- 2 if *CONFIG\_OPENTHREAD\_COMMISSIONER*

### CONFIG\_OPENTHREAD\_JOINER

Enable Joiner

*Found in: Component config > OpenThread*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_SRP\_CLIENT

Enable SRP Client

*Found in: Component config > OpenThread*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_SRP\_CLIENT\_MAX\_SERVICES

Specifies number of service entries in the SRP client service pool

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_SRP\_CLIENT*

Set the max buffer size of service entries in the SRP client service pool.

**Default value:**

- 5 if *CONFIG\_OPENTHREAD\_SRP\_CLIENT*

### CONFIG\_OPENTHREAD\_DNS\_CLIENT

Enable DNS Client

*Found in: Component config > OpenThread*

Select this option to enable DNS Client in OpenThread.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_BORDER\_ROUTER

Enable Border Router

*Found in: Component config > OpenThread*

Select this option to enable border router features in OpenThread.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_PLATFORM\_MSGPOOL\_MANAGEMENT

Allocate message pool buffer from PSRAM

Found in: *Component config > OpenThread*

If enabled, the message pool is managed by platform defined logic.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED` && (`CONFIG_SPIRAM_USE_CAPS_ALLOC` || `CONFIG_SPIRAM_USE_MALLOC`)

### CONFIG\_OPENTHREAD\_NUM\_MESSAGE\_BUFFERS

The number of openthread message buffers

Found in: *Component config > OpenThread*

**Default value:**

- 65 if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_SPINEL\_RX\_FRAME\_BUFFER\_SIZE

The size of openthread spinel rx frame buffer

Found in: *Component config > OpenThread*

**Default value:**

- 2048 if `CONFIG_OPENTHREAD_ENABLED` || `CONFIG_OPENTHREAD_SPINEL_ONLY`

### CONFIG\_OPENTHREAD\_MAC\_MAX\_CSMA\_BACKOFFS\_DIRECT

Maximum backoffs times before declaring a channel access failure.

Found in: *Component config > OpenThread*

The maximum number of backoffs the CSMA-CA algorithm will attempt before declaring a channel access failure.

**Default value:**

- 4 if `CONFIG_OPENTHREAD_ENABLED` || `CONFIG_OPENTHREAD_SPINEL_ONLY`

### CONFIG\_OPENTHREAD\_MLE\_MAX\_CHILDREN

The size of max MLE children entries

Found in: *Component config > OpenThread*

**Default value:**

- 10 if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_TMF\_ADDR\_CACHE\_ENTRIES

The size of max TMF address cache entries

Found in: *Component config > OpenThread*

**Default value:**

- 20 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG\_OPENTHREAD\_DNS64\_CLIENT**

Use dns64 client

*Found in: Component config > OpenThread*

Select this option to acquire NAT64 address from dns servers.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED* && *CONFIG\_LWIP\_IPV4*

**CONFIG\_OPENTHREAD\_DNS\_SERVER\_ADDR**

DNS server address (IPv4)

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_DNS64\_CLIENT*

Set the DNS server IPv4 address.

**Default value:**

- "8.8.8.8" if *CONFIG\_OPENTHREAD\_DNS64\_CLIENT*

**CONFIG\_OPENTHREAD\_UART\_BUFFER\_SIZE**

The uart received buffer size of openthread

*Found in: Component config > OpenThread*

Set the OpenThread UART buffer size.

**Default value:**

- 2048 if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_LINK\_METRICS**

Enable link metrics feature

*Found in: Component config > OpenThread*

Select this option to enable link metrics feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_MACFILTER\_ENABLE**

Enable mac filter feature

*Found in: Component config > OpenThread*

Select this option to enable mac filter feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_CSL\_ENABLE**

Enable CSL feature

*Found in: Component config > OpenThread*

Select this option to enable CSL feature

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_XTAL\_ACCURACY**

The accuracy of the XTAL

*Found in: [Component config](#) > [OpenThread](#)*

The device's XTAL accuracy, in ppm.

**Default value:**

- 130

**CONFIG\_OPENTHREAD\_CSL\_ACCURACY**

The current CSL rx/tx scheduling drift, in units of  $\pm$  ppm

*Found in: [Component config](#) > [OpenThread](#)*

The current accuracy of the clock used for scheduling CSL operations

**Default value:**

- 1 if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_CSL\_UNCERTAIN**

The CSL Uncertainty in units of 10 us.

*Found in: [Component config](#) > [OpenThread](#)*

The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.

**Default value:**

- 1 if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_CSL\_DEBUG\_ENABLE**

Enable CSL debug

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to set rx on when sleep in CSL feature, only for debug

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_DUA\_ENABLE**

Enable Domain Unicast Address feature

*Found in: [Component config](#) > [OpenThread](#)*

Only used for Thread1.2 certification

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**CONFIG\_OPENTHREAD\_TIME\_SYNC**

Enable the time synchronization service feature

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_RADIO\_STATS\_ENABLE

Enable Radio Statistics feature

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable the radio statistics feature, you can use radio command to print some radio Statistics information.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_FTD](#) || [CONFIG\\_OPENTHREAD\\_MTD](#)

### CONFIG\_OPENTHREAD\_SPINEL\_ONLY

Enable OpenThread External Radio Spinel feature

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable the OpenThread Radio Spinel for external protocol stack, such as Zigbee.

**Default value:**

- No (disabled)

### CONFIG\_OPENTHREAD\_RX\_ON\_WHEN\_IDLE

Enable OpenThread radio capability rx on when idle

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable OpenThread radio capability rx on when idle. Do not support this feature when SW coexistence is enabled.
