

# ESP32-S2

## ESP-IDF Programming Guide

Release v5.3.2  
Espressif Systems  
Dec 06, 2024

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 Get Started</b>	<b>3</b>
1.1 Introduction	3
1.2 What You Need	3
1.2.1 Hardware	3
1.2.2 Software	4
1.3 Installation	4
1.3.1 IDE	4
1.3.2 Manual Installation	5
1.4 Build Your First Project	32
1.5 Uninstall ESP-IDF	32
<b>2 API Reference</b>	<b>33</b>
2.1 API Conventions	33
2.1.1 Error Handling	33
2.1.2 Configuration Structures	33
2.1.3 Private APIs	35
2.1.4 Components in Example Projects	35
2.1.5 API Stability	35
2.2 Application Protocols	36
2.2.1 ASIO Port	36
2.2.2 ESP-Modbus	37
2.2.3 ESP-MQTT	37
2.2.4 ESP-TLS	55
2.2.5 ESP HTTP Client	75
2.2.6 ESP Local Control	92
2.2.7 ESP Serial Slave Link	101
2.2.8 ESP x509 Certificate Bundle	116
2.2.9 HTTP Server	118
2.2.10 HTTPS Server	147
2.2.11 ICMP Echo	152
2.2.12 mDNS Service	157
2.2.13 Mbed TLS	157
2.2.14 IP Network Layer	159
2.3 Error Codes Reference	159
2.4 Networking APIs	166
2.4.1 Wi-Fi	166
2.4.2 Ethernet	310
2.4.3 Thread	347
2.4.4 ESP-NETIF	358
2.4.5 IP Network Layer	396
2.4.6 Application Layer	398
2.5 Peripherals API	399
2.5.1 Analog to Digital Converter (ADC) Oneshot Mode Driver	399
2.5.2 Analog to Digital Converter (ADC) Continuous Mode Driver	410
2.5.3 Analog to Digital Converter (ADC) Calibration Driver	419

2.5.4	Clock Tree	422
2.5.5	Digital To Analog Converter (DAC)	434
2.5.6	GPIO & RTC GPIO	448
2.5.7	General Purpose Timer (GPTimer)	470
2.5.8	Dedicated GPIO	485
2.5.9	Hash-Based Message Authentication Code (HMAC)	492
2.5.10	Digital Signature (DS)	496
2.5.11	Inter-Integrated Circuit (I2C)	502
2.5.12	Inter-IC Sound (I2S)	525
2.5.13	LCD	551
2.5.14	LED Control (LEDC)	573
2.5.15	Pulse Counter (PCNT)	592
2.5.16	Remote Control Transceiver (RMT)	607
2.5.17	SD SPI Host Driver	637
2.5.18	Sigma-Delta Modulation (SDM)	643
2.5.19	SPI Flash API	649
2.5.20	SPI Master Driver	681
2.5.21	SPI Slave Driver	703
2.5.22	SPI Slave Half Duplex	710
2.5.23	Temperature Sensor	718
2.5.24	Touch Sensor	723
2.5.25	Touch Element	752
2.5.26	Two-Wire Automotive Interface (TWAI)	782
2.5.27	Universal Asynchronous Receiver/Transmitter (UART)	805
2.5.28	USB Device Stack	831
2.5.29	USB Host	836
2.6	Project Configuration	893
2.6.1	Introduction	893
2.6.2	Project Configuration Menu	894
2.6.3	Using <code>sdkconfig.defaults</code>	894
2.6.4	Kconfig Format Rules	894
2.6.5	Backward Compatibility of Kconfig Options	895
2.6.6	Configuration Options Reference	895
2.7	Provisioning API	1247
2.7.1	Protocol Communication	1247
2.7.2	Unified Provisioning	1263
2.7.3	Wi-Fi Provisioning	1270
2.8	Storage API	1289
2.8.1	FAT Filesystem Support	1290
2.8.2	Manufacturing Utility	1301
2.8.3	Non-Volatile Storage Library	1306
2.8.4	NVS Encryption	1330
2.8.5	NVS Partition Generator Utility	1336
2.8.6	NVS Partition Parser Utility	1342
2.8.7	SD/SDIO/MMC Driver	1343
2.8.8	Partitions API	1350
2.8.9	SPIFFS Filesystem	1359
2.8.10	Virtual Filesystem Component	1364
2.8.11	Wear Levelling API	1380
2.9	System API	1384
2.9.1	App Image Format	1384
2.9.2	Bootloader Image Format	1390
2.9.3	Application Level Tracing	1392
2.9.4	Call Function with External Stack	1397
2.9.5	Chip Revision	1399
2.9.6	Console	1404
2.9.7	eFuse Manager	1413
2.9.8	Error Code and Helper Functions	1444

2.9.9	ESP HTTPS OTA	1447
2.9.10	Event Loop Library	1454
2.9.11	FreeRTOS Overview	1467
2.9.12	FreeRTOS (IDF)	1470
2.9.13	FreeRTOS (Supplemental Features)	1585
2.9.14	Heap Memory Allocation	1612
2.9.15	Memory Management for MMU Supported Memory	1628
2.9.16	Memory Synchronization	1634
2.9.17	Heap Memory Debugging	1638
2.9.18	ESP Timer (High Resolution Timer)	1651
2.9.19	Internal and Unstable APIs	1660
2.9.20	Interrupt Allocation	1662
2.9.21	Logging library	1670
2.9.22	Miscellaneous System APIs	1678
2.9.23	Over The Air Updates (OTA)	1695
2.9.24	Performance Monitor	1708
2.9.25	Power Management	1712
2.9.26	POSIX Threads Support	1718
2.9.27	Random Number Generation	1724
2.9.28	Sleep Modes	1726
2.9.29	SoC Capabilities	1743
2.9.30	System Time	1757
2.9.31	Asynchronous Memory Copy	1764
2.9.32	ULP Coprocessor Programming	1768
2.9.33	ULP RISC-V Coprocessor Programming	1809
2.9.34	Watchdogs	1820
<b>3</b>	<b>Hardware Reference</b>	<b>1829</b>
<b>4</b>	<b>API Guides</b>	<b>1831</b>
4.1	Application Level Tracing Library	1831
4.1.1	Overview	1831
4.1.2	Modes of Operation	1831
4.1.3	Configuration Options and Dependencies	1832
4.1.4	How to Use This Library	1833
4.2	Application Startup Flow	1841
4.2.1	First Stage Bootloader	1841
4.2.2	Second Stage Bootloader	1842
4.2.3	Application Startup	1842
4.3	Bootloader	1844
4.3.1	Bootloader Compatibility	1844
4.3.2	Log Level	1844
4.3.3	Factory Reset	1844
4.3.4	Boot from Test Firmware	1845
4.3.5	Rollback	1846
4.3.6	Watchdog	1846
4.3.7	Bootloader Size	1846
4.3.8	Fast Boot from Deep-Sleep	1846
4.3.9	Custom Bootloader	1847
4.4	Build System	1847
4.4.1	Overview	1847
4.4.2	Using the Build System	1848
4.4.3	Example Project	1849
4.4.4	Project CMakeLists File	1850
4.4.5	Component CMakeLists Files	1852
4.4.6	Component Configuration	1854
4.4.7	Preprocessor Definitions	1854
4.4.8	Component Requirements	1854

4.4.9	Overriding Parts of the Project	1858
4.4.10	Configuration-Only Components	1860
4.4.11	Debugging CMake	1860
4.4.12	Example Component CMakeLists	1861
4.4.13	Custom Sdkconfig Defaults	1865
4.4.14	Flash Arguments	1865
4.4.15	Building the Bootloader	1866
4.4.16	Writing Pure CMake Components	1866
4.4.17	Using Third-Party CMake Projects with Components	1866
4.4.18	Using Prebuilt Libraries with Components	1867
4.4.19	Using ESP-IDF in Custom CMake Projects	1867
4.4.20	ESP-IDF CMake Build System API	1868
4.4.21	File Globbing & Incremental Builds	1872
4.4.22	Build System Metadata	1873
4.4.23	Build System Internals	1873
4.4.24	Migrating from ESP-IDF GNU Make System	1875
4.5	C Support	1876
4.5.1	C Version	1876
4.5.2	Unsupported C Features	1876
4.6	C++ Support	1877
4.6.1	esp-idf-cxx Component	1877
4.6.2	C++ Language Standard	1877
4.6.3	Multithreading	1877
4.6.4	Exception Handling	1878
4.6.5	Runtime Type Information (RTTI)	1878
4.6.6	Developing in C++	1878
4.6.7	Limitations	1880
4.6.8	What to Avoid	1880
4.7	Core Dump	1880
4.7.1	Overview	1880
4.7.2	Configurations	1880
4.7.3	Core Dump to Flash	1881
4.7.4	Core Dump to UART	1882
4.7.5	Core Dump Commands	1884
4.7.6	ROM Functions in Backtraces	1884
4.7.7	Dumping Variables on Demand	1884
4.7.8	Running <code>idf.py coredump-info</code> and <code>idf.py coredump-debug</code>	1885
4.8	Current Consumption Measurement of Modules	1887
4.8.1	Notes to Measurement	1887
4.8.2	Hardware Connection	1888
4.8.3	Measurement Steps	1888
4.9	Deep Sleep Wake Stubs	1890
4.9.1	Introduction	1892
4.9.2	Implement wake stub	1892
4.9.3	Example	1894
4.10	Device Firmware Upgrade via USB	1894
4.10.1	USB Connection	1894
4.10.2	Building the DFU Image	1894
4.10.3	Flashing the DFU Image	1895
4.10.4	Udev Rule (Linux Only)	1895
4.10.5	USB Drivers (Windows Only)	1895
4.10.6	Common Errors and Known Issues	1896
4.10.7	Secure Download Mode	1896
4.11	Error Handling	1896
4.11.1	Overview	1896
4.11.2	Error Codes	1896
4.11.3	Converting Error Codes to Error Messages	1897
4.11.4	ESP_ERROR_CHECK Macro	1897

4.11.5	ESP_ERROR_CHECK_WITHOUT_ABORT Macro	1897
4.11.6	ESP_RETURN_ON_ERROR Macro	1898
4.11.7	ESP_GOTO_ON_ERROR Macro	1898
4.11.8	ESP_RETURN_ON_FALSE Macro	1898
4.11.9	ESP_GOTO_ON_FALSE Macro	1898
4.11.10	CHECK_MACROS Examples	1898
4.11.11	Error Handling Patterns	1899
4.11.12	C++ Exceptions	1899
4.12	ESP-WIFI-MESH	1899
4.12.1	Overview	1900
4.12.2	Introduction	1900
4.12.3	ESP-WIFI-MESH Concepts	1901
4.12.4	Building a Network	1906
4.12.5	Managing a Network	1911
4.12.6	Data Transmission	1914
4.12.7	Channel Switching	1916
4.12.8	Performance	1919
4.12.9	Further Notes	1920
4.13	Support for External RAM	1920
4.13.1	Introduction	1920
4.13.2	Hardware	1920
4.13.3	Configuring External RAM	1920
4.13.4	Restrictions	1922
4.13.5	Failure to Initialize	1923
4.13.6	Encryption	1923
4.14	Fatal Errors	1923
4.14.1	Overview	1923
4.14.2	Panic Handler	1924
4.14.3	Register Dump and Backtrace	1926
4.14.4	GDB Stub	1927
4.14.5	RTC Watchdog Timeout	1927
4.14.6	Guru Meditation Errors	1927
4.14.7	Other Fatal Errors	1929
4.15	Hardware Abstraction	1932
4.15.1	Architecture	1932
4.15.2	LL (Low Level) Layer	1933
4.15.3	HAL (Hardware Abstraction Layer)	1934
4.16	High Priority Interrupts	1935
4.16.1	Interrupt Priorities	1936
4.16.2	Notes	1936
4.17	JTAG Debugging	1937
4.17.1	Introduction	1937
4.17.2	How it Works?	1937
4.17.3	Selecting JTAG Adapter	1938
4.17.4	Setup of OpenOCD	1938
4.17.5	Configuring ESP32-S2 Target	1939
4.17.6	Launching Debugger	1944
4.17.7	Debugging Examples	1944
4.17.8	Building OpenOCD from Sources	1945
4.17.9	Tips and Quirks	1949
4.17.10	Related Documents	1954
4.18	Linker Script Generation	1979
4.18.1	Overview	1979
4.18.2	Quick Start	1980
4.18.3	Linker Script Generation Internals	1983
4.19	lwIP	1988
4.19.1	Supported APIs	1989
4.19.2	BSD Sockets API	1989

4.19.3	Netconn API	1993
4.19.4	lwIP FreeRTOS Task	1993
4.19.5	IPv6 Support	1994
4.19.6	ESP-lwIP Custom Modifications	1995
4.19.7	Performance Optimization	1996
4.20	Memory Types	1998
4.20.1	DRAM (Data RAM)	1998
4.20.2	IRAM (Instruction RAM)	1998
4.20.3	IROM (Code Executed from flash)	1999
4.20.4	DROM (Data Stored in flash)	2000
4.20.5	RTC Slow Memory	2000
4.20.6	RTC FAST Memory	2000
4.20.7	DMA-Capable Requirement	2000
4.20.8	DMA Buffer in the Stack	2001
4.21	OpenThread	2001
4.21.1	Modes of the OpenThread Stack	2001
4.21.2	How to Write an OpenThread Application	2002
4.21.3	The OpenThread Border Router	2003
4.22	Partition Tables	2003
4.22.1	Overview	2003
4.22.2	Built-in Partition Tables	2004
4.22.3	Creating Custom Tables	2004
4.22.4	Generating Binary Partition Table	2007
4.22.5	Partition Size Checks	2007
4.22.6	Flashing the Partition Table	2008
4.22.7	Partition Tool ( <code>parttool.py</code> )	2008
4.23	Performance	2009
4.23.1	How to Optimize Performance	2010
4.23.2	Guides	2010
4.24	Reproducible Builds	2028
4.24.1	Introduction	2028
4.24.2	Reasons for Non-Reproducible Builds	2028
4.24.3	Enabling Reproducible Builds in ESP-IDF	2028
4.24.4	How Reproducible Builds Are Achieved	2028
4.24.5	Reproducible Builds and Debugging	2029
4.24.6	Factors Which Still Affect Reproducible Builds	2029
4.25	RF Calibration	2029
4.25.1	Partial Calibration	2029
4.25.2	Full Calibration	2029
4.25.3	No Calibration	2030
4.25.4	PHY Initialization Data	2030
4.25.5	API Reference	2030
4.26	Thread Local Storage	2038
4.26.1	Overview	2038
4.26.2	FreeRTOS Native APIs	2038
4.26.3	Pthread APIs	2038
4.26.4	C11 Standard	2038
4.27	Tools	2039
4.27.1	IDF Frontend - <code>idf.py</code>	2039
4.27.2	IDF Monitor	2043
4.27.3	IDF Docker Image	2050
4.27.4	IDF Windows Installer	2053
4.27.5	IDF Component Manager	2054
4.27.6	IDF Clang-Tidy	2056
4.27.7	Downloadable IDF Tools	2057
4.28	Unit Testing in ESP32-S2	2070
4.28.1	Normal Test Cases	2070
4.28.2	Multi-device Test Cases	2071

4.28.3	Multi-stage Test Cases . . . . .	2072
4.28.4	Tests For Different Targets . . . . .	2072
4.28.5	Building Unit Test App . . . . .	2073
4.28.6	Running Unit Tests . . . . .	2074
4.28.7	Timing Code with Cache Compensated Timer . . . . .	2075
4.28.8	Mocks . . . . .	2075
4.29	Running ESP-IDF Applications on Host . . . . .	2077
4.29.1	Introduction . . . . .	2078
4.29.2	Requirements for Using Mocks . . . . .	2079
4.29.3	Build and Run . . . . .	2079
4.29.4	Component Linux/Mock Support Overview . . . . .	2079
4.30	USB OTG Console . . . . .	2080
4.30.1	Hardware Requirements . . . . .	2080
4.30.2	Software Configuration . . . . .	2081
4.30.3	Uploading the Application . . . . .	2081
4.30.4	Limitations . . . . .	2081
4.31	Wi-Fi Driver . . . . .	2082
4.31.1	ESP32-S2 Wi-Fi Feature List . . . . .	2082
4.31.2	How To Write a Wi-Fi Application . . . . .	2082
4.31.3	ESP32-S2 Wi-Fi API Error Code . . . . .	2083
4.31.4	ESP32-S2 Wi-Fi API Parameter Initialization . . . . .	2084
4.31.5	ESP32-S2 Wi-Fi Programming Model . . . . .	2084
4.31.6	ESP32-S2 Wi-Fi Event Description . . . . .	2084
4.31.7	ESP32-S2 Wi-Fi Station General Scenario . . . . .	2087
4.31.8	ESP32-S2 Wi-Fi AP General Scenario . . . . .	2090
4.31.9	ESP32-S2 Wi-Fi Scan . . . . .	2090
4.31.10	ESP32-S2 Wi-Fi Station Connecting Scenario . . . . .	2097
4.31.11	ESP32-S2 Wi-Fi Station Connecting When Multiple APs Are Found . . . . .	2105
4.31.12	Wi-Fi Reconnect . . . . .	2105
4.31.13	Wi-Fi Beacon Timeout . . . . .	2106
4.31.14	ESP32-S2 Wi-Fi Configuration . . . . .	2106
4.31.15	Wi-Fi Easy Connect™ (DPP) . . . . .	2112
4.31.16	Wi-Fi Aware™ (NAN) . . . . .	2112
4.31.17	Wireless Network Management . . . . .	2113
4.31.18	Radio Resource Measurement . . . . .	2113
4.31.19	Fast BSS Transition . . . . .	2113
4.31.20	Wi-Fi Location . . . . .	2113
4.31.21	ESP32-S2 Wi-Fi Power-saving Mode . . . . .	2114
4.31.22	ESP32-S2 Wi-Fi Throughput . . . . .	2116
4.31.23	Wi-Fi 80211 Packet Send . . . . .	2116
4.31.24	Wi-Fi Sniffer Mode . . . . .	2117
4.31.25	Wi-Fi Multiple Antennas . . . . .	2118
4.31.26	Wi-Fi Channel State Information . . . . .	2118
4.31.27	Wi-Fi Channel State Information Configure . . . . .	2120
4.31.28	Wi-Fi HT20/40 . . . . .	2120
4.31.29	Wi-Fi QoS . . . . .	2120
4.31.30	Wi-Fi AMSDU . . . . .	2121
4.31.31	Wi-Fi Fragment . . . . .	2121
4.31.32	WPS Enrollee . . . . .	2121
4.31.33	Wi-Fi Buffer Usage . . . . .	2121
4.31.34	How to Improve Wi-Fi Performance . . . . .	2122
4.31.35	Wi-Fi Menuconfig . . . . .	2126
4.31.36	Troubleshooting . . . . .	2128
4.32	Wi-Fi Security . . . . .	2131
4.32.1	ESP32-S2 Wi-Fi Security Features . . . . .	2131
4.32.2	Protected Management Frames (PMF) . . . . .	2134
4.32.3	Wi-Fi Enterprise . . . . .	2135
4.32.4	WPA3-Personal . . . . .	2135

4.32.5	Wi-Fi Enhanced Open™	2137
4.33	Low Power Mode User Guide	2137
4.34	Wi-Fi Expansion	2137
4.35	PHY	2137
4.35.1	Multiple Antennas	2137
<b>5</b>	<b>Security Guides</b>	<b>2141</b>
5.1	Overview	2141
5.1.1	Security	2141
5.2	Features	2145
5.2.1	Flash Encryption	2145
5.2.2	Secure Boot V2	2160
5.3	Workflows	2168
5.3.1	Host-Based Security Workflows	2168
<b>6</b>	<b>Migration Guides</b>	<b>2179</b>
6.1	ESP-IDF 5.x Migration Guide	2179
6.1.1	Migration from 4.4 to 5.0	2179
6.1.2	Migration from 5.0 to 5.1	2208
6.1.3	Migration from 5.1 to 5.2	2211
6.1.4	Migration from 5.2 to 5.3	2214
<b>7</b>	<b>Libraries and Frameworks</b>	<b>2219</b>
7.1	Cloud Frameworks	2219
7.1.1	ESP RainMaker	2219
7.1.2	AWS IoT	2219
7.1.3	Azure IoT	2219
7.1.4	Google IoT Core	2219
7.1.5	Aliyun IoT	2219
7.1.6	Joylink IoT	2220
7.1.7	Tencent IoT	2220
7.1.8	Tencentyun IoT	2220
7.1.9	Baidu IoT	2220
7.2	Espressif's Frameworks	2220
7.2.1	Espressif Audio Development Framework	2220
7.2.2	ESP-CSI	2220
7.2.3	Espressif DSP Library	2220
7.2.4	ESP-WIFI-MESH Development Framework	2221
7.2.5	ESP-WHO	2221
7.2.6	ESP RainMaker	2221

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#), [ESP32-C](#), [ESP32-H](#) and [ESP32-P](#) Series SoCs.

This document describes using ESP-IDF with the ESP32-S2 SoC.

		
<a href="#">Get Started</a>	<a href="#">API Reference</a>	<a href="#">API Guides</a>

# Chapter 1

## Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-S2 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-S2 board.

---

**Note:** This is documentation for stable version v5.3.2 of ESP-IDF. Other *ESP-IDF Versions* are also available.

---

### 1.1 Introduction

ESP32-S2 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- High performance single core Xtensa® 32-bit LX7 CPU
- Ultra Low Power co-processor running either RISC-V or FSM core
- Multiple peripherals
- Built-in security hardware
- USB OTG interface

Powered by 40 nm technology, ESP32-S2 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-S2 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

#### 1.2.1 Hardware

- An **ESP32-S2** board.
- **USB cable** - USB A / micro USB B.
- **Computer** running Windows, Linux, or macOS.

---

**Note:** Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

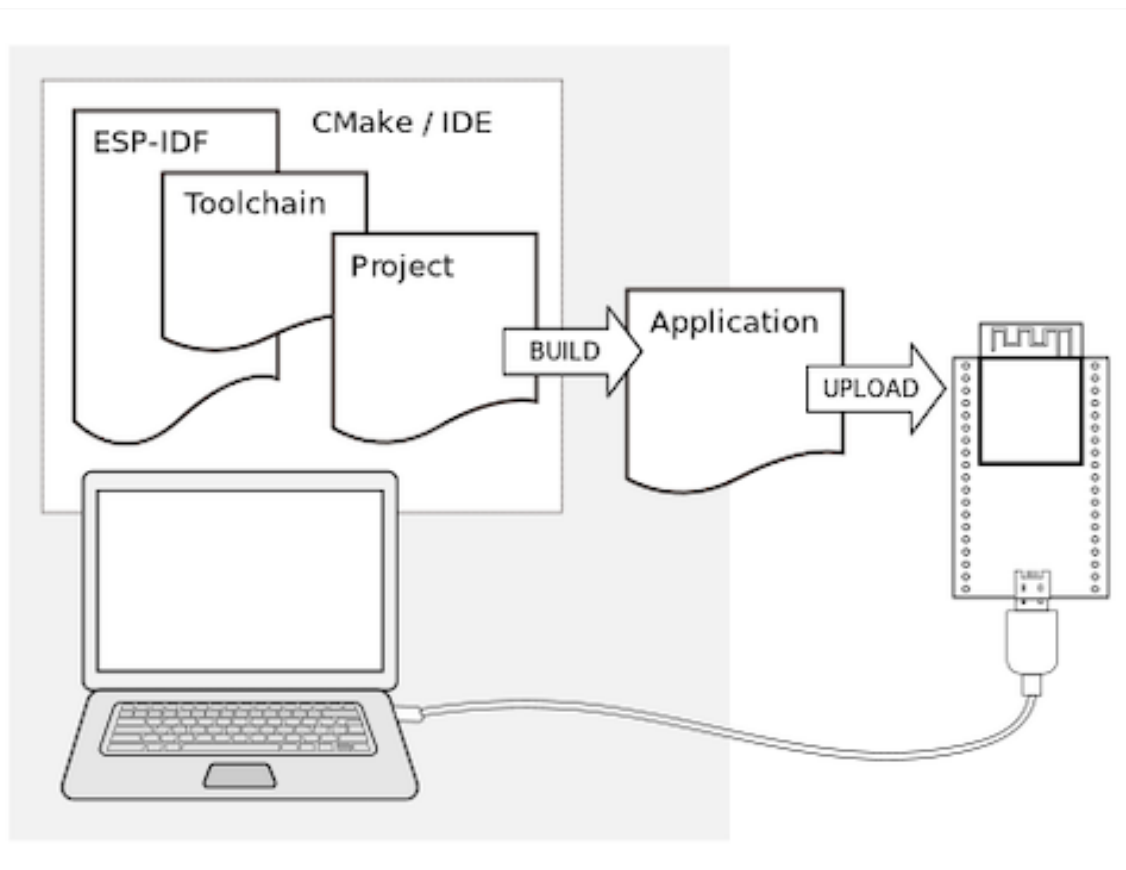

---

If you have one of ESP32-S2 official development boards listed below, you can click on the link to learn more about the hardware.

## 1.2.2 Software

To start using ESP-IDF on **ESP32-S2**, install the following software:

- **Toolchain** to compile code for ESP32-S2
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-S2
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-S2 and scripts to operate the **Toolchain**

## 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

### 1.3.1 IDE

---

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

---

- [Eclipse Plugin](#)
- [VSCode Extension](#)

## 1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

### Standard Setup of Toolchain for Windows

**Introduction** ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we are going to use the Command Prompt, but after ESP-IDF is installed you can use [Eclipse Plugin](#) or another graphical IDE with CMake support instead.

---

**Note:** Limitations:

- The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build.
- The installation path of Python or ESP-IDF must not contain white spaces or parentheses.
- The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via `Control Panel > Change date, time, or number formats > Administrative tab > Change system locale > check the option Beta: Use Unicode UTF-8 for worldwide language support > Ok > reboot the computer.`

---

**ESP-IDF Tools Installer** The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers.

**What Is the Usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer downloads only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\.espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#).

**Components of the Installation** The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD

- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (`cmd.exe`). The installer launches ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Fig. 1: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (`cmd.exe`):

**Using the Command Prompt** For the remaining Getting Started steps, we are going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (`cmd.exe`) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.

```
ESP-IDF PowerShell

Using Python in C:/Users/developer/.espressif/python_env/idf4.1_py3.8_env/scripts
Python 3.8.7
Using Git in c:/Program Files/Git/cmd/
git version 2.29.2.windows.1
Setting IDF_PATH: C:\Users\developer\Desktop\esp-idf
Adding ESP-IDF tools to PATH...

  C:\Users\test\.espressif\python_env\idf4.3_py3.7_env\Scripts
  C:\Users\test\esp\esp-idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

  idf.py build

C:\Users\test\esp\esp-idf>
```

Fig. 4: ESP-IDF Command Prompt

2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

**First Steps on ESP-IDF** Now since all requirements are met, the next topic guides you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S2 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-S2. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-S2 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-S2](#) for full details.

---

**Note:** Keep the port name handy as it is needed in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-S2 as the target, and run the project configuration utility `menuconfig`.

### Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32s2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32s2`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode   [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

Fig. 5: Project configuration - Home window

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for "hello\_word", since this example runs with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See [Additional Tips](#) for more information.

To use the USB for flashing the ESP32-S2, you need to change the channel for the console output to USB. For the ESP32-S2, the default console output channel is the UART.

1. Navigate to the option Channel for console output.  
Component config ---> ESP System Settings ---> Channel for console output
2. Change to the option (the default is always UART):  
USB CDC
3. Save the new configuration and exit the menuconfig screen.

**Build the Project** Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
```

(continues on next page)

(continued from previous page)

```

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↳-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↳bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↳partition-table.bin
or run 'idf.py -p PORT flash'

```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-S2 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace `PORT` with your ESP32-S2 board's USB port name. If the `PORT` is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to [Flashing Troubleshooting](#) page or [Establish Serial Connection with ESP32-S2](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

```

...
esptool.py --chip esp32s2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↳after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB.
↳0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin.
↳0x10000 hello_world.bin
esptool.py v3.0-dev

Hard resetting via RTS pin...
Done

```

If there are no issues by the end of the flash process, the board will reboot and start up the "hello\_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if "hello\_world" is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application.

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```

...
Hello world!
Restarting in 10 seconds...
This is esp32s2 chip with 1 CPU core(s), WiFi, silicon revision 0, 2 MB_
↪external flash
Minimum free heap size: 253900 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

```

To exit IDF monitor use the shortcut `Ctrl+]`.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- *IDF Monitor* for handy shortcuts and more details on using IDF monitor.
- *idf.py* for a full reference of `idf.py` commands and options.

**That is all that you need to get started with ESP32-S2!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-S2 because required hardware is not included in ESP32-S2 so it cannot be supported.

If building an example, please check the README file for the `Supported Targets` table. If this is present including ESP32-S2 target, or the table does not exist at all, the example will work on ESP32-S2.

---

**Additional Tips**

**Permission Denied Issue** With some Linux distributions, you may get the error message similar to `Could not open port <PORT>: Permission denied: '<PORT>'` when flashing the ESP32-S2. *This can be solved by adding the current user to the specific group*, such as `dialout` or `uucp` group.

**Python Compatibility** ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Start with Board Support Package** To speed up prototyping on some development boards, you can use [Board Support Packages \(BSPs\)](#), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via [IDF Component Manager](#), so they can be found in [IDF Component Registry](#).

**Here is an example of how to add ESP32-S2-Kaluga-Kit BSP to your project:**

```
idf.py add-dependency esp32_s2_kaluga_kit
```

More examples of BSP usage can be found in [BSP examples folder](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Related Documents** For advanced users who want to customize the install process:

- [Updating ESP-IDF Tools on Windows](#)
- [Establish Serial Connection with ESP32-S2](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF Monitor](#)

**Updating ESP-IDF Tools on Windows**

**Install ESP-IDF Tools Using a Script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This downloads and installs the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF Tools to PATH Using an Export Script** ESP-IDF tools installer creates a Start menu shortcut for "ESP-IDF Command Prompt". This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which was not started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

### **Establish Serial Connection with ESP32-S2**

Establishing a serial connection with the ESP32-S2 target device could be done using USB-to-UART bridge or USB peripheral supported in ESP32-S2.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

**Supported USB Peripheral** The ESP32-S2 supports the USB peripheral. In this case, the USB-to-UART bridge is not needed and the device can be flashed directly.

Apart from the USB peripheral, some development boards also include the USB-to-UART bridge.

**USB-to-UART Bridge on Development Board** For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32-S2 is UART.

**External USB-to-UART Bridge** Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.

**Flash Using USB** For the ESP32-S2, the USB peripheral is available, allowing you to flash the binaries without the need for an external USB-to-UART bridge.

The USB on the ESP32-S2 uses the **GPIO20** for **D+** and **GPIO19** for **D-**.

After flashing the binaries, a manual reset is needed.

Fig. 6: SoC with Supported USB

Fig. 7: Development Board with USB-to-UART Bridge

Fig. 8: External USB-to-UART Bridge

**Flash Using UART** This section provides guidance on how to establish a serial connection between ESP32-S2 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32-S2 to PC** Connect the ESP32-S2 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32-S2 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-S2 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

Replace `PORT` with the device name for the serial port of your ESP32-S2 board. Please note that `-b` is an optional argument. If you do not specify the baud rate, the default baud rate is `460800`. If you need to specify the baud rate, replace `BAUD` with the baud rate you need.

To check the port name on Windows, please refer to [check-port-on-windows](#). For Linux and macOS users, please see [check-port-on-linux-and-macos](#).

For example, if the port name is `COM3` on Windows and your desired baud rate is `115200`, you can run the following command to flash the device:

```
idf.py -p COM3 -b 115200 flash
```

For Linux users, if the port name is `/dev/ttyUSB0` and the desired baud rate is `115200`, you can run the following command to flash the device:

```
idf.py -p /dev/ttyUSB0 -b 115200 flash
```

For macOS users, if the port name is `/dev/cu.usbserial-1401` and the desired baud rate is `115200`, you can run the following command to flash the device:

```
idf.py -p /dev/cu.usbserial-1401 -b 115200 flash
```

---

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the `BOOT` button and then press the `RESET` button once. After that release the `BOOT` button.

---

**Check Port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-S2 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check Port on Linux and macOS** To check the device name for the serial port of your ESP32-S2 board (or external converter dongle), run this command two times, first with the board/dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

Fig. 9: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Fig. 10: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

---

**Note:** macOS users: if you do not see the serial port then check you have the USB/serial drivers installed. See Section [Connect ESP32-S2 to PC](#) for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

---

**Adding User to dialout or uucp on Linux** The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify Serial Connection** Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-S2.

The default console baud rate on ESP32-S2 is 115200.

**Windows and Linux** In this example, we use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-S2. The log contents depend on application loaded to ESP32-S2, see [Example Output](#). Reset the board if no log has been printed out.

---

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

---

**Note:** If there is no log output, check

- if the required power is supplied to ESP32-S2
- if the board was reset after starting the terminal program
- if the selected serial port is the correct one by using the method stated in [Check Port on Windows](#) and [Check Port on Linux and macOS](#)
- if the serial port is not being used by another program
- if the identified port has been selected in serial terminal programs you are using, as stated in [Windows and Linux](#)
- if settings of the serial port in serial terminal programs are applicable to corresponding applications
- if the correct USB connector (UART) is used on the development board
- if your application is expected to output some log

Fig. 11: Setting Serial Communication in PuTTY on Windows

Fig. 12: Setting Serial Communication in PuTTY on Linux

- if the log output has not been disabled (use [hello world application](#) to test)
- 

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the **screen** command.

- As discussed in [Check port on Linux and macOS](#), run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- The output varies depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change "115200" to the default baud rate of the chip in use):

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the **screen**. The log contents depend on application loaded to ESP32-S2, see [Example Output](#). To exit the current **screen** session, type `Ctrl-A + K`.
- 

**Note:** Do not forget to **exit the current screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

---

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32-S2.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-S2 booting and producing serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

If you got here from [Step 5. First Steps on ESP-IDF](#) when installing s/w for ESP32-S2 development, then you can continue with [Step 5. First Steps on ESP-IDF](#).

## Flashing Troubleshooting

**Failed to Connect** If you run the given command and see errors such as "Failed to connect", there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the [esptool troubleshooting](#) page.

`esptool.py` resets ESP32-S2 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-S2](#)). The DTR and RTS control lines are in turn connected to `GPIO0` and `CHIP_PU (EN)` pins of ESP32-S2, thus changes in the voltage levels of DTR and RTS will boot ESP32-S2 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `GPIO0` and `CHIP_PU`.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-S2 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the `Boot` button (`GPIO0`) and press the `EN` button (`CHIP_PU`).
- For other types of hardware, try pulling `GPIO0` down.

## Standard Toolchain Setup for Linux and macOS

**Installation Step by Step** This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment** These are the steps for setting up the ESP-IDF for your ESP32-S2.

- [Step 1. Install Prerequisites](#)
- [Step 2. Get ESP-IDF](#)
- [Step 3. Set up the Tools](#)
- [Step 4. Set up the Environment Variables](#)
- [Step 5. First Steps on ESP-IDF](#)

**Step 1. Install Prerequisites** In order to use ESP-IDF with the ESP32-S2, you need to install some software packages based on your Operating System. This setup guide helps you on getting everything installed on Linux and macOS based systems.

**For Linux Users** To compile using ESP-IDF, you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja  
↳ccache dfu-util libusb
```

---

**Note:**

- CMake version 3.16 or newer is required for use with ESP-IDF. Run "tools/idf\_tools.py install cmake" to install a suitable version if your OS versions does not have one.
  - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
- 

**For macOS Users** ESP-IDF uses the version of Python installed by default on macOS.

- Install CMake & Ninja build:

- If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.

- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).
- 

**Note:** If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools),  
↳missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Apple M1 Users** If you use Apple M1 platform and see an error like this:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is  
↳present, but tool was not found  
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to  
↳install it.
```

or:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-  
↳patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

**Installing Python 3** Based on macOS [Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 is not included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 is not already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

**Step 2. Get ESP-IDF** To build applications for the ESP32-S2, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v5.3.2 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF is downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the Tools** Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-S2.

```
cd ~/esp/esp-idf
./install.sh esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32s2
```

The above commands install tools for ESP32-S2 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```

**Note:** For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable
↳to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see [Download Error While Installing ESP-IDF Tools](#).

---

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it does not change the URLs used to access any Git repositories.

---

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Note:** For users in China, we recommend using our download server located in China for faster download speed.

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.cn/github_assets"
./install.sh
```

**Customizing the Tools Installation Path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, **export the environment variable `IDF_TOOLS_PATH` before running the installation scripts**. Make sure that your user account has sufficient permissions to read and write this path.

```
export IDF_TOOLS_PATH="$HOME/required_idf_tools_path"
./install.sh

. ./export.sh
```

If changing the `IDF_TOOLS_PATH`, make sure it is exported in the environment before running any ESP-IDF tools or scripts.

**Note:** Using `IDF_TOOLS_PATH` in variable assignment, e.g., `IDF_TOOLS_PATH="$HOME/required_idf_tools_path" ./install.sh`, without prior exporting, will not work in most shells because the variable assignment will not affect the current execution environment, even if it's exported/changed in the sourced script.

---

**Step 4. Set up the Environment Variables** The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export.sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S2 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-S2. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-S2 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`

- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-S2](#) for full details.

---

**Note:** Keep the port name handy as it is needed in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-S2 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32s2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32s2`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

Fig. 13: Project configuration - Home window

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for "hello\_world", since this example runs with default configuration.

---

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See [Additional Tips](#) for more information.

**Console Output Configuration** If you are using the USB for flashing the ESP32-S2, you need to change the channel for the console output from UART (default) to USB.

1. Navigate to the option `Channel` for console output.

- Component config>ESP System Settings>Channel for console output
2. Change to the option (the default is always UART):  
USB CDC
  3. Save the new configuration and exit the menuconfig screen.

**Build the Project** Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-S2 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace PORT with your ESP32-S2 board's USB port name. If the PORT is not defined, the *idf.py* will try to connect automatically using the available USB ports.

For more information on *idf.py* arguments, see [idf.py](#).

---

**Note:** The option *flash* automatically builds and flashes the project, so running *idf.py build* is not necessary.

---

Encountered Issues While Flashing? See the "Additional Tips" below. You can also refer to [Flashing Troubleshooting](#) page or [Establish Serial Connection with ESP32-S2](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32s2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↪after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB_
↪0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin_
↪0x10000 hello_world.bin
esptool.py v3.0-dev
```

(continues on next page)

(continued from previous page)

```

```

If there are no issues by the end of the flash process, the board will reboot and start up the "hello\_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if "hello\_world" is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application.

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
  This is esp32s2 chip with 1 CPU core(s), WiFi, silicon revision 0, 2 MB
↪external flash
Minimum free heap size: 253900 bytes
  Restarting in 9 seconds...
  Restarting in 8 seconds...
  Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

---

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

---

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

### That is all that you need to get started with ESP32-S2!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-S2 because required hardware is not included in ESP32-S2 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-S2 target, or the table does not exist at all, the example will work on ESP32-S2.

---

### Additional Tips

**Permission Denied Issue** With some Linux distributions, you may get the error message similar to `Could not open port <PORT>: Permission denied: '<PORT>'` when flashing the ESP32-S2. *This can be solved by adding the current user to the specific group*, such as `dialout` or `uucp` group.

**Python Compatibility** ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Start with Board Support Package** To speed up prototyping on some development boards, you can use [Board Support Packages \(BSPs\)](#), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via [IDF Component Manager](#), so they can be found in [IDF Component Registry](#).

**Here is an example of how to add ESP32-S2-Kaluga-Kit BSP to your project:**

```
idf.py add-dependency esp32_s2_kaluga_kit
```

More examples of BSP usage can be found in [BSP examples folder](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see [ESP-IDF Versions](#).

The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the Tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the Environment Variables](#).

## 1.4 Build Your First Project

If you already have the ESP-IDF installed and are not using an IDE, you can build your first project from the command line following the [Start a Project on Windows](#) or [Start a Project on Linux and macOS](#).

## 1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow [Uninstall ESP-IDF](#).

# Chapter 2

## API Reference

### 2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures, and types.
- Build system functions, predefined variables, and options. These are documented in the [ESP-IDF CMake Build System API](#).
- *Kconfig* options can be used in code and in the build system (`CMakeLists.txt`) files.
- *Host tools* and their command line parameters are also part of the ESP-IDF interfaces.

ESP-IDF is made up of multiple components where these components either contain code specifically written for ESP chips, or contain a third-party library (i.e., a third-party component). In some cases, third-party components contain an "ESP-IDF specific" wrapper in order to provide an interface that is either simpler or better integrated with the rest of ESP-IDF's features. In other cases, third-party components present the original API of the underlying library directly.

The following sections explain some of the aspects of ESP-IDF APIs and their usage.

#### 2.1.1 Error Handling

Most ESP-IDF APIs return error codes defined with the `esp_err_t` type. See [Error Handling](#) section for more information about error handling approaches. [Error Codes Reference](#) contains the list of error codes returned by ESP-IDF components.

#### 2.1.2 Configuration Structures

---

**Important:** Correct initialization of configuration structures is an important part of making the application compatible with future versions of ESP-IDF.

---

Most initialization, configuration, and installation functions in ESP-IDF (typically named `..._init()`, `..._config()`, and `..._install()`) take a configuration structure pointer as an argument. For example:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

These functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

The C++ language supports designated initializer syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero-
↳ initialized */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = &my_arg,
};

/** Incorrect, .arg is declared after .callback in esp_timer_create_args_t */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

For more information on designated initializers, see [Designated Initializers](#). Note that C++ language versions older than C++20, which are not the default in the current version of ESP-IDF, do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

## Default Initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. Now all fields are_
↳ set to the default values, and any field can still be modified: */
config.server_port = 8081;
```

(continues on next page)

```
httpd_handle_t server;  
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code rather than by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in Example Projects

ESP-IDF examples contain a variety of projects demonstrating the usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Before using, take time to read the code and understand if it is applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the [Versioning Scheme](#).

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source-level Compatibility

ESP-IDF guarantees source-level compatibility of C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Source-level compatibility implies that the application source code can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source-level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however, this is not mandatory. Deprecated functions and files can be removed from major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system's [backward compatibility](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files, and source code.

## Lack of Binary Compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source-level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See *Configuration Structures* for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

## Other Exceptions from Compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issuing reports about any unintended breaking changes that do not fall into the categories below.

- *Private APIs*.
- *Components in Example Projects*.
- Features clearly marked as "beta", "preview", or "experimental".
- Changes made to mitigate security issues or to replace insecure default behaviors with secure ones.
- Features that were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features that depend on non-functional chip hardware features.
- Unexpected or undefined behavior that is not documented explicitly may be fixed/changed, such as due to missing validation of argument ranges.
- Location of *Kconfig* options in `menuconfig`.
- Location and names of example projects.

## 2.2 Application Protocols

### 2.2.1 ASIO Port

ASIO is a cross-platform C++ library, see <https://think-async.com/Asio/>. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component `ASIO` has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ASIO component on GitHub](#)

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`.

### Hosted Documentation

The documentation can be found on the link below:

- [ASIO documentation \(English\)](#)

## 2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, and Ethernet interfaces. Since ESP-IDF version v5.0, the component `freemodbus` has been moved from ESP-IDF to a separate repository:

- [ESP-Modbus component on GitHub](#)

### Hosted Documentation

The documentation can be found through the link below:

- [ESP-Modbus documentation \(English\)](#)

### Application Example

The examples below demonstrate the ESP-Modbus library of serial and TCP ports for both slave and master implementations respectively.

- [protocols/modbus/serial/mb\\_slave](#)
- [protocols/modbus/serial/mb\\_master](#)
- [protocols/modbus/tcp/mb\\_tcp\\_slave](#)
- [protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the `README.md` documents of each specific example for details.

### Protocol References

- For the detailed protocol specifications, see [The Modbus Organization](#).

## 2.2.3 ESP-MQTT

### Overview

ESP-MQTT is an implementation of [MQTT](#) protocol client, which is a lightweight publish/subscribe messaging protocol. Now ESP-MQTT supports [MQTT v5.0](#).

### Features

- Support MQTT over TCP, SSL with Mbed TLS, MQTT over WebSocket, and MQTT over WebSocket Secure
- Easy to setup with URI
- Multiple instances (multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings, and all 3 Quality of Service (QoS) levels (it should be a fully functional client)

### Application Examples

- [protocols/mqtt/tcp](#): MQTT over TCP, default port 1883
- [protocols/mqtt/ssl](#): MQTT over TLS, default port 8883
- [protocols/mqtt/ssl\\_ds](#): MQTT over TLS using digital signature peripheral for authentication, default port 8883
- [protocols/mqtt/ssl\\_mutual\\_auth](#): MQTT over TLS using certificates for authentication, default port 8883

- `protocols/mqtt/ssl_psk`: MQTT over TLS using pre-shared keys for authentication, default port 8883
- `protocols/mqtt/ws`: MQTT over WebSocket, default port 80
- `protocols/mqtt/wss`: MQTT over WebSocket Secure, default port 443
- `protocols/mqtt5`: Uses ESP-MQTT library to connect to broker with MQTT v5.0

### MQTT Message Retransmission

A new MQTT message is created by calling `esp_mqtt_client_publish` or its non blocking counterpart `esp_mqtt_client_enqueue`.

Messages with QoS 0 is sent only once. QoS 1 and 2 have different behaviors since the protocol requires extra steps to complete the process.

The ESP-MQTT library opts to always retransmit unacknowledged QoS 1 and 2 publish messages to avoid losses in faulty connections, even though the MQTT specification requires the re-transmission only on reconnect with Clean Session flag been set to 0 (set `disable_clean_session` to true for this behavior).

QoS 1 and 2 messages that may need retransmission are always enqueued, but first transmission try occurs immediately if `esp_mqtt_client_publish` is used. A transmission retry for unacknowledged messages will occur after `message_retransmit_timeout`. After `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` messages will expire and be deleted. If `CONFIG_MQTT_REPORT_DELETED_MESSAGES` is set, an event will be sent to notify the user.

### Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `esp_mqtt_client_config_t::broker_t` - Allow to set address and security verification.
- `esp_mqtt_client_config_t::credentials_t` - Client credentials for authentication.
- `esp_mqtt_client_config_t::session_t` - Configuration for MQTT session aspects.
- `esp_mqtt_client_config_t::network_t` - Networking related configuration.
- `esp_mqtt_client_config_t::task_t` - Allow to configure FreeRTOS task.
- `esp_mqtt_client_config_t::buffer_t` - Buffer size for input and output.

In the following sections, the most common aspects are detailed.

### Broker

**Address** Broker address can be set by usage of `address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in WebSocket connections.

The `uri` field is used in the format `scheme://hostname:port/path`.

- Currently support `mqtt`, `mqtt5`, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtt5://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
  - `mqtt5://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over WebSocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over WebSocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
↪client);
esp_mqtt_client_start(client);

```

**Note:** By default MQTT client uses event loop library to post related MQTT events (connected, subscribed, published, etc.).

**Verification** For secure connections with TLS used, and to guarantee Broker's identity, the *verification* struct must be set. The broker certificate may be set in PEM or DER format. To select DER, the equivalent *certificate\_len* field must be set. Otherwise, a null-terminated string in PEM format should be provided to *certificate* field.

- Get certificate from server, example: `mqtt.eclipseprojects.io`

```

openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/
↪null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem

```

- Check the sample application: [protocols/mqtt/ssl](#)
- Configuration:

```

const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};

```

For details about other fields, please check the [API Reference](#) and [TLS Server Verification](#).

**Client Credentials** All client related credentials are under the *credentials* field.

- *username*: pointer to the username used for connecting to the broker, can also be set by URI
- *client\_id*: pointer to the client ID, defaults to ESP32\_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format

**Authentication** It is possible to set authentication parameters through the *authentication* field. The client supports the following authentication methods:

- *password*: use a password by setting
- *certificate* and *key*: mutual authentication with TLS, and both can be provided in PEM or DER format
- *use\_secure\_element*: use secure element (ATECC608A) interfaced to ESP32
- *ds\_data*: use Digital Signature Peripheral available in some Espressif devices

**Session** For MQTT session-related configurations, *session* fields should be used.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the *last\_will* struct.

- *topic*: pointer to the LWT message topic
- *msg*: pointer to the LWT message
- *msg\_len*: length of the LWT message, required if *msg* is not null-terminated

- *qos*: quality of service for the LWT message
- *retain*: specifies the retain flag of the LWT message

**Change Settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menu-config`, under Component `config` > ESP-MQTT Configuration.

The following settings are available:

- *CONFIG\_MQTT\_PROTOCOL\_311*: enable 3.1.1 version of MQTT protocol
- *CONFIG\_MQTT\_TRANSPORT\_SSL* and *CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET*: enable specific MQTT transport layer, such as SSL, WEBSOCKET, and WEBSOCKET\_SECURE
- *CONFIG\_MQTT\_CUSTOM\_OUTBOX*: disable default implementation of `mqtt_outbox`, so a specific implementation can be supplied

## Events

The following events may be posted by the MQTT client:

- *MQTT\_EVENT\_BEFORE\_CONNECT*: The client is initialized and about to start connecting to the broker.
- *MQTT\_EVENT\_CONNECTED*: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- *MQTT\_EVENT\_DISCONNECTED*: The client has aborted the connection due to being unable to read or write data, e.g., because the server is unavailable.
- *MQTT\_EVENT\_SUBSCRIBED*: The broker has acknowledged the client's subscribe request. The event data contains the message ID of the subscribe message.
- *MQTT\_EVENT\_UNSUBSCRIBED*: The broker has acknowledged the client's unsubscribe request. The event data contains the message ID of the unsubscribe message.
- *MQTT\_EVENT\_PUBLISHED*: The broker has acknowledged the client's publish message. This is only posted for QoS level 1 and 2, as level 0 does not use acknowledgements. The event data contains the message ID of the publish message.
- *MQTT\_EVENT\_DATA*: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer, multiple *MQTT\_EVENT\_DATA* events are posted and *current\_data\_offset* and *total\_data\_len* from event data updated to keep track of the fragmented message.
- *MQTT\_EVENT\_ERROR*: The client has encountered an error. The field *error\_handle* in the event data contains *error\_type* that can be used to identify the error. The type of error determines which parts of the *error\_handle* struct is filled.

## API Reference

### Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`
- This header file can be included with:

```
#include "mqtt_client.h"
```

- This header file is a part of the API provided by the `mqtt` component. To declare that your component depends on `mqtt`, add the following to your `CMakeLists.txt`:

```
REQUIRES mqtt
```

or

```
PRIV_REQUIRES mqtt
```

### Functions

*esp\_mqtt\_client\_handle\_t* **esp\_mqtt\_client\_init** (const *esp\_mqtt\_client\_config\_t* \*config)

Creates *MQTT* client handle based on the configuration.

**Parameters** **config** -- *MQTT* configuration structure

**Returns** *mqtt\_client\_handle\_t* if successfully created, NULL on error

*esp\_err\_t* **esp\_mqtt\_client\_set\_uri** (*esp\_mqtt\_client\_handle\_t* client, const char \*uri)

Sets *MQTT* connection URI. This API is usually used to overrides the URI configured in *esp\_mqtt\_client\_init*.

**Parameters**

- **client** -- *MQTT* client handle
- **uri** --

**Returns** ESP\_FAIL if URI parse error, ESP\_OK on success

*esp\_err\_t* **esp\_mqtt\_client\_start** (*esp\_mqtt\_client\_handle\_t* client)

Starts *MQTT* client with already created client handle.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL on other error

*esp\_err\_t* **esp\_mqtt\_client\_reconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force reconnection upon a specific event.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

*esp\_err\_t* **esp\_mqtt\_client\_disconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force disconnection from the broker.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization

*esp\_err\_t* **esp\_mqtt\_client\_stop** (*esp\_mqtt\_client\_handle\_t* client)

Stops *MQTT* client tasks.

- Notes:
- Cannot be called from the *MQTT* event handler

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

int **esp\_mqtt\_client\_subscribe\_single** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- *esp\_mqtt\_client\_subscribe* could be used to call this function.

**Parameters**

- **client** -- *MQTT* client handle
- **topic** -- topic filter to subscribe
- **qos** -- Max qos level of the subscription

**Returns** *message\_id* of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_subscribe\_multiple** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_topic\_t* \*topic\_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

#### Parameters

- **client** -- *MQTT* client handle
- **topic\_list** -- List of topics to subscribe
- **size** -- size of topic\_list

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe_single` for details

#### Parameters

- **client** -- *MQTT* client handle
- **topic** --

**Returns** message\_id of the subscribe message on success -1 on failure

int **esp\_mqtt\_client\_publish** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

#### Parameters

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag

**Returns** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success. -1 on failure, -2 in case of full outbox.

int **esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

**Parameters**

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag
- **store** -- if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message\_id if queued successfully, -1 on failure, -2 in case of full outbox.

*esp\_err\_t* **esp\_mqtt\_client\_destroy** (*esp\_mqtt\_client\_handle\_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the *MQTT* event handler

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK ESP\_ERR\_INVALID\_ARG on wrong initialization

*esp\_err\_t* **esp\_mqtt\_set\_config** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_client\_config\_t* \*config)

Set configuration structure, typically used when updating the config (i.e. on "before\_connect" event).

Notes:

- When calling this function make sure to have all the intended configurations set, otherwise default values are set.

**Parameters**

- **client** -- *MQTT* client handle
- **config** -- *MQTT* configuration structure

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG if conflicts on transport configuration. ESP\_OK on success

*esp\_err\_t* **esp\_mqtt\_client\_register\_event** (*esp\_mqtt\_client\_handle\_t* client, *esp\_mqtt\_event\_id\_t* event, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg)

Registers *MQTT* event.

**Parameters**

- **client** -- *MQTT* client handle
- **event** -- event type
- **event\_handler** -- handler callback
- **event\_handler\_arg** -- handlers context

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_OK on success

*esp\_err\_t* **esp\_mqtt\_client\_unregister\_event** (*esp\_mqtt\_client\_handle\_t* client, *esp\_mqtt\_event\_id\_t* event, *esp\_event\_handler\_t* event\_handler)

Unregisters mqtt event.

**Parameters**

- **client** -- mqtt client handle
- **event** -- event ID
- **event\_handler** -- handler to unregister

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on invalid event ID ESP\_OK on success

int **esp\_mqtt\_client\_get\_outbox\_size** (*esp\_mqtt\_client\_handle\_t* client)

Get outbox size.

**Parameters** **client** -- *MQTT* client handle

**Returns** outbox size 0 on wrong initialization

*esp\_err\_t* **esp\_mqtt\_dispatch\_custom\_event** (*esp\_mqtt\_client\_handle\_t* client, *esp\_mqtt\_event\_t* \*event)

Dispatch user event to the mqtt internal event loop.

**Parameters**

- **client** -- *MQTT* client handle
- **event** -- *MQTT* event handle structure

**Returns** ESP\_OK on success ESP\_ERR\_TIMEOUT if the event couldn't be queued (ref also CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE)

## Structures

struct **esp\_mqtt\_error\_codes**

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp\_tls\_last\_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp\_tls\_last\_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking error\_type first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	connect_return_code	Internal error reported from <i>MQTT</i> broker on connection

## Public Members

*esp\_err\_t* **esp\_tls\_last\_esp\_err**

last esp\_err code reported from esp-tls component

int **esp\_tls\_stack\_err**

tls specific error code reported from underlying tls stack

int **esp\_tls\_cert\_verify\_flags**

tls flags reported from underlying tls stack during certificate verification

*esp\_mqtt\_error\_type\_t* **error\_type**

error type referring to the source of the error

*esp\_mqtt\_connect\_return\_code\_t* **connect\_return\_code**

connection refused error code reported from MQTT\* broker on connection

int **esp\_transport\_sock\_errno**

errno from the underlying socket

struct **esp\_mqtt\_event\_t**

*MQTT* event configuration structure

## Public Members

*esp\_mqtt\_event\_id\_t* **event\_id**

*MQTT* event type

*esp\_mqtt\_client\_handle\_t* **client**

*MQTT* client handle for this event

char \***data**

Data associated with this event

int **data\_len**

Length of the data for this event

int **total\_data\_len**

Total length of the data (longer data are supplied with multiple events)

int **current\_data\_offset**

Actual offset for the data associated with this event

char \***topic**

Topic associated with this event

int **topic\_len**

Length of the topic for this event associated with this event

int **msg\_id**

*MQTT* message id of message

int **session\_present**

*MQTT* session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* \***error\_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection, defaults to value from menuconfig

struct **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t* **broker**

Broker address and security verification

struct *esp\_mqtt\_client\_config\_t::credentials\_t* **credentials**

User credentials for broker

struct *esp\_mqtt\_client\_config\_t::session\_t* **session**

*MQTT* session configuration.

struct *esp\_mqtt\_client\_config\_t::network\_t* **network**

Network configuration

struct *esp\_mqtt\_client\_config\_t::task\_t* **task**

FreeRTOS task configuration.

struct *esp\_mqtt\_client\_config\_t::buffer\_t* **buffer**

Buffer size configuration.

struct *esp\_mqtt\_client\_config\_t::outbox\_config\_t* **outbox**

Outbox configuration.

struct **broker\_t**

Broker related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t::address\_t* **address**

Broker address configuration

struct *esp\_mqtt\_client\_config\_t::broker\_t::verification\_t* **verification**

Security verification of the broker

struct **address\_t**

Broker address

- uri have precedence over other fields
- If uri isn't set at least hostname, transport and port should.

### Public Members

const char **\*uri**

Complete *MQTT* broker URI

const char **\*hostname**

Hostname, to set ipv4 pass it as string)

*esp\_mqtt\_transport\_t* **transport**

Selects transport

const char **\*path**

Path in the URI

uint32\_t **port**

*MQTT* server port

struct **verification\_t**

Broker identity verification

If fields are not set broker's identity isn't verified. it's recommended to set the options in this struct for security reasons.

### Public Members

bool **use\_global\_ca\_store**

Use a global ca\_store, look esp-tls documentation for details.

*esp\_err\_t* (**\*cert\_bundle\_attach**)(void \*conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles. Client only attach the bundle, the clean up must be done by the user.

const char **\*certificate**

Certificate data, default is NULL. It's not copied nor freed by the client, user needs to clean up.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const struct *psk\_key\_hint* **\*psk\_hint\_key**

Pointer to PSK struct defined in esp\_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker. It's not copied nor freed by the client, user needs to clean up.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char **\*\*alpn\_protos**

NULL-terminated list of supported application protocols to be used for ALPN.

const char \***common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname. This is ignored if skip\_cert\_common\_name\_check=true. It's not copied nor freed by the client, user needs to clean up.

struct **buffer\_t**

Client buffer size configuration

Client have two buffers for input and output respectively.

### Public Members

int **size**

size of *MQTT* send/receive buffer

int **out\_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by `buffer_size`

struct **credentials\_t**

Client related credentials for authentication.

### Public Members

const char \***username**

*MQTT* username

const char \***client\_id**

Set *MQTT* client identifier. Ignored if set\_null\_client\_id == true If NULL set the default client id. Default client id is ESP32\_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

bool **set\_null\_client\_id**

Selects a NULL client id

struct *esp\_mqtt\_client\_config\_t::credentials\_t::authentication\_t* **authentication**

Client authentication

struct **authentication\_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

### Public Members

const char \***password**

*MQTT* password

const char \***certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with `key`. It's not copied nor freed by the client, user needs to clean up.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const char \***key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also `certificate` has to be provided. It's not copied nor freed by the client, user needs to clean up.

size\_t **key\_len**

Length of the buffer pointed to by key.

const char \***key\_password**

Client key decryption password, not PEM nor DER, if provided `key_password_len` must be correctly set.

int **key\_password\_len**

Length of the password pointed to by `key_password`

bool **use\_secure\_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void \***ds\_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices. It's not copied nor freed by the client, user needs to clean up.

struct **network\_t**

Network related configuration

### Public Members

int **reconnect\_timeout\_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh\_connection\_after\_ms**

Refresh connection after this value (in milliseconds)

bool **disable\_auto\_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

esp\_transport\_handle\_t **transport**

Custom transport handle to use. Warning: The transport should be valid during the client lifetime and is destroyed when `esp_mqtt_client_destroy` is called.

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

struct **outbox\_config\_t**

Client outbox configuration options.

### Public Members

uint64\_t **limit**

Size limit for the outbox in bytes.

struct **session\_t**

*MQTT* Session related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::session\_t::last\_will\_t* **last\_will**

Last will configuration

bool **disable\_clean\_session**

*MQTT* clean session, default `clean_session` is true

int **keepalive**

*MQTT* keepalive, default is 120 seconds When configuring this value, keep in mind that the client attempts to communicate with the broker at half the interval that is actually set. This conservative approach allows for more attempts before the broker's timeout occurs

bool **disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection.

int **message\_retransmit\_timeout**

timeout for retransmitting of failed packet

struct **last\_will\_t**

Last Will and Testament message configuration.

### Public Members

const char **\*topic**

LWT (Last Will and Testament) message topic

const char **\*msg**

LWT message, may be NULL terminated

int **msg\_len**

LWT message length, if msg isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

struct **task\_t**

Client task configuration

### Public Members

int **priority**

*MQTT* task priority

int **stack\_size**

*MQTT* task stack size

struct **topic\_t**

Topic definition struct

### Public Members

const char **\*filter**

Topic filter to subscribe

int **qos**

Max QoS level of the subscription

### Macros

**MQTT\_ERROR\_TYPE\_ESP\_TLS**

MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT\_ERROR\_TYPE\_ESP\_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

**esp\_mqtt\_client\_subscribe** (client\_handle, topic\_type, qos\_or\_size)

Convenience macro to select subscribe function to use.

Notes:

- Usage of `esp_mqtt_client_subscribe_single` is the same as previous `esp_mqtt_client_subscribe`, refer to it for details.

#### Parameters

- **client\_handle** -- *MQTT* client handle
- **topic\_type** -- Needs to be `char*` for single subscription or `esp_mqtt_topic_t` for multiple topics
- **qos\_or\_size** -- It's either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.

**Returns** `message_id` of the subscribe message on success -1 on failure -2 in case of full outbox.

### Type Definitions

```
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
```

```
typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t
```

*MQTT* event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `client` - *MQTT* client handle
- various other data depending on event type

```
typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t
```

*MQTT* connection error codes propagated via ERROR event

```
typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t
```

*MQTT* connection error codes propagated via ERROR event

```
typedef enum esp_mqtt_transport_t esp_mqtt_transport_t
```

```
typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t
```

*MQTT* protocol version used for connection

```
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
```

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from `tcp_transport/esp-tls` | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from *MQTT* broker on connection |

```
typedef struct esp_mqtt_event_t esp_mqtt_event_t
```

*MQTT* event configuration structure

typedef *esp\_mqtt\_event\_t* \***esp\_mqtt\_event\_handle\_t**

typedef struct *esp\_mqtt\_client\_config\_t* **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

typedef struct *topic\_t* **esp\_mqtt\_topic\_t**

Topic definition struct

## Enumerations

enum **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

*Values:*

enumerator **MQTT\_EVENT\_ANY**

enumerator **MQTT\_EVENT\_ERROR**

on error event, additional context: connection return code, error handle from esp\_tls (if supported)

enumerator **MQTT\_EVENT\_CONNECTED**

connected event, additional context: session\_present flag

enumerator **MQTT\_EVENT\_DISCONNECTED**

disconnected event

enumerator **MQTT\_EVENT\_SUBSCRIBED**

subscribed event, additional context:

- msg\_id message id
- error\_handle *error\_type* in case subscribing failed
- data pointer to broker response, check for errors.
- data\_len length of the data for this event

enumerator **MQTT\_EVENT\_UNSUBSCRIBED**

unsubscribed event, additional context: msg\_id

enumerator **MQTT\_EVENT\_PUBLISHED**

published event, additional context: msg\_id

enumerator **MQTT\_EVENT\_DATA**

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received
- retain retain flag of the message
- `qos` QoS level of the message
- `dup` dup flag of the message Note: Multiple `MQTT_EVENT_DATA` could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

enumerator **MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

enumerator **MQTT\_USER\_EVENT**

Custom event used to queue tasks into mqtt event handler All fields from the `esp_mqtt_event_t` type could be used to pass an additional context data to the handler.

enum **esp\_mqtt\_connect\_return\_code\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_CONNECTION\_ACCEPTED**

Connection accepted

enumerator **MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

*MQTT* connection refused reason: Wrong protocol

enumerator **MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

*MQTT* connection refused reason: ID rejected

enumerator **MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

*MQTT* connection refused reason: Server unavailable

enumerator **MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

*MQTT* connection refused reason: Wrong user

enumerator **MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

*MQTT* connection refused reason: Wrong username or password

enum **esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_ERROR\_TYPE\_NONE**

enumerator **MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT**

enumerator **MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED**

enumerator **MQTT\_ERROR\_TYPE\_SUBSCRIBE\_FAILED**

enum **esp\_mqtt\_transport\_t**

*Values:*

enumerator **MQTT\_TRANSPORT\_UNKNOWN**

enumerator **MQTT\_TRANSPORT\_OVER\_TCP**

*MQTT over TCP, using scheme: MQTT*

enumerator **MQTT\_TRANSPORT\_OVER\_SSL**

*MQTT over SSL, using scheme: MQTTS*

enumerator **MQTT\_TRANSPORT\_OVER\_WS**

*MQTT over WebSocket, using scheme:: ws*

enumerator **MQTT\_TRANSPORT\_OVER\_WSS**

*MQTT over WebSocket Secure, using scheme: wss*

enum **esp\_mqtt\_protocol\_ver\_t**

*MQTT protocol version used for connection*

*Values:*

enumerator **MQTT\_PROTOCOL\_UNDEFINED**

enumerator **MQTT\_PROTOCOL\_V\_3\_1**

enumerator **MQTT\_PROTOCOL\_V\_3\_1\_1**

enumerator **MQTT\_PROTOCOL\_V\_5**

## 2.2.4 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functions. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, and non-blocking connection among others. All the configurations can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2, etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree Structure for ESP-TLS Component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
├── private_include
│   ├── esp_tls_mbedtls.h
│   └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contains the public API headers for the component. Internally, the ESP-TLS component operates using either MbedTLS or WolfSSL, which are SSL/TLS libraries. APIs specific to MbedTLS are present in `esp-tls/private_include/esp_tls_mbedtls.h` and APIs specific to WolfSSL are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server Verification

ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected, the client will return a fatal error by default during the TLS connection setup.

- **ca\_cert\_buf** and **ca\_cert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS uses the CA certificate present in the buffer to verify the server. The following variables in the `esp_tls_cfg_t` structure must be set.
  - `ca_cert_buf` - pointer to the buffer which contains the CA certification.
  - `ca_cert_bytes` - the size of the CA certificate in bytes.
- **use\_global\_ca\_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See the API Reference section below for information regarding different APIs used for initializing and setting up the `global_ca_store`.
- **cert\_bundle\_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#).
- **psk\_hint\_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to the PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purposes. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option

is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure.

**Warning:** Enabling this option comes with a potential risk of establishing a TLS connection with a server that has a fake identity, provided that the server certificate is not provided either through API or other mechanisms like `ca_store` etc.

### ESP-TLS Server Cert Selection Hook

The ESP-TLS component provides an option to set the server certification selection hook when using the MbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake. The callback helps to select a certificate to present to the client based on the TLS extensions supplied in the client hello message, such as ALPN and SNI. To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig.

The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

### Underlying SSL/TLS Library Options

The ESP-TLS component offers the option to use MbedTLS or WolfSSL as its underlying SSL/TLS library. By default, only MbedTLS is available and used, WolfSSL SSL/TLS library is also available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides the WolfSSL component in binary format, and it also provides a few examples that are useful for understanding the API. Please refer to the repository `README.md` for information on licensing and other options. Please see the below section for instructions on how to use WolfSSL in your project.

---

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

---

### How to Use WolfSSL with ESP-IDF

There are two ways to use WolfSSL in your project:

- 1) Directly add WolfSSL as a component in your project with the following three commands:

```
(First, change the directory (cd) to your project directory)
mkdir components
cd components
git clone --recursive https://github.com/espressif/esp-wolfssl.git
```

- 2) Add WolfSSL as an extra component in your project.

- Download WolfSSL with:

```
git clone --recursive https://github.com/espressif/esp-wolfssl.git
```

- Include ESP-WolfSSL in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in `CMakeLists.txt` of your project as done in [wolfssl/examples](#). For reference see *Optional Project Variables* in *build-system*.

After the above steps, you will have the option to choose WolfSSL as the underlying SSL/TLS library in the configuration menu of your project as follows:

```
idf.py menuconfig > ESP-TLS > SSL/TLS Library > Mbedtls/Wolfssl
```

### Comparison Between MbedTLS and WolfSSL

The following table shows a typical comparison between WolfSSL and MbedTLS when the [protocols/https\\_request](#) example (which includes server authentication) is running with both SSL/TLS libraries and with all respective configurations set to default. For MbedTLS, the IN\_CONTENT length and OUT\_CONTENT length are set to 16384 bytes and 4096 bytes respectively.

Property	WolfSSL	MbedTLS
Total Heap Consumed	~ 19 KB	~ 37 KB
Task Stack Used	~ 2.2 KB	~ 3.6 KB
Bin size	~ 858 KB	~ 736 KB

**Note:** These values can vary based on configuration options and version of respective libraries.

### Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-S2. Use of the DS for TLS is supported only when ESP-TLS is used with MbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature \(DS\)](#). The technical details of Digital Signature such as how to calculate private key parameters can be found in [ESP32-S2 Technical Reference Manual > Digital Signature \(DS\) \[PDF\]](#). The DS peripheral must be configured before it can be used to perform Digital Signature, see [Configure the DS Peripheral for a TLS Connection](#).

The DS peripheral must be initialized with the required encrypted private key parameters, which are obtained when the DS peripheral is configured. ESP-TLS internally initializes the DS peripheral when provided with the required DS context, i.e., DS parameters. Please see the below code snippet for passing the DS context to the ESP-TLS context. The DS context passed to the ESP-TLS context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from...
→the nvs or provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client certification */,
    .clientcert_bytes = /* length of the client certification */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client certification (*clientcert\_buf*) and the DS params (*ds\_data*) are required and the client key (*clientkey\_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

## TLS Ciphersuites

ESP-TLS provides the ability to set a ciphersuites list in client mode. The TLS ciphersuites list informs the server about the supported ciphersuites for the specific TLS connection regardless of the TLS stack configuration. If the server supports any ciphersuite from this list, then the TLS connection will succeed; otherwise, it will fail.

You can set `ciphersuites_list` in the `esp_tls_cfg_t` structure during client connection as follows:

```
/* ciphersuites_list must end with 0 and must be available in the memory scope.
↳active during the entire TLS connection */
static const int ciphersuites_list[] = {MBEDTLS_TLS_ECDHE_ECDSA_WITH_AES_256_GCM_
↳SHA384, MBEDTLS_TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384, 0};
esp_tls_cfg_t cfg = {
    .ciphersuites_list = ciphersuites_list,
};
```

ESP-TLS will not check the validity of `ciphersuites_list` that was set, you should call `esp_tls_get_ciphersuites_list()` to get ciphersuites list supported in the TLS stack and cross-check it against the supplied list.

---

**Note:** This feature is supported only in the MbedTLS stack.

---

## TLS Protocol Version

ESP-TLS provides the ability to set the TLS protocol version for the respective TLS connection. Once the version is specified, it should be exclusively used to establish the TLS connection. This provides an ability to route different TLS connections to different protocol versions like TLS 1.2 and TLS 1.3 at runtime.

---

**Note:** At the moment, the feature is supported only when ESP-TLS is used with MbedTLS as its underlying SSL/TLS stack.

---

To set TLS protocol version with ESP-TLS, set `esp_tls_cfg_t::tls_version` to the required protocol version from `esp_tls_proto_ver_t`. If the protocol version field is not set, then the default policy is to allow TLS connection based on the server requirement.

The ESP-TLS connection can be configured to use the specified protocol version as follows:

```
#include "esp_tls.h"
esp_tls_cfg_t cfg = {
    .tls_version = ESP_TLS_VER_TLS_1_2,
};
```

## API Reference

### Header File

- [components/esp-tls/esp\\_tls.h](#)
- This header file can be included with:

```
#include "esp_tls.h"
```

- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp-tls
```

or

PRIV_REQUIRES esp-tls
-----------------------

## Functions

*esp\_err\_t* **esp\_tls\_cfg\_server\_session\_tickets\_init** (*esp\_tls\_cfg\_server\_t* \*cfg)

Initialize the server side TLS session ticket context.

This function initializes the server side tls session ticket context which holds all necessary data structures to enable tls session tickets according to RFC5077. Use *esp\_tls\_cfg\_server\_session\_tickets\_free* to free the data.

**Parameters** *cfg* -- [in] server configuration as *esp\_tls\_cfg\_server\_t*

**Returns** ESP\_OK if setup succeeded ESP\_ERR\_INVALID\_ARG if context is already initialized  
ESP\_ERR\_NO\_MEM if memory allocation failed ESP\_ERR\_NOT\_SUPPORTED if session tickets are not available due to build configuration ESP\_FAIL if setup failed

void **esp\_tls\_cfg\_server\_session\_tickets\_free** (*esp\_tls\_cfg\_server\_t* \*cfg)

Free the server side TLS session ticket context.

**Parameters** *cfg* -- server configuration as *esp\_tls\_cfg\_server\_t*

*esp\_tls\_t* \***esp\_tls\_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Returns** *tls* Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

*esp\_tls\_t* \***esp\_tls\_conn\_http\_new** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp\_tls\_conn\_http\_new\_sync* (and its asynchronous version *esp\_tls\_conn\_http\_new\_async*)

### Parameters

- **url** -- [in] url of host.
- **cfg** -- [in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp\_tls\_cfg\_t'. At a minimum, this structure should be zero-initialized.

**Returns** pointer to *esp\_tls\_t*, or NULL if connection couldn't be opened.

int **esp\_tls\_conn\_new\_sync** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

### Parameters

- **hostname** -- [in] Hostname of the host.
- **hostlen** -- [in] Length of hostname.
- **port** -- [in] Port number of the host.
- **cfg** -- [in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.
- **tls** -- [in] Pointer to esp-tls as esp-tls handle.

### Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_http\_new\_sync** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as *esp\_tls\_conn\_new\_sync*() API. However this API accepts host's url.

**Parameters**

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp\_tls\_cfg\_t'. At a minimum, this structure should be zero-initialized.
- **tls** -- **[in]** Pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_new\_async** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn't wait for the connection to get established.

**Parameters**

- **hostname** -- **[in]** Hostname of the host.
- **hostlen** -- **[in]** Length of hostname.
- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. `non_block` member of this structure should be set to be true.
- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp\_tls\_conn\_http\_new\_async** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as `esp_tls_conn_new_async()` API. However this API accepts host's url.

**Parameters**

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`.
- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize\_t **esp\_tls\_conn\_write** (*esp\_tls\_t* \*tls, const void \*data, size\_t datalen)

Write from buffer 'data' into specified tls connection.

**Parameters**

- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.
- **data** -- **[in]** Buffer from which data will be written.
- **datalen** -- **[in]** Length of data buffer.

**Returns**

- $\geq 0$  if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- $< 0$  if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize\_t **esp\_tls\_conn\_read** (*esp\_tls\_t* \*tls, void \*data, size\_t datalen)

Read from specified tls connection into the buffer 'data'.

**Parameters**

- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.
- **data** -- **[in]** Buffer to hold read data.
- **datalen** -- **[in]** Length of data buffer.

**Returns**

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

int **esp\_tls\_conn\_destroy** (*esp\_tls\_t* \*tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new_sync()` (or `esp_tls_conn_http_new_sync()`) and `esp_tls_conn_new_async()` (or `esp_tls_conn_http_new_async()`) APIs.

**Parameters** **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns** - 0 on success

- -1 if socket error or an invalid argument

ssize\_t **esp\_tls\_get\_bytes\_avail** (*esp\_tls\_t* \*tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's `mbedtls_ssl_get_bytes_avail()` API.

**Parameters** **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 in case of invalid arg
- bytes available in the application data record read buffer

*esp\_err\_t* **esp\_tls\_get\_conn\_sockfd** (*esp\_tls\_t* \*tls, int \*sockfd)

Returns the connection socket file descriptor from esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **sockfd** -- **[out]** int pointer to sockfd value.

**Returns** - ESP\_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd == NULL)

*esp\_err\_t* **esp\_tls\_set\_conn\_sockfd** (*esp\_tls\_t* \*tls, int sockfd)

Sets the connection socket file descriptor for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **sockfd** -- **[in]** sockfd value to set.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd < 0)

*esp\_err\_t* **esp\_tls\_get\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* \*conn\_state)

Gets the connection state for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **conn\_state** -- **[out]** pointer to the connection state value.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG (Invalid arguments)

*esp\_err\_t* **esp\_tls\_set\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* conn\_state)

Sets the connection state for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **conn\_state** -- **[in]** connection state value to set.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG (Invalid arguments)

void **esp\_tls\_get\_ssl\_context** (*esp\_tls\_t* \*tls)

Returns the ssl context.

**Parameters** **tls** -- **[in]** handle to esp\_tls context

**Returns** - ssl\_ctx pointer to ssl context of underlying TLS layer on success

- NULL in case of error

*esp\_err\_t* **esp\_tls\_init\_global\_ca\_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp\_tls\_set\_global\_ca\_store(). To be effective, this function must be called before any call to esp\_tls\_set\_global\_ca\_store().

**Returns**

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* **esp\_tls\_set\_global\_ca\_store** (const unsigned char \*cacert\_pem\_buf, const unsigned int cacert\_pem\_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp\_tls\_init\_global\_ca\_store() if it has not already been called. The application must call this function before calling esp\_tls\_conn\_new().

**Parameters**

- **cacert\_pem\_buf** -- **[in]** Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert\_pem\_bytes** -- **[in]** Length of the buffer.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_tls\_free\_global\_ca\_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_last\_error** (*esp\_tls\_error\_handle\_t* h, int \*esp\_tls\_code, int \*esp\_tls\_flags)

Returns last error in esp\_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Parameters**

- **h** -- **[in]** esp-tls error handle.
- **esp\_tls\_code** -- **[out]** last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code
- **esp\_tls\_flags** -- **[out]** last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

**Returns**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK (0) if no error occurred
- specific error code (based on ESP\_ERR\_ESP\_TLS\_BASE) otherwise

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_error\_type** (*esp\_tls\_error\_handle\_t* h, *esp\_tls\_error\_type\_t* err\_type, int \*error\_code)

Returns the last error captured in esp\_tls of a specific type. The error information is cleared internally upon return.

#### Parameters

- **h** -- [in] esp-tls error handle.
- **err\_type** -- [in] specific error type
- **error\_code** -- [out] last error code returned from mbedtls api (set to zero if none). This pointer could be NULL if caller does not care about esp\_tls\_code

#### Returns

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK if a valid error returned and was cleared

*esp\_err\_t* **esp\_tls\_get\_error\_handle** (*esp\_tls\_t* \*tls, *esp\_tls\_error\_handle\_t* \*error\_handle)

Returns the ESP-TLS error\_handle.

#### Parameters

- **tls** -- [in] handle to esp\_tls context
- **error\_handle** -- [out] pointer to the error handle.

#### Returns

- ESP\_OK on success and error\_handle will be updated with the ESP-TLS error handle.
- ESP\_ERR\_INVALID\_ARG if (tls == NULL || error\_handle == NULL)

mbedtls\_x509\_crt \***esp\_tls\_get\_global\_ca\_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call esp\_tls\_set\_global\_ca\_store(). Then the same CA store could be used by the application for APIs other than esp\_tls.

---

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

---

#### Returns

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

const int \***esp\_tls\_get\_ciphersuites\_list** (void)

Get supported TLS ciphersuites list.

See <https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4> for the list of ciphersuites

**Returns** Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites.

int **esp\_tls\_server\_session\_create** (*esp\_tls\_cfg\_server\_t* \*cfg, int sockfd, *esp\_tls\_t* \*tls)

Create TLS/SSL server session.

This function creates a TLS/SSL server context for already accepted client connection and performs TLS/SSL handshake with the client

#### Parameters

- **cfg** -- [in] Pointer to esp\_tls\_cfg\_server\_t
- **sockfd** -- [in] FD of accepted connection
- **tls** -- [out] Pointer to allocated esp\_tls\_t

#### Returns

- 0 if successful
- <0 in case of error

void **esp\_tls\_server\_session\_delete** (*esp\_tls\_t* \*tls)

Close the server side TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_server_session_create()`

**Parameters** `tls` -- **[in]** pointer to `esp_tls_t`

`esp_err_t esp_tls_plain_tcp_connect` (const char \*host, int hostlen, int port, const `esp_tls_cfg_t` \*cfg, `esp_tls_error_handle_t` error\_handle, int \*sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**

- **host** -- **[in]** Hostname of the host.
- **hostlen** -- **[in]** Length of hostname.
- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** ESP-TLS configuration as `esp_tls_cfg_t`.
- **error\_handle** -- **[out]** ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** -- **[out]** Socket descriptor if successfully connected on TCP layer

**Returns** `ESP_OK` on success `ESP_ERR_INVALID_ARG` if invalid output parameters ESP-TLS based error codes on failure

## Structures

struct `psk_key_hint`

ESP-TLS preshared key and hint structure.

### Public Members

const uint8\_t \***key**

key in PSK authentication mode in binary format

const size\_t **key\_size**

length of the key

const char \***hint**

hint in PSK authentication mode in string format

struct `tls_keep_alive_cfg`

esp-tls client session ticket ctx

Keep alive parameters structure

### Public Members

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time (second)

int **keep\_alive\_interval**

Keep-alive interval time (second)

int **keep\_alive\_count**

Keep-alive packet retry send count

struct **esp\_tls\_cfg**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

### Public Members

const char **\*\*alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char \*\*alpn\_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char **\*cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*cacert\_pem\_buf**

CA certificate buffer legacy name

unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char **\*clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*clientcert\_pem\_buf**

Client certificate legacy name

unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

const unsigned char \***clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char \***clientkey\_pem\_buf**

Client key legacy name

unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

const unsigned char \***clientkey\_password**

Client key decryption password string

unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **use\_ecdsa\_peripheral**

Use the ECDSA peripheral for the private key operations

uint8\_t **ecdsa\_key\_efuse\_blk**

The efuse block where the ECDSA key is stored

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use\_secure\_element**

Enable this option to use secure element or atec608a chip

int **timeout\_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32\_MAX

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

const char \***common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

*tls\_keep\_alive\_cfg\_t* \***keep\_alive\_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk\_hint\_key\_t* \***psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void \***ds\_data**

Pointer for digital signature peripheral context

bool **is\_plain\_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp\_tls\_plain\_tcp\_connect() API

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

*esp\_tls\_addr\_family\_t* **addr\_family**

The address family to use when connecting to a host.

const int \***ciphersuites\_list**

Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites. Please check the list validity by esp\_tls\_get\_ciphersuites\_list() API

*esp\_tls\_proto\_ver\_t* **tls\_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

struct **esp\_tls\_cfg\_server**

ESP-TLS Server configuration parameters.

## Public Members

const char \*\***alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char \*\*alpn\_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char \***cacert\_buf**

Client CA certificate in a buffer. This buffer should be NULL terminated

const unsigned char \***cacert\_pem\_buf**

Client CA certificate legacy name

unsigned int **cacert\_bytes**

Size of client CA certificate pointed to by cacert\_pem\_buf

unsigned int **cacert\_pem\_bytes**  
Size of client CA certificate legacy name

const unsigned char \***servercert\_buf**  
Server certificate in a buffer This buffer should be NULL terminated

const unsigned char \***servercert\_pem\_buf**  
Server certificate legacy name

unsigned int **servercert\_bytes**  
Size of server certificate pointed to by servercert\_pem\_buf

unsigned int **servercert\_pem\_bytes**  
Size of server certificate legacy name

const unsigned char \***serverkey\_buf**  
Server key in a buffer This buffer should be NULL terminated

const unsigned char \***serverkey\_pem\_buf**  
Server key legacy name

unsigned int **serverkey\_bytes**  
Size of server key pointed to by serverkey\_pem\_buf

unsigned int **serverkey\_pem\_bytes**  
Size of server key legacy name

const unsigned char \***serverkey\_password**  
Server key decryption password string

unsigned int **serverkey\_password\_len**  
String length of the password pointed to by serverkey\_password

bool **use\_ecdsa\_peripheral**  
Use ECDSA peripheral to use private key

uint8\_t **ecdsa\_key\_efuse\_blk**  
The efuse block where ECDSA key is stored

bool **use\_secure\_element**  
Enable this option to use secure element or atec608a chip

void \***userdata**  
User data to be added to the ssl context. Can be retrieved by callbacks

### Type Definitions

typedef enum *esp\_tls\_conn\_state* **esp\_tls\_conn\_state\_t**  
ESP-TLS Connection State.

typedef enum *esp\_tls\_role* **esp\_tls\_role\_t**

typedef struct *psk\_key\_hint* **psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls\_keep\_alive\_cfg* **tls\_keep\_alive\_cfg\_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef enum *esp\_tls\_addr\_family* **esp\_tls\_addr\_family\_t**

typedef struct *esp\_tls\_cfg* **esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

typedef void \***esp\_tls\_handshake\_callback**

typedef struct *esp\_tls\_cfg\_server* **esp\_tls\_cfg\_server\_t**

ESP-TLS Server configuration parameters.

typedef struct esp\_tls **esp\_tls\_t**

### Enumerations

enum **esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

enumerator **ESP\_TLS\_INIT**

enumerator **ESP\_TLS\_CONNECTING**

enumerator **ESP\_TLS\_HANDSHAKE**

enumerator **ESP\_TLS\_FAIL**

enumerator **ESP\_TLS\_DONE**

enum **esp\_tls\_role**

*Values:*

enumerator **ESP\_TLS\_CLIENT**

enumerator **ESP\_TLS\_SERVER**

enum **esp\_tls\_addr\_family**

*Values:*

enumerator **ESP\_TLS\_AF\_UNSPEC**

Unspecified address family.

enumerator **ESP\_TLS\_AF\_INET**

IPv4 address family.

enumerator **ESP\_TLS\_AF\_INET6**

IPv6 address family.

enum **esp\_tls\_proto\_ver\_t**

*Values:*

enumerator **ESP\_TLS\_VER\_ANY**

enumerator **ESP\_TLS\_VER\_TLS\_1\_2**

enumerator **ESP\_TLS\_VER\_TLS\_1\_3**

enumerator **ESP\_TLS\_VER\_TLS\_MAX**

### Header File

- [components/esp-tls/esp\\_tls\\_errors.h](#)
- This header file can be included with:

```
#include "esp_tls_errors.h"
```

- This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp-tls
```

or

```
PRIV_REQUIRES esp-tls
```

### Structures

struct **esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

## Public Members

### *esp\_err\_t* last\_error

error code (based on ESP\_ERR\_ESP\_TLS\_BASE) of the last occurred error

### int esp\_tls\_error\_code

esp\_tls error code from last esp\_tls failed api

### int esp\_tls\_flags

last certification verification flags

## Macros

### ESP\_ERR\_ESP\_TLS\_BASE

Starting number of ESP-TLS error codes

### ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME

Error if hostname couldn't be resolved upon tls connection

### ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET

Failed to create socket

### ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY

Unsupported protocol family

### ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST

Failed to connect to host

### ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED

failed to set/get socket option

### ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT

new connection in esp\_tls\_low\_level\_conn connection timeouted

### ESP\_ERR\_ESP\_TLS\_SE\_FAILED

### ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN

### ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK

mbedtls parse certificates was partly successful

### ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED

mbedtls api returned error

### ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED

mbedtls api returned error

### ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_X509\_CERT\_PARSE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED**

wolfSSL api returned failed

**ESP\_TLS\_ERR\_SSL\_WANT\_READ**

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- `esp_tls_conn_read()`
- `esp_tls_conn_write()`

**ESP\_TLS\_ERR\_SSL\_WANT\_WRITE****ESP\_TLS\_ERR\_SSL\_TIMEOUT****Type Definitions**

```
typedef struct esp_tls_last_error *esp_tls_error_handle_t
```

```
typedef struct esp_tls_last_error esp_tls_last_error_t
```

Error structure containing relevant errors in case tls error occurred.

**Enumerations**

```
enum esp_tls_error_type_t
```

Definition of different types/sources of error codes reported from different components

*Values:*

enumerator **ESP\_TLS\_ERR\_TYPE\_UNKNOWN**

enumerator **ESP\_TLS\_ERR\_TYPE\_SYSTEM**

System error –`errno`

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS\_CERT\_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP\_TLS\_ERR\_TYPE\_ESP**

ESP-IDF error type –`esp_err_t`

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL\_CERT\_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP\_TLS\_ERR\_TYPE\_MAX**

Last err type –invalid entry

## 2.2.5 ESP HTTP Client

### Overview

`esp_http_client` component provides a set of APIs for making HTTP/S requests from ESP-IDF applications. The steps to use these APIs are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_handle_t` instance, i.e., an HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values are assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data, and closing the connection (as required), while blocking the current task before its completion. All related events are invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests can be found at [protocols/esp\\_http\\_client](#).

### Basic HTTP Request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

### Persistent Connections

Persistent connection means that the HTTP client can reuse the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance. Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

### HTTPS Request

ESP HTTP client supports SSL connections using **mbedTLS**, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

---

**Note:** While making HTTPS requests, if server verification is needed, an additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in the `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

---

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example for implementation details of the above note.

## HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle.
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional).
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection.
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`.
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream.
- `esp_http_client_close()`: Close the connection.
- `esp_http_client_cleanup()`: Release allocated resources.

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

## HTTP Authentication

### ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only one perform operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes two perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.
- Currently, Digest authentication supports only MD5 and SHA-256 algorithms.

### Examples of Authentication Configuration

- Authentication with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

## Event Handling

ESP HTTP Client supports event handling by triggering an event handler corresponding to the event which takes place. `esp_http_client_event_id_t` contains all the events which could occur while performing an HTTP request using the ESP HTTP Client.

To enable event handling, you just need to set a callback function using the `esp_http_client_config_t::event_handler` member.

## ESP HTTP Client Diagnostic Information

Diagnostic information could be helpful to gain insights into a problem. In the case of ESP HTTP Client, the diagnostic information can be collected by registering an event handler with *the Event Loop library*. This feature has been added by keeping in mind the **ESP Insights** framework which collects the diagnostic information. However, this feature can also be used without any dependency on the ESP Insights framework for the diagnostic purpose. Event handler can be registered to the event loop using the `esp_event_handler_register()` function.

Expected data types for different HTTP Client events in the event loop are as follows:

- `HTTP_EVENT_ERROR`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_CONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_HEADERS_SENT`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_HEADER`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_DATA`: `esp_http_client_on_data_t`
- `HTTP_EVENT_ON_FINISH`: `esp_http_client_handle_t`
- `HTTP_EVENT_DISCONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_REDIRECT`: `esp_http_client_redirect_event_data_t`

The `esp_http_client_handle_t` received along with the event data will be valid until `HTTP_EVENT_DISCONNECTED` is not received. This handle has been sent primarily to differentiate between different client connections and must not be used for any other purpose, as it may change based on client connection state.

## TLS Protocol Version

TLS protocol version to be used for the underlying TLS connection can be set in `esp_http_client_config_t`. Please refer to the **TLS Protocol Version** section in the *ESP-TLS* for more details.

The TLS protocol version for the HTTP client can be configured as follows:

```
#include "esp_http_client.h"
esp_http_client_config_t config = {
    .tls_version = ESP_HTTP_CLIENT_TLS_VER_TLS_1_2,
};
```

## API Reference

### Header File

- `components/esp_http_client/include/esp_http_client.h`
- This header file can be included with:

```
#include "esp_http_client.h"
```

- This header file is a part of the API provided by the `esp_http_client` component. To declare that your component depends on `esp_http_client`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_http_client
```

or

PRIV\_REQUIRES esp\_http\_client

## Functions

*esp\_http\_client\_handle\_t* **esp\_http\_client\_init** (const *esp\_http\_client\_config\_t* \*config)

Start a HTTP session This function must be the first function to call, and it returns a *esp\_http\_client\_handle\_t* that you must use as input to other functions in the interface. This call **MUST** have a corresponding call to *esp\_http\_client\_cleanup* when the operation is complete.

**Parameters** **config** -- [in] The configurations, see *http\_client\_config\_t*

### Returns

- *esp\_http\_client\_handle\_t*
- NULL if any errors

*esp\_err\_t* **esp\_http\_client\_perform** (*esp\_http\_client\_handle\_t* client)

Invoke this function after *esp\_http\_client\_init* and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same *esp\_http\_client\_handle\_t* as input as the *esp\_http\_client\_init* call returned. *esp\_http\_client\_perform* performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking *esp\_http\_client\_perform*(), *is\_async* member of *esp\_http\_client\_config\_t* must be set while making a call to *esp\_http\_client\_init*() API. You can do any amount of calls to *esp\_http\_client\_perform* while using the same *esp\_http\_client\_handle\_t*. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. *esp\_http\_client* will then attempt to reuse the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use *esp\_http\_client\_set\_\** between the invokes to set options for the following *esp\_http\_client\_perform*.

---

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several *esp\_http\_client\_handle\_t*. This function include *esp\_http\_client\_open* -> *esp\_http\_client\_write* -> *esp\_http\_client\_fetch\_headers* -> *esp\_http\_client\_read* (and option) *esp\_http\_client\_close*.

---

**Parameters** **client** -- The *esp\_http\_client* handle

### Returns

- ESP\_OK on successful
- ESP\_FAIL on error

*esp\_err\_t* **esp\_http\_client\_cancel\_request** (*esp\_http\_client\_handle\_t* client)

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same *esp\_http\_client* context.

**Parameters** **client** -- The *esp\_http\_client* handle

### Returns

- ESP\_OK on successful
- ESP\_FAIL on error
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_INVALID\_STATE

*esp\_err\_t* **esp\_http\_client\_set\_url** (*esp\_http\_client\_handle\_t* client, const char \*url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

### Parameters

- **client** -- [in] The *esp\_http\_client* handle
- **url** -- [in] The url

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_set\_post\_field** (*esp\_http\_client\_handle\_t* client, const char \*data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**

- **client** -- [in] The `esp_http_client` handle
- **data** -- [in] post data pointer
- **len** -- [in] post length

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_get\_post\_field** (*esp\_http\_client\_handle\_t* client, char \*\*data)

Get current post field information.

**Parameters**

- **client** -- [in] The client
- **data** -- [out] Point to post data pointer

**Returns** Size of post data

*esp\_err\_t* **esp\_http\_client\_set\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, const char \*value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Parameters**

- **client** -- [in] The `esp_http_client` handle
- **key** -- [in] The header key
- **value** -- [in] The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, char \*\*value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- [in] The `esp_http_client` handle
- **key** -- [in] The header key
- **value** -- [out] The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_username** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- [in] The `esp_http_client` handle
- **value** -- [out] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_username** (*esp\_http\_client\_handle\_t* client, const char \*username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **username** -- [in] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **value** -- [out] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* client, const char \*password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **password** -- [in] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_auth\_type\_t* auth\_type)

Set http request auth\_type.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **auth\_type** -- [in] The esp\_http\_client auth type

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*\*data)

Get http request user\_data. The value stored from the *esp\_http\_client\_config\_t* will be written to the address passed into data.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **data** -- [out] A pointer to the pointer that will be set to user\_data.

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*data)

Set http request user\_data. The value passed in +data+ will be available during event callbacks. No memory management will be performed on the user's behalf.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **data** -- [in] The pointer to the user data

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

int **esp\_http\_client\_get\_errno** (*esp\_http\_client\_handle\_t* client)

Get HTTP client session errno.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- (-1) if invalid argument
- errno

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_method\_t* method)

Set http request method.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **method** -- [in] The method

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_timeout\_ms** (*esp\_http\_client\_handle\_t* client, int timeout\_ms)

Set http request timeout.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **timeout\_ms** -- [in] The timeout value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* client, const char \*key)

Delete http request header.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **key** -- [in] The key

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* client, int write\_len)

This function will be open the connection, write all header strings and return.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **write\_len** -- [in] HTTP Content length need to write to the server

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* client, const char \*buffer, int len)

This function will write data to the HTTP connection previously opened by esp\_http\_client\_open()

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **buffer** -- The buffer
- **len** -- [in] This value must not be larger than the write\_len parameter provided to esp\_http\_client\_open()

**Returns**

- (-1) if any errors

- Length of data written

int64\_t **esp\_http\_client\_fetch\_headers** (*esp\_http\_client\_handle\_t* client)

This function need to call after `esp_http_client_open`, it will read from http stream, process all receive headers.

**Parameters** **client** -- **[in]** The `esp_http_client` handle

**Returns**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked` response)
- (-1: `ESP_FAIL`) if any errors
- (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) if call is timed-out before any data was ready
- Download data length defined by content-length header

bool **esp\_http\_client\_is\_chunked\_response** (*esp\_http\_client\_handle\_t* client)

Check response data is chunked.

**Parameters** **client** -- **[in]** The `esp_http_client` handle

**Returns** true or false

int **esp\_http\_client\_read** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Read data from http stream.

---

**Note:** (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) is returned when call is timed-out before any data was ready

---

**Parameters**

- **client** -- **[in]** The `esp_http_client` handle
- **buffer** -- The buffer
- **len** -- **[in]** The length

**Returns**

- (-1) if any errors
- Length of data was read

int **esp\_http\_client\_get\_status\_code** (*esp\_http\_client\_handle\_t* client)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

**Parameters** **client** -- **[in]** The `esp_http_client` handle

**Returns** Status code

int64\_t **esp\_http\_client\_get\_content\_length** (*esp\_http\_client\_handle\_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Parameters** **client** -- **[in]** The `esp_http_client` handle

**Returns**

- (-1) Chunked transfer
- Content-Length value as bytes

*esp\_err\_t* **esp\_http\_client\_close** (*esp\_http\_client\_handle\_t* client)

Close http connection, still kept all http request resources.

**Parameters** **client** -- **[in]** The `esp_http_client` handle

**Returns**

- `ESP_OK`
- `ESP_FAIL`

*esp\_err\_t* **esp\_http\_client\_cleanup** (*esp\_http\_client\_handle\_t* client)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_http\_client\_transport\_t* **esp\_http\_client\_get\_transport\_type** (*esp\_http\_client\_handle\_t* client)

Get transport type.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

*esp\_err\_t* **esp\_http\_client\_set\_redirection** (*esp\_http\_client\_handle\_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_reset\_redirect\_counter** (*esp\_http\_client\_handle\_t* client)

Reset the redirection counter. This is useful to reset redirect counter in cases where the same handle is used for multiple requests.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_auth\_data** (*esp\_http\_client\_handle\_t* client, const char \*auth\_data, int len)

On receiving a custom authentication header, this API can be invoked to set the authentication information from the header. This API can be called from the event handler.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **auth\_data** -- [in] The authentication data received in the header
- **len** -- [in] length of auth\_data.

**Returns**

- ESP\_ERR\_INVALID\_ARG
- ESP\_OK

void **esp\_http\_client\_add\_auth** (*esp\_http\_client\_handle\_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

---

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

---

**Parameters** **client** -- [in] The esp\_http\_client handle

bool **esp\_http\_client\_is\_complete\_data\_received** (*esp\_http\_client\_handle\_t* client)

Checks if entire data in the response has been read without any error.

**Parameters** **client** -- [in] The esp\_http\_client handle

**Returns**

- true
- false

int **esp\_http\_client\_read\_response** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

#### Parameters

- **client** -- [in] The `esp_http_client` handle
- **buffer** -- The buffer
- **len** -- [in] The buffer length

#### Returns

- Length of data was read

*esp\_err\_t* **esp\_http\_client\_flush\_response** (*esp\_http\_client\_handle\_t* client, int \*len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

#### Parameters

- **client** -- [in] The `esp_http_client` handle
- **len** -- Length of data discarded

#### Returns

- ESP\_OK If successful, len will have discarded length
- ESP\_FAIL If failed to read response
- ESP\_ERR\_INVALID\_ARG If the client is NULL

*esp\_err\_t* **esp\_http\_client\_get\_url** (*esp\_http\_client\_handle\_t* client, char \*url, const int len)

Get URL from client.

#### Parameters

- **client** -- [in] The `esp_http_client` handle
- **url** -- [inout] The buffer to store URL
- **len** -- [in] The buffer length

#### Returns

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_chunk\_length** (*esp\_http\_client\_handle\_t* client, int \*len)

Get Chunk-Length from client.

#### Parameters

- **client** -- [in] The `esp_http_client` handle
- **len** -- [out] Variable to store length

#### Returns

- ESP\_OK If successful, len will have length of current chunk
- ESP\_FAIL If the server is not a chunked server
- ESP\_ERR\_INVALID\_ARG If the client or len are NULL

## Structures

struct **esp\_http\_client\_event**

HTTP Client events data.

### Public Members

*esp\_http\_client\_event\_id\_t* **event\_id**

event\_id, to know the cause of the event

*esp\_http\_client\_handle\_t* **client**

esp\_http\_client\_handle\_t context

void **\*data**

data of the event

int **data\_len**

data length of data

void **\*user\_data**

user\_data context, from *esp\_http\_client\_config\_t* user\_data

char **\*header\_key**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header key

char **\*header\_value**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header value

struct **esp\_http\_client\_on\_data**

Argument structure for HTTP\_EVENT\_ON\_DATA event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int64\_t **data\_process**

Total data processed

struct **esp\_http\_client\_redirect\_event\_data**

Argument structure for HTTP\_EVENT\_REDIRECT event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int **status\_code**

Status Code

struct **esp\_http\_client\_config\_t**

HTTP configuration.

### Public Members

const char **\*url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char **\*host**

Domain or IP as string

int **port**

Port to connect, default depend on `esp_http_client_transport_t` (80 or 443)

const char **\*username**

Using for Http authentication

const char **\*password**

Using for Http authentication

*esp\_http\_client\_auth\_type\_t* **auth\_type**

Http authentication type, see `esp_http_client_auth_type_t`

const char **\*path**

HTTP Path, if not set, default is /

const char **\*query**

HTTP query

const char **\*cert\_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size\_t **cert\_len**

Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

const char **\*client\_cert\_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size\_t **client\_cert\_len**

Length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem

const char **\*client\_key\_pem**

SSL client key, PEM format as string, if the server requires to verify client

size\_t **client\_key\_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

const char **\*client\_key\_password**

Client key decryption password string

size\_t **client\_key\_password\_len**

String length of the password pointed to by `client_key_password`

*esp\_http\_client\_proto\_ver\_t* **tls\_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

const char \***user\_agent**

The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**

HTTP Method

int **timeout\_ms**

Network timeout in milliseconds

bool **disable\_auto\_redirect**

Disable HTTP automatic redirects

int **max\_redirection\_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max\_authorization\_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http\_event\_handle\_cb* **event\_handler**

HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**

HTTP transport type, see *esp\_http\_client\_transport\_t*

int **buffer\_size**

HTTP receive buffer size

int **buffer\_size\_tx**

HTTP transmit buffer size

void \***user\_data**

HTTP user\_data context

bool **is\_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

const char \***common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to *esp\_cert\_bundle\_attach*. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

void **\*ds\_data**

Pointer for digital signature peripheral context, see ESP-TLS Documentation for more details

## Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**

Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**

The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**

Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of errno EAGAIN to esp\_err\_t

**ESP\_ERR\_HTTP\_CONNECTION\_CLOSED**

Read FIN from peer and the connection closed

## Type Definitions

typedef struct esp\_http\_client \***esp\_http\_client\_handle\_t**

typedef struct *esp\_http\_client\_event* \***esp\_http\_client\_event\_handle\_t**

typedef struct *esp\_http\_client\_event* **esp\_http\_client\_event\_t**

HTTP Client events data.

typedef struct *esp\_http\_client\_on\_data* **esp\_http\_client\_on\_data\_t**

Argument structure for HTTP\_EVENT\_ON\_DATA event.

typedef struct *esp\_http\_client\_redirect\_event\_data* **esp\_http\_client\_redirect\_event\_data\_t**

Argument structure for HTTP\_EVENT\_REDIRECT event.

typedef *esp\_err\_t* (\***http\_event\_handle\_cb**)(*esp\_http\_client\_event\_t* \*evt)

## Enumerations

enum **esp\_http\_client\_event\_id\_t**

HTTP Client events id.

*Values:*

enumerator **HTTP\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_EVENT\_ON\_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

enumerator **HTTP\_EVENT\_HEADERS\_SENT**

After sending all the headers to the server

enumerator **HTTP\_EVENT\_HEADER\_SENT**

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

enumerator **HTTP\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the server

enumerator **HTTP\_EVENT\_ON\_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP\_EVENT\_ON\_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_EVENT\_REDIRECT**

Intercepting HTTP redirects to handle them manually

enum **esp\_http\_client\_transport\_t**

HTTP Client transport.

*Values:*

enumerator **HTTP\_TRANSPORT\_UNKNOWN**

Unknown

enumerator **HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator **HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

enum **esp\_http\_client\_proto\_ver\_t**

*Values:*

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_ANY**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_TLS\_1\_2**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_TLS\_1\_3**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_MAX**

enum **esp\_http\_client\_method\_t**

HTTP method.

*Values:*

enumerator **HTTP\_METHOD\_GET**

HTTP GET Method

enumerator **HTTP\_METHOD\_POST**

HTTP POST Method

enumerator **HTTP\_METHOD\_PUT**

HTTP PUT Method

enumerator **HTTP\_METHOD\_PATCH**

HTTP PATCH Method

enumerator **HTTP\_METHOD\_DELETE**

HTTP DELETE Method

enumerator **HTTP\_METHOD\_HEAD**

HTTP HEAD Method

enumerator **HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP\_METHOD\_COPY**

HTTP COPY Method

enumerator **HTTP\_METHOD\_MOVE**

HTTP MOVE Method

enumerator **HTTP\_METHOD\_LOCK**

HTTP LOCK Method

enumerator **HTTP\_METHOD\_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP\_METHOD\_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP\_METHOD\_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP\_METHOD\_MKCOL**

HTTP MKCOL Method

enumerator **HTTP\_METHOD\_MAX**

enum **esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:*

enumerator **HTTP\_AUTH\_TYPE\_NONE**

No authentication

enumerator **HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

enumerator **HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

enum **HttpStatus\_Code**

Enum for the HTTP status codes.

*Values:*

enumerator `HttpStatus_Ok`

enumerator `HttpStatus_MultipleChoices`

enumerator `HttpStatus_MovedPermanently`

enumerator `HttpStatus_Found`

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

## 2.2.6 ESP Local Control

### Overview

ESP Local Control (`esp_local_ctrl`) component in ESP-IDF provides capability to control an ESP device over HTTPS or Bluetooth® Low Energy. It provides access to application defined **properties** that are available for reading/writing via a set of configurable handlers.

Initialization of the `esp_local_ctrl` service over HTTPS transport is performed as follows:

```
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[]   asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]   asm("_binary_prvtkey_pem_
↪end");
```

(continues on next page)

(continued from previous page)

```

https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx          = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. `PROTOCOM_SEC2`: specifies that SRP6a-based key exchange and end-to-end encryption based on AES-GCM are used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol, i.e., SRP6a.
2. `PROTOCOM_SEC1`: specifies that Curve25519-based key exchange and end-to-end encryption based on AES-CTR are used.
3. `PROTOCOM_SEC0`: specifies that data will be exchanged as a plain text (no security).
4. `PROTOCOM_SEC_CUSTOM`: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

---

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in *Protocol Communication* for more details.

---

### Creating a Property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique `name` (string), a type` (e.g., enum), flags` (bit fields) and size`.`

The `size` is to be kept 0, if we want our property value to be of variable length (e.g., if it is a string or bytestream). For data types with fixed-length property value, like int, float, etc., setting the `size` field to the right value helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally upto the application, hence they may be used as enumerations, bitfields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);

```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get/set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```

static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
                                     ↪values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value. This is
            ↪essential because the value has to be valid even after this function
            ↪returns. Alternative is to use dynamic allocation and set the free_fn
            ↪field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}

```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t
                                     ↪*prop_values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
            ↪props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
}

```

(continues on next page)

(continued from previous page)

```

return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#).

### Client Side Implementation

The client side implementation establishes a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp\_local\_ctrl** service. The service translates these messages into requests and then call the appropriate handlers (set/get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp\_local\_ctrl** service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service.
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices.
3. `set_prop_values` : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices.

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index-to-name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index-to-name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

Table 1: Endpoints provided by ESP Local Control

Endpoint Name (Bluetooth Low Energy + GATT Server)	URI (HTTPS Server + mDNS)	Description
<code>esp_local_ctrl</code>	<code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</code>	Endpoint used for retrieving version string
<code>esp_local_ctrl</code>	<code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</code>	Endpoint used for sending or receiving control messages

### API Reference

#### Header File

- [components/esp\\_local\\_ctrl/include/esp\\_local\\_ctrl.h](#)
- This header file can be included with:

```
#include "esp_local_ctrl.h"
```

- This header file is a part of the API provided by the `esp_local_ctrl` component. To declare that your component depends on `esp_local_ctrl`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_local_ctrl
```

or

PRIV_REQUIRES esp_local_ctrl
------------------------------

**Functions**

const *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_ble** (void)

Function for obtaining BLE transport mode.

const *esp\_local\_ctrl\_transport\_t* \***esp\_local\_ctrl\_get\_transport\_httpd** (void)

Function for obtaining HTTPD transport mode.

*esp\_err\_t* **esp\_local\_ctrl\_start** (const *esp\_local\_ctrl\_config\_t* \*config)

Start local control service.

**Parameters** *config* -- [in] Pointer to configuration structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_stop** (void)

Stop local control service.

*esp\_err\_t* **esp\_local\_ctrl\_add\_property** (const *esp\_local\_ctrl\_prop\_t* \*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option *max\_properties*

**Parameters** *prop* -- [in] Property description structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_remove\_property** (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters** *name* -- [in] Name of the property to remove

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

const *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (const char \*name)

Get property description structure by name.

This API may be used to get a property's context structure *esp\_local\_ctrl\_prop\_t* when its name is known

**Parameters** *name* -- [in] Name of the property to find

**Returns**

- Pointer to property
- NULL if not found

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

---

**Note:** In case of BLE transport the names and uids of all custom endpoints must be provided beforehand as a part of the *protocomm\_ble\_config\_t* structure set in *esp\_local\_ctrl\_config\_t*, and passed

to `esp_local_ctrl_start()`.

---

#### Parameters

- **ep\_name** -- [in] Name of the endpoint
- **handler** -- [in] Endpoint handler function
- **user\_ctx** -- [in] User data

#### Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

### Unions

union **esp\_local\_ctrl\_transport\_config\_t**

#### Public Members

*esp\_local\_ctrl\_transport\_config\_ble\_t* \*ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \*httpd

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

### Structures

struct **esp\_local\_ctrl\_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

#### Public Members

char \***name**

Unique name of property

uint32\_t **type**

Type of property. This may be set to application defined enums

size\_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

**uint32\_t flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

**void \*ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

**void (\*ctx\_free\_fn)(void \*ctx)**

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members****void \*data**

Pointer to memory holding property value

**size\_t size**

Size of property value

**void (\*free\_fn)(void \*data)**

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

**struct esp\_local\_ctrl\_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

*esp\_err\_t* (\***get\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for retrieving current values of properties.

---

**Note:** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the current values for which have been requested by the client

**Param prop\_values [out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

*esp\_err\_t* (\***set\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], const *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for changing values of properties.

---

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop\_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

void \***usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (\***usr\_ctx\_free\_fn**)(void \*usr\_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp\_local\_ctrl\_proto\_sec\_cfg**

Protocom security configs

## Public Members

*esp\_local\_ctrl\_proto\_sec\_t* **version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below

void \***custom\_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature

const void \***pop**

Proof of possession to be used for local control. Could be NULL.

const void \***sec\_params**

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

struct **esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

### Public Members

const *esp\_local\_ctrl\_transport\_t* \***transport**

Transport layer over which service will be provided

*esp\_local\_ctrl\_transport\_config\_t* **transport\_config**

Transport layer over which service will be provided

*esp\_local\_ctrl\_proto\_sec\_cfg\_t* **proto\_sec**

Security version and POP

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties

size\_t **max\_properties**

This limits the number of properties that are available at a time

### Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

### Type Definitions

typedef struct *esp\_local\_ctrl\_prop* **esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp\_local\_ctrl\_prop\_val* **esp\_local\_ctrl\_prop\_val\_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp\_local\_ctrl\_handlers* **esp\_local\_ctrl\_handlers\_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp\_local\_ctrl\_transport* **esp\_local\_ctrl\_transport\_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm\_ble\_config* **esp\_local\_ctrl\_transport\_config\_ble\_t**

Configuration for transport mode BLE.

This is a forward declaration for *protocomm\_ble\_config\_t*. To use this, application must set `CONFIG_BT_ENABLED` and include *protocomm\_ble.h*.

typedef struct *httpd\_config* **esp\_local\_ctrl\_transport\_config\_httpd\_t**

Configuration for transport mode HTTPD.

This is a forward declaration for *httpd\_ssl\_config\_t* (for HTTPS) or *httpd\_config\_t* (for HTTP)

typedef enum *esp\_local\_ctrl\_proto\_sec* **esp\_local\_ctrl\_proto\_sec\_t**

Security types for *esp\_local\_control*.

typedef *protocomm\_security1\_params\_t* **esp\_local\_ctrl\_security1\_params\_t**

typedef *protocomm\_security2\_params\_t* **esp\_local\_ctrl\_security2\_params\_t**

typedef struct *esp\_local\_ctrl\_proto\_sec\_cfg* **esp\_local\_ctrl\_proto\_sec\_cfg\_t**

Protocom security configs

typedef struct *esp\_local\_ctrl\_config* **esp\_local\_ctrl\_config\_t**

Configuration structure to pass to *esp\_local\_ctrl\_start()*

## Enumerations

enum **esp\_local\_ctrl\_proto\_sec**

Security types for *esp\_local\_control*.

*Values:*

enumerator **PROTOCOL\_SEC0**

enumerator **PROTOCOL\_SEC1**

enumerator **PROTOCOL\_SEC2**

enumerator **PROTOCOL\_SEC\_CUSTOM**

## 2.2.7 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp\_serial\_slave\_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp\_serial\_slave\_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

**Note:** The ESP-IDF component `esp_serial_slave_link` has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ESSL component on GitHub](#)

To add ESSL component in your project, please run `idf.py add-dependency espressif/esp_serial_slave_link`.

## Espressif Device Protocols

For more details about Espressif device protocols, see the following documents.

### ESP SPI Slave HD (Half Duplex) Mode Protocol

#### SPI Slave Capabilities of Espressif Chips

	ESP32	ESP32-S2	ESP32-C3	ESP32-S3	ESP32-C2	ESP32-C6	ESP32-H2	ESP32-P4
SPI Slave HD	N	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)
Tohost intr		N	N	N	N	N	N	N
Frhost intr		2 *	2 *	2 *	2 *	2 *	2 *	2 *
TX DMA		Y	Y	Y	Y	Y	Y	Y
RX DMA		Y	Y	Y	Y	Y	Y	Y
Shared registers		72	64	64	64	64	64	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (listed by the order they should exist):

- Command: 8-bit, master to slave  
This phase determines the rest phases of the transactions. See [Supported Commands](#).
- Address: 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of the shared register to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- Dummy: 8-bit (for 1-bit mode) or 4-bit (for 2/4-bit mode), floating, optional  
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- Data: variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The **direction** means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number (WN) used in corresponding modes.

Mode	Command WN	Address WN	Dummy cycles	Data WN
1-bit	1	1	1	1
DOOUT	1	1	4	2
DIO	1	2	4	2
QOOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it is not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

### Supported Commands

**Note:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, and RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave loads onto the DMA, the master is allowed to read or write in segments. In this way, the master does not have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is `WR_DONE` (0x07) for WRDMA and `CMD8` (0x08) for RDDMA.

Here is an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA.
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave.
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends `CMD8` to the slave.
5. The slave loads another 4092 bytes of data onto the RDDMA.
6. The master can start new reading transactions after it sends the `CMD8`.

## Terminology

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the `esp_serial_slave_link` component.
- **ESSL device**: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  - The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

## Services Provided by ESP Slave

There are some common services provided by the Espressif slaves:

1. **Tohost Interrupts**: The slave can inform the master about certain events by the interrupt line. (optional)
2. **Frhost Interrupts**: The master can inform the slave about certain events.
3. **TX FIFO (master to slave)**: The slave can receive data from the master in units of receiving buffers. The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.

4. RX FIFO (slave to master): The slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: The master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif Chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the SDMMC component. It includes the usage of communicating with ESP SDIO Slave device via the SDMMC Host or SDSPI Host feature. The ESSL device should be initialized as below:

1. Initialize a SDMMC card (see `Document of SDMMC driver` `</api-reference/storage/sdmmc>`) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

---

### ESP SPI Slave

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Has not been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (Optional)

1. Call `essl_get_intr_ena()` to know which events trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it tries to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

## RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it updates the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset Counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

## Application Example

The example below shows how ESP32-S2 SDIO host and slave communicate with each other. The host uses the ESSL SDIO:

[peripherals/sdio](#)

Please refer to the specific example README.md for details.

## API Reference

### Header File

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl.h](#)

### Functions

`esp_err_t` **essl\_init** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Initialize the slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK`: If success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl\_wait\_for\_ready** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Wait for interrupt of an ESSL slave device.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK`: If success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_tx\_buffer\_num** (`essl_handle_t` handle, `uint32_t` \*out\_tx\_num, `uint32_t` wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Parameters

- **handle** -- Handle of a ESSL device.
- **out\_tx\_num** -- Output of buffer num that host can send data to ESSL slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode

- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_get\_rx\_data\_size** (*essl\_handle\_t* handle, uint32\_t \*out\_rx\_size, uint32\_t wait\_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### Parameters

- **handle** -- Handle of an ESSL device.
- **out\_rx\_size** -- Output of data size to read from slave, in bytes
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_reset\_cnt** (*essl\_handle\_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**Parameters** **handle** -- Handle of an ESSL device.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Parameters

- **handle** -- Handle of an ESSL device.
- **start** -- Start address of the packet to send
- **length** -- Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP\_ERR\_TIMEOUT: No buffer to use, or error ftrom SDMMC host controller.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready for receiving.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESSL slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **out\_data** -- **[out]** Data output address
- **size** -- The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out\_length** -- **[out]** Output of length the data actually received from slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success: All the data has been read from the slave.
- ESP\_ERR\_INVALID\_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP\_ERR\_NOT\_FINISHED: Read was successful, but there is still data remaining.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready to send data.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.

---

#### Parameters

- **handle** -- Handle of an ESSL device.
- **addr** -- Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** -- Value to write to the register.
- **value\_o** -- Output of the returned written value.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

#### Parameters

- **handle** -- Handle of a `essl` device.
- **addr** -- Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value\_o** -- Output value read from the register.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_wait\_intr** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

wait for an interrupt of the slave

#### Parameters

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If interrupt is triggered.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- ESP\_ERR\_TIMEOUT: No interrupts before timeout.

*esp\_err\_t* **essl\_clear\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **intr\_mask** -- Mask of interrupt bits to clear.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr** (*essl\_handle\_t* handle, uint32\_t \*intr\_raw, uint32\_t \*intr\_st, uint32\_t wait\_ms)

Get interrupt bits of ESSL slave.

#### Parameters

- **handle** -- Handle of an ESSL device.

- **intr\_raw** -- Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr\_st** -- Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_INVALID\_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_set\_intr\_ena** (`essl_handle_t` handle, uint32\_t ena\_mask, uint32\_t wait\_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **ena\_mask** -- Mask of the interrupt bits to enable.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_intr\_ena** (`essl_handle_t` handle, uint32\_t \*ena\_mask\_o, uint32\_t wait\_ms)

Get interrupt enable bits of ESSL slave.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **ena\_mask\_o** -- Output of interrupt bit enable mask.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_send\_slave\_intr** (`essl_handle_t` handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **intr\_mask** -- Mask of interrupt bits to send to slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

**Functions**

`esp_err_t` **essl\_sdio\_init\_dev** (`essl_handle_t` \*out\_handle, const `essl_sdio_config_t` \*config)

Initialize the ESSL SDIO device and get its handle.

**Parameters**

- **out\_handle** -- Output of the handle.
- **config** -- Configuration for the ESSL SDIO device.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters** **handle** -- Handle of the ESSL SDIO device to deinit.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

## Structures

struct **essl\_sdio\_config\_t**

Configuration for the ESSL SDIO device.

### Public Members

sdmmc\_card\_t \***card**

The initialized sdmmc card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated recv buffer size used by both the host and the slave.

## Header File

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_spi.h](#)

## Functions

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

**Parameters**

- **out\_handle** -- [out] Output of the handle
- **init\_config** -- Configuration for the ESSL SPI device

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

**Parameters** **handle** -- Handle of the ESSL SPI device

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

---

#### Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1).
- **out\_value** -- [out] Read buffer for the shared registers.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

#### Returns

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl\_spi\_get\_packet** (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

#### Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **out\_data** -- [out] Output data address
- **size** -- The size of the output data.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

#### Returns

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl\_spi\_write\_reg** (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

---

---

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

---

#### Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** -- Buffer for data to send, should be align to 4.
- **out\_value** -- [out] Not supported, should be set to `NULL`.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

#### Returns

- `ESP_OK`: success

- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_send\_packet** (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

#### Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **data** -- Address of the data to send
- **size** -- Size of the data to send.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

#### Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl\_spi\_reset\_cnt** (void \*arg)

Reset the counter in Master context.

---

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

**Parameters** **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)

*esp\_err\_t* **essl\_spi\_rdbuf** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in ISR way.

---

**Note:** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a `rdbuf` SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

---

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rdbuf\_polling** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in polling way.

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` `essl_spi_wrbuf` (`spi_device_handle_t` spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in ISR way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` `essl_spi_wrbuf_polling` (`spi_device_handle_t` spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

`esp_err_t` `essl_spi_rddma` (`spi_device_handle_t` spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

---

---

**Note:** This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** -- Total length of data to receive.
- **seg\_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_rddma_seg` (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

---

**Note:** To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg\_len** -- Length of this segment
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_rddma_done` (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

---

**Note:** This is required only when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_wrdma` (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **len** -- Total length of data to send.
- **seg\_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

**Returns**

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

---

**Note:** To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

---

**Parameters**

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **seg\_len** -- Length of this segment
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

**Returns**

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `wrdma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**Note:** This is required only when the slave is working in segment mode.

---

**Parameters**

- **spi** -- SPI device handle representing the slave
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

**Returns**

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

**Structures**

struct **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \***spi**

Pointer to SPI device handle.

uint32\_t **tx\_buf\_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8\_t **tx\_sync\_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8\_t **rx\_sync\_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

## 2.2.8 ESP x509 Certificate Bundle

### Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**Note:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility, the certificates' subject name and public key are stored in a file and embedded in the ESP32-S2 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Mon Mar 11 15:25:27 2024 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition, it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacrt_all.pem`.

---

### Configuration

Most configuration is done through `menuconfig`. CMake generates the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root certificate list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

### Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#)

The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of [curl](#).

Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech's [SSL Survey](#).

These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in [Generating the List of Root Certificates](#).

### Periodic Sync

The bundle is kept updated by periodic sync with the Mozilla's NSS root certificate store. The deprecated certs from the upstream bundle are added to deprecated list (for compatibility reasons) in ESP-IDF minor or patch release. If required, the deprecated certs can be added to the default bundle by enabling `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEPRECATED_LIST`. The deprecated certs shall be removed (reset) on the next major ESP-IDF release.

### Application Examples

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

### API Reference

#### Header File

- [components/mbedtls/esp\\_cert\\_bundle/include/esp\\_cert\\_bundle.h](#)
- This header file can be included with:

```
#include "esp_cert_bundle.h"
```

- This header file is a part of the API provided by the `mbedtls` component. To declare that your component depends on `mbedtls`, add the following to your `CMakeLists.txt`:

```
REQUIRES mbedtls
```

or

```
PRIV_REQUIRES mbedtls
```

## Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach**(void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in `menuconfig` and embedded in the binary.

**Parameters** `conf` -- **[in]** The config struct for the SSL connection.

**Returns**

- `ESP_OK` if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_cert\_bundle\_detach**(mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters** `conf` -- **[in]** The config struct for the SSL connection.

*esp\_err\_t* **esp\_cert\_bundle\_set**(const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through `menuconfig`. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**Parameters**

- `x509_bundle` -- **[in]** A pointer to the certificate bundle.
- `bundle_size` -- **[in]** Size of the certificate bundle in bytes.

**Returns**

- `ESP_OK` if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

bool **esp\_cert\_bundle\_in\_use**(const mbedtls\_x509\_cert \*ca\_chain)

Check if the given CA certificate chain is the default "dummy" certificate chain attached by the `esp_cert_bundle`.

**Parameters** `ca_chain` -- A pointer to the CA chain.

**Returns** true if the `ca_chain` is the dummy CA chain attached by `esp_cert_bundle`

**Returns** false otherwise

## 2.2.9 HTTP Server

### Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-S2. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task closes all open connections, removes registered URI handlers and resets all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including uri name, method type (eg. HTTPD\_GET/HTTPD\_POST/HTTPD\_PUT etc.), function pointer of type `esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

### Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t rcv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, rcv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

```

(continues on next page)

(continued from previous page)

```
/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
```

**Simple HTTP Server Example** Check HTTP server example under [protocols/http\\_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

### Persistent Connections

HTTP server features persistent connections, allowing for the reuse of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

### Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↳data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↳context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http\\_server/persistent\\_sockets](#).

## Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the [protocols/http\\_server/ws\\_echo\\_server](#) example which demonstrates usage of the websocket feature.

## Event Handling

ESP HTTP server has various events for which a handler can be triggered by *the Event Loop library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP server.

`esp_http_server_event_id_t` has all the events which can happen for ESP HTTP server.

Expected data type for different ESP HTTP server events in event loop:

- `HTTP_SERVER_EVENT_ERROR`: `httpd_err_code_t`
- `HTTP_SERVER_EVENT_START`: `NULL`
- `HTTP_SERVER_EVENT_ON_CONNECTED`: `int`
- `HTTP_SERVER_EVENT_ON_HEADER`: `int`
- `HTTP_SERVER_EVENT_HEADERS_SENT`: `int`
- `HTTP_SERVER_EVENT_ON_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_SENT_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_DISCONNECTED`: `int`
- `HTTP_SERVER_EVENT_STOP`: `NULL`

## API Reference

### Header File

- [components/esp\\_http\\_server/include/esp\\_http\\_server.h](#)
- This header file can be included with:

```
#include "esp_http_server.h"
```

- This header file is a part of the API provided by the `esp_http_server` component. To declare that your component depends on `esp_http_server`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_http_server
```

or

```
PRIV_REQUIRES esp_http_server
```

## Functions

*esp\_err\_t* **httpd\_start** (*httpd\_handle\_t* \*handle, const *httpd\_config\_t* \*config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

### Parameters

- **config** -- **[in]** Configuration for new instance of the server
- **handle** -- **[out]** Handle to newly created instance of the server. NULL on error

### Returns

- `ESP_OK` : Instance created successfully
- `ESP_ERR_INVALID_ARG` : Null argument(s)
- `ESP_ERR_HTTPD_ALLOC_MEM` : Failed to allocate memory for instance
- `ESP_ERR_HTTPD_TASK` : Failed to launch server task

*esp\_err\_t* **httpd\_stop** (*httpd\_handle\_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
```

(continues on next page)

(continued from previous page)

```

// Ensure handle is non NULL
if (server != NULL) {
// Stop the httpd server
    httpd_stop(server);
}
}

```

**Parameters** `handle` -- **[in]** Handle to server returned by `httpd_start`

**Returns**

- `ESP_OK` : Server stopped successfully
- `ESP_ERR_INVALID_ARG` : Handle argument is Null

`esp_err_t httpd_register_uri_handler` (`httpd_handle_t` handle, const `httpd_uri_t` \*uri\_handler)

Registers a URI handler.

Example usage:

```

esp_err_t my_uri_handler(httpd_req_t* req)
{
// Recv , Process and Send
    ....
    ....
    ....

// Fail condition
if (....) {
// Return fail to close session //
return ESP_FAIL;
}

// On success
return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
// If failed to register handler
    ....
}

```

**Note:** URI handlers can be registered in real time as long as the server handle is valid.

**Parameters**

- `handle` -- **[in]** handle to HTTPD server instance
- `uri_handler` -- **[in]** pointer to handler that needs to be registered

**Returns**

- `ESP_OK` : On successfully registering the handler
- `ESP_ERR_INVALID_ARG` : Null arguments

- `ESP_ERR_HTTPD_HANDLERS_FULL` : If no slots left for new handler
- `ESP_ERR_HTTPD_HANDLER_EXISTS` : If handler with same URI and method is already registered

*esp\_err\_t* `httpd_unregister_uri_handler` (*httpd\_handle\_t* handle, const char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

**Parameters**

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** URI string
- **method** -- **[in]** HTTP method

**Returns**

- `ESP_OK` : On successfully deregistering the handler
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_FOUND` : Handler with specified URI and method not found

*esp\_err\_t* `httpd_unregister_uri` (*httpd\_handle\_t* handle, const char \*uri)

Unregister all URI handlers with the specified uri string.

**Parameters**

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** uri string specifying all handlers that need to be deregistered

**Returns**

- `ESP_OK` : On successfully deregistering all such handlers
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_FOUND` : No handler registered with specified uri string

*esp\_err\_t* `httpd_sess_set_recv_override` (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **recv\_func** -- **[in]** The receive function to be set for this session

**Returns**

- `ESP_OK` : On successfully registering override
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* `httpd_sess_set_send_override` (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **send\_func** -- **[in]** The send function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_pending\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_pending\_func\_t* pending\_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **pending\_func** -- **[in]** The receive function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_req\_async\_handler\_begin** (*httpd\_req\_t* \*r, *httpd\_req\_t* \*\*out)

Start an asynchronous request. This function can be called in a request handler to get a request copy that can be used on a async thread.

---

**Note:**

- This function is necessary in order to handle multiple requests simultaneously. See examples/async\_requests for example usage.
  - You must call httpd\_req\_async\_handler\_complete() when you are done with the request.
- 

**Parameters**

- **r** -- **[in]** The request to create an async copy of
- **out** -- **[out]** A newly allocated request which can be used on an async thread

**Returns**

- ESP\_OK : async request object created

*esp\_err\_t* **httpd\_req\_async\_handler\_complete** (*httpd\_req\_t* \*r)

Mark an asynchronous request as completed. This will.

- free the request memory
- relinquish ownership of the underlying socket, so it can be reused.
- allow the http server to close our socket if needed (lru\_purge\_enable)

---

**Note:** If async requests are not marked completed, eventually the server will no longer accept incoming connections. The server will log a "httpd\_accept\_conn: error in accept (23)" message if this happens.

---

**Parameters** **r** -- **[in]** The request to mark async work as completed

**Returns**

- ESP\_OK : async request was marked completed

int **httpd\_req\_to\_sockfd** (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

---

**Note:** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

---

**Parameters** **r** -- **[in]** The request whose socket descriptor should be found

**Returns**

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd\_req\_recv** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching '`buf_len`' number of bytes, while the pointer to content data is incremented internally by the same number.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  - Presently Chunked Encoding is not supported
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that the data will be read into
- **buf\_len** -- **[in]** Length of the buffer

**Returns**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket `recv()`
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket `recv()`

size\_t **httpd\_req\_get\_hdr\_value\_len** (*httpd\_req\_t* \*r, const char \*field)

Search for a field in request headers and return the string length of it's value.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

**Parameters**

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The header field to be searched in the request

**Returns**

- **Length** : If field is found in the request URL
- **Zero** : Field not found / Invalid request / Null arguments

*esp\_err\_t* **httpd\_req\_get\_hdr\_value\_str** (*httpd\_req\_t* \*r, const char \*field, char \*val, size\_t val\_size)

Get the value string of a field from the request headers.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once *httpd\_resp\_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
  - Use *httpd\_req\_get\_hdr\_value\_len()* to know the right buffer length
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The field to be searched in the header
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the field is found
- **val\_size** -- **[in]** Size of the user buffer "val"

**Returns**

- **ESP\_OK** : Field found in the request header and value string copied
- **ESP\_ERR\_NOT\_FOUND** : Key not found
- **ESP\_ERR\_INVALID\_ARG** : Null arguments
- **ESP\_ERR\_HTTPD\_INVALID\_REQ** : Invalid HTTP request pointer
- **ESP\_ERR\_HTTPD\_RESULT\_TRUNC** : Value string truncated

*size\_t* **httpd\_req\_get\_url\_query\_len** (*httpd\_req\_t* \*r)

Get Query string length from the request URL.

---

**Note:** This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid

---

**Parameters** **r** -- **[in]** The request being responded to

**Returns**

- **Length** : Query is found in the request URL
- **Zero** : Query not found / Null arguments / Invalid request

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

---

**Note:**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using *httpd\_req\_get\_hdr\_value\_str()* to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid

- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
  - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[out]** Pointer to the buffer into which the query string will be copied (if found)
- **buf\_len** -- **[in]** Length of output buffer

**Returns**

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

*esp\_err\_t* **httpd\_query\_key\_value** (const char \*qry, const char \*key, char \*val, size\_t val\_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

---

**Note:**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
  - If actual value size is greater than val\_size, then the value is truncated, accompanied by truncation error as return value.
- 

**Parameters**

- **qry** -- **[in]** Pointer to query string
- **key** -- **[in]** The key to be searched in the query string
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the key is found
- **val\_size** -- **[in]** Size of the user buffer "val"

**Returns**

- `ESP_OK` : Key is found in the URL query string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

*esp\_err\_t* **httpd\_req\_get\_cookie\_val** (*httpd\_req\_t* \*req, const char \*cookie\_name, char \*val, size\_t \*val\_size)

Get the value string of a cookie value from the "Cookie" request headers by cookie name.

**Parameters**

- **req** -- **[in]** Pointer to the HTTP request
- **cookie\_name** -- **[in]** The cookie name to be searched in the request
- **val** -- **[out]** Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val\_size** -- **[inout]** Pointer to size of the user buffer "val". This variable will contain cookie length if `ESP_OK` is returned and required buffer length in case `ESP_ERR_HTTPD_RESULT_TRUNC` is returned.

**Returns**

- `ESP_OK` : Key is found in the cookie string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

- `ESP_ERR_NO_MEM` : Memory allocation failure

bool `httpd_uri_match_wildcard` (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "\*" for a wildcard match, and "?\*" to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /api/? matches /api and /api/
- /api/\* (sans the backslash) matches /api/ and /api/status, but not /api or /ap
- /api/?\* or /api/\*? (sans the backslash) matches /api/, /api/status, and also /api, but not /apix or /ap

The special characters "?" and "\*" anywhere else in the template will be taken literally.

#### Parameters

- `uri_template` -- [in] URI template (pattern)
- `uri_to_match` -- [in] URI to be matched
- `match_upto` -- [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

**Returns** true if a match was found

*esp\_err\_t* `httpd_resp_send` (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, the request has been responded to.
  - No additional data can then be sent for the request.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

#### Parameters

- `r` -- [in] The request being responded to
- `buf` -- [in] Buffer from where the content is to be fetched
- `buf_len` -- [in] Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

#### Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

*esp\_err\_t* `httpd_resp_send_chunk` (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that stores the data
- **buf\_len** -- **[in]** Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

**Returns**

- `ESP_OK` : On successfully sending the response packet chunk
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

```
static inline esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)
```

API to send a complete string as HTTP response.

This API simply calls `http_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

```
static inline esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)
```

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body (NULL to finish response packet)

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

*esp\_err\_t* **httpd\_resp\_set\_status** (*httpd\_req\_t* \*r, const char \*status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the '200 OK' response is sent as the response.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- This API only sets the status to this value. The status isn't sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

---

**Parameters**

- **r** -- [in] The request being responded to
- **status** -- [in] The HTTP status code of this response

**Returns**

- ESP\_OK : On success
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_type** (*httpd\_req\_t* \*r, const char \*type)

API to set the HTTP content type.

This API sets the 'Content Type' field of the response. The default content type is 'text/html'.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- This API only sets the content type to this value. The type isn't sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

---

**Parameters**

- **r** -- [in] The request being responded to
- **type** -- [in] The Content Type of the response

**Returns**

- ESP\_OK : On success
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_hdr** (*httpd\_req\_t* \*r, const char \*field, const char \*value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
- The header isn't sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Parameters**

- **r** -- **[in]** The request being responded to
- **field** -- **[in]** The field name of the HTTP header
- **value** -- **[in]** The value of this HTTP header

**Returns**

- ESP\_OK : On successfully appending new header
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_HDR : Total additional headers exceed max allowed
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_send\_err** (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error, const char \*msg)

For sending out error code in response to HTTP request.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
- 

**Parameters**

- **req** -- **[in]** Pointer to the HTTP request for which the response needs to be sent
- **error** -- **[in]** Error type to send
- **msg** -- **[in]** Error message string (pass NULL for default message)

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_send\_custom\_err** (*httpd\_req\_t* \*req, const char \*status, const char \*msg)

For sending out custom error code in response to HTTP request.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
- 

**Parameters**

- **req** -- **[in]** Pointer to the HTTP request for which the response needs to be sent
- **status** -- **[in]** Error status to send
- **msg** -- **[in]** Error message string

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline [esp\\_err\\_t](#) **httpd\_resp\_send\_404** ([httpd\\_req\\_t](#) \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

---

**Parameters** `r` -- **[in]** The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline [esp\\_err\\_t](#) **httpd\_resp\_send\_408** ([httpd\\_req\\_t](#) \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

---

**Parameters** `r` -- **[in]** The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline [esp\\_err\\_t](#) **httpd\_resp\_send\_500** ([httpd\\_req\\_t](#) \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

---

**Parameters** `r` -- **[in]** The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet

- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

int **httpd\_send** (*httpd\_req\_t* \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the fully constructed packet is to be read
- **buf\_len** -- **[in]** Length of the buffer

**Returns**

- Bytes : Number of bytes that were sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int **httpd\_socket\_send** (*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

---

**Parameters**

- **hd** -- **[in]** server instance
- **sockfd** -- **[in]** session socket file descriptor
- **buf** -- **[in]** buffer with bytes to send
- **buf\_len** -- **[in]** data size
- **flags** -- **[in]** flags for the send() function

**Returns**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int **httpd\_socket\_recv** (*httpd\_handle\_t* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)

A low level API to receive data from a given socket

This internally calls the default `recv` function, or the function registered by `httpd_sess_set_recv_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

---

#### Parameters

- **hd** -- **[in]** server instance
- **sockfd** -- **[in]** session socket file descriptor
- **buf** -- **[in]** buffer with bytes to send
- **buf\_len** -- **[in]** data size
- **flags** -- **[in]** flags for the `send()` function

#### Returns

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `recv()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `recv()`

*esp\_err\_t* **httpd\_register\_err\_handler** (*httpd\_handle\_t* handle, *httpd\_err\_code\_t* error, *httpd\_err\_handler\_func\_t* handler\_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

#### Parameters

- **handle** -- **[in]** HTTP server handle
- **error** -- **[in]** Error type
- **handler\_fn** -- **[in]** User implemented handler function (Pass NULL to unset any previously set handler)

#### Returns

- `ESP_OK` : handler registered successfully
- `ESP_ERR_INVALID_ARG` : invalid error code or server handle

*esp\_err\_t* **httpd\_queue\_work** (*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

---

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

---

#### Parameters

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **work** -- **[in]** Pointer to the function to be executed in the HTTPD's context
- **arg** -- **[in]** Pointer to the arguments that should be passed to this function

#### Returns

- `ESP_OK` : On successfully queueing the work
- `ESP_FAIL` : Failure in ctrl socket
- `ESP_ERR_INVALID_ARG` : Null arguments

void \***httpd\_sess\_get\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

**Returns**

- `void*` : Pointer to the context associated with this session
- `NULL` : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Context object to assign to the session
- **free\_fn** -- **[in]** Function that should be called to free the context

void \***httpd\_sess\_get\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See also:**

`httpd_sess_get_ctx()`

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

**Returns**

- `void*` : Pointer to the transport context associated with this session
- `NULL` : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session 'transport' context by socket descriptor.

**See also:**

`httpd_sess_set_ctx()`

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Transport context object to assign to the session
- **free\_fn** -- **[in]** Function that should be called to free the transport context

void \***httpd\_get\_global\_user\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global user context (it was set in the server config struct)

**Parameters** **handle** -- **[in]** Handle to server returned by `httpd_start`

**Returns** global user context

void **\*httpd\_get\_global\_transport\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

**Parameters** **handle** -- **[in]** Handle to server returned by httpd\_start

**Returns** global transport context

*esp\_err\_t* **httpd\_sess\_trigger\_close** (*httpd\_handle\_t* handle, int sockfd)

Trigger an httpd session close externally.

---

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

---

#### Parameters

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **sockfd** -- **[in]** The socket descriptor of the session to be closed

#### Returns

- ESP\_OK : On successfully initiating closure
- ESP\_FAIL : Failure to queue work
- ESP\_ERR\_NOT\_FOUND : Socket fd not found
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

---

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

#### Parameters

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **sockfd** -- **[in]** The socket descriptor of the session for which LRU counter is to be updated

#### Returns

- ESP\_OK : Socket found and LRU counter updated
- ESP\_ERR\_NOT\_FOUND : Socket not found
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_get\_client\_list** (*httpd\_handle\_t* handle, size\_t \*fds, int \*client\_fds)

Returns list of current socket descriptors of active sessions.

---

**Note:** Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max\_open\_sockets field in httpd\_config\_t structure.

---

#### Parameters

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **fds** -- **[inout]** In: Size of provided client\_fds array Out: Number of valid client fds returned in client\_fds,
- **client\_fds** -- **[out]** Array of client fds

**Returns**

- ESP\_OK : Successfully retrieved session list
- ESP\_ERR\_INVALID\_ARG : Wrong arguments or list is longer than provided array

**Structures**struct **esp\_http\_server\_event\_data**

Argument structure for HTTP\_SERVER\_EVENT\_ON\_DATA and HTTP\_SERVER\_EVENT\_SENT\_DATA event

**Public Members**int **fd**

Session socket file descriptor

int **data\_len**

Data length

struct **httpd\_config**

HTTP Server Configuration Structure.

---

**Note:** Use HTTPD\_DEFAULT\_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

**Public Members**unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

 BaseType\_t **core\_id**

The core the HTTP server task will run on

uint32\_t **task\_caps**

The memory capabilities to use when allocating the HTTP server task's stack

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

**uint16\_t max\_uri\_handlers**

Maximum allowed uri handlers

**uint16\_t max\_resp\_headers**

Maximum allowed additional headers in HTTP response

**uint16\_t backlog\_conn**

Number of backlog connections

**bool lru\_purge\_enable**

Purge "Least Recently Used" connection

**uint16\_t recv\_wait\_timeout**

Timeout for recv function (in seconds)

**uint16\_t send\_wait\_timeout**

Timeout for send function (in seconds)

**void \*global\_user\_ctx**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **global\_user\_ctx\_free\_fn**

Free function for global user context

**void \*global\_transport\_ctx**

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) **global\_transport\_ctx\_free\_fn**

Free function for global transport context

**bool enable\_so\_linger**

bool to enable/disable linger

**int linger\_timeout**

linger timeout (in seconds)

**bool keep\_alive\_enable**

Enable keep-alive timeout

**int keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

*httpd\_open\_func\_t* **open\_fn**

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

*httpd\_close\_func\_t* **close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to `NULL` if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

*httpd\_uri\_match\_func\_t* **uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) `NULL` : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct **httpd\_req**

HTTP Request Data Structure.

## Public Members

*httpd\_handle\_t* **handle**

Handle to server instance

int **method**

The type of HTTP request, -1 if unsupported method, `HTTP_ANY` for wildcard method to support every method

const char **uri**[HTTPD\_MAX\_URI\_LEN + 1]

The URI of this request (1 byte extra for null termination)

size\_t **content\_len**

Length of the request body

void \***aux**

Internally used members

void \***user\_ctx**

User context pointer passed during URI registration.

void \***sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free\_ctx function is set.

[httpd\\_free\\_ctx\\_fn\\_t](#) **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling free() on the sess\_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the sess\_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess\_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free\_ctx or free()) only if the socket gets closed.

struct **httpd\_uri**

Structure for URI handler.

### Public Members

const char \***uri**

The URI to handle

[httpd\\_method\\_t](#) **method**

Method supported by the URI, HTTP\_ANY for wildcard method to support all methods

*esp\_err\_t* (\***handler**)(*httpd\_req\_t* \*r)

Handler to call for supported request method. This must return ESP\_OK, or else the underlying socket will be closed.

void \***user\_ctx**

Pointer to user context data which will be available to handler

## Macros

**HTTP\_ANY**

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD SOCK\_ERR\_FAIL**

**HTTPD SOCK\_ERR\_INVALID**

**HTTPD SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**ESP\_HTTPD\_DEF\_CTRL\_PORT**

HTTP Server control socket port

**HTTPD\_DEFAULT\_CONFIG ()****ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN****Type Definitions**typedef void \***httpd\_handle\_t**

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http\_method **httpd\_method\_t**

HTTP Method Type wrapper over "enum http\_method" available in "http\_parser" library.

typedef void (\***httpd\_free\_ctx\_fn\_t**)(void \*ctx)

Prototype for freeing context data (if any)

**Param ctx [in]** object to free

```
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- ESP\_OK : On success
- Any value other than ESP\_OK will signal the server to close the socket immediately

```
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for closing a session.

---

**Note:** It's possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

```
typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

**Param reference\_uri [in]** URI/template with respect to which the other URI is matched

**Param uri\_to\_match [in]** URI/template being matched to the reference URI/template

**Param match\_upto [in]** For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**Return** true on match

```
typedef struct httpd_config httpd_config_t
```

HTTP Server Configuration Structure.

---

**Note:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

```
typedef struct httpd_req httpd_req_t
```

HTTP Request Data Structure.

```
typedef struct httpd_uri httpd_uri_t
```

Structure for URI handler.

```
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level send function.

---

**Note:** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_codes`, which will eventually be conveyed as return value of `httpd_send()` function

---

**Param hd [in]** server instance  
**Param sockfd [in]** session socket file descriptor  
**Param buf [in]** buffer with bytes to send  
**Param buf\_len [in]** data size  
**Param flags [in]** flags for the send() function

**Return**

- Bytes : The number of bytes sent successfully
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket send()

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level recv function.

---

**Note:** User specified recv function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

---

**Param hd [in]** server instance  
**Param sockfd [in]** session socket file descriptor  
**Param buf [in]** buffer with bytes to send  
**Param buf\_len [in]** data size  
**Param flags [in]** flags for the send() function

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level "get pending bytes" function.

---

**Note:** User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

---

**Param hd [in]** server instance  
**Param sockfd [in]** session socket file descriptor

**Return**

- Bytes : The number of bytes waiting to be received
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

---

**Note:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
  - When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
  - The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.
- 

**Param req [in]** HTTP request for which the error needs to be handled

**Param error [in]** Error type

**Return**

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

`typedef void (*httpd_work_fn_t)(void *arg)`

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

**Param arg [in]** The arguments for this work function

### Enumerations

enum `httpd_err_code_t`

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

enumerator `HTTPD_500_INTERNAL_SERVER_ERROR`

enumerator `HTTPD_501_METHOD_NOT_IMPLEMENTED`

enumerator `HTTPD_505_VERSION_NOT_SUPPORTED`

enumerator `HTTPD_400_BAD_REQUEST`

enumerator `HTTPD_401_UNAUTHORIZED`

enumerator `HTTPD_403_FORBIDDEN`

enumerator `HTTPD_404_NOT_FOUND`

enumerator `HTTPD_405_METHOD_NOT_ALLOWED`

enumerator `HTTPD_408_REQ_TIMEOUT`

enumerator `HTTPD_411_LENGTH_REQUIRED`

enumerator `HTTPD_414_URI_TOO_LONG`

enumerator `HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE`

enumerator **HTTPD\_ERR\_CODE\_MAX**

enum **esp\_http\_server\_event\_id\_t**

HTTP Server events id.

*Values:*

enumerator **HTTP\_SERVER\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_SERVER\_EVENT\_START**

This event occurs when HTTP Server is started

enumerator **HTTP\_SERVER\_EVENT\_ON\_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP\_SERVER\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP\_SERVER\_EVENT\_HEADERS\_SENT**

After sending all the headers to the client

enumerator **HTTP\_SERVER\_EVENT\_ON\_DATA**

Occurs when receiving data from the client

enumerator **HTTP\_SERVER\_EVENT\_SENT\_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP\_SERVER\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_SERVER\_EVENT\_STOP**

This event occurs when HTTP Server is stopped

## 2.2.10 HTTPS Server

### Overview

This component is built on top of [HTTP Server](#). The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for [HTTP Server](#) applies also to a server you create this way.

### Used APIs

The following APIs of [HTTP Server](#) should not be used with [HTTPS Server](#), as they are used internally to handle secure sessions and to maintain internal state:

- "send", "receive" and "pending" callback registration functions - secure socket handling

- `httpd_sess_set_send_override()`
- `httpd_sess_set_rcv_override()`
- `httpd_sess_set_pending_override()`
- "transport context" - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config::global_transport_ctx`
  - `httpd_config::global_transport_ctx_free_fn`
  - `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

## Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

## Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## Event Handling

ESP HTTPS Server has various events for which a handler can be triggered by the *Event Loop Library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTPS Server.

`esp_https_server_event_id_t` has all the events which can happen for ESP HTTPS server.

Expected data type for different ESP HTTPS server events in event loop:

- `HTTPS_SERVER_EVENT_ERROR` : `esp_https_server_last_error_t`
- `HTTPS_SERVER_EVENT_START` : `NULL`
- `HTTPS_SERVER_EVENT_ON_CONNECTED` : `NULL`
- `HTTPS_SERVER_EVENT_ON_DATA` : `int`
- `HTTPS_SERVER_EVENT_SENT_DATA` : `NULL`
- `HTTPS_SERVER_EVENT_DISCONNECTED` : `NULL`
- `HTTPS_SERVER_EVENT_STOP` : `NULL`

## API Reference

### Header File

- `components/esp_https_server/include/esp_https_server.h`
- This header file can be included with:

```
#include "esp_https_server.h"
```

- This header file is a part of the API provided by the `esp_https_server` component. To declare that your component depends on `esp_https_server`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_https_server
```

or

```
PRIV_REQUIRES esp_https_server
```

## Functions

*esp\_err\_t* **httpd\_ssl\_start** (*httpd\_handle\_t* \*handle, *httpd\_ssl\_config\_t* \*config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

### Parameters

- **config** -- [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** -- [out] - storage for the server handle, must be a valid pointer

**Returns** success

*esp\_err\_t* **httpd\_ssl\_stop** (*httpd\_handle\_t* handle)

Stop the server. Blocks until the server is shut down.

**Parameters** **handle** -- [in]

### Returns

- ESP\_OK: Server stopped successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_FAIL: Failure to shut down server

## Structures

struct **esp\_https\_server\_user\_cb\_arg**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

## Public Members

*httpd\_ssl\_user\_cb\_state\_t* **user\_cb\_state**

State of user callback

*esp\_tls\_t* \***tls**

ESP-TLS connection handle

struct **httpd\_ssl\_config**

HTTPS server config struct

Please use HTTPD\_SSL\_CONFIG\_DEFAULT() to initialize it.

## Public Members

*httpd\_config\_t* **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8\_t \***servercert**

Server certificate

size\_t **servercert\_len**

Server certificate byte length

const uint8\_t \***cacert\_pem**

CA certificate ((CA used to sign clients, or client cert itself)

size\_t **cacert\_len**

CA certificate byte length

const uint8\_t \***prvtkey\_pem**

Private key

size\_t **prvtkey\_len**

Private key byte length

bool **use\_ecdsa\_peripheral**

Use ECDSA peripheral to use private key

uint8\_t **ecdsa\_key\_efuse\_blk**

The efuse block where ECDSA key is stored

[\*httpd\\_ssl\\_transport\\_mode\\_t\*](#) **transport\_mode**

Transport Mode (default secure)

uint16\_t **port\_secure**

Port used when transport mode is secure (default 443)

uint16\_t **port\_insecure**

Port used when transport mode is insecure (default 80)

bool **session\_tickets**

Enable tls session tickets

bool **use\_secure\_element**

Enable secure element for server session

[\*esp\\_https\\_server\\_user\\_cb\*](#) \***user\_cb**

User callback for esp\_https\_server

void \***ssl\_userdata**

User data to add to the ssl context

[\*esp\\_tls\\_handshake\\_callback\*](#) **cert\_select\_cb**

Certificate selection callback to use. The callback is only applicable when CONFIG\_ESP\_TLS\_SERVER\_CERT\_SELECT\_HOOK is enabled in menuconfig

const char \*\***alpn\_protos**

Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself

## Macros

**HTTPD\_SSL\_CONFIG\_DEFAULT** ()

Default config struct init Notes:

- port is set when starting the server, according to 'transport\_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

## Type Definitions

typedef struct *esp\_https\_server\_user\_cb\_arg* **esp\_https\_server\_user\_cb\_arg\_t**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef *esp\_tls\_last\_error\_t* **esp\_https\_server\_last\_error\_t**

typedef void **esp\_https\_server\_user\_cb** (*esp\_https\_server\_user\_cb\_arg\_t* \*user\_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

**Param user\_cb** Callback data struct

typedef struct *httpd\_ssl\_config* **httpd\_ssl\_config\_t**

## Enumerations

enum **esp\_https\_server\_event\_id\_t**

*Values:*

enumerator **HTTPS\_SERVER\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTPS\_SERVER\_EVENT\_START**

This event occurs when HTTPS Server is started

enumerator **HTTPS\_SERVER\_EVENT\_ON\_CONNECTED**

Once the HTTPS Server has been connected to the client

enumerator **HTTPS\_SERVER\_EVENT\_ON\_DATA**

Occurs when receiving data from the client

enumerator **HTTPS\_SERVER\_EVENT\_SENT\_DATA**

Occurs when an ESP HTTPS server sends data to the client

enumerator **HTTPS\_SERVER\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTPS\_SERVER\_EVENT\_STOP**

This event occurs when HTTPS Server is stopped

enum **httpd\_ssl\_transport\_mode\_t**

*Values:*

enumerator `HTTPD_SSL_TRANSPORT_SECURE`

enumerator `HTTPD_SSL_TRANSPORT_INSECURE`

enum `httpd_ssl_user_cb_state_t`

Indicates the state at which the user callback is executed, i.e at session creation or session close.

*Values:*

enumerator `HTTPD_SSL_USER_CB_SESS_CREATE`

enumerator `HTTPD_SSL_USER_CB_SESS_CLOSE`

## 2.2.11 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g., packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending or parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a New Ping Session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\r\n",
```

(continues on next page)

```

        recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
    }

    static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
    {
        uint16_t seqno;
        ip_addr_t target_addr;
        esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
        esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
        ↪addr));
        printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), ↪
        ↪seqno);
    }

    static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
    {
        uint32_t transmitted;
        uint32_t received;
        uint32_t total_time_ms;

        esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↪
        ↪sizeof(transmitted));
        esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
        esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
        ↪time_ms));
        printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
        ↪received, total_time_ms);
    }

    void initialize_ping()
    {
        /* convert URL to IP address */
        ip_addr_t target_addr;
        struct addrinfo hint;
        struct addrinfo *res = NULL;
        memset(&hint, 0, sizeof(hint));
        memset(&target_addr, 0, sizeof(target_addr));
        getaddrinfo("www.espressif.com", NULL, &hint, &res);
        struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
        inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
        freeaddrinfo(res);

        esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
        ping_config.target_addr = target_addr;           // target IP address
        ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
        ↪ping_stop can stop it

        /* set callback functions */
        esp_ping_callbacks_t cbs;
        cbs.on_ping_success = test_on_ping_success;
        cbs.on_ping_timeout = test_on_ping_timeout;
        cbs.on_ping_end = test_on_ping_end;
        cbs.cb_args = "foo"; // arguments that feeds to all callback functions, can_
        ↪be NULL
        cbs.cb_args = eth_event_group;

        esp_ping_handle_t ping;
        esp_ping_new_session(&ping_config, &cbs, &ping);
    }

```

**Start and Stop Ping Session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session does not start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a Ping Session** If a ping session will not be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e., you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get Runtime Statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

## Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

## API Reference

### Header File

- `components/lwip/include/apps/ping/ping_sock.h`
- This header file can be included with:

```
#include "ping/ping_sock.h"
```

- This header file is a part of the API provided by the `lwip` component. To declare that your component depends on `lwip`, add the following to your `CMakeLists.txt`:

```
REQUIRES lwip
```

or

```
PRIV_REQUIRES lwip
```

### Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` \*config, const `esp_ping_callbacks_t` \*cbs, `esp_ping_handle_t` \*hdl\_out)

Create a ping session.

#### Parameters

- **config** -- ping configuration
- **cbs** -- a bunch of callback functions invoked by internal ping task
- **hdl\_out** -- handle of ping session

#### Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

`esp_err_t esp_ping_delete_session` (`esp_ping_handle_t` hdl)

Delete a ping session.

**Parameters** **hdl** -- handle of ping session

#### Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: delete ping session successfully

*esp\_err\_t* **esp\_ping\_start** (*esp\_ping\_handle\_t* hdl)

Start the ping session.

**Parameters** **hdl** -- handle of ping session

**Returns**

- **ESP\_ERR\_INVALID\_ARG**: invalid parameters (e.g. ping handle is null, etc)
- **ESP\_OK**: start ping session successfully

*esp\_err\_t* **esp\_ping\_stop** (*esp\_ping\_handle\_t* hdl)

Stop the ping session.

**Parameters** **hdl** -- handle of ping session

**Returns**

- **ESP\_ERR\_INVALID\_ARG**: invalid parameters (e.g. ping handle is null, etc)
- **ESP\_OK**: stop ping session successfully

*esp\_err\_t* **esp\_ping\_get\_profile** (*esp\_ping\_handle\_t* hdl, *esp\_ping\_profile\_t* profile, void \*data, uint32\_t size)

Get runtime profile of ping session.

**Parameters**

- **hdl** -- handle of ping session
- **profile** -- type of profile
- **data** -- profile data
- **size** -- profile data size

**Returns**

- **ESP\_ERR\_INVALID\_ARG**: invalid parameters (e.g. ping handle is null, etc)
- **ESP\_ERR\_INVALID\_SIZE**: the actual profile data size doesn't match the "size" parameter
- **ESP\_OK**: get profile successfully

## Structures

struct **esp\_ping\_callbacks\_t**

Type of "ping" callback functions.

### Public Members

void \***cb\_args**

arguments for callback functions

void (\***on\_ping\_success**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (\***on\_ping\_timeout**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (\***on\_ping\_end**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when a ping session is finished.

struct **esp\_ping\_config\_t**

Type of "ping" configuration.

### Public Members

uint32\_t **count**

A "ping" session contains count procedures

uint32\_t **interval\_ms**

Milliseconds between each ping procedure

uint32\_t **timeout\_ms**

Timeout value (in milliseconds) of each ping procedure

uint32\_t **data\_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip\_addr\_t **target\_addr**

Target IP address, either IPv4 or IPv6

uint32\_t **task\_stack\_size**

Stack size of internal ping task

uint32\_t **task\_prio**

Priority of internal ping task

uint32\_t **interface**

Netif index, interface=0 means NETIF\_NO\_INDEX

### Macros

**ESP\_PING\_DEFAULT\_CONFIG** ()

Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**

Set ping count to zero will ping target infinitely

### Type Definitions

typedef void \***esp\_ping\_handle\_t**

Type of "ping" session handle.

### Enumerations

enum **esp\_ping\_profile\_t**

Profile of ping session.

*Values:*

- enumerator **ESP\_PING\_PROF\_SEQNO**  
Sequence number of a ping procedure
- enumerator **ESP\_PING\_PROF\_TOS**  
Type of service of a ping procedure
- enumerator **ESP\_PING\_PROF\_TTL**  
Time to live of a ping procedure
- enumerator **ESP\_PING\_PROF\_REQUEST**  
Number of request packets sent out
- enumerator **ESP\_PING\_PROF\_REPLY**  
Number of reply packets received
- enumerator **ESP\_PING\_PROF\_IPADDR**  
IP address of replied target
- enumerator **ESP\_PING\_PROF\_SIZE**  
Size of received packet
- enumerator **ESP\_PING\_PROF\_TIMEGAP**  
Elapsed time between request and reply packet
- enumerator **ESP\_PING\_PROF\_DURATION**  
Elapsed time of the whole ping session

### 2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component mDNS has been moved from ESP-IDF since version v5.0 to a separate repository:

- [mDNS component on GitHub](#)

To add mDNS component in your project, please run `idf.py add-dependency espressif/mdns`.

#### Hosted Documentation

The documentation can be found on the link below:

- [mDNS documentation](#)

### 2.2.13 Mbed TLS

[Mbed TLS](#) is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

---

**Note:** ESP-IDF uses a [fork](#) of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum` (MPI) and ECC) over vanilla Mbed TLS.

---

Mbed TLS supports TLS 1.2, TLS 1.3 and DTLS 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

---

**Note:** Mbed TLS v3.x.x series supports only TLS 1.2 and TLS 1.3 protocols. Support for SSL 3.0, TLS 1.0/1.1 and DTLS 1.0 has been removed (deprecated). TLS 1.3 is fully supported starting Mbed TLS v3.6.0 release, before this release some features were still in experimental state. Please refer to [Mbed TLS ChangeLog](#) for more details.

---

### Mbed TLS Documentation

For Mbed TLS documentation please refer to the following (upstream) pointers:

- [API Reference](#)
- [Knowledge Base](#)

### Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions presented in different branches of ESP-IDF [here](#).

---

**Note:** Please refer the [Mbed TLS](#) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

---

### Application Examples

Examples in ESP-IDF use [ESP-TLS](#) which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples [protocols/https\\_server/simple](#) (Simple HTTPS server) and [protocols/https\\_request](#) (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example [protocols/https\\_mbedtls](#).

### Alternatives

[ESP-TLS](#) acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at [<https://github.com/espressif/esp-wolfSSL>](https://github.com/espressif/esp-wolfSSL) with the upstream submodule pointer.

Please refer to [ESP-TLS: Underlying SSL/TLS Library Options](#) docs for more information on this and comparison of Mbed TLS and wolfSSL.

## Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedTLS`. The full list of config options can be found [here](#).

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration

## Performance and Memory Tweaks

**Reducing Heap Usage** The following table shows typical memory usage with different configs when the [protocols/https\\_request](#) example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed TLS Test	Related Configs	Heap Usage (approx.)
Default	NA	42196 B
Enable SSL Variable Length	<code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code>	42120 B
Disable Keep Peer Certificate	<code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code>	38533 B
Enable Dynamic TX/RX Buffer	<code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</code>	22013 B

**Note:** These values are subject to change with change in configuration options and versions of Mbed TLS.

**Reducing Binary Size** Under `Component Config -> mbedTLS`, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in [Minimizing Binary Size](#) docs.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

### 2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.3 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see [Error Handling](#).

*ESP\_FAIL* (-1): Generic esp\_err\_t code indicating failure

*ESP\_OK* (0): esp\_err\_t value indicating success (no error)

*ESP\_ERR\_NO\_MEM* (0x101): Out of memory

*ESP\_ERR\_INVALID\_ARG* (0x102): Invalid argument

*ESP\_ERR\_INVALID\_STATE* (0x103): Invalid state

*ESP\_ERR\_INVALID\_SIZE* (0x104): Invalid size

*ESP\_ERR\_NOT\_FOUND* (0x105): Requested resource not found

*ESP\_ERR\_NOT\_SUPPORTED* (0x106): Operation or feature not supported

*ESP\_ERR\_TIMEOUT* (0x107): Operation timed out

*ESP\_ERR\_INVALID\_RESPONSE* (0x108): Received response was invalid

*ESP\_ERR\_INVALID\_CRC* (0x109): CRC or checksum was invalid

*ESP\_ERR\_INVALID\_VERSION* (0x10a): Version was invalid

*ESP\_ERR\_INVALID\_MAC* (0x10b): MAC address was invalid

*ESP\_ERR\_NOT\_FINISHED* (0x10c): Operation has not fully completed

*ESP\_ERR\_NOT\_ALLOWED* (0x10d): Operation is not allowed

*ESP\_ERR\_NVS\_BASE* (0x1100): Starting number of error codes

*ESP\_ERR\_NVS\_NOT\_INITIALIZED* (0x1101): The storage driver is not initialized

*ESP\_ERR\_NVS\_NOT\_FOUND* (0x1102): A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS\_READONLY

*ESP\_ERR\_NVS\_TYPE\_MISMATCH* (0x1103): The type of set or get operation doesn't match the type of value stored in NVS

*ESP\_ERR\_NVS\_READ\_ONLY* (0x1104): Storage handle was opened as read only

*ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE* (0x1105): There is not enough space in the underlying storage to save the value

*ESP\_ERR\_NVS\_INVALID\_NAME* (0x1106): Namespace name doesn't satisfy constraints

*ESP\_ERR\_NVS\_INVALID\_HANDLE* (0x1107): Handle has been closed or is NULL

*ESP\_ERR\_NVS\_REMOVE\_FAILED* (0x1108): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

*ESP\_ERR\_NVS\_KEY\_TOO\_LONG* (0x1109): Key name is too long

*ESP\_ERR\_NVS\_PAGE\_FULL* (0x110a): Internal error; never returned by nvs API functions

*ESP\_ERR\_NVS\_INVALID\_STATE* (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs\_flash\_init and nvs\_open again, then retry.

*ESP\_ERR\_NVS\_INVALID\_LENGTH* (0x110c): String or blob length is not sufficient to store data

*ESP\_ERR\_NVS\_NO\_FREE\_PAGES* (0x110d): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs\_flash\_init again.

*ESP\_ERR\_NVS\_VALUE\_TOO\_LONG* (0x110e): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

*ESP\_ERR\_NVS\_PART\_NOT\_FOUND* (0x110f): Partition with specified name is not found in the partition table

*ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND* (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

*ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED* (0x1111): XTS encryption failed while writing NVS entry

*ESP\_ERR\_NVS\_XTS\_DECR\_FAILED* (**0x1112**): XTS decryption failed while reading NVS entry

*ESP\_ERR\_NVS\_XTS\_CFG\_FAILED* (**0x1113**): XTS configuration setting failed

*ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND* (**0x1114**): XTS configuration not found

*ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED* (**0x1115**): NVS encryption is not supported in this version

*ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED* (**0x1116**): NVS key partition is uninitialized

*ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART* (**0x1117**): NVS key partition is corrupt

*ESP\_ERR\_NVS\_CONTENT\_DIFFERS* (**0x1118**): Internal error; never returned by nvs API functions. NVS key is different in comparison

*ESP\_ERR\_NVS\_WRONG\_ENCRYPTION* (**0x1119**): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

*ESP\_ERR\_ULP\_BASE* (**0x1200**): Offset for ULP-related error codes

*ESP\_ERR\_ULP\_SIZE\_TOO\_BIG* (**0x1201**): Program doesn't fit into RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR* (**0x1202**): Load address is outside of RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_DUPLICATE\_LABEL* (**0x1203**): More than one label with the same number was defined

*ESP\_ERR\_ULP\_UNDEFINED\_LABEL* (**0x1204**): Branch instructions references an undefined label

*ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE* (**0x1205**): Branch target is out of range of B instruction (try replacing with BX)

*ESP\_ERR\_OTA\_BASE* (**0x1500**): Base error code for ota\_ops api

*ESP\_ERR\_OTA\_PARTITION\_CONFLICT* (**0x1501**): Error if request was to write or erase the current running partition

*ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID* (**0x1502**): Error if OTA data partition contains invalid content

*ESP\_ERR\_OTA\_VALIDATE\_FAILED* (**0x1503**): Error if OTA app image is invalid

*ESP\_ERR\_OTA\_SMALL\_SEC\_VER* (**0x1504**): Error if the firmware has a secure version less than the running firmware.

*ESP\_ERR\_OTA\_ROLLBACK\_FAILED* (**0x1505**): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

*ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE* (**0x1506**): Error if current active firmware is still marked in pending validation state (*ESP\_OTA\_IMG\_PENDING\_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

*ESP\_ERR\_EFUSE* (**0x1600**): Base error code for efuse api.

*ESP\_OK\_EFUSE\_CNT* (**0x1601**): OK the required number of bits is set.

*ESP\_ERR\_EFUSE\_CNT\_IS\_FULL* (**0x1602**): Error field is full.

*ESP\_ERR\_EFUSE\_REPEATED\_PROG* (**0x1603**): Error repeated programming of programmed bits is strictly forbidden.

*ESP\_ERR\_CODING* (**0x1604**): Error while a encoding operation.

*ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS* (**0x1605**): Error not enough unused key blocks available

*ESP\_ERR\_DAMAGED\_READING* (**0x1606**): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

*ESP\_ERR\_IMAGE\_BASE* (**0x2000**)

*ESP\_ERR\_IMAGE\_FLASH\_FAIL* (**0x2001**)

*ESP\_ERR\_IMAGE\_INVALID* (**0x2002**)

*ESP\_ERR\_WIFI\_BASE* (**0x3000**): Starting number of WiFi error codes

*ESP\_ERR\_WIFI\_NOT\_INIT* (**0x3001**): WiFi driver was not installed by `esp_wifi_init`

*ESP\_ERR\_WIFI\_NOT\_STARTED* (**0x3002**): WiFi driver was not started by `esp_wifi_start`

*ESP\_ERR\_WIFI\_NOT\_STOPPED* (**0x3003**): WiFi driver was not stopped by `esp_wifi_stop`

*ESP\_ERR\_WIFI\_IF* (**0x3004**): WiFi interface error

*ESP\_ERR\_WIFI\_MODE* (**0x3005**): WiFi mode error

*ESP\_ERR\_WIFI\_STATE* (**0x3006**): WiFi internal state error

*ESP\_ERR\_WIFI\_CONN* (**0x3007**): WiFi internal control block of station or soft-AP error

*ESP\_ERR\_WIFI\_NVS* (**0x3008**): WiFi internal NVS module error

*ESP\_ERR\_WIFI\_MAC* (**0x3009**): MAC address is invalid

*ESP\_ERR\_WIFI\_SSID* (**0x300a**): SSID is invalid

*ESP\_ERR\_WIFI\_PASSWORD* (**0x300b**): Password is invalid

*ESP\_ERR\_WIFI\_TIMEOUT* (**0x300c**): Timeout error

*ESP\_ERR\_WIFI\_WAKE\_FAIL* (**0x300d**): WiFi is in sleep state(RF closed) and wakeup fail

*ESP\_ERR\_WIFI\_WOULD\_BLOCK* (**0x300e**): The caller would block

*ESP\_ERR\_WIFI\_NOT\_CONNECT* (**0x300f**): Station still in disconnect status

*ESP\_ERR\_WIFI\_POST* (**0x3012**): Failed to post the event to WiFi task

*ESP\_ERR\_WIFI\_INIT\_STATE* (**0x3013**): Invalid WiFi state when init/deinit is called

*ESP\_ERR\_WIFI\_STOP\_STATE* (**0x3014**): Returned when WiFi is stopping

*ESP\_ERR\_WIFI\_NOT\_ASSOC* (**0x3015**): The WiFi connection is not associated

*ESP\_ERR\_WIFI\_TX\_DISALLOW* (**0x3016**): The WiFi TX is disallowed

*ESP\_ERR\_WIFI\_TWT\_FULL* (**0x3017**): no available flow id

*ESP\_ERR\_WIFI\_TWT\_SETUP\_TIMEOUT* (**0x3018**): Timeout of receiving twt setup response frame, timeout times can be set during twt setup

*ESP\_ERR\_WIFI\_TWT\_SETUP\_TXFAIL* (**0x3019**): TWT setup frame tx failed

*ESP\_ERR\_WIFI\_TWT\_SETUP\_REJECT* (**0x301a**): The twt setup request was rejected by the AP

*ESP\_ERR\_WIFI\_DISCARD* (**0x301b**): Discard frame

*ESP\_ERR\_WIFI\_ROC\_IN\_PROGRESS* (**0x301c**): ROC op is in progress

*ESP\_ERR\_WIFI\_REGISTRAR* (**0x3033**): WPS registrar is not supported

*ESP\_ERR\_WIFI\_WPS\_TYPE* (**0x3034**): WPS type error

*ESP\_ERR\_WIFI\_WPS\_SM* (**0x3035**): WPS state machine is not initialized

*ESP\_ERR\_ESPNOW\_BASE* (**0x3064**): ESPNOW error number base.

*ESP\_ERR\_ESPNOW\_NOT\_INIT* (**0x3065**): ESPNOW is not initialized.

*ESP\_ERR\_ESPNOW\_ARG* (**0x3066**): Invalid argument

*ESP\_ERR\_ESPNOW\_NO\_MEM* (**0x3067**): Out of memory

*ESP\_ERR\_ESPNOW\_FULL* (**0x3068**): ESPNOW peer list is full

*ESP\_ERR\_ESPNOW\_NOT\_FOUND* (**0x3069**): ESPNOW peer is not found

*ESP\_ERR\_ESPNOW\_INTERNAL* (**0x306a**): Internal error

*ESP\_ERR\_ESPNOW\_EXIST* (**0x306b**): ESPNOW peer has existed

*ESP\_ERR\_ESPNOW\_IF* (**0x306c**): Interface error

*ESP\_ERR\_ESPNOW\_CHAN (0x306d)*: Channel error

*ESP\_ERR\_DPP\_FAILURE (0x3097)*: Generic failure during DPP Operation

*ESP\_ERR\_DPP\_TX\_FAILURE (0x3098)*: DPP Frame Tx failed OR not Acked

*ESP\_ERR\_DPP\_INVALID\_ATTR (0x3099)*: Encountered invalid DPP Attribute

*ESP\_ERR\_DPP\_AUTH\_TIMEOUT (0x309a)*: DPP Auth response was not received in time

*ESP\_ERR\_DPP\_INVALID\_LIST (0x309b)*: Channel list given in `esp_supp_dpp_bootstrap_gen()` is not valid or too big

*ESP\_ERR\_MESH\_BASE (0x4000)*: Starting number of MESH error codes

*ESP\_ERR\_MESH\_WIFI\_NOT\_START (0x4001)*

*ESP\_ERR\_MESH\_NOT\_INIT (0x4002)*

*ESP\_ERR\_MESH\_NOT\_CONFIG (0x4003)*

*ESP\_ERR\_MESH\_NOT\_START (0x4004)*

*ESP\_ERR\_MESH\_NOT\_SUPPORT (0x4005)*

*ESP\_ERR\_MESH\_NOT\_ALLOWED (0x4006)*

*ESP\_ERR\_MESH\_NO\_MEMORY (0x4007)*

*ESP\_ERR\_MESH\_ARGUMENT (0x4008)*

*ESP\_ERR\_MESH\_EXCEED\_MTU (0x4009)*

*ESP\_ERR\_MESH\_TIMEOUT (0x400a)*

*ESP\_ERR\_MESH\_DISCONNECTED (0x400b)*

*ESP\_ERR\_MESH\_QUEUE\_FAIL (0x400c)*

*ESP\_ERR\_MESH\_QUEUE\_FULL (0x400d)*

*ESP\_ERR\_MESH\_NO\_PARENT\_FOUND (0x400e)*

*ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND (0x400f)*

*ESP\_ERR\_MESH\_OPTION\_NULL (0x4010)*

*ESP\_ERR\_MESH\_OPTION\_UNKNOWN (0x4011)*

*ESP\_ERR\_MESH\_XON\_NO\_WINDOW (0x4012)*

*ESP\_ERR\_MESH\_INTERFACE (0x4013)*

*ESP\_ERR\_MESH\_DISCARD\_DUPLICATE (0x4014)*

*ESP\_ERR\_MESH\_DISCARD (0x4015)*

*ESP\_ERR\_MESH\_VOTING (0x4016)*

*ESP\_ERR\_MESH\_XMIT (0x4017)*

*ESP\_ERR\_MESH\_QUEUE\_READ (0x4018)*

*ESP\_ERR\_MESH\_PS (0x4019)*

*ESP\_ERR\_MESH\_RECV\_RELEASE (0x401a)*

*ESP\_ERR\_ESP\_NETIF\_BASE (0x5000)*

*ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS (0x5001)*

*ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY (0x5002)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED (0x5003)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED (0x5004)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED (0x5005)*

*ESP\_ERR\_ESP\_NETIF\_NO\_MEM (0x5006)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED (0x5007)*

*ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED (0x5008)*

*ESP\_ERR\_ESP\_NETIF\_INIT\_FAILED (0x5009)*

*ESP\_ERR\_ESP\_NETIF\_DNS\_NOT\_CONFIGURED (0x500a)*

*ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED (0x500b)*

*ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED (0x500c)*

*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED (0x500d)*

*ESP\_ERR\_FLASH\_BASE (0x6000)*: Starting number of flash error codes

*ESP\_ERR\_FLASH\_OP\_FAIL (0x6001)*

*ESP\_ERR\_FLASH\_OP\_TIMEOUT (0x6002)*

*ESP\_ERR\_FLASH\_NOT\_INITIALISED (0x6003)*

*ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST (0x6004)*

*ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP (0x6005)*

*ESP\_ERR\_FLASH\_PROTECTED (0x6006)*

*ESP\_ERR\_HTTP\_BASE (0x7000)*: Starting number of HTTP error codes

*ESP\_ERR\_HTTP\_MAX\_REDIRECT (0x7001)*: The error exceeds the number of HTTP redirects

*ESP\_ERR\_HTTP\_CONNECT (0x7002)*: Error open the HTTP connection

*ESP\_ERR\_HTTP\_WRITE\_DATA (0x7003)*: Error write HTTP data

*ESP\_ERR\_HTTP\_FETCH\_HEADER (0x7004)*: Error read HTTP header from server

*ESP\_ERR\_HTTP\_INVALID\_TRANSPORT (0x7005)*: There are no transport support for the input scheme

*ESP\_ERR\_HTTP\_CONNECTING (0x7006)*: HTTP connection hasn't been established yet

*ESP\_ERR\_HTTP\_EAGAIN (0x7007)*: Mapping of errno EAGAIN to esp\_err\_t

*ESP\_ERR\_HTTP\_CONNECTION\_CLOSED (0x7008)*: Read FIN from peer and the connection closed

*ESP\_ERR\_ESP\_TLS\_BASE (0x8000)*: Starting number of ESP-TLS error codes

*ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME (0x8001)*: Error if hostname couldn't be resolved upon tls connection

*ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET (0x8002)*: Failed to create socket

*ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY (0x8003)*: Unsupported protocol family

*ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST (0x8004)*: Failed to connect to host

*ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED (0x8005)*: failed to set/get socket option

*ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT (0x8006)*: new connection in esp\_tls\_low\_level\_conn connection timeouted

*ESP\_ERR\_ESP\_TLS\_SE\_FAILED (0x8007)*

*ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN (0x8008)*

*ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK (0x8010)*: mbedtls parse certificates was partly successful

*ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED (0x8011)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED (0x8012)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED (0x8013)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED (0x8014)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_X509\_CERT\_PARSE\_FAILED (0x8015)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED (0x8016)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED (0x8017)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED (0x8018)*: mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED (0x8019)*: mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED (0x801a)*: mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED (0x801b)*: mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED (0x801c)*: mbedtls api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED (0x8031)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED (0x8032)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED (0x8033)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED (0x8034)*: wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED (0x8035)*: wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED (0x8036)*: wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED (0x8037)*: wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED (0x8038)*: wolfSSL api returned failed

*ESP\_ERR\_HTTPS\_OTA\_BASE (0x9000)*

*ESP\_ERR\_HTTPS\_OTA\_IN\_PROGRESS (0x9001)*

*ESP\_ERR\_PING\_BASE (0xa000)*

*ESP\_ERR\_PING\_INVALID\_PARAMS (0xa001)*

*ESP\_ERR\_PING\_NO\_MEM (0xa002)*

*ESP\_ERR\_HTTPD\_BASE (0xb000)*: Starting number of HTTPD error codes

*ESP\_ERR\_HTTPD\_HANDLERS\_FULL (0xb001)*: All slots for registering URI handlers have been consumed

*ESP\_ERR\_HTTPD\_HANDLER\_EXISTS (0xb002)*: URI handler with same method and target URI already registered

*ESP\_ERR\_HTTPD\_INVALID\_REQ (0xb003)*: Invalid request pointer

*ESP\_ERR\_HTTPD\_RESULT\_TRUNC (0xb004)*: Result string truncated

*ESP\_ERR\_HTTPD\_RESP\_HDR (0xb005)*: Response header field larger than supported

*ESP\_ERR\_HTTPD\_RESP\_SEND (0xb006)*: Error occurred while sending response packet

*ESP\_ERR\_HTTPD\_ALLOC\_MEM (0xb007)*: Failed to dynamically allocate memory for resource

*ESP\_ERR\_HTTPD\_TASK (0xb008)*: Failed to launch server task/thread

*ESP\_ERR\_HW\_CRYPTO\_BASE (0xc000)*: Starting number of HW cryptography module error codes

*ESP\_ERR\_HW\_CRYPTO\_DS\_HMAC\_FAIL (0xc001)*: HMAC peripheral problem

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_KEY (0xc002)*

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_DIGEST (0xc004)*

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_PADDING (0xc005)*

*ESP\_ERR\_MEMPROT\_BASE (0xd000)*: Starting number of Memory Protection API error codes

*ESP\_ERR\_MEMPROT\_MEMORY\_TYPE\_INVALID (0xd001)*

ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_INVALID (**0xd002**)

ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_OUT\_OF\_RANGE (**0xd003**)

ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_UNALIGNED (**0xd004**)

ESP\_ERR\_MEMPROT\_UNIMGMT\_BLOCK\_INVALID (**0xd005**)

ESP\_ERR\_MEMPROT\_WORLD\_INVALID (**0xd006**)

ESP\_ERR\_MEMPROT\_AREA\_INVALID (**0xd007**)

ESP\_ERR\_MEMPROT\_CPUID\_INVALID (**0xd008**)

ESP\_ERR\_TCP\_TRANSPORT\_BASE (**0xe000**): Starting number of TCP Transport error codes

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_TIMEOUT (**0xe001**): Connection has timed out

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_CLOSED\_BY\_FIN (**0xe002**): Read FIN from peer and the connection has closed (in a clean way)

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_FAILED (**0xe003**): Failed to connect to the peer

ESP\_ERR\_TCP\_TRANSPORT\_NO\_MEM (**0xe004**): Memory allocation failed

*ESP\_ERR\_NVS\_SEC\_BASE* (**0xf000**): Starting number of error codes

*ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_NOT\_FOUND* (**0xf001**): HMAC Key required to generate the NVS encryption keys not found

*ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_BLK\_ALREADY\_USED* (**0xf002**): Provided eFuse block for HMAC key generation is already in use

*ESP\_ERR\_NVS\_SEC\_HMAC\_KEY\_GENERATION\_FAILED* (**0xf003**): Failed to generate/write the HMAC key to eFuse

*ESP\_ERR\_NVS\_SEC\_HMAC\_XTS\_KEYS\_DERIV\_FAILED* (**0xf004**): Failed to derive the NVS encryption keys based on the HMAC-based scheme

## 2.4 Networking APIs

### 2.4.1 Wi-Fi

#### ESP-NOW

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection.

CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps.

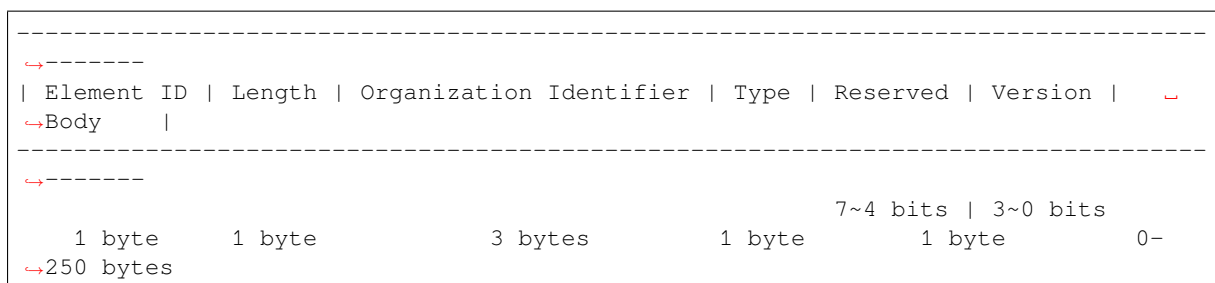

Currently, ESP-NOW supports one version: v1.0. The maximum packet length supported by v1.0 devices is `ESP_NOW_MAX_DATA_LEN` bytes. The v1.0 devices can receive packets if the packet length is less than or equal to `ESP_NOW_MAX_IE_DATA_LEN`. For packets exceeding this length, the v1.0 devices will discard the packet entirely.

The format of the vendor-specific action frame is as follows:

- **Category Code:** The Category Code field is set to the value (127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains one vendor-specific element field,  $x = 257(250 + 7)$ .

The format of the vendor-specific element frame is as follows:

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body, the maximum value is 255.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the actual ESP-NOW data to be transmitted.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

**Security** ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. The Wi-Fi device maintains a Primary Master Key (PMK) and several Local Master Keys (LMKs, each paired device has one LMK). The lengths of both PMK and LMK are 16 bytes.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and Deinitialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW.

When `esp_now_deinit()` is called, all of the information of paired devices are deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 17, the default is 7. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device does not exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_wifi_config_espnow_rate()` to config ESP-NOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

**Config ESP-NOW Power-saving Parameter** Sleep is supported only when ESP32-S2 is configured as station.

Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time.

If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to [connectionless module power save](#) to get more detail.

## Application Examples

- Example of sending and receiving ESP-NOW data between two devices: [wifi/espnow](#).
- For more application examples of how to use ESP-NOW, please visit [ESP-NOW repository](#).

## API Reference

## Header File

- `components/esp_wifi/include/esp_now.h`
- This header file can be included with:

```
#include "esp_now.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your CMakeLists.txt:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

## Functions

`esp_err_t esp_now_init` (void)

Initialize ESPNOW function.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_INTERNAL` : Internal error

`esp_err_t esp_now_deinit` (void)

De-initialize ESPNOW function.

### Returns

- `ESP_OK` : succeed

`esp_err_t esp_now_get_version` (uint32\_t \*version)

Get the version of ESPNOW. Currently, ESPNOW supports one version: v1.0.

```
The v1.0 devices can receive packets if the packet length is less than
↳or equal to ESP_NOW_MAX_IE_DATA_LEN.
For packets exceeding this length, the v1.0 devices will discard the
↳packet entirely.
```

**Parameters** `version` -- ESPNOW version

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_ARG` : invalid argument

`esp_err_t esp_now_register_recv_cb` (`esp_now_recv_cb_t` cb)

Register callback function of receiving ESPNOW data.

**Parameters** `cb` -- callback function of receiving ESPNOW data

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_INTERNAL` : internal error

`esp_err_t esp_now_unregister_recv_cb` (void)

Unregister callback function of receiving ESPNOW data.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized

`esp_err_t esp_now_register_send_cb` (`esp_now_send_cb_t` cb)

Register callback function of sending ESPNOW data.

**Parameters** `cb` -- callback function of sending ESPNOW data

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_INTERNAL` : internal error

*esp\_err\_t* **esp\_now\_unregister\_send\_cb** (void)

Unregister callback function of sending ESPNOW data.

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_send** (const uint8\_t \*peer\_addr, const uint8\_t \*data, size\_t len)

Send ESPNOW data.

**Attention** 1. If peer\_addr is not NULL, send data to the peer whose MAC address matches peer\_addr

**Attention** 2. If peer\_addr is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of data must be less than `ESP_NOW_MAX_DATA_LEN`

**Attention** 4. The buffer pointed to by data argument does not need to be valid after esp\_now\_send returns

**Parameters**

- **peer\_addr** -- peer MAC address
- **data** -- data to send
- **len** -- length of data

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory, when this happens, you can delay a while before sending the next data
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current Wi-Fi interface doesn't match that of peer
- `ESP_ERR_ESPNOW_CHAN`: current Wi-Fi channel doesn't match that of peer

*esp\_err\_t* **esp\_now\_add\_peer** (const *esp\_now\_peer\_info\_t* \*peer)

Add a peer to peer list.

**Parameters** **peer** -- peer information

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

*esp\_err\_t* **esp\_now\_del\_peer** (const uint8\_t \*peer\_addr)

Delete a peer from peer list.

**Parameters** **peer\_addr** -- peer MAC address

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

*esp\_err\_t* **esp\_now\_mod\_peer** (const *esp\_now\_peer\_info\_t* \*peer)

Modify a peer.

**Parameters** **peer** -- peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_FULL : peer list is full

*esp\_err\_t* **esp\_wifi\_config\_espnnow\_rate** (*wifi\_interface\_t* ifx, *wifi\_phy\_rate\_t* rate)

Config ESPNOW rate of specified interface.

*Deprecated:*

please use *esp\_now\_set\_peer\_rate\_config()* instead.

**Attention** 1. This API should be called after *esp\_wifi\_start()*.

**Attention** 2. This API only work when not use Wi-Fi 6 and *esp\_now\_set\_peer\_rate\_config()* not called.

**Parameters**

- **ifx** -- Interface to be configured.
- **rate** -- Phy rate to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_now\_set\_peer\_rate\_config** (const uint8\_t \*peer\_addr, *esp\_now\_rate\_config\_t* \*config)

Set ESPNOW rate config for each peer.

**Attention** 1. This API should be called after *esp\_wifi\_start()* and *esp\_now\_init()*.

**Parameters**

- **peer\_addr** -- peer MAC address
- **config** -- rate config to be configured.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

*esp\_err\_t* **esp\_now\_get\_peer** (const uint8\_t \*peer\_addr, *esp\_now\_peer\_info\_t* \*peer)

Get a peer whose MAC address matches peer\_addr from peer list.

**Parameters**

- **peer\_addr** -- peer MAC address
- **peer** -- peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

*esp\_err\_t* **esp\_now\_fetch\_peer** (bool from\_head, *esp\_now\_peer\_info\_t* \*peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**

- **from\_head** -- fetch from head of list or not
- **peer** -- peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

bool **esp\_now\_is\_peer\_exist** (const uint8\_t \*peer\_addr)

Peer exists or not.

**Parameters** **peer\_addr** -- peer MAC address

**Returns**

- true : peer exists
- false : peer not exists

*esp\_err\_t* **esp\_now\_get\_peer\_num** (*esp\_now\_peer\_num\_t* \*num)

Get the number of peers.

**Parameters** **num** -- number of peers

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_pmk** (const uint8\_t \*pmk)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Parameters** **pmk** -- primary master key

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_wake\_window** (uint16\_t window)

Set wake window for esp\_now to wake up in interval unit.

**Attention** 1. This configuration could work at connected status. When ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work at disconnected status.

**Attention** 2. Default value is the maximum.

**Parameters** **window** -- Milliseconds would the chip keep waked each interval, from 0 to 65535.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

**Structures**

struct **esp\_now\_peer\_info**

ESPNOW peer information parameters.

**Public Members**

uint8\_t **peer\_addr**[ESP\_NOW\_ETH\_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t **lmk**[ESP\_NOW\_KEY\_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8\_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void \***priv**

ESPNOW peer private data

struct **esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

### Public Members

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM

struct **esp\_now\_recv\_info**

ESPNOW packet information.

### Public Members

uint8\_t \***src\_addr**

Source address of ESPNOW packet

uint8\_t \***des\_addr**

Destination address of ESPNOW packet

*wifi\_pkt\_rx\_ctrl\_t* \***rx\_ctrl**

Rx control info of ESPNOW packet

struct **esp\_now\_rate\_config**

ESPNOW rate config.

## Public Members

### *wifi\_phy\_mode\_t* **phymode**

ESPNow phymode of specified interface

### *wifi\_phy\_rate\_t* **rate**

ESPNow rate of specified interface

### bool **ersu**

ESPNow using ERSU to send frame, ERSU is a transmission mode related to 802.11 ax. ERSU is always used in long distance transmission, and its frame has lower rate compared with SU mode

### bool **dcm**

ESPNow using dcm rate to send frame

## Macros

### **ESP\_ERR\_ESPNow\_BASE**

ESPNow error number base.

### **ESP\_ERR\_ESPNow\_NOT\_INIT**

ESPNow is not initialized.

### **ESP\_ERR\_ESPNow\_ARG**

Invalid argument

### **ESP\_ERR\_ESPNow\_NO\_MEM**

Out of memory

### **ESP\_ERR\_ESPNow\_FULL**

ESPNow peer list is full

### **ESP\_ERR\_ESPNow\_NOT\_FOUND**

ESPNow peer is not found

### **ESP\_ERR\_ESPNow\_INTERNAL**

Internal error

### **ESP\_ERR\_ESPNow\_EXIST**

ESPNow peer has existed

### **ESP\_ERR\_ESPNow\_IF**

Interface error

### **ESP\_ERR\_ESPNow\_CHAN**

Channel error

### **ESP\_NOW\_ETH\_ALEN**

Length of ESPNow peer MAC address

**ESP\_NOW\_KEY\_LEN**

Length of ESPNOW peer local master key

**ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**

Maximum number of ESPNOW total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**

Maximum number of ESPNOW encrypted peers

**ESP\_NOW\_MAX\_IE\_DATA\_LEN**

Maximum data length in a vendor-specific element

**ESP\_NOW\_MAX\_DATA\_LEN**

Maximum length of data sent in each ESPNOW transmission for v1.0

**Type Definitions**

```
typedef struct esp_now_peer_info esp_now_peer_info_t
```

ESPNOW peer information parameters.

```
typedef struct esp_now_peer_num esp_now_peer_num_t
```

Number of ESPNOW peers which exist currently.

```
typedef struct esp_now_recv_info esp_now_recv_info_t
```

ESPNOW packet information.

```
typedef struct esp_now_rate_config esp_now_rate_config_t
```

ESPNOW rate config.

```
typedef void (*esp_now_recv_cb_t)(const esp_now_recv_info_t *esp_now_info, const uint8_t *data, int data_len)
```

Callback function of receiving ESPNOW data.

**Attention** `esp_now_info` is a local variable, it can only be used in the callback.

**Param `esp_now_info`** received ESPNOW packet information

**Param `data`** received data

**Param `data_len`** length of received data

```
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNOW data.

**Param `mac_addr`** peer MAC address

**Param `status`** status of sending ESPNOW data (succeed or fail)

**Enumerations**

```
enum esp_now_send_status_t
```

Status of sending ESPNOW data .

*Values:*

enumerator **ESP\_NOW\_SEND\_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP\_NOW\_SEND\_FAIL**

Send ESPNOW data fail

## ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. *ESP-WIFI-MESH Programming Model*
2. *Writing an ESP-WIFI-MESH Application*
3. *Self-Organized Networking*
4. *Application Examples*
5. *API Reference*

For documentation regarding the ESP-WIFI-MESH protocol, please see the [ESP-WIFI-MESH API Guide](#). For more information about ESP-WIFI-MESH Development Framework, please see [ESP-WIFI-MESH Development Framework](#).

## ESP-WIFI-MESH Programming Model

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e., the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

Fig. 1: ESP-WIFI-MESH Software Stack

**System Events** An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Fig. 2: ESP-WIFI-MESH System Events Delivery

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH's self-organizing behavior.** Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`.** In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, **the corresponding handler must start the DHCP client service and immediately obtain an IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application** The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```

ESP_ERROR_CHECK(esp_netif_init());

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↵event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
  
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. *Initialize Mesh*
2. *Configuring an ESP-WIFI-MESH Network*
3. *Start Mesh*

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));
```

**Configuring an ESP-WIFI-MESH Network** ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

Parameter	Description
Channel	Range from 1 to 14
Mesh ID	ID of ESP-WIFI-MESH Network, see <a href="#">mesh_addr_t</a>
Router	Router Configuration, see <a href="#">mesh_router_t</a>
Mesh AP	Mesh AP Configuration, see <a href="#">mesh_ap_cfg_t</a>
Crypto Functions	Crypto Functions for Mesh IE, see <a href="#">mesh_crypto_funcs_t</a>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
       strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
       strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

**Start Mesh** The following code snippet demonstrates how to start ESP-WIFI-MESH.

```
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

**Self-Organized Networking** Self-organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and

conditions. With self-organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in *Building a Network*)
- Selection of a preferred parent node (see **Parent Node Selection** in *Building a Network*)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in *Managing a Network*)

When self-organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, **the application layer should not make any calls to Wi-Fi APIs whilst self-organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.**

**toggling Self-Organized Networking** Self-organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self-organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self-organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self-organized networking.

**Disabling Self-Organized Networking** The following code snippet demonstrates how to disable self-organized networking.

```
//Disable self-organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when disabling self-organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self-Organized Networking** ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when enabling self-organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self-organized networking.

Select Parent	Is Root Node	Effects
N	N	<ul style="list-style-type: none"> <li>• Nodes already connected to a parent node will remain connected.</li> <li>• Nodes previously scanning for a parent nodes will stop scanning. Call <code>esp_mesh_connect()</code> to restart.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• A root node already connected to router will stay connected.</li> <li>• A root node disconnected from router will need to call <code>esp_mesh_connect()</code> to reconnect.</li> </ul>
Y	N	<ul style="list-style-type: none"> <li>• Nodes without a parent node will automatically select a preferred parent and connect.</li> <li>• Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>• For a root node to connect to a parent node, it must give up it's role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.</li> </ul>

The following code snippet demonstrates how to enable self-organized networking.

```
//Enable self-organized networking and select a new parent
esp_mesh_set_self_organized(true, true);

...

//Enable self-organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, **self-organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self-organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using

## ESP-WIFI-MESH.

```

//Disable self-organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results

...

//Re-enable self-organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self-organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self-organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Do not select new parent
esp_mesh_connect(); //Manually reconnect to router

```

**Application Examples** ESP-IDF contains these ESP-WIFI-MESH example projects:

**The Internal Communication Example** demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

**The Manual Networking Example** demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

## API Reference

### Header File

- `components/esp_wifi/include/esp_mesh.h`
- This header file can be included with:

```
#include "esp_mesh.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

### Functions

`esp_err_t esp_mesh_init` (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_deinit** (void)

Mesh de-initialization.

- Release resources **and** stop the mesh

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_CONFIG
- ESP\_ERR\_MESH\_NO\_MEMORY

*esp\_err\_t* **esp\_mesh\_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI\_PS\_NONE.

**Returns**

- ESP\_OK
- ESP\_FAIL

```
esp_err_t esp_mesh_send (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[],  
int opt_count)
```

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

#### Parameters

- **to** -- **[in]** the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then users need to call `esp_mesh_rcv_toDS()` on the root node to forward this packet to the final IP server address.
- **data** -- **[in]** pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.
  - Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
    - \* If the packet is to the root, MESH\_TOS\_P2P must be set to ensure reliable transmission.
    - \* As long as the MESH\_TOS\_P2P is set, the API is blocking, even if the flag is set with MESH\_DATA\_NONBLOCK.
    - \* As long as the MESH\_TOS\_DEF is set, the API is non-blocking.
- **flag** -- **[in]** bitmap for data sent
  - Flag is at least one of the three MESH\_DATA\_P2P/MESH\_DATA\_FROMDS/MESH\_DATA\_TODS, which represents the direction of packet sending.
  - Speed up the route search
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root ("to" parameter isn't NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is blocking or non-blocking, blocking by default.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn't read out in time by `esp_mesh_rcv_toDS()`.  
Generally, we suggest `esp_mesh_rcv_toDS()` is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading `esp_mesh_rcv_toDS()` which avoids unnecessary memory copy.
- **opt** -- **[in]** options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- **opt\_count** -- **[in]** option count
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

#### Returns

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_DISCONNECTED
- ESP\_ERR\_MESH\_OPT\_UNKNOWN
- ESP\_ERR\_MESH\_EXCEED\_MTU
- ESP\_ERR\_MESH\_NO\_MEMORY
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND
- ESP\_ERR\_MESH\_DISCARD

*esp\_err\_t* **esp\_mesh\_send\_block\_time** (uint32\_t time\_ms)

Set blocking time of esp\_mesh\_send()

- Suggest to set the blocking time to at least 5s when the environment is poor. Otherwise, esp\_mesh\_send() may timeout frequently.

**Attention** This API shall be called before mesh is started.

**Parameters** *time\_ms* -- [in] blocking time of esp\_mesh\_send(), unit:ms

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_recv** (*mesh\_addr\_t* \*from, *mesh\_data\_t* \*data, int timeout\_ms, int \*flag, *mesh\_opt\_t* opt[], int opt\_count)

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp\_mesh\_get\_rx\_pending() to check the number of packets available in the queue waiting to be received by applications.

**Parameters**

- **from** -- [out] the address of the original source of the packet
- **data** -- [out] pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **timeout\_ms** -- [in] wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** -- [out] bitmap for data received
  - MESH\_DATA\_FROMDS represents data from external IP network
  - MESH\_DATA\_TODS represents data directed upward within the mesh network
- **opt** -- [out] options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- **opt\_count** -- [in] option count desired to receive
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD

```
esp_err_t esp_mesh_rcv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms,
                             int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_rcv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_rcv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

#### Parameters

- **from** -- **[out]** the address of the original source of the packet
- **to** -- **[out]** the address contains remote IP address and port (IPv4:PORT)
- **data** -- **[out]** pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout\_ms** -- **[in]** wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** -- **[out]** bitmap for data received
  - MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** -- **[out]** options desired to receive
- **opt\_count** -- **[in]** option count desired to receive

#### Returns

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD
- ESP\_ERR\_MESH\_RECV\_RELEASE

```
esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
```

Set mesh stack configuration.

- Use `MESH_INIT_CONFIG_DEFAULT()` to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with

same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. `max_connection` of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Parameters** `config` -- [in] pointer to mesh stack configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* `esp_mesh_get_config` (*mesh\_cfg\_t* \*config)

Get mesh stack configuration.

**Parameters** `config` -- [out] pointer to mesh stack configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_router` (const *mesh\_router\_t* \*router)

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Parameters** `router` -- [in] pointer to router configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_get_router` (*mesh\_router\_t* \*router)

Get router configuration.

**Parameters** `router` -- [out] pointer to router configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_id` (const *mesh\_addr\_t* \*id)

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Parameters** `id` -- [in] pointer to mesh network ID

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT: invalid argument

*esp\_err\_t* `esp_mesh_get_id` (*mesh\_addr\_t* \*id)

Get mesh network ID.

**Parameters** `id` -- [out] pointer to mesh network ID

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_type** (*mesh\_type\_t* type)

Designate device type over the mesh network.

- MESH\_IDLE: designates a device as a self-organized node for a mesh network
- MESH\_ROOT: designates the root node for a mesh network
- MESH\_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH\_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Parameters** type -- [in] device type

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*mesh\_type\_t* **esp\_mesh\_get\_type** (void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Returns** mesh type

*esp\_err\_t* **esp\_mesh\_set\_max\_layer** (int max\_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Parameters** max\_layer -- [in] max layer value

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

int **esp\_mesh\_get\_max\_layer** (void)

Get max layer value.

**Returns** max layer value

*esp\_err\_t* **esp\_mesh\_set\_ap\_password** (const uint8\_t \*pwd, int len)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Parameters**

- **pwd** -- [in] pointer to the password
- **len** -- [in] password length

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_set\_ap\_authmode** (*wifi\_auth\_mode\_t* authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters** **authmode** -- [in] authentication mode

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*wifi\_auth\_mode\_t* **esp\_mesh\_get\_ap\_authmode** (void)

Get mesh softAP authentication mode.

**Returns** authentication mode

*esp\_err\_t* **esp\_mesh\_set\_ap\_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** **connections** -- [in] the number of max connections

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

int **esp\_mesh\_get\_ap\_connections** (void)

Get mesh max connection configuration.

**Returns** the number of mesh max connections

int **esp\_mesh\_get\_non\_mesh\_connections** (void)

Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

int **esp\_mesh\_get\_layer** (void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Returns** layer value

*esp\_err\_t* **esp\_mesh\_get\_parent\_bssid** (*mesh\_addr\_t* \*bssid)

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Parameters** **bssid** -- [out] pointer to parent BSSID

**Returns**

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_is\_root** (void)

Return whether the device is the root node of the network.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_self\_organized** (bool enable, bool select\_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

**Attention** This API is used to dynamically modify whether to enable the self organizing.

#### Parameters

- **enable** -- **[in]** enable or disable self-organized networking
- **select\_parent** -- **[in]** Only valid when self-organized networking is enabled.
  - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

#### Returns

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_get\_self\_organized** (void)

Return whether enable self-organized networking or not.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_waive\_root** (const *mesh\_vote\_t* \*vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

#### Parameters

- **vote** -- **[in]** vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field `is_rc_specified` shall be false.
  - Field `attempts` shall be at least 15 times.

- **reason** -- **[in]** only accept MESH\_VOTE\_REASON\_ROOT\_INITIATED for now

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_DISCARD
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_set\_vote\_percentage** (float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Parameters** **percentage** -- **[in]** vote percentage threshold

**Returns**

- ESP\_OK
- ESP\_FAIL

float **esp\_mesh\_get\_vote\_percentage** (void)

Get vote percentage threshold for approval of being a root.

**Returns** percentage threshold

*esp\_err\_t* **esp\_mesh\_set\_ap\_assoc\_expire** (int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters** **seconds** -- **[in]** the expired time

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_ap\_assoc\_expire** (void)

Get mesh softAP associate expired time.

**Returns** seconds

int **esp\_mesh\_get\_total\_node\_num** (void)

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Returns** total number of devices (including the root)

int **esp\_mesh\_get\_routing\_table\_size** (void)

Get the number of devices in this device's sub-network (including self)

**Returns** the number of devices over this device's sub-network (including self)

*esp\_err\_t* **esp\_mesh\_get\_routing\_table** (*mesh\_addr\_t* \*mac, int len, int \*size)

Get routing table of this device's sub-network (including itself)

**Parameters**

- **mac** -- [out] pointer to routing table
- **len** -- [in] routing table size(in bytes)
- **size** -- [out] pointer to the number of devices in routing table (including itself)

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_post\_toDS\_state** (bool reachable)

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Parameters** **reachable** -- [in] this state represents whether the root is able to access external IP network

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_tx\_pending** (*mesh\_tx\_pending\_t* \*pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Parameters** **pending** -- [out] pointer to the TX pending

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_rx\_pending** (*mesh\_rx\_pending\_t* \*pending)

Return the number of packets available in the queue waiting to be received by applications.

**Parameters** **pending** -- [out] pointer to the RX pending

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_available\_txupQ\_num** (const *mesh\_addr\_t* \*addr, uint32\_t \*xseqno\_in)

Return the number of packets could be accepted from the specified address.

**Parameters**

- **addr** -- [in] self address or an associate children address
- **xseqno\_in** -- [out] sequence number of the last received packet from the specified address

**Returns** the number of upQ for a certain address

*esp\_err\_t* **esp\_mesh\_set\_xon\_qsize** (int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is:  $wnd = xon\_qsize / (2 * max\_connection + 1)$ . However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

**Attention** This API shall be called before mesh is started.

**Parameters** **qsize** -- [in] default:32 (min:16)

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_xon\_qsize** (void)

Get queue size.

**Returns** the number of queue

*esp\_err\_t* **esp\_mesh\_allow\_root\_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

- The default value is true, that is, multiple roots are allowed.

**Parameters** **allowed** -- **[in]** allow or not

**Returns**

- ESP\_OK
- ESP\_WIFI\_ERR\_NOT\_INIT
- ESP\_WIFI\_ERR\_NOT\_START

bool **esp\_mesh\_is\_root\_conflicts\_allowed** (void)

Check whether allow more than one root to exist in one network.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Set group ID addresses.

**Parameters**

- **addr** -- **[in]** pointer to new group ID addresses
- **num** -- **[in]** the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_delete\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Delete group ID addresses.

**Parameters**

- **addr** -- **[in]** pointer to deleted group ID address
- **num** -- **[in]** the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_group\_num** (void)

Get the number of group ID addresses.

**Returns** the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_get\_group\_list** (*mesh\_addr\_t* \*addr, int num)

Get group ID addresses.

**Parameters**

- **addr** -- **[out]** pointer to group ID addresses
- **num** -- **[in]** the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

bool **esp\_mesh\_is\_my\_group** (const *mesh\_addr\_t* \*addr)

Check whether the specified group address is my group.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_capacity\_num** (int num)

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Parameters** num -- [in] mesh network capacity

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_capacity\_num** (void)

Get mesh network capacity.

**Returns** mesh network capacity

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_funcs** (const mesh\_crypto\_funcs\_t \*crypto\_funcs)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is configured.

**Parameters** crypto\_funcs -- [in] crypto functions for mesh IE

- If crypto\_funcs is set to NULL, mesh IE is no longer encrypted.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_key** (const char \*key, int len)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is configured.

**Parameters**

- **key** -- [in] ASCII crypto key
- **len** -- [in] length in bytes, range:8~64

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_ie\_crypto\_key** (char \*key, int len)

Get mesh IE crypto key.

**Parameters**

- **key** -- [out] ASCII crypto key
- **len** -- [in] length in bytes, range:8~64

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_root\_healing\_delay** (int delay\_ms)

Set delay time before starting root healing.

**Parameters** delay\_ms -- [in] delay time in milliseconds

**Returns**

- ESP\_OK

int **esp\_mesh\_get\_root\_healing\_delay** (void)

Get delay time before network starts root healing.

**Returns** delay time in milliseconds

*esp\_err\_t* **esp\_mesh\_fix\_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Parameters** **enable** -- [in] enable or not

**Returns**

- ESP\_OK

bool **esp\_mesh\_is\_root\_fixed** (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the "flag" value in parent networking IE.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_parent** (const *wifi\_config\_t* \*parent, const *mesh\_addr\_t* \*parent\_mesh\_id, *mesh\_type\_t* my\_type, int my\_layer)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Parameters**

- **parent** -- [in] parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent\_mesh\_id** -- [in] parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- **my\_type** -- [in] mesh type
  - MESH\_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my\_type shall set MESH\_ROOT and my\_layer shall set MESH\_ROOT\_LAYER.
- **my\_layer** -- [in] mesh layer
  - my\_layer of the device may change after joining the network.
  - If my\_type is set MESH\_NODE, my\_layer shall be greater than MESH\_ROOT\_LAYER.
  - If my\_type is set MESH\_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

**Returns**

- ESP\_OK
- ESP\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_CONFIG

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_ie\_len** (int \*len)

Get mesh networking IE length of one AP.

**Parameters** `len` -- [out] mesh networking IE length

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* `esp_mesh_scan_get_ap_record` (*wifi\_ap\_record\_t* \*ap\_record, void \*buffer)

Get AP record.

**Attention** Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See "manual\_networking" example.

**Parameters**

- `ap_record` -- [out] pointer to one AP record
- `buffer` -- [out] pointer to the mesh networking IE of this AP

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* `esp_mesh_flush_upstream_packets` (void)

Flush upstream packets pending in to\_parent queue and to\_parent\_p2p queue.

**Returns**

- ESP\_OK

*esp\_err\_t* `esp_mesh_get_subnet_nodes_num` (const *mesh\_addr\_t* \*child\_mac, int \*nodes\_num)

Get the number of nodes in the subnet of a specific child.

**Parameters**

- `child_mac` -- [in] an associated child address of this device
- `nodes_num` -- [out] pointer to the number of nodes in the subnet of a specific child

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_get_subnet_nodes_list` (const *mesh\_addr\_t* \*child\_mac, *mesh\_addr\_t* \*nodes, int nodes\_num)

Get nodes in the subnet of a specific child.

**Parameters**

- `child_mac` -- [in] an associated child address of this device
- `nodes` -- [out] pointer to nodes in the subnet of a specific child
- `nodes_num` -- [in] the number of nodes in the subnet of a specific child

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_disconnect` (void)

Disconnect from current parent.

**Returns**

- ESP\_OK

*esp\_err\_t* `esp_mesh_connect` (void)

Connect to current parent.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_flush\_scan\_result** (void)

Flush scan result.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_switch\_channel** (const uint8\_t \*new\_bssid, int csa\_newchan, int csa\_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Parameters**

- **new\_bssid** -- **[in]** the new router BSSID if the router changes
- **csa\_newchan** -- **[in]** the new channel number to which the whole network is moving
- **csa\_count** -- **[in]** channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_router\_bssid** (uint8\_t \*router\_bssid)

Get the router BSSID.

**Parameters** **router\_bssid** -- **[out]** pointer to the router BSSID

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_INVALID\_ARG

*int64\_t* **esp\_mesh\_get\_tsf\_time** (void)

Get the TSF time.

**Returns** the TSF time

*esp\_err\_t* **esp\_mesh\_set\_topology** (*esp\_mesh\_topology\_t* topo)

Set mesh topology. The default value is MESH\_TOPO\_TREE.

- MESH\_TOPO\_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Parameters** **topo** -- **[in]** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_mesh\_topology\_t* **esp\_mesh\_get\_topology** (void)

Get mesh topology.

**Returns** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

*esp\_err\_t* **esp\_mesh\_enable\_ps** (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_disable\_ps** (void)

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

bool **esp\_mesh\_is\_ps\_enabled** (void)

Check whether the mesh Power Save function is enabled.

**Returns** true/false

bool **esp\_mesh\_is\_device\_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_active\_duty\_cycle** (int dev\_duty, int dev\_duty\_type)

Set the device duty cycle and type.

- The range of dev\_duty values is 1 to 100. The default value is 10.
- dev\_duty = 100, the PS will be stopped.
- dev\_duty is better to not less than 5.
- dev\_duty\_type could be MESH\_PS\_DEVICE\_DUTY\_REQUEST or MESH\_PS\_DEVICE\_DUTY\_DEMAND.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_REQUEST, the device will use a nwk\_duty provided by the network.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_DEMAND, the device will use the specified dev\_duty.

**Attention** This API can be called at any time after mesh is started.

**Parameters**

- **dev\_duty** -- [in] device duty cycle
- **dev\_duty\_type** -- [in] device PS duty cycle type, not accept MESH\_PS\_NETWORK\_DUTY\_MASTER

**Returns**

- ESP\_OK

- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_active\_duty\_cycle** (int \*dev\_duty, int \*dev\_duty\_type)

Get device duty cycle and type.

#### Parameters

- **dev\_duty** -- [out] device duty cycle
- **dev\_duty\_type** -- [out] device PS duty cycle type

#### Returns

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_network\_duty\_cycle** (int nwk\_duty, int duration\_mins, int applied\_rule)

Set the network duty cycle, duration and rule.

- The range of nwk\_duty values is 1 to 100. The default value is 10.
- nwk\_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk\_duty is known as a NWK-DUTY-MASTER.
- duration\_mins specifies how long the specified nwk\_duty will be used. Once duration\_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration\_mins = (-1) represents nwk\_duty will be used until a new NWK-DUTY-MASTER with a different nwk\_duty appears.
- Only the root can set duration\_mins to (-1).
- If applied\_rule is set to MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE, the nwk\_duty will be used by the entire network.
- If applied\_rule is set to MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK, the nwk\_duty will only be used by the up-link path nodes.
- The root does not accept MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK.
- A nwk\_duty with duration\_mins(-1) set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk\_duty shall be set to the same value for all devices; (2)duration\_mins shall be set to (-1); (3)applied\_rule shall be set to MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk\_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk\_duty for the entire network.
- After joins the network, any device can call this API to change the nwk\_duty, duration\_mins or applied\_rule.

#### Parameters

- **nwk\_duty** -- [in] network duty cycle
- **duration\_mins** -- [in] duration (unit: minutes)
- **applied\_rule** -- [in] only support MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE

#### Returns

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_network\_duty\_cycle** (int \*nwk\_duty, int \*duration\_mins, int \*dev\_duty\_type, int \*applied\_rule)

Get the network duty cycle, duration, type and rule.

#### Parameters

- **nwk\_duty** -- [out] current network duty cycle
- **duration\_mins** -- [out] the duration of current nwk\_duty

- **dev\_duty\_type** -- [out] if it includes MESH\_PS\_DEVICE\_DUTY\_MASTER, this device is the current NWK-DUTY-MASTER.
- **applied\_rule** -- [out] MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE

**Returns**

- ESP\_OK

int **esp\_mesh\_get\_running\_active\_duty\_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH\_PS\_DEVICE\_DUTY\_REQUEST, the running active duty cycle is nwk\_duty provided by the network.
- If duty type is set to MESH\_PS\_DEVICE\_DUTY\_DEMAND, the running active duty cycle is dev\_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Returns** the running active duty cycle

[esp\\_err\\_t](#) **esp\_mesh\_ps\_duty\_signaling** (int fwd\_times)

Duty signaling.

**Parameters** **fwd\_times** -- [in] the times of forwarding duty signaling packets

**Returns**

- ESP\_OK

## Unions

union **mesh\_addr\_t**

*#include <esp\_mesh.h>* Mesh address.

### Public Members

uint8\_t **addr**[6]

mac address

[mip\\_t](#) **mip**

mip address

union **mesh\_event\_info\_t**

*#include <esp\_mesh.h>* Mesh event information.

### Public Members

[mesh\\_event\\_channel\\_switch\\_t](#) **channel\_switch**

channel switch

*mesh\_event\_child\_connected\_t* **child\_connected**

child connected

*mesh\_event\_child\_disconnected\_t* **child\_disconnected**

child disconnected

*mesh\_event\_routing\_table\_change\_t* **routing\_table**

routing table change

*mesh\_event\_connected\_t* **connected**

parent connected

*mesh\_event\_disconnected\_t* **disconnected**

parent disconnected

*mesh\_event\_no\_parent\_found\_t* **no\_parent**

no parent found

*mesh\_event\_layer\_change\_t* **layer\_change**

layer change

*mesh\_event\_toDS\_state\_t* **toDS\_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH\_TODS\_REACHABLE.

*mesh\_event\_vote\_started\_t* **vote\_started**

vote started

*mesh\_event\_root\_address\_t* **root\_addr**

root address

*mesh\_event\_root\_switch\_req\_t* **switch\_req**

root switch request

*mesh\_event\_root\_conflict\_t* **root\_conflict**

other powerful root

*mesh\_event\_root\_fixed\_t* **root\_fixed**

fixed root

*mesh\_event\_scan\_done\_t* **scan\_done**

scan done

*mesh\_event\_network\_state\_t* **network\_state**

network state, such as whether current mesh network has a root.

*mesh\_event\_find\_network\_t* **find\_network**

network found that can join

*mesh\_event\_router\_switch\_t* **router\_switch**

new router information

*mesh\_event\_ps\_duty\_t* **ps\_duty**

PS duty information

union **mesh\_rc\_config\_t**

*#include <esp\_mesh.h>* Vote address configuration.

### Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

*mesh\_addr\_t* **rc\_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

### Structures

struct **mip\_t**

IP address and port.

### Public Members

*esp\_ip4\_addr\_t* **ip4**

IP address

uint16\_t **port**

port

struct **mesh\_event\_channel\_switch\_t**

Channel switch information.

### Public Members

uint8\_t **channel**

new channel

struct **mesh\_event\_connected\_t**

Parent connected information.

### Public Members

*wifi\_event\_sta\_connected\_t* **connected**

parent information, same as Wi-Fi event `SYSTEM_EVENT_STA_CONNECTED` does

uint16\_t **self\_layer**  
layer

uint8\_t **duty**  
parent duty

struct **mesh\_event\_no\_parent\_found\_t**  
No parent found information.

### Public Members

int **scan\_times**  
scan times being through

struct **mesh\_event\_layer\_change\_t**  
Layer change information.

### Public Members

uint16\_t **new\_layer**  
new layer

struct **mesh\_event\_vote\_started\_t**  
vote started information

### Public Members

int **reason**  
vote reason, vote could be initiated by children or by the root itself

int **attempts**  
max vote attempts before stopped

*mesh\_addr\_t* **rc\_addr**  
root address specified by users via API `esp_mesh_waive_root()`

struct **mesh\_event\_find\_network\_t**  
find a mesh network that this device can join

### Public Members

uint8\_t **channel**  
channel number of the new found network

uint8\_t **router\_bssid**[6]  
router BSSID

struct **mesh\_event\_root\_switch\_req\_t**

Root switch request information.

### Public Members

int **reason**

root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

*mesh\_addr\_t* **rc\_addr**

the address of root switch requester

struct **mesh\_event\_root\_conflict\_t**

Other powerful root address.

### Public Members

int8\_t **rsssi**

rsssi with router

uint16\_t **capacity**

the number of devices in current network

uint8\_t **addr**[6]

other powerful root address

struct **mesh\_event\_routing\_table\_change\_t**

Routing table change.

### Public Members

uint16\_t **rt\_size\_new**

the new value

uint16\_t **rt\_size\_change**

the changed value

struct **mesh\_event\_root\_fixed\_t**

Root fixed.

### Public Members

bool **is\_fixed**

status

struct **mesh\_event\_scan\_done\_t**

Scan done event information.

**Public Members****uint8\_t number**

the number of APs scanned

struct **mesh\_event\_network\_state\_t**

Network state information.

**Public Members**bool **is\_rootless**

whether current mesh network has a root

struct **mesh\_event\_ps\_duty\_t**

PS duty information.

**Public Members**uint8\_t **duty**

parent or child duty

*mesh\_event\_child\_connected\_t* **child\_connected**

child info

struct **mesh\_opt\_t**

Mesh option.

**Public Members**uint8\_t **type**

option type

uint16\_t **len**

option length

uint8\_t \***val**

option value

struct **mesh\_data\_t**Mesh data for `esp_mesh_send()` and `esp_mesh_rcv()`**Public Members**uint8\_t \***data**

data

`uint16_t size`

data size

`mesh_proto_t proto`

data protocol

`mesh_tos_t tos`

data type of service

struct `mesh_router_t`

Router configuration.

### Public Members

`uint8_t ssid[32]`

SSID

`uint8_t ssid_len`

length of SSID

`uint8_t bssid[6]`

BSSID, if this value is specified, users should also specify "allow\_router\_switch".

`uint8_t password[64]`

password

bool `allow_router_switch`

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after "fail" (`mesh_attempts_t`) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct `mesh_ap_cfg_t`

Mesh softAP configuration.

### Public Members

`uint8_t password[64]`

mesh softAP password

`uint8_t max_connection`

max number of stations allowed to connect in, default 6, max 10 = `max_connection` + `non-mesh_max_connection` max mesh connections

`uint8_t nonmesh_max_connection`

max non-mesh connections

struct **mesh\_cfg\_t**

Mesh initialization configuration.

### Public Members

uint8\_t **channel**

channel, the mesh network on

bool **allow\_channel\_switch**

if this value is set, when "fail" (mesh\_attempts\_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

*mesh\_addr\_t* **mesh\_id**

mesh network identification

*mesh\_router\_t* **router**

router configuration

*mesh\_ap\_cfg\_t* **mesh\_ap**

mesh softAP configuration

const mesh\_crypto\_funcs\_t \***crypto\_funcs**

crypto functions

struct **mesh\_vote\_t**

Vote.

### Public Members

float **percentage**

vote percentage threshold for approval of being a root

bool **is\_rc\_specified**

if true, rc\_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

*mesh\_rc\_config\_t* **config**

vote address configuration

struct **mesh\_tx\_pending\_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

### Public Members

int **to\_parent**

to parent queue

int **to\_parent\_p2p**  
to parent (P2P) queue

int **to\_child**  
to child queue

int **to\_child\_p2p**  
to child (P2P) queue

int **mgmt**  
management queue

int **broadcast**  
broadcast and multicast queue

struct **mesh\_rx\_pending\_t**  
The number of packets available in the queue waiting to be received by applications.

### Public Members

int **toDS**  
to external DS

int **toSelf**  
to self

### Macros

**MESH\_ROOT\_LAYER**  
root layer value

**MESH\_MTU**  
max transmit unit(in bytes)

**MESH\_MPS**  
max payload size(in bytes)

**ESP\_ERR\_MESH\_WIFI\_NOT\_START**  
Mesh error code definition.  
Wi-Fi isn't started

**ESP\_ERR\_MESH\_NOT\_INIT**  
mesh isn't initialized

**ESP\_ERR\_MESH\_NOT\_CONFIG**  
mesh isn't configured

**ESP\_ERR\_MESH\_NOT\_START**

mesh isn't started

**ESP\_ERR\_MESH\_NOT\_SUPPORT**

not supported yet

**ESP\_ERR\_MESH\_NOT\_ALLOWED**

operation is not allowed

**ESP\_ERR\_MESH\_NO\_MEMORY**

out of memory

**ESP\_ERR\_MESH\_ARGUMENT**

illegal argument

**ESP\_ERR\_MESH\_EXCEED\_MTU**

packet size exceeds MTU

**ESP\_ERR\_MESH\_TIMEOUT**

timeout

**ESP\_ERR\_MESH\_DISCONNECTED**

disconnected with parent on station interface

**ESP\_ERR\_MESH\_QUEUE\_FAIL**

queue fail

**ESP\_ERR\_MESH\_QUEUE\_FULL**

queue full

**ESP\_ERR\_MESH\_NO\_PARENT\_FOUND**

no parent found to join the mesh network

**ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND**

no route found to forward the packet

**ESP\_ERR\_MESH\_OPTION\_NULL**

no option found

**ESP\_ERR\_MESH\_OPTION\_UNKNOWN**

unknown option

**ESP\_ERR\_MESH\_XON\_NO\_WINDOW**

no window for software flow control on upstream

**ESP\_ERR\_MESH\_INTERFACE**

low-level Wi-Fi interface error

**ESP\_ERR\_MESH\_DISCARD\_DUPLICATE**

discard the packet due to the duplicate sequence number

**ESP\_ERR\_MESH\_DISCARD**

discard the packet

**ESP\_ERR\_MESH\_VOTING**

vote in progress

**ESP\_ERR\_MESH\_XMIT**

XMIT

**ESP\_ERR\_MESH\_QUEUE\_READ**

error in reading queue

**ESP\_ERR\_MESH\_PS**

mesh PS is not specified as enable or disable

**ESP\_ERR\_MESH\_RECV\_RELEASE**

release esp\_mesh\_rcv\_toDS

**MESH\_DATA\_ENC**

Flags bitmap for esp\_mesh\_send() and esp\_mesh\_rcv()

data encrypted (Unimplemented)

**MESH\_DATA\_P2P**

point-to-point delivery over the mesh network

**MESH\_DATA\_FROMDS**

receive from external IP network

**MESH\_DATA\_TODS**

identify this packet is target to external IP network

**MESH\_DATA\_NONBLOCK**

esp\_mesh\_send() non-block

**MESH\_DATA\_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH\_DATA\_GROUP**

identify this packet is target to a group address

**MESH\_OPT\_SEND\_GROUP**

Option definitions for esp\_mesh\_send() and esp\_mesh\_rcv()

data transmission by group; used with esp\_mesh\_send() and shall have payload

**MESH\_OPT\_RECV\_DS\_ADDR**

return a remote IP address; used with `esp_mesh_send()` and `esp_mesh_recv()`

**MESH\_ASSOC\_FLAG\_MAP\_ASSOC**

Flag of mesh networking IE.

Mesh AP doesn't detect children leave yet

**MESH\_ASSOC\_FLAG\_VOTE\_IN\_PROGRESS**

station in vote, set when root vote start, clear when connect to router or when root switch

**MESH\_ASSOC\_FLAG\_STA\_VOTED**

station vote done, set when connect to router

**MESH\_ASSOC\_FLAG\_NETWORK\_FREE**

no root in current network

**MESH\_ASSOC\_FLAG\_STA\_VOTE\_EXPIRE**

the voted address is expired, means the voted device lose the chance to be root

**MESH\_ASSOC\_FLAG\_ROOTS\_FOUND**

roots conflict is found, means that there are at least two roots in the mesh network

**MESH\_ASSOC\_FLAG\_ROOT\_FIXED**

the root is fixed in the mesh network

**MESH\_PS\_DEVICE\_DUTY\_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH\_PS\_DEVICE\_DUTY\_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH\_PS\_NETWORK\_DUTY\_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK**

**MESH\_INIT\_CONFIG\_DEFAULT ()**

**Type Definitions**

typedef *mesh\_addr\_t* mesh\_event\_root\_address\_t

Root address.

typedef *wifi\_event\_sta\_disconnected\_t* **mesh\_event\_disconnected\_t**

Parent disconnected information.

typedef *wifi\_event\_ap\_staconnected\_t* **mesh\_event\_child\_connected\_t**

Child connected information.

typedef *wifi\_event\_ap\_stadisconnected\_t* **mesh\_event\_child\_disconnected\_t**

Child disconnected information.

typedef *wifi\_event\_sta\_connected\_t* **mesh\_event\_router\_switch\_t**

New router information.

### Enumerations

enum **mesh\_event\_id\_t**

Enumerated list of mesh event id.

*Values:*

enumerator **MESH\_EVENT\_STARTED**

mesh is started

enumerator **MESH\_EVENT\_STOPPED**

mesh is stopped

enumerator **MESH\_EVENT\_CHANNEL\_SWITCH**

channel switch

enumerator **MESH\_EVENT\_CHILD\_CONNECTED**

a child is connected on softAP interface

enumerator **MESH\_EVENT\_CHILD\_DISCONNECTED**

a child is disconnected on softAP interface

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_ADD**

routing table is changed by adding newly joined children

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_REMOVE**

routing table is changed by removing leave children

enumerator **MESH\_EVENT\_PARENT\_CONNECTED**

parent is connected on station interface

enumerator **MESH\_EVENT\_PARENT\_DISCONNECTED**

parent is disconnected on station interface

enumerator **MESH\_EVENT\_NO\_PARENT\_FOUND**

no parent found

enumerator **MESH\_EVENT\_LAYER\_CHANGE**

layer changes over the mesh network

enumerator **MESH\_EVENT\_TODS\_STATE**

state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with `esp_mesh_post_toDS_state()`.

enumerator **MESH\_EVENT\_VOTE\_STARTED**

the process of voting a new root is started either by children or by the root

enumerator **MESH\_EVENT\_VOTE\_STOPPED**

the process of voting a new root is stopped

enumerator **MESH\_EVENT\_ROOT\_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_REQ**

root switch request sent from a new voted root candidate

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_ACK**

root switch acknowledgment responds the above request sent from current root

enumerator **MESH\_EVENT\_ROOT\_ASKED\_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH\_EVENT\_ROOT\_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH\_EVENT\_SCAN\_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH\_EVENT\_NETWORK\_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH\_EVENT\_STOP\_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH\_EVENT\_FIND\_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH\_EVENT\_ROUTER\_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH\_EVENT\_PS\_PARENT\_DUTY**

parent duty

enumerator **MESH\_EVENT\_PS\_CHILD\_DUTY**

child duty

enumerator **MESH\_EVENT\_PS\_DEVICE\_DUTY**

device duty

enumerator **MESH\_EVENT\_MAX**

enum **mesh\_type\_t**

Device type.

*Values:*

enumerator **MESH\_IDLE**

hasn't joined the mesh network yet

enumerator **MESH\_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH\_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH\_LEAF**

has no forwarding ability

enumerator **MESH\_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh\_proto\_t**

Protocol of transmitted application data.

*Values:*

enumerator **MESH\_PROTO\_BIN**

binary

enumerator **MESH\_PROTO\_HTTP**

HTTP protocol

enumerator **MESH\_PROTO\_JSON**

JSON format

enumerator **MESH\_PROTO\_MQTT**

MQTT protocol

enumerator **MESH\_PROTO\_AP**

IP network mesh communication of node's AP interface

enumerator **MESH\_PROTO\_STA**

IP network mesh communication of node's STA interface

enum **mesh\_tos\_t**

For reliable transmission, mesh stack provides three type of services.

*Values:*

enumerator **MESH\_TOS\_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH\_TOS\_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH\_TOS\_DEF**

no retransmission on mesh stack

enum **mesh\_vote\_reason\_t**

Vote reason.

*Values:*

enumerator **MESH\_VOTE\_REASON\_ROOT\_INITIATED**

vote is initiated by the root

enumerator **MESH\_VOTE\_REASON\_CHILD\_INITIATED**

vote is initiated by children

enum **mesh\_disconnect\_reason\_t**

Mesh disconnect reason code.

*Values:*

enumerator **MESH\_REASON\_CYCLIC**

cyclic is detected

enumerator **MESH\_REASON\_PARENT\_IDLE**

parent is idle

enumerator **MESH\_REASON\_LEAF**

the connected device is changed to a leaf

enumerator **MESH\_REASON\_DIFF\_ID**

in different mesh ID

enumerator **MESH\_REASON\_ROOTS**

root conflict is detected

enumerator **MESH\_REASON\_PARENT\_STOPPED**

parent has stopped the mesh

enumerator **MESH\_REASON\_SCAN\_FAIL**

scan fail

enumerator **MESH\_REASON\_IE\_UNKNOWN**

unknown IE

enumerator **MESH\_REASON\_WAIVE\_ROOT**

waive root

enumerator **MESH\_REASON\_PARENT\_WORSE**

parent with very poor RSSI

enumerator **MESH\_REASON\_EMPTY\_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH\_REASON\_PARENT\_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp\_mesh\_topology\_t**

Mesh topology.

*Values:*

enumerator **MESH\_TOPO\_TREE**

tree topology

enumerator **MESH\_TOPO\_CHAIN**

chain topology

enum **mesh\_event\_toDS\_state\_t**

The reachability of the root to a DS (distribute system)

*Values:*

enumerator **MESH\_TODS\_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH\_TODS\_REACHABLE**

the root is able to access external IP network

## SmartConfig

**Introduction** The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile application to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

Currently, ESP32-S2 support three types of SmartConfig: Airkiss, ESPTouch, and ESPTouch v2. ESPTouch v2 has been supported since SmartConfig v3.0 (the version of SmartConfig can be get from `esp_smartconfig_get_version()`), and it employs a completely different algorithm compared to ESPTouch, resulting in faster setup times. Additionally, ESPTouch v2 introduces AES encryption and custom data fields.

Starting from SmartConfig v3.0.2, ESPTouch v2 introduces support for random IV in AES encryption. On the application side, when the option for random IV is disabled, the default IV is set to 0, maintaining consistency with previous versions. When the random IV option is enabled, the IV will be a random value. It is important to note that when AES encryption is enabled with a random IV, the provision time will be extended due to the need of transmitting the IV to the provisioning device. On the provisioning device side, the device will identify whether the random IV for AES is enabled based on the flag in the provisioning packet.

If you are looking for other options to provision your ESP32-S2 devices, check [Provisioning API](#).

**Application Example** Connect ESP32-S2 to the target AP using SmartConfig: [wifi/smart\\_config](#).

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_smartconfig.h](#)
- This header file can be included with:

```
#include "esp_smartconfig.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your CMakeLists.txt:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

### Functions

`const char *esp_smartconfig_get_version (void)`

Get the version of SmartConfig.

#### Returns

- SmartConfig version const char.

`esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)`

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

**Parameters** `config` -- pointer to smartconfig start configure structure

#### Returns

- ESP\_OK: succeed
- others: fail

`esp_err_t esp_smartconfig_stop (void)`

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by smart-config\_start.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t time\_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

**Parameters** **time\_s** -- range 15s~255s, offset:45s.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling esp\_smartconfig\_start.

**Parameters** **type** -- Choose from the smartconfig\_type\_t.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API esp\_smartconfig\_start.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

**Parameters** **enable** -- false-disable(default); true-enable;

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_get\_rvd\_data** (uint8\_t \*rvd\_data, uint8\_t len)

Get reserved data of ESPTouch v2.

**Parameters**

- **rvd\_data** -- reserved data
- **len** -- length of reserved data

**Returns**

- ESP\_OK: succeed
- others: fail

## Structures

struct **smartconfig\_event\_got\_ssid\_pswd\_t**

Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

### Public Members

uint8\_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8\_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid\_set**

whether set MAC address of target AP or not.

uint8\_t **bssid**[6]

MAC address of target AP.

*smartconfig\_type\_t* **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8\_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8\_t **cellphone\_ip**[4]

IP address of cellphone.

struct **smartconfig\_start\_config\_t**

Configure structure for esp\_smartconfig\_start

### Public Members

bool **enable\_log**

Enable smartconfig logs.

bool **esp\_touch\_v2\_enable\_crypt**

Enable ESPTouch v2 crypt.

char \***esp\_touch\_v2\_key**

ESPTouch v2 crypt key, len should be 16.

### Macros

**SMARTCONFIG\_START\_CONFIG\_DEFAULT** ()

### Enumerations

enum **smartconfig\_type\_t**

*Values:*

enumerator **SC\_TYPE\_ESPTOUCH**

protocol: ESPTouch

enumerator **SC\_TYPE\_AIRKISS**

protocol: AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_AIRKISS**

protocol: ESPTouch and AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_V2**

protocol: ESPTouch v2

enum **smartconfig\_event\_t**

Smartconfig event declarations

*Values:*

enumerator **SC\_EVENT\_SCAN\_DONE**

Station smartconfig has finished to scan for APs

enumerator **SC\_EVENT\_FOUND\_CHANNEL**

Station smartconfig has found the channel of the target AP

enumerator **SC\_EVENT\_GOT\_SSID\_PSWD**

Station smartconfig got the SSID and password

enumerator **SC\_EVENT\_SEND\_ACK\_DONE**

Station smartconfig has sent ACK to cellphone

## Wi-Fi

**Introduction** The Wi-Fi libraries provide support for configuring and monitoring the ESP32-S2 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-S2 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-S2.
- Station/AP-coexistence mode (ESP32-S2 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples** Several application examples demonstrating the functionality of Wi-Fi library are provided in [wifi](#) directory of ESP-IDF repository. Please check the [README](#) for more details.

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_wifi.h](#)
- This header file can be included with:

```
#include "esp_wifi.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your CMakeLists.txt:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

## Functions

*esp\_err\_t* **esp\_wifi\_init** (const *wifi\_init\_config\_t* \*config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into *wifi\_init\_config\_t* in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field 'magic' of *wifi\_init\_config\_t* should always be `WIFI_INIT_CONFIG_MAGIC`!

**Parameters** *config* -- pointer to WiFi initialized configuration structure; can point to a temporary variable.

### Returns

- `ESP_OK`: succeed
- `ESP_ERR_NO_MEM`: out of memory
- others: refer to error code `esp_err.h`

*esp\_err\_t* **esp\_wifi\_deinit** (void)

Deinit WiFi Free all resource allocated in `esp_wifi_init` and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

*esp\_err\_t* **esp\_wifi\_set\_mode** (*wifi\_mode\_t* mode)

Set the WiFi operating mode.

```
Set the WiFi operating mode as station, soft-AP, station+soft-AP or NAN.
The default mode is station mode.
```

**Parameters** *mode* -- WiFi operating mode

### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- others: refer to error code in `esp_err.h`

*esp\_err\_t* **esp\_wifi\_get\_mode** (*wifi\_mode\_t* \*mode)

Get current operating mode of WiFi.

**Parameters** *mode* -- [out] store current WiFi mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

**esp\_err\_t esp\_wifi\_start** (void)

Start WiFi according to current configuration. If mode is WIFI\_MODE\_STA, it creates station control block and starts station. If mode is WIFI\_MODE\_AP, it creates soft-AP control block and starts soft-AP. If mode is WIFI\_MODE\_APSTA, it creates soft-AP and station control block and starts soft-AP and station. If mode is WIFI\_MODE\_NAN, it creates NAN control block and starts NAN.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: It doesn't normally happen, the function called inside the API was passed invalid argument, user should check if the wifi related config is correct
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_FAIL: other WiFi internal errors

**esp\_err\_t esp\_wifi\_stop** (void)

Stop WiFi. If mode is WIFI\_MODE\_STA, it stops station and frees station control block. If mode is WIFI\_MODE\_AP, it stops soft-AP and frees soft-AP control block. If mode is WIFI\_MODE\_APSTA, it stops station/soft-AP and frees station/soft-AP control block. If mode is WIFI\_MODE\_NAN, it stops NAN and frees NAN control block.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**esp\_err\_t esp\_wifi\_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp\_wifi\_set\_bandwidth,
- esp\_wifi\_set\_protocol,
- esp\_wifi\_set\_config related
- esp\_wifi\_set\_mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

**esp\_err\_t esp\_wifi\_connect** (void)

Connect WiFi station to the AP.

**Attention** 1. This API only impact WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode

**Attention** 2. If station interface is connected to an AP, call esp\_wifi\_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp\_wifi\_scan\_start() will not be effective until connection between device and the AP is established. If device is scanning and connecting at the same time, it will abort scanning and return a warning message and error number ESP\_ERR\_WIFI\_STATE.

**Attention** 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the 'failure\_retry\_cnt' feature in the '[wifi\\_sta\\_config\\_t](#)'. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_WIFI_MODE`: WiFi mode error
- `ESP_ERR_WIFI_CONN`: WiFi internal error, station or soft-AP control block wrong
- `ESP_ERR_WIFI_SSID`: SSID of AP which station connects is invalid

`esp_err_t esp_wifi_disconnect` (void)

Disconnect WiFi station from the AP.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi was not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_FAIL`: other WiFi internal errors

`esp_err_t esp_wifi_clear_fast_connect` (void)

Currently this API is just an stub API.

**Returns**

- `ESP_OK`: succeed
- others: fail

`esp_err_t esp_wifi_deauth_sta` (uint16\_t aid)

deauthenticate all stations or associated id equals to aid

**Parameters** `aid` -- when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong

`esp_err_t esp_wifi_scan_start` (const `wifi_scan_config_t`\*config, bool block)

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory. And then can be freed in `esp_wifi_scan_get_ap_records()`, `esp_wifi_scan_get_ap_record()` or `esp_wifi_clear_ap_list()`, so call any one to free the memory once the scan is done.

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Parameters**

- **config** -- configuration settings for scanning, if set to NULL default settings will be used of which default values are `show_hidden:false`, `scan_type:active`, `scan_time.active.min:0`, `scan_time.active.max:120` milliseconds, `scan_time.passive:360` milliseconds `home_chan_dwell_time:30ms`
- **block** -- if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi was not started by `esp_wifi_start`
- `ESP_ERR_WIFI_TIMEOUT`: blocking scan is timeout
- `ESP_ERR_WIFI_STATE`: wifi still connecting when invoke `esp_wifi_scan_start`
- others: refer to error code in `esp_err.h`

*esp\_err\_t* **esp\_wifi\_set\_scan\_parameters** (const *wifi\_scan\_default\_params\_t* \*config)

Set default parameters used for scanning by station.

**Attention** The values set using this API are also used for scans used while connecting.

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds.

**Attention** The `home_chan_dwell_time` needs to be a minimum of 30ms and a maximum of 150ms.

**Attention** Set any of the parameters to 0 to indicate using the default parameters - `scan_time.active.min` : 0ms, `scan_time.active.max` : 120ms `home_chan_dwell_time` : 30ms `scan_time.passive` : 360ms

**Attention** Default values can be retrieved using the macro `WIFI_SCAN_PARAMS_DEFAULT_CONFIG()`

**Attention** Set the config parameter to NULL to reset previously set scan parameters to their default values.

**Parameters** `config` -- default configuration settings for all scans by stations

**Returns**

- `ESP_OK`: succeed
- `ESP_FAIL`: failed as station mode has not been started yet
- `ESP_ERR_INVALID_ARG`: values provided do not satisfy the requirements
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in AP mode yet
- `ESP_ERR_INVALID_STATE`: a scan/connect is in progress right now, cannot change scan parameters
- others: refer to error code in `esp_err.h`

*esp\_err\_t* **esp\_wifi\_get\_scan\_parameters** (*wifi\_scan\_default\_params\_t* \*config)

Get default parameters used for scanning by station.

**Parameters** `config` -- structure variable within which scan default params will be stored

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_INVALID_ARG`: passed parameter does not point to a valid memory
- others: refer to error code in `esp_err.h`

*esp\_err\_t* **esp\_wifi\_scan\_stop** (void)

Stop the scan in process.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_num** (uint16\_t \*number)

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Parameters** `number` -- [out] store number of APs found in last scan

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_records** (uint16\_t \*number, *wifi\_ap\_record\_t* \*ap\_records)

Get AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list.

**Parameters**

- **number** -- **[inout]** As input param, it stores max AP number ap\_records can hold. As output param, it receives the actual AP number this API returns.
- **ap\_records** -- *wifi\_ap\_record\_t* array to hold the found APs

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory

*esp\_err\_t* esp\_wifi\_scan\_get\_ap\_record(*wifi\_ap\_record\_t* \*ap\_record)

Get one AP record from the scanned AP list.

**Attention** Different from esp\_wifi\_scan\_get\_ap\_records(), this API only gets one AP record from the scanned AP list each time. This API will free the memory of one AP record, if the user doesn't get all records in the scanned AP list, then needs to call esp\_wifi\_clear\_ap\_list() to free the remaining memory.

**Parameters** **ap\_record** -- **[out]** pointer to one AP record

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_FAIL: scan APs is NULL, means all AP records fetched or no AP found

*esp\_err\_t* esp\_wifi\_clear\_ap\_list(void)

Clear AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list. When the obtained AP list fails, AP records must be cleared, otherwise it may cause memory leakage.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_INVALID\_ARG: It doesn't normally happen, the function called inside the API was passed invalid argument, user should check if the wifi related config is correct

*esp\_err\_t* esp\_wifi\_sta\_get\_ap\_info(*wifi\_ap\_record\_t* \*ap\_info)

Get information of AP to which the device is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Parameters** **ap\_info** -- the *wifi\_ap\_record\_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_1r in the *wifi\_ap\_record\_t* struct. For example, phy\_11b = 1 imply that ap support 802.11b mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_CONN: The station interface don't initialized
- ESP\_ERR\_WIFI\_NOT\_CONNECT: The station is in disconnect status

*esp\_err\_t* **esp\_wifi\_set\_ps** (*wifi\_ps\_type\_t* type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** type -- power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_get\_ps** (*wifi\_ps\_type\_t* \*type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** type -- [out] store current power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_set\_protocol** (*wifi\_interface\_t* ifx, uint8\_t protocol\_bitmap)

Set protocol type of specified interface The default protocol is (WIFI\_PROTOCOL\_11BI|WIFI\_PROTOCOL\_11GI|WIFI\_PROTOCOL\_11N|WIFI\_PROTOCOL\_11NI|WIFI\_PROTOCOL\_11AX) if CONFIG\_SOC\_WIFI\_HE\_SUPPORT and band is 2.4G, the default protocol is (WIFI\_PROTOCOL\_11BI|WIFI\_PROTOCOL\_11GI|WIFI\_PROTOCOL\_11N|WIFI\_PROTOCOL\_11AX). if CONFIG\_SOC\_WIFI\_HE\_SUPPORT and band is 5G, the default protocol is (WIFI\_PROTOCOL\_11AI|WIFI\_PROTOCOL\_11NI|WIFI\_PROTOCOL\_11ACI|WIFI\_PROTOCOL\_11AX).

**Attention** 2.4G: Support 802.11b or 802.11bg or 802.11bgn or 802.11bgnax or LR mode 5G: Support 802.11a or 802.11an or 802.11anac or 802.11anacax

**Parameters**

- **ifx** -- interfaces
- **protocol\_bitmap** -- WiFi protocol bitmap

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_protocol** (*wifi\_interface\_t* ifx, uint8\_t \*protocol\_bitmap)

Get the current protocol bitmap of the specified interface.

**Parameters**

- **ifx** -- interface
- **protocol\_bitmap** -- [out] store current WiFi protocol bitmap of interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_set\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* bw)

Set the bandwidth of specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

**Parameters**

- **ifx** -- interface to be configured
- **bw** -- bandwidth

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* \*bw)

Get the bandwidth of specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**

- **ifx** -- interface to be configured
- **bw** -- [out] store bandwidth of interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_channel** (uint8\_t primary, *wifi\_second\_chan\_t* second)

Set primary/secondary channel of device.

**Attention** 1. This API should be called after esp\_wifi\_start() and before esp\_wifi\_stop()

**Attention** 2. When device is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When device is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When device is in STA+softAP mode, this API should not be called when in the scenarios described above

**Attention** 5. The channel info set by this API will not be stored in NVS. So If you want to remember the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp\_wifi\_set\_config() to store the channel info in NVS.

**Parameters**

- **primary** -- for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** -- for HT20, second is ignored, for HT40, second is the second channel

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_get\_channel** (uint8\_t \*primary, *wifi\_second\_chan\_t* \*second)

Get the primary/secondary channel of device.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**

- **primary** -- store current primary channel
- **second** -- [out] store current second channel

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_country** (const *wifi\_country\_t* \*country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use esp\_wifi\_set\_country\_code instead.

**Attention** 2. The default country is "01" (world safe mode) {.cc="01", .schan=1, .nchan=11, .policy=WIFI\_COUNTRY\_POLICY\_AUTO}.

**Attention** 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

**Attention** 4. When the country policy is WIFI\_COUNTRY\_POLICY\_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="US", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

**Attention** 5. When the country policy is WIFI\_COUNTRY\_POLICY\_MANUAL, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Parameters** **country** -- the configured country info

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_country** (*wifi\_country\_t* \*country)

get the current country info

**Parameters** **country** -- country info

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_mac** (*wifi\_interface\_t* ifx, const uint8\_t mac[6])

Set MAC address of WiFi station, soft-AP or NAN interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. Above mentioned interfaces have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

**Parameters**

- **ifx** -- interface

- **mac** -- the MAC address

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MAC: invalid mac address
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_mac** (*wifi\_interface\_t* ifx, uint8\_t mac[6])

Get mac of specified interface.

**Parameters**

- **ifx** -- interface
- **mac** -- [out] store mac of the interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_rx\_cb** (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters** **cb** -- callback

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_promiscuous** (bool en)

Enable the promiscuous mode.

**Parameters** **en** -- false - disable, true - enable

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous** (bool \*en)

Get the promiscuous mode.

**Parameters** **en** -- [out] store the current status of promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable the promiscuous mode packet type filter.

---

**Note:** The default filter is to filter all packets except WIFI\_PKT\_MISC

---

**Parameters** **filter** -- the packet type filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the promiscuous filter.

**Parameters** *filter* -- [out] store the current status of promiscuous filter

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_ctrl\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable subtype filter of the control packet in promiscuous mode.

---

**Note:** The default filter is to filter none control packet.

---

**Parameters** *filter* -- the subtype of the control packet filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_ctrl\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**Parameters** *filter* -- [out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Set the configuration of the STA, AP or NAN.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP devices are limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the station.

**Attention** 4. The configuration will be stored in NVS for station and soft-AP

**Parameters**

- **interface** -- interface
- **conf** -- station, soft-AP or NAN configuration

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Get configuration of specified interface.

**Parameters**

- **interface** -- interface

- **conf** -- [out] station or soft-AP configuration

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_list** (*wifi\_sta\_list\_t* \*sta)

Get STAs associated with soft-AP.

**Attention** SSC only API

**Parameters** **sta** -- [out] station list ap can get the connected sta's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the *wifi\_sta\_info\_t* struct. For example, phy\_11b = 1 imply that sta support 802.11b mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

*esp\_err\_t* **esp\_wifi\_ap\_get\_sta\_aid** (const uint8\_t mac[6], uint16\_t \*aid)

Get AID of STA connected with soft-AP.

**Parameters**

- **mac** -- STA's mac address
- **aid** -- [out] Store the AID corresponding to STA mac

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: Requested resource not found
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

*esp\_err\_t* **esp\_wifi\_set\_storage** (*wifi\_storage\_t* storage)

Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI\_STORAGE\_FLASH

**Parameters** **storage** -- : storage type

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie** (bool enable, *wifi\_vendor\_ie\_type\_t* type, *wifi\_vendor\_ie\_id\_t* idx, const void \*vnd\_ie)

Set 802.11 Vendor-Specific Information Element.

**Parameters**

- **enable** -- If true, specified IE is enabled. If false, specified IE is removed.
- **type** -- Information Element type. Determines the frame type to associate with the IE.
- **idx** -- Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).

- **vnd\_ie** -- Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *vendor\_ie\_data\_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init()
- ESP\_ERR\_INVALID\_ARG: Invalid argument, including if first byte of vnd\_ie is not WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD) or second byte is an invalid length.
- ESP\_ERR\_NO\_MEM: Out of memory

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie\_cb** (*esp\_vendor\_ie\_cb\_t* cb, void \*ctx)

Register Vendor-Specific Information Element monitoring callback.

**Parameters**

- **cb** -- Callback function
- **ctx** -- Context argument, passed to callback function.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_max\_tx\_power** (int8\_t power)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the max\_tx\_power of the structure *wifi\_country\_t* variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Parameters** **power** -- Maximum WiFi transmitting power.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument, e.g. parameter is out of range

*esp\_err\_t* **esp\_wifi\_get\_max\_tx\_power** (int8\_t \*power)

Get maximum transmitting power after WiFi start.

**Parameters** **power** -- Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_event\_mask** (uint32\_t mask)

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI\_EVENT\_MASK\_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is WIFI\_EVENT\_MASK\_AP\_PROBEREQRCVED.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Parameters** **mask** -- WiFi event mask.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_event\_mask** (uint32\_t \*mask)

Get mask of WiFi events.

**Parameters** **mask** -- WiFi event mask.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_80211\_tx** (*wifi\_interface\_t* ifx, const void \*buffer, int len, bool en\_sys\_seq)

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Parameters**

- **ifx** -- interface if the Wi-Fi mode is Station, the ifx should be WIFI\_IF\_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI\_IF\_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI\_IF\_STA or WIFI\_IF\_AP. If the ifx is wrong, the API returns ESP\_ERR\_WIFI\_IF.
- **buffer** -- raw ieee80211 buffer
- **len** -- the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en\_sys\_seq** -- indicate whether use the internal sequence number. If en\_sys\_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp\_wifi\_80211\_tx is called before the Wi-Fi connection has been set up, both en\_sys\_seq==true and en\_sys\_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en\_sys\_seq must be true, otherwise ESP\_ERR\_INVALID\_ARG is returned.

**Returns**

- ESP\_OK: success
- ESP\_ERR\_WIFI\_IF: Invalid interface
- ESP\_ERR\_INVALID\_ARG: Invalid parameter
- ESP\_ERR\_WIFI\_NO\_MEM: out of memory

*esp\_err\_t* **esp\_wifi\_set\_csi\_rx\_cb** (*wifi\_csi\_cb\_t* cb, void \*ctx)

Register the RX callback function of CSI data.

Each time a CSI data **is** received, the callback function will be called.

**Parameters**

- **cb** -- callback
- **ctx** -- context argument, passed to callback function

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_csi\_config** (const *wifi\_csi\_config\_t* \*config)

Set CSI data configuration.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters** **config** -- configuration

*esp\_err\_t* **esp\_wifi\_get\_csi\_config** (*wifi\_csi\_config\_t* \*config)

Get CSI data configuration.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters** **config** -- configuration

*esp\_err\_t* **esp\_wifi\_set\_csi** (bool en)

Enable or disable CSI.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters** **en** -- true - enable, false - disable

*esp\_err\_t* **esp\_wifi\_set\_ant\_gpio** (const *wifi\_ant\_gpio\_config\_t* \*config)

Set antenna GPIO configuration.

**Parameters** **config** -- Antenna GPIO configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

*esp\_err\_t* **esp\_wifi\_get\_ant\_gpio** (*wifi\_ant\_gpio\_config\_t* \*config)

Get current antenna GPIO configuration.

**Parameters** **config** -- Antenna GPIO configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument, e.g. parameter is NULL

*esp\_err\_t* **esp\_wifi\_set\_ant** (const *wifi\_ant\_config\_t* \*config)

Set antenna configuration.

**Parameters** **config** -- Antenna configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

*esp\_err\_t* **esp\_wifi\_get\_ant** (*wifi\_ant\_config\_t* \*config)

Get current antenna configuration.

**Parameters** **config** -- Antenna configuration.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument, e.g. parameter is NULL

*int64\_t* **esp\_wifi\_get\_tsf\_time** (*wifi\_interface\_t* interface)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters** **interface** -- The interface whose tsf\_time is to be retrieved.

**Returns** 0 or the TSF time

*esp\_err\_t* **esp\_wifi\_set\_inactive\_time** (*wifi\_interface\_t* ifx, *uint16\_t* sec)

Set the inactive time of the STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

**Parameters**

- **ifx** -- interface to be configured.
- **sec** -- Inactive time. Unit seconds.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

*esp\_err\_t* **esp\_wifi\_get\_inactive\_time** (*wifi\_interface\_t* ifx, *uint16\_t* \*sec)

Get inactive time of specified interface.

**Parameters**

- **ifx** -- Interface to be configured.
- **sec** -- Inactive time. Unit seconds.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_stats\_dump** (*uint32\_t* modules)

Dump WiFi statistics.

**Parameters** **modules** -- statistic modules to be dumped

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_set\_rssi\_threshold** (int32\_t rssi)

Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW.

**Attention** If the user wants to receive another WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.

**Parameters** **rssi** -- threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_ftm\_initiate\_session** (wifi\_ftm\_initiator\_cfg\_t \*cfg)

Start an FTM Initiator session by sending FTM request If successful, event WIFI\_EVENT\_FTM\_REPORT is generated with the result of the FTM procedure.

**Attention** 1. Use this API only in Station mode.

**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

**Parameters** **cfg** -- FTM Initiator session configuration

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_end\_session** (void)

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_resp\_set\_offset** (int16\_t offset\_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters** **offset\_cm** -- T1 Offset to be added in centimeters

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_get\_report** (*wifi\_ftm\_report\_entry\_t* \*report, uint8\_t num\_entries)

Get FTM measurements report copied into a user provided buffer.

**Attention 1.** To get the FTM report, user first needs to allocate a buffer of size (sizeof(wifi\_ftm\_report\_entry\_t) \* num\_entries) where the API will fill up to num\_entries valid FTM measurements in the buffer. Total number of entries can be found in the event WIFI\_EVENT\_FTM\_REPORT as ftm\_report\_num\_entries

**Attention 2.** The internal FTM report is freed upon use of this API which means the API can only be used once after every FTM session initiated

**Attention 3.** Passing the buffer as NULL merely frees the FTM report

#### Parameters

- **report** -- Pointer to the buffer for receiving the FTM report
- **num\_entries** -- Number of FTM report entries to be filled in the report

#### Returns

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_config\_11b\_rate** (*wifi\_interface\_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

**Attention 1.** This API should be called after esp\_wifi\_init() and before esp\_wifi\_start().

**Attention 2.** Only when really need to disable 11b rate call this API otherwise don't call this.

#### Parameters

- **ifx** -- Interface to be configured.
- **disable** -- true means disable 11b rate while false means enable 11b rate.

#### Returns

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_connectionless\_module\_set\_wake\_interval** (uint16\_t wake\_interval)

Set wake interval for connectionless modules to wake up periodically.

**Attention 1.** Only one wake interval for all connectionless modules.

**Attention 2.** This configuration could work at connected status. When ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work at disconnected status.

**Attention 3.** Event WIFI\_EVENT\_CONNECTIONLESS\_MODULE\_WAKE\_INTERVAL\_START would be posted each time wake interval starts.

**Attention 4.** Recommend to configure interval in multiples of hundred. (e.g. 100ms)

**Attention 5.** Recommend to configure interval to ESP\_WIFI\_CONNECTIONLESS\_INTERVAL\_DEFAULT\_MODE to get stable performance at coexistence mode.

**Parameters** **wake\_interval** -- Milliseconds after would the chip wake up, from 1 to 65535.

*esp\_err\_t* **esp\_wifi\_force\_wakeup\_acquire** (void)

Request extra reference of Wi-Fi radio. Wi-Fi keep active state(RF opened) to be able to receive packets.

**Attention** Please pair the use of esp\_wifi\_force\_wakeup\_acquire with esp\_wifi\_force\_wakeup\_release.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_force\_wakeup\_release** (void)

Release extra reference of Wi-Fi radio. Wi-Fi go to sleep state(RF closed) if no more use of radio.

**Attention** Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_set\_country\_code** (const char \*country, bool ieee80211d\_enabled)  
configure country

**Attention** 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention** 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 4. The country configuration is stored into flash.

**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention** 6. Supported country codes are "01"(world safe mode) "AT","AU","BE","BG","BR", "CA","CH","CN","CY","CZ","DE","DK","EE","ES","FI","FR","GB","GR","HK","HR","HU", "IE","IN","IS","IT","JP","KR","LI","LT","LU","LV","MT","MX","NL","NO","NZ","PL","PT", "RO","SE","SI","SK","TW","US"

**Attention** 7. When country code "01" (world safe mode) is set, SoftAP mode won't contain country IE.

**Attention** 8. The default country is "01" (world safe mode) and `ieee80211d_enabled` is TRUE.

**Attention** 9. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

#### Parameters

- **country** -- the configured country ISO code
- **ieee80211d\_enabled** -- 802.11d is enabled or not

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_country\_code** (char \*country)  
get the current country code

**Parameters** **country** -- country code

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_config\_80211\_tx\_rate** (*wifi\_interface\_t* ifx, *wifi\_phy\_rate\_t* rate)

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

**Parameters**

- **ifx** -- Interface to be configured.
- **rate** -- Phy rate to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_disable\_pmf\_config** (*wifi\_interface\_t* ifx)

Disable PMF configuration for specified interface.

**Attention** This API should be called after `esp_wifi_set_config()` and before `esp_wifi_start()`.

**Parameters** **ifx** -- Interface to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_sta\_get\_aid** (uint16\_t \*aid)

Get the Association id assigned to STA by AP.

**Attention** aid = 0 if station is not connected to AP.

**Parameters** **aid** -- [out] store the aid

**Returns**

- ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_sta\_get\_negotiated\_phymode** (*wifi\_phy\_mode\_t* \*phymode)

Get the negotiated phymode after connection.

**Parameters** **phymode** -- [out] store the negotiated phymode.

**Returns**

- ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_set\_dynamic\_cs** (bool enabled)

Config dynamic carrier sense.

**Attention** This API should be called after `esp_wifi_start()`.

**Parameters** **enabled** -- Dynamic carrier sense is enabled or not.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_sta\_get\_rssi** (int \*rssi)

Get the rssi information of AP to which the device is associated with.

**Attention** 1. This API should be called after station connected to AP.

**Attention** 2. Use this API only in WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode.

**Parameters** `rss` -- store the rssi info received from last beacon.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_FAIL`: failed

## Structures

struct `wifi_init_config_t`

WiFi stack configuration parameters passed to `esp_wifi_init` call.

### Public Members

`wifi_osi_funcs_t` \*`osi_funcs`

WiFi OS functions

`wpa_crypto_funcs_t` `wpa_crypto_funcs`

WiFi station crypto functions when connect

int `static_rx_buf_num`

WiFi static RX buffer number

int `dynamic_rx_buf_num`

WiFi dynamic RX buffer number

int `tx_buf_type`

WiFi TX buffer type

int `static_tx_buf_num`

WiFi static TX buffer number

int `dynamic_tx_buf_num`

WiFi dynamic TX buffer number

int `rx_mgmt_buf_type`

WiFi RX MGMT buffer type

int `rx_mgmt_buf_num`

WiFi RX MGMT buffer number

int `cache_tx_buf_num`

WiFi TX cache buffer number

int `csi_enable`

WiFi channel state information enable flag

int `ampdu_rx_enable`

WiFi AMPDU RX feature enable flag

int **ampdu\_tx\_enable**  
WiFi AMPDU TX feature enable flag

int **amsdu\_tx\_enable**  
WiFi AMSDU TX feature enable flag

int **nvs\_enable**  
WiFi NVS flash enable flag

int **nano\_enable**  
Nano option for printf/scan family enable flag

int **rx\_ba\_win**  
WiFi Block Ack RX window size

int **wifi\_task\_core\_id**  
WiFi Task Core ID

int **beacon\_max\_len**  
WiFi softAP maximum length of the beacon

int **mgmt\_sbuf\_num**  
WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64\_t **feature\_caps**  
Enables additional WiFi features and capabilities

bool **sta\_disconnected\_pm**  
WiFi Power Management for station at disconnected status

int **espnow\_max\_encrypt\_num**  
Maximum encrypt number of peers supported by espnow

int **tx\_hetb\_queue\_num**  
WiFi TX HE TB QUEUE number for STA HE TB PPDU transmission

bool **dump\_hesigb\_enable**  
enable dump sigb field

int **magic**  
WiFi init magic number, it should be the last field

### Macros

**ESP\_ERR\_WIFI\_NOT\_INIT**  
WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED**  
WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED**

WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF**

WiFi interface error

**ESP\_ERR\_WIFI\_MODE**

WiFi mode error

**ESP\_ERR\_WIFI\_STATE**

WiFi internal state error

**ESP\_ERR\_WIFI\_CONN**

WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS**

WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC**

MAC address is invalid

**ESP\_ERR\_WIFI\_SSID**

SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD**

Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT**

Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL**

WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK**

The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT**

Station still in disconnect status

**ESP\_ERR\_WIFI\_POST**

Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE**

Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE**

Returned when WiFi is stopping

**ESP\_ERR\_WIFI\_NOT\_ASSOC**

The WiFi connection is not associated

**ESP\_ERR\_WIFI\_TX\_DISALLOW**

The WiFi TX is disallowed

**ESP\_ERR\_WIFI\_TWT\_FULL**

no available flow id

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TIMEOUT**

Timeout of receiving twt setup response frame, timeout times can be set during twt setup

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TXFAIL**

TWT setup frame tx failed

**ESP\_ERR\_WIFI\_TWT\_SETUP\_REJECT**

The twt setup request was rejected by the AP

**ESP\_ERR\_WIFI\_DISCARD**

Discard frame

**ESP\_ERR\_WIFI\_ROC\_IN\_PROGRESS**

ROC op is in progress

**WIFI\_STATIC\_TX\_BUFFER\_NUM**

**WIFI\_CACHE\_TX\_BUFFER\_NUM**

**WIFI\_DYNAMIC\_TX\_BUFFER\_NUM**

**WIFI\_RX\_MGMT\_BUF\_NUM\_DEF**

**WIFI\_CSI\_ENABLED**

**WIFI\_AMPDU\_RX\_ENABLED**

**WIFI\_AMPDU\_TX\_ENABLED**

**WIFI\_AMSDU\_TX\_ENABLED**

**WIFI\_NVS\_ENABLED**

**WIFI\_NANO\_FORMAT\_ENABLED**

**WIFI\_INIT\_CONFIG\_MAGIC**

**WIFI\_DEFAULT\_RX\_BA\_WIN**

WIFI\_TASK\_CORE\_ID

WIFI\_SOFTAP\_BEACON\_MAX\_LEN

WIFI\_MGMT\_SBUF\_NUM

WIFI\_STA\_DISCONNECTED\_PM\_ENABLED

WIFI\_ENABLE\_WPA3\_SAE

WIFI\_ENABLE\_SPIRAM

WIFI\_FTM\_INITIATOR

WIFI\_FTM\_RESPONDER

WIFI\_ENABLE\_GCMP

WIFI\_ENABLE\_GMAC

WIFI\_ENABLE\_11R

WIFI\_ENABLE\_ENTERPRISE

WIFI\_DUMP\_HESIGB\_ENABLED

WIFI\_TX\_HETB\_QUEUE\_NUM

CONFIG\_FEATURE\_WPA3\_SAE\_BIT

CONFIG\_FEATURE\_CACHE\_TX\_BUF\_BIT

CONFIG\_FEATURE\_FTM\_INITIATOR\_BIT

CONFIG\_FEATURE\_FTM\_RESPONDER\_BIT

CONFIG\_FEATURE\_GCMP\_BIT

CONFIG\_FEATURE\_GMAC\_BIT

CONFIG\_FEATURE\_11R\_BIT

CONFIG\_FEATURE\_WIFI\_ENT\_BIT

WIFI\_FEATURE\_CAPS

**WIFI\_INIT\_CONFIG\_DEFAULT()**

**ESP\_WIFI\_CONNECTIONLESS\_INTERVAL\_DEFAULT\_MODE**

## Type Definitions

typedef struct *wifi\_osi\_funcs\_t* **wifi\_osi\_funcs\_t**

typedef void (\***wifi\_promiscuous\_cb\_t**)(void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Param buf** Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.

**Param type** promiscuous packet type.

typedef struct *wifi\_sta\_list\_t* **wifi\_sta\_list\_t**

Forward declare *wifi\_sta\_list\_t*. The definition depends on the target device that implements *esp\_wifi*.

typedef void (\***esp\_vendor\_ie\_cb\_t**)(void \*ctx, *wifi\_vendor\_ie\_type\_t* type, const uint8\_t sa[6], const *vendor\_ie\_data\_t* \*vnd\_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

**Param ctx** Context argument, as passed to *esp\_wifi\_set\_vendor\_ie\_cb()* when registering callback.

**Param type** Information element type, based on frame type received.

**Param sa** Source 802.11 address.

**Param vnd\_ie** Pointer to the vendor specific element data received.

**Param rssi** Received signal strength indication.

typedef void (\***wifi\_csi\_cb\_t**)(void \*ctx, *wifi\_csi\_info\_t* \*data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

**Param ctx** context argument, passed to *esp\_wifi\_set\_csi\_rx\_cb()* when registering callback function.

**Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

## Header File

- [components/esp\\_wifi/include/esp\\_wifi\\_types.h](#)
- This header file can be included with:

```
#include "esp_wifi_types.h"
```

- This header file is a part of the API provided by the *esp\_wifi* component. To declare that your component depends on *esp\_wifi*, add the following to your CMakeLists.txt:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

## Type Definitions

```
typedef struct wifi_csi_config_t wifi_csi_config_t
```

```
typedef struct wifi_pkt_rx_ctrl_t wifi_pkt_rx_ctrl_t
```

## Header File

- `components/esp_wifi/include/esp_wifi_types_generic.h`
- This header file can be included with:

```
#include "esp_wifi_types_generic.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

## Unions

```
union wifi_config_t
```

*#include <esp\_wifi\_types\_generic.h>* Configuration data for device's AP or STA or NAN.

The usage of this union (for ap, sta or nan configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

### Public Members

*wifi\_ap\_config\_t* **ap**

Configuration of AP

*wifi\_sta\_config\_t* **sta**

Configuration of STA

*wifi\_nan\_config\_t* **nan**

Configuration of NAN

## Structures

```
struct wifi_country_t
```

Structure describing Wi-Fi country-based regional restrictions.

### Public Members

char **cc**[3]

Country code string

uint8\_t **schan**

Start channel of the allowed 2.4GHz Wi-Fi channels

uint8\_t **nchan**

Total channel number of the allowed 2.4GHz Wi-Fi channels

int8\_t **max\_tx\_power**

This field is used for getting Wi-Fi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

*wifi\_country\_policy\_t* **policy**

Country policy

struct **wifi\_active\_scan\_time\_t**

Range of active scan times per channel.

### Public Members

uint32\_t **min**

Minimum active scan time per channel, units: millisecond

uint32\_t **max**

Maximum active scan time per channel, units: millisecond, values above 1500 ms may cause station to disconnect from AP and are not recommended.

struct **wifi\_scan\_time\_t**

Aggregate of active & passive scan time per channel.

### Public Members

*wifi\_active\_scan\_time\_t* **active**

Active scan time per channel, units: millisecond.

uint32\_t **passive**

Passive scan time per channel, units: millisecond, values above 1500 ms may cause station to disconnect from AP and are not recommended.

struct **wifi\_scan\_channel\_bitmap\_t**

Channel bitmap for setting specific channels to be scanned.

### Public Members

uint16\_t **ghz\_2\_channels**

Represents 2.4 GHz channels

uint32\_t **ghz\_5\_channels**

Represents 5 GHz channels

struct **wifi\_scan\_config\_t**

Parameters for an SSID scan.

### Public Members

uint8\_t **\*ssid**

SSID of AP

uint8\_t **\*bssid**

MAC address of AP

uint8\_t **channel**

Channel, scan the specific channel

bool **show\_hidden**

Enable it to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**

Scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**

Scan time per channel

uint8\_t **home\_chan\_dwell\_time**

Time spent at home channel between scanning consecutive channels.

*wifi\_scan\_channel\_bitmap\_t* **channel\_bitmap**

Channel bitmap for setting specific channels to be scanned. For 2.4ghz channels set `ghz_2_channels` from BIT(1) to BIT(14) from LSB to MSB order to indicate channels to be scanned. Currently scanning in 5ghz channels is not supported. Please note that the 'channel' parameter above needs to be set to 0 to allow scanning by bitmap.

struct **wifi\_scan\_default\_params\_t**

Parameters default scan configurations.

### Public Members

*wifi\_scan\_time\_t* **scan\_time**

Scan time per channel

uint8\_t **home\_chan\_dwell\_time**

Time spent at home channel between scanning consecutive channels.

struct **wifi\_he\_ap\_info\_t**

Description of a Wi-Fi AP HE Info.

### Public Members

uint8\_t **bss\_color**

The BSS Color value associated with the AP's corresponding BSS

uint8\_t **partial\_bss\_color**

Indicates whether an AID assignment rule is based on the BSS color

uint8\_t **bss\_color\_disabled**

Indicates whether the BSS color usage is disabled

uint8\_t **bssid\_index**

In a M-BSSID set, identifies the non-transmitted BSSID

struct **wifi\_ap\_record\_t**

Description of a Wi-Fi AP.

### Public Members

uint8\_t **bssid**[6]

MAC address of AP

uint8\_t **ssid**[33]

SSID of AP

uint8\_t **primary**

Channel of AP

*wifi\_second\_chan\_t* **second**

Secondary channel of AP

int8\_t **rssi**

Signal strength of AP. Note that in some rare cases where signal strength is very strong, RSSI values can be slightly positive

*wifi\_auth\_mode\_t* **authmode**

Auth mode of AP

*wifi\_cipher\_type\_t* **pairwise\_cipher**

Pairwise cipher of AP

*wifi\_cipher\_type\_t* **group\_cipher**

Group cipher of AP

*wifi\_ant\_t* **ant**

Antenna used to receive beacon from AP

uint32\_t **phy\_11b**

Bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

Bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

Bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_1r**

Bit: 3 flag to identify if low rate is enabled or not

uint32\_t **phy\_11a**

Bit: 4 flag to identify if 11ax mode is enabled or not

uint32\_t **phy\_11ac**

Bit: 5 flag to identify if 11ax mode is enabled or not

uint32\_t **phy\_11ax**

Bit: 6 flag to identify if 11ax mode is enabled or not

uint32\_t **wps**

Bit: 7 flag to identify if WPS is supported or not

uint32\_t **ftm\_responder**

Bit: 8 flag to identify if FTM is supported in responder mode

uint32\_t **ftm\_initiator**

Bit: 9 flag to identify if FTM is supported in initiator mode

uint32\_t **reserved**

Bit: 10..31 reserved

*wifi\_country\_t* **country**

Country information of AP

*wifi\_he\_ap\_info\_t* **he\_ap**

HE AP info

uint8\_t **bandwidth**

For AP 20 MHz this value is set to 1. For AP 40 MHz this value is set to 2. For AP 80 MHz this value is set to 3. For AP 160MHz this value is set to 4. For AP 80+80MHz this value is set to 5

uint8\_t **vht\_ch\_freq1**

This fields are used only AP bandwidth is 80 and 160 MHz, to transmit the center channel frequency of the BSS. For AP bandwidth is 80 + 80 MHz, it is the center channel frequency of the lower frequency segment.

uint8\_t **vht\_ch\_freq2**

This fields are used only AP bandwidth is 80 + 80 MHz, and is used to transmit the center channel frequency of the second segment.

struct **wifi\_scan\_threshold\_t**

Structure describing parameters for a Wi-Fi fast scan.

### Public Members

`int8_t rssi`

The minimum rssi to accept in the fast scan mode

`wifi_auth_mode_t authmode`

The weakest auth mode to accept in the fast scan mode Note: In case this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won't connect to deprecated WEP/WPA networks. Please set auth mode threshold as WIFI\_AUTH\_WEP/WIFI\_AUTH\_WPA\_PSK to connect to WEP/WPA networks

struct `wifi_pmf_config_t`

Configuration structure for Protected Management Frame.

### Public Members

bool `capable`

Deprecated variable. Device will always connect in PMF mode if other device also advertises PMF capability.

bool `required`

Advertises that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct `wifi_ap_config_t`

Soft-AP configuration settings for the device.

### Public Members

`uint8_t ssid[32]`

SSID of soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

`uint8_t password[64]`

Password of soft-AP.

`uint8_t ssid_len`

Optional length of SSID field.

`uint8_t channel`

Channel of soft-AP

`wifi_auth_mode_t authmode`

Auth mode of soft-AP. Do not support AUTH\_WEP, AUTH\_WAPI\_PSK and AUTH\_OWE in soft-AP mode. When the auth mode is set to WPA2\_PSK, WPA2\_WPA3\_PSK or WPA3\_PSK, the pairwise cipher will be overwritten with WIFI\_CIPHER\_TYPE\_CCMP.

`uint8_t ssid_hidden`

Broadcast SSID or not, default 0, broadcast the SSID

uint8\_t **max\_connection**

Max number of stations allowed to connect in

uint16\_t **beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

uint8\_t **csa\_count**

Channel Switch Announcement Count. Notify the station that the channel will switch after the csa\_count beacon intervals. Default value: 3

uint8\_t **dtim\_period**

Dtim period of soft-AP. Default value: 2

*wifi\_cipher\_type\_t* **pairwise\_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI\_CIPHER\_TYPE\_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI\_CIPHER\_TYPE\_TKIP, WIFI\_CIPHER\_TYPE\_CCMP and WIFI\_CIPHER\_TYPE\_TKIP\_CCMP.

bool **ftm\_responder**

Enable FTM Responder mode

*wifi\_pmf\_config\_t* **pmf\_cfg**

Configuration for Protected Management Frame

*wifi\_sae\_pwe\_method\_t* **sae\_pwe\_h2e**

Configuration for SAE PWE derivation method

struct **wifi\_sta\_config\_t**

STA configuration settings for the device.

## Public Members

uint8\_t **ssid**[32]

SSID of target AP.

uint8\_t **password**[64]

Password of target AP.

*wifi\_scan\_method\_t* **scan\_method**

Do all channel scan or fast scan

bool **bssid\_set**

Whether set MAC address of target AP or not. Generally, station\_config.bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

`uint8_t bssid[6]`

MAC address of target AP

`uint8_t channel`

Channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

`uint16_t listen_interval`

Listen interval for ESP32 station to receive beacon when `WIFI_PS_MAX_MODEM` is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

`wifi_sort_method_t sort_method`

Sort the connect AP in the list by rssi or security mode

`wifi_scan_threshold_t threshold`

When `scan_threshold` is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

`wifi_pmf_config_t pmf_cfg`

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

`uint32_t rm_enabled`

Whether Radio Measurements are enabled for the connection

`uint32_t btm_enabled`

Whether BSS Transition Management is enabled for the connection. Note that when `btm` is enabled, the application itself should not set specific `bssid` (i.e using `bssid_set` and `bssid` in this config) or channel to connect to. This defeats the purpose of a BTM supported network, and hence if `btm` is supported and a specific `bssid` or channel is set in this config, it will be cleared from the config at the first disconnection or connection so that the device can roam to other BSS. It is recommended not to set BSSID when BTM is enabled.

`uint32_t mbo_enabled`

Whether MBO is enabled for the connection. Note that when `mbo` is enabled, the application itself should not set specific `bssid` (i.e using `bssid_set` and `bssid` in this config) or channel to connect to. This defeats the purpose of a MBO supported network, and hence if `btm` is supported and a specific `bssid` or channel is set in this config, it will be cleared from the config at the first disconnection or connection so that the device can roam to other BSS. It is recommended not to set BSSID when MBO is enabled. Enabling `mbo` here, automatically enables `btm` and `rm` above.

`uint32_t ft_enabled`

Whether FT is enabled for the connection

`uint32_t owe_enabled`

Whether OWE is enabled for the connection

`uint32_t transition_disable`

Whether to enable transition disable feature

`uint32_t reserved`

Reserved for future feature set

*wifi\_sae\_pwe\_method\_t* **sae\_pwe\_h2e**

Configuration for SAE PWE derivation method

*wifi\_sae\_pk\_mode\_t* **sae\_pk\_mode**

Configuration for SAE-PK (Public Key) Authentication method

**uint8\_t failure\_retry\_cnt**

Number of connection retries station will do before moving to next AP. scan\_method should be set as WIFI\_ALL\_CHANNEL\_SCAN to use this config. Note: Enabling this may cause connection time to increase in case best AP doesn't behave properly.

**uint32\_t he\_dcm\_set**

Whether DCM max.constellation for transmission and reception is set.

**uint32\_t he\_dcm\_max\_constellation\_tx**

Indicate the max.constellation for DCM in TB PPDU the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

**uint32\_t he\_dcm\_max\_constellation\_rx**

Indicate the max.constellation for DCM in both Data field and HE-SIG-B field the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

**uint32\_t he\_mcs9\_enabled**

Whether to support HE-MCS 0 to 9. The default value is 0.

**uint32\_t he\_su\_beamformee\_disabled**

Whether to disable support for operation as an SU beamformee.

**uint32\_t he\_trig\_su\_bmforming\_feedback\_disabled**

Whether to disable support the transmission of SU feedback in an HE TB sounding sequence.

**uint32\_t he\_trig\_mu\_bmforming\_partial\_feedback\_disabled**

Whether to disable support the transmission of partial-bandwidth MU feedback in an HE TB sounding sequence.

**uint32\_t he\_trig\_cqi\_feedback\_disabled**

Whether to disable support the transmission of CQI feedback in an HE TB sounding sequence.

**uint32\_t he\_reserved**

Reserved for future feature set

**uint8\_t sae\_h2e\_identifier**[SAE\_H2E\_IDENTIFIER\_LEN]

Password identifier for H2E. this needs to be null terminated string

struct **wifi\_nan\_config\_t**

NAN Discovery start configuration.

## Public Members

uint8\_t **op\_channel**

NAN Discovery operating channel

uint8\_t **master\_pref**

Device's preference value to serve as NAN Master

uint8\_t **scan\_time**

Scan time in seconds while searching for a NAN cluster

uint16\_t **warm\_up\_sec**

Warm up time before assuming NAN Anchor Master role

struct **wifi\_sta\_info\_t**

Description of STA associated with AP.

### Public Members

uint8\_t **mac**[6]

MAC address

int8\_t **rss**

Current average rssi of sta connected

uint32\_t **phy\_11b**

Bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

Bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

Bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_1r**

Bit: 3 flag to identify if low rate is enabled or not

uint32\_t **phy\_11a**

Bit: 4 flag to identify if 11ax mode is enabled or not

uint32\_t **phy\_11ac**

Bit: 5 flag to identify if 11ax mode is enabled or not

uint32\_t **phy\_11ax**

Bit: 6 flag to identify if 11ax mode is enabled or not

uint32\_t **is\_mesh\_child**

Bit: 7 flag to identify mesh child

uint32\_t **reserved**

Bit: 8..31 reserved

struct **vendor\_ie\_data\_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

### Public Members

uint8\_t **element\_id**

Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]

Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**

Vendor-specific OUI type.

uint8\_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi\_promiscuous\_filter\_t**

Mask for filtering different packet types in promiscuous mode.

### Public Members

uint32\_t **filter\_mask**

OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

struct **wifi\_ant\_gpio\_t**

Wi-Fi GPIO configuration for antenna selection.

### Public Members

uint8\_t **gpio\_select**

Whether this GPIO is connected to external antenna switch

uint8\_t **gpio\_num**

The GPIO number that connects to external antenna switch

struct **wifi\_ant\_gpio\_config\_t**

Wi-Fi GPIOs configuration for antenna selection.

### Public Members

*wifi\_ant\_gpio\_t* **gpio\_cfg**[4]

The configurations of GPIOs that connect to external antenna switch

struct **wifi\_ant\_config\_t**

Wi-Fi antenna configuration.

### Public Members

*wifi\_ant\_mode\_t* **rx\_ant\_mode**

Wi-Fi antenna mode for receiving

*wifi\_ant\_t* **rx\_ant\_default**

Default antenna mode for receiving, it's ignored if **rx\_ant\_mode** is not **WIFI\_ANT\_MODE\_AUTO**

*wifi\_ant\_mode\_t* **tx\_ant\_mode**

Wi-Fi antenna mode for transmission, it can be set to **WIFI\_ANT\_MODE\_AUTO** only if **rx\_ant\_mode** is set to **WIFI\_ANT\_MODE\_AUTO**

uint8\_t **enabled\_ant0**

Index (in antenna GPIO configuration) of enabled **WIFI\_ANT\_MODE\_ANT0**

uint8\_t **enabled\_ant1**

Index (in antenna GPIO configuration) of enabled **WIFI\_ANT\_MODE\_ANT1**

struct **wifi\_action\_tx\_req\_t**

Action Frame Tx Request.

### Public Members

*wifi\_interface\_t* **ifx**

Wi-Fi interface to send request to

uint8\_t **dest\_mac**[6]

Destination MAC address

bool **no\_ack**

Indicates no ack required

*wifi\_action\_rx\_cb\_t* **rx\_cb**

Rx Callback to receive any response

uint32\_t **data\_len**

Length of the appended Data

uint8\_t **data**[0]

Appended Data payload

struct **wifi\_ftm\_initiator\_cfg\_t**

FTM Initiator configuration.

### Public Members

uint8\_t **resp\_mac**[6]

MAC address of the FTM Responder

uint8\_t **channel**

Primary channel of the FTM Responder

uint8\_t **frm\_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16\_t **burst\_period**

Requested period between FTM bursts in 100's of milliseconds (allowed values 0(No pref) - 100)

bool **use\_get\_report\_api**

True - Using `esp_wifi_ftm_get_report` to get FTM report, False - Using `ftm_report_data` from `WIFI_EVENT_FTM_REPORT` to get FTM report

struct **wifi\_nan\_publish\_cfg\_t**

NAN Publish service configuration parameters.

### Public Members

char **service\_name**[ESP\_WIFI\_MAX\_SVC\_NAME\_LEN]

Service name identifier

*wifi\_nan\_service\_type\_t* **type**

Service type

char **matching\_filter**[ESP\_WIFI\_MAX\_FILTER\_LEN]

Comma separated filters for filtering services

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]

Service info shared in Publish frame

uint8\_t **single\_replied\_event**

Give single Replied event or every time

uint8\_t **datapath\_reqd**

NAN Datapath required for the service

uint8\_t **reserved**

Reserved

struct **wifi\_nan\_subscribe\_cfg\_t**

NAN Subscribe service configuration parameters.

### Public Members

char **service\_name**[ESP\_WIFI\_MAX\_SVC\_NAME\_LEN]

Service name identifier

*wifi\_nan\_service\_type\_t* **type**

Service type

char **matching\_filter**[ESP\_WIFI\_MAX\_FILTER\_LEN]

Comma separated filters for filtering services

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]

Service info shared in Subscribe frame

uint8\_t **single\_match\_event**

Give single Match event or every time

uint8\_t **reserved**

Reserved

struct **wifi\_nan\_followup\_params\_t**

NAN Follow-up parameters.

### Public Members

uint8\_t **inst\_id**

Own service instance id

uint8\_t **peer\_inst\_id**

Peer's service instance id

uint8\_t **peer\_mac**[6]

Peer's MAC address

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]

Service info(or message) to be shared

struct **wifi\_nan\_datapath\_req\_t**

NAN Datapath Request parameters.

### Public Members

uint8\_t **pub\_id**  
Publisher's service instance id

uint8\_t **peer\_mac**[6]  
Peer's MAC address

bool **confirm\_required**  
NDP Confirm frame required

struct **wifi\_nan\_datapath\_resp\_t**  
NAN Datapath Response parameters.

### Public Members

bool **accept**  
True - Accept incoming NDP, False - Reject it

uint8\_t **ndp\_id**  
NAN Datapath Identifier

uint8\_t **peer\_mac**[6]  
Peer's MAC address

struct **wifi\_nan\_datapath\_end\_req\_t**  
NAN Datapath End parameters.

### Public Members

uint8\_t **ndp\_id**  
NAN Datapath Identifier

uint8\_t **peer\_mac**[6]  
Peer's MAC address

struct **wifi\_event\_sta\_scan\_done\_t**  
Argument structure for WIFI\_EVENT\_SCAN\_DONE event.

### Public Members

uint32\_t **status**  
Status of scanning APs: 0 —success, 1 - failure

uint8\_t **number**  
Number of scan results

uint8\_t **scan\_id**

Scan sequence number, used for block scan

struct **wifi\_event\_sta\_connected\_t**

Argument structure for WIFI\_EVENT\_STA\_CONNECTED event.

### Public Members

uint8\_t **ssid**[32]

SSID of connected AP

uint8\_t **ssid\_len**

SSID length of connected AP

uint8\_t **bssid**[6]

BSSID of connected AP

uint8\_t **channel**

Channel of connected AP

*wifi\_auth\_mode\_t* **authmode**

Authentication mode used by AP

uint16\_t **aid**

Authentication id assigned by the connected AP

struct **wifi\_event\_sta\_disconnected\_t**

Argument structure for WIFI\_EVENT\_STA\_DISCONNECTED event.

### Public Members

uint8\_t **ssid**[32]

SSID of disconnected AP

uint8\_t **ssid\_len**

SSID length of disconnected AP

uint8\_t **bssid**[6]

BSSID of disconnected AP

uint8\_t **reason**

Disconnection reason

int8\_t **rssi**

Disconnection RSSI

struct **wifi\_event\_sta\_authmode\_change\_t**

Argument structure for WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE event.

### Public Members

*wifi\_auth\_mode\_t* **old\_mode**

Old auth mode of AP

*wifi\_auth\_mode\_t* **new\_mode**

New auth mode of AP

struct **wifi\_event\_sta\_wps\_er\_pin\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_PIN event.

### Public Members

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_sta\_wps\_er\_success\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS event.

### Public Members

uint8\_t **ap\_cred\_cnt**

Number of AP credentials received

uint8\_t **ssid**[MAX\_SSID\_LEN]

SSID of AP

uint8\_t **passphrase**[MAX\_PASSPHRASE\_LEN]

Passphrase for the AP

struct *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] **ap\_cred**[MAX\_WPS\_AP\_CRED]

All AP credentials received from WPS handshake

struct **wifi\_event\_ap\_staconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event.

### Public Members

uint8\_t **mac**[6]

MAC address of the station connected to Soft-AP

uint8\_t **aid**

AID assigned by the Soft-AP to the connected station

bool **is\_mesh\_child**

Flag indicating whether the connected station is a mesh child

struct **wifi\_event\_ap\_stadisconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event.

### Public Members

uint8\_t **mac**[6]

MAC address of the station disconnects from the soft-AP

uint8\_t **aid**

AID that the Soft-AP assigned to the disconnected station

bool **is\_mesh\_child**

Flag indicating whether the disconnected station is a mesh child

uint16\_t **reason**

Disconnection reason

struct **wifi\_event\_ap\_probe\_req\_rx\_t**

Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event.

### Public Members

int **rss\_i**

Received probe request signal strength

uint8\_t **mac**[6]

MAC address of the station which send probe request

struct **wifi\_event\_bss\_rssi\_low\_t**

Argument structure for WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event.

### Public Members

int32\_t **rss\_i**

RSSI value of bss

struct **wifi\_event\_home\_channel\_change\_t**

Argument structure for WIFI\_EVENT\_HOME\_CHANNEL\_CHANGE event.

### Public Members

uint8\_t **old\_chan**

Old home channel of the device

*wifi\_second\_chan\_t* **old\_snd**

Old second channel of the device

uint8\_t **new\_chan**

New home channel of the device

*wifi\_second\_chan\_t* **new\_snd**

New second channel of the device

struct **wifi\_ftm\_report\_entry\_t**

Structure representing a report entry for Fine Timing Measurement (FTM) in Wi-Fi.

This structure holds the information related to the FTM process between a Wi-Fi FTM Initiator and a Wi-Fi FTM Responder. FTM is used for precise distance measurement by timing the exchange of frames between devices.

### Public Members

uint8\_t **dlog\_token**

Dialog Token of the FTM frame

int8\_t **rss\_i**

RSSI of the FTM frame received

uint32\_t **rtt**

Round Trip Time in pSec with a peer

uint64\_t **t1**

Time of departure of FTM frame from FTM Responder in pSec

uint64\_t **t2**

Time of arrival of FTM frame at FTM Initiator in pSec

uint64\_t **t3**

Time of departure of ACK from FTM Initiator in pSec

uint64\_t **t4**

Time of arrival of ACK at FTM Responder in pSec

struct **wifi\_event\_ftm\_report\_t**

Argument structure for WIFI\_EVENT\_FTM\_REPORT event.

### Public Members

uint8\_t **peer\_mac[6]**

MAC address of the FTM Peer

*wifi\_ftm\_status\_t* **status**

Status of the FTM operation

uint32\_t **rtt\_raw**

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32\_t **rtt\_est**

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32\_t **dist\_est**

Estimated one-way distance in Centi-Meters

*wifi\_ftm\_report\_entry\_t* \***ftm\_report\_data**

Pointer to FTM Report, should be freed after use. Note: Highly recommended to use API `esp_wifi_ftm_get_report` to get the report instead of using this

uint8\_t **ftm\_report\_num\_entries**

Number of entries in the FTM Report data

struct **wifi\_event\_action\_tx\_status\_t**

Argument structure for `WIFI_EVENT_ACTION_TX_STATUS` event.

### Public Members

*wifi\_interface\_t* **ifx**

Wi-Fi interface to send request to

uint32\_t **context**

Context to identify the request

uint8\_t **da**[6]

Destination MAC address

uint8\_t **status**

Status of the operation

struct **wifi\_event\_roc\_done\_t**

Argument structure for `WIFI_EVENT_ROC_DONE` event.

### Public Members

uint32\_t **context**

Context to identify the request

struct **wifi\_event\_ap\_wps\_rg\_pin\_t**

Argument structure for `WIFI_EVENT_AP_WPS_RG_PIN` event.

### Public Members

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_ap\_wps\_rg\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_FAILED event.

### Public Members

*wps\_fail\_reason\_t* **reason**

WPS failure reason *wps\_fail\_reason\_t*

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

struct **wifi\_event\_ap\_wps\_rg\_success\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS event.

### Public Members

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

struct **wifi\_event\_nan\_svc\_match\_t**

Argument structure for WIFI\_EVENT\_NAN\_SVC\_MATCH event.

### Public Members

uint8\_t **subscribe\_id**

Subscribe Service Identifier

uint8\_t **publish\_id**

Publish Service Identifier

uint8\_t **pub\_if\_mac**[6]

NAN Interface MAC of the Publisher

bool **update\_pub\_id**

Indicates whether publisher's service ID needs to be updated

struct **wifi\_event\_nan\_replied\_t**

Argument structure for WIFI\_EVENT\_NAN\_REPLIED event.

### Public Members

uint8\_t **publish\_id**

Publish Service Identifier

uint8\_t **subscribe\_id**  
Subscribe Service Identifier

uint8\_t **sub\_if\_mac**[6]  
NAN Interface MAC of the Subscriber

struct **wifi\_event\_nan\_receive\_t**  
Argument structure for WIFI\_EVENT\_NAN\_RECEIVE event.

### Public Members

uint8\_t **inst\_id**  
Our Service Identifier

uint8\_t **peer\_inst\_id**  
Peer's Service Identifier

uint8\_t **peer\_if\_mac**[6]  
Peer's NAN Interface MAC

uint8\_t **peer\_svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Peer Service Info

struct **wifi\_event\_ndp\_indication\_t**  
Argument structure for WIFI\_EVENT\_NDP\_INDICATION event.

### Public Members

uint8\_t **publish\_id**  
Publish Id for NAN Service

uint8\_t **ndp\_id**  
NDP instance id

uint8\_t **peer\_nmi**[6]  
Peer's NAN Management Interface MAC

uint8\_t **peer\_ndi**[6]  
Peer's NAN Data Interface MAC

uint8\_t **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Service Specific Info

struct **wifi\_event\_ndp\_confirm\_t**  
Argument structure for WIFI\_EVENT\_NDP\_CONFIRM event.

**Public Members****uint8\_t status**

NDP status code

**uint8\_t ndp\_id**

NDP instance id

**uint8\_t peer\_nmi[6]**

Peer's NAN Management Interface MAC

**uint8\_t peer\_ndi[6]**

Peer's NAN Data Interface MAC

**uint8\_t own\_ndi[6]**

Own NAN Data Interface MAC

**uint8\_t svc\_info[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]**

Service Specific Info

struct **wifi\_event\_ndp\_terminated\_t**

Argument structure for WIFI\_EVENT\_NDP\_TERMINATED event.

**Public Members****uint8\_t reason**

Termination reason code

**uint8\_t ndp\_id**

NDP instance id

**uint8\_t init\_ndi[6]**

Initiator's NAN Data Interface MAC

struct **wifi\_event\_neighbor\_report\_t**

Argument structure for WIFI\_EVENT\_STA\_NEIGHBOR\_REP event.

**Public Members****uint8\_t report[ESP\_WIFI\_MAX\_NEIGHBOR\_REP\_LEN]**

Neighbor Report received from the AP

**uint16\_t report\_len**

Length of the report

## Macros

### **WIFI\_OFFCHAN\_TX\_REQ**

Request off-channel transmission

### **WIFI\_OFFCHAN\_TX\_CANCEL**

Cancel off-channel transmission

### **WIFI\_ROC\_REQ**

Request remain on channel

### **WIFI\_ROC\_CANCEL**

Cancel remain on channel

### **WIFI\_ACTIVE\_SCAN\_MIN\_DEFAULT\_TIME**

Default minimum active scan time per channel

### **WIFI\_ACTIVE\_SCAN\_MAX\_DEFAULT\_TIME**

Default maximum active scan time per channel

### **WIFI\_PASSIVE\_SCAN\_DEFAULT\_TIME**

Default passive scan time per channel

### **WIFI\_SCAN\_HOME\_CHANNEL\_DWELL\_DEFAULT\_TIME**

Default time spent at home channel between scanning consecutive channels

### **WIFI\_SCAN\_PARAMS\_DEFAULT\_CONFIG ()**

### **WIFI\_PROTOCOL\_11B**

802.11b protocol

### **WIFI\_PROTOCOL\_11G**

802.11g protocol

### **WIFI\_PROTOCOL\_11N**

802.11n protocol

### **WIFI\_PROTOCOL\_LR**

Low Rate protocol

### **WIFI\_PROTOCOL\_11A**

802.11a protocol

### **WIFI\_PROTOCOL\_11AC**

802.11ac protocol

### **WIFI\_PROTOCOL\_11AX**

802.11ax protocol

### **SAE\_H2E\_IDENTIFIER\_LEN**

Length of the password identifier for H2E

**WIFI\_VENDOR\_IE\_ELEMENT\_ID**

Vendor Information Element ID

**WIFI\_PROMIS\_FILTER\_MASK\_ALL**

Filter all packets

**WIFI\_PROMIS\_FILTER\_MASK\_MGMT**

Filter the packets with type of WIFI\_PKT\_MGMT

**WIFI\_PROMIS\_FILTER\_MASK\_CTRL**

Filter the packets with type of WIFI\_PKT\_CTRL

**WIFI\_PROMIS\_FILTER\_MASK\_DATA**

Filter the packets with type of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_MISC**

Filter the packets with type of WIFI\_PKT\_MISC

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_MPDU**

Filter the MPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_AMPDU**

Filter the AMPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_FCSFAIL**

Filter the FCS failed packets, do not open it in general

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ALL**

Filter all control packets

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_WRAPPER**

Filter the control packets with subtype of Control Wrapper

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BAR**

Filter the control packets with subtype of Block Ack Request

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BA**

Filter the control packets with subtype of Block Ack

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_PSPOLL**

Filter the control packets with subtype of PS-Poll

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_RTS**

Filter the control packets with subtype of RTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CTS**

Filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**

Filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**

Filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**

Filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**

Mask all Wi-Fi events

**WIFI\_EVENT\_MASK\_NONE**

Mask none of the Wi-Fi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVED**

Mask SYSTEM\_EVENT\_AP\_PROBEREQRECVED event

**ESP\_WIFI\_NAN\_MAX\_SVC\_SUPPORTED**

Maximum number of NAN services supported

**ESP\_WIFI\_NAN\_DATAPATH\_MAX\_PEERS**

Maximum number of NAN datapath peers supported

**ESP\_WIFI\_NDP\_ROLE\_INITIATOR**

Initiator role for NAN Data Path

**ESP\_WIFI\_NDP\_ROLE\_RESPONDER**

Responder role for NAN Data Path

**ESP\_WIFI\_MAX\_SVC\_NAME\_LEN**

Maximum length of NAN service name

**ESP\_WIFI\_MAX\_FILTER\_LEN**

Maximum length of NAN service filter

**ESP\_WIFI\_MAX\_SVC\_INFO\_LEN**

Maximum length of NAN service info

**ESP\_WIFI\_MAX\_NEIGHBOR\_REP\_LEN**

Maximum length of NAN Neighbor Report

**MAX\_SSID\_LEN**

Maximum length of SSID

**MAX\_PASSPHRASE\_LEN**

Maximum length of passphrase

**MAX\_WPS\_AP\_CRED**

Maximum number of AP credentials received from WPS handshake

**WIFI\_STATIS\_BUFFER**

Buffer statistic

**WIFI\_STATIS\_RXTX**

RX/TX statistic

**WIFI\_STATIS\_HW**

Hardware statistic

**WIFI\_STATIS\_DIAG**

Diagnostic statistic

**WIFI\_STATIS\_PS**

Power save statistic

**WIFI\_STATIS\_ALL**

All statistic

**Type Definitions**

```
typedef struct wifi_csi_info_t wifi_csi_info_t
```

CSI data type.

```
typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

**Param hdr** Pointer to the IEEE 802.11 Header structure

**Param payload** Pointer to the Payload following 802.11 Header

**Param len** Length of the Payload

**Param channel** Channel number the frame is received on

**Enumerations**

```
enum wifi_mode_t
```

Wi-Fi mode type.

*Values:*

enumerator **WIFI\_MODE\_NULL**

Null mode

enumerator **WIFI\_MODE\_STA**

Wi-Fi station mode

enumerator **WIFI\_MODE\_AP**

Wi-Fi soft-AP mode

enumerator **WIFI\_MODE\_APSTA**

Wi-Fi station + soft-AP mode

enumerator **WIFI\_MODE\_NAN**

Wi-Fi NAN mode

enumerator **WIFI\_MODE\_MAX**

enum **wifi\_interface\_t**

Wi-Fi interface type.

*Values:*

enumerator **WIFI\_IF\_STA**

Station interface

enumerator **WIFI\_IF\_AP**

Soft-AP interface

enumerator **WIFI\_IF\_NAN**

NAN interface

enumerator **WIFI\_IF\_MAX**

Maximum number of interfaces

enum **wifi\_country\_policy\_t**

Wi-Fi country policy.

*Values:*

enumerator **WIFI\_COUNTRY\_POLICY\_AUTO**

Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI\_COUNTRY\_POLICY\_MANUAL**

Country policy is manual, always use the configured country info

enum **wifi\_auth\_mode\_t**

Wi-Fi authmode type Strength of authmodes Personal Networks : OPEN < WEP < WPA\_PSK < OWE < WPA2\_PSK = WPA\_WPA2\_PSK < WAPI\_PSK < WPA3\_PSK = WPA2\_WPA3\_PSK = DPP Enterprise Networks : WIFI\_AUTH\_WPA2\_ENTERPRISE < WIFI\_AUTH\_WPA3\_ENTERPRISE = WIFI\_AUTH\_WPA2\_WPA3\_ENTERPRISE < WIFI\_AUTH\_WPA3\_ENT\_192.

*Values:*

enumerator **WIFI\_AUTH\_OPEN**

Authenticate mode : open

enumerator **WIFI\_AUTH\_WEP**

Authenticate mode : WEP

enumerator **WIFI\_AUTH\_WPA\_PSK**

Authenticate mode : WPA\_PSK

enumerator **WIFI\_AUTH\_WPA2\_PSK**

Authenticate mode : WPA2\_PSK

enumerator **WIFI\_AUTH\_WPA\_WPA2\_PSK**

Authenticate mode : WPA\_WPA2\_PSK

enumerator **WIFI\_AUTH\_ENTERPRISE**

Authenticate mode : Wi-Fi EAP security

enumerator **WIFI\_AUTH\_WPA2\_ENTERPRISE**

Authenticate mode : Wi-Fi EAP security

enumerator **WIFI\_AUTH\_WPA3\_PSK**

Authenticate mode : WPA3\_PSK

enumerator **WIFI\_AUTH\_WPA2\_WPA3\_PSK**

Authenticate mode : WPA2\_WPA3\_PSK

enumerator **WIFI\_AUTH\_WAPI\_PSK**

Authenticate mode : WAPI\_PSK

enumerator **WIFI\_AUTH\_OWE**

Authenticate mode : OWE

enumerator **WIFI\_AUTH\_WPA3\_ENT\_192**

Authenticate mode : WPA3\_ENT\_SUITE\_B\_192\_BIT

enumerator **WIFI\_AUTH\_WPA3\_EXT\_PSK**

This authentication mode will yield same result as **WIFI\_AUTH\_WPA3\_PSK** and not recommended to be used. It will be deprecated in future, please use **WIFI\_AUTH\_WPA3\_PSK** instead.

enumerator **WIFI\_AUTH\_WPA3\_EXT\_PSK\_MIXED\_MODE**

This authentication mode will yield same result as **WIFI\_AUTH\_WPA3\_PSK** and not recommended to be used. It will be deprecated in future, please use **WIFI\_AUTH\_WPA3\_PSK** instead.

enumerator **WIFI\_AUTH\_DPP**

Authenticate mode : DPP

enumerator **WIFI\_AUTH\_MAX**

enum **wifi\_err\_reason\_t**

Wi-Fi disconnection reason codes.

These reason codes are used to indicate the cause of disconnection.

*Values:*

enumerator **WIFI\_REASON\_UNSPECIFIED**

Unspecified reason

enumerator **WIFI\_REASON\_AUTH\_EXPIRE**

Authentication expired

enumerator **WIFI\_REASON\_AUTH\_LEAVE**

Deauthentication due to leaving

enumerator **WIFI\_REASON\_ASSOC\_EXPIRE**

Association expired

enumerator **WIFI\_REASON\_ASSOC\_TOOMANY**

Too many associated stations

enumerator **WIFI\_REASON\_NOT\_AUTHED**

Not authenticated

enumerator **WIFI\_REASON\_NOT\_ASSOCED**

Not associated

enumerator **WIFI\_REASON\_ASSOC\_LEAVE**

Deassociated due to leaving

enumerator **WIFI\_REASON\_ASSOC\_NOT\_AUTHED**

Association but not authenticated

enumerator **WIFI\_REASON\_DISASSOC\_PWRCAP\_BAD**

Disassociated due to poor power capability

enumerator **WIFI\_REASON\_DISASSOC\_SUPCHAN\_BAD**

Disassociated due to unsupported channel

enumerator **WIFI\_REASON\_BSS\_TRANSITION\_DISASSOC**

Disassociated due to BSS transition

enumerator **WIFI\_REASON\_IE\_INVALID**

Invalid Information Element (IE)

enumerator **WIFI\_REASON\_MIC\_FAILURE**

MIC failure

enumerator **WIFI\_REASON\_4WAY\_HANDSHAKE\_TIMEOUT**

4-way handshake timeout

enumerator **WIFI\_REASON\_GROUP\_KEY\_UPDATE\_TIMEOUT**

Group key update timeout

enumerator **WIFI\_REASON\_IE\_IN\_4WAY\_DIFFERS**

IE differs in 4-way handshake

enumerator **WIFI\_REASON\_GROUP\_CIPHER\_INVALID**

Invalid group cipher

enumerator **WIFI\_REASON\_PAIRWISE\_CIPHER\_INVALID**

Invalid pairwise cipher

enumerator **WIFI\_REASON\_AKMP\_INVALID**

Invalid AKMP

enumerator **WIFI\_REASON\_UNSUPP\_RSN\_IE\_VERSION**

Unsupported RSN IE version

enumerator **WIFI\_REASON\_INVALID\_RSN\_IE\_CAP**

Invalid RSN IE capabilities

enumerator **WIFI\_REASON\_802\_1X\_AUTH\_FAILED**

802.1X authentication failed

enumerator **WIFI\_REASON\_CIPHER\_SUITE\_REJECTED**

Cipher suite rejected

enumerator **WIFI\_REASON\_TDLS\_PEER\_UNREACHABLE**

TDLS peer unreachable

enumerator **WIFI\_REASON\_TDLS\_UNSPECIFIED**

TDLS unspecified

enumerator **WIFI\_REASON\_SSP\_REQUESTED\_DISASSOC**

SSP requested disassociation

enumerator **WIFI\_REASON\_NO\_SSP\_ROAMING\_AGREEMENT**

No SSP roaming agreement

enumerator **WIFI\_REASON\_BAD\_CIPHER\_OR\_AKM**

Bad cipher or AKM

enumerator **WIFI\_REASON\_NOT\_AUTHORIZED\_THIS\_LOCATION**

Not authorized in this location

enumerator **WIFI\_REASON\_SERVICE\_CHANGE\_PERCLUDES\_TS**

Service change precludes TS

enumerator **WIFI\_REASON\_UNSPECIFIED\_QOS**

Unspecified QoS reason

enumerator **WIFI\_REASON\_NOT\_ENOUGH\_BANDWIDTH**

Not enough bandwidth

enumerator **WIFI\_REASON\_MISSING\_ACKS**

Missing ACKs

enumerator **WIFI\_REASON\_EXCEEDED\_TXOP**

Exceeded TXOP

enumerator **WIFI\_REASON\_STA\_LEAVING**

Station leaving

enumerator **WIFI\_REASON\_END\_BA**

End of Block Ack (BA)

enumerator **WIFI\_REASON\_UNKNOWN\_BA**

Unknown Block Ack (BA)

enumerator **WIFI\_REASON\_TIMEOUT**

Timeout

enumerator **WIFI\_REASON\_PEER\_INITIATED**

Peer initiated disassociation

enumerator **WIFI\_REASON\_AP\_INITIATED**

AP initiated disassociation

enumerator **WIFI\_REASON\_INVALID\_FT\_ACTION\_FRAME\_COUNT**

Invalid FT action frame count

enumerator **WIFI\_REASON\_INVALID\_PMKID**

Invalid PMKID

enumerator **WIFI\_REASON\_INVALID\_MDE**

Invalid MDE

enumerator **WIFI\_REASON\_INVALID\_FTE**

Invalid FTE

enumerator **WIFI\_REASON\_TRANSMISSION\_LINK\_ESTABLISH\_FAILED**

Transmission link establishment failed

enumerator **WIFI\_REASON\_ALTERNATIVE\_CHANNEL\_OCCUPIED**

Alternative channel occupied

enumerator **WIFI\_REASON\_BEACON\_TIMEOUT**

Beacon timeout

enumerator **WIFI\_REASON\_NO\_AP\_FOUND**

No AP found

enumerator **WIFI\_REASON\_AUTH\_FAIL**

Authentication failed

enumerator **WIFI\_REASON\_ASSOC\_FAIL**

Association failed

enumerator **WIFI\_REASON\_HANDSHAKE\_TIMEOUT**

Handshake timeout

enumerator **WIFI\_REASON\_CONNECTION\_FAIL**

Connection failed

enumerator **WIFI\_REASON\_AP\_TSF\_RESET**

AP TSF reset

enumerator **WIFI\_REASON\_ROAMING**

Roaming

enumerator **WIFI\_REASON\_ASSOC\_COMEBACK\_TIME\_TOO\_LONG**

Association comeback time too long

enumerator **WIFI\_REASON\_SA\_QUERY\_TIMEOUT**

SA query timeout

enumerator **WIFI\_REASON\_NO\_AP\_FOUND\_W\_COMPATIBLE\_SECURITY**

No AP found with compatible security

enumerator **WIFI\_REASON\_NO\_AP\_FOUND\_IN\_AUTHMODE\_THRESHOLD**

No AP found in auth mode threshold

enumerator **WIFI\_REASON\_NO\_AP\_FOUND\_IN\_RSSI\_THRESHOLD**

No AP found in RSSI threshold

enum **wifi\_second\_chan\_t**

Wi-Fi second channel type.

*Values:*

enumerator **WIFI\_SECOND\_CHAN\_NONE**

The channel width is HT20

enumerator **WIFI\_SECOND\_CHAN\_ABOVE**

The channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI\_SECOND\_CHAN\_BELOW**

The channel width is HT40 and the secondary channel is below the primary channel

enum **wifi\_scan\_type\_t**

Wi-Fi scan type.

*Values:*

enumerator **WIFI\_SCAN\_TYPE\_ACTIVE**

Active scan

enumerator **WIFI\_SCAN\_TYPE\_PASSIVE**

Passive scan

enum **wifi\_cipher\_type\_t**

Wi-Fi cipher type.

*Values:*

enumerator **WIFI\_CIPHER\_TYPE\_NONE**

The cipher type is none

enumerator **WIFI\_CIPHER\_TYPE\_WEP40**

The cipher type is WEP40

enumerator **WIFI\_CIPHER\_TYPE\_WEP104**

The cipher type is WEP104

enumerator **WIFI\_CIPHER\_TYPE\_TKIP**

The cipher type is TKIP

enumerator **WIFI\_CIPHER\_TYPE\_CCMP**

The cipher type is CCMP

enumerator **WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**

The cipher type is TKIP and CCMP

enumerator **WIFI\_CIPHER\_TYPE\_AES\_CMAC128**

The cipher type is AES-CMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_SMS4**

The cipher type is SMS4

enumerator **WIFI\_CIPHER\_TYPE\_GCMP**

The cipher type is GCMP

enumerator **WIFI\_CIPHER\_TYPE\_GCMP256**

The cipher type is GCMP-256

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC128**

The cipher type is AES-GMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC256**

The cipher type is AES-GMAC-256

enumerator **WIFI\_CIPHER\_TYPE\_UNKNOWN**

The cipher type is unknown

enum **wifi\_ant\_t**

Wi-Fi antenna.

*Values:*

enumerator **WIFI\_ANT\_ANT0**

Wi-Fi antenna 0

enumerator **WIFI\_ANT\_ANT1**

Wi-Fi antenna 1

enumerator **WIFI\_ANT\_MAX**

Invalid Wi-Fi antenna

enum **wifi\_scan\_method\_t**

Wi-Fi scan method.

*Values:*

enumerator **WIFI\_FAST\_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI\_ALL\_CHANNEL\_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi\_sort\_method\_t**

Wi-Fi sort AP method.

*Values:*

enumerator **WIFI\_CONNECT\_AP\_BY\_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI\_CONNECT\_AP\_BY\_SECURITY**

Sort match AP in scan list by security mode

enum **wifi\_ps\_type\_t**

Wi-Fi power save type.

*Values:*

enumerator **WIFI\_PS\_NONE**

No power save

enumerator **WIFI\_PS\_MIN\_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI\_PS\_MAX\_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi\\_sta\\_config\\_t](#)

enum **wifi\_bandwidth\_t**

Wi-Fi bandwidth type.

*Values:*

enumerator **WIFI\_BW\_HT20**

Bandwidth is HT20

enumerator **WIFI\_BW20**

Bandwidth is 20 MHz

enumerator **WIFI\_BW\_HT40**

Bandwidth is HT40

enumerator **WIFI\_BW40**

Bandwidth is 40 MHz

enumerator **WIFI\_BW80**

Bandwidth is 80 MHz

enumerator **WIFI\_BW160**

Bandwidth is 160 MHz

enumerator **WIFI\_BW80\_BW80**

Bandwidth is 80 + 80 MHz

enum **wifi\_sae\_pwe\_method\_t**

Configuration for SAE PWE derivation.

*Values:*

enumerator **WPA3\_SAE\_PWE\_UNSPECIFIED**

enumerator **WPA3\_SAE\_PWE\_HUNT\_AND\_PECK**

enumerator **WPA3\_SAE\_PWE\_HASH\_TO\_ELEMENT**

enumerator **WPA3\_SAE\_PWE\_BOTH**

enum **wifi\_sae\_pk\_mode\_t**

Configuration for SAE-PK.

*Values:*

enumerator **WPA3\_SAE\_PK\_MODE\_AUTOMATIC**

enumerator **WPA3\_SAE\_PK\_MODE\_ONLY**

enumerator **WPA3\_SAE\_PK\_MODE\_DISABLED**

enum **wifi\_storage\_t**

Wi-Fi storage type.

*Values:*

enumerator **WIFI\_STORAGE\_FLASH**

All configuration will store in both memory and flash

enumerator **WIFI\_STORAGE\_RAM**

All configuration will only store in the memory

enum **wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

*Values:*

enumerator **WIFI\_VND\_IE\_TYPE\_BEACON**

Beacon frame

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_REQ**

Probe request frame

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_RESP**

Probe response frame

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ**

Association request frame

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP**

Association response frame

enum **wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

*Values:*

enumerator **WIFI\_VND\_IE\_ID\_0**

Vendor ID element 0

enumerator **WIFI\_VND\_IE\_ID\_1**

Vendor ID element 1

enum **wifi\_phy\_mode\_t**

Operation PHY mode.

*Values:*

enumerator **WIFI\_PHY\_MODE\_LR**

PHY mode for Low Rate

enumerator **WIFI\_PHY\_MODE\_11B**

PHY mode for 11b

enumerator **WIFI\_PHY\_MODE\_11G**

PHY mode for 11g

enumerator **WIFI\_PHY\_MODE\_11A**

PHY mode for 11a

enumerator **WIFI\_PHY\_MODE\_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI\_PHY\_MODE\_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI\_PHY\_MODE\_HE20**

PHY mode for Bandwidth HE20

enumerator **WIFI\_PHY\_MODE\_VHT20**

PHY mode for Bandwidth VHT20

enum **wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

*Values:*

enumerator **WIFI\_PKT\_MGMT**

Management frame, indicates 'buf' argument is wifi\_promiscuous\_pkt\_t

enumerator **WIFI\_PKT\_CTRL**

Control frame, indicates 'buf' argument is wifi\_promiscuous\_pkt\_t

enumerator **WIFI\_PKT\_DATA**

Data frame, indicates 'buf' argument is wifi\_promiscuous\_pkt\_t

enumerator **WIFI\_PKT\_MISC**

Other type, such as MIMO etc. 'buf' argument is wifi\_promiscuous\_pkt\_t but the payload is zero length.

enum **wifi\_ant\_mode\_t**

Wi-Fi antenna mode.

*Values:*

enumerator **WIFI\_ANT\_MODE\_ANT0**

Enable Wi-Fi antenna 0 only

enumerator **WIFI\_ANT\_MODE\_ANT1**

Enable Wi-Fi antenna 1 only

enumerator **WIFI\_ANT\_MODE\_AUTO**

Enable Wi-Fi antenna 0 and 1, automatically select an antenna

enumerator **WIFI\_ANT\_MODE\_MAX**

Invalid Wi-Fi enabled antenna

enum **wifi\_nan\_service\_type\_t**

NAN Services types.

*Values:*

enumerator **NAN\_PUBLISH\_SOLICITED**

Send unicast Publish frame to Subscribers that match the requirement

enumerator **NAN\_PUBLISH\_UNSOLICITED**

Send broadcast Publish frames in every Discovery Window(DW)

enumerator **NAN\_SUBSCRIBE\_ACTIVE**

Send broadcast Subscribe frames in every DW

enumerator **NAN\_SUBSCRIBE\_PASSIVE**

Passively listens to Publish frames

enum **wifi\_phy\_rate\_t**

Wi-Fi PHY rate encodings.

---

**Note:** Rate Table: MCS Rate and Guard Interval Information

MCS RATE	HT20	HT40	HE20	VHT20
WIFI_PHY_RATE_MCS0	16.7 Mbps (800 ns)	13.5 Mbps (800 ns)	8.1 Mbps (1600 ns)	6.5 Mbps (800 ns)

MCS6 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS7\_SGI**

MCS7 with short GI

enumerator **WIFI\_PHY\_RATE\_LORA\_250K**

Espressif-specific Long Range mode rate, 250 Kbps

enumerator **WIFI\_PHY\_RATE\_LORA\_500K**

Espressif-specific Long Range mode rate, 500 Kbps

enumerator **WIFI\_PHY\_RATE\_MAX**

enum **wifi\_event\_t**

Wi-Fi event declarations.

*Values:*

enumerator **WIFI\_EVENT\_WIFI\_READY**

Wi-Fi ready

enumerator **WIFI\_EVENT\_SCAN\_DONE**

Finished scanning AP

enumerator **WIFI\_EVENT\_STA\_START**

Station start

enumerator **WIFI\_EVENT\_STA\_STOP**

Station stop

enumerator **WIFI\_EVENT\_STA\_CONNECTED**

Station connected to AP

enumerator **WIFI\_EVENT\_STA\_DISCONNECTED**

Station disconnected from AP

enumerator **WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**

The auth mode of AP connected by device's station changed

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**

Station WPS succeeds in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**

Station WPS fails in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

Station WPS timeout in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PIN**

Station WPS pin code in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**

Station WPS overlap in enrollee mode

enumerator **WIFI\_EVENT\_AP\_START**

Soft-AP start

enumerator **WIFI\_EVENT\_AP\_STOP**

Soft-AP stop

enumerator **WIFI\_EVENT\_AP\_STACONNECTED**

A station connected to Soft-AP

enumerator **WIFI\_EVENT\_AP\_STADISCONNECTED**

A station disconnected from Soft-AP

enumerator **WIFI\_EVENT\_AP\_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

enumerator **WIFI\_EVENT\_FTM\_REPORT**

Receive report of FTM procedure

enumerator **WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW**

AP's RSSI crossed configured threshold

enumerator **WIFI\_EVENT\_ACTION\_TX\_STATUS**

Status indication of Action Tx operation

enumerator **WIFI\_EVENT\_ROC\_DONE**

Remain-on-Channel operation complete

enumerator **WIFI\_EVENT\_STA\_BEACON\_TIMEOUT**

Station beacon timeout

enumerator **WIFI\_EVENT\_CONNECTIONLESS\_MODULE\_WAKE\_INTERVAL\_START**

Connectionless module wake interval start

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS**

Soft-AP wps succeeds in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_FAILED**

Soft-AP wps fails in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_TIMEOUT**

Soft-AP wps timeout in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PIN**

Soft-AP wps pin code in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PBC\_OVERLAP**

Soft-AP wps overlap in registrar mode

enumerator **WIFI\_EVENT\_ITWT\_SETUP**

iTWT setup

enumerator **WIFI\_EVENT\_ITWT\_TEARDOWN**

iTWT teardown

enumerator **WIFI\_EVENT\_ITWT\_PROBE**

iTWT probe

enumerator **WIFI\_EVENT\_ITWT\_SUSPEND**

iTWT suspend

enumerator **WIFI\_EVENT\_TWT\_WAKEUP**

TWT wakeup

enumerator **WIFI\_EVENT\_BTWT\_SETUP**

bTWT setup

enumerator **WIFI\_EVENT\_BTWT\_TEARDOWN**

bTWT teardown

enumerator **WIFI\_EVENT\_NAN\_STARTED**

NAN Discovery has started

enumerator **WIFI\_EVENT\_NAN\_STOPPED**

NAN Discovery has stopped

enumerator **WIFI\_EVENT\_NAN\_SVC\_MATCH**

NAN Service Discovery match found

enumerator **WIFI\_EVENT\_NAN\_REPLIED**  
Replied to a NAN peer with Service Discovery match

enumerator **WIFI\_EVENT\_NAN\_RECEIVE**  
Received a Follow-up message

enumerator **WIFI\_EVENT\_NDP\_INDICATION**  
Received NDP Request from a NAN Peer

enumerator **WIFI\_EVENT\_NDP\_CONFIRM**  
NDP Confirm Indication

enumerator **WIFI\_EVENT\_NDP\_TERMINATED**  
NAN Datapath terminated indication

enumerator **WIFI\_EVENT\_HOME\_CHANNEL\_CHANGE**  
Wi-Fi home channel change , doesn't occur when scanning

enumerator **WIFI\_EVENT\_STA\_NEIGHBOR\_REP**  
Received Neighbor Report response

enumerator **WIFI\_EVENT\_MAX**  
Invalid Wi-Fi event ID

enum **wifi\_event\_sta\_wps\_fail\_reason\_t**  
Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_FAILED event.

*Values:*

enumerator **WPS\_FAIL\_REASON\_NORMAL**  
WPS normal fail reason

enumerator **WPS\_FAIL\_REASON\_RECV\_M2D**  
WPS receive M2D frame

enumerator **WPS\_FAIL\_REASON\_RECV\_DEAUTH**  
Recv deauth from AP while wps handshake

enumerator **WPS\_FAIL\_REASON\_MAX**  
Max WPS fail reason

enum **wifi\_ftm\_status\_t**  
FTM operation status types.

*Values:*

enumerator **FTM\_STATUS\_SUCCESS**  
FTM exchange is successful

enumerator **FTM\_STATUS\_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM\_STATUS\_CONF\_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM\_STATUS\_NO\_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM\_STATUS\_FAIL**

Unknown error during FTM exchange

enumerator **FTM\_STATUS\_NO\_VALID\_MSMT**

FTM session did not result in any valid measurements

enumerator **FTM\_STATUS\_USER\_TERM**

User triggered termination

enum **wps\_fail\_reason\_t**

WPS fail reason.

*Values:*

enumerator **WPS\_AP\_FAIL\_REASON\_NORMAL**

WPS normal fail reason

enumerator **WPS\_AP\_FAIL\_REASON\_CONFIG**

WPS failed due to incorrect config

enumerator **WPS\_AP\_FAIL\_REASON\_AUTH**

WPS failed during auth

enumerator **WPS\_AP\_FAIL\_REASON\_MAX**

Max WPS fail reason

enum **wifi\_band\_t**

Argument structure for wifi band

*Values:*

enumerator **WIFI\_BAND\_2G**

enumerator **WIFI\_BAND\_5G**

enumerator **WIFI\_BAND\_2G\_5G**

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_eap\\_client.h](#)
- This header file can be included with:

```
#include "esp_eap_client.h"
```

- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your `CMakeLists.txt`:

```
REQUIRES wpa_supplicant
```

or

```
PRIV_REQUIRES wpa_supplicant
```

## Functions

*esp\_err\_t* **esp\_wifi\_sta\_enterprise\_enable** (void)

Enable EAP authentication(WiFi Enterprise) for the station mode.

This function enables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is enabled, the ESP device will attempt to authenticate with the configured EAP credentials when connecting to a secure Wi-Fi network.

---

**Note:** Before calling this function, ensure that the Wi-Fi configuration and EAP credentials (such as username and password) have been properly set using the appropriate configuration APIs.

---

### Returns

- `ESP_OK`: EAP authentication enabled successfully.
- `ESP_ERR_NO_MEM`: Failed to enable EAP authentication due to memory allocation failure.

*esp\_err\_t* **esp\_wifi\_sta\_enterprise\_disable** (void)

Disable EAP authentication(WiFi Enterprise) for the station mode.

This function disables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is disabled, the ESP device will not attempt to authenticate using EAP credentials when connecting to a secure Wi-Fi network.

---

**Note:** Disabling EAP authentication may cause the device to connect to the Wi-Fi network using other available authentication methods, if configured using `esp_wifi_set_config()`.

---

### Returns

- `ESP_OK`: EAP authentication disabled successfully.
- `ESP_ERR_INVALID_STATE`: EAP client is in an invalid state for disabling.

*esp\_err\_t* **esp\_eap\_client\_set\_identity** (const unsigned char \*identity, int len)

Set identity for PEAP/TTLS authentication method.

This function sets the identity to be used during PEAP/TTLS authentication.

### Parameters

- **identity** -- **[in]** Pointer to the identity data.
- **len** -- **[in]** Length of the identity data (limited to 1~127 bytes).

### Returns

- `ESP_OK`: The identity was set successfully.
- `ESP_ERR_INVALID_ARG`: Invalid argument (`len <= 0` or `len >= 128`).
- `ESP_ERR_NO_MEM`: Memory allocation failure.

void **esp\_eap\_client\_clear\_identity** (void)

Clear the previously set identity for PEAP/TTLS authentication.

This function clears the identity that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured identity during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_username** (const unsigned char \*username, int len)

Set username for PEAP/TTLS authentication method.

This function sets the username to be used during PEAP/TTLS authentication.

#### Parameters

- **username** -- **[in]** Pointer to the username data.
- **len** -- **[in]** Length of the username data (limited to 1~127 bytes).

#### Returns

- ESP\_OK: The username was set successfully.
- ESP\_ERR\_INVALID\_ARG: Failed due to an invalid argument (len <= 0 or len >= 128).
- ESP\_ERR\_NO\_MEM: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_username** (void)

Clear username for PEAP/TTLS method.

This function clears the previously set username for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_password** (const unsigned char \*password, int len)

Set password for PEAP/TTLS authentication method.

This function sets the password to be used during PEAP/TTLS authentication.

#### Parameters

- **password** -- **[in]** Pointer to the password data.
- **len** -- **[in]** Length of the password data (len > 0).

#### Returns

- ESP\_OK: The password was set successfully.
- ESP\_ERR\_INVALID\_ARG: Failed due to an invalid argument (len <= 0).
- ESP\_ERR\_NO\_MEM: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_password** (void)

Clear password for PEAP/TTLS method.

This function clears the previously set password for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_new\_password** (const unsigned char \*new\_password, int len)

Set a new password for MSCHAPv2 authentication method.

This function sets the new password to be used during MSCHAPv2 authentication. The new password is used to substitute the old password when an eap-mschapv2 failure request message with error code ERROR\_PASSWD\_EXPIRED is received.

#### Parameters

- **new\_password** -- **[in]** Pointer to the new password data.
- **len** -- **[in]** Length of the new password data.

#### Returns

- ESP\_OK: The new password was set successfully.
- ESP\_ERR\_INVALID\_ARG: Failed due to an invalid argument (len <= 0).
- ESP\_ERR\_NO\_MEM: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_new\_password** (void)

Clear new password for MSCHAPv2 method.

This function clears the previously set new password for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_ca\_cert** (const unsigned char \*ca\_cert, int ca\_cert\_len)

Set CA certificate for EAP authentication.

This function sets the Certificate Authority (CA) certificate to be used during EAP authentication. The CA certificate is passed to the EAP client module through a global pointer.

#### Parameters

- **ca\_cert** -- **[in]** Pointer to the CA certificate data.
- **ca\_cert\_len** -- **[in]** Length of the CA certificate data.

**Returns**

- ESP\_OK: The CA certificate was set successfully.

void **esp\_eap\_client\_clear\_ca\_cert** (void)

Clear the previously set Certificate Authority (CA) certificate for EAP authentication.

This function clears the CA certificate that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured CA certificate during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_certificate\_and\_key** (const unsigned char \*client\_cert, int client\_cert\_len, const unsigned char \*private\_key, int private\_key\_len, const unsigned char \*private\_key\_password, int private\_key\_passwd\_len)

Set client certificate and private key for EAP authentication.

This function sets the client certificate and private key to be used during authentication. Optionally, a private key password can be provided for encrypted private keys.

**Attention** 1. The client certificate, private key, and private key password are provided as pointers to the respective data arrays.

**Attention** 2. The client\_cert, private\_key, and private\_key\_password should be zero-terminated.

**Parameters**

- **client\_cert** -- **[in]** Pointer to the client certificate data.
- **client\_cert\_len** -- **[in]** Length of the client certificate data.
- **private\_key** -- **[in]** Pointer to the private key data.
- **private\_key\_len** -- **[in]** Length of the private key data (limited to 1~4096 bytes).
- **private\_key\_password** -- **[in]** Pointer to the private key password data (optional).
- **private\_key\_passwd\_len** -- **[in]** Length of the private key password data (can be 0 for no password).

**Returns**

- ESP\_OK: The certificate, private key, and password (if provided) were set successfully.

void **esp\_eap\_client\_clear\_certificate\_and\_key** (void)

Clear the previously set client certificate and private key for EAP authentication.

This function clears the client certificate and private key that were previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured certificate and private key during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_disable\_time\_check** (bool disable)

Set EAP client certificates time check (disable or not).

This function enables or disables the time check for EAP client certificates. When disabled, the certificates' expiration time will not be checked during the authentication process.

**Parameters** **disable** -- **[in]** True to disable EAP client certificates time check, false to enable it.

**Returns**

- ESP\_OK: The EAP client certificates time check setting was updated successfully.

*esp\_err\_t* **esp\_eap\_client\_get\_disable\_time\_check** (bool \*disable)

Get EAP client certificates time check status.

This function retrieves the current status of the EAP client certificates time check.

**Parameters** **disable** -- **[out]** Pointer to a boolean variable to store the disable status.

**Returns**

- `ESP_OK`: The status of EAP client certificates time check was retrieved successfully.

*esp\_err\_t* `esp_eap_client_set_ttls_phase2_method` (*esp\_eap\_ttls\_phase2\_types* type)

Set EAP-TTLS phase 2 method.

This function sets the phase 2 method to be used during EAP-TTLS authentication.

**Parameters** `type` -- **[in]** The type of phase 2 method to be used (e.g., EAP, MSCHAPv2, MSCHAP, PAP, CHAP).

**Returns**

- `ESP_OK`: The EAP-TTLS phase 2 method was set successfully.

*esp\_err\_t* `esp_eap_client_set_suiteb_192bit_certification` (bool enable)

Enable or disable Suite-B 192-bit certification checks.

This function enables or disables the 192-bit Suite-B certification checks during EAP-TLS authentication. Suite-B is a set of cryptographic algorithms which generally are considered more secure.

**Parameters** `enable` -- **[in]** True to enable 192-bit Suite-B certification checks, false to disable it.

**Returns**

- `ESP_OK`: The 192-bit Suite-B certification checks were set successfully.

*esp\_err\_t* `esp_eap_client_set_pac_file` (const unsigned char \*pac\_file, int pac\_file\_len)

Set the PAC (Protected Access Credential) file for EAP-FAST authentication.

EAP-FAST requires a PAC file that contains the client's credentials.

**Attention** 1. For files read from the file system, length has to be decremented by 1 byte.

**Attention** 2. Disabling the `ESP_WIFI_MBEDTLS_TLS_CLIENT` config is required to use EAP-FAST.

**Parameters**

- `pac_file` -- **[in]** Pointer to the PAC file buffer.
- `pac_file_len` -- **[in]** Length of the PAC file buffer.

**Returns**

- `ESP_OK`: The PAC file for EAP-FAST authentication was set successfully.

*esp\_err\_t* `esp_eap_client_set_fast_params` (*esp\_eap\_fast\_config* config)

Set the parameters for EAP-FAST Phase 1 authentication.

EAP-FAST supports Fast Provisioning, where clients can be authenticated faster using precomputed keys (PAC). This function allows configuring parameters for Fast Provisioning.

**Attention** 1. Disabling the `ESP_WIFI_MBEDTLS_TLS_CLIENT` config is required to use EAP-FAST.

**Parameters** `config` -- **[in]** Configuration structure with Fast Provisioning parameters.

**Returns**

- `ESP_OK`: The parameters for EAP-FAST Phase 1 authentication were set successfully.

*esp\_err\_t* `esp_eap_client_use_default_cert_bundle` (bool use\_default\_bundle)

Use the default certificate bundle for EAP authentication.

By default, the EAP client uses a built-in certificate bundle for server verification. Enabling this option allows the use of the default certificate bundle.

**Parameters** `use_default_bundle` -- **[in]** True to use the default certificate bundle, false to use a custom bundle.

**Returns**

- `ESP_OK`: The option to use the default certificate bundle was set successfully.

## Structures

struct **esp\_eap\_fast\_config**

Configuration settings for EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling).

This structure defines the configuration options that can be used to customize the behavior of the EAP-FAST authentication protocol, specifically for Fast Provisioning and PAC (Protected Access Credential) handling.

### Public Members

int **fast\_provisioning**

Enable or disable Fast Provisioning in EAP-FAST (0 = disabled, 1 = enabled)

int **fast\_max\_pac\_list\_len**

Maximum length of the PAC (Protected Access Credential) list

bool **fast\_pac\_format\_binary**

Set to true for binary format PAC, false for ASCII format PAC

## Enumerations

enum **esp\_eap\_ttls\_phase2\_types**

Enumeration of phase 2 authentication types for EAP-TTLS.

This enumeration defines the supported phase 2 authentication methods that can be used in the EAP-TTLS (Extensible Authentication Protocol - Tunneled Transport Layer Security) protocol for the second authentication phase.

*Values:*

enumerator **ESP\_EAP\_TTLS\_PHASE2\_EAP**

EAP (Extensible Authentication Protocol)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_MSCHAPV2**

MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol - Version 2)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_MSCHAP**

MS-CHAP (Microsoft Challenge Handshake Authentication Protocol)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_PAP**

PAP (Password Authentication Protocol)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_CHAP**

CHAP (Challenge Handshake Authentication Protocol)

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_wps.h](#)
- This header file can be included with:

```
#include "esp_wps.h"
```

- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your `CMakeLists.txt`:

```
REQUIRES wpa_supplicant
```

or

```
PRIV_REQUIRES wpa_supplicant
```

## Functions

*esp\_err\_t* **esp\_wifi\_wps\_enable** (const *esp\_wps\_config\_t* \*config)

Enable Wi-Fi WPS function.

**Parameters** `config` -- : WPS config to be used in connection

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wps type is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_FAIL` : wps initialization fails

*esp\_err\_t* **esp\_wifi\_wps\_disable** (void)

Disable Wi-Fi WPS function and release resource it taken.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on

*esp\_err\_t* **esp\_wifi\_wps\_start** (int timeout\_ms)

Start WPS session.

**Attention** WPS can only be used when station is enabled. WPS needs to be enabled first for using this API.

**Parameters** `timeout_ms` -- : deprecated: This argument's value will have not effect in functionality of API. The argument will be removed in future. The app should start WPS and register for WIFI events to get the status. WPS status is updated through WPS events. See `wifi_event_t` enum for more info.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wps type is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_ERR_WIFI_WPS_SM` : wps state machine is not initialized
- `ESP_FAIL` : wps initialization fails

*esp\_err\_t* **esp\_wifi\_ap\_wps\_enable** (const *esp\_wps\_config\_t* \*config)

Enable Wi-Fi AP WPS function.

**Attention** WPS can only be used when softAP is enabled.

**Parameters** `config` -- wps configuration to be used.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wps type is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_FAIL` : wps initialization fails

*esp\_err\_t* **esp\_wifi\_ap\_wps\_disable** (void)

Disable Wi-Fi SoftAP WPS function and release resource it taken.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_WIFI\_WPS\_MODE : wifi is not in station mode or sniffer mode is on

*esp\_err\_t* **esp\_wifi\_ap\_wps\_start** (const unsigned char \*pin)

WPS starts to work.

**Attention** WPS can only be used when softAP is enabled.

**Parameters** **pin** -- : Pin to be used in case of WPS mode is pin. If Pin is not provided, device will use the pin generated/provided during *esp\_wifi\_ap\_wps\_enable()* and reported in WIFI\_EVENT\_AP\_WPS\_RG\_PIN

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_WIFI\_WPS\_TYPE : wps type is invalid
- ESP\_ERR\_WIFI\_WPS\_MODE : wifi is not in station mode or sniffer mode is on
- ESP\_ERR\_WIFI\_WPS\_SM : wps state machine is not initialized
- ESP\_FAIL : wps initialization fails

## Structures

struct **wps\_factory\_information\_t**

Structure representing WPS factory information for ESP device.

This structure holds various strings representing factory information for a device, such as the manufacturer, model number, model name, and device name. Each string is a null-terminated character array. If any of the strings are empty, the default values are used.

### Public Members

char **manufacturer**[WPS\_MAX\_MANUFACTURER\_LEN]

Manufacturer of the device. If empty, the default manufacturer is used.

char **model\_number**[WPS\_MAX\_MODEL\_NUMBER\_LEN]

Model number of the device. If empty, the default model number is used.

char **model\_name**[WPS\_MAX\_MODEL\_NAME\_LEN]

Model name of the device. If empty, the default model name is used.

char **device\_name**[WPS\_MAX\_DEVICE\_NAME\_LEN]

Device name. If empty, the default device name is used.

struct **esp\_wps\_config\_t**

Structure representing configuration settings for WPS (Wi-Fi Protected Setup).

This structure encapsulates various configuration settings for WPS, including the WPS type (PBC or PIN), factory information that will be shown in the WPS Information Element (IE), and a PIN if the WPS type is set to PIN.

## Public Members

### *wps\_type\_t* **wps\_type**

The type of WPS to be used (PBC or PIN).

### *wps\_factory\_information\_t* **factory\_info**

Factory information to be shown in the WPS Information Element (IE). Vendor can choose to display their own information.

char **pin**[PIN\_LEN]

WPS PIN (Personal Identification Number) used when *wps\_type* is set to WPS\_TYPE\_PIN.

## Macros

### **ESP\_ERR\_WIFI\_REGISTRAR**

WPS registrar is not supported

### **ESP\_ERR\_WIFI\_WPS\_TYPE**

WPS type error

### **ESP\_ERR\_WIFI\_WPS\_SM**

WPS state machine is not initialized

### **WPS\_MAX\_MANUFACTURER\_LEN**

Maximum length of the manufacturer name in WPS information

### **WPS\_MAX\_MODEL\_NUMBER\_LEN**

Maximum length of the model number in WPS information

### **WPS\_MAX\_MODEL\_NAME\_LEN**

Maximum length of the model name in WPS information

### **WPS\_MAX\_DEVICE\_NAME\_LEN**

Maximum length of the device name in WPS information

### **PIN\_LEN**

The length of the WPS PIN (Personal Identification Number).

### **WPS\_CONFIG\_INIT\_DEFAULT** (type)

Initialize a default WPS configuration structure with specified WPS type.

This macro initializes a *esp\_wps\_config\_t* structure with default values for the specified WPS type. It sets the WPS type, factory information (including default manufacturer, model number, model name, and device name), and a default PIN value if applicable.

#### Parameters

- **type** -- The WPS type to be used (PBC or PIN).

**Returns** An initialized *esp\_wps\_config\_t* structure with the specified WPS type and default values.

## Type Definitions

typedef enum *wps\_type* **wps\_type\_t**

Enumeration of WPS (Wi-Fi Protected Setup) types.

## Enumerations

enum **wps\_type**

Enumeration of WPS (Wi-Fi Protected Setup) types.

*Values:*

enumerator **WPS\_TYPE\_DISABLE**

WPS is disabled

enumerator **WPS\_TYPE\_PBC**

WPS Push Button Configuration method

enumerator **WPS\_TYPE\_PIN**

WPS PIN (Personal Identification Number) method

enumerator **WPS\_TYPE\_MAX**

Maximum value for WPS type enumeration

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_rrm.h](#)
- This header file can be included with:

```
#include "esp_rrm.h"
```

- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your `CMakeLists.txt`:

```
REQUIRES wpa_supplicant
```

or

```
PRIV_REQUIRES wpa_supplicant
```

## Functions

int **esp\_rrm\_send\_neighbor\_rep\_request** (*neighbor\_rep\_request\_cb* cb, void \*cb\_ctx)

Send Radio measurement neighbor report request to connected AP.

*Deprecated:*

This function is deprecated and will be removed in the future. Please use 'esp\_rrm\_send\_neighbor\_report\_request'

### Parameters

- **cb** -- callback function for neighbor report
- **cb\_ctx** -- callback context

### Returns

- 0: success
- -1: AP does not support RRM
- -2: station not connected to AP

int **esp\_rrm\_send\_neighbor\_report\_request** (void)

Send Radio measurement neighbor report request to connected AP.

### Returns

- 0: success

- -1: AP does not support RRM
- -2: station not connected to AP

bool **esp\_rrm\_is\_rrm\_supported\_connection** (void)

Check RRM capability of connected AP.

#### Returns

- true: AP supports RRM
- false: AP does not support RRM or station not connected to AP

### Type Definitions

typedef void (\***neighbor\_rep\_request\_cb**)(void \*ctx, const uint8\_t \*report, size\_t report\_len)

Callback function type to get neighbor report.

**Param ctx** neighbor report context

**Param report** neighbor report

**Param report\_len** neighbor report length

#### Return

- void

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_wnm.h](#)
- This header file can be included with:

```
#include "esp_wnm.h"
```

- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your `CMakeLists.txt`:

```
REQUIRES wpa_supplicant
```

or

```
PRIV_REQUIRES wpa_supplicant
```

### Functions

int **esp\_wnm\_send\_bss\_transition\_mgmt\_query** (enum *btm\_query\_reason* query\_reason, const char \*btm\_candidates, int cand\_list)

Send bss transition query to connected AP.

#### Parameters

- **query\_reason** -- reason for sending query
- **btm\_candidates** -- btm candidates list if available
- **cand\_list** -- whether candidate list to be included from scan results available in supplicant's cache.

#### Returns

- 0: success
- -1: AP does not support BTM
- -2: station not connected to AP

bool **esp\_wnm\_is\_btm\_supported\_connection** (void)

Check bss transition capability of connected AP.

#### Returns

- true: AP supports BTM
- false: AP does not support BTM or station not connected to AP

## Enumerations

enum **btm\_query\_reason**

enum btm\_query\_reason: Reason code for sending btm query

*Values:*

enumerator **REASON\_UNSPECIFIED**

enumerator **REASON\_FRAME\_LOSS**

enumerator **REASON\_DELAY**

enumerator **REASON\_BANDWIDTH**

enumerator **REASON\_LOAD\_BALANCE**

enumerator **REASON\_RSSI**

enumerator **REASON\_RETRANSMISSIONS**

enumerator **REASON\_INTERFERENCE**

enumerator **REASON\_GRAY\_ZONE**

enumerator **REASON\_PREMIUM\_AP**

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_mbo.h](#)
- This header file can be included with:

```
#include "esp_mbo.h"
```

- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your `CMakeLists.txt`:

```
REQUIRES wpa_supplicant
```

or

```
PRIV_REQUIRES wpa_supplicant
```

## Functions

int **esp\_mbo\_update\_non\_pref\_chan** (struct *non\_pref\_chan\_s* \*non\_pref\_chan)

Update channel preference for MBO IE.

**Parameters** `non_pref_chan` -- Non preference channel list

**Returns**

- 0: success else failure

## Structures

struct **non\_pref\_chan**

Structure representing a non-preferred channel in a wireless network.

This structure encapsulates information about a non-preferred channel including the reason for its non-preference, the operating class, channel number, and preference level.

### Public Members

enum *non\_pref\_chan\_reason* **reason**

Reason for the channel being non-preferred

uint8\_t **oper\_class**

Operating class of the channel

uint8\_t **chan**

Channel number

uint8\_t **preference**

Preference level of the channel

struct **non\_pref\_chan\_s**

Structure representing a list of non-preferred channels in a wireless network.

This structure encapsulates information about a list of non-preferred channels including the number of non-preferred channels and an array of structures representing individual non-preferred channels.

### Public Members

size\_t **non\_pref\_chan\_num**

Number of non-preferred channels in the list

struct *non\_pref\_chan* **chan**[]

Array of structures representing individual non-preferred channels

## Enumerations

enum **non\_pref\_chan\_reason**

Enumeration of reasons for a channel being non-preferred in a wireless network.

This enumeration defines various reasons why a specific channel might be considered non-preferred in a wireless network configuration.

*Values:*

enumerator **NON\_PREF\_CHAN\_REASON\_UNSPECIFIED**

Unspecified reason for non-preference

enumerator **NON\_PREF\_CHAN\_REASON\_RSSI**

Non-preferred due to low RSSI (Received Signal Strength Indication)

enumerator **NON\_PREF\_CHAN\_REASON\_EXT\_INTERFERENCE**

Non-preferred due to external interference

enumerator **NON\_PREF\_CHAN\_REASON\_INT\_INTERFERENCE**

Non-preferred due to internal interference

## Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect, adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like Wi-Fi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added.

Easy Connect brings many benefits in the user experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-S2 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-S2 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™.

Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect, no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-S2 using a supported smartphone: [wifi/wifi\\_easy\\_connect/dpp-enrollee](#).

## API Reference

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_dpp.h](#)
- This header file can be included with:

```
#include "esp_dpp.h"
```

- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your `CMakeLists.txt`:

```
REQUIRES wpa_supplicant
```

or

```
PRIV_REQUIRES wpa_supplicant
```

**Functions****esp\_err\_t esp\_supp\_dpp\_init** (*esp\_supp\_dpp\_event\_cb\_t* evt\_cb)

Initialize DPP Supplicant.

Starts DPP Supplicant **and** initializes related Data Structures.

return

- ESP\_OK: Success
- ESP\_FAIL: Failure

**Parameters** **evt\_cb** -- Callback function to receive DPP related events**esp\_err\_t esp\_supp\_dpp\_deinit** (void)

De-initialize DPP Supplicant.

Frees memory **from DPP** Supplicant Data Structures.

**Returns**

- ESP\_OK: Success

**esp\_err\_t esp\_supp\_dpp\_bootstrap\_gen** (const char \*chan\_list, *esp\_supp\_dpp\_bootstrap\_t* type, const char \*key, const char \*info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information **as** an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Parameters**

- **chan\_list** -- List of channels device will be available on for listening
- **type** -- Bootstrap method type, only QR Code method is supported for now.
- **key** -- (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** -- (Optional) Ancilliary Device Information like Serial Number

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_DPP\_INVALID\_LIST: Channel list not valid
- ESP\_FAIL: Failure

**esp\_err\_t esp\_supp\_dpp\_start\_listen** (void)

Start listening on Channels provided during esp\_supp\_dpp\_bootstrap\_gen.

Listens on every Channel **from Channel** List **for** a pre-defined wait time.

**Returns**

- ESP\_OK: Success
- ESP\_FAIL: Generic Failure
- ESP\_ERR\_INVALID\_STATE: ROC attempted before WiFi is started
- ESP\_ERR\_NO\_MEM: Memory allocation failed while posting ROC request

**esp\_err\_t esp\_supp\_dpp\_stop\_listen** (void)

Stop listening on Channels.

Stops listening on Channels **and** cancels ongoing listen operation.

**Returns**

- ESP\_OK: Success

- ESP\_FAIL: Failure

### Macros

**ESP\_DPP\_AUTH\_TIMEOUT\_SECS**

**ESP\_DPP\_MAX\_CHAN\_COUNT**

**ESP\_ERR\_DPP\_FAILURE**

Generic failure during DPP Operation

**ESP\_ERR\_DPP\_TX\_FAILURE**

DPP Frame Tx failed OR not Acked

**ESP\_ERR\_DPP\_INVALID\_ATTR**

Encountered invalid DPP Attribute

**ESP\_ERR\_DPP\_AUTH\_TIMEOUT**

DPP Auth response was not received in time

**ESP\_ERR\_DPP\_INVALID\_LIST**

Channel list given in esp\_supp\_dpp\_bootstrap\_gen() is not valid or too big

### Type Definitions

typedef enum *dpp\_bootstrap\_type* **esp\_supp\_dpp\_bootstrap\_t**

Types of Bootstrap Methods for DPP.

typedef void (\***esp\_supp\_dpp\_event\_cb\_t**)(*esp\_supp\_dpp\_event\_t* evt, void \*data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called **with** DPP related information.

**Param evt** DPP event ID

**Param data** Event data payload

### Enumerations

enum **dpp\_bootstrap\_type**

Types of Bootstrap Methods for DPP.

*Values:*

enumerator **DPP\_BOOTSTRAP\_QR\_CODE**

QR Code Method

enumerator **DPP\_BOOTSTRAP\_PKEX**

Proof of Knowledge Method

enumerator **DPP\_BOOTSTRAP\_NFC\_URI**

NFC URI record Method

enum **esp\_supp\_dpp\_event\_t**

Types of Callback Events received from DPP Supplicant.

*Values:*

enumerator **ESP\_SUPP\_DPP\_URI\_READY**

URI is ready through Bootstrapping

enumerator **ESP\_SUPP\_DPP\_CFG\_RECVD**

Config received via DPP Authentication

enumerator **ESP\_SUPP\_DPP\_PDR\_RECVD**

Peer Discovery Response is received

enumerator **ESP\_SUPP\_DPP\_FAIL**

DPP Authentication failure

## Wi-Fi Aware™ (NAN)

Wi-Fi Aware™ or NAN (Neighbor Awareness Networking) is a protocol that allows Wi-Fi devices to discover services in their proximity. Typically, location-based services are based on querying servers for information about the environment and the location knowledge is based on GPS or other location reckoning techniques. However, NAN does not require real-time connection to servers, GPS or other geo-location, but instead uses direct device-to-device Wi-Fi to discover and exchange information. NAN scales effectively in dense Wi-Fi environments and complements the connectivity of Wi-Fi by providing information about people and services in the proximity.

Multiple NAN devices which are in the vicinity form a NAN cluster which allows them to communicate with each other. Devices within a NAN cluster can advertise (Publish method) or look for (Subscribe method) services using NAN Service Discovery protocols. Matching of services is done by service name, once a match is found, a device can either send a message or establish an IPv6 Datapath with the peer.

ESP32-S2 supports Wi-Fi Aware in standalone mode with support for both Service Discovery and Datapath. Wi-Fi Aware is still an evolving protocol. Please refer to Wi-Fi Alliance's official page on [Wi-Fi Aware](#) for more information. Many Android smartphones with Android 8 or higher support Wi-Fi Aware. Refer to Android's developer guide on Wi-Fi Aware [Wi-Fi Aware](#) for more information.

**Application Example** A pair of examples for a Publisher-Subscriber use case: [wifi/wifi\\_aware/nan\\_publisher](#) and [wifi/wifi\\_aware/nan\\_subscriber](#). A user interactive console example to explore full functionality of Wi-Fi Aware: [wifi/wifi\\_aware/nan\\_console](#). Please check the *README* for more details in respective example directories.

## API Reference

### Header File

- [components/esp\\_wifi/wifi\\_apps/nan\\_app/include/esp\\_nan.h](#)
- This header file can be included with:

```
#include "esp_nan.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

## Functions

*esp\_err\_t* **esp\_wifi\_nan\_start** (const *wifi\_nan\_config\_t* \*nan\_cfg)

Start NAN Discovery with provided configuration.

**Attention** This API should be called after `esp_wifi_init()`.

**Parameters** `nan_cfg` -- NAN related parameters to be configured.

### Returns

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_nan\_stop** (void)

Stop NAN Discovery, end NAN Services and Datapaths.

### Returns

- ESP\_OK: succeed
- others: failed

uint8\_t **esp\_wifi\_nan\_publish\_service** (const *wifi\_nan\_publish\_cfg\_t* \*publish\_cfg, bool ndp\_resp\_needed)

Start Publishing a service to the NAN Peers in vicinity.

**Attention** This API should be called after `esp_wifi_nan_start()`.

### Parameters

- **publish\_cfg** -- Configuration parameters for publishing a service.
- **ndp\_resp\_needed** -- Setting this true will require user response for every NDP Req using `esp_wifi_nan_datapath_resp` API.

### Returns

- non-zero: Publish service identifier
- zero: failed

uint8\_t **esp\_wifi\_nan\_subscribe\_service** (const *wifi\_nan\_subscribe\_cfg\_t* \*subscribe\_cfg)

Subscribe for a service within the NAN cluster.

**Attention** This API should be called after `esp_wifi_nan_start()`.

**Parameters** `subscribe_cfg` -- Configuration parameters for subscribing for a service.

### Returns

- non-zero: Subscribe service identifier
- zero: failed

*esp\_err\_t* **esp\_wifi\_nan\_send\_message** (*wifi\_nan\_followup\_params\_t* \*fup\_params)

Send a follow-up message to the NAN Peer with matched service.

**Attention** This API should be called after a NAN service is discovered due to a match.

**Parameters** `fup_params` -- Configuration parameters for sending a Follow-up message.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_nan\_cancel\_service** (uint8\_t service\_id)

Cancel a NAN service.

**Parameters** **service\_id** -- Publish/Subscribe service id to be cancelled.

**Returns**

- ESP\_OK: succeed
- others: failed

uint8\_t **esp\_wifi\_nan\_datapath\_req** (*wifi\_nan\_datapath\_req\_t* \*req)

Send NAN Datapath Request to a NAN Publisher with matched service.

**Attention** This API should be called by the Subscriber after a match occurs with a Publisher.

**Parameters** **req** -- NAN Datapath Request parameters.

**Returns**

- non-zero NAN Datapath identifier: If NAN datapath req was accepted by publisher
- zero: If NAN datapath req was rejected by publisher or a timeout occurs

*esp\_err\_t* **esp\_wifi\_nan\_datapath\_resp** (*wifi\_nan\_datapath\_resp\_t* \*resp)

Respond to a NAN Datapath request with Accept or Reject.

**Attention** This API should be called if `ndp_resp_needed` is set True by the Publisher and a `WIFI_EVENT_NDP_INDICATION` event is received due to an incoming NDP request.

**Parameters** **resp** -- NAN Datapath Response parameters.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_nan\_datapath\_end** (*wifi\_nan\_datapath\_end\_req\_t* \*req)

Terminate a NAN Datapath.

**Parameters** **req** -- NAN Datapath end request parameters.

**Returns**

- ESP\_OK: succeed
- others: failed

void **esp\_wifi\_nan\_get\_ipv6\_linklocal\_from\_mac** (ip6\_addr\_t \*ip6, uint8\_t \*mac\_addr)

Get IPv6 Link Local address using MAC address.

**Parameters**

- **ip6** -- **[out]** Derived IPv6 Link Local address.
- **mac\_addr** -- **[in]** Input MAC Address.

*esp\_err\_t* **esp\_wifi\_nan\_get\_own\_svc\_info** (uint8\_t \*own\_svc\_id, char \*svc\_name, int \*num\_peer\_records)

brief Get own Service information from Service ID OR Name.

**Attention** If service information is to be fetched from service name, set `own_svc_id` as zero.

**Parameters**

- **own\_svc\_id** -- **[inout]** As input, it indicates Service ID to search for. As output, it indicates Service ID of the service found using Service Name.

- **svc\_name** -- **[inout]** As input, it indicates Service Name to search for. As output, it indicates Service Name of the service found using Service ID.
- **num\_peer\_records** -- **[out]** Number of peers discovered by corresponding service.

**Returns**

- ESP\_OK: succeed
- ESP\_FAIL: failed

*esp\_err\_t* **esp\_wifi\_nan\_get\_peer\_records** (int \*num\_peer\_records, uint8\_t own\_svc\_id, struct *nan\_peer\_record* \*peer\_record)

brief Get a list of Peers discovered by the given Service.

**Parameters**

- **num\_peer\_records** -- **[inout]** As input param, it stores max peers peer\_record can hold. As output param, it specifies the actual number of peers this API returns.
- **own\_svc\_id** -- Service ID of own service.
- **peer\_record** -- **[out]** Pointer to first peer record.

**Returns**

- ESP\_OK: succeed
- ESP\_FAIL: failed

*esp\_err\_t* **esp\_wifi\_nan\_get\_peer\_info** (char \*svc\_name, uint8\_t \*peer\_mac, struct *nan\_peer\_record* \*peer\_info)

brief Find Peer's Service information using Peer MAC and optionally Service Name.

**Parameters**

- **svc\_name** -- Service Name of the published/subscribed service.
- **peer\_mac** -- Peer's NAN Management Interface MAC address.
- **peer\_info** -- **[out]** Peer's service information structure.

**Returns**

- ESP\_OK: succeed
- ESP\_FAIL: failed

**Structures**

struct **nan\_peer\_record**

Parameters of a peer service record

**Public Members**

uint8\_t **peer\_svc\_id**

Identifier of Peer's service

uint8\_t **own\_svc\_id**

Identifier of own service associated with Peer

uint8\_t **peer\_nmi**[6]

Peer's NAN Management Interface address

uint8\_t **peer\_svc\_type**

Peer's service type (Publish/Subscribe)

uint8\_t **ndp\_id**

Specifies if the peer has any active datapath

uint8\_t **peer\_ndi**[6]

Peer's NAN Data Interface address, only valid when `ndp_id` is non-zero

### Macros

**WIFI\_NAN\_CONFIG\_DEFAULT** ()

**NDP\_STATUS\_ACCEPTED**

**NDP\_STATUS\_REJECTED**

**NAN\_MAX\_PEERS\_RECORD**

**ESP\_NAN\_PUBLISH**

**ESP\_NAN\_SUBSCRIBE**

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the [mesh](#) directory of ESP-IDF examples.

## 2.4.2 Ethernet

### Ethernet

**Overview** ESP-IDF provides a set of consistent and flexible APIs to support external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc Control of Ethernet Driver*

**Basic Ethernet Concepts** Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low-power applications. However, with ubiquitous deployment, internet connectivity, high data rates, and limitless-range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, a data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling appears as shown below:

**Preamble and Start-of-Frame Delimiter** The preamble contains seven bytes of 55H. It allows the receiver to lock onto the stream of data before the actual frame arrives.

The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will be automatically generated or stripped from the packets.

Fig. 3: Ethernet Data Frame Format

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multicast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not.

Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multicast address, i.e., FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a unicast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or unicast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. For more information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length** The type/length field is a 2-byte field. If the value in this field is  $\leq 1500$  (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is  $\geq 1536$ , it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H

- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets violates Ethernet standards and will be dropped by most Ethernet nodes.

This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet the IEEE 802.3 specification requirements when small data payloads are used.

The DA, SA, type, payload, and padding of an Ethernet packet must be no smaller than 60 bytes in total. If the required 4-byte FCS field is added, packets must be no smaller than 64 bytes. If the payload field is less than 46-byte long, a padding field is required.

The FCS field is a 4-byte field that contains an industry-standard 32-bit CRC calculated with the data from the DA, SA, type, payload, and padding fields. Given the complexity of calculating a CRC, the hardware normally automatically generates a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

---

**Note:** Besides the basic data frame described above, there are two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN-tagged frames. They are not supported in ESP-IDF.

---

**Configure MAC and PHY** The Ethernet driver is composed of two parts: MAC and PHY.

You need to set up the necessary parameters for MAC and PHY respectively based on your Ethernet board design, and then combine the two together to complete the driver installation.

Basic common configuration for MAC layer is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds. Typically, MAC reset should be finished within 100 ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets. These two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when the cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY devices can share the same SMI bus, so each PHY needs a unique address. Usually, this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.

- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds. Typically, PHY reset should be finished within 100 ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. The Ethernet driver starts negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connects the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to `-1`.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** The Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of the two.

### SPI-Ethernet Module

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();           // apply default
↳common MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();           // apply default PHY
↳configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;                 // alter the PHY
↳address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;     // alter the GPIO
↳used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt-driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
↳SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

### Note:

- When creating MAC and PHY instances for SPI-Ethernet modules (e.g., DM9051), the constructor function must have the same suffix (e.g., `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we do not have other choices but the integrated PHY.
- The SPI device configuration (i.e., `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module's specs and the examples in ESP-IDF.

**Install Driver** To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e., not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g., `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g., `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most Ethernet IoT applications, any Ethernet frame received by a driver should be passed to the upper layer (e.g., TCP/IP stack). This field is set to a function that is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low-level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver_
↳configuration
esp_eth_handle_t eth_handle = NULL; // after the driver is installed, we will get_
↳the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

The Ethernet driver also includes an event-driven model, which sends useful and important events to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to [ESP Event](#).

```
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // create a default event loop that runs in the_
↳background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);_
↳// register Ethernet event handler (to deal with user specific stuff when event_
↳like link up/down happened) (continues on next page)
```

**Start Ethernet Driver** After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack** Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we are still on level 2 (i.e., Data Link Layer). While we can detect link up and down events and gain MAC address in user space, it is infeasible to obtain the IP address, let alone send an HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP. For more information about it, please refer to [LwIP](#).

To connect the Ethernet driver to TCP/IP stack, follow these three steps:

1. Create a network interface for the Ethernet driver
2. Attach the network interface to the Ethernet driver
3. Register IP event handlers

For more information about the network interface, please refer to [Network Interface](#).

```
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface before registering the user's Ethernet/IP event handlers, i.e., register the event handlers as the last thing prior to starting the Ethernet driver. Such an approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface so the system is in the expected state when executing the user's handlers.

**Misc Control of Ethernet Driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`

- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```

/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
          mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
→addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

```

**Flow Control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. The ethernet flow control mechanism allows the receiving node to signal the sender requesting the suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After the Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```

bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);

```

One thing that should be kept in mind is that the pause frame ability is advertised to the peer end by PHY during auto-negotiation. The Ethernet driver sends a pause frame only when both sides of the link support it.

### Application Examples

- Ethernet basic example: [ethernet/basic](#)
- Ethernet iperf example: [ethernet/iperf](#)
- Ethernet to Wi-Fi AP "router": [network/eth2ap](#)
- Wi-Fi station to Ethernet "bridge": [network/sta2eth](#)
- Most protocol examples should also work for Ethernet: [protocols](#)

### Advanced Topics

**Custom PHY Driver** There are multiple PHY manufacturers with wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies the user's actual needs due to price, features, stock availability, etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in Section 22.2.4 Management Functions. It defines provisions of the so-called "MII Management Interface" to control the PHY and gather status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration, etc. This basic management functionality is addressed by [esp\\_eth/src/phy/esp\\_eth\\_phy\\_802\\_3.c](#) in ESP-IDF and so it makes the creation of a new custom PHY chip driver quite a simple task.

**Note:** Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, but it just requires more effort. You will have to

define all PHY management functions.

---

The majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the [esp\\_eth/src/phy/esp\\_eth\\_phy\\_802\\_3.c](#). However, the following may require developing chip-specific management functions:

- Link status which is almost always chip-specific
- Chip initialization, even though not strictly required, should be customized to at least ensure that the expected chip is used
- Chip-specific features configuration

#### Steps to create a custom PHY driver:

1. Define vendor-specific registry layout based on the PHY datasheet. See [esp\\_eth/src/phy/esp\\_eth\\_phy\\_ip101.c](#) as an example.
2. Prepare derived PHY management object info structure which:
  - must contain at least parent IEEE 802.3 [phy\\_802\\_3\\_t](#) object
  - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See [esp\\_eth/src/phy/esp\\_eth\\_phy\\_ksz80xx.c](#) as an example.
3. Define chip-specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip-specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among other users via [IDF Component Registry](#).

## API Reference

### Header File

- [components/hal/include/hal/eth\\_types.h](#)
- This header file can be included with:

```
#include "hal/eth_types.h"
```

### Enumerations

enum **eth\_data\_interface\_t**

Ethernet interface.

*Values:*

enumerator **EMAC\_DATA\_INTERFACE\_RMII**

Reduced Media Independent Interface

enumerator **EMAC\_DATA\_INTERFACE\_MII**

Media Independent Interface

enum **eth\_link\_t**

Ethernet link status.

*Values:*

enumerator **ETH\_LINK\_UP**

Ethernet link is up

enumerator **ETH\_LINK\_DOWN**

Ethernet link is down

enum **eth\_speed\_t**

Ethernet speed.

*Values:*

enumerator **ETH\_SPEED\_10M**

Ethernet speed is 10Mbps

enumerator **ETH\_SPEED\_100M**

Ethernet speed is 100Mbps

enumerator **ETH\_SPEED\_MAX**

Max speed mode (for checking purpose)

enum **eth\_duplex\_t**

Ethernet duplex mode.

*Values:*

enumerator **ETH\_DUPLEX\_HALF**

Ethernet is in half duplex

enumerator **ETH\_DUPLEX\_FULL**

Ethernet is in full duplex

enum **eth\_checksum\_t**

Ethernet Checksum.

*Values:*

enumerator **ETH\_CHECKSUM\_SW**

Ethernet checksum calculate by software

enumerator **ETH\_CHECKSUM\_HW**

Ethernet checksum calculate by hardware

enum **eth\_mac\_dma\_burst\_len\_t**

Internal ethernet EMAC's DMA available burst sizes.

*Values:*

enumerator **ETH\_DMA\_BURST\_LEN\_32**

enumerator **ETH\_DMA\_BURST\_LEN\_16**

enumerator **ETH\_DMA\_BURST\_LEN\_8**

enumerator **ETH\_DMA\_BURST\_LEN\_4**

enumerator **ETH\_DMA\_BURST\_LEN\_2**

enumerator **ETH\_DMA\_BURST\_LEN\_1**

### Header File

- [components/esp\\_eth/include/esp\\_eth.h](#)
- This header file can be included with:

```
#include "esp_eth.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_driver.h](#)
- This header file can be included with:

```
#include "esp_eth_driver.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Functions

*esp\_err\_t* **esp\_eth\_driver\_install** (const *esp\_eth\_config\_t* \*config, *esp\_eth\_handle\_t* \*out\_hdl)

Install Ethernet driver.

#### Parameters

- **config** -- [in] configuration of the Ethernet driver
- **out\_hdl** -- [out] handle of Ethernet driver

#### Returns

- **ESP\_OK**: install `esp_eth` driver successfully
- **ESP\_ERR\_INVALID\_ARG**: install `esp_eth` driver failed because of some invalid argument
- **ESP\_ERR\_NO\_MEM**: install `esp_eth` driver failed because there's no memory for driver
- **ESP\_FAIL**: install `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_driver\_uninstall** (*esp\_eth\_handle\_t* hdl)

Uninstall Ethernet driver.

---

**Note:** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

---

**Parameters** **hdl** -- [in] handle of Ethernet driver

**Returns**

- ESP\_OK: uninstall esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: uninstall esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: uninstall esp\_eth driver failed because it has more than one reference
- ESP\_FAIL: uninstall esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

---

**Note:** This API will start driver state machine and internal software timer (for checking link status).

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

**Returns**

- ESP\_OK: start esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: start esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: start esp\_eth driver failed because driver has started already
- ESP\_FAIL: start esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* hdl)

Stop Ethernet driver.

---

**Note:** This function does the oppsite operation of `esp_eth_start`.

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

**Returns**

- ESP\_OK: stop esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: stop esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: stop esp\_eth driver failed because driver has not started yet
- ESP\_FAIL: stop esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* hdl, *esp\_err\_t* (\*stack\_input)(*esp\_eth\_handle\_t* hdl, uint8\_t \*buffer, uint32\_t length, void \*priv), void \*priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

---

**Note:** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

---

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **stack\_input** -- **[in]** function pointer, which does the actual process on incoming packets
- **priv** -- **[in]** private resource, which gets passed to `stack_input` callback without any modification

**Returns**

- ESP\_OK: update input path successfully
- ESP\_ERR\_INVALID\_ARG: update input path failed because of some invalid argument
- ESP\_FAIL: update input path failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* hdl, void \*buf, size\_t length)

General Transmit.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **buf** -- **[in]** buffer of the packet to transfer
- **length** -- **[in]** length of the buffer to transfer

**Returns**

- ESP\_OK: transmit frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: transmit frame buffer failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: invalid driver state (e.i. driver is not started)
- ESP\_ERR\_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit\_vargs** (*esp\_eth\_handle\_t* hdl, uint32\_t argc, ...)

Special Transmit with variable number of arguments.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **argc** -- **[in]** number variable arguments
- . . . -- variable arguments

**Returns**

- ESP\_OK: transmit successful
- ESP\_ERR\_INVALID\_STATE: invalid driver state (e.i. driver is not started)
- ESP\_ERR\_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

*esp\_err\_t* **esp\_eth\_ioctl** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_io\_cmd\_t* cmd, void \*data)

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- ETH\_CMD\_S\_MAC\_ADDR sets Ethernet interface MAC address. *data* argument is pointer to MAC address buffer with expected size of 6 bytes.
- ETH\_CMD\_G\_MAC\_ADDR gets Ethernet interface MAC address. *data* argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- ETH\_CMD\_S\_PHY\_ADDR sets PHY address in range of <0-31>. *data* argument is pointer to memory of *uint32\_t* datatype from where the configuration option is read.
- ETH\_CMD\_G\_PHY\_ADDR gets PHY address. *data* argument is pointer to memory of *uint32\_t* datatype to which the PHY address is to be stored.
- ETH\_CMD\_S\_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- ETH\_CMD\_G\_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype to which the current configuration is to be stored.
- ETH\_CMD\_S\_SPEED sets the Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH\_CMD\_G\_SPEED gets current Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype to which the speed is to be stored.
- ETH\_CMD\_S\_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- ETH\_CMD\_S\_FLOW\_CTRL sets/resets Ethernet interface flow control. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.

- `ETH_CMD_S_DUPLEX_MODE` sets the Ethernet duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **cmd** -- **[in]** IO control command
- **data** -- **[inout]** address of data for `set` command or address where to store the data when used with `get` command

**Returns**

- `ESP_OK`: process io command successfully
- `ESP_ERR_INVALID_ARG`: process io command failed because of some invalid argument
- `ESP_FAIL`: process io command failed because some other error occurred
- `ESP_ERR_NOT_SUPPORTED`: requested feature is not supported

*esp\_err\_t* **esp\_eth\_get\_phy\_instance** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_phy\_t* \*\*phy)

Get PHY instance memory address.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **phy** -- **[out]** pointer to memory to store the instance

**Returns** *esp\_err\_t*

- `ESP_OK`: success
- `ESP_ERR_INVALID_ARG`: failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_get\_mac\_instance** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_mac\_t* \*\*mac)

Get MAC instance memory address.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **mac** -- **[out]** pointer to memory to store the instance

**Returns** *esp\_err\_t*

- `ESP_OK`: success
- `ESP_ERR_INVALID_ARG`: failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

---

**Note:** Ethernet driver handle can be obtained by `os_timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Parameters** `hdl` -- [in] handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

## Structures

struct `esp_eth_config_t`

Configuration of Ethernet driver.

## Public Members

`esp_eth_mac_t *mac`

Ethernet MAC object.

`esp_eth_phy_t *phy`

Ethernet PHY object.

uint32\_t `check_link_period_ms`

Period time of checking Ethernet link status.

`esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)`

Input frame buffer to user's stack.

**Param** `eth_handle` [in] handle of Ethernet driver

**Param** `buffer` [in] frame buffer that will get input to upper stack

**Param** `length` [in] length of the frame buffer

**Return**

- `ESP_OK`: input frame buffer to upper stack successfully
- `ESP_FAIL`: error occurred when inputting buffer to upper stack

`esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)`

Callback function invoked when lowlevel initialization is finished.

**Param** `eth_handle` [in] handle of Ethernet driver

**Return**

- `ESP_OK`: process extra lowlevel initialization successfully
- `ESP_FAIL`: error occurred when processing extra lowlevel initialization

`esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)`

Callback function invoked when lowlevel deinitialization is finished.

**Param** `eth_handle` [in] handle of Ethernet driver

**Return**

- `ESP_OK`: process extra lowlevel deinitialization successfully
- `ESP_FAIL`: error occurred when processing extra lowlevel deinitialization

`esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`

Read PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding

read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

struct **esp\_eth\_phy\_reg\_rw\_data\_t**

Data structure to Read/Write PHY register via ioctl API.

### Public Members

uint32\_t **reg\_addr**

PHY register address

uint32\_t \***reg\_value\_p**

Pointer to a memory where the register value is read/written

### Macros

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

### Type Definitions

typedef void \***esp\_eth\_handle\_t**

Handle of Ethernet driver.

## Enumerations

enum **esp\_eth\_io\_cmd\_t**

Command list for ioctl API.

*Values:*

enumerator **ETH\_CMD\_G\_MAC\_ADDR**

Get MAC address

enumerator **ETH\_CMD\_S\_MAC\_ADDR**

Set MAC address

enumerator **ETH\_CMD\_G\_PHY\_ADDR**

Get PHY address

enumerator **ETH\_CMD\_S\_PHY\_ADDR**

Set PHY address

enumerator **ETH\_CMD\_G\_AUTONEGO**

Get PHY Auto Negotiation

enumerator **ETH\_CMD\_S\_AUTONEGO**

Set PHY Auto Negotiation

enumerator **ETH\_CMD\_G\_SPEED**

Get Speed

enumerator **ETH\_CMD\_S\_SPEED**

Set Speed

enumerator **ETH\_CMD\_S\_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH\_CMD\_S\_FLOW\_CTRL**

Set flow control

enumerator **ETH\_CMD\_G\_DUPLEX\_MODE**

Get Duplex mode

enumerator **ETH\_CMD\_S\_DUPLEX\_MODE**

Set Duplex mode

enumerator **ETH\_CMD\_S\_PHY\_LOOPBACK**

Set PHY loopback

enumerator **ETH\_CMD\_READ\_PHY\_REG**

Read PHY register

enumerator **ETH\_CMD\_WRITE\_PHY\_REG**

Write PHY register

enumerator **ETH\_CMD\_CUSTOM\_MAC\_CMDS**

enumerator **ETH\_CMD\_CUSTOM\_PHY\_CMDS**

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_com.h](#)
- This header file can be included with:

```
#include "esp_eth_com.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Structures

struct **esp\_eth\_mediator\_s**

Ethernet mediator.

### Public Members

*esp\_err\_t* (**\*phy\_reg\_read**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

*esp\_err\_t* (**\*phy\_reg\_write**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

*esp\_err\_t* (**\*stack\_input**)(*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

**Param eth [in]** mediator of Ethernet driver

**Param buffer [in]** packet buffer

**Param length [in]** length of the packet

**Return**

- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

*esp\_err\_t* (\***on\_state\_changed**)(*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)

Callback on Ethernet state changed.

**Param eth [in]** mediator of Ethernet driver

**Param state [in]** new state

**Param args [in]** optional argument for the new state

**Return**

- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

## Macros

**ETH\_CMD\_CUSTOM\_MAC\_CMDS\_OFFSET**

Offset for start of MAC custom ioctl commands.

**ETH\_CMD\_CUSTOM\_PHY\_CMDS\_OFFSET**

Offset for start of PHY custom ioctl commands.

## Type Definitions

typedef struct *esp\_eth\_mediator\_s* **esp\_eth\_mediator\_t**

Ethernet mediator.

## Enumerations

enum **esp\_eth\_state\_t**

Ethernet driver state.

*Values:*

enumerator **ETH\_STATE\_LLINIT**

Lowlevel init done

enumerator **ETH\_STATE\_DEINIT**

Deinit done

enumerator **ETH\_STATE\_LINK**

Link status changed

enumerator **ETH\_STATE\_SPEED**

Speed updated

enumerator **ETH\_STATE\_DUPLEX**

Duplex updated

enumerator **ETH\_STATE\_PAUSE**

Pause ability updated

enum **eth\_event\_t**

Ethernet event declarations.

*Values:*

enumerator **ETHERNET\_EVENT\_START**

Ethernet driver start

enumerator **ETHERNET\_EVENT\_STOP**

Ethernet driver stop

enumerator **ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_mac.h](#)
- This header file can be included with:

```
#include "esp_eth_mac.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Structures

struct **esp\_eth\_mac\_s**

Ethernet MAC.

### Public Members

*esp\_err\_t* (**\*set\_mediator**)(*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Param eth [in]** Ethernet mediator

**Return**

- `ESP_OK`: set mediator for Ethernet MAC successfully
- `ESP_ERR_INVALID_ARG`: set mediator for Ethernet MAC failed because of invalid argument

*esp\_err\_t* (**\*init**)(*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***start**)(*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***stop**)(*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***transmit**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [in]** packet buffer to transmit

**Param length [in]** length of packet

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***transmit\_vargs**)(*esp\_eth\_mac\_t* \*mac, uint32\_t argc, va\_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

---

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

---

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param argc [in]** number variable arguments

**Param args [in]** variable arguments

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***receive**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

---

**Note:** Memory of buf is allocated in the Layer2, make sure it get free after process.

---

**Note:** Before this function got invoked, the value of "length" should set by user, equals the size of buffer. After the function returned, the value of "length" means the real length of received data.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [out]** packet buffer which will preserve the received frame

**Param length [out]** length of the received packet

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned "length" indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [in]** MAC address

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [out]** MAC address

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_mac\_t* \*mac, *eth\_speed\_t* speed)

Set speed of MAC.

**Param mac [in]** Ethernet MAC instance

**Param speed [in]** MAC speed

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_mac\_t* \*mac, *eth\_duplex\_t* duplex)

Set duplex mode of MAC.

**Param mac [in]** Ethernet MAC instance

**Param duplex [in]** MAC duplex

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_mac\_t* \*mac, *eth\_link\_t* link)

Set link status of MAC.

**Param mac [in]** Ethernet MAC instance

**Param link [in]** Link status

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

*esp\_err\_t* (\***set\_promiscuous**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Set promiscuous of MAC.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

*esp\_err\_t* (**\*enable\_flow\_ctrl**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Enable flow control on MAC layer or not.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable flow control; set false to disable flow control

**Return**

- ESP\_OK: set flow control successfully
- ESP\_FAIL: set flow control failed because some error occurred

*esp\_err\_t* (**\*set\_peer\_pause\_ability**)(*esp\_eth\_mac\_t* \*mac, uint32\_t ability)

Set the PAUSE ability of peer node.

**Param mac [in]** Ethernet MAC instance

**Param ability [in]** zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**

- ESP\_OK: set peer pause ability successfully
- ESP\_FAIL: set peer pause ability failed because some error occurred

*esp\_err\_t* (**\*custom\_ioctl**)(*esp\_eth\_mac\_t* \*mac, int cmd, void \*data)

Custom IO function of MAC driver. This function is intended to extend common options of *esp\_eth\_ioctl* to cover specifics of MAC chip.

---

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

---

**Param mac [in]** Ethernet MAC instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for *set* command or address where to store the data when used with *get* command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (**\*del**)(*esp\_eth\_mac\_t* \*mac)

Free memory of Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

### Public Members

uint32\_t **sw\_reset\_timeout\_ms**

Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**

Stack size of the receive task

uint32\_t **rx\_task\_prio**

Priority of the receive task

uint32\_t **flags**

Flags that specify extra capability for mac driver

## Macros

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG()**

Default configuration for Ethernet MAC object.

## Type Definitions

typedef struct *esp\_eth\_mac\_s* **esp\_eth\_mac\_t**

Ethernet MAC.

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_mac\\_esp.h](#)
- This header file can be included with:

```
#include "esp_eth_mac_esp.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your CMakeLists.txt:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_mac\\_spi.h](#)
- This header file can be included with:

```
#include "esp_eth_mac_spi.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your CMakeLists.txt:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

## Structures

struct **eth\_spi\_custom\_driver\_config\_t**

Custom SPI Driver Configuration. This structure declares configuration and callback functions to access Ethernet SPI module via user's custom SPI driver.

### Public Members

void \***config**

Custom driver specific configuration data used by *init()* function.

---

**Note:** Type and its content is fully under user's control

---

void **(\*init)**(const void \*spi\_config)

Custom driver SPI Initialization.

---

**Note:** return type and its content is fully under user's control

---

**Param spi\_config [in]** Custom driver specific configuration

#### Return

- spi\_ctx: when initialization is successful, a pointer to context structure holding all variables needed for subsequent SPI access operations (e.g. SPI bus identification, mutexes, etc.)
- NULL: driver initialization failed

*esp\_err\_t* **(\*deinit)**(void \*spi\_ctx)

Custom driver De-initialization.

**Param spi\_ctx [in]** a pointer to driver specific context structure

#### Return

- ESP\_OK: driver de-initialization was successful
- ESP\_FAIL: driver de-initialization failed
- any other failure codes are allowed to be used to provide failure isolation

*esp\_err\_t* **(\*read)**(void \*spi\_ctx, uint32\_t cmd, uint32\_t addr, void \*data, uint32\_t data\_len)

Custom driver SPI read.

---

**Note:** The read function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

---

**Param spi\_ctx [in]** a pointer to driver specific context structure

**Param cmd [in]** command

**Param addr [in]** register address

**Param data [out]** read data

**Param data\_len [in]** read data length in bytes

#### Return

- ESP\_OK: read was successful
- ESP\_FAIL: read failed
- any other failure codes are allowed to be used to provide failure isolation

`esp_err_t (*write)(void *spi_ctx, uint32_t cmd, uint32_t addr, const void *data, uint32_t data_len)`

Custom driver SPI write.

---

**Note:** The write function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

---

**Param spi\_ctx [in]** a pointer to driver specific context structure

**Param cmd [in]** command

**Param addr [in]** register address

**Param data [in]** data to write

**Param data\_len [in]** length of data to write in bytes

**Return**

- ESP\_OK: write was successful
- ESP\_FAIL: write failed
- any other failure codes are allowed to be used to provide failure isolation

## Macros

### ETH\_DEFAULT\_SPI

Default configuration of the custom SPI driver. Internal ESP-IDF SPI Master driver is used by default.

## Header File

- `components/esp_eth/include/esp_eth_phy.h`
- This header file can be included with:

```
#include "esp_eth_phy.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your CMakeLists.txt:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

## Functions

`esp_eth_phy_t *esp_eth_phy_new_ip101 (const eth_phy_config_t *config)`

Create a PHY instance of IP101.

**Parameters config -- [in]** configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_rt18201 (const eth_phy_config_t *config)`

Create a PHY instance of RTL8201.

**Parameters config -- [in]** configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

`esp_eth_phy_t *esp_eth_phy_new_lan87xx (const eth_phy_config_t *config)`

Create a PHY instance of LAN87xx.

**Parameters config -- [in]** configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_dp83848** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of DP83848.

**Parameters** *config* -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ksz80xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters** *config* -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Structures**

struct **esp\_eth\_phy\_s**

Ethernet PHY.

**Public Members**

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_phy\_t* \*phy, *esp\_eth\_mediator\_t* \*mediator)

Set mediator for PHY.

**Param** *phy* [in] Ethernet PHY instance

**Param** *mediator* [in] mediator of Ethernet driver

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

*esp\_err\_t* (\***reset**)(*esp\_eth\_phy\_t* \*phy)

Software Reset Ethernet PHY.

**Param** *phy* [in] Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***reset\_hw**)(*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

---

**Note:** Hardware reset is mostly done by pull down and up PHY's nRST pin

---

**Param** *phy* [in] Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***autonego\_ctrl**)(*esp\_eth\_phy\_t* \*phy, *eth\_phy\_autoneg\_cmd\_t* cmd, bool \*autonego\_en\_stat)

Configure auto negotiation.

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param autonego\_en\_stat [out]** Address where to store current status of auto negotiation configuration

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid command

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_phy\_t* \*phy, *eth\_link\_t* link)

Set Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Param link [in]** new link status

**Return**

- ESP\_OK: set Ethernet PHY link status successfully
- ESP\_FAIL: set Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***pwrctrl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** set true to power on Ethernet PHY; ser false to power off Ethernet PHY

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [in]** PHY chip address

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t \*addr)

Get PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** PHY chip address

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

*esp\_err\_t* (\***advertise\_pause\_ability**)(*esp\_eth\_phy\_t* \*phy, uint32\_t ability)

Advertise pause function supported by MAC layer.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** Pause ability

**Return**

- ESP\_OK: Advertise pause ability successfully
- ESP\_ERR\_INVALID\_ARG: Advertise pause ability failed because of invalid argument

*esp\_err\_t* (\***loopback**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Sets the PHY to loopback mode.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** enables or disables PHY loopback

**Return**

- ESP\_OK: PHY instance loopback mode has been configured successfully
- ESP\_FAIL: PHY instance loopback configuration failed because some error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_phy\_t* \*phy, *eth\_speed\_t* speed)

Sets PHY speed mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param speed [in]** Speed mode to be set

**Return**

- ESP\_OK: PHY instance speed mode has been configured successfully
- ESP\_FAIL: PHY instance speed mode configuration failed because some error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_phy\_t* \*phy, *eth\_duplex\_t* duplex)

Sets PHY duplex mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param duplex [in]** Duplex mode to be set

**Return**

- ESP\_OK: PHY instance duplex mode has been configured successfully
- ESP\_FAIL: PHY instance duplex mode configuration failed because some error occurred

*esp\_err\_t* (**\*custom\_ioctl**)(*esp\_eth\_phy\_t* \*phy, int cmd, void \*data)

Custom IO function of PHY driver. This function is intended to extend common options of *esp\_eth\_ioctl* to cover specifics of PHY chip.

---

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

---

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for *set* command or address where to store the data when used with *get* command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (**\*del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

struct **eth\_phy\_config\_t**

Ethernet PHY configuration.

### Public Members

int32\_t **phy\_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset\_gpio\_num**  
Reset GPIO number, -1 means no hardware reset

### Macros

**ESP\_ETH\_PHY\_ADDR\_AUTO**  
**ETH\_PHY\_DEFAULT\_CONFIG()**  
Default configuration for Ethernet PHY object.

### Type Definitions

typedef struct *esp\_eth\_phy\_s* **esp\_eth\_phy\_t**  
Ethernet PHY.

### Enumerations

enum **eth\_phy\_autoneg\_cmd\_t**  
Auto-negotiation control commands.  
*Values:*  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_RESTART**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_EN**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_DIS**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_G\_STAT**

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy\\_802\\_3.h](#)
- This header file can be included with:

```
#include "esp_eth_phy_802_3.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Functions

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_mediator** (*phy\_802\_3\_t* \*phy\_802\_3, *esp\_eth\_mediator\_t* \*eth)  
Set Ethernet mediator.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **eth** -- Ethernet mediator pointer

#### Returns

- **ESP\_OK**: Ethernet mediator set successfully
- **ESP\_ERR\_INVALID\_ARG**: if `eth` is `NULL`

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_reset** (*phy\_802\_3\_t* \*phy\_802\_3)

Reset PHY.

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY reset successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_autonego\_ctrl** (*phy\_802\_3\_t* \*phy\_802\_3, *eth\_phy\_autoneg\_cmd\_t* cmd, bool \*autonego\_en\_stat)

Control autonegotiation mode of Ethernet PHY.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **cmd** -- autonegotiation command enumeration
- **autonego\_en\_stat** -- [out] autonegotiation enabled flag

**Returns**

- ESP\_OK: Ethernet PHY autonegotiation configured successfully
- ESP\_FAIL: Ethernet PHY autonegotiation configuration fail because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid value of cmd

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_pwrctl** (*phy\_802\_3\_t* \*phy\_802\_3, bool enable)

Power control of Ethernet PHY.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to power ON Ethernet PHY; set false to power OFF Ethernet PHY

**Returns**

- ESP\_OK: Ethernet PHY power down mode set successfully
- ESP\_FAIL: Ethernet PHY power up or power down failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t addr)

Set Ethernet PHY address.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **addr** -- new PHY address

**Returns**

- ESP\_OK: Ethernet PHY address set

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_get\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t \*addr)

Get Ethernet PHY address.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **addr** -- [out] Ethernet PHY address

**Returns**

- ESP\_OK: Ethernet PHY address read successfully
- ESP\_ERR\_INVALID\_ARG: addr pointer is NULL

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_advertise\_pause\_ability** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t ability)

Advertise pause function ability.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **ability** -- enable or disable pause ability

**Returns**

- ESP\_OK: pause ability set successfully
- ESP\_FAIL: Advertise pause function ability failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_loopback** (*phy\_802\_3\_t* \*phy\_802\_3, bool enable)

Set Ethernet PHY loopback mode.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to enable loopback; set false to disable loopback

**Returns**

- ESP\_OK: Ethernet PHY loopback mode set successfully
- ESP\_FAIL: Ethernet PHY loopback configuration failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_speed** (*phy\_802\_3\_t* \*phy\_802\_3, *eth\_speed\_t* speed)

Set Ethernet PHY speed.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **speed** -- new speed of Ethernet PHY link

**Returns**

- ESP\_OK: Ethernet PHY speed set successfully
- ESP\_FAIL: Set Ethernet PHY speed failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_duplex** (*phy\_802\_3\_t* \*phy\_802\_3, *eth\_duplex\_t* duplex)

Set Ethernet PHY duplex mode.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **duplex** -- new duplex mode for Ethernet PHY link

**Returns**

- ESP\_OK: Ethernet PHY duplex mode set successfully
- ESP\_ERR\_INVALID\_STATE: unable to set duplex mode to Half if loopback is enabled
- ESP\_FAIL: Set Ethernet PHY duplex mode failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_link** (*phy\_802\_3\_t* \*phy\_802\_3, *eth\_link\_t* link)

Set Ethernet PHY link status.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **link** -- new link status

**Returns**

- ESP\_OK: Ethernet PHY link set successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_init** (*phy\_802\_3\_t* \*phy\_802\_3)

Initialize Ethernet PHY.

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY initialized successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_deinit** (*phy\_802\_3\_t* \*phy\_802\_3)

Power off Ethernet PHY.

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY powered off successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_del** (*phy\_802\_3\_t* \*phy\_802\_3)

Delete Ethernet PHY infostructure.

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY infostructure deleted

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_reset\_hw** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t reset\_assert\_us)

Performs hardware reset with specific reset pin assertion time.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **reset\_assert\_us** -- Hardware reset pin assertion time

**Returns**

- ESP\_OK: reset Ethernet PHY successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_detect\_phy\_addr** (*esp\_eth\_mediator\_t* \*eth, int \*detected\_addr)

Detect PHY address.

**Parameters**

- **eth** -- Mediator of Ethernet driver
- **detected\_addr** -- [out] a valid address after detection

**Returns**

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_init** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip initialization.

---

**Note:** It should be called as the first function in PHY specific driver instance

---

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: initialized Ethernet PHY successfully
- ESP\_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: PHY device not detected
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_deinit** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip de-initialization.

---

**Note:** It should be called as the last function in PHY specific driver instance

---

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: de-initialized Ethernet PHY successfully
- ESP\_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_oui** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t \*oui)

Reads raw content of OUI field.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **oui** -- [out] OUI value

**Returns**

- ESP\_OK: OUI field read successfully
- ESP\_FAIL: OUI field read failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid oui argument
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_manufac\_info** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t \*model, uint8\_t \*rev)

Reads manufacturer's model and revision number.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **model** -- [out] Manufacturer's model number (can be NULL when not required)
- **rev** -- [out] Manufacturer's revision number (can be NULL when not required)

**Returns**

- ESP\_OK: Manufacturer's info read successfully
- ESP\_FAIL: Manufacturer's info read failed because some error occurred
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_get\_mmd\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t \*mmd\_addr)

Reads MDIO device's internal address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- [out] Current address stored in device's register

**Returns**

- ESP\_OK: Address register read successfully
- ESP\_FAIL: Address register read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_mmd\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t mmd\_addr)

Write to DIO device's internal address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- [out] New value of MDIO device's address register value

**Returns**

- ESP\_OK: Address register written to successfully
- ESP\_FAIL: Address register write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_mmd\_data** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, *esp\_eth\_phy\_802\_3\_mmd\_func\_t* function, uint32\_t \*data)

Read data of MDIO device's memory at address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data read from the device's memory

**Returns**

- ESP\_OK: Memory read successfully
- ESP\_FAIL: Memory read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_write\_mmd\_data** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, *esp\_eth\_phy\_802\_3\_mmd\_func\_t* function, uint32\_t data)

Write data to MDIO device's memory at address register.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data to write to the device's memory

#### Returns

- ESP\_OK: Memory written successfully
- ESP\_FAIL: Memory write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

```
esp_err_t esp_eth_phy_802_3_read_mmd_register(phy_802_3_t *phy_802_3, uint8_t devaddr,
                                             uint16_t mmd_addr, uint32_t *data)
```

Set MMD address to mmd\_addr with function MMD\_FUNC\_NOINCR and read contents to \*data.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- Address of MDIO device register
- **data** -- [out] Data read from the device's memory

#### Returns

- ESP\_OK: Memory read successfully
- ESP\_FAIL: Memory read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```
esp_err_t esp_eth_phy_802_3_write_mmd_register(phy_802_3_t *phy_802_3, uint8_t devaddr,
                                               uint16_t mmd_addr, uint32_t data)
```

Set MMD address to mmd\_addr with function MMD\_FUNC\_NOINCR and write data.

#### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- Address of MDIO device register
- **data** -- [out] Data to write to the device's memory

#### Returns

- ESP\_OK: Memory written to successfully
- ESP\_FAIL: Memory write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

```
inline phy_802_3_t *esp_eth_phy_into_phy_802_3(esp_eth_phy_t *phy)
```

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters** **phy** -- Ethernet PHY instance

**Returns** *phy\_802\_3\_t*\*

- address to parent IEEE 802.3 PHY object infostructure

```
esp_err_t esp_eth_phy_802_3_obj_config_init(phy_802_3_t *phy_802_3, const eth_phy_config_t
                                             *config)
```

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

#### Parameters

- **phy\_802\_3** -- Address to IEEE 802.3 PHY object infostructure
- **config** -- Configuration of the IEEE 802.3 PHY object

#### Returns

- ESP\_OK: configuration initialized successfully
- ESP\_ERR\_INVALID\_ARG: invalid `config` argument

## Structures

struct **phy\_802\_3\_t**

IEEE 802.3 PHY object infostructure.

### Public Members

*esp\_eth\_phy\_t* **parent**

Parent Ethernet PHY instance

*esp\_eth\_mediator\_t* \***eth**

Mediator of Ethernet driver

int **addr**

PHY address

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

*eth\_link\_t* **link\_status**

Current Link status

int **reset\_gpio\_num**

Reset GPIO number, -1 means no hardware reset

## Enumerations

enum **esp\_eth\_phy\_802\_3\_mmd\_func\_t**

IEEE 802.3 MMD modes enumeration.

*Values:*

enumerator **MMD\_FUNC\_ADDRESS**

enumerator **MMD\_FUNC\_DATA\_NOINCR**

enumerator **MMD\_FUNC\_DATA\_RWINCR**

enumerator **MMD\_FUNC\_DATA\_WINCR**

## Header File

- `components/esp_eth/include/esp_eth_netif_glue.h`
- This header file can be included with:

```
#include "esp_eth_netif_glue.h"
```

- This header file is a part of the API provided by the `esp_eth` component. To declare that your component depends on `esp_eth`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_eth
```

or

```
PRIV_REQUIRES esp_eth
```

### Functions

*esp\_eth\_netif\_glue\_handle\_t* **esp\_eth\_new\_netif\_glue** (*esp\_eth\_handle\_t* eth\_hdl)

Create a netif glue for Ethernet driver.

---

**Note:** netif glue is used to attach io driver to TCP/IP netif

---

**Parameters** **eth\_hdl** -- Ethernet driver handle

**Returns** glue object, which inherits `esp_netif_driver_base_t`

*esp\_err\_t* **esp\_eth\_del\_netif\_glue** (*esp\_eth\_netif\_glue\_handle\_t* eth\_netif\_glue)

Delete netif glue of Ethernet driver.

**Parameters** **eth\_netif\_glue** -- netif glue

**Returns** -ESP\_OK: delete netif glue successfully

### Type Definitions

```
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

## 2.4.3 Thread

### Thread

**Introduction** [Thread](#) is an IP-based mesh networking protocol. It is based on the 802.15.4 physical and MAC layer.

**Application Examples** The [openthread](#) directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell [openthread/ot\\_cli](#)
- The Thread Border Router [openthread/ot\\_br](#)
- The Thread Radio Co-Processor [openthread/ot\\_rcp](#)

**API Reference** For manipulating the Thread network, the OpenThread API shall be used. The OpenThread API docs can be found at the [OpenThread API docs](#).

ESP-IDF provides extra APIs for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

## Header File

- [components/openthread/include/esp\\_openthread.h](#)
- This header file can be included with:

```
#include "esp_openthread.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

## Functions

*esp\_err\_t* **esp\_openthread\_init** (const *esp\_openthread\_platform\_config\_t* \*init\_config)

Initializes the full OpenThread stack.

---

**Note:** The OpenThread instance will also be initialized in this function.

---

**Parameters** *init\_config* -- [in] The initialization configuration.

### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_ARG if radio or host connection mode not supported
- ESP\_ERR\_INVALID\_STATE if already initialized

*esp\_err\_t* **esp\_openthread\_auto\_start** (otOperationalDatasetTlvs \*datasetTlvs)

Starts the Thread protocol operation and attaches to a Thread network.

**Parameters** *datasetTlvs* -- [in] The operational dataset (TLV encoded), if it's NULL, the function will generate the dataset based on the configurations from `kconfig`.

### Returns

- ESP\_OK on success
- ESP\_FAIL on failures

*esp\_err\_t* **esp\_openthread\_launch\_mainloop** (void)

Launches the OpenThread main loop.

---

**Note:** This function will not return unless error happens when running the OpenThread stack.

---

### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_FAIL on other failures

*esp\_err\_t* **esp\_openthread\_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized

otInstance \***esp\_openthread\_get\_instance** (void)

This function acquires the underlying OpenThread instance.

---

**Note:** This function can be called on other tasks without lock.

---

**Returns** The OpenThread instance pointer

### Header File

- [components/openthread/include/esp\\_openthread\\_types.h](#)
- This header file can be included with:

```
#include "esp_openthread_types.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Structures

struct **esp\_openthread\_role\_changed\_event\_t**

OpenThread role changed event data.

#### Public Members

otDeviceRole **previous\_role**

Previous Thread role

otDeviceRole **current\_role**

Current Thread role

struct **esp\_openthread\_dataset\_changed\_event\_t**

OpenThread dataset changed event data.

#### Public Members

*esp\_openthread\_dataset\_type\_t* **type**

Dataset type

otOperationalDataset **new\_dataset**

New dataset

struct **esp\_openthread\_mainloop\_context\_t**

This structure represents a context for a `select()` based mainloop.

### Public Members

fd\_set **read\_fds**

The read file descriptors

fd\_set **write\_fds**

The write file descriptors

fd\_set **error\_fds**

The error file descriptors

int **max\_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp\_openthread\_uart\_config\_t**

The uart port config for OpenThread.

### Public Members

*uart\_port\_t* **port**

UART port number

*uart\_config\_t* **uart\_config**

UART configuration, see *uart\_config\_t* docs

gpio\_num\_t **rx\_pin**

UART RX pin

gpio\_num\_t **tx\_pin**

UART TX pin

struct **esp\_openthread\_spi\_host\_config\_t**

The spi port config for OpenThread.

### Public Members

*spi\_host\_device\_t* **host\_device**

SPI host device

*spi\_dma\_chan\_t* **dma\_channel**

DMA channel

*spi\_bus\_config\_t* **spi\_interface**

SPI bus

*spi\_device\_interface\_config\_t* **spi\_device**

SPI peripheral device

*gpio\_num\_t* **intr\_pin**

SPI interrupt pin

struct **esp\_openthread\_spi\_slave\_config\_t**

The spi slave config for OpenThread.

### Public Members

*spi\_host\_device\_t* **host\_device**

SPI host device

*spi\_bus\_config\_t* **bus\_config**

SPI bus config

*spi\_slave\_interface\_config\_t* **slave\_config**

SPI slave config

*gpio\_num\_t* **intr\_pin**

SPI interrupt pin

struct **esp\_openthread\_radio\_config\_t**

The OpenThread radio configuration.

### Public Members

*esp\_openthread\_radio\_mode\_t* **radio\_mode**

The radio mode

*esp\_openthread\_uart\_config\_t* **radio\_uart\_config**

The uart configuration to RCP

*esp\_openthread\_spi\_host\_config\_t* **radio\_spi\_config**

The spi configuration to RCP

struct **esp\_openthread\_host\_connection\_config\_t**

The OpenThread host connection configuration.

### Public Members

*esp\_openthread\_host\_connection\_mode\_t* **host\_connection\_mode**

The host connection mode

*esp\_openthread\_uart\_config\_t* **host\_uart\_config**

The uart configuration to host

*usb\_serial\_jtag\_driver\_config\_t* **host\_usb\_config**

The usb configuration to host

*esp\_openthread\_spi\_slave\_config\_t* **spi\_slave\_config**

The spi configuration to host

struct **esp\_openthread\_port\_config\_t**

The OpenThread port specific configuration.

### Public Members

const char \***storage\_partition\_name**

The partition for storing OpenThread dataset

uint8\_t **netif\_queue\_size**

The packet queue size for the network interface

uint8\_t **task\_queue\_size**

The task queue size

struct **esp\_openthread\_platform\_config\_t**

The OpenThread platform configuration.

### Public Members

*esp\_openthread\_radio\_config\_t* **radio\_config**

The radio configuration

*esp\_openthread\_host\_connection\_config\_t* **host\_config**

The host connection configuration

*esp\_openthread\_port\_config\_t* **port\_config**

The port configuration

### Type Definitions

typedef void (\***esp\_openthread\_rcp\_failure\_handler**)(void)

typedef void (\***esp\_openthread\_compatibility\_error\_callback**)(void)

### Enumerations

enum **esp\_openthread\_event\_t**

OpenThread event declarations.

*Values:*

enumerator **OPENTHREAD\_EVENT\_START**

OpenThread stack start

enumerator **OPENTHREAD\_EVENT\_STOP**

OpenThread stack stop

enumerator **OPENTHREAD\_EVENT\_DETACHED**

OpenThread detached

enumerator **OPENTHREAD\_EVENT\_ATTACHED**

OpenThread attached

enumerator **OPENTHREAD\_EVENT\_ROLE\_CHANGED**

OpenThread role changed

enumerator **OPENTHREAD\_EVENT\_IF\_UP**

OpenThread network interface up

enumerator **OPENTHREAD\_EVENT\_IF\_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD\_EVENT\_GOT\_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD\_EVENT\_LOST\_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_TREL\_ADD\_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_REMOVE\_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_SET\_DNS\_SERVER**

OpenThread stack set DNS server >

enumerator **OPENTHREAD\_EVENT\_PUBLISH\_MESHCOPE**

OpenThread stack start to publish meshcop-e service >

enumerator **OPENTHREAD\_EVENT\_REMOVE\_MESHCOPE**

OpenThread stack start to remove meshcop-e service >

enumerator **OPENTHREAD\_EVENT\_DATASET\_CHANGED**

OpenThread dataset changed >

enum **esp\_openthread\_dataset\_type\_t**

OpenThread dataset type.

*Values:*

enumerator **OPENTHREAD\_ACTIVE\_DATASET**

Active dataset

enumerator **OPENTHREAD\_PENDING\_DATASET**

Pending dataset

enum **esp\_openthread\_radio\_mode\_t**

The radio mode of OpenThread.

*Values:*

enumerator **RADIO\_MODE\_NATIVE**

Use the native 15.4 radio

enumerator **RADIO\_MODE\_UART\_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_SPI\_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_TREL**

Use the Thread Radio Encapsulation Link (TREL)

enumerator **RADIO\_MODE\_MAX**

Using for parameter check

enum **esp\_openthread\_host\_connection\_mode\_t**

How OpenThread connects to the host.

*Values:*

enumerator **HOST\_CONNECTION\_MODE\_NONE**

Disable host connection

enumerator **HOST\_CONNECTION\_MODE\_CLI\_UART**

CLI UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_CLI\_USB**

CLI USB connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_UART**

RCP UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_SPI**

RCP SPI connection to the host

enumerator **HOST\_CONNECTION\_MODE\_MAX**

Using for parameter check

### Header File

- [components/openthread/include/esp\\_openthread\\_lock.h](#)
- This header file can be included with:

```
#include "esp_openthread_lock.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Functions

*esp\_err\_t* **esp\_openthread\_lock\_init** (void)

This function initializes the OpenThread API lock.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` if allocation has failed
- `ESP_ERR_INVALID_STATE` if already initialized

void **esp\_openthread\_lock\_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp\_openthread\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API lock.

---

**Note:** Every OpenThread APIs that takes an `otInstance` argument **MUST** be protected with this API lock except that the call site is in OpenThread callbacks.

---

**Parameters** `block_ticks` -- [in] The maximum number of RTOS ticks to wait for the lock.

#### Returns

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_lock\_release** (void)

This function releases the OpenThread API lock.

bool **esp\_openthread\_task\_switching\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API task switching lock.

---

**Note:** In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it's not allowed, since the previous OpenThread API lock is not released yet. This `task_switching` lock allows the OpenThread API can be called in this case.

---

**Note:** Please use `esp_openthread_lock_acquire()` for normal cases.

---

**Parameters** `block_ticks` -- **[in]** The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void `esp_openthread_task_switching_lock_release` (void)

This function releases the OpenThread API task switching lock.

---

**Note:** This API must be called after `esp_openthread_task_switching_lock_acquire` or `esp_openthread_lock_acquire` and will cause a crash if the current task is not the task switching lock holder. This error could be caused by calling OpenThread APIs without locking OpenThread stack.

---

## Header File

- [components/openthread/include/esp\\_openthread\\_netif\\_glue.h](#)
- This header file can be included with:

```
#include "esp_openthread_netif_glue.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your `CMakeLists.txt`:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

## Functions

void `*esp_openthread_netif_glue_init` (const `esp_openthread_platform_config_t` \*config)

This function initializes the OpenThread network interface glue.

**Parameters** `config` -- **[in]** The platform configuration.

**Returns**

- glue pointer on success
- NULL on failure

void `esp_openthread_netif_glue_deinit` (void)

This function deinitializes the OpenThread network interface glue.

`esp_netif_t` \*`esp_openthread_get_netif` (void)

This function acquires the OpenThread netif.

**Returns** The OpenThread netif or NULL if not initialized.

void `esp_openthread_register_meshcop_e_handler` (`esp_event_handler_t` handler, bool for\_publish)

This function register a handler for meshcop-e service publish event and remove event.

**Parameters**

- **handler** -- [in] The handler.
- **for\_publish** -- [in] The usage of handler, true for publish event and false for remove event.

### Macros

**ESP\_NETIF\_INHERENT\_DEFAULT\_OPENTHREAD** ()

Default configuration reference of OpenThread esp-netif.

**ESP\_NETIF\_DEFAULT\_OPENTHREAD** ()

### Header File

- [components/openthread/include/esp\\_openthread\\_border\\_router.h](#)
- This header file can be included with:

```
#include "esp_openthread_border_router.h"
```

- This header file is a part of the API provided by the `openthread` component. To declare that your component depends on `openthread`, add the following to your CMakeLists.txt:

```
REQUIRES openthread
```

or

```
PRIV_REQUIRES openthread
```

### Functions

void **esp\_openthread\_set\_backbone\_netif** (*esp\_netif\_t* \*backbone\_netif)

Sets the backbone interface used for border routing.

---

**Note:** This function must be called before `esp_openthread_init`

---

**Parameters** **backbone\_netif** -- [in] The backbone network interface (WiFi or ethernet)

*esp\_err\_t* **esp\_openthread\_border\_router\_init** (void)

Initializes the border router features of OpenThread.

---

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option `CONFIG_OPENTHREAD_BORDER_ROUTER` is required.

---

#### Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if feature not supported
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_FIAL` on other failures

*esp\_err\_t* **esp\_openthread\_border\_router\_deinit** (void)

Deinitializes the border router features of OpenThread.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized
- `ESP_FIAL` on other failures

*esp\_netif\_t* \***esp\_openthread\_get\_backbone\_netif** (void)

Gets the backbone interface of OpenThread border router.

**Returns** The backbone interface or NULL if border router not initialized.

void **esp\_openthread\_register\_rcp\_failure\_handler** (*esp\_openthread\_rcp\_failure\_handler*  
handler)

Registers the callback for RCP failure.

void **esp\_openthread\_set\_compatibility\_error\_callback** (*esp\_openthread\_compatibility\_error\_callback*  
callback)

Registers the callback for spinel compatibility error.

---

**Note:** This function must be called before `esp_openthread_init`.

---

**Parameters** **callback** -- **[in]** The callback.

*esp\_err\_t* **esp\_openthread\_rcp\_deinit** (void)

Deinitializes the connection to RCP.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if fail to deinitialize RCP

*esp\_err\_t* **esp\_openthread\_rcp\_init** (void)

Initializes the connection to RCP.

**Returns**

- ESP\_OK on success
- ESP\_FAIL if fail to initialize RCP

*esp\_err\_t* **esp\_openthread\_set\_meshcop\_instance\_name** (const char \*instance\_name)

Sets the meshcop(e) instance name.

---

**Note:** This function can only be called before `esp_openthread_border_router_init`. If `instance_name` is NULL, then the service will use the hostname as instance name.

---

**Parameters** **instance\_name** -- **[in]** The instance name, can be NULL.

**Returns**

- ESP\_OK on success
- ESP\_FAIL if fail to initialize RCP

Thread is an IPv6-based mesh networking technology for IoT.

Code examples for the Thread API are provided in the [openthread](#) directory of ESP-IDF examples.

## 2.4.4 ESP-NETIF

### ESP-NETIF

The purpose of the ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This allows applications to choose between IP stacks in the future.
- The APIs it provides are thread-safe, even if the underlying TCP/IP stack APIs are not.

(continued from previous page)

### Data and Event Flow in the Diagram

- . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<---->-- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagate to the driver, user code, and network stack
- | User settings and runtime configuration

### ESP-NETIF Interaction

**A) User Code, Boilerplate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and is outlined as below:

#### A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure it with
  - ESP-NETIF specific options (flags, behavior, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - Use default handlers for common interfaces defined in IO drivers; or define a specific handler for customized behavior or new interfaces
  - Register handlers for app-related events (such as IP lost or acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- 1) Gets and sets TCP/IP-related parameters (DHCP, IP, etc)
- 2) Receives IP events (connect or disconnect)
- 3) Controls application lifecycle (set interface up or down)

**B) Communication Driver, IO Driver, and Media Driver** Communication driver plays these two important roles in relation to ESP-NETIF:

- 1) Event handlers: Defines behavior patterns of interaction with ESP-NETIF (e.g., ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input or output functions to use ESP-NETIF transmit, receive, and free receive buffer
  - Installs driver\_transmit to the appropriate ESP-NETIF object so that outgoing packets from the network stack are passed to the IO driver
  - Calls `esp_netif_receive()` to pass incoming data to the network stack

**C) ESP-NETIF** ESP-NETIF serves as an intermediary between an IO driver and a network stack, connecting the packet data path between the two. It provides a set of interfaces for attaching a driver to an ESP-NETIF object at runtime and configures a network stack during compiling. Additionally, a set of APIs is provided to control the network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface can be divided into six groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input or Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters API for basic network interface properties
- 5) Network stack abstraction API: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
  - [SNTP API](#)
- 6) Driver conversion utilities API

**D) Network Stack** The network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**E) ESP-NETIF L2 TAP Interface** The ESP-NETIF L2 TAP interface is a mechanism in ESP-IDF used to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from the user application. Its typical usage in the embedded world might be the implementation of non-IP-related protocols, e.g., PTP, Wake on LAN. Note that only Ethernet (IEEE 802.3) is currently supported.

From a user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS, which provides file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). To learn more, refer to [Virtual Filesystem Component](#).

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configurations can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as a generic entry point to the Layer 2 infrastructure. What is important is then the specific configuration of the particular file descriptor. It can be configured to give access to a specific Network Interface identified by `if_key` (e.g., `ETH_DEF`) and to filter only specific frames based on their type (e.g., Ethernet type in the case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with the IP stack and so the IP-related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though this option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from the perspective of the user's application, as it only gets access to the frame types it is interested in, and the remaining traffic is either passed to other L2 TAP file descriptors or to the IP stack.

### ESP-NETIF L2 TAP Interface Usage Manual

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#) first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

**open()** Once the ESP-NETIF L2 TAP is registered, it can be opened at path name `"/dev/net/tap"`. The same path name can be opened multiple times up to [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP\\_MAX\\_FDS](#) and multiple file descriptors with a different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with the `O_NONBLOCK` file status flag to make sure the `read()` does not block. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, `-1` is returned, and `errno` is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior to its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to a specific Network Interface that is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in [esp\\_netif/include/esp\\_netif\\_defaults.h](#).
- `L2TAP_S_DEVICE_DRV_HNDL` - is another way to bound the file descriptor to a specific Network Interface. In this case, the Network interface is identified directly by IO Driver handle (e.g., `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with the type to be passed to the file descriptor. In the case of Ethernet frames, the frames are to be filtered based on the Length and Ethernet type field. In case the filter value is set less than or equal to `0x05DC`, the Ethernet type field is considered to represent IEEE802.3 Length Field, and all frames with values in interval `<0, 0x05DC>` at that field are passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by the user's application. In case the filter value is set greater than `0x05DC`, the Ethernet type field is considered to represent protocol identification and only frames that are equal to the set value are to be passed to the file descriptor.

All above-set configuration options have a getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to a specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to make `L2TAP_S_RCV_FILTER` option available.

---

**Note:** VLAN-tagged frames are currently not recognized. If the user needs to process VLAN-tagged frames, they need a set filter to be equal to the VLAN tag (i.e., `0x8100` or `0x88A8`) and process the VLAN-tagged frames in the user application.

---

---

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when the user's application does not require the usage of an IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

---

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- \* `EBADF` - not a valid file descriptor.
- \* `EACCES` - options change is denied in this state (e.g., file descriptor has not been bounded to Network interface yet).
- \* `EINVAL` - invalid configuration argument. Ethernet type filter is already used by other file descriptors on that same Network interface.
- \* `ENODEV` - no such Network Interface which is tried to be assigned to the file descriptor exists.
- \* `ENOSYS` - unsupported operation, passed configuration option does not exist.

**fcntl()** `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with the file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, and the third argument is ignored.
- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- \* `EBADF` - not a valid file descriptor.
- \* `ENOSYS` - unsupported command.

**read()** Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on the actual state of the `O_NONBLOCK` file status flag. When the file status flag is set to blocking, the read operation waits until a frame is received and the context is switched to other tasks. When the file status flag is set to non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reached a configured threshold, the newly arrived frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when the size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

\* EBADF - not a valid file descriptor.

\* EAGAIN - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()** A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. The user's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of an Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header, and user data. The length of these fields is as follows:

Destination MAC	Source MAC	Type/Length	Payload (protocol header/data)
6 B	6 B	2 B	0-1486 B

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when the size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

\* EBADF - not a valid file descriptor.

\* EBADMSG - The Ethernet type of the frame is different from the file descriptor configured filter.

\* EIO - Network interface not available or busy.

**close()** Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread-safe and can be called from a different task than the file descriptor is actually used. If such a situation occurs and one task is blocked in the I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with an error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

\* EBADF - not a valid file descriptor.

**select()** Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to make the `select()` function available.

**SNTP API** You can find a brief introduction to SNTP in general, its initialization code, and basic modes in Section *SNTP Time Synchronization* in *System Time*.

This section provides more details about specific use cases of the SNTP service, with statically configured servers, or use the DHCP-provided servers, or both. The workflow is usually very simple:

- 1) Initialize and configure the service using `esp_netif_sntp_init()`. This operations can only be called once (unless the SNTP service has been destroyed by `esp_netif_sntp_deinit()`)
- 2) Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It is useful to start the service explicitly after connecting if we want to use the DHCP-obtained NTP servers. Please note, this option needs to be enabled before connecting, but the SNTP service should be started after.
- 3) Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).
- 4) Stop and destroy the service using `esp_netif_sntp_deinit()`.

**Basic Mode with Statically Defined Server(s)** Initialize the module with the default configuration after connecting to the network. Note that it is possible to provide multiple NTP servers in the configuration struct:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,
    ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"
↪) );
esp_netif_sntp_init(&config);
```

**Note:** If we want to configure multiple SNTP servers, we have to update the lwIP configuration `CONFIG_LWIP_SNTP_MAX_SERVERS`.

**Use DHCP-Obtained SNTP Server(s)** First of all, we have to enable the lwIP configuration option `CONFIG_LWIP_DHCP_GET_NTP_SRV`. Then we have to initialize the SNTP module with the DHCP option and without the NTP server:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});
config.start = false; // start the SNTP service explicitly
config.server_from_dhcp = true; // accept the NTP offer from the DHCP_
↪server
esp_netif_sntp_init(&config);
```

Then, once we are connected, we could start the service using:

```
esp_netif_sntp_start();
```

**Note:** It is also possible to start the service during initialization (default `config.start=true`). This would likely to cause the initial SNTP request to fail (since we are not connected yet) and lead to some back-off time for subsequent requests.

**Use Both Static and Dynamic Servers** Very similar to the scenario above (DHCP provided SNTP server), but in this configuration, we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when the DHCP-provided information gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining a DHCP lease.

The typical configuration now looks as per below, providing the specific `IP_EVENT` to update the config and index of the first server to reconfigure (for example setting `config.index_of_first_server=1` would keep the DHCP provided server at index 0, and the statically configured server at index 1).

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // start the SNTP service explicitly
↪(after connecting)
```

(continues on next page)

(continued from previous page)

```

config.server_from_dhcp = true;           // accept the NTP offers from DHCP
↪server
config.renew_servers_after_new_IP = true; // let esp-netif update the configured
↪SNTP server(s) after receiving the DHCP lease
config.index_of_first_server = 1;       // updates from server num 1, leaving
↪server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP; // IP event on which we refresh
↪the configuration

```

Then we start the service normally with `esp_netif_sntp_start()`.

**ESP-NETIF Programmer's Manual** Please refer to the following example to understand the initialization process of the default interface:

- Wi-Fi Station: `wifi/getting_started/station/main/station_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
- L2 TAP: `protocols/l2tap/main/l2tap_main.c`
- Wi-Fi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`

For more specific cases, please consult this guide: *ESP-NETIF Custom I/O Driver*.

**Wi-Fi Default Initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e., a pointer to a network interface object allocated and configured with default settings, as a consequence, which means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wi-Fi in AP+STA mode, both these interfaces have to be created.

## API Reference

### Header File

- `components/esp_netif/include/esp_netif.h`
- This header file can be included with:

```
#include "esp_netif.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

## Functions

*esp\_err\_t* **esp\_netif\_init** (void)

Initialize the underlying TCP/IP stack.

---

**Note:** This function should be called exactly once from application code, when the application starts up.

---

### Returns

- ESP\_OK on success
- ESP\_FAIL if initializing failed

*esp\_err\_t* **esp\_netif\_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization **is not** supported yet

### Returns

- ESP\_ERR\_INVALID\_STATE if esp\_netif not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

*esp\_netif\_t* \***esp\_netif\_new** (const *esp\_netif\_config\_t* \*esp\_netif\_config)

Creates an instance of new esp-netif object based on provided config.

**Parameters** *esp\_netif\_config* -- [in] pointer esp-netif configuration

### Returns

- pointer to esp-netif object on success
- NULL otherwise

void **esp\_netif\_destroy** (*esp\_netif\_t* \*esp\_netif)

Destroys the esp\_netif object.

**Parameters** *esp\_netif* -- [in] pointer to the object to be deleted

*esp\_err\_t* **esp\_netif\_set\_driver\_config** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_driver\_ifconfig\_t* \*driver\_config)

Configures driver related options of esp\_netif object.

### Parameters

- *esp\_netif* -- [inout] pointer to the object to be configured
- *driver\_config* -- [in] pointer esp-netif io driver related configuration

### Returns

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

*esp\_err\_t* **esp\_netif\_attach** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_io\_driver\_handle* driver\_handle)

Attaches esp\_netif instance to the io driver handle.

Calling this function enables connecting specific esp\_netif object with already initialized io driver to update esp\_netif object with driver specific configuration (i.e. calls post\_attach callback, which typically sets io driver callbacks to esp\_netif instance and starts the driver)

### Parameters

- *esp\_netif* -- [inout] pointer to esp\_netif object to be attached
- *driver\_handle* -- [in] pointer to the driver handle

### Returns

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's post\_attach callback failed

*esp\_err\_t* **esp\_netif\_receive** (*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **buffer** -- [in] Received data
- **len** -- [in] Length of the data frame
- **eb** -- [in] Pointer to internal buffer (used in Wi-Fi driver)

#### Returns

- ESP\_OK

void **esp\_netif\_action\_start** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_stop** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver stop event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_connected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver connected event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_disconnected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver disconnected event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_got\_ip** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon network got IP event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_join\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base,  
int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group join.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_leave\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base,  
int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group leave.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_add\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id,  
void \*data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

void **esp\_netif\_action\_remove\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** -- The base type of the event
- **event\_id** -- The specific ID of the event
- **data** -- Optional data associated with the event

*esp\_err\_t* **esp\_netif\_set\_default\_netif** (*esp\_netif\_t* \*esp\_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route\_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route\_prio number (unless the selected netif gets destroyed)

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** ESP\_OK on success

*esp\_netif\_t* \***esp\_netif\_get\_default\_netif** (void)

Getter function of the default netif.

This API returns the selected default netif.

**Returns** Handle to esp-netif instance of the default netif.

*esp\_err\_t* **esp\_netif\_join\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to join a IPv6 multicast group.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **addr** -- **[in]** The multicast group to join

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_leave\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to leave a IPv6 multicast group.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **addr** -- **[in]** The multicast group to leave

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Set the mac address for the interface instance.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **mac** -- **[in]** Desired mac address for the related network interface

**Returns**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_get\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Get the mac address for the interface instance.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **mac** -- **[out]** Resultant mac address for the related network interface

**Returns**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_NOT\_SUPPORTED - mac not supported on this interface

*esp\_err\_t* **esp\_netif\_set\_hostname** (*esp\_netif\_t* \*esp\_netif, const char \*hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG\_LWIP\_LOCAL\_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **hostname** -- **[in]** New hostname for the interface. Maximum length 32 bytes.

**Returns**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

*esp\_err\_t* **esp\_netif\_get\_hostname** (*esp\_netif\_t* \*esp\_netif, const char \*\*hostname)

Get interface hostname.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **hostname** -- **[out]** Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**Returns**

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS - parameter error

bool **esp\_netif\_is\_netif\_up** (*esp\_netif\_t* \*esp\_netif)

Test if supplied interface is up or down.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- true - Interface is up
- false - Interface is down

*esp\_err\_t* **esp\_netif\_get\_ip\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [out] If successful, IP information will be returned in this argument.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [out] If successful, IP information will be returned in this argument.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_set\_ip\_info** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

---

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

---

---

**Note:** Calling this interface for may generate a SYSTEM\_EVENT\_STA\_GOT\_IP or SYSTEM\_EVENT\_ETH\_GOT\_IP event.

---

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [in] IP information to set on the specified interface

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED If DHCP server or client is still running

*esp\_err\_t* **esp\_netif\_set\_old\_ip\_info** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **ip\_info** -- **[in]** Store the old IP information for the specified interface

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

int **esp\_netif\_get\_netif\_impl\_index** (*esp\_netif\_t* \*esp\_netif)

Get net interface index from network stack implementation.

---

**Note:** This index could be used in `setsockopt()` to bind socket with multicast interface

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied **esp\_netif**

*esp\_err\_t* **esp\_netif\_get\_netif\_impl\_name** (*esp\_netif\_t* \*esp\_netif, char \*name)

Get net interface name from network stack implementation.

---

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

---

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **name** -- **[out]** Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_napt\_enable** (*esp\_netif\_t* \*esp\_netif)

Enable NAPT on an interface.

---

**Note:** Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

*esp\_err\_t* **esp\_netif\_napt\_disable** (*esp\_netif\_t* \*esp\_netif)

Disable NAPT on an interface.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

*esp\_err\_t* **esp\_netif\_dhcps\_option** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP server option.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **opt\_op** -- **[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** -- **[in]** Option index to get or set, must be one of the supported enum values.
- **opt\_val** -- **[inout]** Pointer to the option parameter.
- **opt\_len** -- **[in]** Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_option** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP client option.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **opt\_op** -- **[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** -- **[in]** Option index to get or set, must be one of the supported enum values.
- **opt\_val** -- **[inout]** Pointer to the option parameter.
- **opt\_len** -- **[in]** Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP client (only if enabled in interface object)

---

**Note:** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP client (only if enabled in interface object)

---

**Note:** Calling action\_netif\_stop() will also stop the DHCP Client if it is running.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP client status.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **status** -- [out] If successful, the status of DHCP client will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP Server status.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **status** -- [out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcps\_get\_clients\_by\_mac** (*esp\_netif\_t* \*esp\_netif, int num, *esp\_netif\_pair\_mac\_ip\_t* \*mac\_ip\_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**

- **esp\_netif** -- [in] Handle to esp-netif instance
- **num** -- [in] Number of clients with specified MAC addresses in the array of pairs
- **mac\_ip\_pair** -- [inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS on invalid params
- ESP\_ERR\_NOT\_SUPPORTED if DHCP server not enabled

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

Note that LWIP stores DNS server information globally, not per interface, so the first parameter is unused in the default LWIP configuration. If CONFIG\_ESP\_NETIF\_SET\_DNS\_PER\_DEFAULT\_NETIF=1 this API sets internal DNS server information per netif. It's also possible to set the global DNS server info by supplying esp\_netif=NULL

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type `ESP_NETIF_DNS_MAIN`.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **type** -- **[in]** Type of DNS Server to set: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- **dns** -- **[in]** DNS Server address to set

#### Returns

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp\_netif\_set\_dns\_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Note that LWIP stores DNS server information globally, not per interface, so the first parameter is unused in the default LWIP configuration. If `CONFIG_ESP_NETIF_SET_DNS_PER_DEFAULT_NETIF=1` this API returns internally saved DNS server information per netif. It's also possible to ask for the global DNS server info by supplying `esp_netif=NULL`

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **type** -- **[in]** Type of DNS Server to get: `ESP_NETIF_DNS_MAIN`, `ESP_NETIF_DNS_BACKUP`, `ESP_NETIF_DNS_FALLBACK`
- **dns** -- **[out]** DNS Server result is written here on success

#### Returns

- `ESP_OK` on success
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` invalid params

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a `SYSTEM_EVENT_GOT_IP6` event will be sent.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

#### Parameters

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **if\_ip6** -- **[out]** IPv6 information will be returned in this argument if successful.

#### Returns

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **if\_ip6** -- [out] IPv6 information will be returned in this argument if successful.

#### Returns

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp\_netif\_get\_all\_ip6** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* if\_ip6[])

Get all IPv6 addresses of the specified interface.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **if\_ip6** -- [out] Array of IPv6 addresses will be copied to the argument

**Returns** number of returned IPv6 addresses

int **esp\_netif\_get\_all\_preferred\_ip6** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* if\_ip6[])

Get all preferred IPv6 addresses of the specified interface.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **if\_ip6** -- [out] Array of IPv6 addresses will be copied to the argument

**Returns** number of returned IPv6 addresses

*esp\_err\_t* **esp\_netif\_add\_ip6\_address** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* addr, bool preferred)

Cause the TCP/IP stack to add an IPv6 address to the interface.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **addr** -- [in] The address to be added
- **preferred** -- [in] The preferred status of the address

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_remove\_ip6\_address** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to remove an IPv6 address from the interface.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **addr** -- [in] The address to be removed

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED
- ESP\_ERR\_NO\_MEM

void **esp\_netif\_set\_ip4\_addr** (*esp\_ip4\_addr\_t* \*addr, uint8\_t a, uint8\_t b, uint8\_t c, uint8\_t d)

Sets IPv4 address to the specified octets.

**Parameters**

- **addr** -- [out] IP address to be set
- **a** -- the first octet (127 for IP 127.0.0.1)
- **b** --
- **c** --
- **d** --

char \***esp\_ip4addr\_ntoa** (const *esp\_ip4\_addr\_t* \*addr, char \*buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

**Parameters**

- **addr** -- ip address in network order to convert
- **buf** -- target buffer where the string is stored
- **buflen** -- length of buf

**Returns** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32\_t **esp\_ip4addr\_aton** (const char \*addr)

Ascii internet address interpretation routine The value returned is in network order.

**Parameters** **addr** -- IP address in ascii representation (e.g. "127.0.0.1")

**Returns** ip address in network order

*esp\_err\_t* **esp\_netif\_str\_to\_ip4** (const char \*src, *esp\_ip4\_addr\_t* \*dst)

Converts Ascii internet IPv4 address into esp\_ip4\_addr\_t.

**Parameters**

- **src** -- [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
- **dst** -- [out] Address of the target esp\_ip4\_addr\_t structure to receive converted address

**Returns**

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

*esp\_err\_t* **esp\_netif\_str\_to\_ip6** (const char \*src, *esp\_ip6\_addr\_t* \*dst)

Converts Ascii internet IPv6 address into esp\_ip4\_addr\_t Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:0:2:1" or "2001:db8::2:1")

**Parameters**

- **src** -- [in] IPv6 address in ascii representation (e.g. ""2001:0db8:85a3:0000:0000:0000:0002:0001")
- **dst** -- [out] Address of the target esp\_ip6\_addr\_t structure to receive converted address

**Returns**

- ESP\_OK on success
- ESP\_FAIL if conversion failed
- ESP\_ERR\_INVALID\_ARG if invalid parameter is passed into

*esp\_netif\_iodriver\_handle* **esp\_netif\_get\_io\_driver** (*esp\_netif\_t* \*esp\_netif)

Gets media driver handle for this esp-netif instance.

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

**Returns** opaque pointer of related IO driver

*esp\_netif\_t* \***esp\_netif\_get\_handle\_from\_ifkey** (const char \*if\_key)

Searches over a list of created objects to find an instance with supplied if key.

**Parameters** **if\_key** -- Textual description of network interface

**Returns** Handle to esp-netif instance

*esp\_netif\_flags\_t* **esp\_netif\_get\_flags** (*esp\_netif\_t* \*esp\_netif)

Returns configured flags for this interface.

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

**Returns** Configuration flags

const char \***esp\_netif\_get\_ifkey** (*esp\_netif\_t* \*esp\_netif)

Returns configured interface key for this esp-netif instance.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** Textual description of related interface

const char \***esp\_netif\_get\_desc** (*esp\_netif\_t* \*esp\_netif)

Returns configured interface type for this esp-netif instance.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** Enumerated type of this interface, such as station, AP, ethernet

int **esp\_netif\_get\_route\_prio** (*esp\_netif\_t* \*esp\_netif)

Returns configured routing priority number.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** Integer representing the instance's route-prio, or -1 if invalid parameters

int32\_t **esp\_netif\_get\_event\_id** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_event\_type\_t* event\_type)

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **event\_type** -- (either get or lost IP)

**Returns** specific event id which is configured to be raised if the interface lost or acquired IP address  
-1 if supplied event\_type is not known

*esp\_netif\_t* \***esp\_netif\_next** (*esp\_netif\_t* \*esp\_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

---

**Note:** This API doesn't lock the list, nor the TCPIP context, as this it's usually required to get atomic access between iteration steps rather than within a single iteration. Therefore it is recommended to iterate over the interfaces inside *esp\_netif\_tcpip\_exec()*

---

---

**Note:** This API is deprecated. Please use *esp\_netif\_next\_unsafe()* directly if all the system interfaces are under your control and you can safely iterate over them. Otherwise, iterate over interfaces using *esp\_netif\_tcpip\_exec()*, or use *esp\_netif\_find\_if()* to search in the list of netifs with defined predicate.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

*esp\_netif\_t* \***esp\_netif\_next\_unsafe** (*esp\_netif\_t* \*esp\_netif)

Iterates over list of interfaces without list locking. Returns first netif if NULL given as parameter.

Used for bulk search loops within TCPIP context, e.g. using *esp\_netif\_tcpip\_exec()*, or if we're sure that the iteration is safe from our application perspective (e.g. no interface is removed between iterations)

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

*esp\_netif\_t* \***esp\_netif\_find\_if** (*esp\_netif\_find\_predicate\_t* fn, void \*ctx)

Return a netif pointer for the first interface that meets criteria defined by the callback.

**Parameters**

- **fn** -- Predicate function returning true for the desired interface
- **ctx** -- Context pointer passed to the predicate, typically a descriptor to compare with

**Returns** valid netif pointer if found, NULL if not

size\_t **esp\_netif\_get\_nr\_of\_ifs** (void)

Returns number of registered esp\_netif objects.

**Returns** Number of esp\_netifs

void **esp\_netif\_netstack\_buf\_ref** (void \*netstack\_buf)

increase the reference counter of net stack buffer

**Parameters** **netstack\_buf** -- [in] the net stack buffer

void **esp\_netif\_netstack\_buf\_free** (void \*netstack\_buf)

free the netstack buffer

**Parameters** **netstack\_buf** -- [in] the net stack buffer

esp\_err\_t **esp\_netif\_tcpip\_exec** (esp\_netif\_callback\_fn fn, void \*ctx)

Utility to execute the supplied callback in TCP/IP context.

**Parameters**

- **fn** -- Pointer to the callback
- **ctx** -- Parameter to the callback

**Returns** The error code (esp\_err\_t) returned by the callback

## Type Definitions

typedef bool (\***esp\_netif\_find\_predicate\_t**)(esp\_netif\_t \*netif, void \*ctx)

Predicate callback for *esp\_netif\_find\_if()* used to find interface which meets defined criteria.

typedef esp\_err\_t (\***esp\_netif\_callback\_fn**)(void \*ctx)

TCPIP thread safe callback used with *esp\_netif\_tcpip\_exec()*

## Header File

- [components/esp\\_netif/include/esp\\_netif\\_sntp.h](#)
- This header file can be included with:

```
#include "esp_netif_sntp.h"
```

- This header file is a part of the API provided by the esp\_netif component. To declare that your component depends on esp\_netif, add the following to your CMakeLists.txt:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

## Functions

esp\_err\_t **esp\_netif\_sntp\_init** (const esp\_sntp\_config\_t \*config)

Initialize SNTP with supplied config struct.

**Parameters** **config** -- Config struct

**Returns** ESP\_OK on success

esp\_err\_t **esp\_netif\_sntp\_start** (void)

Start SNTP service if it wasn't started during init (config.start = false) or restart it if already started.

**Returns** ESP\_OK on success

void **esp\_netif\_sntp\_deinit** (void)

Deinitialize esp\_netif SNTP module.

*esp\_err\_t* **esp\_netif\_sntp\_sync\_wait** (TickType\_t tout)

Wait for time sync event.

**Parameters** tout -- Specified timeout in RTOS ticks

**Returns** ESP\_TIMEOUT if sync event didn't come within the timeout  
ESP\_ERR\_NOT\_FINISHED if the sync event came, but we're in smooth update mode  
and still in progress (SNTP\_SYNC\_STATUS\_IN\_PROGRESS) ESP\_OK if time sync'ed

*esp\_err\_t* **esp\_netif\_sntp\_reachability** (unsigned int index, unsigned int \*reachability)

Returns SNTP server's reachability shift register as described in RFC 5905.

**Parameters**

- **index** -- Index of the SERVER
- **reachability** -- reachability shift register

**Returns** ESP\_OK on success, ESP\_ERR\_INVALID\_STATE if SNTP not initialized  
ESP\_ERR\_INVALID\_ARG if invalid arguments

## Structures

struct **esp\_sntp\_config**

SNTP configuration struct.

### Public Members

bool **smooth\_sync**

set to true if smooth sync required

bool **server\_from\_dhcp**

set to true to request NTP server config from DHCP

bool **wait\_for\_sync**

if true, we create a semaphore to signal time sync event

bool **start**

set to true to automatically start the SNTP service

*esp\_sntp\_time\_cb\_t* **sync\_cb**

optionally sets callback function on time sync event

bool **renew\_servers\_after\_new\_IP**

this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

*ip\_event\_t* **ip\_event\_to\_renew**

set the IP event id on which we refresh server list (if renew\_servers\_after\_new\_IP=true)

size\_t **index\_of\_first\_server**

refresh server list after this server (if renew\_servers\_after\_new\_IP=true)

size\_t **num\_of\_servers**

number of preconfigured NTP servers

const char \***servers**[1]

list of servers

## Macros

**ESP\_SNTP\_SERVER\_LIST** (...)

Utility macro for providing multiple servers in parentheses.

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG\_MULTIPLE** (servers\_in\_list, list\_of\_servers)

Default configuration to init SNTP with multiple servers.

### Parameters

- **servers\_in\_list** -- Number of servers in the list
- **list\_of\_servers** -- List of servers (use [ESP\\_SNTP\\_SERVER\\_LIST\(...\)](#))

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG** (server)

Default configuration with a single server.

## Type Definitions

typedef void (\***esp\_sntp\_time\_cb\_t**)(struct timeval \*tv)

Time sync notification function.

typedef struct *esp\_sntp\_config* **esp\_sntp\_config\_t**

SNTP configuration struct.

## Header File

- [components/esp\\_netif/include/esp\\_netif\\_types.h](#)
- This header file can be included with:

```
#include "esp_netif_types.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

## Structures

struct **esp\_netif\_dns\_info\_t**

DNS server info.

### Public Members

*esp\_ip\_addr\_t* **ip**

IPV4 address of DNS server

struct **esp\_netif\_ip\_info\_t**

Event structure for IP\_EVENT\_STA\_GOT\_IP, IP\_EVENT\_ETH\_GOT\_IP events

### Public Members

*esp\_ip4\_addr\_t* **ip**

Interface IPV4 address

*esp\_ip4\_addr\_t* **netmask**

Interface IPV4 netmask

*esp\_ip4\_addr\_t* **gw**

Interface IPV4 gateway address

struct **esp\_netif\_ip6\_info\_t**

IPV6 IP address information.

### Public Members

*esp\_ip6\_addr\_t* **ip**

Interface IPV6 address

struct **ip\_event\_got\_ip\_t**

Event structure for IP\_EVENT\_GOT\_IP event.

### Public Members

*esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip\_info\_t* **ip\_info**

IP address, netmask, gateway IP address

bool **ip\_changed**

Whether the assigned IP has changed or not

struct **ip\_event\_got\_ip6\_t**

Event structure for IP\_EVENT\_GOT\_IP6 event

### Public Members

*esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip6\_info\_t* **ip6\_info**

IPv6 address of the interface

int **ip\_index**

IPv6 address index

struct **ip\_event\_add\_ip6\_t**

Event structure for ADD\_IP6 event

### Public Members

*esp\_ip6\_addr\_t* **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip\_event\_ap\_staipassigned\_t**

Event structure for IP\_EVENT\_AP\_STAIPASSIGNED event

### Public Members

*esp\_netif\_t* \***esp\_netif**

Pointer to the associated netif handle

*esp\_ip4\_addr\_t* **ip**

IP address which was assigned to the station

uint8\_t **mac**[6]

MAC address of the connected client

struct **bridgeif\_config**

LwIP bridge configuration

### Public Members

uint16\_t **max\_fdb\_dyn\_entries**

maximum number of entries in dynamic forwarding database

uint16\_t **max\_fdb\_sta\_entries**

maximum number of entries in static forwarding database

uint8\_t **max\_ports**

maximum number of ports the bridge can consist of

struct **esp\_netif\_inherent\_config**

ESP-netif inherent config parameters.

### Public Members

*esp\_netif\_flags\_t* **flags**

flags that define esp-netif behavior

uint8\_t **mac**[6]

initial mac address for this interface

const *esp\_netif\_ip\_info\_t* \***ip\_info**  
initial ip address for this interface

uint32\_t **get\_ip\_event**  
event id to be raised when interface gets an IP

uint32\_t **lost\_ip\_event**  
event id to be raised when interface loses its IP

const char \***if\_key**  
string identifier of the interface

const char \***if\_desc**  
textual description of the interface

int **route\_prio**  
numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route\_prio indicates a higher priority

*bridgeif\_config\_t* \***bridge\_info**  
LwIP bridge configuration

struct **esp\_netif\_driver\_base\_s**  
ESP-netif driver base handle.

### Public Members

*esp\_err\_t* (\***post\_attach**)(*esp\_netif\_t* \*netif, *esp\_netif\_iodriver\_handle* h)  
post attach function pointer

*esp\_netif\_t* \***netif**  
netif handle

struct **esp\_netif\_driver\_ifconfig**  
Specific IO driver configuration.

### Public Members

*esp\_netif\_iodriver\_handle* **handle**  
io-driver handle

*esp\_err\_t* (\***transmit**)(void \*h, void \*buffer, size\_t len)  
transmit function pointer

*esp\_err\_t* (\***transmit\_wrap**)(void \*h, void \*buffer, size\_t len, void \*netstack\_buffer)  
transmit wrap function pointer

`void (*driver_free_rx_buffer)(void *h, void *buffer)`  
free rx buffer function pointer

struct **esp\_netif\_config**  
Generic esp\_netif configuration.

### Public Members

const *esp\_netif\_inherent\_config\_t* \***base**  
base config

const *esp\_netif\_driver\_ifconfig\_t* \***driver**  
driver config

const *esp\_netif\_netstack\_config\_t* \***stack**  
stack config

struct **esp\_netif\_pair\_mac\_ip\_t**  
DHCP client's addr info (pair of MAC and IP address)

### Public Members

uint8\_t **mac**[6]  
Clients MAC address

*esp\_ip4\_addr\_t* **ip**  
Clients IP address

### Macros

**ESP\_ERR\_ESP\_NETIF\_BASE**  
Definition of ESP-NETIF based errors.

**ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS**

**ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED**

**ESP\_ERR\_ESP\_NETIF\_NO\_MEM**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED**

### Type Definitions

typedef struct esp\_netif\_obj **esp\_netif\_t**

typedef enum *esp\_netif\_flags* **esp\_netif\_flags\_t**

typedef enum *esp\_netif\_ip\_event\_type* **esp\_netif\_ip\_event\_type\_t**

typedef struct *bridgeif\_config* **bridgeif\_config\_t**

LwIP bridge configuration

typedef struct *esp\_netif\_inherent\_config* **esp\_netif\_inherent\_config\_t**

ESP-netif inherent config parameters.

typedef struct *esp\_netif\_config* **esp\_netif\_config\_t**

typedef void \***esp\_netif\_iodriver\_handle**

IO driver handle type.

typedef struct *esp\_netif\_driver\_base\_s* **esp\_netif\_driver\_base\_t**

ESP-netif driver base handle.

typedef struct *esp\_netif\_driver\_ifconfig* **esp\_netif\_driver\_ifconfig\_t**

typedef struct esp\_netif\_netstack\_config **esp\_netif\_netstack\_config\_t**

Specific L3 network stack configuration.

typedef *esp\_err\_t* (\***esp\_netif\_receive\_t**)(*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

ESP-NETIF Receive function type.

## Enumerations

enum **esp\_netif\_dns\_type\_t**

Type of DNS server.

*Values:*

enumerator **ESP\_NETIF\_DNS\_MAIN**

DNS main server address

enumerator **ESP\_NETIF\_DNS\_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_MAX**

enum **esp\_netif\_dhcp\_status\_t**

Status of DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_DHCP\_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP\_NETIF\_DHCP\_STARTED**

DHCP client/server has been started

enumerator **ESP\_NETIF\_DHCP\_STOPPED**

DHCP client/server has been stopped

enumerator **ESP\_NETIF\_DHCP\_STATUS\_MAX**

enum **esp\_netif\_dhcp\_option\_mode\_t**

Mode for DHCP client or DHCP server option functions.

*Values:*

enumerator **ESP\_NETIF\_OP\_START**

enumerator **ESP\_NETIF\_OP\_SET**

Set option

enumerator **ESP\_NETIF\_OP\_GET**

Get option

enumerator **ESP\_NETIF\_OP\_MAX**

enum **esp\_netif\_dhcp\_option\_id\_t**

Supported options for DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_SUBNET\_MASK**

Network mask

enumerator **ESP\_NETIF\_DOMAIN\_NAME\_SERVER**

Domain name server

enumerator **ESP\_NETIF\_ROUTER\_SOLICITATION\_ADDRESS**

Solicitation router address

enumerator **ESP\_NETIF\_REQUESTED\_IP\_ADDRESS**

Request specific IP address

enumerator **ESP\_NETIF\_IP\_ADDRESS\_LEASE\_TIME**

Request IP address lease time

enumerator **ESP\_NETIF\_IP\_REQUEST\_RETRY\_TIME**

Request IP address retry counter

enumerator **ESP\_NETIF\_VENDOR\_CLASS\_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP\_NETIF\_VENDOR\_SPECIFIC\_INFO**

Vendor Specific Information of a DHCP server

enum **ip\_event\_t**

IP event declarations

*Values:*

enumerator **IP\_EVENT\_STA\_GOT\_IP**

station got IP from connected AP

enumerator **IP\_EVENT\_STA\_LOST\_IP**

station lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_AP\_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP\_EVENT\_GOT\_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP\_EVENT\_ETH\_GOT\_IP**

ethernet got IP from connected AP

enumerator **IP\_EVENT\_ETH\_LOST\_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_PPP\_GOT\_IP**

PPP interface got IP

enumerator **IP\_EVENT\_PPP\_LOST\_IP**

PPP interface lost IP

enum **esp\_netif\_flags**

*Values:*

enumerator **ESP\_NETIF\_DHCP\_CLIENT**

enumerator **ESP\_NETIF\_DHCP\_SERVER**

enumerator **ESP\_NETIF\_FLAG\_AUTOUP**

enumerator **ESP\_NETIF\_FLAG\_GARP**

enumerator **ESP\_NETIF\_FLAG\_EVENT\_IP\_MODIFIED**

enumerator **ESP\_NETIF\_FLAG\_IS\_PPP**

enumerator **ESP\_NETIF\_FLAG\_IS\_BRIDGE**

enumerator **ESP\_NETIF\_FLAG\_MLDV6\_REPORT**

enum **esp\_netif\_ip\_event\_type**

*Values:*

enumerator **ESP\_NETIF\_IP\_EVENT\_GOT\_IP**

enumerator **ESP\_NETIF\_IP\_EVENT\_LOST\_IP**

or

```
PRIV_REQUIRES esp_netif
```

## Functions

`esp_ip6_addr_type_t esp_netif_ip6_get_addr_type(esp_ip6_addr_t *ip6_addr)`

Get the IPv6 address type.

**Parameters** `ip6_addr` -- [in] IPv6 type

**Returns** IPv6 type in form of enum `esp_ip6_addr_type_t`

static inline void **esp\_netif\_ip\_addr\_copy** (*esp\_ip\_addr\_t* \*dest, const *esp\_ip\_addr\_t* \*src)

Copy IP addresses.

#### Parameters

- **dest** -- [out] destination IP
- **src** -- [in] source IP

### Structures

struct **esp\_ip6\_addr**

IPv6 address.

#### Public Members

uint32\_t **addr**[4]

IPv6 address

uint8\_t **zone**

zone ID

struct **esp\_ip4\_addr**

IPv4 address.

#### Public Members

- This header file can be included with:

```
#include "esp_vfs_l2tap.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

```
PRIV_REQUIRES esp_netif
```

## Functions

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_register** (*l2tap\_vfs\_config\_t* \*config)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

**Parameters** **config** -- L2 TAP virtual filesystem driver configuration. Default base path `/dev/net/tap` is used when this parameter is NULL.

**Returns** `esp_err_t`

- `ESP_OK` on success

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_unregister** (const char \*base\_path)

Removes L2 TAP virtual filesystem driver.

**Parameters** **base\_path** -- Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this parameter is NULL.

**Returns** *esp\_err\_t*

- ESP\_OK on success

*esp\_err\_t* **esp\_vfs\_l2tap\_eth\_filter** (*l2tap\_iodriver\_handle* driver\_handle, void \*buff, size\_t \*size)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

**Parameters**

- **driver\_handle** -- handle of driver at which the frame was received
- **buff** -- received L2 frame
- **size** -- input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

**Returns** *esp\_err\_t*

- ESP\_OK is always returned

## Structures

struct **l2tap\_vfs\_config\_t**

L2Tap VFS config parameters.

## Public Members

const char \***base\_path**  
vfs base path

## Macros

**L2TAP\_VFS\_DEFAULT\_PATH**

**L2TAP\_VFS\_CONFIG\_DEFAULT** ()

## Type Definitions

typedef void \***l2tap\_iodriver\_handle**

## Enumerations

enumerator **L2TAP\_G\_RCV\_FILTER**

enumerator **L2TAP\_S\_INTF\_DEVICE**

enumerator **L2TAP\_G\_INTF\_DEVICE**

enumerator **L2TAP\_S\_DEVICE\_DRV\_HNDL**

enumerator **L2TAP\_G\_DEVICE\_DRV\_HNDL**

## Wi-Fi Default API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_wifi\\_default.h](#)
- This header file can be included with:

```
#include "esp_wifi_default.h"
```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_wifi
```

or

```
PRIV_REQUIRES esp_wifi
```

### Functions

*esp\_err\_t* **esp\_netif\_attach\_wifi\_station** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi station interface to supplied netif.

**Parameters** `esp_netif` -- instance to attach the wifi station to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_netif\_attach\_wifi\_ap** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi soft AP interface to supplied netif.

**Parameters** `esp_netif` -- instance to attach the wifi AP to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_sta\_handlers** (void)

Sets default wifi event handlers for STA interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_ap\_handlers** (void)

Sets default wifi event handlers for AP interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_nan\_handlers** (void)

Sets default wifi event handlers for NAN interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_clear\_default\_wifi\_driver\_and\_handlers** (void \*esp\_netif)

Clears default wifi event handlers for supplied network interface.

**Parameters** `esp_netif` -- instance of corresponding if object

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

---

**Note:** The API creates *esp\_netif* object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

---

**Note:** The API creates *esp\_netif* object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_nan** (void)

Creates default WIFI NAN. In case of any init error this API aborts.

---

**Note:** The API creates *esp\_netif* object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

void **esp\_netif\_destroy\_default\_wifi** (void \**esp\_netif*)

Destroys default WIFI netif created with `esp_netif_create_default_wifi_...()` API.

---

**Note:** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if *esp\_netif* is NULL)

---

**Parameters** *esp\_netif* -- [in] object to detach from WiFi and destroy

*esp\_netif\_t* \***esp\_netif\_create\_wifi** (*wifi\_interface\_t* wifi\_if, const *esp\_netif\_inherent\_config\_t* \**esp\_netif\_config*)

Creates *esp\_netif* WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Parameters**

- *wifi\_if* -- [in] type of wifi interface
- *esp\_netif\_config* -- [in] inherent esp-netif configuration pointer

**Returns** pointer to esp-netif instance

```
esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t
                                                    **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

#### Parameters

- **p\_netif\_sta** -- [out] pointer where the resultant STA interface is saved (if non NULL)
- **p\_netif\_ap** -- [out] pointer where the resultant AP interface is saved (if non NULL)

**Returns** ESP\_OK on success

## 2.4.5 IP Network Layer

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with ESP-NETIF connection capabilities.

By convention, the I/O driver has to register itself as an ESP-NETIF driver, and thus holds a dependency on ESP-NETIF component and is responsible for providing data path functions, post-attach callback and in most cases, also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet Input/Output** According to the diagram shown in the *ESP-NETIF Architecture* part, the following three API functions for the packet data path must be defined for connecting with ESP-NETIF:

- *esp\_netif\_transmit()*
- *esp\_netif\_free\_rx\_buffer()*
- *esp\_netif\_receive()*

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e., they get called from ESP-NETIF (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls *esp\_netif\_receive()* on a new data received event.

**Post Attach Callback** A final part of the network interface initialization consists of attaching the ESP-NETIF instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳driver_handle);
```

It is assumed that the *esp\_netif\_iodriver\_handle* is a pointer to driver's object, a struct derived from *struct esp\_netif\_driver\_base\_s*, so that the first member of I/O driver structure must be this base structure with pointers to:

- post-attach function callback
- related ESP-NETIF instance

As a result, the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as...
↳esp-netif driver */
    driver_impl_t *h;                     /*!< handle of driver...
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`.

So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between ESP-NETIF and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default Handlers** I/O drivers also typically provide default definitions of lifecycle behavior of related network interfaces based on state transitions of I/O drivers. For example *driver start* -> *network start*, etc.

An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↳netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↳EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↳EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network Stack Connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the ESP-NETIF, specifically from its TCP/IP stack connecting layer.

Note that ESP-IDF provides several network stack configurations for the most common network interfaces, such as for the Wi-Fi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set.

The following API reference outlines these network stack interaction with the ESP-NETIF:

### Header File

- `components/esp_netif/include/esp_netif_net_stack.h`
- This header file can be included with:

```
#include "esp_netif_net_stack.h"
```

- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_netif
```

or

PRIV_REQUIRES esp_netif
-------------------------

## Functions

*esp\_netif\_t* \***esp\_netif\_get\_handle\_from\_netif\_impl** (void \*dev)

Returns esp-netif handle.

**Parameters** *dev* -- **[in]** opaque ptr to network interface of specific TCP/IP stack

**Returns** handle to related esp-netif instance

void \***esp\_netif\_get\_netif\_impl** (*esp\_netif\_t* \*esp\_netif)

Returns network stack specific implementation handle.

**Parameters** *esp\_netif* -- **[in]** Handle to esp-netif instance

**Returns** handle to related network stack netif handle

*esp\_err\_t* **esp\_netif\_set\_link\_speed** (*esp\_netif\_t* \*esp\_netif, uint32\_t speed)

Set link-speed for the specified network interface.

### Parameters

- *esp\_netif* -- **[in]** Handle to esp-netif instance
- *speed* -- **[in]** Link speed in bit/s

**Returns** ESP\_OK on success

*esp\_err\_t* **esp\_netif\_transmit** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

### Parameters

- *esp\_netif* -- **[in]** Handle to esp-netif instance
- *data* -- **[in]** Data to be transmitted
- *len* -- **[in]** Length of the data frame

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

*esp\_err\_t* **esp\_netif\_transmit\_wrap** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len, void \*netstack\_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

### Parameters

- *esp\_netif* -- **[in]** Handle to esp-netif instance
- *data* -- **[in]** Data to be transmitted
- *len* -- **[in]** Length of the data frame
- *netstack\_buf* -- **[in]** net stack buffer

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

void **esp\_netif\_free\_rx\_buffer** (void \*esp\_netif, void \*buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

### Parameters

- *esp\_netif* -- **[in]** Handle to esp-netif instance
- *buffer* -- **[in]** Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

## 2.4.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

## 2.5 Peripherals API

### 2.5.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

#### Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pins.

ESP32-S2 has two ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide introduces ADC oneshot mode conversion.

#### Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- *Resource Allocation* - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- *Unit Configuration* - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- *Read Conversion Result* - covers how to get ADC conversion raw result.
- *Hardware Limitations* - describes the ADC-related hardware limitations.
- *Power Management* - covers power management-related information.
- *IRAM Safe* - describes tips on how to read ADC conversion raw results when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The ADC oneshot mode driver is implemented based on ESP32-S2 SAR ADC module. Different ESP chips might have different numbers of independent ADCs. From the oneshot mode driver's point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the [datasheet](#) to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::clk_src` selects the source clock of the ADC. If set to 0, the driver will fall back to using a default clock source, see `adc_oneshot_clk_src_t` to know the details.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

### Create an ADC Unit Handle Under Normal Oneshot Mode

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

**Unit Configuration** After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to [TRM](#) > On-Chip Sensor and Analog Signal Processing.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number, check [datasheet](#) to know the ADC IOs.

Additionally, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with the above configuration structure. You should specify an ADC channel to be configured as well. Function `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.

### Configure Two ADC Channels

```
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &
↪config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &
↪config));
```

**Read Conversion Result** After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safe to use. ADC(s) are shared by some other drivers/peripherals, see [Hardware Limitations](#). This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers/peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

This function will fail due to invalid arguments.

The ADC conversion results read from this function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to <a href="#">TRM</a> > On-Chip Sensor and Analog Signal Processing.
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where bitwidth is the <code>adc_oneshot_chan_cfg_t::bitwidth</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

### Read Raw Result

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪ adc_raw[0][0]);

ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪ adc_raw[0][1]);
```

### Hardware Limitations

- Random Number Generator (RNG) uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.
- ADC2 is also used by Wi-Fi. `adc_oneshot_read()` has provided protection between the Wi-Fi driver and ADC oneshot mode driver.

**Power Management** When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides will not be blocked. Therefore the clock frequency is stable when reading.

**IRAM Safe** By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled. Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc. If these APIs execute when the Cache is disabled, you will probably see errors like `Illegal Instruction` or `Load/Store Prohibited`.

### Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread-safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread-safe. Besides, concurrently calling this function may result in failures of the above thread-safe APIs.

### Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see *IRAM Safe* for more details.

### Application Examples

- ADC oneshot mode example: [peripherals/adc/oneshot\\_read](#).

### API Reference

#### Header File

- `components/hal/include/hal/adc_types.h`
- This header file can be included with:

```
#include "hal/adc_types.h"
```

#### Structures

struct `adc_digi_pattern_config_t`  
ADC digital controller pattern configuration.

#### Public Members

`uint8_t atten`  
Attenuation of this ADC channel.

`uint8_t channel`  
ADC channel.

`uint8_t unit`  
ADC unit.

`uint8_t bit_width`  
ADC output bit width.

struct `adc_digi_output_data_t`  
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

---

**Note:** ESP32: Only `type1` is valid. ADC2 does not support DMA mode.

---

---

**Note:** ESP32-S2: Member `channel` can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

---

#### Public Members

**uint16\_t data**

ADC real output data info. Resolution: 12 bit.

ADC real output data info. Resolution: 11 bit.

**uint16\_t channel**

ADC channel index info.

ADC channel index info. For ESP32-S2: If (channel < ADC\_CHANNEL\_MAX), The data is valid. If (channel > ADC\_CHANNEL\_MAX), The data is invalid.

struct *adc\_digi\_output\_data\_t*::[anonymous]::[anonymous] **type1**

ADC type1

**uint16\_t unit**

ADC unit index info. 0: ADC1; 1: ADC2.

struct *adc\_digi\_output\_data\_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 11bit.

**uint16\_t val**

Raw data value

struct **adc\_digi\_clk\_t**

ADC digital controller (DMA mode) clock system setting. Calculation formula:  $\text{controller\_clk} = (\text{APLL or APB}) / (\text{div\_num} + \text{div\_a} / \text{div\_b} + 1)$ .

---

**Note:** : The clocks of the DAC digital controller use the ADC digital controller clock divider.

---

**Public Members**bool **use\_apll**

true: use APLL clock; false: use APB clock.

uint32\_t **div\_num**

Division factor. Range: 0 ~ 255. Note: When a higher frequency clock is used (the division factor is less than 9), the ADC reading value will be slightly offset.

uint32\_t **div\_b**

Division factor. Range: 1 ~ 63.

uint32\_t **div\_a**

Division factor. Range: 0 ~ 63.

**Type Definitions**

typedef *soc\_periph\_adc\_digi\_clk\_src\_t* **adc\_oneshot\_clk\_src\_t**

Clock source type of oneshot mode which uses digital controller.

typedef *soc\_periph\_adc\_digi\_clk\_src\_t* **adc\_continuous\_clk\_src\_t**

Clock source type of continuous mode which uses digital controller.

### Enumerations

enum **adc\_unit\_t**

ADC unit.

*Values:*

enumerator **ADC\_UNIT\_1**

SAR ADC 1.

enumerator **ADC\_UNIT\_2**

SAR ADC 2.

enum **adc\_channel\_t**

ADC channels.

*Values:*

enumerator **ADC\_CHANNEL\_0**

ADC channel.

enumerator **ADC\_CHANNEL\_1**

ADC channel.

enumerator **ADC\_CHANNEL\_2**

ADC channel.

enumerator **ADC\_CHANNEL\_3**

ADC channel.

enumerator **ADC\_CHANNEL\_4**

ADC channel.

enumerator **ADC\_CHANNEL\_5**

ADC channel.

enumerator **ADC\_CHANNEL\_6**

ADC channel.

enumerator **ADC\_CHANNEL\_7**

ADC channel.

enumerator **ADC\_CHANNEL\_8**

ADC channel.

enumerator **ADC\_CHANNEL\_9**

ADC channel.

enum **adc\_atten\_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

*Values:*

enumerator **ADC\_ATTEN\_DB\_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC\_ATTEN\_DB\_2\_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator **ADC\_ATTEN\_DB\_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator **ADC\_ATTEN\_DB\_12**

The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator **ADC\_ATTEN\_DB\_11**

This is deprecated, it behaves the same as `ADC_ATTEN_DB_12`

enum **adc\_bitwidth\_t**

*Values:*

enumerator **ADC\_BITWIDTH\_DEFAULT**

Default ADC output bits, max supported width will be selected.

enumerator **ADC\_BITWIDTH\_9**

ADC output width is 9Bit.

enumerator **ADC\_BITWIDTH\_10**

ADC output width is 10Bit.

enumerator **ADC\_BITWIDTH\_11**

ADC output width is 11Bit.

enumerator **ADC\_BITWIDTH\_12**

ADC output width is 12Bit.

enumerator **ADC\_BITWIDTH\_13**

ADC output width is 13Bit.

enum **adc\_ulp\_mode\_t**

*Values:*

enumerator **ADC\_ULP\_MODE\_DISABLE**

ADC ULP mode is disabled.

enumerator **ADC\_ULP\_MODE\_FSM**

ADC is controlled by ULP FSM.

enumerator **ADC\_ULP\_MODE\_RISCV**

ADC is controlled by ULP RISCv.

enum **adc\_digi\_convert\_mode\_t**

ADC digital controller (DMA mode) work mode.

*Values:*

enumerator **ADC\_CONV\_SINGLE\_UNIT\_1**

Only use ADC1 for conversion.

enumerator **ADC\_CONV\_SINGLE\_UNIT\_2**

Only use ADC2 for conversion.

enumerator **ADC\_CONV\_BOTH\_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC\_CONV\_ALTER\_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 .....

enum **adc\_digi\_output\_format\_t**

ADC digital controller (DMA mode) output data format option.

*Values:*

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE1**

See [adc\\_digi\\_output\\_data\\_t.type1](#)

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE2**

See [adc\\_digi\\_output\\_data\\_t.type2](#)

enum **adc\_digi\_iir\_filter\_t**

ADC IIR Filter ID.

*Values:*

enumerator **ADC\_DIGI\_IIR\_FILTER\_0**

Filter 0.

enumerator **ADC\_DIGI\_IIR\_FILTER\_1**

Filter 1.

enum **adc\_digi\_iir\_filter\_coeff\_t**

IIR Filter Coefficient.

*Values:*

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_2**

The filter coefficient is 2.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_4**

The filter coefficient is 4.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_8**

The filter coefficient is 8.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_16**

The filter coefficient is 16.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_64**

The filter coefficient is 64.

enum **adc\_monitor\_id\_t**

ADC monitor (continuous mode) ID.

*Values:*

enumerator **ADC\_MONITOR\_0**

The monitor index 0.

enumerator **ADC\_MONITOR\_1**

The monitor index 1.

enum **adc\_monitor\_mode\_t**

Monitor config/event mode type.

*Values:*

enumerator **ADC\_MONITOR\_MODE\_HIGH**

ADC raw\_result > threshold value, monitor interrupt will be generated.

enumerator **ADC\_MONITOR\_MODE\_LOW**

ADC raw\_result < threshold value, monitor interrupt will be generated.

## Header File

- [components/esp\\_adc/include/esp\\_adc/adc\\_oneshot.h](#)
- This header file can be included with:

```
#include "esp_adc/adc_oneshot.h"
```

- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_adc
```

or

```
PRIV_REQUIRES esp_adc
```

## Functions

`esp_err_t adc_oneshot_new_unit` (const `adc_oneshot_unit_init_cfg_t` \*init\_config,  
`adc_oneshot_unit_handle_t` \*ret\_unit)

Create a handle to a specific ADC unit.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

**Parameters**

- **init\_config** -- **[in]** Driver initial configurations
- **ret\_unit** -- **[out]** ADC unit handle

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NO\_MEM: No memory
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be claimed is already in use
- ESP\_FAIL: Clock source isn't initialised correctly

*esp\_err\_t* **adc\_oneshot\_config\_channel** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_channel\_t* channel, const *adc\_oneshot\_chan\_cfg\_t* \*config)

Set ADC oneshot mode required configurations.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

**Parameters**

- **handle** -- **[in]** ADC handle
- **channel** -- **[in]** ADC channel to be configured
- **config** -- **[in]** ADC configurations

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments

*esp\_err\_t* **adc\_oneshot\_read** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_channel\_t* chan, int \*out\_raw)

Get one ADC conversion raw result.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

---

**Note:** This API should NOT be called in an ISR context

---

**Parameters**

- **handle** -- **[in]** ADC handle
- **chan** -- **[in]** ADC channel
- **out\_raw** -- **[out]** ADC conversion raw result

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_TIMEOUT: Timeout, the ADC result is invalid

*esp\_err\_t* **adc\_oneshot\_del\_unit** (*adc\_oneshot\_unit\_handle\_t* handle)

Delete the ADC unit handle.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

**Parameters** **handle** -- **[in]** ADC handle**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be disclaimed isn't in use

*esp\_err\_t* **adc\_oneshot\_io\_to\_channel** (int io\_num, *adc\_unit\_t* \*const unit\_id, *adc\_channel\_t* \*const channel)

Get ADC channel from the given GPIO number.

#### Parameters

- **io\_num** -- [in] GPIO number
- **unit\_id** -- [out] ADC unit
- **channel** -- [out] ADC channel

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: The IO is not a valid ADC pad

*esp\_err\_t* **adc\_oneshot\_channel\_to\_io** (*adc\_unit\_t* unit\_id, *adc\_channel\_t* channel, int \*const io\_num)

Get GPIO number from the given ADC channel.

#### Parameters

- **unit\_id** -- [in] ADC unit
- **channel** -- [in] ADC channel
- **io\_num** -- [out] GPIO number
- -- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **adc\_oneshot\_get\_calibrated\_result** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_cali\_handle\_t* cali\_handle, *adc\_channel\_t* chan, int \*cali\_result)

Convenience function to get ADC calibrated result.

This is an all-in-one function which does:

- oneshot read ADC raw result
- calibrate the raw result and convert it into calibrated result (in mV)

#### Parameters

- **handle** -- [in] ADC oneshot handle, you should call `adc_oneshot_new_unit()` to get this handle
- **cali\_handle** -- [in] ADC calibration handle, you should call `adc_cali_create_scheme_x()` in `adc_cali_scheme.h` to create a handle
- **chan** -- [in] ADC channel
- **cali\_result** -- [out] Calibrated ADC result (in mV)

#### Returns

- ESP\_OK Other return errors from `adc_oneshot_read()` and `adc_cali_raw_to_voltage()`

## Structures

struct **adc\_oneshot\_unit\_init\_cfg\_t**

ADC oneshot driver initial configurations.

## Public Members

*adc\_unit\_t* **unit\_id**

ADC unit.

*adc\_oneshot\_clk\_src\_t* **clk\_src**

Clock source.

***adc\_ulp\_mode\_t* ulp\_mode**ADC controlled by ULP, see `adc_ulp_mode_t`struct **adc\_oneshot\_chan\_cfg\_t**

ADC channel configurations.

**Public Members*****adc\_atten\_t* atten**

ADC attenuation.

***adc\_bitwidth\_t* bitwidth**

ADC conversion result bits.

**Type Definitions**typedef struct `adc_oneshot_unit_ctx_t` \***adc\_oneshot\_unit\_handle\_t**

Type of ADC unit handle for oneshot mode.

**2.5.2 Analog to Digital Converter (ADC) Continuous Mode Driver****Introduction**

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pads. Additionally, the Direct Memory Access (DMA) functionality is utilized to efficiently retrieve ADC conversion results.

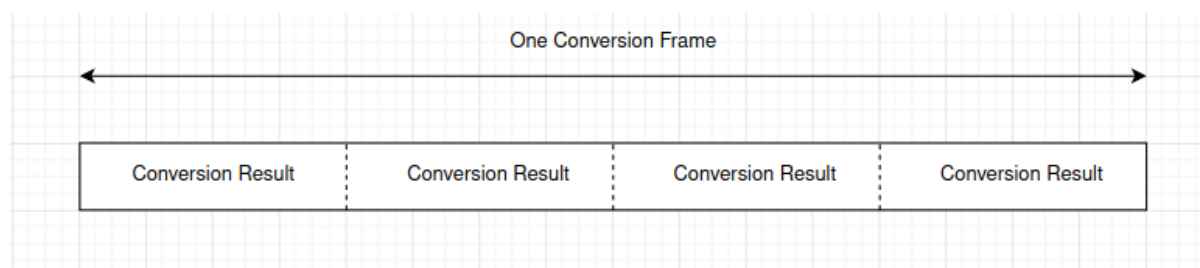

ESP32-S2 has two ADC unit(s), which can be used in scenarios like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide introduces ADC continuous mode conversion.

**Driver Concepts** ADC continuous mode conversion is made up of multiple conversion frames.

- Conversion Frame: One conversion frame contains multiple conversion results. Conversion frame size is configured in `adc_continuous_new_handle()` in bytes.
- Conversion Result: One conversion result contains multiple bytes, see `SOC_ADC_DIGI_RESULT_BYTES`. Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel, and raw data.

## Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from a group of ADC channels continuously:

- *Resource Allocation*: covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- *ADC Configurations*: describes how to configure the ADC(s) to make it work under continuous mode.
- *ADC Control*: describes ADC control functions.
- *Register Event Callbacks*: describes how to hook user-specific code to an ADC continuous mode event callback function.
- *Read Conversion Result*: covers how to get ADC conversion result.
- *Hardware Limitations*: describes the ADC-related hardware limitations.
- *Power Management*: covers power management-related information.
- *IRAM Safe*: covers the IRAM safe functions.
- *Thread Safety*: lists which APIs are guaranteed to be thread-safe by the driver.

**Resource Allocation** The ADC continuous mode driver is implemented based on ESP32-S2 SAR ADC module. Different ESP targets might have different numbers of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size`: set the maximum size of the pool in bytes, and the driver saves ADC conversion result into the pool. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size`: set the size of the ADC conversion frame, in bytes.
- `adc_continuous_handle_cfg_t::flags`: set the flags that can change the driver's behavior.
  - `flush_pool`: auto flush the pool when it's full.

After setting up the above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means the SPI3 peripheral is in use. See *Hardware Limitations* for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

**IIR filter** Two IIR filters are available when ADC is working in continuous mode. To create an ADC IIR filter, you should set up `adc_continuous_iir_filter_config_t` and call `adc_new_continuous_iir_filter()`.

- `adc_digi_filter_config_t::unit`: ADC unit.
- `adc_digi_filter_config_t::channel`: ADC channel to be filtered.
- `adc_digi_filter_config_t::coeff`: Filter coefficient.

On ESP32-S2, the filter is per ADC unit. Once a filter is enabled, all the enabled ADC channels in this ADC unit will be filtered. However, we suggest only enabling one ADC channel per unit, when using the filter feature. Because the filtered results depend on the previous filtered result. So you should not enable multiple ADC channels, to avoid mixing the filtered results.

To recycle a filter, you should call `adc_del_continuous_iir_filter()`.

**Monitor** 2 monitors are available when ADC is working under continuous mode, you can set one or two threshold(s) of a monitor on a working ADC channel, then the monitor will invoke interrupts every sample loop if conversion result outranges of the threshold. To create an ADC monitor, you need to set up the `adc_monitor_config_t` and call `adc_new_continuous_monitor()`.

- `adc_monitor_config_t::adc_unit`: Configures which ADC unit the channel you want to monitor belongs to.
- `adc_monitor_config_t::channel`: The channel you want to monitor.
- `adc_monitor_config_t::h_threshold`: The high threshold, conversion result larger than this value invokes interrupt, set to -1 if do not use.
- `adc_monitor_config_t::l_threshold`: The low threshold, conversion result less than this value invokes interrupt, set to -1 if do not use.

Once a monitor is created, you can operate it by following APIs to construct your apps.

- `adc_continuous_monitor_enable()`: Enable a monitor.
- `adc_continuous_monitor_disable()`: Disable a monitor.
- `adc_monitor_register_callbacks()`: register user callbacks to take action when the ADC value exceeds of the threshold.
- `adc_del_continuous_monitor()`: Delete a created monitor and free resources.

---

**Note:** There are some hardware limitations on ESP32-S2: 1. Only one threshold is supported for one monitor. 2. Only one monitor is supported for one ADC unit. 3. All enabled channel(s) of a certain ADC unit in ADC continuous mode driver will be monitored. The `adc_monitor_config_t::channel` parameter will not be used.

---

### Initialize the ADC Continuous Mode Driver

```
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_continuous_deinit());
```

**ADC Configurations** After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`: number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`: list of configs for each ADC channel that will be used, see the description below.
- `adc_continuous_config_t::sample_freq_hz`: expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`: continuous conversion mode.
- `adc_continuous_config_t::format`: conversion output format.

Set `adc_digi_pattern_config_t` with the following process:

- `adc_digi_pattern_config_t::atten`: ADC attenuation. Refer to the On-Chip Sensor and Analog Signal Processing chapter in TRM.
- `adc_digi_pattern_config_t::channel`: the IO corresponding ADC channel number. See the note below.
- `adc_digi_pattern_config_t::unit`: the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`: the bitwidth of the raw conversion result.

---

**Note:** For the IO corresponding ADC channel number, check TRM to acquire the ADC IOs. Besides, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

---

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you should not call this API at this moment.

See ADC continuous mode example [peripherals/adc/continuous\\_read](#) to see configuration codes.

To enable/disable the ADC IIR filter, you should call `adc_continuous_iir_filter_enable()` / `adc_continuous_iir_filter_disable()`.

To enable/disable the ADC monitor, you should call `adc_continuous_monitor_enable()` / `adc_continuous_monitor_disable()`.

## ADC Control

**Start and Stop** Calling `adc_continuous_start()` makes the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results.

On the contrary, calling `adc_continuous_stop()` stops the ADC conversion.

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

**Register Event Callbacks** By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t`.

- `adc_continuous_evt_cbs_t::on_conv_done`: this is invoked when one conversion frame finishes.
- `adc_continuous_evt_cbs_t::on_pool_ovf`: this is invoked when the internal pool is full. Newer conversion results will be discarded.

As the above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logic should not appear in these callbacks. The callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()` by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Especially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions are not in the internal RAM. Check the error log for more details. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, it indicates that the ADC continuous mode driver is started, and you should not add a callback at this moment.

**Conversion Done Event** When the driver completes a conversion, it triggers the `adc_continuous_evt_cbs_t::on_conv_done` event and fills the event data. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

---

**Note:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

---

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

---

**Pool Overflow Event** The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver will not fill in the event data. This usually happens because the speed to read data from the pool by calling `adc_continuous_read()` is much slower than the ADC conversion speed.

**Read Conversion Result** After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

Function `adc_continuous_read()` tries to read the expected length of conversion results each time.

- When calling `adc_continuous_read()`, you can request to read a conversion result of the specified length. Sometimes, however, the actual available conversion results may be less than the requested length, in which case the function still moves the data from the internal pool into the buffer you provided. Therefore, to learn the number of conversion results actually moved into the buffer, please check the value of `out_length`.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there are still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, newly generated results will be lost. Next time when `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` to indicate this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from the above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor and Analog Signal Processing chapter in <a href="#">TRM</a> .
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where the bitwidth is the <code>adc_digi_pattern_config_t::bit_width</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to [Analog to Digital Converter \(ADC\) Calibration Driver](#).

### Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or one-shot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator (RNG) uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 is also used by Wi-Fi. `adc_continuous_start()` has provided the protection between Wi-Fi driver and ADC continuous mode driver.
- ADC continuous mode driver uses SPI3 peripheral as hardware DMA FIFO. Therefore, if SPI3 is in use already, the `adc_continuous_new_handle()` will return `ESP_ERR_NOT_FOUND`.

**Power Management** When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by

`adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise, the power management will be out of action.

**IRAM Safe** All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, the driver's internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety** ADC continuous mode driver APIs are not guaranteed to be thread-safe. However, the share hardware mutual exclusion is provided by the driver. See *Hardware Limitations* for more details.

### Application Examples

- ADC continuous mode example: [peripherals/adc/continuous\\_read](#).

### API Reference

#### Header File

- `components/esp_adc/include/esp_adc/adc_continuous.h`
- This header file can be included with:

```
#include "esp_adc/adc_continuous.h"
```

- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_adc
```

or

```
PRIV_REQUIRES esp_adc
```

#### Functions

`esp_err_t adc_continuous_new_handle` (const `adc_continuous_handle_cfg_t` \*hdl\_config, `adc_continuous_handle_t` \*ret\_handle)

Initialize ADC continuous driver and get a handle to it.

##### Parameters

- **hdl\_config** -- [in] Pointer to ADC initialization config. Refer to `adc_continuous_handle_cfg_t`.
- **ret\_handle** -- [out] ADC continuous mode driver handle

##### Returns

- `ESP_ERR_INVALID_ARG` If the combination of arguments is invalid.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_NO_MEM` If out of memory
- `ESP_OK` On success

`esp_err_t adc_continuous_config` (`adc_continuous_handle_t` handle, const `adc_continuous_config_t` \*config)

Set ADC continuous mode required configurations.

##### Parameters

- **handle** -- [in] ADC continuous mode driver handle
- **config** -- [in] Refer to `adc_digi_config_t`.

##### Returns

- `ESP_ERR_INVALID_STATE`: Driver state is invalid, you shouldn't call this API at this moment
- `ESP_ERR_INVALID_ARG`: If the combination of arguments is invalid.
- `ESP_OK`: On success

*esp\_err\_t* **adc\_continuous\_register\_event\_callbacks** (*adc\_continuous\_handle\_t* handle, const *adc\_continuous\_evt\_cbs\_t* \*cbs, void \*user\_data)

Register callbacks.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the `cbs` structure to `NULL`.

---

---

**Note:** When `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including `user_data`) should be in internal RAM as well.

---

---

**Note:** You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

---

#### Parameters

- **handle** -- [in] ADC continuous mode driver handle
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be delivered to the callback functions directly

#### Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_INVALID_STATE`: Driver state is invalid, you shouldn't call this API at this moment

*esp\_err\_t* **adc\_continuous\_start** (*adc\_continuous\_handle\_t* handle)

Start the ADC under continuous mode. After this, the hardware starts working.

**Parameters** **handle** -- [in] ADC continuous mode driver handle

#### Returns

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

*esp\_err\_t* **adc\_continuous\_read** (*adc\_continuous\_handle\_t* handle, *uint8\_t* \*buf, *uint32\_t* length\_max, *uint32\_t* \*out\_length, *uint32\_t* timeout\_ms)

Read bytes from ADC under continuous mode.

#### Parameters

- **handle** -- [in] ADC continuous mode driver handle
- **buf** -- [out] Conversion result buffer to read from ADC. Suggest convert to *adc\_digi\_output\_data\_t* for ADC Conversion Results. See the subsection *Driver Backgrounds* in this header file to learn about this concept.
- **length\_max** -- [in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out\_length** -- [out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout\_ms** -- [in] Time to wait for data via this API, in millisecond.

#### Returns

- `ESP_ERR_INVALID_STATE` Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.

- ESP\_ERR\_TIMEOUT Operation timed out
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_stop** (*adc\_continuous\_handle\_t* handle)

Stop the ADC. After this, the hardware stops working.

**Parameters** **handle** -- [in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_deinit** (*adc\_continuous\_handle\_t* handle)

Deinitialize the ADC continuous driver.

**Parameters** **handle** -- [in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_flush\_pool** (*adc\_continuous\_handle\_t* handle)

Flush the driver internal pool.

---

**Note:** This API is not supposed to be called in an ISR context

---

**Parameters** **handle** -- [in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid, you should call this API when it's in init state
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_io\_to\_channel** (int io\_num, *adc\_unit\_t* \*const unit\_id, *adc\_channel\_t* \*const channel)

Get ADC channel from the given GPIO number.

**Parameters**

- **io\_num** -- [in] GPIO number
- **unit\_id** -- [out] ADC unit
- **channel** -- [out] ADC channel

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: The IO is not a valid ADC pad

*esp\_err\_t* **adc\_continuous\_channel\_to\_io** (*adc\_unit\_t* unit\_id, *adc\_channel\_t* channel, int \*const io\_num)

Get GPIO number from the given ADC channel.

**Parameters**

- **unit\_id** -- [in] ADC unit
- **channel** -- [in] ADC channel
- **io\_num** -- [out] GPIO number
- -- ESP\_OK: On success
- -- ESP\_ERR\_INVALID\_ARG: Invalid argument

## Structures

struct **adc\_continuous\_handle\_cfg\_t**

ADC continuous mode driver initial configurations.

### Public Members

uint32\_t **max\_store\_buf\_size**

Max length of the conversion results that driver can store, in bytes.

uint32\_t **conv\_frame\_size**

Conversion frame size, in bytes. This should be in multiples of SOC\_ADC\_DIGI\_DATA\_BYTES\_PER\_CONV.

uint32\_t **flush\_pool**

Flush the internal pool when the pool is full.

struct *adc\_continuous\_handle\_cfg\_t*::[anonymous] **flags**

Driver flags.

struct **adc\_continuous\_config\_t**

ADC continuous mode driver configurations.

### Public Members

uint32\_t **pattern\_num**

Number of ADC channels that will be used.

*adc\_digi\_pattern\_config\_t* \***adc\_pattern**

List of configs for each ADC channel that will be used.

uint32\_t **sample\_freq\_hz**

The expected ADC sampling frequency in Hz. Please refer to *soc/soc\_caps.h* to know available sampling frequency range

*adc\_digi\_convert\_mode\_t* **conv\_mode**

ADC DMA conversion mode, see *adc\_digi\_convert\_mode\_t*.

*adc\_digi\_output\_format\_t* **format**

ADC DMA conversion output format, see *adc\_digi\_output\_format\_t*.

struct **adc\_continuous\_evt\_data\_t**

Event data structure.

---

**Note:** The *conv\_frame\_buffer* is maintained by the driver itself, so never free this piece of memory.

---

### Public Members

uint8\_t \***conv\_frame\_buffer**

Pointer to conversion result buffer for one conversion frame.

`uint32_t size`

Conversion frame size.

struct `adc_continuous_evt_cbs_t`

Group of ADC continuous mode callbacks.

---

**Note:** These callbacks are all running in an ISR environment.

---

---

**Note:** When `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

---

### Public Members

[\*adc\\_continuous\\_callback\\_t on\\_conv\\_done\*](#)

Event callback, invoked when one conversion frame is done. See the subsection `Driver Backgrounds` in this header file to learn about the `conversion frame` concept.

[\*adc\\_continuous\\_callback\\_t on\\_pool\\_ovf\*](#)

Event callback, invoked when the internal pool is full.

### Macros

`ADC_MAX_DELAY`

ADC read max timeout value, it may make the `adc_continuous_read` block forever if the OS supports.

### Type Definitions

typedef struct `adc_continuous_ctx_t` \*`adc_continuous_handle_t`

Type of `adc` continuous mode driver handle.

typedef bool (`*adc_continuous_callback_t`)(`adc_continuous_handle_t` handle, const `adc_continuous_evt_data_t` \*edata, void \*user\_data)

Prototype of ADC continuous mode event callback.

**Param handle [in]** ADC continuous mode driver handle

**Param edata [in]** Pointer to ADC continuous mode event data

**Param user\_data [in]** User registered context, registered when in `adc_continuous_register_event_callbacks()`

**Return** Whether a high priority task is woken up by this function

## 2.5.3 Analog to Digital Converter (ADC) Calibration Driver

### Introduction

In ESP32-S2, the analog-to-digital converter (ADC) compares the input analog voltage to the reference, and determines each bit of the output digital result. By design, the ADC reference voltage for ESP32-S2 is 1100 mV. However,

the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide introduces the ADC calibration driver to minimize the effect of different reference voltages, and get more accurate output results.

## Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- *Calibration Scheme Creation* - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- *Result Conversion* - covers how to convert ADC raw result to calibrated result.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Minimize Noise* - describes a general way to minimize the noise.

**Calibration Scheme Creation** The ADC calibration driver provides ADC calibration scheme(s). From the calibration driver's point of view, an ADC calibration scheme is created for an ADC calibration handle `adc_cali_handle_t`.

`adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. If you already know the supported schemes, this step can be skipped. Just call the corresponding function to create the scheme handle.

If you use your custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Line Fitting Scheme** ESP32-S2 supports `ADC_CALI_SCHEME_VER_LINE_FITTING` scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

- `adc_cali_line_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_line_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_line_fitting_config_t::bitwidth`, bit width of ADC raw result.

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

This function may fail due to reasons such as `ESP_ERR_INVALID_ARG` or `ESP_ERR_NO_MEM`. Especially, when the function returns `ESP_ERR_NOT_SUPPORTED`, this means the calibration scheme required eFuse bits are not burned on your board.

```
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
adc_cali_line_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

## Delete Line Fitting Scheme

```
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

---

**Note:** If you want to use your custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in `components/esp_adc/interface/adc_cali_interface.h` to know the ESP ADC calibration interface.

---

**Result Conversion** After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to an invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme is not created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

### Get Voltage

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↳voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↳ADC1_CHAN0, voltage[0][0]);
```

**Thread Safety** The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread-safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread-safe, you should avoid calling them from multiple tasks.

**Minimize Noise** The ESP32-S2 ADC is sensitive to noise, leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g., a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

## API Reference

### Header File

- `components/esp_adc/include/esp_adc/adc_cali.h`
- This header file can be included with:

```
#include "esp_adc/adc_cali.h"
```

- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_adc
```

or

```
PRIV_REQUIRES esp_adc
```

### Functions

`esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)`

Check the supported ADC calibration scheme.

**Parameters** `scheme_mask` -- [out] Supported ADC calibration scheme(s)

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_SUPPORTED`: No supported calibration scheme

`esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)`

Convert ADC raw data to calibrated voltage.

**Parameters**

- `handle` -- [in] ADC calibration handle
- `raw` -- [in] ADC raw data

- **voltage** -- [out] Calibrated ADC voltage (in mV)

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_INVALID\_STATE: Invalid state, scheme didn't registered

**Type Definitions**

```
typedef struct adc_cali_scheme_t *adc_cali_handle_t
    ADC calibration handle.
```

**Enumerations**

```
enum adc_cali_scheme_ver_t
    ADC calibration scheme.
```

*Values:*

```
enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
    Line fitting scheme.
```

```
enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
    Curve fitting scheme.
```

**Header File**

- [components/esp\\_adc/include/esp\\_adc/adc\\_cali\\_scheme.h](#)
- This header file can be included with:

```
#include "esp_adc/adc_cali_scheme.h"
```

- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_adc
```

or

```
PRIV_REQUIRES esp_adc
```

## 2.5.4 Clock Tree

The clock subsystem of ESP32-S2 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that can be called to monitor the status of the module clocks at runtime.

**Introduction**

This section lists definitions of ESP32-S2's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help select a proper source clock for the peripheral.

**Root Clocks** Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), Wi-Fi, Bluetooth, the RTC, and the peripherals.

ESP32-S2's root clocks are listed in `soc_root_clk_t`:

- **Internal 8 MHz RC Oscillator (RC\_FAST)**  
This RC oscillator generates a about 8.5 MHz clock signal output as the `RC_FAST_CLK`. The about 8.5 MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a `RC_FAST_D256_CLK`. The exact frequency of `RC_FAST_CLK` can be computed in runtime through calibration on the `RC_FAST_D256_CLK`.
- **External 40 MHz Crystal (XTAL)**
- **Internal 90 kHz RC Oscillator (RC\_SLOW)**  
This RC oscillator generates a about 90kHz clock signal output as the `RC_SLOW_CLK`. The exact frequency of this clock can be computed in runtime through calibration.
- **External 32 kHz Crystal - optional (XTAL32K)**  
The clock source for this `XTAL32K_CLK` can be either a 32 kHz crystal connecting to the `XTAL_32K_P` and `XTAL_32K_N` pins or a 32 kHz clock signal generated by an external circuit. The external signal must be connected to the `XTAL_32K_P` pin. `XTAL32K_CLK` can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from an RC oscillator circuit is less accurate and more sensitive to the environment compared to the signal generated from a crystal. ESP32-S2 provides several clock source options for the `RTC_SLOW_CLK`, and it is possible to make the choice based on the requirements for system time accuracy and power consumption. For more details, please refer to [RTC Timer Clock Sources](#).

**Module Clocks** ESP32-S2's available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

## API Usage

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, `esp_clk_tree_src_get_freq_hz()`. This function allows you to obtain the clock frequency at any time by providing the clock name `soc_module_clk_t` and specifying the desired precision level for the returned frequency value `esp_clk_tree_src_freq_precision_t`.

## API Reference

### Header File

- `components/soc/esp32s2/include/soc/clk_tree_defs.h`
- This header file can be included with:

```
#include "soc/clk_tree_defs.h"
```

### Macros

#### `SOC_CLK_RC_FAST_FREQ_APPROX`

Approximate `RC_FAST_CLK` frequency in Hz

#### `SOC_CLK_RC_SLOW_FREQ_APPROX`

Approximate `RC_SLOW_CLK` frequency in Hz

**SOC\_CLK\_RC\_FAST\_D256\_FREQ\_APPROX**

Approximate RC\_FAST\_D256\_CLK frequency in Hz

**SOC\_CLK\_XTAL32K\_FREQ\_APPROX**

Approximate XTAL32K\_CLK frequency in Hz

**SOC\_GPTIMER\_CLKS**

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

**SOC\_LCD\_CLKS**

Array initializer for all supported clock sources of LCD.

**SOC\_RMT\_CLKS**

Array initializer for all supported clock sources of RMT.

**SOC\_TEMP\_SENSOR\_CLKS**

Array initializer for all supported clock sources of Temperature Sensor.

**SOC\_UART\_CLKS**

Array initializer for all supported clock sources of UART.

**SOC\_I2S\_CLKS**

Array initializer for all supported clock sources of I2S.

**SOC\_I2C\_CLKS**

Array initializer for all supported clock sources of I2C.

**SOC\_SPI\_CLKS**

Array initializer for all supported clock sources of SPI.

**SOC\_SDM\_CLKS**

Array initializer for all supported clock sources of SDM.

**SOC\_GLITCH\_FILTER\_CLKS**

Array initializer for all supported clock sources of Glitch Filter.

**SOC\_DAC\_DIGI\_CLKS**

Array initializer for all supported clock sources of DAC digital controller.

**SOC\_DAC\_COSINE\_CLKS**

Array initializer for all supported clock sources of DAC cosine wave generator.

**SOC\_TWAI\_CLKS**

Array initializer for all supported clock sources of TWAI.

**SOC\_ADC\_DIGI\_CLKS**

Array initializer for all supported clock sources of ADC digital controller.

**SOC\_ADC\_RTC\_CLKS**

Array initializer for all supported clock sources of ADC RTC controller.

**SOC\_MWDT\_CLKS**

Array initializer for all supported clock sources of MWDT.

**SOC\_LEDC\_CLKS**

Array initializer for all supported clock sources of LEDC.

**Enumerations**

enum **soc\_root\_clk\_t**

Root clock.

*Values:*

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_FAST**

Internal 8MHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_SLOW**

Internal 90kHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL**

External 40MHz crystal

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL32K**

External 32kHz crystal/clock signal

enum **soc\_cpu\_clk\_src\_t**

CPU\_CLK mux inputs, which are the supported clock sources for the CPU\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_CPU\_CLK\_SRC\_XTAL**

Select XTAL\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_PLL**

Select PLL\_CLK as CPU\_CLK source (PLL\_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)

enumerator **SOC\_CPU\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_APLL**

Select APLL\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_INVALID**

Invalid CPU\_CLK source

enum **soc\_rtc\_slow\_clk\_src\_t**

RTC\_SLOW\_CLK mux inputs, which are the supported clock sources for the RTC\_SLOW\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_SLOW**

Select RC\_SLOW\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_XTAL32K**

Select XTAL32K\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_FAST\_D256**

Select RC\_FAST\_D256\_CLK (referred as FOSC\_DIV or 8m\_d256/8md256 in TRM and reg. description) as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_INVALID**

Invalid RTC\_SLOW\_CLK source

enum **soc\_rtc\_fast\_clk\_src\_t**

RTC\_FAST\_CLK mux inputs, which are the supported clock sources for the RTC\_FAST\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D4**

Select XTAL\_D4\_CLK (may referred as XTAL\_CLK\_DIV\_4) as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_DIV**

Alias name for SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D4

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_INVALID**

Invalid RTC\_FAST\_CLK source

enum **soc\_xtal\_freq\_t**

Possible main XTAL frequency options on the target.

---

**Note:** Enum values equal to the frequency value in MHz

---

---

**Note:** Not all frequency values listed here are supported in IDF. Please check `SOC_XTAL_SUPPORT_XXX` in `soc_caps.h` for the supported ones.

---

*Values:*

enumerator **SOC\_XTAL\_FREQ\_40M**  
40MHz XTAL

enum **soc\_module\_clk\_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

---

**Note:** enum starts from 1, to save 0 for special purpose

---

*Values:*

enumerator **SOC\_MOD\_CLK\_CPU**  
CPU\_CLK can be sourced from XTAL, PLL, RC\_FAST, or APLL by configuring `soc_cpu_clk_src_t`

enumerator **SOC\_MOD\_CLK\_RTC\_FAST**  
RTC\_FAST\_CLK can be sourced from XTAL\_D4 or RC\_FAST by configuring `soc_rtc_fast_clk_src_t`

enumerator **SOC\_MOD\_CLK\_RTC\_SLOW**  
RTC\_SLOW\_CLK can be sourced from RC\_SLOW, XTAL32K, or RC\_FAST\_D256 by configuring `soc_rtc_slow_clk_src_t`

enumerator **SOC\_MOD\_CLK\_APB**  
APB\_CLK is highly dependent on the CPU\_CLK source

enumerator **SOC\_MOD\_CLK\_PLL\_F160M**  
PLL\_F160M\_CLK is derived from PLL, and has a fixed frequency of 160MHz

enumerator **SOC\_MOD\_CLK\_XTAL32K**  
XTAL32K\_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST**  
RC\_FAST\_CLK comes from the internal 8MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST\_D256**  
RC\_FAST\_D256\_CLK is derived from the internal 8MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_XTAL**  
XTAL\_CLK comes from the external 40MHz crystal

enumerator **SOC\_MOD\_CLK\_REF\_TICK**

REF\_TICK is derived from XTAL or RC\_FAST via a divider, it has a fixed frequency of 1MHz by default

enumerator **SOC\_MOD\_CLK\_APLL**

APLL is sourced from PLL, and its frequency is configurable through APLL configuration registers

enumerator **SOC\_MOD\_CLK\_TEMP\_SENSOR**

TEMP\_SENSOR\_CLK comes directly from the internal 8MHz rc oscillator

enumerator **SOC\_MOD\_CLK\_INVALID**

Indication of the end of the available module clock sources

enum **soc\_periph\_systimer\_clk\_src\_t**

Type of SYSTIMER clock source.

*Values:*

enumerator **SYSTIMER\_CLK\_SRC\_XTAL**

SYSTIMER source clock is XTAL

enumerator **SYSTIMER\_CLK\_SRC\_DEFAULT**

SYSTIMER source clock default choice is XTAL

enum **soc\_periph\_gptimer\_clk\_src\_t**

Type of GPTimer clock source.

*Values:*

enumerator **GPTIMER\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **GPTIMER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER\_CLK\_SRC\_DEFAULT**

Select APB as the default choice

enum **soc\_periph\_tg\_clk\_src\_legacy\_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

*Values:*

enumerator **TIMER\_SRC\_CLK\_APB**

Timer group source clock is APB

enumerator **TIMER\_SRC\_CLK\_XTAL**

Timer group source clock is XTAL

enumerator **TIMER\_SRC\_CLK\_DEFAULT**

Timer group source clock default choice is APB

enum **soc\_periph\_lcd\_clk\_src\_t**

Type of LCD clock source.

*Values:*

enumerator **LCD\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **LCD\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default choice

enum **soc\_periph\_rmt\_clk\_src\_t**

Type of RMT clock source.

*Values:*

enumerator **RMT\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **RMT\_CLK\_SRC\_REF\_TICK**

Select REF\_TICK as the source clock

enumerator **RMT\_CLK\_SRC\_DEFAULT**

Select APB as the default choice

enum **soc\_periph\_rmt\_clk\_src\_legacy\_t**

Type of RMT clock source, reserved for the legacy RMT driver.

*Values:*

enumerator **RMT\_BASECLK\_APB**

RMT source clock is APB CLK

enumerator **RMT\_BASECLK\_REF**

RMT source clock is REF\_TICK

enumerator **RMT\_BASECLK\_DEFAULT**

RMT source clock default choice is APB

enum **soc\_periph\_temperature\_sensor\_clk\_src\_t**

Type of Temp Sensor clock source.

*Values:*

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_DEFAULT**

Select RC\_FAST as the default choice

enum **soc\_periph\_uart\_clk\_src\_legacy\_t**

Type of UART clock source, reserved for the legacy UART driver.

*Values:*

enumerator **UART\_SCLK\_APB**

UART source clock is APB CLK

enumerator **UART\_SCLK\_REF\_TICK**

UART source clock is REF\_TICK

enumerator **UART\_SCLK\_DEFAULT**

UART source clock default choice is APB

enum **soc\_periph\_i2s\_clk\_src\_t**

I2S clock source enum.

*Values:*

enumerator **I2S\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default source clock

enumerator **I2S\_CLK\_SRC\_PLL\_160M**

Select PLL\_F160M as the source clock

enumerator **I2S\_CLK\_SRC\_APLL**

Select APLL as the source clock

enum **soc\_periph\_i2c\_clk\_src\_t**

Type of I2C clock source.

*Values:*

enumerator **I2C\_CLK\_SRC\_APB**

enumerator **I2C\_CLK\_SRC\_REF\_TICK**

enumerator **I2C\_CLK\_SRC\_DEFAULT**

enum **soc\_periph\_spi\_clk\_src\_t**

Type of SPI clock source.

*Values:*

enumerator **SPI\_CLK\_SRC\_DEFAULT**

Select APB as SPI source clock

enumerator **SPI\_CLK\_SRC\_APB**

Select XTAL as SPI source clock

enum **soc\_periph\_sdm\_clk\_src\_t**

Sigma Delta Modulator clock source.

*Values:*

enumerator **SDM\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **SDM\_CLK\_SRC\_DEFAULT**

Select APB as the default clock choice

enum **soc\_periph\_glitch\_filter\_clk\_src\_t**

Glitch filter clock source.

*Values:*

enumerator **GLITCH\_FILTER\_CLK\_SRC\_APB**

Select APB clock as the source clock

enumerator **GLITCH\_FILTER\_CLK\_SRC\_DEFAULT**

Select APB clock as the default clock choice

enum **soc\_periph\_dac\_digi\_clk\_src\_t**

DAC digital controller clock source.

*Values:*

enumerator **DAC\_DIGI\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **DAC\_DIGI\_CLK\_SRC\_APLL**

Select APLL as the source clock

enumerator **DAC\_DIGI\_CLK\_SRC\_DEFAULT**

Select APB as the default source clock

enum **soc\_periph\_dac\_cosine\_clk\_src\_t**

DAC cosine wave generator clock source.

*Values:*

enumerator **DAC\_COSINE\_CLK\_SRC\_RTC\_FAST**

Select RTC FAST as the source clock

enumerator **DAC\_COSINE\_CLK\_SRC\_DEFAULT**

Select RTC FAST as the default source clock

enum **soc\_periph\_twai\_clk\_src\_t**

TWAI clock source.

*Values:*

enumerator **TWAI\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **TWAI\_CLK\_SRC\_DEFAULT**

Select APB as the default clock choice

enum **soc\_periph\_adc\_digi\_clk\_src\_t**

ADC digital controller clock source.

*Values:*

enumerator **ADC\_DIGI\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **ADC\_DIGI\_CLK\_SRC\_APLL**

Select APLL as the source clock

enumerator **ADC\_DIGI\_CLK\_SRC\_DEFAULT**

Select APB as the default clock choice

enum **soc\_periph\_adc\_rtc\_clk\_src\_t**

ADC RTC controller clock source.

*Values:*

enumerator **ADC\_RTC\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **ADC\_RTC\_CLK\_SRC\_DEFAULT**

Select RC\_FAST as the default clock choice

enum **soc\_periph\_mwdt\_clk\_src\_t**

MWDT clock source.

*Values:*

enumerator **MWDT\_CLK\_SRC\_APB**

Select APB as the source clock

enumerator **MWDT\_CLK\_SRC\_DEFAULT**

Select APB as the default clock choice

enum **soc\_periph\_ledc\_clk\_src\_legacy\_t**

Type of LEDC clock source, reserved for the legacy LEDC driver.

*Values:*

enumerator **LEDC\_AUTO\_CLK**

LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer

enumerator **LEDC\_USE\_APB\_CLK**

Select APB as the source clock

enumerator **LEDC\_USE\_RC\_FAST\_CLK**

Select RC\_FAST as the source clock

enumerator **LEDC\_USE\_REF\_TICK**

Select REF\_TICK as the source clock

enumerator **LEDC\_USE\_XTAL\_CLK**

Select XTAL as the source clock

enumerator **LEDC\_USE\_RTC8M\_CLK**

Alias of 'LEDC\_USE\_RC\_FAST\_CLK'

enum **soc\_clkout\_sig\_id\_t**

*Values:*

enumerator **CLKOUT\_SIG\_PLL**

PLL\_CLK is the output of crystal oscillator frequency multiplier

enumerator **CLKOUT\_SIG\_RC\_SLOW**

RC slow clock, depends on the RTC\_CLK\_SRC configuration

enumerator **CLKOUT\_SIG\_XTAL**

Main crystal oscillator clock

enumerator **CLKOUT\_SIG\_APLL**

Divided by PLL, frequency is configurable

enumerator **CLKOUT\_SIG\_REF\_TICK**

Divided by APB clock, usually be 1MHz

enumerator **CLKOUT\_SIG\_PLL\_F80M**

From PLL, usually be 80MHz

enumerator **CLKOUT\_SIG\_RC\_FAST**

RC fast clock, about 17.5MHz

enumerator **CLKOUT\_SIG\_INVALID**

### Header File

- [components/esp\\_hw\\_support/include/esp\\_clk\\_tree.h](#)
- This header file can be included with:

```
#include "esp_clk_tree.h"
```

## Functions

`esp_err_t esp_clk_tree_src_get_freq_hz` (*soc\_module\_clk\_t* clk\_src, *esp\_clk\_tree\_src\_freq\_precision\_t* precision, *uint32\_t* \*freq\_value)

Get frequency of module clock source.

### Parameters

- **clk\_src** -- [in] Clock source available to modules, in *soc\_module\_clk\_t*
- **precision** -- [in] Degree of precision, one of *esp\_clk\_tree\_src\_freq\_precision\_t* values. This arg only applies to the clock sources that their frequencies can vary: `SOC_MOD_CLK_RTC_FAST`, `SOC_MOD_CLK_RTC_SLOW`, `SOC_MOD_CLK_RC_FAST`, `SOC_MOD_CLK_RC_FAST_D256`, `SOC_MOD_CLK_XTAL32K`. For other clock sources, this field is ignored.
- **freq\_value** -- [out] Frequency of the clock source, in Hz

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Calibration failed

## Enumerations

enum `esp_clk_tree_src_freq_precision_t`

Degree of precision of frequency value to be returned by `esp_clk_tree_src_get_freq_hz()`

Values:

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_CACHED`

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_APPROX`

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_EXACT`

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_INVALID`

## 2.5.5 Digital To Analog Converter (DAC)

### Overview

ESP32-S2 has two 8-bit DAC (digital to analog converter) channels respectively connected to GPIO17 (Channel 1) and GPIO18 (Channel 2). Each DAC channel can convert the digital value 0~255 to the analog voltage 0~Vref (The reference voltage 'Vref' here is input from the pin `VDD3P3_RTC_IO`, which ideally equals to the power supply VDD). The output voltage can be calculated as the following:

$$\text{out\_voltage} = \text{Vref} * \text{digi\_val} / 255$$

The DAC peripheral supports outputting analog signal in the following ways:

1. Outputting a voltage directly. The DAC channel keeps outputting a specified voltage.
2. Outputting continuous analog signal by DMA. The DAC converts the data in a buffer at a specified frequency.
3. Outputting a cosine wave by the cosine wave generator. The DAC channel can output a cosine wave with specified frequency and amplitude.

For other analog output options, see [Sigma-Delta Modulation](#) and [LED Control](#). Both modules produce high-frequency PWM/PDM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

## DAC File Structure

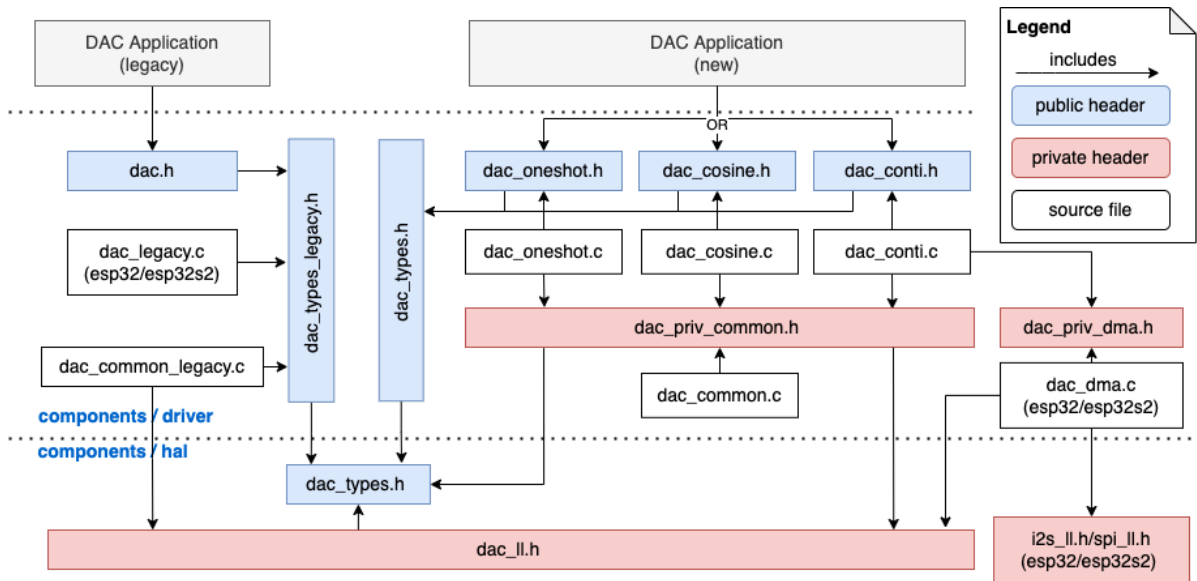

Fig. 4: DAC File Structure

**Public headers that need to be included in the DAC application are listed as follows:**

- `dac.h`: The top header file of the legacy DAC driver, which should be only included in the apps which use the legacy driver API.
- `dac_oneshot.h`: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with one-shot mode.
- `dac_cosine.h`: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with cosine mode.
- `dac_continuous.h`: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with continuous mode.

**Note:** The legacy driver cannot coexist with the new driver. Include `dac.h` to use the legacy driver or `dac_oneshot.h`, `dac_cosine.h`, and `dac_continuous.h` to use the new driver. The legacy driver might be removed in the future.

## Functional Overview

**Resources Management** The DAC on ESP32-S2 has two channels. The channels have separate software resources and can be managed by `dac_oneshot_handle_t`, `dac_cosine_handle_t`, or `dac_continuous_handle_t` according to the usage. Registering different modes on a same DAC channel is not allowed.

**Direct Voltage Output (One-shot/Direct Mode)** The DAC channels in the group can convert an 8-bit digital value into the analog when `dac_oneshot_output_voltage()` is called (it can be called in ISR). The analog voltage is kept on the DAC channel until the next conversion starts. To start the voltage conversion, the DAC channels need to be enabled first through registering by `dac_oneshot_new_channel()`.

**Continuous Wave Output (Continuous/DMA Mode)** DAC channels can convert digital data continuously via the DMA. There are three ways to write the DAC data:

1. Normal writing (synchronous): Data can be transmitted at one time and kept blocked until all the data has been loaded into the DMA buffer, and the voltage is kept as the last conversion value while no more data is

inputted. It is usually used to transport a long signal like an audio. To convert data continuously, the continuous channel handle need to be allocated by calling `dac_continuous_new_channels()` and the DMA conversion should be enabled by calling `dac_continuous_enable()`. Then data can be written by `dac_continuous_write()` synchronously. Refer to [peripherals/dac/dac\\_continuous/dac\\_audio](#) for examples.

2. Cyclical writing: A piece of data can be converted cyclically without blocking, and no more operation is needed after the data are loaded into the DMA buffer. But note that the inputted buffer size is limited by the number of descriptors and the DMA buffer size. It is usually used to transport short signals that need to be repeated, e.g., a sine wave. To achieve cyclical writing, call `dac_continuous_write_cyclically()` after the DAC continuous mode is enabled. Refer to [peripherals/dac/dac\\_continuous/signal\\_generator](#) for examples.
3. Asynchronous writing: Data can be transmitted asynchronously based on the event callback. `dac_event_callbacks_t::on_convert_done` must be registered to use asynchronous mode. Users can get the `dac_event_data_t` in the callback which contains the DMA buffer address and length, allowing them to load the data into the buffer directly. To use the asynchronous writing, call `dac_continuous_register_event_callback()` to register the `dac_event_callbacks_t::on_convert_done` before enabling, and then `dac_continuous_start_async_writing()` to start the asynchronous writing. Note that once the asynchronous writing is started, the callback function will be triggered continuously. Call `dac_continuous_write_asynchronously()` to load the data either in a separate task or in the callback directly. Refer to [peripherals/dac/dac\\_continuous/dac\\_audio](#) for examples.

On ESP32-S2, the DAC digital controller can be connected internally to the SPI3 and use its DMA for continuous conversion.

The clock sources of the DAC digital controller include:

- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_APB` supports frequency between 77 Hz to several MHz. It is the default clock which can also be selected by `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_DEFAULT`.
- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_APLL` supports frequency between 6 Hz to several MHz. However, it might be occupied by other peripherals, thus not providing the required frequency. In such case, this clock source is available only if APLL still can be correctly divided into the target DAC DMA frequency.

**Cosine Wave Output (Cosine Mode)** The DAC peripheral has a cosine wave generator, which can generate cosine wave on the channels. Users can specify the frequency, amplitude, and phase of the cosine wave. To output the cosine wave, please acquire the DAC to cosine mode using `dac_cosine_new_channel()`, and then start the cosine wave generator by `dac_cosine_start()`.

Currently, the clock source of the cosine wave generator only comes from `RTC_FAST` which can be selected by `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_FAST`. It is also the default clock source which is the same as `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_DEFAULT`.

**Power Management** When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the clock source of DAC before entering Light-sleep mode, thus potential influence to the DAC signals may lead to false data conversion.

When using DAC driver in continuous mode, it can prevent the system from changing or stopping the clock source in DMA or cosine mode by acquiring a power management lock. When the clock source is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX`. When the clock source is APLL (only in DMA mode), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the DAC is converting (i.e., DMA or cosine wave generator is working), the driver guarantees that the power management lock is acquired after calling `dac_continuous_enable()`. Likewise, the driver will release the lock when `dac_continuous_disable()` is called.

**IRAM Safe** By default, the DAC DMA interrupt will be deferred when the cache is disabled for reasons like writing/erasing Flash. Thus the DMA EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_DAC_ISR_IRAM_SAFE` which:

1. Enables the interrupt being serviced even when cache is disabled;
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

**Thread Safety** All the public DAC APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the DAC driver uses mutex lock to ensure the thread safety, thus the APIs except `dac_oneshot_output_voltage()` are not allowed to be used in ISR.

### Kconfig Options

- `CONFIG_DAC_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_DAC_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the warning message compilation while using the legacy DAC driver.
- `CONFIG_DAC_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.

### Application Example

The basic examples for the One-shot Mode, Continuous Mode, and Cosine Mode can be found in:

- `peripherals/dac/dac_oneshot`
- `peripherals/dac/dac_continuous`
- `peripherals/dac/dac_cosine_wave`

### API Reference

#### Header File

- `components/esp_driver_dac/include/driver/dac_oneshot.h`
- This header file can be included with:

```
#include "driver/dac_oneshot.h"
```

- This header file is a part of the API provided by the `esp_driver_dac` component. To declare that your component depends on `esp_driver_dac`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_dac
```

or

```
PRIV_REQUIRES esp_driver_dac
```

#### Functions

`esp_err_t dac_oneshot_new_channel` (const `dac_oneshot_config_t` \*oneshot\_cfg, `dac_oneshot_handle_t` \*ret\_handle)

Allocate a new DAC oneshot channel.

---

**Note:** The channel will be enabled as well when the channel allocated

---

#### Parameters

- **oneshot\_cfg** -- [in] The configuration for the oneshot channel
- **ret\_handle** -- [out] The returned oneshot channel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid
- ESP\_ERR\_INVALID\_STATE The DAC channel has been registered already
- ESP\_ERR\_NO\_MEM No memory for the DAC oneshot channel resources
- ESP\_OK Allocate the new DAC oneshot channel success

*esp\_err\_t* **dac\_oneshot\_del\_channel** (*dac\_oneshot\_handle\_t* handle)

Delete the DAC oneshot channel.

---

**Note:** The channel will be disabled as well when the channel deleted

---

**Parameters** **handle** -- [in] The DAC oneshot channel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid
- ESP\_ERR\_INVALID\_STATE The channel has already been de-registered
- ESP\_OK Delete the oneshot channel success

*esp\_err\_t* **dac\_oneshot\_output\_voltage** (*dac\_oneshot\_handle\_t* handle, uint8\_t digi\_value)

Output the voltage.

---

**Note:** Generally it'll take 7~11 us on ESP32 and 10~21 us on ESP32-S2

---

**Parameters**

- **handle** -- [in] The DAC oneshot channel handle
- **digi\_value** -- [in] The digital value that need to be converted

**Returns**

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid
- ESP\_OK Convert the digital value success

**Structures**

struct **dac\_oneshot\_config\_t**

DAC oneshot channel configuration.

**Public Members**

*dac\_channel\_t* **chan\_id**

DAC channel id

**Type Definitions**

typedef struct dac\_oneshot\_s \***dac\_oneshot\_handle\_t**

DAC oneshot channel handle

**Header File**

PRIV_REQUIRES esp_driver_dac
```

## Functions

`esp_err_t dac_cosine_new_channel` (const `dac_cosine_config_t` \*`cos_cfg`, `dac_cosine_handle_t` \*`ret_handle`)

Allocate a new DAC cosine wave channel.

---

**Note:** Since there is only one cosine wave generator, only the first channel can set the frequency of the cosine wave. Normally, the latter one is not allowed to set a different frequency, but it can be forced to set by setting the bit `force_set_freq` in the configuration, notice that another channel will be affected as well when the frequency is updated.

---

### Parameters

- **`cos_cfg`** -- [in] The configuration of cosine wave channel
- **`ret_handle`** -- [out] The returned cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The DAC channel has been registered already
- `ESP_ERR_NO_MEM` No memory for the DAC cosine wave channel resources
- `ESP_OK` Allocate the new DAC cosine wave channel success

`esp_err_t dac_cosine_del_channel` (`dac_cosine_handle_t` handle)

Delete the DAC cosine wave channel.

**Parameters** **handle** -- [in] The DAC cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The channel has already been deregistered
- `ESP_OK` Delete the cosine wave channel success

`esp_err_t dac_cosine_start` (`dac_cosine_handle_t` handle)

Start outputting the cosine wave on the channel.

**Parameters** **handle** -- [in] The DAC cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The channel has been started already
- `ESP_OK` Start the cosine wave success

`esp_err_t dac_cosine_stop` (`dac_cosine_handle_t` handle)

Stop outputting the cosine wave on the channel.

**Parameters** **handle** -- [in] The DAC cosine wave channel handle

### Returns

- `ESP_ERR_INVALID_ARG` The input parameter is invalid
- `ESP_ERR_INVALID_STATE` The channel has been stopped already
- `ESP_OK` Stop the cosine wave success

## Structures

struct **dac\_cosine\_config\_t**

DAC cosine channel configurations.

### Public Members

*dac\_channel\_t* **chan\_id**

The cosine wave channel id

uint32\_t **freq\_hz**

The frequency of cosine wave, unit: Hz. The cosine wave generator is driven by RTC\_FAST clock which is divide from RC\_FAST, With the default RTC clock, the minimum frequency of cosine wave is about 130 Hz, Although it can support up to several MHz frequency theoretically, the waveform will distort at high frequency due to the hardware limitation. Typically not suggest to set the frequency higher than 200 KHz

*dac\_cosine\_clk\_src\_t* **clk\_src**

The clock source of the cosine wave generator, currently only support DAC\_COSINE\_CLK\_SRC\_DEFAULT

*dac\_cosine\_atten\_t* **atten**

The attenuation of cosine wave amplitude

*dac\_cosine\_phase\_t* **phase**

The phase of cosine wave, can only support DAC\_COSINE\_PHASE\_0 or DAC\_COSINE\_PHASE\_180, default as 0 while setting an unsupported phase

int8\_t **offset**

The DC offset of cosine wave

bool **force\_set\_freq**

Force to set the cosine wave frequency

struct *dac\_cosine\_config\_t*::[anonymous] **flags**

Flags of cosine mode

## Type Definitions

typedef struct dac\_cosine\_s \***dac\_cosine\_handle\_t**

DAC cosine wave channel handle

## Header File

- `components/esp_driver_dac/include/driver/dac_continuous.h`
- This header file can be included with:

```
#include "driver/dac_continuous.h"
```

- This header file is a part of the API provided by the `esp_driver_dac` component. To declare that your component depends on `esp_driver_dac`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_dac
```

or

```
PRIV_REQUIRES esp_driver_dac
```

## Functions

*esp\_err\_t* **dac\_continuous\_new\_channels** (const *dac\_continuous\_config\_t* \*cont\_cfg,  
*dac\_continuous\_handle\_t* \*ret\_handle)

Allocate new DAC channels in continuous mode.

---

**Note:** The DAC channels can't be registered to continuous mode separately

---

### Parameters

- **cont\_cfg** -- [in] Continuous mode configuration
- **ret\_handle** -- [out] The returned continuous mode handle

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The DAC channel has been registered already
- **ESP\_ERR\_NOT\_FOUND** Not found the available dma peripheral, might be occupied
- **ESP\_ERR\_NO\_MEM** No memory for the DAC continuous mode resources
- **ESP\_OK** Allocate the new DAC continuous mode success

*esp\_err\_t* **dac\_continuous\_del\_channels** (*dac\_continuous\_handle\_t* handle)

Delete the DAC continuous handle.

**Parameters** **handle** -- [in] The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The channels have already been deregistered or not disabled
- **ESP\_OK** Delete the continuous channels success

*esp\_err\_t* **dac\_continuous\_enable** (*dac\_continuous\_handle\_t* handle)

Enabled the DAC continuous mode.

---

**Note:** Must enable the channels before

---

**Parameters** **handle** -- [in] The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The channels have been enabled already
- **ESP\_OK** Enable the continuous output success

*esp\_err\_t* **dac\_continuous\_disable** (*dac\_continuous\_handle\_t* handle)

Disable the DAC continuous mode.

**Parameters** **handle** -- [in] The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

### Returns

- **ESP\_ERR\_INVALID\_ARG** The input parameter is invalid
- **ESP\_ERR\_INVALID\_STATE** The channels have been enabled already
- **ESP\_OK** Disable the continuous output success

*esp\_err\_t* **dac\_continuous\_write** (*dac\_continuous\_handle\_t* handle, uint8\_t \*buf, size\_t buf\_size, size\_t \*bytes\_loaded, int timeout\_ms)

Write DAC data continuously.

---

**Note:** The data in buffer will only be converted one time, This function will be blocked until all data loaded or timeout then the DAC output will keep outputting the voltage of the last data in the buffer

---

---

**Note:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available, The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing CONFIG\_DAC\_DMA\_AUTO\_16BIT\_ALIGN in menuconfig.

---

#### Parameters

- **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **buf** -- **[in]** The digital data buffer to convert
- **buf\_size** -- **[in]** The buffer size of digital data buffer
- **bytes\_loaded** -- **[out]** The bytes that has been loaded into DMA buffer, can be NULL if don't need it
- **timeout\_ms** -- **[in]** The timeout time in millisecond, set a minus value means will block forever

#### Returns

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid
- ESP\_ERR\_INVALID\_STATE The DAC continuous mode has not been enabled yet
- ESP\_ERR\_TIMEOUT Waiting for semaphore or message queue timeout
- ESP\_OK Success to output the acyclic DAC data

*esp\_err\_t* **dac\_continuous\_write\_cyclically** (*dac\_continuous\_handle\_t* handle, uint8\_t \*buf, size\_t buf\_size, size\_t \*bytes\_loaded)

Write DAC continuous data cyclically.

---

**Note:** The data in buffer will be converted cyclically using DMA once this function is called, This function will return once the data loaded into DMA buffers.

---

---

**Note:** The buffer size of cyclically output is limited by the descriptor number and dma buffer size while initializing the continuous mode. Concretely, in order to load all the data into descriptors, the cyclic buffer size is not supposed to be greater than `desc_num * buf_size`

---

---

**Note:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available, The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing CONFIG\_DAC\_DMA\_AUTO\_16BIT\_ALIGN in menuconfig.

---

#### Parameters

- **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **buf** -- **[in]** The digital data buffer to convert
- **buf\_size** -- **[in]** The buffer size of digital data buffer
- **bytes\_loaded** -- **[out]** The bytes that has been loaded into DMA buffer, can be NULL if don't need it

#### Returns

- ESP\_ERR\_INVALID\_ARG The input parameter is invalid

- `ESP_ERR_INVALID_STATE` The DAC continuous mode has not been enabled yet
- `ESP_OK` Success to output the acyclic DAC data

`esp_err_t dac_continuous_register_event_callback` (*dac\_continuous\_handle\_t* handle, const *dac\_event\_callbacks\_t* \*callbacks, void \*user\_data)

Set event callbacks for DAC continuous mode.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to `NULL`.

---

---

**Note:** When `CONFIG_DAC_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in this function, including the `user_data`, should be in the internal RAM as well.

---

#### Parameters

- **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **callbacks** -- **[in]** Group of callback functions, input `NULL` to clear the former callbacks
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK` Set event callbacks successfully
- `ESP_ERR_INVALID_ARG` Set event callbacks failed because of invalid argument

`esp_err_t dac_continuous_start_async_writing` (*dac\_continuous\_handle\_t* handle)

Start the async writing.

---

**Note:** When the asynchronous writing start, the DAC will keep outputting '0' until the data are loaded into the DMA buffer. To loaded the data into DMA buffer, 'on\_convert\_done' callback is required, which can be registered by 'dac\_continuous\_register\_event\_callback' before enabling

---

**Parameters** **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

#### Returns

- `ESP_OK` Start asynchronous writing successfully
- `ESP_ERR_INVALID_ARG` The handle is `NULL`
- `ESP_ERR_INVALID_STATE` The channel is not enabled or the 'on\_convert\_done' callback is not registered

`esp_err_t dac_continuous_stop_async_writing` (*dac\_continuous\_handle\_t* handle)

Stop the sync writing.

**Parameters** **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'

#### Returns

- `ESP_OK` Stop asynchronous writing successfully
- `ESP_ERR_INVALID_ARG` The handle is `NULL`
- `ESP_ERR_INVALID_STATE` Asynchronous writing has not started

`esp_err_t dac_continuous_write_asynchronously` (*dac\_continuous\_handle\_t* handle, `uint8_t` \*dma\_buf, `size_t` dma\_buf\_len, const `uint8_t` \*data, `size_t` data\_len, `size_t` \*bytes\_loaded)

Write DAC data asynchronously.

---

**Note:** This function can be called when the asynchronous writing started, and it can be called in the callback directly but recommend to writing data in a task, referring to `:example:peripherals/dac/dac_continuous/dac_audio`

---

#### Parameters

- **handle** -- **[in]** The DAC continuous channel handle that obtained from 'dac\_continuous\_new\_channels'
- **dma\_buf** -- **[in]** The DMA buffer address, it can be acquired from '*dac\_event\_data\_t*' in the 'on\_convert\_done' callback
- **dma\_buf\_len** -- **[in]** The DMA buffer length, it can be acquired from '*dac\_event\_data\_t*' in the 'on\_convert\_done' callback
- **data** -- **[in]** The data that need to be written
- **data\_len** -- **[in]** The data length the need to be written
- **bytes\_loaded** -- **[out]** The bytes number that has been loaded/written into the DMA buffer

#### Returns

- ESP\_OK Write the data into DMA buffer successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE The channels haven't start the asynchronous writing
- ESP\_ERR\_NOT\_FOUND The param 'dam\_buf' not match any existed DMA buffer

### Structures

struct **dac\_continuous\_config\_t**

DAC continuous channels' configurations.

### Public Members

*dac\_channel\_mask\_t* **chan\_mask**

DAC channels' mask for selecting which channels are used

uint32\_t **desc\_num**

The number of DMA descriptor, at least 2 descriptors are required The number of descriptors is directly proportional to the max data buffer size while converting in cyclic output but only need to ensure it is greater than '1' in acyclic output Typically, suggest to set the number bigger than 5, in case the DMA stopped while sending a short buffer

size\_t **buf\_size**

The DMA buffer size, should be within 32~4092 bytes. Each DMA buffer will be attached to a DMA descriptor, i.e. the number of DMA buffer will be equal to the DMA descriptor number The DMA buffer size is not allowed to be greater than 4092 bytes The total DMA buffer size equal to `desc_num * buf_size` Typically, suggest to set the size to the multiple of 4

uint32\_t **freq\_hz**

The frequency of DAC conversion in continuous mode, unit: Hz The supported range is related to the target and the clock source. For the clock `DAC_DIGI_CLK_SRC_DEFAULT`: the range is 19.6 KHz to several MHz on ESP32 and 77 Hz to several MHz on ESP32-S2. For the clock `DAC_DIGI_CLK_SRC_APLL`: the range is 648 Hz to several MHz on ESP32 and 6 Hz to several MHz on ESP32-S2. Typically not suggest to set the frequency higher than 2 MHz, otherwise the severe distortion will appear

`int8_t offset`

The offset of the DAC digital data. Range -128~127

`dac_continuous_digi_clk_src_t clk_src`

The clock source of digital controller, which can affect the range of supported frequency. Currently `DAC_DIGI_CLK_SRC_DEFAULT` and `DAC_DIGI_CLK_SRC_APLL` are available

`dac_continuous_channel_mode_t chan_mode`

The channel mode of continuous mode, only take effect when multiple channels enabled, depends converting the buffer alternately or simultaneously

struct `dac_event_data_t`

Event structure used in DAC event queue.

### Public Members

void `*buf`

The pointer of DMA buffer that just finished sending

size\_t `buf_size`

The writable buffer size of the DMA buffer, equal to '`dac_continuous_config_t::buf_size`'

size\_t `write_bytes`

The number of bytes that be written successfully

struct `dac_event_callbacks_t`

Group of DAC callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When `CONFIG_DAC_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

`dac_isr_callback_t on_convert_done`

Callback of data conversion done event. An event data buffer previously loaded to the driver has been output and converted. The event data includes DMA buffer address and size that just finished converting.

`dac_isr_callback_t on_stop`

Callback of finished sending all the data. All loaded event data buffers are converted. Driver is pending for new data buffers to be loaded. The event data will be NULL in this callback.

### Type Definitions

typedef struct `dac_continuous_s` `*dac_continuous_handle_t`

DAC continuous channel handle

```
typedef bool (*dac_isr_callback_t)(dac_continuous_handle_t handle, const dac_event_data_t *event, void *user_data)
```

DAC event callback.

**Param handle [in]** DAC channel handle, created from `dac_continuous_new_channels()`

**Param event [in]** DAC event data

**Param user\_data [in]** User registered context, passed from `dac_continuous_register_event_callback()`

**Return** Whether a high priority task has been waken up by this callback function

## Enumerations

```
enum dac_channel_mask_t
```

DAC channel mask.

*Values:*

enumerator **DAC\_CHANNEL\_MASK\_CH0**

DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator **DAC\_CHANNEL\_MASK\_CH1**

DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator **DAC\_CHANNEL\_MASK\_ALL**

Both DAC channel 0 and channel 1

## Header File

- [components/esp\\_driver\\_dac/include/driver/dac\\_types.h](#)
- This header file can be included with:

```
#include "driver/dac_types.h"
```

- This header file is a part of the API provided by the `esp_driver_dac` component. To declare that your component depends on `esp_driver_dac`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_dac
```

or

```
PRIV_REQUIRES esp_driver_dac
```

## Type Definitions

```
typedef soc_periph_dac_digi_clk_src_t dac_continuous_digi_clk_src_t
```

DAC DMA (digital controller) clock source.

```
typedef soc_periph_dac_cosine_clk_src_t dac_cosine_clk_src_t
```

DAC cosine wave generator clock source.

## Enumerations

```
enum dac_continuous_channel_mode_t
```

DAC channel work mode in dma mode.

---

**Note:** Only take effect when multiple channels enabled.

---

---

**Note:** Assume the data in buffer is 'A B C D E F' DAC\_CHANNEL\_MODE\_SIMUL:

- channel 0: A B C D E F
  - channel 1: A B C D E F DAC\_CHANNEL\_MODE\_ALTER:
  - channel 0: A C E
  - channel 1: B D F
- 

*Values:*

enumerator **DAC\_CHANNEL\_MODE\_SIMUL**

The data in the DMA buffer is simultaneously output to the enable channel of the DAC.

enumerator **DAC\_CHANNEL\_MODE\_ALTER**

The data in the DMA buffer is alternately output to the enable channel of the DAC.

### Header File

- [components/hal/include/hal/dac\\_types.h](#)
- This header file can be included with:

```
#include "hal/dac_types.h"
```

### Enumerations

enum **dac\_channel\_t**

*Values:*

enumerator **DAC\_CHAN\_0**

DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator **DAC\_CHAN\_1**

DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator **DAC\_CHANNEL\_1**

Alias of 'DAC\_CHAN\_0', now the channel index start from '0'

enumerator **DAC\_CHANNEL\_2**

Alias of 'DAC\_CHAN\_1', now the channel index start from '0'

enum **dac\_cosine\_atten\_t**

The attenuation of the amplitude of the cosine wave generator. The max amplitude is VDD3P3\_RTC.

*Values:*

enumerator **DAC\_COSINE\_ATTEN\_DEFAULT**

No attenuation to the DAC cosine wave amplitude. Default.

enumerator **DAC\_COSINE\_ATTEN\_DB\_0**

Original amplitude of the DAC cosine wave, equals to DAC\_COSINE\_ATTEN\_DEFAULT

enumerator **DAC\_COSINE\_ATTEN\_DB\_6**

1/2 amplitude of the DAC cosine wave

enumerator **DAC\_COSINE\_ATTEN\_DB\_12**

1/4 amplitude of the DAC cosine wave

enumerator **DAC\_COSINE\_ATTEN\_DB\_18**

1/8 amplitude of the DAC cosine wave

enum **dac\_cosine\_phase\_t**

Set the phase of the cosine wave generator output.

---

**Note:** Only 0 or 180 are supported, it will be set to 0 as default if configured to an unsupported phase.

---

*Values:*

enumerator **DAC\_COSINE\_PHASE\_0**

Phase shift +0°

enumerator **DAC\_COSINE\_PHASE\_180**

Phase shift +180°

## 2.5.6 GPIO & RTC GPIO

### GPIO Summary

The ESP32-S2 chip features 43 physical GPIO pins (GPIO0 ~ GPIO21 and GPIO26 ~ GPIO46). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through IO MUX, RTC IO MUX and the GPIO matrix, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32-S2 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	RTC GPIO	Comment
GPIO0		RTC_GPIO0	Strapping pin
GPIO1	ADC1_CH0	RTC_GPIO1	
GPIO2	ADC1_CH1	RTC_GPIO2	
GPIO3	ADC1_CH2	RTC_GPIO3	
GPIO4	ADC1_CH3	RTC_GPIO4	
GPIO5	ADC1_CH4	RTC_GPIO5	
GPIO6	ADC1_CH5	RTC_GPIO6	
GPIO7	ADC1_CH6	RTC_GPIO7	
GPIO8	ADC1_CH7	RTC_GPIO8	
GPIO9	ADC1_CH8	RTC_GPIO9	
GPIO10	ADC1_CH9	RTC_GPIO10	
GPIO11	ADC2_CH0	RTC_GPIO11	
GPIO12	ADC2_CH1	RTC_GPIO12	

continues on next page

Table 2 – continued from previous page

GPIO	Analog Function	RTC GPIO	Comment
GPIO13	ADC2_CH2	RTC_GPIO13	
GPIO14	ADC2_CH3	RTC_GPIO14	
GPIO15	ADC2_CH4	RTC_GPIO15	
GPIO16	ADC2_CH5	RTC_GPIO16	
GPIO17	ADC2_CH6	RTC_GPIO17	
GPIO18	ADC2_CH7	RTC_GPIO18	
GPIO19	ADC2_CH8	RTC_GPIO19	
GPIO20	ADC2_CH9	RTC_GPIO20	
GPIO21		RTC_GPIO21	
GPIO26			SPI0/1
GPIO27			SPI0/1
GPIO28			SPI0/1
GPIO29			SPI0/1
GPIO30			SPI0/1
GPIO31			SPI0/1
GPIO32			SPI0/1
GPIO33			
GPIO34			
GPIO35			
GPIO36			
GPIO37			
GPIO38			
GPIO39			JTAG
GPIO40			JTAG
GPIO41			JTAG
GPIO42			JTAG
GPIO43			
GPIO44			
GPIO45			Strapping pin
GPIO46			GPI; Strapping pin

**Note:**

- Strapping pin: GPIO0, GPIO45 and GPIO46 are strapping pins. For more information, please refer to [ESP32-S2 datasheet](#)
- SPI0/1: GPIO26-32 are usually used for SPI flash and PSRAM and not recommended for other uses.
- JTAG: GPIO39-42 are usually used for inline debug.
- GPI: GPIO46 is fixed to pull-down and is input only.

There is also separate "RTC GPIO" support, which functions when GPIOs are routed to the "RTC" low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- The *Ultra Low Power FSM co-processor* is running
- The *Ultra Low Power RISC-V co-processor* is running
- Analog functions such as ADC/DAC/etc are in use

**Check Current Configuration of IOs**

GPIO driver offers a dump function `gpio_dump_io_configuration()` to show the current configurations of IOs, such as pull-up/pull-down, input/output enable, pin mapping, etc. Below is an example of how to dump the configuration of GPIO4, GPIO18, and GPIO26:

```
gpio_dump_io_configuration(stdout, (1ULL << 4) | (1ULL << 18) | (1ULL << 26));
```

The dump will be like this:

```
=====IO DUMP Start=====
IO[4] -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigIn ID: (simple GPIO input)
  SleepSelEn: 1

IO[18] -
  Pullup: 0, Pulldown: 0, DriveCap: 2
  InputEn: 0, OutputEn: 1, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigOut ID: 256 (simple GPIO output)
  SleepSelEn: 1

IO[26] **RESERVED** -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 0 (IOMUX)
  SleepSelEn: 1

=====IO DUMP End=====
```

In addition, if you would like to dump the configurations of all IOs, you can use:

```
gpio_dump_all_io_configuration(stdout, SOC_GPIO_VALID_GPIO_MASK);
```

If an IO pin is routed to a peripheral signal through the GPIO matrix, the signal ID printed in the dump information is defined in the [soc/esp32s2/include/soc/gpio\\_sig\\_map.h](#) header file. The word **\*\*RESERVED\*\*** indicates the IO is occupied by either SPI flash or PSRAM. It is strongly not recommended to reconfigure them for other application purposes.

Do not rely on the default configurations values in the Technical Reference Manual, because it may be changed in the bootloader or application startup code before `app_main`.

### Configure USB PHY Pins to GPIO

To configure the USB PHY pins to GPIO, you can use the function `gpio_config()`. Below is an example of how to configure the USB PHY pins to GPIO:

```
gpio_config_t usb_phy_conf = {
    .pin_bit_mask = (1ULL << USB_PHY_DP_PIN) | (1ULL << USB_PHY_DM_PIN),
    .mode = GPIO_MODE_INPUT_OUTPUT,
    .pull_up_en = 0,
    .pull_down_en = 0,
    .intr_type = GPIO_INTR_DISABLE,
};
gpio_config(&usb_phy_conf);
```

### GPIO Glitch Filter

The ESP32-S2 chip features hardware filters to remove unwanted glitch pulses from the input GPIO, which can help reduce false triggering of the interrupt and prevent a noise being routed to the peripheral side.

Each GPIO can be configured with a glitch filter, which can be used to filter out pulses shorter than **two** sample clock cycles. The duration of the filter is not configurable. The sample clock is the clock source of the

IO\_MUX. In the driver, we call this kind of filter as `pin glitch filter`. You can create the filter handle by calling `gpio_new_pin_glitch_filter()`. All the configurations for a pin glitch filter are listed in the `gpio_pin_glitch_filter_config_t` structure.

- `gpio_pin_glitch_filter_config_t::gpio_num` sets the GPIO number to enable the glitch filter.

The glitch filter is disabled by default, and can be enabled by calling `gpio_glitch_filter_enable()`. To recycle the filter, you can call `gpio_del_glitch_filter()`. Please note, before deleting the filter, you should disable it first by calling `gpio_glitch_filter_disable()`.

### Application Example

- GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

## API Reference - Normal GPIO

### Header File

- `components/esp_driver_gpio/include/driver/gpio.h`
- This header file can be included with:

```
#include "driver/gpio.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

```
PRIV_REQUIRES esp_driver_gpio
```

### Functions

`esp_err_t gpio_config` (const `gpio_config_t` \*pGPIOConfig)

GPIO common configuration.

```
Configure GPIO's Mode, pull-up, PullDown, IntrType
```

**Parameters** `pGPIOConfig` -- Pointer to GPIO configure struct

**Returns**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

`esp_err_t gpio_reset_pin` (`gpio_num_t` gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

---

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

---

**Parameters** `gpio_num` -- GPIO number.

**Returns** Always return `ESP_OK`.

`esp_err_t gpio_set_intr_type` (`gpio_num_t` gpio\_num, `gpio_int_type_t` intr\_type)

GPIO set interrupt trigger type.

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **intr\_type** -- Interrupt type, select from gpio\_int\_type\_t

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_enable** (gpio\_num\_t gpio\_num)

Enable GPIO module interrupt signal.

---

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue.

---

**Parameters** **gpio\_num** -- GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_disable** (gpio\_num\_t gpio\_num)

Disable GPIO module interrupt signal.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters** **gpio\_num** -- GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_level** (gpio\_num\_t gpio\_num, uint32\_t level)

GPIO set output level.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set the output level of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **level** -- Output level. 0: low ; 1: high

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO number error

int **gpio\_get\_level** (gpio\_num\_t gpio\_num)

GPIO get input level.

<p><b>Warning:</b> If the pad is not configured for input (or input and output) the returned value is always 0.</p>
---

**Parameters** `gpio_num` -- GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

*esp\_err\_t* `gpio_set_direction` (`gpio_num_t` `gpio_num`, *gpio\_mode\_t* `mode`)

GPIO set direction.

Configure GPIO direction, such as `output_only`, `input_only`, `output_and_input`

**Parameters**

- `gpio_num` -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` -- GPIO direction

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO error

*esp\_err\_t* `gpio_set_pull_mode` (`gpio_num_t` `gpio_num`, *gpio\_pull\_mode\_t* `pull`)

Configure GPIO pull-up/pull-down resistors.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- `gpio_num` -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull` -- GPIO pull up/down mode.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` : Parameter error

*esp\_err\_t* `gpio_wakeup_enable` (`gpio_num_t` `gpio_num`, *gpio\_int\_type\_t* `intr_type`)

Enable GPIO wake-up function.

**Parameters**

- `gpio_num` -- GPIO number.
- `intr_type` -- GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* `gpio_wakeup_disable` (`gpio_num_t` `gpio_num`)

Disable GPIO wake-up function.

**Parameters** `gpio_num` -- GPIO number

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* `gpio_isr_register` (`void (*fn)(void*)`, `void *arg`, `int intr_alloc_flags`, *gpio\_isr\_handle\_t* `*handle`)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

**Parameters**

- **fn** -- Interrupt handler function.
- **arg** -- Parameter for handler function
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (gpio\_num\_t gpio\_num)

Enable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pullup\_dis** (gpio\_num\_t gpio\_num)

Disable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpiopulldown\_en** (gpio\_num\_t gpio\_num)

Enable pull-down on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpiopulldown\_dis** (gpio\_num\_t gpio\_num)

Disable pull-down on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the GPIO driver's ETS\_GPIO\_INTR\_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio\_isr\_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio\_isr\_handler\_add() function.

**Parameters** **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM No memory to install this service
- ESP\_ERR\_INVALID\_STATE ISR service already installed.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_INVALID\_ARG GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (gpio\_num\_t gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

#### Parameters

- **gpio\_num** -- GPIO number
- **isr\_handler** -- ISR handler function for the corresponding GPIO number.
- **args** -- parameter for ISR handler.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_isr\_handler\_remove** (gpio\_num\_t gpio\_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters** **gpio\_num** -- GPIO number

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Wrong state, the ISR service has not been initialized.
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* strength)

Set GPIO pad drive capability.

#### Parameters

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_get\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get GPIO pad drive capability.

#### Parameters

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_hold\_en** (gpio\_num\_t gpio\_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the power domain of where GPIO/IOMUX belongs to becomes off. For example, chip or system is reset (e.g. watchdog time-out, deep-sleep events are triggered), or peripheral power-down in light-sleep.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

Please be aware that,

On ESP32P4, the states of IOs can not be hold after waking up from Deep-sleep.

Additionally, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters** `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

*esp\_err\_t* `gpio_hold_dis` (`gpio_num_t` `gpio_num`)

Disable gpio pad hold function.

When the chip is woken up from peripheral power-down sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters** `gpio_num` -- GPIO number, only support output-capable GPIOs

**Returns**

- `ESP_OK` Success
- `ESP_ERR_NOT_SUPPORTED` Not support pad hold function

void `gpio_deep_sleep_hold_en` (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void `gpio_deep_sleep_hold_dis` (void)

Disable all digital gpio pads hold function during Deep-sleep.

void `gpio_iomux_in` (`uint32_t` `gpio_num`, `uint32_t` `signal_idx`)

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- `gpio_num` -- GPIO number of the pad.
- `signal_idx` -- Peripheral signal id to input. One of the `*_IN_IDX` signals in `soc/gpio_sig_map.h`.

void `gpio_iomux_out` (`uint8_t` `gpio_num`, `int` `func`, `bool` `out_en_inv`)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- `gpio_num` -- `gpio_num` GPIO number of the pad.
- `func` -- The function number of the peripheral pin to output pin. One of the `FUNC_X_*` of specified pin (X) in `soc/io_mux_reg.h`.
- `out_en_inv` -- True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* `gpio_force_hold_all` (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

**Warning:**

- a. This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), **MUST** be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.
- b. The hold state of all pads will be cancelled during ROM boot, so it is not recommended to use this API to hold the pads state during deepsleep and reset.

*esp\_err\_t* `gpio_force_unhold_all` (void)

Unhold all digital and rtc gpio pads.

---

**Note:** The global hold signal and the hold signal of each IO act on the PAD through 'or' logic, so if a pad has already been configured to hold by `gpio_hold_en`, this API can't release its hold state.

---

*esp\_err\_t* `gpio_sleep_sel_en` (gpio\_num\_t gpio\_num)

Enable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** `gpio_num` -- GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* `gpio_sleep_sel_dis` (gpio\_num\_t gpio\_num)

Disable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** `gpio_num` -- GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* `gpio_sleep_set_direction` (gpio\_num\_t gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

**Parameters**

- `gpio_num` -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* `gpio_sleep_set_pull_mode` (gpio\_num\_t gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- `gpio_num` -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull` -- GPIO pull up/down mode.

**Returns**

- ESP\_OK Success

- `ESP_ERR_INVALID_ARG` : Parameter error

*esp\_err\_t* **gpio\_dump\_io\_configuration** (FILE \*out\_stream, uint64\_t io\_bit\_mask)

Dump IO configuration information to console.

#### Parameters

- `out_stream` -- IO stream (e.g. stdout)
- `io_bit_mask` -- IO pin bit mask, each bit maps to an IO

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

## Structures

struct **gpio\_config\_t**

Configuration parameters of GPIO pad for `gpio_config` function.

### Public Members

uint64\_t **pin\_bit\_mask**

GPIO pin: set with bit mask, each bit maps to a GPIO

*gpio\_mode\_t* **mode**

GPIO mode: set input/output mode

*gpio\_pullup\_t* **pull\_up\_en**

GPIO pull-up

*gpio\_pulldown\_t* **pull\_down\_en**

GPIO pull-down

*gpio\_int\_type\_t* **intr\_type**

GPIO interrupt type

## Macros

**GPIO\_PIN\_COUNT**

**GPIO\_IS\_VALID\_GPIO** (gpio\_num)

Check whether it is a valid GPIO number.

**GPIO\_IS\_VALID\_OUTPUT\_GPIO** (gpio\_num)

Check whether it can be a valid GPIO number of output mode.

**GPIO\_IS\_VALID\_DIGITAL\_IO\_PAD** (gpio\_num)

Check whether it can be a valid digital I/O pad.

## Type Definitions

typedef *intr\_handle\_t* **gpio\_isr\_handle\_t**

typedef void (\***gpio\_isr\_t**)(void \*arg)

GPIO interrupt handler.

**Param arg** User registered data

### Enumerations

enum `gpio_port_t`

*Values:*

enumerator `GPIO_PORT_0`

enumerator `GPIO_PORT_MAX`

enum `gpio_int_type_t`

*Values:*

enumerator `GPIO_INTR_DISABLE`

Disable GPIO interrupt

enumerator `GPIO_INTR_POSEDGE`

GPIO interrupt type : rising edge

enumerator `GPIO_INTR_NEGEDGE`

GPIO interrupt type : falling edge

enumerator `GPIO_INTR_ANYEDGE`

GPIO interrupt type : both rising and falling edge

enumerator **GPIO\_INTR\_LOW\_LEVEL**

GPIO interrupt type : input low level trigger

enumerator **GPIO\_INTR\_HIGH\_LEVEL**

GPIO interrupt type : input high level trigger

enumerator **GPIO\_INTR\_MAX**

enum **gpio\_mode\_t**

*Values:*

enumerator **GPIO\_MODE\_DISABLE**

GPIO mode : disable input and output

enumerator **GPIO\_MODE\_INPUT**

GPIO mode : input only

enumerator **GPIO\_MODE\_OUTPUT**

GPIO mode : output only mode

enumerator **GPIO\_MODE\_OUTPUT\_OD**

GPIO mode : output only with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT\_OD**

GPIO mode : output and input with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT**

GPIO mode : output and input mode

enum **gpio\_pullup\_t**

*Values:*

enumerator **GPIO\_PULLUP\_DISABLE**

Disable GPIO pull-up resistor

enumerator **GPIO\_PULLUP\_ENABLE**

Enable GPIO pull-up resistor

enum **gpiopulldown\_t**

*Values:*

enumerator **GPIO\_PULLDOWN\_DISABLE**

Disable GPIO pull-down resistor

enumerator **GPIO\_PULLDOWN\_ENABLE**

Enable GPIO pull-down resistor

enum **gpio\_pull\_mode\_t**

*Values:*

enumerator **GPIO\_PULLUP\_ONLY**

Pad pull up

enumerator **GPIO\_PULLDOWN\_ONLY**

Pad pull down

enumerator **GPIO\_PULLUP\_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO\_FLOATING**

Pad floating

enum **gpio\_drive\_cap\_t**

*Values:*

enumerator **GPIO\_DRIVE\_CAP\_0**

Pad drive capability: weak

enumerator **GPIO\_DRIVE\_CAP\_1**

Pad drive capability: stronger

enumerator **GPIO\_DRIVE\_CAP\_2**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_DEFAULT**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_3**

Pad drive capability: strongest

enumerator **GPIO\_DRIVE\_CAP\_MAX**

## API Reference - RTC GPIO

### Header File

- [components/esp\\_driver\\_gpio/include/driver/rtc\\_io.h](#)
- This header file can be included with:

```
#include "driver/rtc_io.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

```
PRIV_REQUIRES esp_driver_gpio
```

## Functions

bool **rtc\_gpio\_is\_valid\_gpio** (gpio\_num\_t gpio\_num)

Determine if the specified GPIO is a valid RTC GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns** true if GPIO is valid for RTC GPIO use. false otherwise.

int **rtc\_io\_number\_get** (gpio\_num\_t gpio\_num)

Get RTC IO index number by gpio number.

**Parameters** **gpio\_num** -- GPIO number

**Returns** >=0: Index of rtcio. -1 : The gpio is not rtcio.

*esp\_err\_t* **rtc\_gpio\_init** (gpio\_num\_t gpio\_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_deinit** (gpio\_num\_t gpio\_num)

Init a GPIO as digital GPIO.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

uint32\_t **rtc\_gpio\_get\_level** (gpio\_num\_t gpio\_num)

Get the RTC IO input level.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- 1 High level
- 0 Low level
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_level** (gpio\_num\_t gpio\_num, uint32\_t level)

Set the RTC IO output level.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **level** -- output level

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction** (gpio\_num\_t gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_direction\_in\_sleep** (gpio\_num\_t gpio\_num, *rtc\_gpio\_mode\_t* mode)

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 supports INPUT\_ONLY mode. The rest targets support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**Parameters**

- **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_en** (gpio\_num\_t gpio\_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_en** (gpio\_num\_t gpio\_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_dis** (gpio\_num\_t gpio\_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pulldown\_dis** (gpio\_num\_t gpio\_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* strength)

Set RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (gpio\_num\_t gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get RTC GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_iomux\_func\_sel** (gpio\_num\_t gpio\_num, int func)

Select a RTC IOMUX function for the RTC IO.

**Parameters**

- **gpio\_num** -- GPIO number
- **func** -- Function to assign to the pin

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_hold\_en** (gpio\_num\_t gpio\_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_hold\_dis** (gpio\_num\_t gpio\_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**Parameters** **gpio\_num** -- GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_force\_hold\_en\_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a "force hold" input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

*esp\_err\_t* **rtc\_gpio\_force\_hold\_dis\_all** (void)

Disable force hold signal for all RTC IOs.

*esp\_err\_t* **rtc\_gpio\_wakeup\_enable** (gpio\_num\_t gpio\_num, *gpio\_intr\_type\_t* intr\_type)

Enable wakeup from sleep mode using specific GPIO.

**Parameters**

- **gpio\_num** -- GPIO number
- **intr\_type** -- Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO, or intr\_type is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

*esp\_err\_t* **rtc\_gpio\_wakeup\_disable** (gpio\_num\_t gpio\_num)

Disable wakeup from sleep mode using specific GPIO.

**Parameters** `gpio_num` -- GPIO number

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `gpio_num` is not an RTC IO

### Macros

### Enumerations

enum **rtc\_gpio\_mode\_t**

RTCIO output/input mode type.

*Values:*

enumerator **RTC\_GPIO\_MODE\_INPUT\_ONLY**

Pad input

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_ONLY**

Pad output

enumerator **RTC\_GPIO\_MODE\_INPUT\_OUTPUT**

Pad input + output

enumerator **RTC\_GPIO\_MODE\_DISABLED**

Pad (output + input) disable

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_OD**

Pad open-drain output

enumerator `RTC_GPIO_MODE_INPUT_OUTPUT_OD`

Pad input + open-drain output

## API Reference - GPIO Glitch Filter

### Header File

- `components/esp_driver_gpio/include/driver/gpio_filter.h`
- This header file can be included with:

```
#include "driver/gpio_filter.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

```
PRIV_REQUIRES esp_driver_gpio
```

### Functions

`esp_err_t gpio_new_pin_glitch_filter` (const `gpio_pin_glitch_filter_config_t` \*config, `gpio_glitch_filter_handle_t` \*ret\_filter)

Create a pin glitch filter.

---

**Note:** Pin glitch filter parameters are fixed, pulses shorter than two sample clocks (IO-MUX's source clock) will be filtered out. It's independent with "flex" glitch filter. See also `gpio_new_flex_glitch_filter`.

---

---

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

---

#### Parameters

- **config** -- [in] Glitch filter configuration
- **ret\_filter** -- [out] Returned glitch filter handle

#### Returns

- `ESP_OK`: Create a pin glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Create a pin glitch filter failed because of invalid arguments (e.g. wrong GPIO number)
- `ESP_ERR_NO_MEM`: Create a pin glitch filter failed because of out of memory
- `ESP_FAIL`: Create a pin glitch filter failed because of other error

`esp_err_t gpio_new_flex_glitch_filter` (const `gpio_flex_glitch_filter_config_t` \*config, `gpio_glitch_filter_handle_t` \*ret\_filter)

Allocate a flex glitch filter.

---

**Note:** "flex" means the filter parameters (window, threshold) are adjustable. It's independent with pin glitch filter. See also `gpio_new_pin_glitch_filter`.

---

---

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

---

#### Parameters

- **config** -- **[in]** Glitch filter configuration
- **ret\_filter** -- **[out]** Returned glitch filter handle

**Returns**

- ESP\_OK: Allocate a flex glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Allocate a flex glitch filter failed because of invalid arguments (e.g. wrong GPIO number, filter parameters out of range)
- ESP\_ERR\_NO\_MEM: Allocate a flex glitch filter failed because of out of memory
- ESP\_ERR\_NOT\_FOUND: Allocate a flex glitch filter failed because the underlying hardware resources are used up
- ESP\_FAIL: Allocate a flex glitch filter failed because of other error

*esp\_err\_t* **gpio\_del\_glitch\_filter** (*gpio\_glitch\_filter\_handle\_t* filter)

Delete a glitch filter.

**Parameters** **filter** -- **[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Delete glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Delete glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Delete glitch filter failed because the glitch filter is still in working
- ESP\_FAIL: Delete glitch filter failed because of other error

*esp\_err\_t* **gpio\_glitch\_filter\_enable** (*gpio\_glitch\_filter\_handle\_t* filter)

Enable a glitch filter.

**Parameters** **filter** -- **[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Enable glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Enable glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Enable glitch filter failed because the glitch filter is already enabled
- ESP\_FAIL: Enable glitch filter failed because of other error

*esp\_err\_t* **gpio\_glitch\_filter\_disable** (*gpio\_glitch\_filter\_handle\_t* filter)

Disable a glitch filter.

**Parameters** **filter** -- **[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Disable glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Disable glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Disable glitch filter failed because the glitch filter is not enabled yet
- ESP\_FAIL: Disable glitch filter failed because of other error

**Structures**

struct **gpio\_pin\_glitch\_filter\_config\_t**

Configuration of GPIO pin glitch filter.

**Public Members**

glitch\_filter\_clock\_source\_t **clk\_src**

Clock source for the glitch filter

gpio\_num\_t **gpio\_num**

GPIO number

struct **gpio\_flex\_glitch\_filter\_config\_t**

Configuration of GPIO flex glitch filter.

### Public Members

glitch\_filter\_clock\_source\_t **clk\_src**

Clock source for the glitch filter

gpio\_num\_t **gpio\_num**

GPIO number

uint32\_t **window\_width\_ns**

Sample window width (in ns)

uint32\_t **window\_thres\_ns**

Sample window threshold (in ns), during the `window_width_ns` sample window, any pulse whose width < `window_thres_ns` will be discarded.

### Type Definitions

typedef struct gpio\_glitch\_filter\_t \***gpio\_glitch\_filter\_handle\_t**

Typedef of GPIO glitch filter handle.

## 2.5.7 General Purpose Timer (GPTimer)

### Introduction

GPTimer (General Purpose Timer) is the driver of ESP32-S2 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

### Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- [Resource Allocation](#) - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- [Set and Get Count Value](#) - covers how to force the timer counting from a start point and how to get the count value at anytime.
- [Set up Alarm Action](#) - covers the parameters that should be set up to enable the alarm event.
- [Register Event Callbacks](#) - covers how to hook user specific code to the alarm event callback function.
- [Enable and Disable Timer](#) - covers how to enable and disable the timer.

- *Start and Stop Timer* - shows some typical use cases that start the timer with different alarm behavior.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.<sup>1</sup>

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind manages all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section *Power Management*.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to  $1 / \text{resolution\_hz}$  seconds.
- `gptimer_config::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `gptimer_config_t::backup_before_sleep` enables the backup of the GPTimer registers before entering sleep mode. This option implies an balance between power consumption and memory usage. If the power consumption is not a concern, you can disable this option to save memory. But if you want to save more power, you should enable this option to backup the GPTimer registers before entering sleep mode, and restore them after waking up. This feature depends on specific hardware module, if you enable this flag on an unsupported chip, you will get an error message like `register back up is not supported`.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to *Interrupt Handling*.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e., all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value depends on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This allows the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

### Creating a GPTimer Handle with Resolution of 1 MHz

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

<sup>1</sup> Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to **ESP32-S2 Technical Reference Manual** > Chapter **Timer Group (TIMG)** [PDF]. The driver does forbid you from applying for more timers, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `gptimer_new_timer()`).

**Set and Get Count Value** When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

**Set up Alarm Action** For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that triggers the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

---

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

---

**Register Event Callbacks** After the timer starts up, it can generate a specific event (e.g., the "Alarm Event") dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function lazy installs the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section [Enable and Disable Timer](#) for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function:

- Switches the timer driver state from **init** to **enable**.
- Enables the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See Section [Power Management](#) for more information.

Calling `gptimer_disable()` does the opposite, that is, put the timer driver back to the **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

Calling `gptimer_start()` transits the driver state from **enable** to **run**, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the "start protection" state (i.e., `gptimer_start()` is called but not finished).

### Start Timer as a Wall Clock

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

### Trigger Period Events

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this_
↳callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

### Trigger One-Shot Event

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;
```

(continues on next page)

(continued from previous page)

```

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**Dynamic Alarm Update** Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz

```

(continues on next page)

```

};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**Power Management** When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system may adjust or disable the clock source before going to sleep. As a result, the time keeping will be inaccurate.

The driver can prevent the above issue by creating a power management lock. The lock type is set based on different clock sources. The driver will acquire the lock in `gptimer_enable()`, and release it in `gptimer_disable()`. So that the timer can work correctly in between these two functions, because the clock source won't be disabled or adjusted its frequency during this time.

**IRAM Safe** By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM<sup>2</sup>
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

### Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash).

<sup>2</sup> `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or flash).
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled, see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

## Application Examples

- Typical use cases of GPTimer are listed in the example [peripherals/timer\\_group/gptimer](#).

## API Reference

### Header File

- `components/esp_driver_gptimer/include/driver/gptimer.h`
- This header file can be included with:

```
#include "driver/gptimer.h"
```

- This header file is a part of the API provided by the `esp_driver_gptimer` component. To declare that your component depends on `esp_driver_gptimer`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gptimer
```

or

```
PRIV_REQUIRES esp_driver_gptimer
```

### Functions

`esp_err_t gptimer_new_timer` (const `gptimer_config_t` \*config, `gptimer_handle_t` \*ret\_timer)

Create a new General Purpose Timer, and return the handle.

---

**Note:** The newly created timer is put in the "init" state.

---

#### Parameters

- `config` -- [in] GPTimer configuration
- `ret_timer` -- [out] Returned timer handle

#### Returns

- `ESP_OK`: Create GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Create GPTimer failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create GPTimer failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create GPTimer failed because all hardware timers are used up and no more free one
- `ESP_FAIL`: Create GPTimer failed because of other error

`esp_err_t gptimer_del_timer` (`gptimer_handle_t` timer)

Delete the GPTimer handle.

---

**Note:** A timer must be in the "init" state before it can be deleted.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

#### Returns

- ESP\_OK: Delete GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Delete GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete GPTimer failed because the timer is not in init state
- ESP\_FAIL: Delete GPTimer failed because of other error

*esp\_err\_t* **gptimer\_set\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t value)

Set GPTimer raw count value.

---

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [in] Count value to be set

#### Returns

- ESP\_OK: Set GPTimer raw count value successfully
- ESP\_ERR\_INVALID\_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP\_FAIL: Set GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer raw count value.

---

**Note:** This function will trigger a software capture event and then return the captured count value.

---

---

**Note:** With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned GPTimer count value

#### Returns

- ESP\_OK: Get GPTimer raw count value successfully
- ESP\_ERR\_INVALID\_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP\_FAIL: Get GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_resolution** (*gptimer\_handle\_t* timer, uint32\_t \*out\_resolution)

Return the real resolution of the timer.

---

**Note:** usually the timer resolution is same as what you configured in the *gptimer\_config\_t::resolution\_hz*, but some unstable clock source (e.g. RC\_FAST) will do a calibration, the real resolution can be different from the configured one.

---

#### Parameters

- **timer** -- [in] Timer handle created by *gptimer\_new\_timer*
- **out\_resolution** -- [out] Returned timer resolution, in Hz

#### Returns

- ESP\_OK: Get GPTimer resolution successfully
- ESP\_ERR\_INVALID\_ARG: Get GPTimer resolution failed because of invalid argument
- ESP\_FAIL: Get GPTimer resolution failed because of other error

*esp\_err\_t* **gptimer\_get\_captured\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer captured count value.

---

**Note:** The capture action can be issued either by ETM event or by software (see also *gptimer\_get\_raw\_count*).

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If *CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM* is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** -- [in] Timer handle created by *gptimer\_new\_timer*
- **value** -- [out] Returned captured count value

#### Returns

- ESP\_OK: Get GPTimer captured count value successfully
- ESP\_ERR\_INVALID\_ARG: Get GPTimer captured count value failed because of invalid argument
- ESP\_FAIL: Get GPTimer captured count value failed because of other error

*esp\_err\_t* **gptimer\_register\_event\_callbacks** (*gptimer\_handle\_t* timer, const *gptimer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for GPTimer.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to *gptimer\_enable*

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the *cbs* structure to NULL.

---

#### Parameters

- **timer** -- **[in]** Timer handle created by `gptimer_new_timer`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the timer is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* **gptimer\_set\_alarm\_action** (*gptimer\_handle\_t* timer, const *gptimer\_alarm\_config\_t* \*config)

Set alarm event actions for GPTimer.

---

**Note:** This function is allowed to run within ISR context, so you can update new alarm action immediately in any ISR callback.

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled. In this case, please also ensure the *gptimer\_alarm\_config\_t* instance is placed in the static data section instead of in the read-only data section. e.g.: `static gptimer_alarm_config_t alarm_config = { ... };`

---

**Parameters**

- **timer** -- **[in]** Timer handle created by `gptimer_new_timer`
- **config** -- **[in]** Alarm configuration, especially, set config to NULL means disabling the alarm function

**Returns**

- `ESP_OK`: Set alarm action for GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Set alarm action for GPTimer failed because of invalid argument
- `ESP_FAIL`: Set alarm action for GPTimer failed because of other error

*esp\_err\_t* **gptimer\_enable** (*gptimer\_handle\_t* timer)

Enable GPTimer.

---

**Note:** This function will transit the timer state from "init" to "enable".

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the *gptimer\_config\_t*, while `CONFIG_PM_ENABLE` is enabled.

---

---

**Note:** Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

---

**Parameters** **timer** -- **[in]** Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Enable GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Enable GPTimer failed because of invalid argument

- `ESP_ERR_INVALID_STATE`: Enable GPTimer failed because the timer is already enabled
- `ESP_FAIL`: Enable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_disable** (*gptimer\_handle\_t* timer)

Disable GPTimer.

---

**Note:** This function will transit the timer state from "enable" to "init".

---

---

**Note:** This function will disable the interrupt service if it's installed.

---

---

**Note:** This function will release the PM lock if it's acquired in the `gptimer_enable`.

---

---

**Note:** Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Disable GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Disable GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable GPTimer failed because the timer is not enabled yet
- `ESP_FAIL`: Disable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_start** (*gptimer\_handle\_t* timer)

Start GPTimer (internal counter starts counting)

---

**Note:** This function will transit the timer state from "enable" to "run".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Start GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Start GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start GPTimer failed because the timer is not enabled or is already in running
- `ESP_FAIL`: Start GPTimer failed because of other error

*esp\_err\_t* **gptimer\_stop** (*gptimer\_handle\_t* timer)

Stop GPTimer (internal counter stops counting)

---

**Note:** This function will transit the timer state from "run" to "enable".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Stop GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Stop GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop GPTimer failed because the timer is not in running.
- `ESP_FAIL`: Stop GPTimer failed because of other error

## Structures

struct `gptimer_config_t`

General Purpose Timer configuration.

### Public Members

`gptimer_clock_source_t` `clk_src`

GPTimer clock source

`gptimer_count_direction_t` `direction`

Count direction

uint32\_t `resolution_hz`

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to  $(1 / \text{resolution\_hz})$  seconds

int `intr_priority`

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t `intr_shared`

Set true, the timer interrupt number can be shared with other peripherals

uint32\_t `backup_before_sleep`

If set, the driver will backup/restore the GPTimer registers before/after entering/exist sleep mode. By this approach, the system can power off GPTimer's power domain. This can save power, but at the expense of more RAM being consumed

struct `gptimer_config_t::[anonymous]` `flags`

GPTimer config flags

struct `gptimer_event_callbacks_t`

Group of supported GPTimer callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When `CONFIG_GPTIMER_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM.

---

### Public Members

*gptimer\_alarm\_cb\_t* **on\_alarm**

Timer alarm callback

struct **gptimer\_alarm\_config\_t**

General Purpose Timer alarm configuration.

### Public Members

uint64\_t **alarm\_count**

Alarm target count value

uint64\_t **reload\_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32\_t **auto\_reload\_on\_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer\_alarm\_config\_t*::[anonymous] **flags**

Alarm config flags

### Header File

- [components/esp\\_driver\\_gptimer/include/driver/gptimer\\_etm.h](#)
- This header file can be included with:

```
#include "driver/gptimer_etm.h"
```

- This header file is a part of the API provided by the `esp_driver_gptimer` component. To declare that your component depends on `esp_driver_gptimer`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gptimer
```

or

```
PRIV_REQUIRES esp_driver_gptimer
```

### Functions

*esp\_err\_t* **gptimer\_new\_etm\_event** (*gptimer\_handle\_t* timer, const *gptimer\_etm\_event\_config\_t* \*config, *esp\_etm\_event\_handle\_t* \*out\_event)

Get the ETM event for GPTimer.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM event configuration
- **out\_event** -- [out] Returned ETM event handle

#### Returns

- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

`esp_err_t gptimer_new_etm_task` (`gptimer_handle_t` timer, const `gptimer_etm_task_config_t` \*config, `esp_etm_task_handle_t` \*out\_task)

Get the ETM task for GPTimer.

---

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM task configuration
- **out\_task** -- [out] Returned ETM task handle

#### Returns

- `ESP_OK`: Get ETM task successfully
- `ESP_ERR_INVALID_ARG`: Get ETM task failed because of invalid argument
- `ESP_FAIL`: Get ETM task failed because of other error

### Structures

struct `gptimer_etm_event_config_t`

GPTimer ETM event configuration.

#### Public Members

`gptimer_etm_event_type_t` **event\_type**

GPTimer ETM event type

struct `gptimer_etm_task_config_t`

GPTimer ETM task configuration.

#### Public Members

`gptimer_etm_task_type_t` **task\_type**

GPTimer ETM task type

### Header File

- `components/esp_driver_gptimer/include/driver/gptimer_types.h`
- This header file can be included with:

```
#include "driver/gptimer_types.h"
```

- This header file is a part of the API provided by the `esp_driver_gptimer` component. To declare that your component depends on `esp_driver_gptimer`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gptimer
```

or

```
PRIV_REQUIRES esp_driver_gptimer
```

## Structures

struct **gptimer\_alarm\_event\_data\_t**

GPTimer alarm event data.

### Public Members

uint64\_t **count\_value**

Current count value

uint64\_t **alarm\_value**

Current alarm value

## Type Definitions

typedef struct gptimer\_t \***gptimer\_handle\_t**

Type of General Purpose Timer handle.

typedef bool (\***gptimer\_alarm\_cb\_t**)(*gptimer\_handle\_t* timer, const *gptimer\_alarm\_event\_data\_t* \*edata, void \*user\_ctx)

Timer alarm callback prototype.

**Param timer [in]** Timer handle created by `gptimer_new_timer`

**Param edata [in]** Alarm event data, fed by driver

**Param user\_ctx [in]** User data, passed from `gptimer_register_event_callbacks`

**Return** Whether a high priority task has been waken up by this function

## Header File

- [components/hal/include/hal/timer\\_types.h](#)
- This header file can be included with:

```
#include "hal/timer_types.h"
```

## Type Definitions

typedef *soc\_periph\_gptimer\_clk\_src\_t* **gptimer\_clock\_source\_t**

GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

## Enumerations

enum **gptimer\_count\_direction\_t**

GPTimer count direction.

*Values:*

enumerator **GPTIMER\_COUNT\_DOWN**

Decrease count value

enumerator **GPTIMER\_COUNT\_UP**

Increase count value

enum **gptimer\_etm\_task\_type\_t**

GPTimer specific tasks that supported by the ETM module.

*Values:*

enumerator **GPTIMER\_ETM\_TASK\_START\_COUNT**

Start the counter

enumerator **GPTIMER\_ETM\_TASK\_STOP\_COUNT**

Stop the counter

enumerator **GPTIMER\_ETM\_TASK\_EN\_ALARM**

Enable the alarm

enumerator **GPTIMER\_ETM\_TASK\_RELOAD**

Reload preset value into counter

enumerator **GPTIMER\_ETM\_TASK\_CAPTURE**

Capture current count value into specific register

enumerator **GPTIMER\_ETM\_TASK\_MAX**

Maximum number of tasks

enum **gptimer\_etm\_event\_type\_t**

GPTimer specific events that supported by the ETM module.

*Values:*

enumerator **GPTIMER\_ETM\_EVENT\_ALARM\_MATCH**

Count value matches the alarm target value

enumerator **GPTIMER\_ETM\_EVENT\_MAX**

Maximum number of events

## 2.5.8 Dedicated GPIO

### Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as "dedicated" can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this "CPU Dedicated" way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

## Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What's more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

---

**Note:** Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It's highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it's impossible to control GPIOA.

---

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

---

**Note:** `dedic_gpio_new_bundle()` doesn't cover any GPIO pad configuration (e.g., pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g., `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

---

## GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that output from the given GPIO bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that input to the given GPIO bundle	<code>dedic_gpio_bundle_read_in()</code>

**Note:** Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try *Manipulate GPIOs by Writing Assembly Code* instead to reduce the overhead but should take care of the thread safety by themselves.

## Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g., `dedic_gpio_cpu_ll_write_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated "set/clear" instructions:
  - Set bits of GPIO: `set_bit_gpio_out imm[7:0]`
  - Clear bits of GPIO: `clr_bit_gpio_out imm[7:0]`
  - Note: Immediate value width depends on the number of dedicated GPIO channels

For details of supported dedicated GPIO instructions, please refer to **ESP32-S2 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)** [PDF].

Some of the dedicated CPU instructions are also wrapped inside `hal/dedic_gpio_cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

## Interrupt Handling

Dedicated GPIO can also trigger interrupt on specific input event. All supported events are defined in `dedic_gpio_intr_type_t`.

One can enable and register interrupt callback by calling `dedic_gpio_bundle_set_interrupt_and_callback()`. The prototype of the callback function is defined in `dedic_gpio_isr_callback_t`. Keep in mind, the callback should return true if there's some high priority task woken up.

```
// user defined ISR callback
IRAM_ATTR bool dedic_gpio_isr_callback(dedic_gpio_bundle_handle_t bundle, uint32_t
↪index, void *args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)args;
    BaseType_t high_task_wakeup = pdFALSE;
    xSemaphoreGiveFromISR(sem, &high_task_wakeup);
    return high_task_wakeup == pdTRUE;
}

// enable positive edge interrupt on the second GPIO in the bundle (i.e., index 1)
```

(continues on next page)

(continued from previous page)

```
ESP_ERROR_CHECK(dedic_gpio_bundle_set_interrupt_and_callback(bundle, BIT(1), DEDIC_
↳GPIO_INTR_POS_EDGE, dedic_gpio_isr_callback, sem));

// wait for done semaphore
xSemaphoreTake(sem, portMAX_DELAY);
```

## Application Example

- Software emulation (bit banging) of the UART/I2C/SPI protocols in assembly using the dedicated GPIOs and their associated CPU instructions: [peripherals/dedicated\\_gpio](#).
- Matrix keyboard example based on dedicated GPIO: [peripherals/gpio/matrix\\_keyboard](#).

## API Reference

### Header File

- [components/esp\\_driver\\_gpio/include/driver/dedic\\_gpio.h](#)
- This header file can be included with:

```
#include "driver/dedic_gpio.h"
```

- This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_gpio
```

or

```
PRIV_REQUIRES esp_driver_gpio
```

### Functions

*esp\_err\_t* **dedic\_gpio\_get\_out\_mask** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*mask)

Get allocated channel mask.

---

**Note:** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

---

---

**Note:** With the returned mask, user can directly invoke LL function like "dedic\_gpio\_cpu\_ll\_write\_mask" or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

---

#### Parameters

- **bundle** -- [in] Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"
- **mask** -- [out] Returned mask value for on specific direction (in or out)

#### Returns

- ESP\_OK: Get channel mask successfully
- ESP\_ERR\_INVALID\_ARG: Get channel mask failed because of invalid argument
- ESP\_FAIL: Get channel mask failed because of other error

*esp\_err\_t* **dedic\_gpio\_get\_in\_mask** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*mask)

*esp\_err\_t* **dedic\_gpio\_get\_out\_offset** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*offset)

Get the channel offset of the GPIO bundle.

A GPIO bundle maps the GPIOs of a particular direction to a consecutive set of channels within a particular GPIO bank of a particular CPU. This function returns the offset to the bundle's first channel of a particular direction within the bank.

#### Parameters

- **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"
- **offset** -- **[out]** Offset value to the first channel of a specific direction (in or out)

#### Returns

- ESP\_OK: Get channel offset successfully
- ESP\_ERR\_INVALID\_ARG: Get channel offset failed because of invalid argument
- ESP\_FAIL: Get channel offset failed because of other error

*esp\_err\_t* **dedic\_gpio\_get\_in\_offset** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*offset)

*esp\_err\_t* **dedic\_gpio\_new\_bundle** (const *dedic\_gpio\_bundle\_config\_t* \*config, *dedic\_gpio\_bundle\_handle\_t* \*ret\_bundle)

Create GPIO bundle and return the handle.

---

**Note:** One has to enable at least input or output mode in "config" parameter.

---

#### Parameters

- **config** -- **[in]** Configuration of GPIO bundle
- **ret\_bundle** -- **[out]** Returned handle of the new created GPIO bundle

#### Returns

- ESP\_OK: Create GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Create GPIO bundle failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPIO bundle failed because of no capable memory
- ESP\_ERR\_NOT\_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP\_FAIL: Create GPIO bundle failed because of other error

*esp\_err\_t* **dedic\_gpio\_del\_bundle** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Destroy GPIO bundle.

**Parameters** **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

#### Returns

- ESP\_OK: Destroy GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Destroy GPIO bundle failed because of invalid argument
- ESP\_FAIL: Destroy GPIO bundle failed because of other error

void **dedic\_gpio\_bundle\_write** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t mask, uint32\_t value)

Write value to GPIO bundle.

---

**Note:** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

---

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

#### Parameters

- **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

- **mask** -- **[in]** Mask of the GPIOs to be written in the given bundle
- **value** -- **[in]** Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_out** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that output from the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

**Returns** Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_in** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that input to the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

**Returns** Value that input to the GPIO bundle, low bit represents low member in the bundle

*esp\_err\_t* **dedic\_gpio\_bundle\_set\_interrupt\_and\_callback** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t mask, *dedic\_gpio\_intr\_type\_t* intr\_type, *dedic\_gpio\_isr\_callback\_t* cb\_isr, void \*cb\_args)

Set interrupt and callback function for GPIO bundle.

---

**Note:** This function is only valid for bundle with input mode enabled. See "dedic\_gpio\_bundle\_config\_t"

---

---

**Note:** The mask is seen from the view of GPIO Bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

---

#### Parameters

- **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"
- **mask** -- **[in]** Mask of the GPIOs in the given bundle
- **intr\_type** -- **[in]** Interrupt type, set to DEDIC\_GPIO\_INTR\_NONE can disable interrupt
- **cb\_isr** -- **[in]** Callback function, which got invoked in ISR context. A NULL pointer here will bypass the callback
- **cb\_args** -- **[in]** User defined argument to be passed to the callback function

#### Returns

- ESP\_OK: Set GPIO interrupt and callback function successfully
- ESP\_ERR\_INVALID\_ARG: Set GPIO interrupt and callback function failed because of invalid argument
- ESP\_FAIL: Set GPIO interrupt and callback function failed because of other error

## Structures

struct **dedic\_gpio\_bundle\_config\_t**

Type of Dedicated GPIO bundle configuration.

### Public Members

const int \***gpio\_array**

Array of GPIO numbers, `gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num`

size\_t **array\_size**

Number of GPIOs in `gpio_array`

unsigned int **in\_en**

Enable input

unsigned int **in\_invert**

Invert input signal

unsigned int **out\_en**

Enable output

unsigned int **out\_invert**

Invert output signal

struct *dedic\_gpio\_bundle\_config\_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

## Type Definitions

typedef struct *dedic\_gpio\_bundle\_t* \***dedic\_gpio\_bundle\_handle\_t**

Type of Dedicated GPIO bundle.

typedef bool (\***dedic\_gpio\_isr\_callback\_t**)(*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t index, void \*args)

Type of dedicated GPIO ISR callback function.

**Param bundle** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

**Param index** Index of the GPIO in its corresponding bundle (count from 0)

**Param args** User defined arguments for the callback function. It's passed through `dedic_gpio_bundle_set_interrupt_and_callback`

**Return** If a high priority task is woken up by the callback function

## Enumerations

enum **dedic\_gpio\_intr\_type\_t**

Supported type of dedicated GPIO interrupt.

*Values:*

enumerator **DEDIC\_GPIO\_INTR\_NONE**

No interrupt

enumerator **DEDIC\_GPIO\_INTR\_LOW\_LEVEL**

Interrupt on low level

enumerator **DEDIC\_GPIO\_INTR\_HIGH\_LEVEL**

Interrupt on high level

enumerator **DEDIC\_GPIO\_INTR\_NEG\_EDGE**

Interrupt on negedge

enumerator **DEDIC\_GPIO\_INTR\_POS\_EDGE**

Interrupt on posedge

enumerator **DEDIC\_GPIO\_INTR\_BOTH\_EDGE**

Interrupt on both negedge and posedge

## 2.5.9 Hash-Based Message Authentication Code (HMAC)

Hash-based Message Authentication Code (HMAC) is a secure authentication technique that verifies the authenticity and integrity of a message with a pre-shared key. This module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block.

For more detailed information on the application workflow and the HMAC calculation process, see **ESP32-S2 Technical Reference Manual > HMAC Accelerator (HMAC)** [[PDF](#)].

### Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel.

To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates the HMAC of the received message itself.
- B checks whether the received and calculated HMACs match.

If they do match, the message is authentic.

However, the HMAC itself is not bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

### HMAC on ESP32-S2

On ESP32-S2, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, ESP32-S2 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called **Upstream** mode, while the last two modes are called **Downstream** modes.

**eFuse Keys for HMAC** Six physical eFuse blocks can be used as keys for the HMAC module: block 4 ~ block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ~ `HMAC_KEY5`.

Each key has a corresponding eFuse parameter **key purpose** determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the **key purpose** (see [ESP32-S2 Technical Reference Manual > eFuse Controller \(eFuse\) \[PDF\]](#)).

Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

**HMAC Generation for Software** Key purpose value: 8

In this case, the HMAC is given out to the software, e.g., to authenticate a message.

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length, and the eFuse key block ID which contains the secret and has the eFuse key purpose set to Upstream mode.

**HMAC for Digital Signature** Key purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. You only need to provide the eFuse key block and purpose on the HMAC side, additional parameters are required for the Digital Signature component in that case.

Neither the key nor the actual HMAC is ever exposed outside the HMAC module and DS component. The calculation of the HMAC and its handover to the DS component happen internally.

For more details, see [ESP32-S2 Technical Reference Manual > Digital Signature \(DS\) \[PDF\]](#).

**HMAC for Enabling JTAG** Key purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before.

Following is the procedure to re-enable the JTAG:

#### Stage 1: Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose `HMAC_DOWN_ALL` (5) or `HMAC_DOWN_JTAG` (6). This can be done using the `esp_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read-protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the `soft_jtag_disable` bit/bits on ESP32-S2. This will permanently disable JTAG unless the correct key value is provided by the software.

---

**Note:** The API `esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG)` can be used to burn `soft_jtag_disable` bit on ESP32-S2.

---

**Note:** If `HARD_DIS_JTAG` eFuse is set, then `SOFT_DIS_JTAG` functionality does not work because JTAG is permanently disabled.

---

JTAG enables

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

End-to-end example of soft disable and re-enable JTAG workflow: [security/hmac\\_soft\\_jtag](#).

For more details, see [ESP32-S2 Technical Reference Manual > HMAC Accelerator \(HMAC\) \[PDF\]](#).

### Application Outline

The following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage.

We use `esp_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ESP_EFUSE_KEY_PURPOSE_HMAC_UP` (8) means that this key can only be used for HMAC generation for software usage:

```
#include "esp_efuse.h"

const uint8_t key_data[32] = { ... };

esp_err_t status = esp_efuse_write_key(EFUSE_BLK_KEY4,
                                     ESP_EFUSE_KEY_PURPOSE_HMAC_UP,
                                     key_data, sizeof(key_data));

if (status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

## API Reference

### Header File

- `components/esp_hw_support/include/esp_hmac.h`
- This header file can be included with:

```
#include "esp_hmac.h"
```

### Functions

`esp_err_t esp_hmac_calculate` (*hmac\_key\_id\_t* key\_id, const void \*message, size\_t message\_len, uint8\_t \*hmac)

Calculate the HMAC of a given message.

Calculate the HMAC `hmac` of a given message `message` with length `message_len`. SHA256 is used for the calculation.

---

**Note:** Uses the HMAC peripheral in "upstream" mode.

---

#### Parameters

- **key\_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** -- the message for which to calculate the HMAC
- **message\_len** -- message length return `ESP_ERR_INVALID_STATE` if unsuccessful
- **hmac** -- [out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

#### Returns

- `ESP_OK`, if the calculation was successful,
- `ESP_ERR_INVALID_ARG` if message or hmac is a nullptr or if key\_id out of range
- `ESP_FAIL`, if the hmac calculation failed

`esp_err_t esp_hmac_jtag_enable` (*hmac\_key\_id\_t* key\_id, const uint8\_t \*token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

---

**Note:** Return value of the API does not indicate the JTAG status.

---

#### Parameters

- **key\_id** -- Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** -- Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

#### Returns

- `ESP_OK`, if the key\_purpose of the key\_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- `ESP_FAIL`, if the key\_purpose of the key\_id is not set to HMAC downstream purpose or JTAG is permanently disabled by `EFUSE_HARD_DIS_JTAG` eFuse parameter.
- `ESP_ERR_INVALID_ARG`, invalid input arguments

`esp_err_t esp_hmac_jtag_disable` (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling `esp_hmac_jtag_enable`() API.

**Returns**

- ESP\_OK return ESP\_OK after writing the HMAC\_SET\_INVALIDATE\_JTAG\_REG with value 1.

**Enumerations**

enum `hmac_key_id_t`

The possible efuse keys for the HMAC peripheral

*Values:*

enumerator `HMAC_KEY0`

enumerator `HMAC_KEY1`

enumerator `HMAC_KEY2`

enumerator `HMAC_KEY3`

enumerator `HMAC_KEY4`

enumerator `HMAC_KEY5`

enumerator `HMAC_KEY_MAX`

## 2.5.10 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as the input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in the signature calculation and the registers used, see **ESP32-S2 Technical Reference Manual > Digital Signature (DS)** [\[PDF\]](#).

### Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters, and the message.

## Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-S2 or alternatively on a host. For this context, ESP-IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in **ESP32-S2 Technical Reference Manual > Digital Signature (DS)** [PDF].

## Signature Calculation with ESP-IDF

For more detailed information on the workflow and the registers used, see **ESP32-S2 Technical Reference Manual > Digital Signature (DS)** [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. The eFuse key block ID which is used as the key for the HMAC
2. The location of the encrypted private key parameters
3. The message to be signed

Since the signature calculation takes some time, there are two possible API versions to use in ESP-IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

The APIs `esp_ds_sign()` and `esp_ds_start_sign()` calculate a plain RSA signature with the help of the DS peripheral. This signature needs to be converted to an appropriate format for further use. For example, the MbedTLS SSL stack supports PKCS#1 format. The API `esp_ds_rsa_sign()` can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses `esp_ds_start_sign()` and converts the signature into PKCS#1 v1.5 format.

---

**Note:** This is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

---

## Configure the DS Peripheral for a TLS Connection

The DS peripheral on ESP32-S2 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps:

- 1) Randomly generate a 256-bit value called the Initialization Vector (IV).
- 2) Randomly generate a 256-bit value called the HMAC\_KEY.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256-bit HMAC\_KEY on the eFuse, which can only be read by the DS peripheral.

For more details, see **ESP32-S2 Technical Reference Manual > Digital Signature (DS)** [PDF].

To configure the DS peripheral for development purposes, you can use the `esp-secure-cert-tool`.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the DS data from the flash, which has been done through the APIs provided by the `esp_secure_cert_mgr` component. Please refer to the [component/README](#) for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with the help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* for more details.

As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls` context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

### Example for SSL Mutual Authentication Using DS

The example [protocols/mqtt/ssl\\_ds](#) shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through *ESP-MQTT*) to connect to broker `test.mosquitto.org` using SSL transport with mutual authentication. The SSL part is internally performed with *ESP-TLS*. See [protocols/mqtt/ssl\\_ds/README.md](#) for more details.

## API Reference

### Header File

- [components/esp\\_hw\\_support/include/esp\\_ds.h](#)
- This header file can be included with:

```
#include "esp_ds.h"
```

### Functions

`esp_err_t esp_ds_sign` (const void \*message, const `esp_ds_data_t` \*data, `hmac_key_id_t` key\_id, void \*signature)

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \text{ mod } M$  where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

---

**Note:** Please see note section of `esp_ds_start_sign()` for more details about the input parameters.

---

#### Parameters

- **message** -- the message to be signed; its length should be  $(\text{data->rsa\_length} + 1) * 4$  bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** -- the destination of the signature, should be  $(\text{data->rsa\_length} + 1) * 4$  bytes long

#### Returns

- `ESP_OK` if successful, the signature was written to the parameter `signature`.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component
- `ESP_ERR_HW_CRYPTODS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid.
- `ESP_ERR_HW_CRYPTODS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches.

*esp\_err\_t* **esp\_ds\_start\_sign** (const void \*message, const *esp\_ds\_data\_t* \*data, *hmac\_key\_id\_t* key\_id, *esp\_ds\_context\_t* \*\*esp\_ds\_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \text{ mod } M$  where,  $Z$  is the signature,  $X$  is the input message,  $Y$  and  $M$  are the RSA private key parameters.

---

**Note:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner. The numbers  $Y$ ,  $M$ ,  $R_b$  which are a part of `esp_ds_data_t` should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

---

#### Parameters

- **message** -- the message to be signed; its length should be  $(\text{data->rsa\_length} + 1) * 4$  bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** -- the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** -- the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp\_ds\_ctx** -- the context object which is needed for finishing the signing process later

#### Returns

- `ESP_OK` if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component

bool **esp\_ds\_is\_busy** (void)

Return true if the DS peripheral is busy, otherwise false.

---

**Note:** Only valid if `esp_ds_start_sign()` was called before.

---

*esp\_err\_t* **esp\_ds\_finish\_sign** (void \*signature, *esp\_ds\_context\_t* \*esp\_ds\_ctx)

Finish the signing process.

#### Parameters

- **signature** -- the destination of the signature, should be  $(\text{data->rsa\_length} + 1) * 4$  bytes long, the resultant signature bytes shall be written in little endian format.
- **esp\_ds\_ctx** -- the context object retrieved by `esp_ds_start_sign()`

#### Returns

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL
- `ESP_ERR_HW_CRYPTODS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.

- `ESP_ERR_HW_CRYPTODS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

`esp_err_t esp_ds_encrypt_params` (`esp_ds_data_t` \*data, const void \*iv, const `esp_ds_p_data_t` \*p\_data, const void \*key)

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

---

**Note:** The numbers Y, M, Rb which are a part of `esp_ds_data_t` should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

---

### Parameters

- **data** -- Output buffer to store encrypted data, suitable for later use generating signatures.
- **iv** -- Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p\_data** -- Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** -- Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

### Returns

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `p_data->rsa_length` is too long

## Structures

struct `esp_digital_signature_data`

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

## Public Members

`esp_digital_signature_length_t` `rsa_length`

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

This value must match the length field encrypted and stored in 'c', or invalid results will be returned. (The DS peripheral will always use the value in 'c', not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

---

**Note:** In IDF, the enum type `length` is the same as of type `unsigned`, so they can be used interchangeably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

---

`uint32_t` `iv`[`ESP_DS_IV_BIT_LEN / 32`]

IV value used to encrypt 'c'

uint8\_t **c**[ESP\_DS\_C\_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp\_ds\_p\_data\_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling `esp_ds_encrypt_params()`. Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

---

**Note:** Y, M, Rb, & M\_Prime must all be in little endian format.

---

### Public Members

uint32\_t **Y**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA exponent.

uint32\_t **M**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA modulus.

uint32\_t **Rb**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA r inverse operand.

uint32\_t **M\_prime**

RSA M prime operand.

uint32\_t **length**

RSA length in words (32 bit)

### Macros

**ESP\_DS\_IV\_BIT\_LEN**

**ESP\_DS\_IV\_LEN**

**ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_MD\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_M\_PRIME\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_L\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_PADDING\_BIT\_LEN**

**ESP\_DS\_C\_LEN**

### Type Definitions

typedef struct esp\_ds\_context **esp\_ds\_context\_t**

typedef struct *esp\_digital\_signature\_data* **esp\_ds\_data\_t**

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

### Enumerations

enum **esp\_digital\_signature\_length\_t**

*Values:*

enumerator **ESP\_DS\_RSA\_1024**

enumerator **ESP\_DS\_RSA\_2048**

enumerator **ESP\_DS\_RSA\_3072**

enumerator **ESP\_DS\_RSA\_4096**

## 2.5.11 Inter-Integrated Circuit (I2C)

### Introduction

I2C is a serial, synchronous, multi-device, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. I2C uses two bidirectional open-drain lines: serial data line (SDA) and serial clock line (SCL), pulled up by resistors.

ESP32-S2 has 2 I2C controller (also called port), responsible for handling communication on the I2C bus. A single I2C controller can be a master or a slave.

Typically, an I2C slave device has a 7-bit address or 10-bit address. ESP32-S2 supports both I2C Standard-mode (Sm) and Fast-mode (Fm) which can go up to 100KHz and 400KHz respectively.

**Warning:** The clock frequency of SCL in master mode should not be larger than 400 KHz

---

**Note:** The frequency of SCL is influenced by both the pull-up resistor and the wire capacitance. Therefore, users are strongly recommended to choose appropriate pull-up resistors to make the frequency accurate. The recommended value for pull-up resistors usually ranges from 1K Ohms to 10K Ohms.

Keep in mind that the higher the frequency, the smaller the pull-up resistor should be (but not less than 1 KOhms). Indeed, large resistors will decline the current, which will increase the clock switching time and reduce the frequency. We usually recommend a range of 2 KOhms to 5 KOhms, but users may also need to make some adjustments depending on their current draw requirements.

---

### I2C Clock Configuration

- `i2c_clock_source_t::I2C_CLK_SRC_DEFAULT`: Default I2C source clock.
- `i2c_clock_source_t::I2C_CLK_SRC_APB`: APB clock as I2C clock source.
- `i2c_clock_source_t::I2C_CLK_SRC_REF_TICK`: 1MHZ clock.

## I2C File Structure

Fig. 5: I2C file structure

### Public headers that need to be included in the I2C application

- `i2c.h`: The header file of legacy I2C APIs (for apps using legacy driver).
- `i2c_master.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with master mode).
- `i2c_slave.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with slave mode).

**Note:** The legacy driver can't coexist with the new driver. Include `i2c.h` to use the legacy driver or the other two headers to use the new driver. Please keep in mind that the legacy driver is now deprecated and will be removed in future.

### Public headers that have been included in the headers above

- `i2c_types_legacy.h`: The legacy public types that only used in the legacy driver.
- `i2c_types.h`: The header file that provides public types.

## Functional Overview

The I2C driver offers following services:

- *Resource Allocation* - covers how to allocate I2C bus with properly set of configurations. It also covers how to recycle the resources when they finished working.

- *I2C Master Controller* - covers behavior of I2C master controller. Introduce data transmit, data receive, and data transmit and receive.
- *I2C Slave Controller* - covers behavior of I2C slave controller. Involve data transmit and data receive.
- *Power Management* - describes how different source clock will affect power consumption.
- *IRAM Safe* - describes tips on how to make the I2C interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation** Both I2C master bus and I2C slave bus, when supported, are represented by `i2c_bus_handle_t` in the driver. The available ports are managed in a resource pool that allocates a free port on request.

**Install I2C master bus and device** The I2C master is designed based on bus-device model. So `i2c_master_bus_config_t` and `i2c_device_config_t` are required separately to allocate the I2C master bus instance and I2C device instance.

Fig. 6: I2C master bus-device module

I2C master bus requires the configuration that specified by `i2c_master_bus_config_t`:

- `i2c_master_bus_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_master_bus_config_t::sda_io_num` sets the GPIO number for the serial data bus (SDA).
- `i2c_master_bus_config_t::scl_io_num` sets the GPIO number for the serial clock bus (SCL).
- `i2c_master_bus_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to *Power Management* section.
- `i2c_master_bus_config_t::glitch_ignore_cnt` sets the glitch period of master bus, if the glitch period on the line is less than this value, it can be filtered out, typically value is 7.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)).
- `i2c_master_bus_config_t::trans_queue_depth` Depth of internal transfer queue. Only valid in asynchronous transaction.
- `i2c_master_bus_config_t::enable_internal_pullup` Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. A suitable external pullup is recommended.

If the configurations in `i2c_master_bus_config_t` is specified, users can call `i2c_new_master_bus()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

I2C master device requires the configuration that specified by `i2c_device_config_t`:

- `i2c_device_config_t::dev_addr_length` configure the address bit length of the slave device. User can choose from enumerator `I2C_ADDR_BIT_LEN_7` or `I2C_ADDR_BIT_LEN_10` (if supported).
- `i2c_device_config_t::device_address` I2C device raw address. Please parse the device address to this member directly. For example, the device address is 0x28, then parse 0x28 to `i2c_device_config_t::device_address`, don't carry a write/read bit.
- `i2c_device_config_t::scl_speed_hz` set the scl line frequency of this device.
- `i2c_device_config_t::scl_wait_us`. SCL await time (in us). Usually this value should not be very small because slave stretch will happen in pretty long time. (It's possible even stretch for 12ms). Set 0 means use default reg value.

Once the `i2c_device_config_t` structure is populated with mandatory parameters, users can call `i2c_master_bus_add_device()` to allocate an I2C device instance and mounted to the master bus then. This function will return an I2C device handle if it runs correctly. Specifically, when the I2C bus is not initialized properly, calling this function will result in a `ESP_ERR_INVALID_ARG` error.

```
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```

**Get I2C master handle via port** Given that i2c master handle has been initialized in some module(e.g. an audio module), an another module(e.g. a video module) is not convenient to reused the handle. We have a helper function, `i2c_master_get_bus_handle()` for getting the initialized handle via port. However, please make sure the handle has already been initialized ahead of time. Otherwise an error would be reported.

```
// Source File 1
#include "driver/i2c_master.h"
i2c_master_bus_handle_t bus_handle;
i2c_master_bus_config_t i2c_mst_config = {
    ... // same as others
};
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

// Source File 2
#include "driver/i2c_master.h"
i2c_master_bus_handle_t handle;
ESP_ERROR_CHECK(i2c_master_get_bus_handle(0, &handle));
```

**Uninstall I2C master bus and device** If a previously installed I2C bus or device is no longer needed, it's recommended to recycle the resource by calling `i2c_master_bus_rm_device()` or `i2c_del_master_bus()`, so that to release the underlying hardware.

**Install I2C slave device** I2C slave requires the configuration that specified by `i2c_slave_config_t`:

- `i2c_slave_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_slave_config_t::sda_io_num` sets the GPIO number for serial data bus (SDA).
- `i2c_slave_config_t::scl_io_num` sets the GPIO number for serial clock bus (SCL).
- `i2c_slave_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to [Power Management](#) section.
- `i2c_slave_config_t::send_buf_depth` sets the sending buffer length.
- `i2c_slave_config_t::slave_addr` sets the slave address
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `i2c_del_master_bus()` is called.
- `i2c_slave_config_t::addr_bit_len` sets true if you need the slave to have a 10-bit address.

Once the `i2c_slave_config_t` structure is populated with mandatory parameters, users can call `i2c_new_slave_device()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.

```
i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
```

**Uninstall I2C slave device** If a previously installed I2C bus is no longer needed, it's recommended to recycle the resource by calling `i2c_del_slave_device()`, so that to release the underlying hardware.

**I2C Master Controller** After installing the i2c master driver by `i2c_new_master_bus()`, ESP32-S2 is ready to communicate with other I2C devices. I2C APIs allow the standard transactions. Like the wave as follows:

**I2C Master Write** After installing I2C master bus successfully, you can simply call `i2c_master_transmit()` to write data to the slave device. The principle of this function can be explained by following chart.

In order to organize the process, the driver uses a command link, that should be populated with a sequence of commands and then passed to I2C controller for execution.

Fig. 7: I2C master write to slave

Simple example for writing data to slave:

```
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

ESP_ERROR_CHECK(i2c_master_transmit(dev_handle, data_wr, DATA_LENGTH, -1));
```

**I2C Master Read** After installing I2C master bus successfully, you can simply call `i2c_master_receive()` to read data from the slave device. The principle of this function can be explained by following chart.

Fig. 8: I2C master read from slave

Simple example for reading data from slave:

```
#define DATA_LENGTH 100
i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};
i2c_master_bus_handle_t bus_handle;
```

(continues on next page)

(continued from previous page)

```

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));

i2c_master_receive(dev_handle, data_rd, DATA_LENGTH, -1);

```

**I2C Master Write and Read** Some I2C device needs write configurations before reading data from it, therefore, an interface called `i2c_master_transmit_receive()` can help. The principle of this function can be explained by following chart.

Fig. 9: I2C master write to slave and read from slave

Simple example for writing and reading from slave:

```

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(I2C_PORT_NUM_0, &dev_cfg, &dev_handle));
uint8_t buf[20] = {0x20};
uint8_t buffer[2];
ESP_ERROR_CHECK(i2c_master_transmit_receive(dev_handle, buf, sizeof(buf), buffer, 2, -1));

```

**I2C Master Probe** I2C driver can use `i2c_master_probe()` to detect whether the specific device has been connected on I2C bus. If this function return `ESP_OK`, that means the device has been detected.

**Important:** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get `ESP_ERR_TIMEOUT` while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, setting `flags.enable_internal_pullup` as true is also acceptable.

Fig. 10: I2C master probe

Simple example for probing an I2C device:

```

i2c_master_bus_config_t i2c_mst_config_1 = {
    .clk_source = I2C_CLK_SRC_DEFAULT,

```

(continues on next page)

(continued from previous page)

```

        .i2c_port = TEST_I2C_PORT,
        .scl_io_num = I2C_MASTER_SCL_IO,
        .sda_io_num = I2C_MASTER_SDA_IO,
        .glitch_ignore_cnt = 7,
        .flags.enable_internal_pullup = true,
};
i2c_master_bus_handle_t bus_handle;

ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config_1, &bus_handle));
ESP_ERROR_CHECK(i2c_master_probe(bus_handle, 0x22, -1));
ESP_ERROR_CHECK(i2c_del_master_bus(bus_handle));

```

**I2C Slave Controller** After installing the i2c slave driver by `i2c_new_slave_device()`, ESP32-S2 is ready to communicate with other I2C master as a slave.

**I2C Slave Write** The send buffer of the I2C slave is used as a FIFO to store the data to be sent. The data will queue up until the master requests them. You can call `i2c_slave_transmit()` to transfer data.

Simple example for writing data to FIFO:

```

uint8_t *data_wr = (uint8_t *) malloc(DATA_LENGTH);

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,    // 7-bit address
    .clk_source = I2C_CLK_SRC_DEFAULT,     // set the clock source
    .i2c_port = 0,                          // set I2C port number
    .send_buf_depth = 256,                  // set tx buffer length
    .scl_io_num = 2,                        // SCL gpio number
    .sda_io_num = 1,                        // SDA gpio number
    .slave_addr = 0x58,                     // slave address
};

i2c_bus_handle_t i2c_bus_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &i2c_bus_handle));
for (int i = 0; i < DATA_LENGTH; i++) {
    data_wr[i] = i;
}

ESP_ERROR_CHECK(i2c_slave_transmit(i2c_bus_handle, data_wr, DATA_LENGTH, 10000));

```

**I2C Slave Read** Whenever the master writes data to the slave, the slave will automatically store data in the receive buffer. This allows the slave application to call the function `i2c_slave_receive()` as its own discretion. As `i2c_slave_receive()` is designed as a non-blocking interface. So the user needs to register callback `i2c_slave_register_event_callbacks()` to know when the receive has finished.

```

static IRAM_ATTR bool i2c_slave_rx_done_callback(i2c_slave_dev_handle_t channel,
↪const i2c_slave_rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    return high_task_wakeup == pdTRUE;
}

uint8_t *data_rd = (uint8_t *) malloc(DATA_LENGTH);
uint32_t size_rd = 0;

```

(continues on next page)

(continued from previous page)

```

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};

i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));

s_receive_queue = xQueueCreate(1, sizeof(i2c_slave_rx_done_event_data_t));
i2c_slave_event_callbacks_t cbs = {
    .on_recv_done = i2c_slave_rx_done_callback,
};
ESP_ERROR_CHECK(i2c_slave_register_event_callbacks(slave_handle, &cbs, s_receive_
↪queue));

i2c_slave_rx_done_event_data_t rx_data;
ESP_ERROR_CHECK(i2c_slave_receive(slave_handle, data_rd, DATA_LENGTH));
xQueueReceive(s_receive_queue, &rx_data, pdMS_TO_TICKS(10000));
// Receive done.

```

## Register Event Callbacks

**I2C master callbacks** When an I2C master bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some functions that need to be called when those events occurred, you can hook your functions to the ISR (Interrupt Service Routine) by calling `i2c_master_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback functions are required to return a boolean value, to tell the ISR whether a high priority task is woke up by it.

I2C master event callbacks are listed in the `i2c_master_event_callbacks_t`.

Although I2C is a synchronous communication protocol, we also support asynchronous behavior by registering above callback. In this way, I2C APIs will be non-blocking interface. But note that on the same bus, only one device can adopt asynchronous operation.

---

**Important:** I2C master asynchronous transaction is still an experimental feature. (The issue is when asynchronous transaction is very large, it will cause memory problem.)

---

- `i2c_master_event_callbacks_t::on_recv_done` sets a callback function for master "transaction-done" event. The function prototype is declared in `i2c_master_callback_t`.

**I2C slave callbacks** When an I2C slave bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `i2c_slave_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn't attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

I2C slave event callbacks are listed in the `i2c_slave_event_callbacks_t`.

- `i2c_slave_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `i2c_slave_received_callback_t`.

**Power Management** When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2C fifo before going into light sleep, thus potentially changing the I2C signals and leading to transmitting or receiving invalid data.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever user creates an I2C bus that has selected `I2C_CLK_SRC_APB` as the clock source, the driver will guarantee that the power management lock is acquired when I2C operations begin and release the lock automatically when I2C operations finish.

If the controller clock source is selected to `I2C_CLK_SRC_REF_TICK`, then the driver won't install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the I2C interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_I2C_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety** The factory function `i2c_new_master_bus()` and `i2c_new_slave_device()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other public I2C APIs are not thread safe. which means the user should avoid calling them from multiple tasks, if user strongly needs to call them in multiple tasks, please add extra lock.

### Kconfig Options

- `CONFIG_I2C_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_I2C_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

## API Reference

### Header File

- `components/esp_driver_i2c/include/driver/i2c_master.h`
- This header file can be included with:

```
#include "driver/i2c_master.h"
```

- This header file is a part of the API provided by the `esp_driver_i2c` component. To declare that your component depends on `esp_driver_i2c`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2c
```

or

```
PRIV_REQUIRES esp_driver_i2c
```

## Functions

*esp\_err\_t* **i2c\_new\_master\_bus** (const *i2c\_master\_bus\_config\_t* \*bus\_config, *i2c\_master\_bus\_handle\_t* \*ret\_bus\_handle)

Allocate an I2C master bus.

### Parameters

- **bus\_config** -- [in] I2C master bus configuration.
- **ret\_bus\_handle** -- [out] I2C bus handle

### Returns

- ESP\_OK: I2C master bus initialized successfully.
- ESP\_ERR\_INVALID\_ARG: I2C bus initialization failed because of invalid argument.
- ESP\_ERR\_NO\_MEM: Create I2C bus failed because of out of memory.
- ESP\_ERR\_NOT\_FOUND: No more free bus.

*esp\_err\_t* **i2c\_master\_bus\_add\_device** (*i2c\_master\_bus\_handle\_t* bus\_handle, const *i2c\_device\_config\_t* \*dev\_config, *i2c\_master\_dev\_handle\_t* \*ret\_handle)

Add I2C master BUS device.

### Parameters

- **bus\_handle** -- [in] I2C bus handle.
- **dev\_config** -- [in] device config.
- **ret\_handle** -- [out] device handle.

### Returns

- ESP\_OK: Create I2C master device successfully.
- ESP\_ERR\_INVALID\_ARG: I2C bus initialization failed because of invalid argument.
- ESP\_ERR\_NO\_MEM: Create I2C bus failed because of out of memory.

*esp\_err\_t* **i2c\_del\_master\_bus** (*i2c\_master\_bus\_handle\_t* bus\_handle)

Deinitialize the I2C master bus and delete the handle.

**Parameters** **bus\_handle** -- [in] I2C bus handle.

### Returns

- ESP\_OK: Delete I2C bus success, otherwise, failed.
- Otherwise: Some module delete failed.

*esp\_err\_t* **i2c\_master\_bus\_rm\_device** (*i2c\_master\_dev\_handle\_t* handle)

I2C master bus delete device.

**Parameters** **handle** -- i2c device handle

### Returns

- ESP\_OK: If device is successfully deleted.

*esp\_err\_t* **i2c\_master\_transmit** (*i2c\_master\_dev\_handle\_t* i2c\_dev, const uint8\_t \*write\_buffer, size\_t write\_size, int xfer\_timeout\_ms)

Perform a write transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

### Parameters

- **i2c\_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **write\_buffer** -- [in] Data bytes to send on the I2C bus.
- **write\_size** -- [in] Size, in bytes, of the write buffer.
- **xfer\_timeout\_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever.

### Returns

- ESP\_OK: I2C master transmit success

- `ESP_ERR_INVALID_ARG`: I2C master transmit parameter invalid.
- `ESP_ERR_TIMEOUT`: Operation timeout(larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_transmit_receive` (*`i2c_master_dev_handle_t`* `i2c_dev`, `const uint8_t *write_buffer`, `size_t write_size`, `uint8_t *read_buffer`, `size_t read_size`, `int xfer_timeout_ms`)

Perform a write-read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

#### Parameters

- `i2c_dev` -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- `write_buffer` -- **[in]** Data bytes to send on the I2C bus.
- `write_size` -- **[in]** Size, in bytes, of the write buffer.
- `read_buffer` -- **[out]** Data bytes received from i2c bus.
- `read_size` -- **[in]** Size, in bytes, of the read buffer.
- `xfer_timeout_ms` -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

#### Returns

- `ESP_OK`: I2C master transmit-receive success
- `ESP_ERR_INVALID_ARG`: I2C master transmit parameter invalid.
- `ESP_ERR_TIMEOUT`: Operation timeout(larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_receive` (*`i2c_master_dev_handle_t`* `i2c_dev`, `uint8_t *read_buffer`, `size_t read_size`, `int xfer_timeout_ms`)

Perform a read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

---

**Note:** If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

---

#### Parameters

- `i2c_dev` -- **[in]** I2C master device handle that created by `i2c_master_bus_add_device`.
- `read_buffer` -- **[out]** Data bytes received from i2c bus.
- `read_size` -- **[in]** Size, in bytes, of the read buffer.
- `xfer_timeout_ms` -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

#### Returns

- `ESP_OK`: I2C master receive success
- `ESP_ERR_INVALID_ARG`: I2C master receive parameter invalid.
- `ESP_ERR_TIMEOUT`: Operation timeout(larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_probe` (*`i2c_master_bus_handle_t`* `bus_handle`, `uint16_t address`, `int xfer_timeout_ms`)

Probe I2C address, if address is correct and ACK is received, this function will return `ESP_OK`.

**Attention** Pull-ups must be connected to the SCL and SDA pins when this function is called. If you get `ESP_ERR_TIMEOUT` while `xfer_timeout_ms` was parsed correctly, you should check the pull-up resistors. If you do not have proper resistors nearby, `flags.enable_internal_pullup`` is also acceptable.

---

**Note:** The principle of this function is to send device address with a write command. If the device on your I2C bus, there would be an ACK signal and function returns `ESP_OK`. If the device is not on your I2C bus, there would be a NACK signal and function returns `ESP_ERR_NOT_FOUND`. `ESP_ERR_TIMEOUT` is not an expected failure, which indicated that the i2c probe not works properly, usually caused by pull-up resistors not be connected properly. Suggestion check data on SDA/SCL line to see whether there is ACK/NACK signal is on line when i2c probe function fails.

---

**Note:** There are lots of I2C devices all over the world, we assume that not all I2C device support the behavior like `device_address+nack/ack`. So, if the on line data is strange and no ack/nack got respond. Please check the device datasheet.

---

#### Parameters

- **bus\_handle** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **address** -- [in] I2C device address that you want to probe.
- **xfer\_timeout\_ms** -- [in] Wait timeout, in ms. Note: -1 means wait forever (Not recommended in this function).

#### Returns

- `ESP_OK`: I2C device probe successfully
- `ESP_ERR_NOT_FOUND`: I2C probe failed, doesn't find the device with specific address you gave.
- `ESP_ERR_TIMEOUT`: Operation timeout (larger than `xfer_timeout_ms`) because the bus is busy or hardware crash.

`esp_err_t i2c_master_register_event_callbacks` (`i2c_master_dev_handle_t` i2c\_dev, const `i2c_master_event_callbacks_t` \*cbs, void \*user\_data)

Register I2C transaction callbacks for a master device.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

---

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

---

**Note:** If the callback is used for helping asynchronous transaction. On the same bus, only one device can be used for performing asynchronous operation.

---

#### Parameters

- **i2c\_dev** -- [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

#### Returns

- ESP\_OK: Set I2C transaction callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set I2C transaction callbacks failed because of invalid argument
- ESP\_FAIL: Set I2C transaction callbacks failed because of other error

*esp\_err\_t* **i2c\_master\_bus\_reset** (*i2c\_master\_bus\_handle\_t* bus\_handle)

Reset the I2C master bus.

**Parameters** **bus\_handle** -- I2C bus handle.

**Returns**

- ESP\_OK: Reset succeed.
- ESP\_ERR\_INVALID\_ARG: I2C master bus handle is not initialized.
- Otherwise: Reset failed.

*esp\_err\_t* **i2c\_master\_bus\_wait\_all\_done** (*i2c\_master\_bus\_handle\_t* bus\_handle, int timeout\_ms)

Wait for all pending I2C transactions done.

**Parameters**

- **bus\_handle** -- [in] I2C bus handle
- **timeout\_ms** -- [in] Wait timeout, in ms. Specially, -1 means to wait forever.

**Returns**

- ESP\_OK: Flush transactions successfully
- ESP\_ERR\_INVALID\_ARG: Flush transactions failed because of invalid argument
- ESP\_ERR\_TIMEOUT: Flush transactions failed because of timeout
- ESP\_FAIL: Flush transactions failed because of other error

*esp\_err\_t* **i2c\_master\_get\_bus\_handle** (*i2c\_port\_num\_t* port\_num, *i2c\_master\_bus\_handle\_t* \*ret\_handle)

Retrieves the I2C master bus handle for a specified I2C port number.

This function retrieves the I2C master bus handle for the given I2C port number. Please make sure the handle has already been initialized, and this function would simply returns the existing handle. Note that the returned handle still can't be used concurrently

**Parameters**

- **port\_num** -- I2C port number for which the handle is to be retrieved.
- **ret\_handle** -- Pointer to a variable where the retrieved handle will be stored.

**Returns**

- ESP\_OK: Success. The handle is retrieved successfully.
- ESP\_ERR\_INVALID\_ARG: Invalid argument, such as invalid port number
- ESP\_ERR\_INVALID\_STATE: Invalid state, such as the I2C port is not initialized.

## Structures

struct **i2c\_master\_bus\_config\_t**

I2C master bus specific configurations.

## Public Members

*i2c\_port\_num\_t* **i2c\_port**

I2C port number, -1 for auto selecting, (not include LP I2C instance)

*gpio\_num\_t* **sda\_io\_num**

GPIO number of I2C SDA signal, pulled-up internally

*gpio\_num\_t* **scl\_io\_num**

GPIO number of I2C SCL signal, pulled-up internally

***i2c\_clock\_source\_t* clk\_source**

Clock source of I2C master bus

**uint8\_t glitch\_ignore\_cnt**

If the glitch period on the line is less than this value, it can be filtered out, typically value is 7 (unit: I2C module clock cycle)

**int intr\_priority**

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

**size\_t trans\_queue\_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background, only valid in asynchronous transaction. (Typically max\_device\_num \* per\_transaction)

**uint32\_t enable\_internal\_pullup**

Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. Recommend proper external pull-up if possible

**struct *i2c\_master\_bus\_config\_t*::[anonymous] flags**

I2C master config flags

**struct *i2c\_device\_config\_t***

I2C device configuration.

**Public Members*****i2c\_addr\_bit\_len\_t* dev\_addr\_length**

Select the address length of the slave device.

**uint16\_t device\_address**

I2C device raw address. (The 7/10 bit address without read/write bit)

**uint32\_t scl\_speed\_hz**

I2C SCL line frequency.

**uint32\_t scl\_wait\_us**

Timeout value. (unit: us). Please note this value should not be so small that it can handle stretch/disturbance properly. If 0 is set, that means use the default reg value

**uint32\_t disable\_ack\_check**

Disable ACK check. If this is set false, that means ack check is enabled, the transaction will be stopped and API returns error when nack is detected.

**struct *i2c\_device\_config\_t*::[anonymous] flags**

I2C device config flags

**struct *i2c\_master\_event\_callbacks\_t***

Group of I2C master callbacks, can be used to get status during transaction or doing other small things. But take care potential concurrency issues.

---

**Note:** The callbacks are all running under ISR context

---

---

**Note:** When CONFIG\_I2C\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

### *i2c\_master\_callback\_t* on\_trans\_done

I2C master transaction finish callback

## Header File

- `components/esp_driver_i2c/include/driver/i2c_slave.h`
- This header file can be included with:

```
#include "driver/i2c_slave.h"
```

- This header file is a part of the API provided by the `esp_driver_i2c` component. To declare that your component depends on `esp_driver_i2c`, add the following to your CMakeLists.txt:

```
REQUIRES esp_driver_i2c
```

or

```
PRIV_REQUIRES esp_driver_i2c
```

## Functions

*esp\_err\_t* **i2c\_new\_slave\_device** (const *i2c\_slave\_config\_t* \*slave\_config, *i2c\_slave\_dev\_handle\_t* \*ret\_handle)

Initialize an I2C slave device.

### Parameters

- **slave\_config** -- [in] I2C slave device configurations
- **ret\_handle** -- [out] Return a generic I2C device handle

### Returns

- ESP\_OK: I2C slave device initialized successfully
- ESP\_ERR\_INVALID\_ARG: I2C device initialization failed because of invalid argument.
- ESP\_ERR\_NO\_MEM: Create I2C device failed because of out of memory.

*esp\_err\_t* **i2c\_del\_slave\_device** (*i2c\_slave\_dev\_handle\_t* i2c\_slave)

Deinitialize the I2C slave device.

**Parameters** **i2c\_slave** -- [in] I2C slave device handle that created by `i2c_new_slave_device`.

### Returns

- ESP\_OK: Delete I2C device successfully.
- ESP\_ERR\_INVALID\_ARG: I2C device initialization failed because of invalid argument.

*esp\_err\_t* **i2c\_slave\_receive** (*i2c\_slave\_dev\_handle\_t* i2c\_slave, uint8\_t \*data, size\_t buffer\_size)

Read bytes from I2C internal buffer. Start a job to receive I2C data.

---

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `i2c_slave_register_event_callbacks()`.

---

**Parameters**

- **i2c\_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- **[out]** Buffer to store data from I2C fifo. Should be valid until `on_recv_done` is triggered.
- **buffer\_size** -- **[in]** Buffer size of data that provided by users.

**Returns**

- `ESP_OK`: I2C slave receive success.
- `ESP_ERR_INVALID_ARG`: I2C slave receive parameter invalid.
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in fifo mode, but `I2C_SLAVE_NONFIFO` mode is configured

```
esp_err_t i2c_slave_transmit(i2c_slave_dev_handle_t i2c_slave, const uint8_t *data, int size, int xfer_timeout_ms)
```

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

---

**Note:** If you connect this slave device to some master device, the data transaction direction is from slave device to master device.

---

**Parameters**

- **i2c\_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **data** -- **[in]** Buffer to write to slave fifo, can pickup by master. Can be freed after this function returns. Equal or larger than `size`.
- **size** -- **[in]** In bytes, of `data` buffer.
- **xfer\_timeout\_ms** -- **[in]** Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- `ESP_OK`: I2C slave transmit success.
- `ESP_ERR_INVALID_ARG`: I2C slave transmit parameter invalid.
- `ESP_ERR_TIMEOUT`: Operation timeout(larger than `xfer_timeout_ms`) because the device is busy or hardware crash.
- `ESP_ERR_NOT_SUPPORTED`: This function should be work in fifo mode, but `I2C_SLAVE_NONFIFO` mode is configured

```
esp_err_t i2c_slave_register_event_callbacks(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_event_callbacks_t *cbs, void *user_data)
```

Set I2C slave event callbacks for I2C slave channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

---

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

**Parameters**

- **i2c\_slave** -- **[in]** I2C slave device handle that created by `i2c_new_slave_device`.
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set I2C transaction callbacks successfully

- `ESP_ERR_INVALID_ARG`: Set I2C transaction callbacks failed because of invalid argument
- `ESP_FAIL`: Set I2C transaction callbacks failed because of other error

## Structures

struct `i2c_slave_config_t`

I2C slave specific configurations.

### Public Members

`i2c_port_num_t` `i2c_port`

I2C port number, -1 for auto selecting

`gpio_num_t` `sda_io_num`

SDA IO number used by I2C bus

`gpio_num_t` `scl_io_num`

SCL IO number used by I2C bus

`i2c_clock_source_t` `clk_source`

Clock source of I2C bus.

`uint32_t` `send_buf_depth`

Depth of internal transfer ringbuffer, increase this value can support more transfers pending in the background

`uint16_t` `slave_addr`

I2C slave address

`i2c_addr_bit_len_t` `addr_bit_len`

I2C slave address in bit length

`int` `intr_priority`

I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

struct `i2c_slave_config_t::`[anonymous] `flags`

I2C slave config flags

struct `i2c_slave_event_callbacks_t`

Group of I2C slave callbacks (e.g. get i2c slave stretch cause). But take care of potential concurrency issues.

---

**Note:** The callbacks are all running under ISR context

---

---

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

### *i2c\_slave\_received\_callback\_t* on\_recv\_done

I2C slave receive done callback

## Header File

- `components/esp_driver_i2c/include/driver/i2c_types.h`
- This header file can be included with:

```
#include "driver/i2c_types.h"
```

- This header file is a part of the API provided by the `esp_driver_i2c` component. To declare that your component depends on `esp_driver_i2c`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2c
```

or

```
PRIV_REQUIRES esp_driver_i2c
```

## Structures

struct `i2c_master_event_data_t`

Data type used in I2C event callback.

## Public Members

### *i2c\_master\_event\_t* event

The I2C hardware event that I2C callback is called.

struct `i2c_slave_rx_done_event_data_t`

Event structure used in I2C slave.

## Public Members

uint8\_t \***buffer**

Pointer for buffer received in callback.

## Type Definitions

typedef int `i2c_port_num_t`

I2C port number.

typedef struct `i2c_master_bus_t` \*`i2c_master_bus_handle_t`

Type of I2C master bus handle.

typedef struct `i2c_master_dev_t` \*`i2c_master_dev_handle_t`

Type of I2C master bus device handle.

typedef struct `i2c_slave_dev_t` \*`i2c_slave_dev_handle_t`

Type of I2C slave device handle.

```
typedef bool (*i2c_master_callback_t)(i2c_master_dev_handle_t i2c_dev, const i2c_master_event_data_t *evt_data, void *arg)
```

An callback for I2C transaction.

**Param i2c\_dev [in]** Handle for I2C device.

**Param evt\_data [out]** I2C capture event data, fed by driver

**Param arg [in]** User data, set in `i2c_master_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*i2c_slave_received_callback_t)(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_rx_done_event_data_t *evt_data, void *arg)
```

Callback signature for I2C slave.

**Param i2c\_slave [in]** Handle for I2C slave.

**Param evt\_data [out]** I2C capture event data, fed by driver

**Param arg [in]** User data, set in `i2c_slave_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

## Enumerations

```
enum i2c_master_status_t
```

Enumeration for I2C fsm status.

*Values:*

enumerator **I2C\_STATUS\_READ**

read status for current master command

enumerator **I2C\_STATUS\_WRITE**

write status for current master command

enumerator **I2C\_STATUS\_START**

Start status for current master command

enumerator **I2C\_STATUS\_STOP**

stop status for current master command

enumerator **I2C\_STATUS\_IDLE**

idle status for current master command

enumerator **I2C\_STATUS\_ACK\_ERROR**

ack error status for current master command

enumerator **I2C\_STATUS\_DONE**

I2C command done

enumerator **I2C\_STATUS\_TIMEOUT**

I2C bus status error, and operation timeout

```
enum i2c_master_event_t
```

Enumeration for I2C event.

*Values:*

enumerator **I2C\_EVENT\_ALIVE**

i2c bus in alive status.

enumerator **I2C\_EVENT\_DONE**

i2c bus transaction done

enumerator **I2C\_EVENT\_NACK**

i2c bus nack

enumerator **I2C\_EVENT\_TIMEOUT**

i2c bus timeout

### Header File

- [components/hal/include/hal/i2c\\_types.h](#)
- This header file can be included with:

```
#include "hal/i2c_types.h"
```

### Structures

struct **i2c\_hal\_clk\_config\_t**

Data structure for calculating I2C bus timing.

### Public Members

uint16\_t **clkm\_div**

I2C core clock divider

uint16\_t **scl\_low**

I2C scl low period

uint16\_t **scl\_high**

I2C scl high period

uint16\_t **scl\_wait\_high**

I2C scl wait\_high period

uint16\_t **sda\_hold**

I2C scl low period

uint16\_t **sda\_sample**

I2C sda sample time

uint16\_t **setup**

I2C start and stop condition setup period

uint16\_t **hold**

I2C start and stop condition hold period

`uint16_t tout`  
I2C bus timeout period

### Type Definitions

typedef `soc_periph_i2c_clk_src_t` `i2c_clock_source_t`  
I2C group clock source.

### Enumerations

enum `i2c_port_t`  
I2C port number, can be `I2C_NUM_0` ~ (`I2C_NUM_MAX`-1).

*Values:*

enumerator `I2C_NUM_0`  
I2C port 0

enumerator `I2C_NUM_1`  
I2C port 1

enumerator `I2C_NUM_MAX`  
I2C port max

enum `i2c_addr_bit_len_t`  
Enumeration for I2C device address bit length.

*Values:*

enumerator `I2C_ADDR_BIT_LEN_7`  
i2c address bit length 7

enum `i2c_mode_t`

*Values:*

enumerator `I2C_MODE_SLAVE`  
I2C slave mode

enumerator `I2C_MODE_MASTER`  
I2C master mode

enumerator `I2C_MODE_MAX`

enum `i2c_rw_t`

*Values:*

enumerator `I2C_MASTER_WRITE`  
I2C write data

enumerator `I2C_MASTER_READ`  
I2C read data

enum **i2c\_trans\_mode\_t**

*Values:*

enumerator **I2C\_DATA\_MODE\_MSB\_FIRST**

I2C data msb first

enumerator **I2C\_DATA\_MODE\_LSB\_FIRST**

I2C data lsb first

enumerator **I2C\_DATA\_MODE\_MAX**

enum **i2c\_addr\_mode\_t**

*Values:*

enumerator **I2C\_ADDR\_BIT\_7**

I2C 7bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_10**

I2C 10bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_MAX**

enum **i2c\_ack\_type\_t**

*Values:*

enumerator **I2C\_MASTER\_ACK**

I2C ack for each byte read

enumerator **I2C\_MASTER\_NACK**

I2C nack for each byte read

enumerator **I2C\_MASTER\_LAST\_NACK**

I2C nack for the last byte

enumerator **I2C\_MASTER\_ACK\_MAX**

enum **i2c\_slave\_stretch\_cause\_t**

Enum for I2C slave stretch causes.

*Values:*

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_ADDRESS\_MATCH**

Stretching SCL low when the slave is read by the master and the address just matched

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_TX\_EMPTY**

Stretching SCL low when TX FIFO is empty in slave mode

enumerator **I2C\_SLAVE\_STRETCH\_CAUSE\_RX\_FULL**

Stretching SCL low when RX FIFO is full in slave mode

enumerator `I2C_SLAVE_STRETCH_CAUSE_SENDING_ACK`

Stretching SCL low when slave sending ACK

## 2.5.12 Inter-IC Sound (I2S)

### Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32-S2 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK:** Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK:** Bit clock line. The bit clock for data line.
- **WS:** Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT:** Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller supports single RX or TX simplex communication. As RX and TX channels share a clock, they can only be combined with the same configuration to establish a full-duplex communication.

### I2S File Structure

Fig. 11: I2S File Structure

**Public headers that need to be included in the I2S application are as follows:**

- `i2s.h`: The header file that provides legacy I2S APIs (for apps using legacy driver).
- `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

---

**Note:** The legacy driver cannot coexist with the new driver. Include `i2s.h` to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

---

**Public headers that have been included in the headers above are as follows:**

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

## I2S Clock

### Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_APLL`: Audio PLL clock, which is more precise than `I2S_CLK_SRC_PLL_160M` in high sample rate applications. Its frequency is configurable according to the sample rate. However, if APLL has been occupied by EMAC or other channels, the APLL frequency cannot be changed, and the driver will try to work under this APLL frequency. If this frequency cannot meet the requirements of I2S, the clock configuration will fail.

### Clock Terminology

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

---

**Note:** Normally, MCLK should be the multiple of `sample rate` and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to the `sample rate`. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

---

## I2S Communication Mode

### Overview of All Modes

Target	Standard	PDM TX	PDM RX	TDM	ADC/DAC	LCD/Camera
ESP32	I2S 0/1	I2S 0	I2S 0	none	I2S 0	I2S 0
ESP32-S2	I2S 0	none	none	none	none	I2S 0
ESP32-C3	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-C6	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	none	none
ESP32-H2	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-P4	I2S 0~2	I2S 0	I2S 0	I2S 0~2	none	none

**Standard Mode** In standard mode, there are always two sound channels, i.e., the left and right channels, which are called "slots". These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the following:

- **Philips Format:** Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

- **MSB Format:** Basically the same as Philips format, but without data shift.

- **PCM Short Format:** Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

**LCD/Camera Mode** LCD/Camera mode is only supported on I2S0 over a parallel bus. For LCD mode, I2S0 should work at master TX mode. For camera mode, I2S0 should work at slave RX mode. These two modes are not implemented by the I2S driver. Please refer to *180 Interfaced LCD* for details about the LCD implementation. For more information, see *ESP32-S2 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF]*.

### Functional Overview

The I2S driver offers the following services:

**Resource Management** There are three levels of resources in the I2S driver:

- platform level: Resources of all I2S controllers in the current target.
- controller level: Resources in one I2S controller.
- channel level: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels' resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver guarantees that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

**Finite State Machine** There are three states for an I2S channel, namely, registered, ready, and running. Their relationship is shown in the following diagram:

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the *I2S Communication Mode* section.

**Data Transport** The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num`

Fig. 12: I2S Finite State Machine

\* slot\_num \* slot\_bit\_width / 8. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keep waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

**Configuration** Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding reconfig functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that:

1. Keeps the interrupt being serviced even when the cache is disabled.
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

### Kconfig Options

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.

### Application Example

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to *Standard Mode* for information about STD API. And for more details, please refer to `esp_driver_i2s/include/driver/i2s_std.h`.

**STD TX Mode** Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit	slot mode	slot mask	WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high
16 bit	mono	left		0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
		right		0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
		both		0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
	stereo	left		0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007
		right		0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		both		0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** Similar for 8-bit and 32-bit data widths, the type of the buffer is better to be `uint8_t` and `uint32_t`. But specially, when the data width is 24-bit, the data buffer should be aligned with 3-byte (i.e., every 3 bytes stands for a 24-bit data in one slot). Additionally, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the writing buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro.
 * This helper macro is defined in `i2s_common.h` and shared by all the I2S
 * communication modes.
 * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can
↳be generated by the macros
 * These two helper macros are defined in `i2s_std.h` which can only be used in
↳STD mode.
 * They can help to specify the slot and clock configurations for initialization
↳or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
```

(continues on next page)

(continued from previous page)

```

        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
→wait);

/* If the configurations of slot or clock need to be updated,
 * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_
→resources */
i2s_del_channel(tx_handle);

```

**STD RX Mode** Taking 16-bit data width for example, when the data on the line are:

WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data bit width	slot mode	slot mask	data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7
16 bit	mono	left	0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
		right	0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
	stereo	any	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** 8-bit, 24-bit, and 32-bit are similar as 16-bit, where the data bit-width in the receiving buffer is equal to the data bit-width on the line. Additionally, when using 24-bit data width, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the receiving buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t rx_handle;
/* Get the default channel configuration by helper macro.

```

(continues on next page)

(continued from previous page)

```

* This helper macro is defined in `i2s_common.h` and shared by all the I2S_
↪communication modes.
* It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
/* Allocate a new RX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Setting the configurations, the slot configuration and clock configuration can_
↪be generated by the macros
* These two helper macros are defined in `i2s_std.h` which can only be used in_
↪STD mode.
* They can help to specify the slot and clock configurations for initialization_
↪or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↪MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before reading data, start the RX channel first */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel_
↪resources */
i2s_del_channel(rx_handle);

```

**Full-duplex** Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels share the BCLK and WS signals. Currently, STD and TDM communication modes supports full-duplex mode in the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */

```

(continues on next page)

(continued from previous page)

```

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
/* Allocate for TX and RX channel at the same time, then they will work in full-
↪duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since TX and RX channel have to
↪be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↪SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...

```

**Simplex Mode** To allocate a channel handle in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32-S2 are not independent, so the TX and RX channel cannot coexist on the same I2S port in simplex mode.

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↪SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};

```

(continues on next page)

```

    },
},
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* RX channel will be registered on another I2S, if no other available I2S unit_
↳found
 * it will return ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle);
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
},
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

## Application Notes

**How to Prevent Data Lost** For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t_
↳handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

```

interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092

```

- Determine `dma_desc_num`. `dma_desc_num` is decided by the maximum time of `i2s_channel_read` polling cycle. All the received data is supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

```
dma_desc_num > polling_cycle / interrupt_interval
```

- Determine the receiving buffer size. The receiving buffer offered by users in `i2s_channel_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

```
recv_buffer_size > dma_desc_num * dma_buffer_size
```

For example, if there is an I2S application, and the known values are:

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms
```

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

```
dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↪ 549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↪ = 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes
```

## API Reference

### Standard Mode

#### Header File

- `components/esp_driver_i2s/include/driver/i2s_std.h`
- This header file can be included with:

```
#include "driver/i2s_std.h"
```

- This header file is a part of the API provided by the `esp_driver_i2s` component. To declare that your component depends on `esp_driver_i2s`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2s
```

or

```
PRIV_REQUIRES esp_driver_i2s
```

#### Functions

`esp_err_t i2s_channel_init_std_mode(i2s_chan_handle_t handle, const i2s_std_config_t *std_cfg)`

Initialize I2S channel to standard mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

#### Parameters

- **handle** -- **[in]** I2S channel handler
- **std\_cfg** -- **[in]** Configurations for standard mode, including clock, slot and GPIO The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

**Returns**

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for standard mode.

---

**Note:** Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **clk\_cfg** -- **[in]** Standard mode clock configuration, can be generated by `I2S_STD_CLK_DEFAULT_CONFIG`

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for standard mode.

---

**Note:** Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **slot\_cfg** -- **[in]** Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode

- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

`esp_err_t i2s_channel_reconfig_std_gpio` (`i2s_chan_handle_t` handle, const `i2s_std_gpio_config_t` \*gpio\_cfg)

Reconfigure the I2S GPIO for standard mode.

---

**Note:** Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

#### Parameters

- **handle** -- [in] I2S channel handler
- **gpio\_cfg** -- [in] Standard mode GPIO configuration, specified by user

#### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

### Structures

struct `i2s_std_slot_config_t`

I2S slot configuration for standard mode.

#### Public Members

`i2s_data_bit_width_t data_bit_width`

I2S sample data bit width (valid data bits per sample)

`i2s_slot_bit_width_t slot_bit_width`

I2S slot bit width (total bits per slot)

`i2s_slot_mode_t slot_mode`

Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO` In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

`i2s_std_slot_mask_t slot_mask`

Select the left, right or both slot

uint32\_t `ws_width`

WS signal width (i.e. the number of BCLK ticks that WS signal is high)

bool `ws_pol`

WS signal polarity, set true to enable high lever first

bool **bit\_shift**

Set to enable bit shift in Philips mode

bool **msb\_right**

Set to place right channel data at the MSB in the FIFO

struct **i2s\_std\_clk\_config\_t**

I2S clock configuration for standard mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source, see `soc_periph_i2s_clk_src_t` for the supported clock sources. selected `I2S_CLK_SRC_EXTERNAL` (if supports) to enable the external source clock input via MCLK pin,

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of MCLK to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of 3 (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s\_std\_gpio\_config\_t**

I2S standard mode GPIO pins configuration.

### Public Members

gpio\_num\_t **mclk**

MCK pin, output by default, input if the clock source is selected to `I2S_CLK_SRC_EXTERNAL`

gpio\_num\_t **bclk**

BCK pin, input in slave role, output in master role

gpio\_num\_t **ws**

WS pin, input in slave role, output in master role

gpio\_num\_t **dout**

DATA pin, output

gpio\_num\_t **din**

DATA pin, input

uint32\_t **mclk\_inv**

Set 1 to invert the MCLK input/output

uint32\_t **bclk\_inv**

Set 1 to invert the BCLK input/output

uint32\_t **ws\_inv**

Set 1 to invert the WS input/output

struct *i2s\_std\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_std\_config\_t**

I2S standard mode major configuration that including clock/slot/GPIO configuration.

### Public Members

*i2s\_std\_clk\_config\_t* **clk\_cfg**

Standard mode clock configuration, can be generated by macro I2S\_STD\_CLK\_DEFAULT\_CONFIG

*i2s\_std\_slot\_config\_t* **slot\_cfg**

Standard mode slot configuration, can be generated by macros I2S\_STD\_[mode]\_SLOT\_DEFAULT\_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

*i2s\_std\_gpio\_config\_t* **gpio\_cfg**

Standard mode GPIO configuration, specified by user

### Macros

**I2S\_STD\_PHILIPS\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

#### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PCM(short) format in 2 slots.

---

**Note:** PCM(long) is same as Philips in 2 slots

---

#### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

MSB format in 2 slots.

#### Parameters

- **bits\_per\_sample** -- I2S data bit width
- **mono\_or\_stereo** -- I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_CLK\_DEFAULT\_CONFIG** (rate)

I2S default standard clock configuration.

---

**Note:** Please set the `mclk_multiple` to `I2S_MCLK_MULTIPLE_384` while using 24 bits data width. Otherwise the sample rate might be imprecise since the BCLK division is not a integer.

---

**Parameters**

- **rate** -- sample rate

**I2S Driver****Header File**

- `components/esp_driver_i2s/include/driver/i2s_common.h`
- This header file can be included with:

```
#include "driver/i2s_common.h"
```

- This header file is a part of the API provided by the `esp_driver_i2s` component. To declare that your component depends on `esp_driver_i2s`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2s
```

or

```
PRIV_REQUIRES esp_driver_i2s
```

**Functions**

`esp_err_t i2s_new_channel` (const `i2s_chan_config_t` \*chan\_cfg, `i2s_chan_handle_t` \*ret\_tx\_handle, `i2s_chan_handle_t` \*ret\_rx\_handle)

Allocate new I2S channel(s)

---

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

---

---

**Note:** When the port id in channel configuration is `I2S_NUM_AUTO`, driver will allocate I2S port automatically on one of the I2S controller, otherwise driver will try to allocate the new channel on the selected port.

---

---

**Note:** If both `tx_handle` and `rx_handle` are not NULL, it means this I2S controller will work at full-duplex mode, the RX and TX channels will be allocated on a same I2S port in this case. Note that some configurations of TX/RX channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee TX/RX channels write/read synchronously, they can only share the clock signals for now.

---

---

**Note:** If `tx_handle` OR `rx_handle` is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both RX and TX channel) will be occupied, even if only one of RX or TX channel is registered. For the other targets, another channel on this controller will still available.

---

**Parameters**

- **chan\_cfg** -- [in] I2S controller channel configurations

- **ret\_tx\_handle** -- [out] I2S channel handler used for managing the sending channel(optional)
- **ret\_rx\_handle** -- [out] I2S channel handler used for managing the receiving channel(optional)

**Returns**

- ESP\_OK Allocate new channel(s) success
- ESP\_ERR\_NOT\_SUPPORTED The communication mode is not supported on the current chip
- ESP\_ERR\_INVALID\_ARG NULL pointer or illegal parameter in *i2s\_chan\_config\_t*
- ESP\_ERR\_NOT\_FOUND No available I2S channel found

*esp\_err\_t* **i2s\_del\_channel** (*i2s\_chan\_handle\_t* handle)

Delete the I2S channel.

---

**Note:** Only allowed to be called when the I2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

---

---

**Note:** Resource will be free automatically if all channels in one port are deleted

---

**Parameters** **handle** -- [in] I2S channel handler

- ESP\_OK Delete successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer

*esp\_err\_t* **i2s\_channel\_get\_info** (*i2s\_chan\_handle\_t* handle, *i2s\_chan\_info\_t* \*chan\_info)

Get I2S channel information.

**Parameters**

- **handle** -- [in] I2S channel handler
- **chan\_info** -- [out] I2S channel basic information

**Returns**

- ESP\_OK Get I2S channel information success
- ESP\_ERR\_NOT\_FOUND The input handle doesn't match any registered I2S channels, it may not an I2S channel handle or not available any more
- ESP\_ERR\_INVALID\_ARG The input handle or chan\_info pointer is NULL

*esp\_err\_t* **i2s\_channel\_enable** (*i2s\_chan\_handle\_t* handle)

Enable the I2S channel.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

---

---

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting BCLK and WS signal. For MCLK signal, it will start to output when initialization is finished

---

**Parameters** **handle** -- [in] I2S channel handler

- ESP\_OK Start successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not initialized or already started

*esp\_err\_t* **i2s\_channel\_disable** (*i2s\_chan\_handle\_t* handle)

Disable the I2S channel.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

---

---

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop BCLK and WS signal but not MCLK signal

---

**Parameters** `handle` -- [in] I2S channel handler

**Returns**

- ESP\_OK Stop successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* `i2s_channel_preload_data` (*i2s\_chan\_handle\_t* tx\_handle, const void \*src, size\_t size, size\_t \*bytes\_loaded)

Preload the data into TX DMA buffer.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

---

---

**Note:** As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.

---

---

**Note:** This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

---

**Parameters**

- `tx_handle` -- [in] I2S TX channel handler
- `src` -- [in] The pointer of the source buffer to be loaded
- `size` -- [in] The source buffer size
- `bytes_loaded` -- [out] The bytes that successfully been loaded into the TX DMA buffer

**Returns**

- ESP\_OK Load data successful
- ESP\_ERR\_INVALID\_ARG NULL pointer or not TX direction
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* `i2s_channel_write` (*i2s\_chan\_handle\_t* handle, const void \*src, size\_t size, size\_t \*bytes\_written, uint32\_t timeout\_ms)

I2S write data.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., TX channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **src** -- **[in]** The pointer of sent data buffer
- **size** -- **[in]** Max data buffer length
- **bytes\_written** -- **[out]** Byte number that actually be sent, can be NULL if not needed
- **timeout\_ms** -- **[in]** Max block time

**Returns**

- ESP\_OK Write successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not TX handle
- ESP\_ERR\_TIMEOUT Writing timeout, no writing event received from ISR within ticks\_to\_wait
- ESP\_ERR\_INVALID\_STATE I2S is not ready to write

*esp\_err\_t* **i2s\_channel\_read** (*i2s\_chan\_handle\_t* handle, void \*dest, size\_t size, size\_t \*bytes\_read, uint32\_t timeout\_ms)

I2S read data.

---

**Note:** Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **dest** -- **[in]** The pointer of receiving data buffer
- **size** -- **[in]** Max data buffer length
- **bytes\_read** -- **[out]** Byte number that actually be read, can be NULL if not needed
- **timeout\_ms** -- **[in]** Max block time

**Returns**

- ESP\_OK Read successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not RX handle
- ESP\_ERR\_TIMEOUT Reading timeout, no reading event received from ISR within ticks\_to\_wait
- ESP\_ERR\_INVALID\_STATE I2S is not ready to read

*esp\_err\_t* **i2s\_channel\_register\_event\_callback** (*i2s\_chan\_handle\_t* handle, const *i2s\_event\_callbacks\_t* \*callbacks, void \*user\_data)

Set event callbacks for I2S channel.

---

**Note:** Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

---

**Parameters**

- **handle** -- **[in]** I2S channel handler
- **callbacks** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

**Structures**

struct **i2s\_event\_callbacks\_t**

Group of I2S callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

**Public Members**

*i2s\_isr\_callback\_t* **on\_recv**

Callback of data received event, only for RX channel The event data includes DMA buffer address and size that just finished receiving data

*i2s\_isr\_callback\_t* **on\_recv\_q\_ovf**

Callback of receiving queue overflowed event, only for RX channel The event data includes buffer size that has been overwritten

*i2s\_isr\_callback\_t* **on\_sent**

Callback of data sent event, only for TX channel The event data includes DMA buffer address and size that just finished sending data

*i2s\_isr\_callback\_t* **on\_send\_q\_ovf**

Callback of sending queue overflowed event, only for TX channel The event data includes buffer size that has been overwritten

struct **i2s\_chan\_config\_t**

I2S controller channel configuration.

**Public Members**

*i2s\_port\_t* **id**

I2S port id

*i2s\_role\_t* **role**

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

uint32\_t **dma\_desc\_num**

I2S DMA buffer number, it is also the number of DMA descriptor

uint32\_t **dma\_frame\_num**

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of 3 when the data bit width is 24.

bool **auto\_clear**

Alias of `auto_clear_after_cb`

bool **auto\_clear\_after\_cb**

Set to auto clear DMA TX buffer after `on_sent` callback, I2S will always send zero automatically if no data to send. So that user can assign the data to the DMA buffers directly in the callback, and the data won't be cleared after quit the callback.

bool **auto\_clear\_before\_cb**

Set to auto clear DMA TX buffer before `on_sent` callback, I2S will always send zero automatically if no data to send So that user can access data in the callback that just finished to send.

int **intr\_priority**

I2S interrupt priority, range [0, 7], if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct **i2s\_chan\_info\_t**

I2S channel information.

### Public Members

*i2s\_port\_t* **id**

I2S port id

*i2s\_role\_t* **role**

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

*i2s\_dir\_t* **dir**

I2S channel direction

*i2s\_comm\_mode\_t* **mode**

I2S channel communication mode

*i2s\_chan\_handle\_t* **pair\_chan**

I2S pair channel handle in duplex mode, always NULL in simplex mode

uint32\_t **total\_dma\_buf\_size**

Total size of all the allocated DMA buffers

- 0 if the channel has not been initialized
- non-zero if the channel has been initialized

### Macros

**I2S\_CHANNEL\_DEFAULT\_CONFIG** (`i2s_num`, `i2s_role`)

get default I2S property

## I2S\_GPIO\_UNUSED

Used in `i2s_gpio_config_t` for signals which are not used

## I2S Types

### Header File

- [components/esp\\_driver\\_i2s/include/driver/i2s\\_types.h](#)
- This header file can be included with:

```
#include "driver/i2s_types.h"
```

- This header file is a part of the API provided by the `esp_driver_i2s` component. To declare that your component depends on `esp_driver_i2s`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_i2s
```

or

```
PRIV_REQUIRES esp_driver_i2s
```

### Structures

#### struct `i2s_event_data_t`

Event structure used in I2S event queue.

### Public Members

#### void `*data`

(Deprecated) The secondary pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

#### void `*dma_buf`

The first level pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

#### size\_t `size`

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the `dma_frame_num` and `data_bit_width`, typically it is fixed when `data_bit_width` is not changed.

### Type Definitions

```
typedef struct i2s_channel_obj_t *i2s_chan_handle_t
```

I2S channel object handle, the control unit of the I2S driver

```
typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
```

I2S event callback.

**Param handle** [in] I2S channel handle, created from `i2s_new_channel()`

**Param event** [in] I2S event data

**Param user\_ctx** [in] User registered context, passed from `i2s_channel_register_event_callback()`

**Return** Whether a high priority task has been waken up by this callback function

## Enumerations

enum **i2s\_port\_t**

I2S controller port number, the max port number is (SOC\_I2S\_NUM -1).

*Values:*

enumerator **I2S\_NUM\_0**

I2S controller port 0

enumerator **I2S\_NUM\_AUTO**

Select whichever port is available

enum **i2s\_comm\_mode\_t**

I2S controller communication mode.

*Values:*

enumerator **I2S\_COMM\_MODE\_STD**

I2S controller using standard communication mode, support Philips/MSB/PCM format

enumerator **I2S\_COMM\_MODE\_NONE**

Unspecified I2S controller mode

enum **i2s\_mclk\_multiple\_t**

The multiple of MCLK to sample rate.

---

**Note:** MCLK is the minimum resolution of the I2S clock. Increasing mclk multiple can reduce the clock jitter of BCLK and WS, which is also useful for the codec that don't require MCLK but have strict requirement to BCLK. For the 24-bit slot width, please choose a multiple that can be divided by 3 (i.e. 24-bit compatible).

---

*Values:*

enumerator **I2S\_MCLK\_MULTIPLE\_128**

MCLK = sample\_rate \* 128

enumerator **I2S\_MCLK\_MULTIPLE\_192**

MCLK = sample\_rate \* 192 (24-bit compatible)

enumerator **I2S\_MCLK\_MULTIPLE\_256**

MCLK = sample\_rate \* 256

enumerator **I2S\_MCLK\_MULTIPLE\_384**

MCLK = sample\_rate \* 384 (24-bit compatible)

enumerator **I2S\_MCLK\_MULTIPLE\_512**

MCLK = sample\_rate \* 512

enumerator **I2S\_MCLK\_MULTIPLE\_576**

MCLK = sample\_rate \* 576 (24-bit compatible)

enumerator **I2S\_MCLK\_MULTIPLE\_768**  
MCLK = sample\_rate \* 768 (24-bit compatible)

enumerator **I2S\_MCLK\_MULTIPLE\_1024**  
MCLK = sample\_rate \* 1024

enumerator **I2S\_MCLK\_MULTIPLE\_1152**  
MCLK = sample\_rate \* 1152 (24-bit compatible)

### Header File

- [components/hal/include/hal/i2s\\_types.h](#)
- This header file can be included with:

```
#include "hal/i2s_types.h"
```

### Type Definitions

typedef *soc\_periph\_i2s\_clk\_src\_t* **i2s\_clock\_src\_t**  
I2S clock source

### Enumerations

enum **i2s\_slot\_mode\_t**  
I2S channel slot mode.

*Values:*

enumerator **I2S\_SLOT\_MODE\_MONO**  
I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S\_SLOT\_MODE\_STEREO**  
I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s\_dir\_t**  
I2S channel direction.

*Values:*

enumerator **I2S\_DIR\_RX**  
I2S channel direction RX

enumerator **I2S\_DIR\_TX**  
I2S channel direction TX

enum **i2s\_role\_t**  
I2S controller role.  
*Values:*

enumerator **I2S\_ROLE\_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S\_ROLE\_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s\_data\_bit\_width\_t**

Available data bit width in one slot.

*Values:*

enumerator **I2S\_DATA\_BIT\_WIDTH\_8BIT**

I2S channel data bit-width: 8

enumerator **I2S\_DATA\_BIT\_WIDTH\_16BIT**

I2S channel data bit-width: 16

enumerator **I2S\_DATA\_BIT\_WIDTH\_24BIT**

I2S channel data bit-width: 24

enumerator **I2S\_DATA\_BIT\_WIDTH\_32BIT**

I2S channel data bit-width: 32

enum **i2s\_slot\_bit\_width\_t**

Total slot bit width in one slot.

*Values:*

enumerator **I2S\_SLOT\_BIT\_WIDTH\_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S\_SLOT\_BIT\_WIDTH\_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S\_SLOT\_BIT\_WIDTH\_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S\_SLOT\_BIT\_WIDTH\_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S\_SLOT\_BIT\_WIDTH\_32BIT**

I2S channel slot bit-width: 32

enum **i2s\_std\_slot\_mask\_t**

I2S slot select in standard mode.

---

**Note:** It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference

---

*Values:*

enumerator **I2S\_STD\_SLOT\_LEFT**

I2S transmits or receives left slot

enumerator **I2S\_STD\_SLOT\_RIGHT**

I2S transmits or receives right slot

enumerator **I2S\_STD\_SLOT\_BOTH**

I2S transmits or receives both left and right slot

enum **i2s\_pdm\_slot\_mask\_t**

I2S slot select in PDM mode.

*Values:*

enumerator **I2S\_PDM\_SLOT\_RIGHT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled up

enumerator **I2S\_PDM\_SLOT\_LEFT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled down

enumerator **I2S\_PDM\_SLOT\_BOTH**

I2S PDM transmits or receives both two slots

## 2.5.13 LCD

### Introduction

ESP chips can generate various kinds of timings needed by common LCDs on the market, like SPI LCD, I2C LCD, Parallel LCD (Intel 8080), RGB/SRGB LCD, MIPI DSI LCD and etc. The `esp_lcd` component offers an abstracted driver framework to support them in a unified way.

An LCD typically consists of two main planes:

- **Control Plane:** This plane allows us to read and write to the internal registers of the LCD device controller. Host typically uses this plane for tasks such as initializing the LCD power supply and performing gamma calibration.
- **Data Plane:** The data plane is responsible for transmitting pixel data to the LCD device.

### Functional Overview

In the context of `esp_lcd`, both the data plane and the control plane are represented by the `esp_lcd_panel_handle_t` type.

On some LCDs, these two planes may be combined into a single plane. In this configuration, pixel data is transmitted through the control plane, achieving functionality similar to that of the data plane. This merging is common in SPI LCDs and I2C LCDs. Additionally, there are LCDs that do not require a separate control plane. For instance, certain RGB LCDs automatically execute necessary initialization procedures after power-up. Host devices only need to continuously refresh pixel data through the data plane. However, it's essential to note that not all RGB LCDs eliminate the control plane entirely. Some LCD devices can simultaneously support multiple interfaces, requiring the host to send specific commands via the control plane (such as those based on the SPI interface) to enable the RGB mode.

This document will discuss how to create the control plane and data plane, as mentioned earlier, based on different types of LCDs.

## SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

Currently the driver supports SPI, Quad SPI and Octal SPI (simulate Intel 8080 timing) modes.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
↳transfer 80 lines of pixels (assume pixel is RGB565) at most in one
↳SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
↳AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver uses this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver uses this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e., this LCD), you can set the gpio number to `-1` to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver uses this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
↳HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to `-1`.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD

controller chip.

- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

## API Reference

### Header File

- `components/esp_lcd/include/esp_lcd_io_spi.h`
- This header file can be included with:

```
#include "esp_lcd_io_spi.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

### Functions

`esp_err_t esp_lcd_new_panel_io_spi` (`esp_lcd_spi_bus_handle_t` bus, const `esp_lcd_panel_io_spi_config_t` \*io\_config, `esp_lcd_panel_io_handle_t` \*ret\_io)

Create LCD panel IO handle, for SPI interface.

#### Parameters

- **bus** -- [in] SPI bus handle
- **io\_config** -- [in] IO configuration, for SPI interface
- **ret\_io** -- [out] Returned IO handle

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

### Structures

struct `esp_lcd_panel_io_spi_config_t`

Panel IO configuration structure, for SPI interface.

#### Public Members

int `cs_gpio_num`

GPIO used for CS line

int **dc\_gpio\_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi\_mode**

Traditional SPI mode (0~3)

unsigned int **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Size of internal transaction queue

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void **\*user\_ctx**

User private data, passed directly to on\_color\_trans\_done's user\_ctx

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_high\_on\_cmd**

If enabled, DC level = 1 indicates command transfer

unsigned int **dc\_low\_on\_data**

If enabled, DC level = 0 indicates color data transfer

unsigned int **dc\_low\_on\_param**

If enabled, DC level = 0 indicates parameter transfer

unsigned int **octal\_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad\_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio\_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb\_first**

transmit LSB bit first

unsigned int **cs\_high\_active**

CS line is high active

```
struct esp_lcd_panel_io_spi_config_t::[anonymous] flags
```

Extra flags to fine-tune the SPI device

## Type Definitions

```
typedef int esp_lcd_spi_bus_handle_t
```

Type of LCD SPI bus handle

## I2C Interfaced LCD

1. Create I2C bus. Please refer to *I2C API doc* for more details.

```
i2c_master_bus_handle_t i2c_bus = NULL;
i2c_master_bus_config_t bus_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .glitch_ignore_cnt = 7,
    .i2c_port = I2C_BUS_PORT,
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .flags.enable_internal_pullup = true,
};
ESP_ERROR_CHECK(i2c_new_master_bus(&bus_config, &i2c_bus));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- *esp\_lcd\_panel\_io\_i2c\_config\_t::dev\_addr* sets the I2C device address of the LCD controller chip. The LCD driver uses this address to communicate with the LCD controller chip.
- *esp\_lcd\_panel\_io\_i2c\_config\_t::scl\_speed\_hz* sets the I2C clock frequency in Hz. The value should not exceed the range recommended in the LCD spec.
- *esp\_lcd\_panel\_io\_i2c\_config\_t::lcd\_cmd\_bits* and *esp\_lcd\_panel\_io\_i2c\_config\_t::lcd\_param\_bits* set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .scl_speed_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c(i2c_bus, &io_config, &io_
↪handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- *esp\_lcd\_panel\_dev\_config\_t::reset\_gpio\_num* sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- *esp\_lcd\_panel\_dev\_config\_t::bits\_per\_pixel* sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
```

(continues on next page)

(continued from previous page)

```
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↪panel_handle));
```

## API Reference

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_io\\_i2c.h](#)
- This header file can be included with:

```
#include "esp_lcd_io_i2c.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

### Functions

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c\_v1** (uint32\_t bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface in legacy implementation.

---

**Note:** Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

---

#### Parameters

- **bus** -- [in] I2C bus handle, (in uint32\_t)
- **io\_config** -- [in] IO configuration, for I2C interface
- **ret\_io** -- [out] Returned IO handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c\_v2** (*i2c\_master\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface in new implementation.

---

**Note:** Please don't call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

---

#### Parameters

- **bus** -- [in] I2C bus handle, (in *i2c\_master\_dev\_handle\_t*)
- **io\_config** -- [in] IO configuration, for I2C interface
- **ret\_io** -- [out] Returned IO handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid

- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

## Structures

struct `esp_lcd_panel_io_i2c_config_t`

Panel IO configuration structure, for I2C interface.

### Public Members

uint32\_t `dev_addr`

I2C device address

*`esp_lcd_panel_io_color_trans_done_cb_t`* `on_color_trans_done`

Callback invoked when color data transfer has finished

void \*`user_ctx`

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

size\_t `control_phase_bytes`

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int `dc_bit_offset`

Offset of the D/C selection bit in control phase

int `lcd_cmd_bits`

Bit-width of LCD command

int `lcd_param_bits`

Bit-width of LCD parameter

unsigned int `dc_low_on_data`

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int `disable_control_phase`

If this flag is enabled, the control phase isn't used

struct *`esp_lcd_panel_io_i2c_config_t`*::[anonymous] `flags`

Extra flags to fine-tune the I2C device

uint32\_t `scl_speed_hz`

I2C LCD SCL frequency (hz)

## Macros

`esp_lcd_new_panel_io_i2c` (bus, io\_config, ret\_io)

Create LCD panel IO handle.

### Parameters

- `bus` -- [in] I2C bus handle
- `io_config` -- [in] IO configuration, for I2C interface

- **ret\_io** -- [out] Returned IO handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

### Type Definitions

```
typedef uint32_t esp_lcd_i2c_bus_handle_t
```

Type of LCD I2C bus handle

### I80 Interfaced LCD

1. Create I80 bus by `esp_lcd_new_i80_bus()`. You need to set up the following parameters for an Intel 8080 parallel bus:
  - `esp_lcd_i80_bus_config_t::clk_src` sets the clock source of the I80 bus. Note, the default clock source may be different between ESP targets.
  - `esp_lcd_i80_bus_config_t::wr_gpio_num` sets the GPIO number of the pixel clock (also referred as WR in some LCD spec)
  - `esp_lcd_i80_bus_config_t::dc_gpio_num` sets the GPIO number of the data/command select pin (also referred as RS in some LCD spec)
  - `esp_lcd_i80_bus_config_t::bus_width` sets the bit width of the data bus (only support 8 or 16)
  - `esp_lcd_i80_bus_config_t::data_gpio_nums` is the array of the GPIO number of the data bus. The number of GPIOs should be equal to the `esp_lcd_i80_bus_config_t::bus_width` value.
  - `esp_lcd_i80_bus_config_t::max_transfer_bytes` sets the maximum number of bytes that can be transferred in one transaction.

```
esp_lcd_i80_bus_handle_t i80_bus = NULL;
esp_lcd_i80_bus_config_t bus_config = {
    .clk_src = LCD_CLK_SRC_DEFAULT,
    .dc_gpio_num = EXAMPLE_PIN_NUM_DC,
    .wr_gpio_num = EXAMPLE_PIN_NUM_PCLK,
    .data_gpio_nums = {
        EXAMPLE_PIN_NUM_DATA0,
        EXAMPLE_PIN_NUM_DATA1,
        EXAMPLE_PIN_NUM_DATA2,
        EXAMPLE_PIN_NUM_DATA3,
        EXAMPLE_PIN_NUM_DATA4,
        EXAMPLE_PIN_NUM_DATA5,
        EXAMPLE_PIN_NUM_DATA6,
        EXAMPLE_PIN_NUM_DATA7,
    },
    .bus_width = 8,
    .max_transfer_bytes = EXAMPLE_LCD_H_RES * 100 * sizeof(uint16_t), /
    ↪ / transfer 100 lines of pixels (assume pixel is RGB565) at most in
    ↪ one transaction
    .dma_burst_size = EXAMPLE_DMA_BURST_SIZE,
};
ESP_ERROR_CHECK(esp_lcd_new_i80_bus(&bus_config, &i80_bus));
```

2. Allocate an LCD IO device handle from the I80 bus. In this step, you need to provide the following information:
  - `esp_lcd_panel_io_i80_config_t::cs_gpio_num` sets the GPIO number of the chip select pin.
  - `esp_lcd_panel_io_i80_config_t::pclk_hz` sets the pixel clock frequency in Hz. Higher pixel clock frequency results in higher refresh rate, but may cause flickering if the DMA bandwidth is not sufficient or the LCD controller chip does not support high pixel clock frequency.

- `esp_lcd_panel_io_i80_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i80_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_i80_config_t::trans_queue_depth` sets the maximum number of transactions that can be queued in the LCD IO device. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i80_config_t io_config = {
    .cs_gpio_num = EXAMPLE_PIN_NUM_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .trans_queue_depth = 10,
    .dc_levels = {
        .dc_idle_level = 0,
        .dc_cmd_level = 0,
        .dc_dummy_level = 0,
        .dc_data_level = 1,
    },
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i80(i80_bus, &io_config, &io_
↪handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I80 IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the GPIO number of the reset pin. If the LCD controller chip does not have a reset pin, you can set this value to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the color order the pixel color data.

```
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_RGB,
    .bits_per_pixel = 16,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

## API Reference

### Header File

- `components/esp_lcd/include/esp_lcd_io_i80.h`
- This header file can be included with:

```
#include "esp_lcd_io_i80.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

PRIV\_REQUIRES esp\_lcd

## Functions

*esp\_err\_t* **esp\_lcd\_new\_i80\_bus** (const *esp\_lcd\_i80\_bus\_config\_t* \*bus\_config, *esp\_lcd\_i80\_bus\_handle\_t* \*ret\_bus)

Create Intel 8080 bus handle.

### Parameters

- **bus\_config** -- [in] Bus configuration
- **ret\_bus** -- [out] Returned bus handle

### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_NOT\_FOUND if no free bus is available
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_del\_i80\_bus** (*esp\_lcd\_i80\_bus\_handle\_t* bus)

Destroy Intel 8080 bus handle.

**Parameters** **bus** -- [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if there still be some device attached to the bus
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i80** (*esp\_lcd\_i80\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i80\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO, for Intel 8080 interface.

### Parameters

- **bus** -- [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- **io\_config** -- [in] IO configuration, for i80 interface
- **ret\_io** -- [out] Returned panel IO handle

### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_SUPPORTED if some configuration can't be satisfied, e.g. pixel clock out of the range
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

void \***esp\_lcd\_i80\_alloc\_draw\_buffer** (*esp\_lcd\_panel\_io\_handle\_t* io, size\_t size, uint32\_t caps)

Allocate a draw buffer that can be used by I80 interfaced LCD panel.

---

**Note:** This function differs from the normal 'heap\_caps\_\*' functions in that it can also automatically handle the alignment required by DMA burst, cache line size, etc.

---

### Parameters

- **io** -- [in] Panel IO handle, created by `esp_lcd_new_panel_io_i80()`
- **size** -- [in] Size of memory to be allocated
- **caps** -- [in] Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory desired for the allocation

**Returns** Pointer to a new buffer of size 'size' with capabilities 'caps', or NULL if allocation failed

## Structures

struct **esp\_lcd\_i80\_bus\_config\_t**

LCD Intel 8080 bus configuration structure.

### Public Members

int **dc\_gpio\_num**

GPIO used for D/C line

int **wr\_gpio\_num**

GPIO used for WR line

*lcd\_clock\_source\_t* **clk\_src**

Clock source for the I80 LCD peripheral

int **data\_gpio\_nums**[ESP\_LCD\_I80\_BUS\_WIDTH\_MAX]

GPIOs used for data lines

size\_t **bus\_width**

Number of data lines, 8 or 16

size\_t **max\_transfer\_bytes**

Maximum transfer size, this determines the length of internal DMA link

size\_t **psram\_trans\_align**

DMA transfer alignment for data allocated from PSRAM

size\_t **dma\_burst\_size**

DMA burst size, in bytes

size\_t **sram\_trans\_align**

DMA transfer alignment for data allocated from SRAM

struct **esp\_lcd\_panel\_io\_i80\_config\_t**

Panel IO configuration structure, for intel 8080 interface.

### Public Members

int **cs\_gpio\_num**

GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

uint32\_t **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Transaction queue size, larger queue, higher throughput

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data was transferred done

void **\*user\_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_idle\_level**

Level of DC line in IDLE phase

unsigned int **dc\_cmd\_level**

Level of DC line in CMD phase

unsigned int **dc\_dummy\_level**

Level of DC line in DUMMY phase

unsigned int **dc\_data\_level**

Level of DC line in DATA phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **dc\_levels**

Each i80 device might have its own D/C control logic

unsigned int **cs\_active\_high**

If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int **reverse\_color\_bits**

Reverse the data bits,  $D[N:0] \rightarrow D[0:N]$

unsigned int **swap\_color\_bytes**

Swap adjacent two color bytes

unsigned int **pclk\_active\_neg**

The display will write data lines when there's a falling edge on WR signal (a.k.a the PCLK)

unsigned int **pclk\_idle\_low**

The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

struct *esp\_lcd\_panel\_io\_i80\_config\_t*::[anonymous] **flags**

Panel IO config flags

## Macros

**ESP\_LCD\_I80\_BUS\_WIDTH\_MAX**

Maximum width of I80 bus

## Type Definitions

```
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
```

Type of LCD intel 8080 bus handle

---

**Note:** ESP-IDF provides only a limited number of LCD device controller drivers out of the box (e.g., ST7789), more drivers are available in the [Espressif Component Registry](#).

---

## LCD Control Panel Operations

- `esp_lcd_panel_reset()` can reset the LCD control panel.
- `esp_lcd_panel_init()` performs a basic initialization of the control panel. To perform more manufacture specific initialization, please refer to [Steps to Add Manufacture Specific Initialization](#).
- By combining using `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can achieve the functionality of rotating or mirroring the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen by cutting down the output path from the frame buffer to the LCD screen. Please note, this is not controlling the LCD backlight. Backlight control is not covered by the `esp_lcd` driver.
- `esp_lcd_panel_disp_sleep()` can reduce the power consumption of the LCD screen by entering the sleep mode. The internal frame buffer is still retained.

## LCD Data Panel Operations

- `esp_lcd_panel_reset()` can reset the LCD data panel.
- `esp_lcd_panel_init()` performs a basic initialization of the data panel.
- `esp_lcd_panel_draw_bitmap()` is the function which does the magic to flush the user draw buffer to the LCD screen, where the target draw window is configurable. Please note, this function expects the draw buffer is a 1-D array and there's no stride in between each lines.

## Steps to Add Manufacture Specific Initialization

The LCD controller drivers (e.g., st7789) in ESP-IDF only provide basic initialization in the `esp_lcd_panel_init()`, leaving the vast majority of settings to the default values. Some LCD modules needs to set a bunch of manufacture specific configurations before it can display normally. These configurations usually include gamma, power voltage and so on. If you want to add manufacture specific initialization, please follow the steps below:

```
esp_lcd_panel_reset(panel_handle);
esp_lcd_panel_init(panel_handle);
// set extra configurations e.g., gamma control
// with the underlying IO handle
// please consult your manufacture for special commands and corresponding values
esp_lcd_panel_io_tx_param(io_handle, GAMMA_CMD, (uint8_t[]) {
    GAMMA_ARRAY
}, N);
// turn on the display
esp_lcd_panel_disp_on_off(panel_handle, true);
```

## Application Example

- Software JPEG decoding and display - [peripherals/lcd/tjpgd](#)
- Universal SPI LCD example with SPI touch - [peripherals/lcd/spi\\_lcd\\_touch](#)
- i80 controller based LCD and LVGL animation UI - [peripherals/lcd/i80\\_controller](#)

- I2C interfaced OLED display scrolling text - [peripherals/lcd/i2c\\_oled](#)

## API Reference

### Header File

- [components/hal/include/hal/lcd\\_types.h](#)
- This header file can be included with:

```
#include "hal/lcd_types.h"
```

### Type Definitions

typedef [soc\\_periph\\_lcd\\_clk\\_src\\_t](#) **lcd\_clock\_source\_t**

LCD clock source.

### Enumerations

enum **lcd\_rgb\_data\_endian\_t**

RGB data endian.

*Values:*

enumerator **LCD\_RGB\_DATA\_ENDIAN\_BIG**

RGB data endian: MSB first

enumerator **LCD\_RGB\_DATA\_ENDIAN\_LITTLE**

RGB data endian: LSB first

enum **lcd\_color\_space\_t**

LCD color space.

*Values:*

enumerator **LCD\_COLOR\_SPACE\_RGB**

Color space: RGB

enumerator **LCD\_COLOR\_SPACE\_YUV**

Color space: YUV

enum **lcd\_color\_rgb\_pixel\_format\_t**

LCD color pixel format in RGB color space.

*Values:*

enumerator **LCD\_COLOR\_PIXEL\_FORMAT\_RGB565**

16 bits, 5 bits per R/B value, 6 bits for G value

enumerator **LCD\_COLOR\_PIXEL\_FORMAT\_RGB666**

18 bits, 6 bits per R/G/B value

enumerator **LCD\_COLOR\_PIXEL\_FORMAT\_RGB888**

24 bits, 8 bits per R/G/B value

enum **lcd\_color\_format\_t**

LCD color format.

*Values:*

enumerator **LCD\_COLOR\_FMT\_RGB565**

RGB565.

enumerator **LCD\_COLOR\_FMT\_RGB666**

RGB666.

enumerator **LCD\_COLOR\_FMT\_RGB888**

RGB888.

enumerator **LCD\_COLOR\_FMT\_YUV422**

YUV422.

enum **lcd\_color\_range\_t**

LCD color range.

*Values:*

enumerator **LCD\_COLOR\_RANGE\_LIMIT**

Limited color range

enumerator **LCD\_COLOR\_RANGE\_FULL**

Full color range

enum **lcd\_yuv\_sample\_t**

YUV sampling method.

*Values:*

enumerator **LCD\_YUV\_SAMPLE\_422**

YUV 4:2:2 sampling

enumerator **LCD\_YUV\_SAMPLE\_420**

YUV 4:2:0 sampling

enumerator **LCD\_YUV\_SAMPLE\_411**

YUV 4:1:1 sampling

enum **lcd\_yuv\_conv\_std\_t**

The standard used for conversion between RGB and YUV.

*Values:*

enumerator **LCD\_YUV\_CONV\_STD\_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD\_YUV\_CONV\_STD\_BT709**

YUV<->RGB conversion standard: BT.709

enum **lcd\_yuv422\_pack\_order\_t**

YUV422 packing order.

*Values:*

enumerator **LCD\_YUV422\_PACK\_ORDER\_YUYV**

YUYV

enumerator **LCD\_YUV422\_PACK\_ORDER\_YVYU**

YVYU

enumerator **LCD\_YUV422\_PACK\_ORDER\_UYVY**

UYVY

enumerator **LCD\_YUV422\_PACK\_ORDER\_VYUY**

VYUY

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_types.h](#)
- This header file can be included with:

```
#include "esp_lcd_types.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```

```

or

```
PRIV_REQUIRES esp_lcd
```

### Structures

struct **esp\_lcd\_video\_timing\_t**

Timing parameters for the video data transmission.

#### Public Members

uint32\_t **h\_size**

Horizontal resolution, i.e. the number of pixels in a line

uint32\_t **v\_size**

Vertical resolution, i.e. the number of lines in the frame

uint32\_t **hsync\_pulse\_width**

Horizontal sync width, in pixel clock

uint32\_t **hsync\_back\_porch**

Horizontal back porch, number of pixel clock between hsync and start of line active data

uint32\_t **hsync\_front\_porch**

Horizontal front porch, number of pixel clock between the end of active data and the next hsync

uint32\_t **vsync\_pulse\_width**

Vertical sync width, in number of lines

uint32\_t **vsync\_back\_porch**

Vertical back porch, number of invalid lines between vsync and start of frame

uint32\_t **vsync\_front\_porch**

Vertical front porch, number of invalid lines between the end of frame and the next vsync

struct **esp\_lcd\_panel\_io\_event\_data\_t**

Type of LCD panel IO event data.

struct **esp\_lcd\_panel\_io\_callbacks\_t**

Type of LCD panel IO callbacks.

### Public Members

[\*esp\\_lcd\\_panel\\_io\\_color\\_trans\\_done\\_cb\\_t\*](#) **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

struct **esp\_lcd\_color\_conv\_config\_t**

Configuration of LCD color conversion.

### Public Members

[\*lcd\\_color\\_range\\_t\*](#) **in\_color\_range**

Color range of the input color

[\*lcd\\_color\\_range\\_t\*](#) **out\_color\_range**

Color range of the output color

[\*lcd\\_yuv\\_conv\\_std\\_t\*](#) **conv\_std**

YUV conversion standard: BT601, BT709

[\*lcd\\_yuv422\\_pack\\_order\\_t\*](#) **in\_pack\_order**

YUV422 packing order of the input color

struct [\*esp\\_lcd\\_color\\_conv\\_config\\_t\*](#)::[anonymous]::[anonymous]::[anonymous] **yuv422**

YUV422 specific

struct [\*esp\\_lcd\\_color\\_conv\\_config\\_t\*](#)::[anonymous]::[anonymous] **yuv**

YUV specific

union [\*esp\\_lcd\\_color\\_conv\\_config\\_t\*](#)::[anonymous] **spec**

Extra configuration for specific color conversion

## Type Definitions

typedef struct esp\_lcd\_panel\_io\_t \***esp\_lcd\_panel\_io\_handle\_t**

Type of LCD panel IO handle

typedef struct esp\_lcd\_panel\_t \***esp\_lcd\_panel\_handle\_t**

Type of LCD panel handle

typedef bool (\***esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t**)(*esp\_lcd\_panel\_io\_handle\_t* panel\_io, *esp\_lcd\_panel\_io\_event\_data\_t* \*edata, void \*user\_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel\_io [in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Param edata [in]** Panel IO event data, fed by driver

**Param user\_ctx [in]** User data, passed from `esp_lcd_panel_io_xxx_config_t`

**Return** Whether a high priority task has been waken up by this function

## Enumerations

enum **lcd\_rgb\_element\_order\_t**

RGB element order.

*Values:*

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_RGB**

RGB element order: RGB

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_BGR**

RGB element order: BGR

## Header File

- `components/esp_lcd/include/esp_lcd_panel_io.h`
- This header file can be included with:

```
#include "esp_lcd_panel_io.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd

PRIV_REQUIRES esp_lcd
```

## Functions

*esp\_err\_t* **esp\_lcd\_panel\_io\_rx\_param**(*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, void \*param, size\_t param\_size)

Transmit LCD command and receive corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

**Parameters**

- **io** -- **[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- **[in]** The specific LCD command, set to -1 if no command needed
- **param** -- **[out]** Buffer for the command data
- **param\_size** -- **[in]** Size of `param` buffer

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

`esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)`

Transmit LCD command and corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

**Parameters**

- **io** -- **[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- **[in]** The specific LCD command, set to -1 if no command needed
- **param** -- **[in]** Buffer that holds the command specific parameters, set to `NULL` if no parameter is needed for the command
- **param\_size** -- **[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)`

Transmit LCD RGB data.

---

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

---

**Parameters**

- **io** -- **[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- **[in]** The specific LCD command, set to -1 if no command needed
- **color** -- **[in]** Buffer that holds the RGB color data
- **color\_size** -- **[in]** Size of `color` in memory, in bytes

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

`esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)`

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters** **io** -- **[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_register\_event\_callbacks** (*esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_io\_callbacks\_t* \*cbs, void \*user\_ctx)

Register LCD panel IO callbacks.

**Parameters**

- **io** -- **[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** -- **[in]** structure with all LCD panel IO callbacks
- **user\_ctx** -- **[in]** User private data, passed directly to callback's `user_ctx`

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Header File**

- `components/esp_lcd/include/esp_lcd_panel_ops.h`
- This header file can be included with:

```
#include "esp_lcd_panel_ops.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

**Functions**

*esp\_err\_t* **esp\_lcd\_panel\_reset** (*esp\_lcd\_panel\_handle\_t* panel)

Reset LCD panel.

---

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

---

**Parameters** **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_init** (*esp\_lcd\_panel\_handle\_t* panel)

Initialize LCD panel.

---

**Note:** Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

---

**Parameters** **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_del** (*esp\_lcd\_panel\_handle\_t* panel)

Deinitialize the LCD panel.

**Parameters** **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_draw\_bitmap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_start, int y\_start, int x\_end, int y\_end, const void \*color\_data)

Draw bitmap on LCD panel.

**Parameters**

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_start** -- **[in]** Start pixel index in the target frame buffer, on x-axis (x\_start is included)
- **y\_start** -- **[in]** Start pixel index in the target frame buffer, on y-axis (y\_start is included)
- **x\_end** -- **[in]** End pixel index in the target frame buffer, on x-axis (x\_end is not included)
- **y\_end** -- **[in]** End pixel index in the target frame buffer, on y-axis (y\_end is not included)
- **color\_data** -- **[in]** RGB color data that will be dumped to the specific window range

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_mirror** (*esp\_lcd\_panel\_handle\_t* panel, bool mirror\_x, bool mirror\_y)

Mirror the LCD panel on specific axis.

---

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

---

**Parameters**

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror\_x** -- **[in]** Whether the panel will be mirrored about the x axis
- **mirror\_y** -- **[in]** Whether the panel will be mirrored about the y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_swap\_xy** (*esp\_lcd\_panel\_handle\_t* panel, bool swap\_axes)

Swap/Exchange x and y axis.

---

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

---

**Parameters**

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap\_axes** -- **[in]** Whether to swap the x and y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_set\_gap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_gap, int y\_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

---

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

---

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_gap** -- [in] Extra gap on x axis, in pixels
- **y\_gap** -- [in] Extra gap on y axis, in pixels

**Returns**

- ESP\_OK on success

*esp\_err\_t* `esp_lcd_panel_invert_color` (*esp\_lcd\_panel\_handle\_t* panel, bool invert\_color\_data)

Invert the color (bit-wise invert the color data line)

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert\_color\_data** -- [in] Whether to invert the color data

**Returns**

- ESP\_OK on success

*esp\_err\_t* `esp_lcd_panel_disp_on_off` (*esp\_lcd\_panel\_handle\_t* panel, bool on\_off)

Turn on or off the display.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on\_off** -- [in] True to turns on display, False to turns off display

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* `esp_lcd_panel_disp_off` (*esp\_lcd\_panel\_handle\_t* panel, bool off)

Turn off the display.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** -- [in] Whether to turn off the screen

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* `esp_lcd_panel_disp_sleep` (*esp\_lcd\_panel\_handle\_t* panel, bool sleep)

Enter or exit sleep mode.

**Parameters**

- **panel** -- [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **sleep** -- [in] True to enter sleep mode, False to wake up

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

**Header File**

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`
- This header file can be included with:

```
#include "esp_lcd_panel_vendor.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

## 2.5.14 LED Control (LEDC)

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-S2 only supports configuring channels in "low speed" mode.

1. *Timer Configuration* by specifying the PWM signal's frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Fig. 13: Key Settings of LED PWM Controller's API

---

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling `ledc_timer_config()`), and then for the channels (by calling `ledc_channel_config()`). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

---

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency in Hz
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 3: Characteristics of ESP32-S2 LEDC source clocks

Clock name	Clock freq	Clock capabilities
APB_CLK	80 MHz	/
REF_TICK	1 MHz	Dynamic Frequency Scaling compatible
RC_FAST_CLK	~ 8 MHz	Dynamic Frequency Scaling compatible, Light sleep compatible
XTAL_CLK	40 MHz	Dynamic Frequency Scaling compatible

---

**Note:**

1. On ESP32-S2, if `RC_FAST_CLK` is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.
- 

The LEDC driver offers a helper function `ledc_find_suitable_duty_resolution()` to find the maximum possible resolution for the timer, given the source clock frequency and the desired PWM signal frequency.

When a timer is no longer needed by any channel, it can be deconfigured by calling the same function `ledc_timer_config()`. The configuration structure `ledc_timer_config_t` passes in should be:

- `ledc_timer_config_t::speed_mode` The speed mode of the timer which wants to be deconfigured belongs to (`ledc_mode_t`)
- `ledc_timer_config_t::timer_num` The ID of the timers which wants to be deconfigured (`ledc_timer_t`)
- `ledc_timer_config_t::deconfigure` Set this to true so that the timer specified can be deconfigured

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

---

**Note:** All the timers and channels in the ESP32-S2's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

---

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2 ** \text{duty\_resolution})$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of ~ 0.1%.

**Warning:** On ESP32-S2, when channel's binded timer selects its maximum duty resolution, the duty cycle value cannot be set to  $(2 ** \text{duty\_resolution})$ . Otherwise, the internal duty counter in the hardware will overflow and be messed up.

**Change PWM Duty Cycle Using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency "on the fly":

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel's timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called "behind the scenes" by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

### Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ( $2^{13} = 8192$  discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the [ESP32-S2 Technical Reference Manual > LED PWM Controller \(LEDC\) \[PDF\]](#)).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits results in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 resolves this issue and makes it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver also captures and reports attempts to configure frequency/duty resolution combinations that are below the supported minimum, e.g.,:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↪increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

### Application Example

The LEDC basic example: [peripherals/ledc/ledc\\_basic](#).

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc\\_fade](#).

### API Reference

#### Header File

- `components/esp_driver_ledc/include/driver/ledc.h`
- This header file can be included with:

```
#include "driver/ledc.h"
```

- This header file is a part of the API provided by the `esp_driver_ledc` component. To declare that your component depends on `esp_driver_ledc`, add the following to your `CMakeLists.txt`:

PRIV_REQUIRES esp_driver_ledc
```

## Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` \*ledc\_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty.

**Parameters** `ledc_conf` -- Pointer of LEDC channel configure struct

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`uint32_t ledc_find_suitable_duty_resolution` (uint32\_t src\_clk\_freq, uint32\_t timer\_freq)

Helper function to find the maximum possible duty resolution in bits for `ledc_timer_config()`

### Parameters

- `src_clk_freq` -- LEDC timer source clock frequency (Hz) (See doxygen comments of `ledc_clk_cfg_t` or get from `esp_clk_tree_src_get_freq_hz`)
- `timer_freq` -- Desired LEDC timer frequency (Hz)

### Returns

- 0 The timer frequency cannot be achieved
- Others The largest duty resolution value to be set

`esp_err_t ledc_timer_config` (const `ledc_timer_config_t` \*timer\_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

**Parameters** `timer_conf` -- Pointer of LEDC timer configure struct

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.
- `ESP_ERR_INVALID_STATE` Timer cannot be de-configured because timer is not configured or is not paused

`esp_err_t ledc_update_duty` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

LEDC update channel parameters.

---

**Note:** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

---

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

---

**Note:** If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

---

---

**Note:** This function is allowed to run within ISR context.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_pin** (int gpio\_num, *ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* ledc\_channel)

Set LEDC output gpio.

---

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

---

#### Parameters

- **gpio\_num** -- The LEDC output gpio
- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc\_channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t idle\_level)

LEDC stop. Disable LEDC output, and set idle level.

---

**Note:** If `CONFIG_LEDC_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

---

---

**Note:** This function is allowed to run within ISR context.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **idle\_level** -- Set output idle level after LEDC stops.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num, uint32\_t freq\_hz)

LEDC set channel frequency (Hz)

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`
- **freq\_hz** -- Set the LEDC frequency

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

`uint32_t ledc_get_freq` (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num)

LEDC get channel frequency (Hz)

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- 0 error
- Others Current LEDC frequency

*esp\_err\_t ledc\_set\_duty\_with\_hpoint* (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, `uint32_t` duty, `uint32_t` hpoint)

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is  $[0, (2^{**}duty\_resolution)]$
- **hpoint** -- Set the LEDC hpoint value, the range is  $[0, (2^{**}duty\_resolution)-1]$

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

`int ledc_get_hpoint` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

**Returns**

- `LEDC_ERR_VAL` if parameter error
- Others Current hpoint value of LEDC channel

*esp\_err\_t ledc\_set\_duty* (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, `uint32_t` duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`uint32_t ledc_get_duty` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

#### Returns

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

*esp\_err\_t ledc\_set\_fade* (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, `uint32_t` duty, *ledc\_duty\_direction\_t* fade\_direction, `uint32_t` step\_num, `uint32_t` duty\_cycle\_num, `uint32_t` duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_direction** -- Set the direction of the gradient
- **step\_num** -- Set the number of the gradient
- **duty\_cycle\_num** -- Set how many LEDC tick each time the gradient lasts
- **duty\_scale** -- Set gradient change amplitude

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

#### Parameters

- **fn** -- Interrupt handler function.
- **arg** -- User-supplied argument passed to the handler function.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Failed to find available interrupt source

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- Timer index (0-3), there are 4 timers in LEDC module
- **clock\_divider** -- Timer clock divide value, the timer clock is divided from the selected clock source
- **duty\_resolution** -- Resolution of duty setting in number of bits. The range is [1, SOC\_LEDC\_TIMER\_BIT\_WIDTH]
- **clk\_src** -- Select LEDC source clock.

#### Returns

- (-1) Parameter error
- Other Current LEDC duty

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from ledc\_timer\_t

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from ledc\_timer\_t

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **timer\_sel** -- LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

*esp\_err\_t* `ledc_bind_channel_timer` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **timer\_sel** -- LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

*esp\_err\_t* `ledc_set_fade_with_step` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, `uint32_t` target\_duty, `uint32_t` scale, `uint32_t` cycle\_num)

Set LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every cycle\_num cycles

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

*esp\_err\_t* `ledc_set_fade_with_time` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, `uint32_t` target\_duty, `int` max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* `ledc_fade_func_install` (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters** `intr_alloc_flags` -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Intr flag error
- ESP\_ERR\_NOT\_FOUND Failed to find available interrupt source
- ESP\_ERR\_INVALID\_STATE Fade function already installed

void `ledc_fade_func_uninstall` (void)

Uninstall LEDC fade function.

*esp\_err\_t* `ledc_fade_start` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

---

---

**Note:** Starting fade operation with this API is not thread-safe, use with care.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number

- **fade\_mode** -- Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized or fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

*esp\_err\_t* **ledc\_fade\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.

---

**Note:** This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

---

---

**Note:** Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

---

---

**Note:** If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards has no use in stopping the fade. Fade will continue until it reaches the target duty.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *uint32\_t* duty, *uint32\_t* hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is `[0, (2**duty_resolution)]`
- **hpoint** -- Set the LEDC hpoint value, the range is `[0, (2**duty_resolution)-1]`

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_time\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t max\_fade\_time\_ms, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once, before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).
- **fade\_mode** -- choose blocking or non-blocking mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_step\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every cycle\_num cycles
- **fade\_mode** -- choose blocking or non-blocking mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_cb\_register** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_cbs\_t* \*cbs, void \*user\_arg)

LEDC callback registration function.

---

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **cbs** -- Group of LEDC callback functions
- **user\_arg** -- user registered data for the callback function

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

#### Structures

struct **ledc\_channel\_config\_t**

Configuration parameters of LEDC channel for `ledc_channel_config` function.

#### Public Members

int **gpio\_num**

the LEDC output `gpio_num`, if you want to use `gpio16`, `gpio_num = 16`

*ledc\_mode\_t* **speed\_mode**

LEDC speed `speed_mode`, high-speed mode (only exists on `esp32`) or low-speed mode

*ledc\_channel\_t* **channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

*ledc\_intr\_type\_t* **intr\_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

*ledc\_timer\_t* **timer\_sel**

Select the timer source of channel (0 - LEDC\_TIMER\_MAX-1)

uint32\_t **duty**

LEDC channel duty, the range of duty setting is  $[0, (2^{**duty\_resolution})]$

int **hpoint**

LEDC channel `hpoint` value, the range is  $[0, (2^{**duty\_resolution})-1]$

unsigned int **output\_invert**

Enable (1) or disable (0) `gpio` output invert

struct *ledc\_channel\_config\_t*::[anonymous] **flags**

LEDC flags

struct **ledc\_timer\_config\_t**

Configuration parameters of LEDC timer for `ledc_timer_config` function.

### Public Members

*ledc\_mode\_t* **speed\_mode**

LEDC speed `speed_mode`, high-speed mode (only exists on esp32) or low-speed mode

*ledc\_timer\_bit\_t* **duty\_resolution**

LEDC channel duty resolution

*ledc\_timer\_t* **timer\_num**

The timer source of channel (0 - LEDC\_TIMER\_MAX-1)

uint32\_t **freq\_hz**

LEDC timer frequency (Hz)

*ledc\_clk\_cfg\_t* **clk\_cfg**

Configure LEDC source clock from `ledc_clk_cfg_t`. Note that LEDC\_USE\_RC\_FAST\_CLK and LEDC\_USE\_XTAL\_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC\_FAST\_CLK as the clock source and have another LEDC timer uses XTAL\_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

bool **deconfigure**

Set this field to de-configure a LEDC timer which has been configured before. Note that it will not check whether the timer wants to be de-configured is binded to any channel. Also, the timer has to be paused first before it can be de-configured. When this field is set, `duty_resolution`, `freq_hz`, `clk_cfg` fields are ignored.

struct **ledc\_cb\_param\_t**

LEDC callback parameter.

### Public Members

*ledc\_cb\_event\_t* **event**

Event name

uint32\_t **speed\_mode**

Speed mode of the LEDC channel group

uint32\_t **channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

uint32\_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2\*\*duty\_resolution)]

struct **ledc\_cbs\_t**

Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*ledc\_cb\_t* **fade\_cb**

LEDC fade\_end callback function

### Macros

**LEDC\_APB\_CLK\_HZ**

Frequency of one of the LEDC peripheral clock sources, APB\_CLK.

---

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

---

**LEDC\_REF\_CLK\_HZ**

Frequency of one of the LEDC peripheral clock sources, REF\_TICK.

---

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

---

**LEDC\_ERR\_DUTY**

**LEDC\_ERR\_VAL**

### Type Definitions

typedef *intr\_handle\_t* **ledc\_isr\_handle\_t**

typedef bool (\***ledc\_cb\_t**)(const *ledc\_cb\_param\_t* \*param, void \*user\_arg)

Type of LEDC event callback.

**Param param** LEDC callback parameter

**Param user\_arg** User registered data

**Return** Whether a high priority task has been waken up by this function

### Enumerations

enum **ledc\_cb\_event\_t**

LEDC callback event type.

*Values:*

enumerator **LEDC\_FADE\_END\_EVT**

LEDC fade end event

## Header File

- [components/hal/include/hal/ledc\\_types.h](#)
- This header file can be included with:

```
#include "hal/ledc_types.h"
```

## Type Definitions

typedef *soc\_periph\_ledc\_clk\_src\_legacy\_t* **ledc\_clk\_cfg\_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, *ledc\_clk\_src\_t*, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

## Enumerations

enum **ledc\_mode\_t**

*Values:*

enumerator **LEDC\_LOW\_SPEED\_MODE**

LEDC low speed speed\_mode

enumerator **LEDC\_SPEED\_MODE\_MAX**

LEDC speed limit

enum **ledc\_intr\_type\_t**

*Values:*

enumerator **LEDC\_INTR\_DISABLE**

Disable LEDC interrupt

enumerator **LEDC\_INTR\_FADE\_END**

Enable LEDC interrupt

enumerator **LEDC\_INTR\_MAX**

enum **ledc\_duty\_direction\_t**

*Values:*

enumerator **LEDC\_DUTY\_DIR\_DECREASE**

LEDC duty decrease direction

enumerator **LEDC\_DUTY\_DIR\_INCREASE**

LEDC duty increase direction

enumerator **LEDC\_DUTY\_DIR\_MAX**

enum **ledc\_slow\_clk\_sel\_t**

LEDC global clock sources.

*Values:*

enumerator **LEDC\_SLOW\_CLK\_RC\_FAST**

LEDC low speed timer clock source is RC\_FAST clock

enumerator **LEDC\_SLOW\_CLK\_APB**

LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC\_SLOW\_CLK\_XTAL**

LEDC low speed timer clock source XTAL clock

enumerator **LEDC\_SLOW\_CLK\_RTC8M**

Alias of 'LEDC\_SLOW\_CLK\_RC\_FAST'

enum **ledc\_clk\_src\_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match `ledc_clk_cfg_t` values are a hack to avoid collision with `LEDC_AUTO_CLK` in the driver, as these enums have very similar names and user may pass one of these by mistake.

*Values:*

enumerator **LEDC\_REF\_TICK**

LEDC timer clock divided from reference tick (1Mhz)

enumerator **LEDC\_APB\_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC\_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_APB_CLK_SEL`

enum **ledc\_timer\_t**

*Values:*

enumerator **LEDC\_TIMER\_0**

LEDC timer 0

enumerator **LEDC\_TIMER\_1**

LEDC timer 1

enumerator **LEDC\_TIMER\_2**

LEDC timer 2

enumerator **LEDC\_TIMER\_3**

LEDC timer 3

enumerator **LEDC\_TIMER\_MAX**

enum **ledc\_channel\_t**

*Values:*

enumerator **LEDC\_CHANNEL\_0**

LEDC channel 0

enumerator **LEDC\_CHANNEL\_1**

LEDC channel 1

enumerator **LEDC\_CHANNEL\_2**

LEDC channel 2

enumerator **LEDC\_CHANNEL\_3**

LEDC channel 3

enumerator **LEDC\_CHANNEL\_4**

LEDC channel 4

enumerator **LEDC\_CHANNEL\_5**

LEDC channel 5

enumerator **LEDC\_CHANNEL\_6**

LEDC channel 6

enumerator **LEDC\_CHANNEL\_7**

LEDC channel 7

enumerator **LEDC\_CHANNEL\_MAX**

enum **ledc\_timer\_bit\_t**

*Values:*

enumerator **LEDC\_TIMER\_1\_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC\_TIMER\_5\_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC\_TIMER\_6\_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC\_TIMER\_7\_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC\_TIMER\_8\_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC\_TIMER\_9\_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC\_TIMER\_10\_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC\_TIMER\_11\_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC\_TIMER\_12\_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC\_TIMER\_13\_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC\_TIMER\_14\_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC\_TIMER\_BIT\_MAX**

enum **ledc\_fade\_mode\_t**

*Values:*

enumerator **LEDC\_FADE\_NO\_WAIT**

LEDC fade function will return immediately

enumerator **LEDC\_FADE\_WAIT\_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC\_FADE\_MAX**

## 2.5.15 Pulse Counter (PCNT)

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32-S2 contains multiple pulse counter units in the module.<sup>1</sup> Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of **edge** type and **level** type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit's counter on each edge. The level signal is the so-called **control signal**, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a **quadrature decoder**.

---

<sup>1</sup> Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver does not forbid you from applying for more PCNT units and channels, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `pcnt_new_unit()`).

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal's frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

## Functional Overview

Description of the PCNT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Set Up Channel Actions* - covers how to configure the PCNT channel to behave on different signal edges and levels.
- *Watch Points* - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- *Register Event Callbacks* - describes how to hook your specific code to the watch point event callback function.
- *Set Glitch Filter* - describes how to enable and set the timing parameters for the internal glitch filter.
- *Enable and Disable Unit* - describes how to enable and disable the PCNT unit.
- *Unit IO Control* - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- *Power Management* - describes what functionality will prevent the chip from going into low power mode.
- *IRAM Safe* - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there is a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter's width, which by default is 16 bit at most, defined in the hardware. See also *Compensate Overflow Loss* for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

---

**Note:** Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

---

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e., unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it is recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by **edge** type signal and **level** type signal. Please note, either of them can be assigned to `-1` if it is not actually used, and thus it will become a **virtual IO**. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO causes that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.
- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for **edge** and **level** input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to `-1`.
- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.
- `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO's input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e., channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it is recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
```

(continues on next page)

(continued from previous page)

```
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

**Set Up Channel Actions** The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to `-1` when allocating PCNT channel by `pcnt_new_channel()`.

```
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
↳DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the
↳counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
↳KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

**Watch Points** Each PCNT unit can be configured to watch several different values that you are interested in. The value to be watched is also called **Watch Point**. The watch point itself can not exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See *Register Event Callbacks* for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly-used watch points are: **zero cross**, **maximum/minimum count** and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can not find any free hardware resource to save the watch point. You can not add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

**Note:** Due to the hardware limitation, after adding a watch point, you should call `pcnt_unit_clear_count()` to make it take effect.

**Register Event Callbacks** When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different **counting direction** and **counting step size**.

Registering callback function results in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_
↳data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &(edata->watch_point_value), &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```

**Set Glitch Filter** The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nano seconds. If a signal pulse's width is smaller than this value, then it will be treated as noise and will not increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a NULL filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Note:** The glitch filter operates using the APB clock. To ensure the counter does not miss any pulses, the maximum glitch width should be longer than one APB\_CLK cycle (typically 12.5 ns if APB is 80 MHz). Since the APB frequency can change with Dynamic Frequency Scaling (DFS), the filter may not function as expected in such cases. Therefore, the driver installs a power management lock for each PCNT unit. For more details on the power management strategy used in the PCNT driver, please refer to [Power Management](#).

```
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
```

(continues on next page)

(continued from previous page)

```
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

**Enable and Disable Unit** Before doing IO control to the PCNT unit, you need to enable it first, by calling `pcnt_unit_enable()`. Internally, this function:

- switches the PCNT driver state from **init** to **enable**.
- enables the interrupt service if it has been lazy installed in `pcnt_unit_register_event_callbacks()`.
- acquires a proper power management lock if it has been installed. See also *Power Management* for more information.

On the contrary, calling `pcnt_unit_disable()` will do the opposite, that is, put the PCNT driver back to the **init** state, disable the interrupts service and release the power management lock.

### Unit IO Control

**Start/Stop and Clear** Calling `pcnt_unit_start()` makes the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling `pcnt_unit_stop()` will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling `pcnt_unit_clear_count()`.

Note, `pcnt_unit_start()` and `pcnt_unit_stop()` should be called when the unit has been enabled by `pcnt_unit_enable()`. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Get Count Value** You can read current count value at any time by calling `pcnt_unit_get_count()`. The returned count value is a **signed** integer, where the sign can be used to reflect the direction.

```
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

**Compensate Overflow Loss** The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter's bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the *Watch Points*.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware's count value, but also accumulates the high/low overflow loss to it.

---

**Note:** `pcnt_unit_clear_count()` resets the accumulated count value as well.

---

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system adjusts the APB frequency before entering light sleep, which can cause the PCNT glitch filter to misinterpret valid signals as noise.

To prevent this, the driver can acquire a power management lock of type `ESP_PM_APB_FREQ_MAX`, ensuring the APB frequency remains constant. This lock is acquired when the PCNT unit is enabled via `pcnt_unit_enable()` and released when the unit is disabled via `pcnt_unit_disable()`.

**IRAM Safe** By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM<sup>2</sup>
3. Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety** The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enabling this option increases the firmware binary size.

### Application Examples

- Decode the quadrature signals from rotary encoder: [peripherals/pcnt/rotary\\_encoder](#).

## API Reference

### Header File

- `components/esp_driver_pcnt/include/driver/pulse_cnt.h`
- This header file can be included with:

```
#include "driver/pulse_cnt.h"
```

- This header file is a part of the API provided by the `esp_driver_pcnt` component. To declare that your component depends on `esp_driver_pcnt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_pcnt
```

or

<sup>2</sup> `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

`PRIV_REQUIRES esp_driver_pcnt`

## Functions

*esp\_err\_t* **pcnt\_new\_unit** (const *pcnt\_unit\_config\_t* \*config, *pcnt\_unit\_handle\_t* \*ret\_unit)

Create a new PCNT unit, and return the handle.

---

**Note:** The newly created PCNT unit is put in the init state.

---

### Parameters

- **config** -- [in] PCNT unit configuration
- **ret\_unit** -- [out] Returned PCNT unit handle

### Returns

- ESP\_OK: Create PCNT unit successfully
- ESP\_ERR\_INVALID\_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- ESP\_ERR\_NO\_MEM: Create PCNT unit failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
- ESP\_FAIL: Create PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_del\_unit** (*pcnt\_unit\_handle\_t* unit)

Delete the PCNT unit handle.

---

**Note:** A PCNT unit can't be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

---

**Parameters** **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

### Returns

- ESP\_OK: Delete the PCNT unit successfully
- ESP\_ERR\_INVALID\_ARG: Delete the PCNT unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP\_FAIL: Delete the PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_set\_glitch\_filter** (*pcnt\_unit\_handle\_t* unit, const *pcnt\_glitch\_filter\_config\_t* \*config)

Set glitch filter for PCNT unit.

---

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won't be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

---

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

---

### Parameters

- **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** -- [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**

- ESP\_OK: Set glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP\_ERR\_INVALID\_STATE: Set glitch filter failed because the unit is not in the init state
- ESP\_FAIL: Set glitch filter failed because of other error

*esp\_err\_t* **pcnt\_unit\_enable** (*pcnt\_unit\_handle\_t* unit)

Enable the PCNT unit.

---

**Note:** This function will transit the unit state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `pcnt_unit_register_event_callbacks()`.

---

---

**Note:** This function will acquire the PM lock if it's lazy installed in `pcnt_unit_set_glitch_filter()`.

---

---

**Note:** Enable a PCNT unit doesn't mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

---

**Parameters** **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP\_OK: Enable PCNT unit successfully
- ESP\_ERR\_INVALID\_ARG: Enable PCNT unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP\_FAIL: Enable PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_disable** (*pcnt\_unit\_handle\_t* unit)

Disable the PCNT unit.

---

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

---

---

**Note:** Disable a PCNT unit doesn't mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

---

**Parameters** **unit** -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP\_OK: Disable PCNT unit successfully
- ESP\_ERR\_INVALID\_ARG: Disable PCNT unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP\_FAIL: Disable PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_start** (*pcnt\_unit\_handle\_t* unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_stop` (*pcnt\_unit\_handle\_t* unit)

Stop PCNT from counting.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** The stop operation won't clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Stop PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Stop PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_clear_count` (*pcnt\_unit\_handle\_t* unit)

Clear PCNT pulse count value to zero.

---

**Note:** It's recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Clear PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Clear PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Clear PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_get_count` (*pcnt\_unit\_handle\_t* unit, int \*value)

Get PCNT count value.

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `value` -- [out] Returned count value

**Returns**

- `ESP_OK`: Get PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Get PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Get PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_register_event_callbacks` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for PCNT unit.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `pcnt_unit_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- `unit` -- [in] PCNT unit handle created by `pcnt_new_unit()`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the unit is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* **pcnt\_unit\_add\_watch\_point** (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

**Parameters**

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** -- **[in]** Value to be watched

**Returns**

- **ESP\_OK**: Add watch point successfully
- **ESP\_ERR\_INVALID\_ARG**: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- **ESP\_ERR\_INVALID\_STATE**: Add watch point failed because the same watch point has already been added
- **ESP\_ERR\_NOT\_FOUND**: Add watch point failed because no more hardware watch point can be configured
- **ESP\_FAIL**: Add watch point failed because of other error

*esp\_err\_t* **pcnt\_unit\_remove\_watch\_point** (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Remove a watch point for PCNT unit.

**Parameters**

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** -- **[in]** Watch point value

**Returns**

- **ESP\_OK**: Remove watch point successfully
- **ESP\_ERR\_INVALID\_ARG**: Remove watch point failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE**: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- **ESP\_FAIL**: Remove watch point failed because of other error

*esp\_err\_t* **pcnt\_new\_channel** (*pcnt\_unit\_handle\_t* unit, const *pcnt\_chan\_config\_t* \*config, *pcnt\_channel\_handle\_t* \*ret\_chan)

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

---

**Note:** This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

---

**Parameters**

- **unit** -- **[in]** PCNT unit handle created by `pcnt_new_unit()`
- **config** -- **[in]** PCNT channel configuration
- **ret\_chan** -- **[out]** Returned channel handle

**Returns**

- **ESP\_OK**: Create PCNT channel successfully
- **ESP\_ERR\_INVALID\_ARG**: Create PCNT channel failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create PCNT channel failed because of insufficient memory
- **ESP\_ERR\_NOT\_FOUND**: Create PCNT channel failed because all PCNT channels are used up and no more free one
- **ESP\_ERR\_INVALID\_STATE**: Create PCNT channel failed because the unit is not in the init state
- **ESP\_FAIL**: Create PCNT channel failed because of other error

*esp\_err\_t* **pcnt\_del\_channel** (*pcnt\_channel\_handle\_t* chan)

Delete the PCNT channel.

**Parameters** **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`

**Returns**

- **ESP\_OK**: Delete the PCNT channel successfully

- `ESP_ERR_INVALID_ARG`: Delete the PCNT channel failed because of invalid argument
- `ESP_FAIL`: Delete the PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_edge_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_edge\_action\_t* pos\_act, *pcnt\_channel\_edge\_action\_t* neg\_act)

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in *pcnt\_chan\_config\_t*. We use these actions to control when and how to change the counter value.

#### Parameters

- **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- **pos\_act** -- **[in]** Action on posedge signal
- **neg\_act** -- **[in]** Action on negedge signal

#### Returns

- `ESP_OK`: Set edge action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set edge action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set edge action for PCNT channel failed because of other error

*esp\_err\_t* `pcnt_channel_set_level_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_level\_action\_t* high\_act, *pcnt\_channel\_level\_action\_t* low\_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in *pcnt\_chan\_config\_t*. We use these actions to control when and how to change the counting mode.

#### Parameters

- **chan** -- **[in]** PCNT channel handle created by `pcnt_new_channel()`
- **high\_act** -- **[in]** Action on high level signal
- **low\_act** -- **[in]** Action on low level signal

#### Returns

- `ESP_OK`: Set level action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set level action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set level action for PCNT channel failed because of other error

## Structures

struct `pcnt_watch_event_data_t`

PCNT watch event data.

## Public Members

int `watch_point_value`

Watch point value that triggered the event

*pcnt\_unit\_zero\_cross\_mode\_t* `zero_cross_mode`

Zero cross mode

struct `pcnt_event_callbacks_t`

Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_PCNT\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

### Public Members

*pcnt\_watch\_cb\_t* **on\_reach**

Called when PCNT unit counter reaches any watch point

struct **pcnt\_unit\_config\_t**

PCNT unit configuration.

### Public Members

int **low\_limit**

Low limitation of the count unit, should be lower than 0

int **high\_limit**

High limitation of the count unit, should be higher than 0

int **intr\_priority**

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **accum\_count**

Whether to accumulate the count value when overflows at the high/low limit

struct *pcnt\_unit\_config\_t*::[anonymous] **flags**

Extra flags

struct **pcnt\_chan\_config\_t**

PCNT channel configuration.

### Public Members

int **edge\_gpio\_num**

GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int **level\_gpio\_num**

GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32\_t **invert\_edge\_input**

Invert the input edge signal

uint32\_t **invert\_level\_input**

Invert the input level signal

uint32\_t **virt\_edge\_io\_level**

Virtual edge IO level, 0: low, 1: high. Only valid when `edge_gpio_num` is set to -1

uint32\_t **virt\_level\_io\_level**

Virtual level IO level, 0: low, 1: high. Only valid when `level_gpio_num` is set to -1

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt\_chan\_config\_t*::[anonymous] **flags**

Channel config flags

struct **pcnt\_glitch\_filter\_config\_t**

PCNT glitch filter configuration.

### Public Members

uint32\_t **max\_glitch\_ns**

Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

### Type Definitions

typedef struct *pcnt\_unit\_t* \***pcnt\_unit\_handle\_t**

Type of PCNT unit handle.

typedef struct *pcnt\_chan\_t* \***pcnt\_channel\_handle\_t**

Type of PCNT channel handle.

typedef bool (\***pcnt\_watch\_cb\_t**)(*pcnt\_unit\_handle\_t* unit, const *pcnt\_watch\_event\_data\_t* \*edata, void \*user\_ctx)

PCNT watch event callback prototype.

---

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

---

**Param unit [in]** PCNT unit handle

**Param edata [in]** PCNT event data, fed by the driver

**Param user\_ctx [in]** User data, passed from `pcnt_unit_register_event_callbacks()`

**Return** Whether a high priority task has been woken up by this function

### Header File

- [components/hal/include/hal/pcnt\\_types.h](#)
- This header file can be included with:

```
#include "hal/pcnt_types.h"
```

## Enumerations

enum **pcnt\_channel\_level\_action\_t**

PCNT channel action on control level.

*Values:*

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_KEEP**

Keep current count mode

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_INVERSE**

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_HOLD**

Hold current count value

enum **pcnt\_channel\_edge\_action\_t**

PCNT channel action on signal edge.

*Values:*

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_HOLD**

Hold current count value

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_INCREASE**

Increase count value

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_DECREASE**

Decrease count value

enum **pcnt\_unit\_zero\_cross\_mode\_t**

PCNT unit zero cross mode.

*Values:*

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_ZERO**

start from positive value, end to zero, i.e. +N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_ZERO**

start from negative value, end to zero, i.e. -N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_POS**

start from negative value, end to positive value, i.e. -N->+M

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_NEG**

start from positive value, end to negative value, i.e. +N->-M

### 2.5.16 Remote Control Transceiver (RMT)

## Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-S2 contains multiple channels in the RMT peripheral<sup>1</sup>. Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols** The RMT hardware defines data in its own pattern -- the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal's duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal's logic level, i.e., high or low.

Fig. 14: Structure of RMT symbols (L - signal level)

**RMT Transmitter Overview** The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver encodes the user's data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview** The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal's stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

<sup>1</sup> Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing [Resource Allocation](#).

Fig. 15: RMT Transmitter Overview

Fig. 16: RMT Receiver Overview

## Functional Overview

The description of the RMT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- *Carrier Modulation and Demodulation* - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- *Register Event Callbacks* - covers how to register user-provided event callbacks to receive RMT channel events.
- *Enable and Disable Channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for a TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for an RX channel.
- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- *RMT Encoder* - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- *Power Management* - describes how different clock sources affects power consumption.
- *IRAM Safe* - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation** Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel** To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the *Power Management* section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, you can set a larger value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel's assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the

priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,           // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .trans_queue_depth = 4,           // set the number of transactions that can
    ↪pend in the background
    .flags.invert_out = false,         // do not invert output signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

**Install RMT RX Channel** To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the [Power Management](#) section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```

rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2, // GPIO number
    .flags.invert_in = false, // do not invert input signal
    .flags.with_dma = false, // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));

```

**Note:** Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

**Uninstall RMT Channel** If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

**Carrier Modulation and Demodulation** The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal's frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

**Note:** For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```

rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 38000, // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_
↪level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33, // duty cycle 33%
    .frequency_hz = 25000, // 25 KHz carrier, should be smaller than_
↪the transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));

```

**Register Event Callbacks** When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver's ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the "trans-done" event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for "receive-done" event. The function prototype is declared in `rmt_rx_done_callback_t`.

---

**Note:** The "receive-done" is not equivalent to "receive-finished". This callback can also be called at a "partial-receive-done" time, for many times during one receive transaction.

---

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is **only** valid during the callback, please do not try to save this pointer and use that outside of the callback function.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns. If you also enabled the partial receive feature, then the user buffer will be used as a "second level buffer", where its content can be overwritten by data comes in afterwards. In this case, you should copy the received data to another place if you want to keep it or process it later.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.
- `rmt_rx_done_event_data_t::is_last` indicates whether the current received buffer is the last one in the transaction. This is useful when you enable the partial reception feature by `rmt_receive_config_t::extra_rmt_receive_flags::en_partial_rx`.

**Enable and Disable Channel** `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`.

`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

**Initiate TX Transaction** RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to [RMT Encoder](#).

Once you created an encoder, you can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, you also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The "trans-done" event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the "trans-done" event is when the specified number of iterations have completed.

---

**Note:** The **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

---

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
- `rmt_transmit_config_t::queue_nonblocking` sets whether to wait for a free slot in the transaction queue when it is full. If this value is set to `true`, then the function will return with an error code `ESP_ERR_INVALID_STATE` when the queue is full. Otherwise, the function will block until a free slot is available in the queue.

---

**Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
  - Customize an encoder and construct an infinite loop in the encoding function. See also [RMT Encoder](#).
- 

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. You cannot recycle or modify the payload buffer until the transaction is finished. You can get the transaction completion event by registering a callback function via `rmt_tx_register_event_callbacks()`. To ensure all pending transactions to complete, you can also use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission** In some real-time control applications (e.g., to make two robotic arms move simultaneously), you do not want any time drift between different channels. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

**Install RMT Sync Manager** To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

Fig. 17: RMT TX Sync

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```

rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that
        ↪ can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
    ↪ num * 3, &transmit_config));

```

(continues on next page)

(continued from previous page)

```
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for
↳tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
↳num * 3, &transmit_config));
```

**Initiate RX Transaction** As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.
- If the incoming packet is long, that they cannot be stored in the user buffer at once, you can enable the partial reception feature by setting `rmt_receive_config_t::extra_rmt_receive_flags::en_partial_rx` to true. In this case, the driver invokes `rmt_rx_event_callbacks_t::on_recv_done` callback multiple times during one transaction, when the user buffer is **almost full**. You can check the value of `:cpp:member::rmt_rx_done_event_data_t::is_last` to know if the transaction is about to finish. Please note this features is not supported on all ESP series chips because it relies on hardware abilities like "ping-pong receive" or "DMA receive".

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames are truncated by the hardware, and the driver reports an error message: `hw buffer too small, received symbols truncated`.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also *Register Event Callbacks* for more information.

// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

```

**RMT Encoder** An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, the driver utilizes a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also [Composite Pattern](#) for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
  - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
  - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
  - If the result contains `RMT_ENCODING_MEM_FULL`, the program needs to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
  - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

**Copy Encoder** A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

**Bytes Encoder** A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianness of each byte. If it is set to true, the encoder encodes the **Most Significant Bit** first. Otherwise, it encodes the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

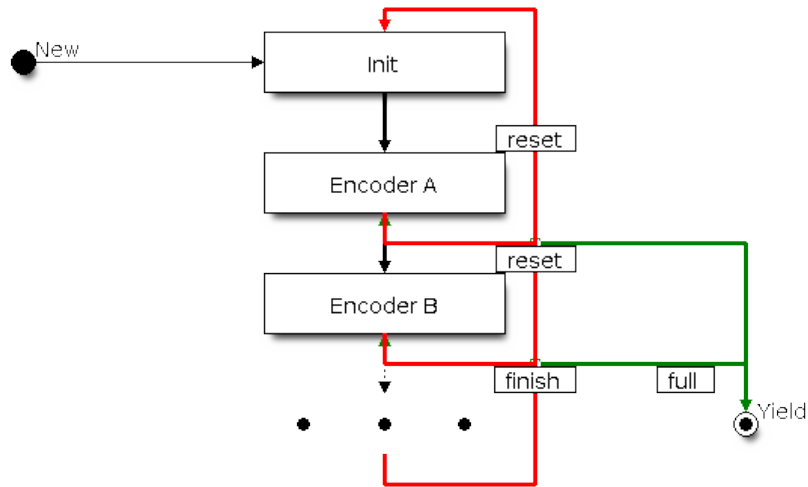

Fig. 18: RMT Encoder Chain

**Simple Callback Encoder** A simple callback encoder is created by calling `rmt_new_simple_encoder()`. The simple callback encoder allows you to provide a callback that reads data from userspace and writes symbols to the output stream without having to chain other encoders. The callback itself gets a pointer to the data passed to `rmt_transmit()`, a counter indicating the amount of symbols already written by the callback in this transmission, and a pointer where to write the encoded RMT symbols as well as the free space there. If the space is not enough for the callback to encode something, it can return 0 and the RMT will wait for previous symbols to be transmitted and call the callback again, now with more space available. If the callback successfully writes RMT symbols, it should return the number of symbols written.

A configuration structure `rmt_simple_encoder_config_t` should be provided in advance before calling `rmt_new_simple_encoder()`:

- `rmt_simple_encoder_config_t::callback` and `rmt_simple_encoder_config_t::arg` provide the callback function and an opaque argument that will be passed to that function.
- `rmt_simple_encoder_config_t::min_chunk_size` specifies the minimum amount of free space, in symbols, the encoder will be always be able to write some data to. In other words, when this amount of free space is passed to the encoder, it should never return 0 (except when the encoder is done encoding symbols).

While the functionality of an encoding process using the simple callback encoder can usually also realized by chaining other encoders, the simple callback can be more easy to understand and maintain than an encoder chain.

**Customize RMT Encoder for NEC Protocol** This section demonstrates how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is  $562.5 \mu\text{s}$  in length, logical bits

are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a 562.5  $\mu$ s pulse burst followed by a 562.5  $\mu$ s space, with a total transmit time of 1.125 ms
- Logical 1: a 562.5  $\mu$ s pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

Fig. 19: IR NEC Frame

- 9 ms leading pulse burst, also called the "AGC pulse"
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 562.5  $\mu$ s pulse burst to signify the end of message transmission

Then you can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard_
    ↪encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading_
    ↪and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address_
    ↪and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT_
    ↪representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT_
    ↪representation
    int state; // record the current encoding state, i.e., we are in which_
    ↪encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t_
    ↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
    ↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
    ↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
```

(continues on next page)

(continued from previous page)

```

switch (nec_encoder->state) {
case 0: // send leading code
    encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_leading_symbol,
                                sizeof(rmt_symbol_word_t), &
↪session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 1; // we can only switch to the next state when_
↪the current encoder finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding_
↪artifacts
    }
    // fall-through
case 1: // send address
    encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->address, sizeof(uint16_t), &session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 2; // we can only switch to the next state when_
↪the current encoder finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding_
↪artifacts
    }
    // fall-through
case 2: // send command
    encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↪code->command, sizeof(uint16_t), &session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = 3; // we can only switch to the next state when_
↪the current encoder finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding_
↪artifacts
    }
    // fall-through
case 3: // send ending code
    encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↪encoder->nec_ending_symbol,
                                sizeof(rmt_symbol_word_t), &
↪session_state);
    if (session_state & RMT_ENCODING_COMPLETE) {
        nec_encoder->state = RMT_ENCODING_RESET; // back to the initial_
↪encoding session
        state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding_
↪has finished
    }
    if (session_state & RMT_ENCODING_MEM_FULL) {
        state |= RMT_ENCODING_MEM_FULL;
        goto out; // yield if there is no free space to put other encoding_
↪artifacts
    }
}
out:
    *ret_state = state;

```

(continues on next page)

```
    return encoded_symbols;
}
```

A full sample code can be found in [peripherals/rmt/ir\\_nec\\_transceiver](#). In the above snippet, we use a `switch-case` and several `goto` statements to implement a [Finite-state machine](#). With this pattern, users can construct much more complex IR protocols.

**Power Management** When power management is enabled, i.e., [CONFIG\\_PM\\_ENABLE](#) is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type [ESP\\_PM\\_APB\\_FREQ\\_MAX](#). Whenever the user creates an RMT channel that has selected [RMT\\_CLK\\_SRC\\_APB](#) as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by [rmt\\_enable\(\)](#). Likewise, the driver releases the lock after [rmt\\_disable\(\)](#) is called for the same channel. This also reveals that the [rmt\\_enable\(\)](#) and [rmt\\_disable\(\)](#) should appear in pairs.

If the channel clock source is selected to others like [RMT\\_CLK\\_SRC\\_XTAL](#), then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#) that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM<sup>2</sup>
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt handler to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Another Kconfig option [CONFIG\\_RMT\\_RECV\\_FUNC\\_IN\\_IRAM](#) can place [rmt\\_receive\(\)](#) into the IRAM as well. So that the receive function can be used even when the flash cache is disabled.

**Thread Safety** The factory function [rmt\\_new\\_tx\\_channel\(\)](#), [rmt\\_new\\_rx\\_channel\(\)](#) and [rmt\\_new\\_sync\\_manager\(\)](#) are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the [rmt\\_channel\\_handle\\_t](#) and [rmt\\_sync\\_manager\\_handle\\_t](#) as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

The following functions are allowed to use under ISR context as well.

- [rmt\\_receive\(\)](#)

### Kconfig Options

- [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#) controls whether the default ISR handler can work when cache is disabled, see also [IRAM Safe](#) for more information.
- [CONFIG\\_RMT\\_ENABLE\\_DEBUG\\_LOG](#) is used to enable the debug log at the cost of increased firmware binary size.
- [CONFIG\\_RMT\\_RECV\\_FUNC\\_IN\\_IRAM](#) controls where to place the RMT receive function (IRAM or Flash), see [IRAM Safe](#) for more information.

<sup>2</sup> The callback function, e.g., [rmt\\_tx\\_event\\_callbacks\\_t::on\\_trans\\_done](#), and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

## Application Examples

- RMT-based RGB LED strip customized encoder: [peripherals/rmt/led\\_strip](#)
- RMT IR NEC protocol encoding and decoding: [peripherals/rmt/ir\\_nec\\_transceiver](#)
- RMT transactions in queue: [peripherals/rmt/musical\\_buzzer](#)
- RMT-based stepper motor with S-curve algorithm: [peripherals/rmt/stepper\\_motor](#)
- RMT infinite loop for driving DShot ESC: [peripherals/rmt/dshot\\_esc](#)
- RMT simulate 1-wire protocol (take DS18B20 as example): [peripherals/rmt/onewire](#)

## FAQ

- Why the RMT transmits more data than expected?  
The encoding for the RMT transmission is carried out within the ISR context. Should the RMT encoding process be prolonged (for example, through logging or tracing the procedure) or if it is delayed due to interrupt latency and preemptive interrupts, the hardware transmitter might read from the memory before the encoder has written to it. Consequently, the transmitter would end up sending outdated data. Although it's not possible to instruct the transmitter to pause and wait, this issue can be mitigated by employing a combination of the following strategies:
  - Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 64.
  - Place the encoding function in the IRAM with `IRAM_ATTR` attribute.
  - Enable the `rmt_tx_channel_config_t::with_dma` if DMA is available.
  - Install the RMT driver on a separate CPU core to avoid competing for the same CPU resources with other interrupt heavy peripherals (e.g. WiFi, Bluetooth).

## API Reference

### Header File

- [components/esp\\_driver\\_rmt/include/driver/rmt\\_tx.h](#)
- This header file can be included with:

```
#include "driver/rmt_tx.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

### Functions

`esp_err_t rmt_new_tx_channel` (const `rmt_tx_channel_config_t` \*config, `rmt_channel_handle_t` \*ret\_chan)

Create a RMT TX channel.

#### Parameters

- **config** -- [in] TX channel configurations
- **ret\_chan** -- [out] Returned generic RMT channel handle

#### Returns

- `ESP_OK`: Create RMT TX channel successfully
- `ESP_ERR_INVALID_ARG`: Create RMT TX channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT TX channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create RMT TX channel failed because all RMT channels are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- `ESP_FAIL`: Create RMT TX channel failed because of other error

*esp\_err\_t* **rmt\_transmit** (*rmt\_channel\_handle\_t* tx\_channel, *rmt\_encoder\_handle\_t* encoder, const void \*payload, size\_t payload\_bytes, const *rmt\_transmit\_config\_t* \*config)

Transmit data by RMT TX channel.

---

**Note:** This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there's another one under processing. Based on the setting of *rmt\_transmit\_config\_t::queue\_nonblocking*, if there're too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

---

---

**Note:** The payload data to be transmitted will be encoded into RMT symbols by the specific *encoder*.

---

---

**Note:** You CAN'T modify the *payload* during the transmission, it should be kept valid until the transmission is finished.

---

#### Parameters

- **tx\_channel** -- [in] RMT TX channel that created by *rmt\_new\_tx\_channel()*
- **encoder** -- [in] RMT encoder that created by various factory APIs like *rmt\_new\_bytes\_encoder()*
- **payload** -- [in] The raw data to be encoded into RMT symbols
- **payload\_bytes** -- [in] Size of the *payload* in bytes
- **config** -- [in] Transmission specific configuration

#### Returns

- ESP\_OK: Transmit data successfully
- ESP\_ERR\_INVALID\_ARG: Transmit data failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Transmit data failed because channel is not enabled
- ESP\_ERR\_NOT\_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP\_FAIL: Transmit data failed because of other error

*esp\_err\_t* **rmt\_tx\_wait\_all\_done** (*rmt\_channel\_handle\_t* tx\_channel, int timeout\_ms)

Wait for all pending TX transactions done.

---

**Note:** This function will block forever if the pending transaction can't be finished within a limited time (e.g. an infinite loop transaction). See also *rmt\_disable()* for how to terminate a working channel.

---

#### Parameters

- **tx\_channel** -- [in] RMT TX channel that created by *rmt\_new\_tx\_channel()*
- **timeout\_ms** -- [in] Wait timeout, in ms. Specially, -1 means to wait forever.

#### Returns

- ESP\_OK: Flush transactions successfully
- ESP\_ERR\_INVALID\_ARG: Flush transactions failed because of invalid argument
- ESP\_ERR\_TIMEOUT: Flush transactions failed because of timeout
- ESP\_FAIL: Flush transactions failed because of other error

*esp\_err\_t* **rmt\_tx\_register\_event\_callbacks** (*rmt\_channel\_handle\_t* tx\_channel, const *rmt\_tx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for RMT TX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the *cbs* structure to NULL.

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

**Parameters**

- **tx\_channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()`
- **cbs** -- **[in]** Group of callback functions
- **user\_data** -- **[in]** User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* **rmt\_new\_sync\_manager** (const *rmt\_sync\_manager\_config\_t* \*config, *rmt\_sync\_manager\_handle\_t* \*ret\_syncro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

---

**Note:** All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

---

**Parameters**

- **config** -- **[in]** Synchronization manager configuration
- **ret\_syncro** -- **[out]** Returned synchronization manager handle

**Returns**

- `ESP_OK`: Create sync manager successfully
- `ESP_ERR_INVALID_ARG`: Create sync manager failed because of invalid argument
- `ESP_ERR_NOT_SUPPORTED`: Create sync manager failed because it is not supported by hardware
- `ESP_ERR_INVALID_STATE`: Create sync manager failed because not all channels are enabled
- `ESP_ERR_NO_MEM`: Create sync manager failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create sync manager failed because all sync controllers are used up and no more free one
- `ESP_FAIL`: Create sync manager failed because of other error

*esp\_err\_t* **rmt\_del\_sync\_manager** (*rmt\_sync\_manager\_handle\_t* syncro)

Delete synchronization manager.

**Parameters** **syncro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- `ESP_OK`: Delete the synchronization manager successfully
- `ESP_ERR_INVALID_ARG`: Delete the synchronization manager failed because of invalid argument
- `ESP_FAIL`: Delete the synchronization manager failed because of other error

*esp\_err\_t* **rmt\_sync\_reset** (*rmt\_sync\_manager\_handle\_t* syncro)

Reset synchronization manager.

**Parameters** **syncro** -- **[in]** Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

- `ESP_OK`: Reset the synchronization manager successfully

- `ESP_ERR_INVALID_ARG`: Reset the synchronization manager failed because of invalid argument
- `ESP_FAIL`: Reset the synchronization manager failed because of other error

## Structures

struct **rmt\_tx\_event\_callbacks\_t**

Group of RMT TX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

*rmt\_tx\_done\_callback\_t* **on\_trans\_done**

Event callback, invoked when transmission is finished

struct **rmt\_tx\_channel\_config\_t**

RMT TX channel specific configuration.

## Public Members

gpio\_num\_t **gpio\_num**

GPIO number used by RMT TX channel. Set to -1 if unused

*rmt\_clock\_source\_t* **clk\_src**

Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32\_t **resolution\_hz**

Channel clock resolution, in Hz

size\_t **mem\_block\_symbols**

Size of memory block, in number of *rmt\_symbol\_word\_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

size\_t **trans\_queue\_depth**

Depth of internal transfer queue, increase this value can support more transfers pending in the background

int **intr\_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **invert\_out**

Whether to invert the RMT channel signal before output to GPIO pad

uint32\_t **with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32\_t **io\_loop\_back**

The signal output from the GPIO will be fed to the input path as well

uint32\_t **io\_od\_mode**

Configure the GPIO as open-drain mode

struct *rmt\_tx\_channel\_config\_t*::[anonymous] **flags**

TX channel config flags

struct **rmt\_transmit\_config\_t**

RMT transmit specific configuration.

### Public Members

int **loop\_count**

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32\_t **eot\_level**

Set the output level for the "End Of Transmission"

uint32\_t **queue\_nonblocking**

If set, when the transaction queue is full, driver will not block the thread but return directly

struct *rmt\_transmit\_config\_t*::[anonymous] **flags**

Transmit specific config flags

struct **rmt\_sync\_manager\_config\_t**

Synchronous manager configuration.

### Public Members

const *rmt\_channel\_handle\_t*\***tx\_channel\_array**

Array of TX channels that are about to be managed by a synchronous controller

size\_t **array\_size**

Size of the `tx_channel_array`

### Header File

- [components/esp\\_driver\\_rmt/include/driver/rmt\\_rx.h](#)
- This header file can be included with:

```
#include "driver/rmt_rx.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

## Functions

*esp\_err\_t* **rmt\_new\_rx\_channel** (const *rmt\_rx\_channel\_config\_t* \*config, *rmt\_channel\_handle\_t* \*ret\_chan)

Create a RMT RX channel.

### Parameters

- **config** -- [in] RX channel configurations
- **ret\_chan** -- [out] Returned generic RMT channel handle

### Returns

- ESP\_OK: Create RMT RX channel successfully
- ESP\_ERR\_INVALID\_ARG: Create RMT RX channel failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create RMT RX channel failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP\_ERR\_NOT\_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP\_FAIL: Create RMT RX channel failed because of other error

*esp\_err\_t* **rmt\_receive** (*rmt\_channel\_handle\_t* rx\_channel, void \*buffer, size\_t buffer\_size, const *rmt\_receive\_config\_t* \*config)

Initiate a receive job for RMT RX channel.

---

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

---

---

**Note:** This function can also be called in ISR context.

---

---

**Note:** If you want this function to work even when the flash cache is disabled, please enable the `CONFIG_RMT_RECV_FUNC_IN_IRAM` option.

---

### Parameters

- **rx\_channel** -- [in] RMT RX channel that created by `rmt_new_rx_channel()`
- **buffer** -- [in] The buffer to store the received RMT symbols
- **buffer\_size** -- [in] size of the `buffer`, in bytes
- **config** -- [in] Receive specific configurations

### Returns

- ESP\_OK: Initiate receive job successfully
- ESP\_ERR\_INVALID\_ARG: Initiate receive job failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Initiate receive job failed because channel is not enabled
- ESP\_FAIL: Initiate receive job failed because of other error

*esp\_err\_t* **rmt\_rx\_register\_event\_callbacks** (*rmt\_channel\_handle\_t* rx\_channel, const *rmt\_rx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for RMT RX channel.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback

---

member in the `cbs` structure to `NULL`.

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

#### Parameters

- `rx_channel` -- [in] RMT generic channel that created by `rmt_new_rx_channel()`
- `cbs` -- [in] Group of callback functions
- `user_data` -- [in] User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

### Structures

struct `rmt_rx_event_callbacks_t`

Group of RMT RX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

### Public Members

[\*rmt\\_rx\\_done\\_callback\\_t\*](#) `on_recv_done`

Event callback, invoked when the RMT channel reception is finished or partial data is received

struct `rmt_rx_channel_config_t`

RMT RX channel specific configuration.

### Public Members

`gpio_num_t` `gpio_num`

GPIO number used by RMT RX channel. Set to -1 if unused

[\*rmt\\_clock\\_source\\_t\*](#) `clk_src`

Clock source of RMT RX channel, channels in the same group must use the same clock source

`uint32_t` `resolution_hz`

Channel clock resolution, in Hz

**size\_t mem\_block\_symbols**

Size of memory block, in number of *rmt\_symbol\_word\_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

**int intr\_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

**uint32\_t invert\_in**

Whether to invert the incoming RMT channel signal

**uint32\_t with\_dma**

If set, the driver will allocate an RMT channel with DMA capability

**uint32\_t io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

**struct *rmt\_rx\_channel\_config\_t*::[anonymous] flags**

RX channel config flags

**struct *rmt\_receive\_config\_t***

RMT receive specific configuration.

**Public Members****uint32\_t signal\_range\_min\_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

**uint32\_t signal\_range\_max\_ns**

RMT will stop receiving if one symbol level has kept more than *signal\_range\_max\_ns*

**struct *rmt\_receive\_config\_t*::*extra\_rmt\_receive\_flags* flags**

Receive specific config flags

**struct *extra\_rmt\_receive\_flags***

Receive specific flags.

**Public Members****uint32\_t en\_partial\_rx**

Set this flag if the incoming data is very long, and the driver can only receive the data piece by piece, because the user buffer is not sufficient to save all the data.

**Header File**

- [components/esp\\_driver\\_rmt/include/driver/rmt\\_common.h](#)
- This header file can be included with:

```
#include "driver/rmt_common.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

## Functions

`esp_err_t rmt_del_channel (rmt_channel_handle_t channel)`

Delete an RMT channel.

**Parameters** `channel` -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

### Returns

- ESP\_OK: Delete RMT channel successfully
- ESP\_ERR\_INVALID\_ARG: Delete RMT channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete RMT channel failed because it is still in working
- ESP\_FAIL: Delete RMT channel failed because of other error

`esp_err_t rmt_apply_carrier (rmt_channel_handle_t channel, const rmt_carrier_config_t *config)`

Apply modulation feature for TX channel or demodulation feature for RX channel.

### Parameters

- channel** -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- config** -- **[in]** Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

### Returns

- ESP\_OK: Apply carrier configuration successfully
- ESP\_ERR\_INVALID\_ARG: Apply carrier configuration failed because of invalid argument
- ESP\_FAIL: Apply carrier configuration failed because of other error

`esp_err_t rmt_enable (rmt_channel_handle_t channel)`

Enable the RMT channel.

---

**Note:** This function will acquire a PM lock that might be installed during channel allocation

---

**Parameters** `channel` -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

### Returns

- ESP\_OK: Enable RMT channel successfully
- ESP\_ERR\_INVALID\_ARG: Enable RMT channel failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable RMT channel failed because it's enabled already
- ESP\_FAIL: Enable RMT channel failed because of other error

`esp_err_t rmt_disable (rmt_channel_handle_t channel)`

Disable the RMT channel.

---

**Note:** This function will release a PM lock that might be installed during channel allocation

---

**Parameters** `channel` -- **[in]** RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

### Returns

- `ESP_OK`: Disable RMT channel successfully
- `ESP_ERR_INVALID_ARG`: Disable RMT channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable RMT channel failed because it's not enabled yet
- `ESP_FAIL`: Disable RMT channel failed because of other error

### Structures

struct **rmt\_carrier\_config\_t**

RMT carrier wave configuration (for either modulation or demodulation)

### Public Members

uint32\_t **frequency\_hz**

Carrier wave frequency, in Hz, 0 means disabling the carrier

float **duty\_cycle**

Carrier wave duty cycle (0~100%)

uint32\_t **polarity\_active\_low**

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32\_t **always\_on**

If set, the carrier can always exist even there's not transfer undergoing

struct *rmt\_carrier\_config\_t*::[anonymous] **flags**

Carrier config flags

### Header File

- [components/esp\\_driver\\_rmt/include/driver/rmt\\_encoder.h](#)
- This header file can be included with:

```
#include "driver/rmt_encoder.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

### Functions

*esp\_err\_t* **rmt\_new\_bytes\_encoder** (const *rmt\_bytes\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

#### Parameters

- **config** -- [in] Bytes encoder configuration
- **ret\_encoder** -- [out] Returned encoder handle

#### Returns

- `ESP_OK`: Create RMT bytes encoder successfully

- `ESP_ERR_INVALID_ARG`: Create RMT bytes encoder failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT bytes encoder failed because out of memory
- `ESP_FAIL`: Create RMT bytes encoder failed because of other error

*esp\_err\_t* **rmt\_bytes\_encoder\_update\_config** (*rmt\_encoder\_handle\_t* bytes\_encoder, const *rmt\_bytes\_encoder\_config\_t* \*config)

Update the configuration of the bytes encoder.

---

**Note:** The configurations of the bytes encoder is also set up by `rmt_new_bytes_encoder()`. This function is used to update the configuration of the bytes encoder at runtime.

---

#### Parameters

- **bytes\_encoder** -- **[in]** Bytes encoder handle, created by e.g `rmt_new_bytes_encoder()`
- **config** -- **[in]** Bytes encoder configuration

#### Returns

- `ESP_OK`: Update RMT bytes encoder successfully
- `ESP_ERR_INVALID_ARG`: Update RMT bytes encoder failed because of invalid argument
- `ESP_FAIL`: Update RMT bytes encoder failed because of other error

*esp\_err\_t* **rmt\_new\_copy\_encoder** (const *rmt\_copy\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

#### Parameters

- **config** -- **[in]** Copy encoder configuration
- **ret\_encoder** -- **[out]** Returned encoder handle

#### Returns

- `ESP_OK`: Create RMT copy encoder successfully
- `ESP_ERR_INVALID_ARG`: Create RMT copy encoder failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT copy encoder failed because out of memory
- `ESP_FAIL`: Create RMT copy encoder failed because of other error

*esp\_err\_t* **rmt\_new\_simple\_encoder** (const *rmt\_simple\_encoder\_config\_t* \*config, *rmt\_encoder\_handle\_t* \*ret\_encoder)

Create RMT simple callback encoder, which uses a callback to convert incoming data into RMT symbols.

#### Parameters

- **config** -- **[in]** Simple callback encoder configuration
- **ret\_encoder** -- **[out]** Returned encoder handle

#### Returns

- `ESP_OK`: Create RMT simple callback encoder successfully
- `ESP_ERR_INVALID_ARG`: Create RMT simple callback encoder failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT simple callback encoder failed because out of memory
- `ESP_FAIL`: Create RMT simple callback encoder failed because of other error

*esp\_err\_t* **rmt\_del\_encoder** (*rmt\_encoder\_handle\_t* encoder)

Delete RMT encoder.

**Parameters** **encoder** -- **[in]** RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

#### Returns

- `ESP_OK`: Delete RMT encoder successfully
- `ESP_ERR_INVALID_ARG`: Delete RMT encoder failed because of invalid argument

- ESP\_FAIL: Delete RMT encoder failed because of other error

*esp\_err\_t* **rmt\_encoder\_reset** (*rmt\_encoder\_handle\_t* encoder)

Reset RMT encoder.

**Parameters** **encoder** -- [in] RMT encoder handle, created by e.g. `rmt_new_bytes_encoder()`

**Returns**

- ESP\_OK: Reset RMT encoder successfully
- ESP\_ERR\_INVALID\_ARG: Reset RMT encoder failed because of invalid argument
- ESP\_FAIL: Reset RMT encoder failed because of other error

void **\*rmt\_alloc\_encoder\_mem** (size\_t size)

A helper function to allocate a proper memory for RMT encoder.

**Parameters** **size** -- Size of memory to be allocated

**Returns** Pointer to the allocated memory if the allocation is successful, NULL otherwise

## Structures

struct **rmt\_encoder\_t**

Interface of RMT encoder.

## Public Members

size\_t (**\*encode**)(*rmt\_encoder\_t* \*encoder, *rmt\_channel\_handle\_t* tx\_channel, const void \*primary\_data, size\_t data\_size, *rmt\_encode\_state\_t* \*ret\_state)

Encode the user data into RMT symbols and write into RMT memory.

---

**Note:** The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

---

---

**Note:** It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

---

**Param encoder** [in] Encoder handle

**Param tx\_channel** [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`

**Param primary\_data** [in] App data to be encoded into RMT symbols

**Param data\_size** [in] Size of primary\_data, in bytes

**Param ret\_state** [out] Returned current encoder's state

**Return** Number of RMT symbols that the primary data has been encoded into

*esp\_err\_t* (**\*reset**)(*rmt\_encoder\_t* \*encoder)

Reset encoding state.

**Param encoder** [in] Encoder handle

**Return**

- ESP\_OK: reset encoder successfully
- ESP\_FAIL: reset encoder failed

*esp\_err\_t* (**\*del**)(*rmt\_encoder\_t* \*encoder)

Delete encoder object.

**Param encoder [in]** Encoder handle

**Return**

- ESP\_OK: delete encoder successfully
- ESP\_FAIL: delete encoder failed

struct **rmt\_bytes\_encoder\_config\_t**

Bytes encoder configuration.

### Public Members

*rmt\_symbol\_word\_t* **bit0**

How to represent BIT0 in RMT symbol

*rmt\_symbol\_word\_t* **bit1**

How to represent BIT1 in RMT symbol

uint32\_t **msb\_first**

Whether to encode MSB bit first

struct *rmt\_bytes\_encoder\_config\_t*::[anonymous] **flags**

Encoder config flag

struct **rmt\_copy\_encoder\_config\_t**

Copy encoder configuration.

struct **rmt\_simple\_encoder\_config\_t**

Simple callback encoder configuration.

### Public Members

*rmt\_encode\_simple\_cb\_t* **callback**

Callback to call for encoding data into RMT items

void \***arg**

Opaque user-supplied argument for callback

size\_t **min\_chunk\_size**

Minimum amount of free space, in RMT symbols, the encoder needs in order to guarantee it always returns non-zero. Defaults to 64 if zero / not given.

### Type Definitions

```
typedef size_t (rmt_encode_simple_cb_t)(const void *data, size_t data_size, size_t symbols_written, size_t symbols_free, rmt_symbol_word_t *symbols, bool *done, void *arg)
```

Callback for simple callback encoder.

This will get called to encode the data stream of given length (as passed to `rmt_transmit` by the user) into symbols to be sent by the hardware.

The callback will be initially called with `symbol_pos=0`. If the callback encodes `N` symbols and finishes, the next callback will always be with `symbols_written=N`. If the callback then encodes `M` symbols, the next callback

will always be with `symbol_pos=N+M`, etc. The only exception is when the encoder is reset (e.g. to begin a new transaction) in which case `symbol_pos` will always restart at 0.

If the amount of free space in the symbol buffer (as indicated by `symbols_free`) is too low, the function can return 0 as result and the RMT will call the function again once there is more space available. Note that the callback should eventually return non-0 if called with free space of `rmt_simple_encoder_config_t:min_chunk_size` or more. It is acceptable to return 0 for a given free space N, then on the next call (possibly with a larger free buffer space) return less or more than N symbols.

When the transaction is done (all `data_size` data is encoded), the callback can indicate this by setting `*done` to true. This can either happen on the last callback call that returns an amount of symbols encoded, or on a callback that returns zero. In either case, the callback will not be called again for this transaction.

**Param data [in]** Data pointer, as passed to `rmt_transmit()`

**Param data\_size [in]** Size of the data, as passed to `rmt_transmit()`

**Param symbols\_written [in]** Current position in encoded stream, in symbols

**Param symbols\_free [in]** The maximum amount of symbols that can be written into the `symbols` buffer

**Param symbols [out]** Symbols to be sent to the RMT hardware

**Param done [out]** Setting this to true marks this transaction as finished

**Param arg** Opaque argument

**Return** Amount of symbols encoded in this callback round. 0 if more space is needed.

## Enumerations

enum `rmt_encode_state_t`

RMT encoding state.

*Values:*

enumerator `RMT_ENCODING_RESET`

The encoding session is in reset state

enumerator `RMT_ENCODING_COMPLETE`

The encoding session is finished, the caller can continue with subsequent encoding

enumerator `RMT_ENCODING_MEM_FULL`

The encoding artifact memory is full, the caller should return from current encoding session

## Header File

- [components/esp\\_driver\\_rmt/include/driver/rmt\\_types.h](#)
- This header file can be included with:

```
#include "driver/rmt_types.h"
```

- This header file is a part of the API provided by the `esp_driver_rmt` component. To declare that your component depends on `esp_driver_rmt`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_rmt
```

or

```
PRIV_REQUIRES esp_driver_rmt
```

## Structures

struct `rmt_tx_done_event_data_t`

Type of RMT TX done event data.

## Public Members

size\_t **num\_symbols**

The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct **rmt\_rx\_done\_event\_data\_t**

Type of RMT RX done event data.

## Public Members

*rmt\_symbol\_word\_t* \***received\_symbols**

Point to the received RMT symbols

size\_t **num\_symbols**

The number of received RMT symbols

uint32\_t **is\_last**

Indicating if the current received data are the last part of the transaction

struct *rmt\_rx\_done\_event\_data\_t*::[anonymous] **flags**

Extra flags

## Type Definitions

typedef struct *rmt\_channel\_t* \***rmt\_channel\_handle\_t**

Type of RMT channel handle.

typedef struct *rmt\_sync\_manager\_t* \***rmt\_sync\_manager\_handle\_t**

Type of RMT synchronization manager handle.

typedef struct *rmt\_encoder\_t* \***rmt\_encoder\_handle\_t**

Type of RMT encoder handle.

typedef bool (\***rmt\_tx\_done\_callback\_t**)(*rmt\_channel\_handle\_t* tx\_chan, const *rmt\_tx\_done\_event\_data\_t* \*edata, void \*user\_ctx)

Prototype of RMT event callback.

**Param tx\_chan [in]** RMT channel handle, created from `rmt_new_tx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `rmt_tx_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this callback function

typedef bool (\***rmt\_rx\_done\_callback\_t**)(*rmt\_channel\_handle\_t* rx\_chan, const *rmt\_rx\_done\_event\_data\_t* \*edata, void \*user\_ctx)

Prototype of RMT event callback.

**Param rx\_chan [in]** RMT channel handle, created from `rmt_new_rx_channel()`

**Param edata [in]** Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param** `user_ctx` [in] User registered context, passed from `rmt_rx_register_event_callbacks()`  
**Return** Whether a high priority task has been waken up by this function

### Header File

- `components/hal/include/hal/rmt_types.h`
- This header file can be included with:

```
#include "hal/rmt_types.h"
```

### Unions

union `rmt_symbol_word_t`

`#include <rmt_types.h>` The layout of RMT symbol stored in memory, which is decided by the hardware design.

### Public Members

uint16\_t `duration0`

Duration of level0

uint16\_t `level0`

Level of the first part

uint16\_t `duration1`

Duration of level1

uint16\_t `level1`

Level of the second part

struct `rmt_symbol_word_t`::[anonymous] [**anonymous**]

uint32\_t `val`

Equivalent unsigned value for the RMT symbol

### Type Definitions

typedef `soc_periph_rmt_clk_src_t` `rmt_clock_source_t`

RMT group clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

## 2.5.17 SD SPI Host Driver

## Overview

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle `sdspi_dev_handle_t`, which returns when the device is attached to an SPI bus by calling `sdspi_host_init_device()`. It is important to note that the SPI bus should be initialized beforehand by `spi_bus_initialize()`.

With the help of *SPI Master Driver* the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

## How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize the structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use the `SDSPI_HOST_DEFAULT` macro to initialize the `sdmmc_host_t` structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device SD SPI handle just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

## Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see *SD/SDIO/MMC Driver*.

---

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

<p><b>Warning:</b> If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see <i>Sharing the SPI Bus Among SD Cards and Other SPI Devices</i>.</p>
--

### Sharing the SPI Bus Among SD Cards and Other SPI Devices

The SD card has an SPI mode, enabling it to function as an SPI device, but there are some restrictions that we need to pay attention to.

**Pin Loading of Other Devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC Loading** SD cards, designed for high-speed communications, have small pin capacitors (AC loading) to work until 50 MHz. However, the other attached devices will increase the pin's AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother, i.e., the gradient of the edge is smaller. The setup timing requirements of an SD card may be violated when the card is connected to a bus with a high AC load. Even worse, high AC loads may cause the SD card and other SPI devices to fail to properly resolve clock signals from the host, affecting communication stability.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors. The larger the pin capacity, the greater the pin response time, the smaller the max frequency the SD bus can work.

To see if your pin AC loading is too heavy, you can try the following tests:

Terminology:

- **launch edge**: at which clock edge the data starts to toggle;
- **latch edge**: at which clock edge the data is supposed to be sampled by the receiver. For SD card, it is the rising edge.

1. Use an oscilloscope to see the clock and compare the data line to the clock.
  - If you see the clock is not fast enough, e.g., the rising/falling edge is longer than 1/4 of the clock cycle, it means the clock is skewed too much.
  - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

You may also observe the corresponding phenomenon that data delayed largely from the launching edge of the clock with logic analyzers. But it is not as obvious as with an oscilloscope.

2. Try to use a slower clock frequency.

If the lower frequency can work while the higher frequency cannot, it is an indication that the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices with lower pin load or slow down the clock speed.

**DC Loading** The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700  $\mu$ A, otherwise, the device output may not be read correctly.

### Initialization Sequence

---

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed, such as setting `SDMMC_FREQ_PROBING` to 400 kHz for SD card, to avoid the influence of pin AC loading, as discussed in the previous section.

---

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed. Refer to [storage/sd\\_card](#) for further details.

1. Initialize the SPI bus properly by `spi_bus_initialize()`.
2. Tie the CS lines of all other devices than the SD card to idle state (by default it's high). This is to avoid conflicts with the SD card in the following step.

You can do this by either:

1. Attach devices to the SPI bus by calling `spi_bus_add_device()`. This function will by default initialize the GPIO that is used as CS to the idle level: high.
2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
3. Rely on the internal/external pull-up (**not recommended**) to pull up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up. For example, internal pull-down should be enabled.

3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount()`.  
This step will put the SD card into the SPI mode, which **should** be done before all other SPI communications on the same bus. Otherwise, the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.  
If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before the next power cycle, i.e., powered down and powered up again.
4. Now you can talk to other SPI devices freely!

## API Reference

### Header File

- `components/esp_driver_sdspi/include/driver/sdspi_host.h`
- This header file can be included with:

```
#include "driver/sdspi_host.h"
```

- This header file is a part of the API provided by the `esp_driver_sdspi` component. To declare that your component depends on `esp_driver_sdspi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_sdspi
```

or

```
PRIV_REQUIRES esp_driver_sdspi
```

### Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

---

**Note:** This function is not thread safe

---

#### Returns

- `ESP_OK` on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` \*dev\_config, `sdspi_dev_handle_t` \*out\_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

---

**Note:** This function is not thread safe

---

---

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

---

---

**Note:** The SDIO over `sdspi` needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

---

#### Parameters

- `dev_config` -- pointer to device configuration structure
- `out_handle` -- Output of the handle to the `sdspi` device.

#### Returns

- `ESP_OK` on success

- ESP\_ERR\_INVALID\_ARG if `sdspi_host_init_device` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

*esp\_err\_t* **sdspi\_host\_remove\_device** (*sdspi\_dev\_handle\_t* handle)

Remove an SD SPI device.

**Parameters** `handle` -- Handle of the SD SPI device

**Returns** Always ESP\_OK

*esp\_err\_t* **sdspi\_host\_do\_transaction** (*sdspi\_dev\_handle\_t* handle, `sdmmc_command_t *cmdinfo`)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

---

**Note:** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

---

#### Parameters

- `handle` -- Handle of the `sdspi` device
- `cmdinfo` -- pointer to structure describing command and data to transfer

#### Returns

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response

*esp\_err\_t* **sdspi\_host\_set\_card\_clk** (*sdspi\_dev\_handle\_t* host, `uint32_t freq_khz`)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**Note:** This function is not thread safe

---

#### Parameters

- `host` -- Handle of the `sdspi` device
- `freq_khz` -- card clock frequency, in kHz

#### Returns

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdspi\_host\_get\_real\_freq** (*sdspi\_dev\_handle\_t* handle, `int *real_freq_khz`)

Calculate working frequency for specific device.

#### Parameters

- `handle` -- SDSPI device handle
- `real_freq_khz` -- [out] output parameter to hold the calculated frequency (in kHz)

#### Returns

- ESP\_ERR\_INVALID\_ARG : `handle` is NULL or invalid or `real_freq_khz` parameter is NULL
- ESP\_OK : Success

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using `sdspi_host_init`.

---

**Note:** This function is not thread safe

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (*sdspi\_dev\_handle\_t* handle)

Enable SDIO interrupt.

**Parameters** `handle` -- Handle of the sdspi device

**Returns**

- ESP\_OK on success

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (*sdspi\_dev\_handle\_t* handle, TickType\_t timeout\_ticks)

Wait for SDIO interrupt until timeout.

**Parameters**

- `handle` -- Handle of the sdspi device
- `timeout_ticks` -- Ticks to wait before timeout.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **sdspi\_host\_get\_dma\_info** (int slot, esp\_dma\_mem\_info\_t \*dma\_mem\_info)

Get the DMA memory information for the host driver.

**Parameters**

- `slot` -- [in] Not used
- `dma_mem_info` -- [out] DMA memory information structure

**Returns**

- ESP\_OK: ON success.
- ESP\_ERR\_INVALID\_ARG: Invalid argument.

**Structures**

struct **sdspi\_device\_config\_t**

Extra configuration for SD SPI device.

**Public Members**

*spi\_host\_device\_t* **host\_id**

SPI host to use, SPIx\_HOST (see `spi_types.h`).

gpio\_num\_t **gpio\_cs**

GPIO number of CS signal.

gpio\_num\_t **gpio\_cd**

GPIO number of card detect signal.

gpio\_num\_t **gpio\_wp**

GPIO number of write protect signal.

gpio\_num\_t **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

bool **gpio\_wp\_polarity**

GPIO write protect polarity 0 means "active low", i.e. card is protected when the GPIO is low; 1 means "active high", i.e. card is protected when GPIO is high.

## Macros

**SDSPI\_DEFAULT\_HOST**

**SDSPI\_DEFAULT\_DMA**

**SDSPI\_HOST\_DEFAULT ()**

Default sdmmc\_host\_t structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an sdspi device initialized by `sdspi_host_init_device ()`.

**SDSPI\_SLOT\_NO\_CS**

indicates that card select line is not used

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_IO\_ACTIVE\_LOW**

**SDSPI\_DEVICE\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SD SPI device.

## Type Definitions

typedef int **sdspi\_dev\_handle\_t**

Handle representing an SD SPI device.

## 2.5.18 Sigma-Delta Modulation (SDM)

### Introduction

ESP32-S2 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.<sup>1</sup>

Delta-sigma modulation converts an analog voltage signal into a pulse frequency, or pulse density, which can be understood as pulse-density modulation (PDM) (refer to [Delta-sigma modulation on Wikipedia](#)).

The main differences comparing to I2S PDM mode and DAC peripheral are:

---

<sup>1</sup> Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter [GPIO and IOMUX](#) in ESP32-S2 Technical Reference Manual for more details. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `sdm_new_channel ()`).

1. SDM has no clock signal, it is just like the DAC mode of PDM;
2. SDM has no DMA, and it can not change its output density continuously. If you have to, you can update the density in a timer's callback;
3. Based on the former two points, unlike the DAC peripheral, an external active or passive low-pass filter is required additionally to restore the analog wave (See *Convert to an Analog Signal (Optional)*).

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

## Functional Overview

The following sections of this document cover the typical steps to install and operate an SDM channel:

- *Resource Allocation* - covers how to initialize and configure an SDM channel and how to recycle the resources when it finishes working.
- *Enable and Disable Channel* - covers how to enable and disable the channel.
- *Set Pulse Density* - describes how to set the equivalent duty cycle of the PDM pulses.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** In ESP-IDF, the information and attributes of SDM channels are managed and accessed through specific data structures, where the data structure is called `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware-generated signal with the sigma-delta modulation. The driver manages all available channels in a pool so that there is no need to manually assign a fixed channel to a GPIO.

To install an SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel-specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses output from.
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e., all hardware SDM channels have been used up), `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting an SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not been enabled yet by `sdm_channel_enable()`.

## Creating an SDM Channel with a Sample Rate of 1 MHz

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

**Enable and Disable Channel** Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function:

- switches the channel state from **init** to **enable**
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also [Power Management](#) for more information.

On the contrary, calling `sdm_channel_disable()` does the opposite, that is, put the channel back to the **init** state and releases the power management lock.

**Set Pulse Density** For the output PDM signals, the pulse density decides the output analog voltage that is restored by a low-pass filter. The restored analog voltage from the channel is calculated by  $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$ . The range of the quantized `density` input parameter of `sdm_channel_set_pulse_density()` is from -128 to 127 (8-bit signed integer). Depending on the value of the `density` parameter, the duty cycle of the output signal will be changed accordingly. For example, if a zero value is set, then the output signal's duty will be around 50%.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into Light-sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver guarantees that the power management lock is acquired when enabling the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

**IRAM Safe** There is a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly-used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_pulse_density()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread-safe by the driver, which means, the user can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_pulse_density()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread-safe. This means the user should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see [IRAM Safe](#) for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

### Convert to an Analog Signal (Optional)

Typically, if a Sigma-Delta signal is connected to an LED to adjust the brightness, you do not have to add any filter between them, because our eyes have their own low-pass filters for changes in light intensity. However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low-pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

Fig. 20: Sallen-Key Low Pass Filter

### Application Example

- 100 Hz sine wave that is modulated with Sigma-Delta: [peripherals/sigma\\_delta/sdm\\_dac](#).
- LED driven by a GPIO that is modulated with Sigma-Delta: [peripherals/sigma\\_delta/sdm\\_led](#).

### API Reference

PRIV_REQUIRES esp_driver_sdm
```

#### Functions

`esp_err_t sdm_new_channel` (const `sdm_config_t` \*config, `sdm_channel_handle_t` \*ret\_chan)

Create a new Sigma Delta channel.

##### Parameters

- **config** -- [in] SDM configuration
- **ret\_chan** -- [out] Returned SDM channel handle

##### Returns

- ESP\_OK: Create SDM channel successfully
- ESP\_ERR\_INVALID\_ARG: Create SDM channel failed because of invalid argument

- `ESP_ERR_NO_MEM`: Create SDM channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create SDM channel failed because all channels are used up and no more free one
- `ESP_FAIL`: Create SDM channel failed because of other error

*esp\_err\_t* **sdm\_del\_channel** (*sdm\_channel\_handle\_t* chan)

Delete the Sigma Delta channel.

**Parameters** `chan` -- [in] SDM channel created by `sdm_new_channel`

**Returns**

- `ESP_OK`: Delete the SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Delete the SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete the SDM channel failed because the channel is not in init state
- `ESP_FAIL`: Delete the SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_enable** (*sdm\_channel\_handle\_t* chan)

Enable the Sigma Delta channel.

---

**Note:** This function will transit the channel state from init to enable.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `sdm_config_t`, while `CONFIG_PM_ENABLE` is enabled.

---

**Parameters** `chan` -- [in] SDM channel created by `sdm_new_channel`

**Returns**

- `ESP_OK`: Enable SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Enable SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable SDM channel failed because the channel is already enabled
- `ESP_FAIL`: Enable SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_disable** (*sdm\_channel\_handle\_t* chan)

Disable the Sigma Delta channel.

---

**Note:** This function will do the opposite work to the `sdm_channel_enable()`

---

**Parameters** `chan` -- [in] SDM channel created by `sdm_new_channel`

**Returns**

- `ESP_OK`: Disable SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Disable SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable SDM channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable SDM channel failed because of other error

*esp\_err\_t* **sdm\_channel\_set\_pulse\_density** (*sdm\_channel\_handle\_t* chan, *int8\_t* density)

Set the pulse density of the PDM output signal.

---

**Note:** The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be  $V_{out} = VDD_{IO} / 256 * density + VDD_{IO} / 2$

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

#### Parameters

- **chan** -- [in] SDM channel created by `sdm_new_channel`
- **density** -- [in] Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

#### Returns

- `ESP_OK`: Set pulse density successfully
- `ESP_ERR_INVALID_ARG`: Set pulse density failed because of invalid argument
- `ESP_FAIL`: Set pulse density failed because of other error

*esp\_err\_t* **sdm\_channel\_set\_duty** (*sdm\_channel\_handle\_t* chan, int8\_t duty)

The alias function of `sdm_channel_set_pulse_density`, it decides the pulse density of the output signal.

---

**Note:** `sdm_channel_set_pulse_density` has a more appropriate name compare this alias function, suggest to turn to `sdm_channel_set_pulse_density` instead

---

#### Parameters

- **chan** -- [in] SDM channel created by `sdm_new_channel`
- **duty** -- [in] Actually it's the quantized pulse density of the PDM output signal

#### Returns

- `ESP_OK`: Set duty cycle successfully
- `ESP_ERR_INVALID_ARG`: Set duty cycle failed because of invalid argument
- `ESP_FAIL`: Set duty cycle failed because of other error

### Structures

struct **sdm\_config\_t**

Sigma Delta channel configuration.

#### Public Members

int **gpio\_num**

GPIO number

*sdm\_clock\_source\_t* **clk\_src**

Clock source

uint32\_t **sample\_rate\_hz**

Over sample rate in Hz, it determines the frequency of the carrier pulses

uint32\_t **invert\_out**

Whether to invert the output signal

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

```
struct sdm_config_t::[anonymous] flags  
    Extra flags
```

### Type Definitions

```
typedef struct sdm_channel_t *sdm_channel_handle_t  
    Type of Sigma Delta channel handle.
```

### Header File

- [components/hal/include/hal/sdm\\_types.h](#)
- This header file can be included with:

```
#include "hal/sdm_types.h"
```

### Type Definitions

```
typedef soc_periph_sdm_clk_src_t sdm_clock_source_t
```

## 2.5.19 SPI Flash API

### Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, and memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the *partition table*, see [Partitions API](#)

---

**Note:** `esp_partition_*` APIs are recommended to be used instead of the lower level `esp_flash_*` API functions when accessing the main SPI flash chip, since they conduct bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. `esp_flash_*` functions can still be used directly when accessing an external (secondary) SPI flash chip.

---

Different from the API before ESP-IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the "main" SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

---

**Note:** Instead of going through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to the limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations is also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

---

---

**Note:** Flash APIs after ESP-IDF v4.0 are no longer **atomic**. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

---

---

**Note:** Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

---

### Support for Features of Flash Chips

**Quad/Dual Mode Chips** Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on the following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

---

**Note:** Only when one flash series listed above is supported by ESP32-S2, this flash series is supported by the chip driver by default. You can use `Component config > SPI Flash driver > Auto-detect flash chips` in `menuconfig` to enable/disable a flash series.

---

### Optional Features

**Optional Features for Flash** Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High Performance Mode of QSPI Flash Chips*
- *32-bit Address Support of QSPI Flash Chips*
- *OPI Flash Support*

---

**Note:** When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
  - If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.
- 

**Attention:** This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own bought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

**Auto Suspend & Resume** This feature is only supported on ESP32-S3, ESP32-C2, ESP32-C3, ESP32-C6, ESP32-H2 for now.

The support for ESP32-P4 may be added in the future.

**Flash Unique ID** This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

**High Performance Mode of QSPI Flash Chips** This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2, ESP32-P4 may be added in the future.

---

**Note:** This section is provided for QSPI flash chips. Octal flash used on ESP-chips support High performance mode by default so far, please refer to the [OPI Flash Support](#) for the list of supported octal flash chips.

---

**32-bit Address Support of QSPI Flash Chips** This feature is supported on all Espressif chips (see restrictions to application below).

---

**Note:** This section is provided for QSPI flash chips. The 32-bit address support of Octal Flash chips are considered as part of the Octal flash support. Please refer to the [OPI Flash Support](#) for the list of supported octal flash chips.

---

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 32 MBytes), flash uses a 32-bits address to address memory region higher than 16 MBytes. Unfortunately, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

### Restrictions

---

**Important:** Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system.

Mapping data/instructions to 32-bit physical address space (so as to be accessed by the CPU) needs the support of MMU. However ESP32-S2 doesn't support this feature. Only ESP32-S3 and ESP32-P4 supports this up to now.

---

**OPI Flash Support** This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- Flash unique ID - means that flash supports its unique 64-bit ID.

If you want to use these features, please ensure both ESP32-S2 and ALL flash chips in your product support these features. For more details, refer to [Optional Features for Flash](#).

You may also customise your own flash chip driver. See [Overriding Default Chip Drivers](#) for more details.

**Warning:** Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers** During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

### Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g., `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
  - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
  - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
  - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

---

#### Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.

1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASHS_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example [storage/custom\\_flash\\_driver](#).

4. Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:

```
idf_component_register(SRCS "spi_flash_chip_drivers.c"
                      "spi_flash_chip_mychip.c" # modify as needed
                      REQUIRES hal
                      PRIV_REQUIRES spi_flash
                      LDFRAGMENTS linker.lf)
idf_component_add_link_dependency(FROM spi_flash)
```

- An example of this component `CMakeLists.txt` can be found in [storage/custom\\_flash\\_driver/components/custom\\_chip\\_driver/CMakeLists.txt](#)
5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.
  6. Build your project, and you will see the new flash driver is used.

**Example** See also [storage/custom\\_flash\\_driver](#).

### Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This also detects the chip type, and influence the following operations.

**Note:** Multiple flash chips can be attached to the same bus now.

## SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the "main" SPI flash chip in favour of *partition-specific functions*.

## SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

## Concurrency Constraints for Flash on SPI1

### Concurrency Constraints for Flash on SPI1

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-S2, the config options `CONFIG_SPIRAM_XIP_FROM_PSRAM` (disabled by default) allows the cache to read/write PSRAM concurrently with SPI1 operations. See *XIP from PSRAM Feature* for more details.

If these options are disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see *When the Caches Are Disabled*. These constraints will cause more IRAM/DRAM usages.

**When the Caches Are Disabled** Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

---

**Note:** When `CONFIG_SPIRAM_XIP_FROM_PSRAM` is enabled, these APIs will not disable the caches.

---

The way that these APIs disable the caches also disables non-IRAM-safe interrupts. These will be restored until the Flash operation completes.

See also *OS Functions* and *SPI Bus Lock*.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g., IRAM, DRAM) and flash cache, please refer to the *application memory layout* documentation.

**IRAM-Safe Interrupt Handlers** For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the *interrupt handler is registered*.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See [How to Place Code in IRAM](#).

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

---

**Note:** When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both TAG and format string are placed into DRAM in that case.

---

**Non-IRAM-Safe Interrupt Handlers** If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users will not see the corresponding hardware event happening.

**XIP from PSRAM Feature** If `CONFIG_SPIRAM_XIP_FROM_PSRAM` is enabled, the flash `.text` sections (used for instructions) and the flash `.rodata` sections (used for read only data) will be placed in PSRAM.

The corresponding virtual memory range will be mapped to PSRAM.

If both of the above options are enabled, the Cache won't be disabled during an SPI1 Flash operation. You don't need to make sure ISRs, ISR callbacks and involved data are placed in internal RAM.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) causes significant influence to the whole system. See [Concurrency Constraints for Flash on SPI1](#) for more details.

## SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

## Memory Mapping API

ESP32-S2 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when [flash encryption](#) is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `spi_flash_mmap.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It adjusts the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

---

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

---

## SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g., lock, delay) in different stages (1st/2nd boot, or the app).

**Host Driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-S2 memory-spi functionalities. However, due to the speed limitations of ESP32-S2, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

## OS Functions

## SPI Features

## SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock disables the cache before device operations start, and enables it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver has not supported SPI1 bus. Only the SPI Flash driver can attach to the bus.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

Currently the OS function layer provides entries of a lock and delay.

The lock (see *SPI Bus Lock*) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device does not have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option `CONFIG_ESP_TASK_WDT_PANIC` is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It is pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
  - Increase `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` or decrease `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` in menuconfig.
  - You can also increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.
2. Please be aware of the consequences of enabling the `CONFIG_ESP_TASK_WDT_PANIC` option when doing long-running SPI flash operations which triggers the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.
3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

## Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation:

- In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation.
- In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

**SPI Flash API ESP-IDF Version vs Chip-ROM Version** There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

## Feature Supported by ESP-IDF but Not in Chip-ROM

- Octal Flash chip support. See [OPI Flash Support](#) for details.
- 32-bit-address support for GD25Q256. Note this feature is an optional feature, please do read [32-bit Address Support of QSPI Flash Chips](#) for details.
- TH Flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`.
- `CONFIG_SPI_FLASH_VERIFY_WRITE`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option prints the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option checks if you are writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.
- `CONFIG_SPI_FLASH_AUTO_SUSPEND`, enabling this option to automatically suspend / resume a long Flash operation when short Flash operation happens. Note this feature is an optional feature, please do read [Auto Suspend & Resume](#) for more limitations.

## Bugfixes Introduced in ESP-IDF but Not in Chip-ROM

- Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cfd5cf684567fbd6fd9e)
- Fixed issue that only 4MB virtual address ranges can be mapped to read-only data on Flash.

## API Reference - SPI Flash

### Header File

- `components/spi_flash/include/esp_flash_spi_init.h`
- This header file can be included with:

```
#include "esp_flash_spi_init.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

### Functions

`esp_err_t spi_bus_add_flash_device` (`esp_flash_t **out_chip`, const `esp_flash_spi_device_config_t *config`)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

#### Parameters

- **out\_chip** -- Pointer to hold the initialized chip.
- **config** -- Configuration of the chips to initialize.

#### Returns

- `ESP_ERR_INVALID_ARG`: `out_chip` is `NULL`, or some field in the `config` is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

`esp_err_t spi_bus_remove_flash_device` (`esp_flash_t *chip`)

Remove a SPI Flash device from the SPI bus.

**Parameters** **chip** -- The flash device to remove.

#### Returns

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

### Structures

struct `esp_flash_spi_device_config_t`

Configurations for the SPI Flash to init.

#### Public Members

`spi_host_device_t` **host\_id**

Bus to use.

int **cs\_io\_num**

GPIO pin to output the CS signal.

`esp_flash_io_mode_t` **io\_mode**

IO mode to read from the Flash.

enum *esp\_flash\_speed\_s* **speed**

Speed of the Flash clock. Replaced by `freq_mhz`.

int **input\_delay\_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs\_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq\_mhz**

The frequency of flash chip(MHZ)

### Header File

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

### Functions

*esp\_err\_t* **esp\_flash\_init** (*esp\_flash\_t* \*chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

---

**Note:** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

---

---

**Note:** If the `chip->drv` pointer is NULL, `chip chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

---

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp\_flash\_chip\_driver\_initialized** (const *esp\_flash\_t* \*chip)

Check if appropriate chip driver is set.

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** true if set, otherwise false.

*esp\_err\_t* **esp\_flash\_read\_id** (*esp\_flash\_t* \*chip, uint32\_t \*out\_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_id** -- [out] Pointer to receive ID value.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_size** (*esp\_flash\_t* \*chip, uint32\_t \*out\_size)

Detect flash size based on flash ID.

---

**Note:** 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

- a. The `out_size` returned only stands for The `out_size` stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.
- 

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_size** -- [out] Detected size in bytes, standing for the size in the binary image header.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_physical\_size** (*esp\_flash\_t* \*chip, uint32\_t \*flash\_size)

Detect flash size based on flash ID.

---

**Note:** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash\_size** -- [out] Detected size in bytes.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read\_unique\_chip\_id** (*esp\_flash\_t* \*chip, uint64\_t \*out\_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

---

**Note:** This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out\_id** -- [out] Pointer to receive unique ID value.

**Returns**

- ESP\_OK on success, or a flash error code if operation failed.
- ESP\_ERR\_NOT\_SUPPORTED if the chip doesn't support read id.

*esp\_err\_t* **esp\_flash\_erase\_chip** (*esp\_flash\_t* \*chip)

Erase flash chip contents.

**Parameters** **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if a read-only partition is present.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_erase\_region** (*esp\_flash\_t* \*chip, uint32\_t start, uint32\_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP\_ERR\_INVALID\_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **start** -- Address to start erasing flash. Must be sector aligned.
- **len** -- Length of region to erase. Must also be sector aligned.

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP\_ERR\_NOT\_ALLOWED if the address range (`start + len`) overlaps with a read-only partition address space
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool \*write\_protected)

Read if the entire chip is write protected.

---

**Note:** A correct result for this flag depends on the SPI flash chip model and `chip_drv` in use (via the `chip->drv` field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **write\_protected** -- [out] Pointer to boolean, set to the value of the write protect flag.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool write\_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **write\_protect** -- Boolean value for the write protect flag

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protectable\_regions** (const *esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*\*out\_regions, uint32\_t \*out\_num\_regions)

Read the list of individually protectable regions of this SPI flash chip.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_regions** -- [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out\_num\_regions** -- [out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool \*out\_protected)

Detect if a region of the SPI flash chip is protected.

---

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **out\_protected** -- [out] Pointer to a flag which is set based on the protected status for this region.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool protect)

Update the protected status for a region of the SPI flash chip.

---

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection

is enabled for the entire chip.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **protect** -- Write protection flag to set.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read** (*esp\_flash\_t* \*chip, void \*buffer, uint32\_t address, uint32\_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

---

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

---

#### Parameters

- **chip** -- Pointer to identify flash chip. If `NULL`, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **buffer** -- Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** -- Address on flash to read from. Must be less than `chip->size` field.
- **length** -- Length (in bytes) of data to read.

#### Returns

- `ESP_OK`: success
- `ESP_ERR_NO_MEM`: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write** (*esp\_flash\_t* \*chip, const void \*buffer, uint32\_t address, uint32\_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

#### Parameters

- **chip** -- Pointer to identify flash chip. If `NULL`, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **address** -- Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** -- Length (in bytes) of data to write.

#### Returns

- `ESP_OK` on success
- `ESP_FAIL`, bad write, this will be detected only when `CONFIG_SPI_FLASH_VERIFY_WRITE` is enabled

- `ESP_ERR_NOT_SUPPORTED` if the chip is not able to perform the operation. This is indicated by `WREN = 1` after the command is sent.
- `ESP_ERR_NOT_ALLOWED` if the address range (`address - address + length`) overlaps with a read-only partition address space
- Other flash error code if operation failed.

`esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)`

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

---

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** -- Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write.
- **length** -- Length (in bytes) of data to write. 16 byte aligned.

#### Returns

- `ESP_OK`: on success
- `ESP_FAIL`: bad write, this will be detected only when `CONFIG_SPI_FLASH_VERIFY_WRITE` is enabled
- `ESP_ERR_NOT_SUPPORTED`: encrypted write not supported for this chip.
- `ESP_ERR_INVALID_ARG`: Either the address, buffer or length is invalid.
- `ESP_ERR_NOT_ALLOWED` if the address range (`address - address + length`) overlaps with a read-only partition address space

`esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)`

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

#### Parameters

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** -- Address on flash to read from.
- **out\_buffer** -- Pointer to a buffer for the data to read to.
- **length** -- Length (in bytes) of data to read.

#### Returns

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: encrypted read not supported for this chip.

static inline bool `esp_flash_is_quad_mode` (const `esp_flash_t` \*chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** true if flash works in quad mode, otherwise false

## Structures

struct `esp_flash_region_t`

Structure for describing a region of flash.

## Public Members

`uint32_t offset`

Start address of this region.

`uint32_t size`

Size of the region.

struct `esp_flash_os_functions_t`

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

`esp_err_t (*start)(void *arg)`

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

`esp_err_t (*end)(void *arg)`

Called after completing any flash operation.

`esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)`

Called before any erase/write operations to check whether the region is limited by the OS

`esp_err_t (*delay_us)(void *arg, uint32_t us)`

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

`void (*get_temp_buffer)(void *arg, size_t request_size, size_t *out_size)`

Called for get temp buffer when buffer from application cannot be directly read into/write from.

`void (*release_temp_buffer)(void *arg, void *temp_buf)`

Called for release temp buffer.

`esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)`

Yield to other tasks. Called during erase operations.

**Return** ESP\_OK means yield needs to be called (got an event to handle), while ESP\_ERR\_TIMEOUT means skip yield.

`esp_err_t (*yield)(void *arg, uint32_t *out_status)`

Yield to other tasks. Called during erase operations.

`int64_t (*get_system_time)(void *arg)`

Called for get system time.

`void (*set_flash_op_status)(uint32_t op_status)`

Call to set flash operation status

struct **esp\_flash\_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

*spi\_flash\_host\_inst\_t* \***host**

Pointer to hardware-specific "host\_driver" structure. Must be initialized before used.

const *spi\_flash\_chip\_t* \***chip\_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const *esp\_flash\_os\_functions\_t* \***os\_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void \***os\_func\_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

*esp\_flash\_io\_mode\_t* **read\_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32\_t **size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

uint32\_t **chip\_id**

Detected chip id.

uint32\_t **busy**

This flag is used to verify chip's status.

uint32\_t **hpm\_dummy\_ena**

This flag is used to verify whether flash works under HPM status.

uint32\_t **reserved\_flags**

reserved.

### Macros

**SPI\_FLASH\_YIELD\_REQ\_YIELD**

**SPI\_FLASH\_YIELD\_REQ\_SUSPEND**

**SPI\_FLASH\_YIELD\_STA\_RESUME**

**SPI\_FLASH\_OS\_IS\_ERASING\_STATUS\_FLAG**

## Type Definitions

typedef struct *spi\_flash\_chip\_t* **spi\_flash\_chip\_t**

## Header File

- `components/spi_flash/include/spi_flash_mmap.h`
- This header file can be included with:

```
#include "spi_flash_mmap.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

## Functions

*esp\_err\_t* **spi\_flash\_mmap** (*size\_t* src\_addr, *size\_t* size, *spi\_flash\_mmap\_memory\_t* memory, const void \*\*out\_ptr, *spi\_flash\_mmap\_handle\_t* \*out\_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if `mmap/munmap` are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use `spi_flash_mmap_dump()` function.

### Parameters

- **src\_addr** -- Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (`SPI_FLASH_MMU_PAGE_SIZE`)
- **size** -- Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** -- Address space where the region should be mapped (data or instruction)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region
- **out\_handle** -- [out] Output, handle which should be used for `spi_flash_munmap` call

**Returns** `ESP_OK` on success, `ESP_ERR_NO_MEM` if pages can not be allocated

*esp\_err\_t* **spi\_flash\_mmap\_pages** (const int \*pages, *size\_t* page\_count, *spi\_flash\_mmap\_memory\_t* memory, const void \*\*out\_ptr, *spi\_flash\_mmap\_handle\_t* \*out\_handle)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as `spi_flash_mmap()` but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

### Parameters

- **pages** -- An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page\_count** -- Number of entries in the pages array
- **memory** -- Address space where the region should be mapped (instruction or data)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region

- **out\_handle** -- [out] Output, handle which should be used for spi\_flash\_munmap call

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if pages can not be allocated
- ESP\_ERR\_INVALID\_ARG if pagecount is zero or pages array is not in internal memory

void **spi\_flash\_munmap** (*spi\_flash\_mmap\_handle\_t* handle)

Release region previously obtained using spi\_flash\_mmap.

---

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

---

**Parameters handle** -- Handle obtained from spi\_flash\_mmap

void **spi\_flash\_mmap\_dump** (void)

Display information about mapped regions.

This function lists handles obtained using spi\_flash\_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32\_t **spi\_flash\_mmap\_get\_free\_pages** (*spi\_flash\_mmap\_memory\_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi\_flash\_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters memory** -- memory type of MMU table free page

**Returns** number of free pages which can be mmaped

size\_t **spi\_flash\_cache2phys** (const void \*cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi\_flash\_mmap(), any address in memory mapped flash space can be looked up.

**Parameters cached** -- Pointer to flashed cached memory.

**Returns**

- SPI\_FLASH\_CACHE2PHYS\_FAIL If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void \***spi\_flash\_phys2cache** (size\_t phys\_offs, *spi\_flash\_mmap\_memory\_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi\_flash\_mmap(), any address in flash can be looked up.

---

**Note:** Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

---

---

**Note:** This function doesn't impose any alignment constraints, but if memory argument is SPI\_FLASH\_MMAP\_INST and phys\_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

---

**Parameters**

- **phys\_offs** -- Physical offset in flash memory to look up.
- **memory** -- Address space type to look up a flash cache address mapping for (instruction or data)

**Returns**

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to **phys\_offs**.

**Macros****ESP\_ERR\_FLASH\_OP\_FAIL**

This file contains `spi_flash_mmap_xx` APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

**ESP\_ERR\_FLASH\_OP\_TIMEOUT****SPI\_FLASH\_SEC\_SIZE**

SPI Flash sector size

**SPI\_FLASH\_MMU\_PAGE\_SIZE**

Flash cache MMU mapping page size

**SPI\_FLASH\_CACHE2PHYS\_FAIL****Type Definitions**

```
typedef uint32_t spi_flash_mmap_handle_t
```

Opaque handle for memory region obtained from `spi_flash_mmap`.

**Enumerations**

```
enum spi_flash_mmap_memory_t
```

Enumeration which specifies memory space requested in an `mmap` call.

*Values:*

enumerator **SPI\_FLASH\_MMAP\_DATA**

map to data memory, allows byte-aligned access

enumerator **SPI\_FLASH\_MMAP\_INST**

map to instruction memory, allows only 4-byte-aligned access

**Header File**

- `components/hal/include/hal/spi_flash_types.h`
- This header file can be included with:

```
#include "hal/spi_flash_types.h"
```

**Structures**

```
struct spi_flash_trans_t
```

Definition of a common transaction. Also holds the return value.

**Public Members****uint8\_t reserved**

Reserved, must be 0.

**uint8\_t mosi\_len**

Output data length, in bytes.

**uint8\_t miso\_len**

Input data length, in bytes.

**uint8\_t address\_bitlen**

Length of address in bits, set to 0 if command does not need an address.

**uint32\_t address**

Address to perform operation on.

**const uint8\_t \*mosi\_data**

Output data to slave.

**uint8\_t \*miso\_data**

[out] Input data from slave, little endian

**uint32\_t flags**

Flags for this transaction. Set to 0 for now.

**uint16\_t command**

Command to send.

**uint8\_t dummy\_bitlen**

Basic dummy bits to use.

**uint32\_t io\_mode**Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.**struct spi\_flash\_sus\_cmd\_conf**

Configuration structure for the flash chip suspend feature.

**Public Members****uint32\_t sus\_mask**

SUS/SUS1/SUS2 bit in flash register.

**uint32\_t cmd\_rdsr**

Read flash status register(2) command.

**uint32\_t sus\_cmd**

Flash suspend command.

uint32\_t **res\_cmd**

Flash resume command.

uint32\_t **reserved**

Reserved, set to 0.

struct **spi\_flash\_encryption\_t**

Structure for flash encryption operations.

### Public Members

void (**\*flash\_encryption\_enable**)(void)

Enable the flash encryption.

void (**\*flash\_encryption\_disable**)(void)

Disable the flash encryption.

void (**\*flash\_encryption\_data\_prepare**)(uint32\_t address, const uint32\_t \*buffer, uint32\_t size)

Prepare flash encryption before operation.

---

**Note:** address and buffer must be 8-word aligned.

---

**Param address** The destination address in flash for the write operation.

**Param buffer** Data for programming

**Param size** Size to program.

void (**\*flash\_encryption\_done**)(void)

flash data encryption operation is done.

void (**\*flash\_encryption\_destroy**)(void)

Destroy encrypted result

bool (**\*flash\_encryption\_check**)(uint32\_t address, uint32\_t length)

Check if is qualified to encrypt the buffer

**Param address** the address of written flash partition.

**Param length** Buffer size.

struct **spi\_flash\_host\_inst\_t**

SPI Flash Host driver instance

### Public Members

const struct *spi\_flash\_host\_driver\_s* \***driver**

Pointer to the implementation function table.

struct **spi\_flash\_host\_driver\_s**

Host driver configuration and context structure.

## Public Members

*esp\_err\_t* (\***dev\_config**)(*spi\_flash\_host\_inst\_t* \*host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

*esp\_err\_t* (\***common\_command**)(*spi\_flash\_host\_inst\_t* \*host, *spi\_flash\_trans\_t* \*t)

Send an user-defined spi transaction to the device.

*esp\_err\_t* (\***read\_id**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t \*id)

Read flash ID.

void (\***erase\_chip**)(*spi\_flash\_host\_inst\_t* \*host)

Erase whole flash chip.

void (\***erase\_sector**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific sector by its start address.

void (\***erase\_block**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific block by its start address.

*esp\_err\_t* (\***read\_status**)(*spi\_flash\_host\_inst\_t* \*host, uint8\_t \*out\_sr)

Read the status of the flash chip.

*esp\_err\_t* (\***set\_write\_protect**)(*spi\_flash\_host\_inst\_t* \*host, bool wp)

Disable write protection.

void (\***program\_page**)(*spi\_flash\_host\_inst\_t* \*host, const void \*buffer, uint32\_t address, uint32\_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (\***supports\_direct\_write**)(*spi\_flash\_host\_inst\_t* \*host, const void \*p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (\***write\_data\_slicer**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to write

**Param len** Length request to write

**Param align\_addr** Output of the aligned address to write to

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually written in one `program_page` call

*esp\_err\_t* (\***read**)(*spi\_flash\_host\_inst\_t* \*host, void \*buffer, uint32\_t address, uint32\_t read\_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (\***supports\_direct\_read**)(*spi\_flash\_host\_inst\_t* \*host, const void \*p)

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

`int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)`

Slicer for read data. The `read` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to read

**Param len** Length request to read

**Param align\_addr** Output of the aligned address to read

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually read in one `read` call

`uint32_t (*host_status)(spi_flash_host_inst_t *host)`

Check the host status, 0:busy, 1:idle, 2:suspended.

`esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)`

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

`void (*poll_cmd_done)(spi_flash_host_inst_t *host)`

Internal use, poll the HW until the last operation is done.

`esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)`

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

`void (*check_suspend)(spi_flash_host_inst_t *host)`

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

`void (*resume)(spi_flash_host_inst_t *host)`

Resume flash from suspend manually

`void (*suspend)(spi_flash_host_inst_t *host)`

Set flash in suspend status manually

`esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)`

Suspend feature setup for setting cmd and status register mask.

## Macros

**SPI\_FLASH\_TRANS\_FLAG\_CMD16**

Send command of 16 bits.

**SPI\_FLASH\_TRANS\_FLAG\_IGNORE\_BASEIO**

Not applying the basic io mode configuration for this transaction.

**SPI\_FLASH\_TRANS\_FLAG\_BYTE\_SWAP**

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

**SPI\_FLASH\_TRANS\_FLAG\_PE\_CMD**

Indicates that this transaction is to erase/program flash chip.

**SPI\_FLASH\_CONFIG\_CONF\_BITS**

OR the `io_mode` with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

**SPI\_FLASH\_OPI\_FLAG**

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

**SPI\_FLASH\_READ\_MODE\_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

**Type Definitions**

```
typedef enum esp_flash_speed_s esp_flash_speed_t
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

```
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t
```

**Enumerations**

```
enum esp_flash_speed_s
```

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

*Values:*

```
enumerator ESP_FLASH_5MHZ
```

The flash runs under 5MHz.

```
enumerator ESP_FLASH_10MHZ
```

The flash runs under 10MHz.

```
enumerator ESP_FLASH_20MHZ
```

The flash runs under 20MHz.

```
enumerator ESP_FLASH_26MHZ
```

The flash runs under 26MHz.

```
enumerator ESP_FLASH_40MHZ
```

The flash runs under 40MHz.

```
enumerator ESP_FLASH_80MHZ
```

The flash runs under 80MHz.

enumerator **ESP\_FLASH\_120MHZ**

The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP\_FLASH\_SPEED\_MAX**

The maximum frequency supported by the host is ESP\_FLASH\_SPEED\_MAX-1.

enum **esp\_flash\_io\_mode\_t**

Mode used for reading from SPI flash.

*Values:*

enumerator **SPI\_FLASH\_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI\_FLASH\_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI\_FLASH\_DOUT**

Data read using dual I/O.

enumerator **SPI\_FLASH\_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI\_FLASH\_QOUT**

Data read using quad I/O.

enumerator **SPI\_FLASH\_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI\_FLASH\_OPI\_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI\_FLASH\_OPI\_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI\_FLASH\_READ\_MODE\_MAX**

The fastest io mode supported by the host is ESP\_FLASH\_READ\_MODE\_MAX-1.

### Header File

- [components/hal/include/hal/esp\\_flash\\_err.h](#)
- This header file can be included with:

```
#include "hal/esp_flash_err.h"
```

### Macros

**ESP\_ERR\_FLASH\_NOT\_INITIALISED**

esp\_flash\_chip\_t structure not correctly initialised by esp\_flash\_init().

**ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST**

Requested operation isn't supported via this host SPI bus (chip->spi field).

**ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP**

Requested operation isn't supported by this model of SPI flash chip.

**ESP\_ERR\_FLASH\_PROTECTED**

Write operation failed due to chip's write protection being enabled.

**Enumerations**

enum [anonymous]

Values:

enumerator **ESP\_ERR\_FLASH\_SIZE\_NOT\_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP\_ERR\_FLASH\_NO\_RESPONSE**

Chip did not respond to the command, or timed out.

**Header File**

- [components/spi\\_flash/include/esp\\_spi\\_flash\\_counters.h](#)
- This header file can be included with:

```
#include "esp_spi_flash_counters.h"
```

- This header file is a part of the API provided by the `spi_flash` component. To declare that your component depends on `spi_flash`, add the following to your `CMakeLists.txt`:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

**Functions**

void **esp\_flash\_reset\_counters** (void)

Reset SPI flash operation counters.

void **spi\_flash\_reset\_counters** (void)

void **esp\_flash\_dump\_counters** (FILE \*stream)

Print SPI flash operation counters.

void **spi\_flash\_dump\_counters** (void)

const *esp\_flash\_counters\_t* \***esp\_flash\_get\_counters** (void)

Return current SPI flash operation counters.

**Returns** pointer to the *esp\_flash\_counters\_t* structure holding values of the operation counters

const *spi\_flash\_counters\_t* \***spi\_flash\_get\_counters** (void)

## Structures

struct **esp\_flash\_counter\_t**

Structure holding statistics for one type of operation

### Public Members

uint32\_t **count**

number of times operation was executed

uint32\_t **time**

total time taken, in microseconds

uint32\_t **bytes**

total number of bytes

struct **esp\_flash\_counters\_t**

Structure for counters of flash actions

### Public Members

*esp\_flash\_counter\_t* **read**

counters for read action, like `esp_flash_read`

*esp\_flash\_counter\_t* **write**

counters for write action, like `esp_flash_write`

*esp\_flash\_counter\_t* **erase**

counters for erase action, like `esp_flash_erase`

## Type Definitions

typedef *esp\_flash\_counter\_t* **spi\_flash\_counter\_t**

typedef *esp\_flash\_counters\_t* **spi\_flash\_counters\_t**

## API Reference - Flash Encrypt

### Header File

- `components/bootloader_support/include/esp_flash_encrypt.h`
- This header file can be included with:

```
#include "esp_flash_encrypt.h"
```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

```
REQUIRES bootloader_support
```

or

`PRIV_REQUIRES bootloader_support`

### Functions

bool **esp\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH\_CRYPT\_CNT efuse has an odd number of bits set.

**Returns** true if flash encryption is enabled.

*esp\_err\_t* **esp\_flash\_encrypt\_check\_and\_update** (void)

bool **esp\_flash\_encrypt\_state** (void)

Returns the Flash Encryption state and prints it.

**Returns** True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp\_flash\_encrypt\_initialized\_once** (void)

Checks if the first initialization was done.

If the first initialization was done then FLASH\_CRYPT\_CNT != 0

**Returns** true - the first initialization was done false - the first initialization was NOT done

*esp\_err\_t* **esp\_flash\_encrypt\_init** (void)

The first initialization of Flash Encryption key and related eFuses.

**Returns** ESP\_OK if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_contents** (void)

Encrypts flash content.

**Returns** ESP\_OK if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_enable** (void)

Activates Flash encryption on the chip.

It burns FLASH\_CRYPT\_CNT eFuse based on the CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE option.

**Returns** ESP\_OK if all operations succeeded

bool **esp\_flash\_encrypt\_is\_write\_protected** (bool print\_error)

Returns True if the write protection of FLASH\_CRYPT\_CNT is set.

**Parameters** **print\_error** -- Print error if it is write protected

**Returns** true - if FLASH\_CRYPT\_CNT is write protected

*esp\_err\_t* **esp\_flash\_encrypt\_region** (uint32\_t src\_addr, size\_t data\_length)

Encrypt-in-place a block of flash sectors.

---

**Note:** This function resets RTC\_WDT between operations with sectors.

---

#### Parameters

- **src\_addr** -- Source offset in flash. Should be multiple of 4096 bytes.
- **data\_length** -- Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns** ESP\_OK if all operations succeeded, ESP\_ERR\_FLASH\_OP\_FAIL if SPI flash fails, ESP\_ERR\_FLASH\_OP\_TIMEOUT if flash times out.

void **esp\_flash\_write\_protect\_crypt\_cnt** (void)

Write protect FLASH\_CRYPT\_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

---

**Note:** On ESP32 V3 only, write protecting FLASH\_CRYPT\_CNT will also prevent disabling UART Download Mode. If both are wanted, call `esp_efuse_disable_rom_download_mode()` before calling this function.

---

*esp\_flash\_enc\_mode\_t* **esp\_get\_flash\_encryption\_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

#### Returns

void **esp\_flash\_encryption\_init\_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

---

**Note:** This function is called automatically during app startup, it doesn't need to be called from the app.

---

bool **esp\_flash\_encryption\_cfg\_verify\_release\_mode** (void)

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

#### Returns

- True - all eFuses are configured correctly
- False - not all eFuses are configured correctly.

void **esp\_flash\_encryption\_set\_release\_mode** (void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- "disable encrypt in dl mode"
- set FLASH\_CRYPT\_CNT efuse to max

### Enumerations

enum **esp\_flash\_enc\_mode\_t**

*Values:*

enumerator **ESP\_FLASH\_ENC\_MODE\_DISABLED**

enumerator **ESP\_FLASH\_ENC\_MODE\_DEVELOPMENT**

enumerator `ESP_FLASH_ENC_MODE_RELEASE`

## 2.5.20 SPI Master Driver

SPI Master driver is a program that controls ESP32-S2's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a master.

For more hardware information about the GP-SPI peripheral(s), see [ESP32-S2 Technical Reference Manual > SPI Controller \[PDF\]](#).

### Terminology

The terms used in relation to the SPI Master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32-S2 initiates SPI transmissions over the bus and acts as an SPI Master.
Device	SPI slave Device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in a daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. The oscillating signal generated by a Host keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for the data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for the data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
Assertion	The action of activating a line.
De-assertion	The action of returning the line back to inactive (back to idle) status.
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <b>launches</b> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <b>latches in</b> the signal.

### Driver Features

The SPI Master driver governs the communications between Hosts and Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI Bus Lock*.

**Warning:** The SPI Master driver allows multiple Devices to be connected on a same SPI bus (sharing a single ESP32-S2 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread-safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral-related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Command	In this phase, a command (0-16 bit) is written to the bus by the Host.
Address	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
Dummy	This phase is configurable and is used to meet the timing requirements.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, Device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the Read and Write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the Read and Write phases are not simultaneous (one direction at a time). The lengths of the Write and Read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The Command and Address phases are optional, as not every SPI Device requires a command and/or address. This is reflected in the Device's configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no Command or Address phase will occur.

The Read and Write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the Read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the Write phase is skipped.

The driver supports two types of transactions: interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device*.

**Interrupt Transactions** Interrupt transactions blocks the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver automatically handles them one by one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions are complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1  $\mu$ s to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see *Bus Acquiring*.

**Transaction Line Mode** Supported line modes for ESP32-S2 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO Setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DUAL	SPI_COM-MON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DUAL SPI_TRANS_MULTILINE_ADDR	SPI_COM-MON_BUSFLAG_DUAL
Quad Output	1	1	4	SPI_TRANS_MODE_QUAD	SPI_COM-MON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QUAD SPI_TRANS_MULTILINE_ADDR	SPI_COM-MON_BUSFLAG_QUAD
Octal Output	1	1	8	SPI_TRANS_MODE_OCTAL	SPI_COM-MON_BUSFLAG_OCTAL
OPI	8	8	8	SPI_TRANS_MODE_OCTAL SPI_TRANS_MULTILINE_CMD SPI_TRANS_MULTILINE_ADDR	SPI_COM-MON_BUSFLAG_OCTAL

**Command and Address Phases** During the Command and Address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the Command and Address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the Command and Address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the Command and Address phase need to have the same number of lines as the data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device is read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory (MALLOC\_CAP\_DMA), see *DMA-Capable Memory*.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data line to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other Devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

### Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the Device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To remove a certain Device from the bus, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver from the bus, make sure no more devices are attached and call `spi_bus_free()`.

The example code for the SPI Master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

**Transactions with Integers Other than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB is first used in rare cases. If a value of fewer than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional "random" bits, so the reading must be performed correctly.

On top of that, ESP32-S2 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has a size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transaction (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

**GPIO Matrix and IO\_MUX** Most of the chip's peripheral signals have a direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via the GPIO matrix will behave the same compared to routing them via IOMUX.

The IO\_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0 <sup>1</sup>	10
SCLK	12
MISO	13
MOSI	11
QUADWP	14
QUADHD	9

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

<sup>1</sup> Only the first Device attached to the bus can use the CS0 pin.

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transactions.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2  $\mu$ s per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2  $\mu$ s, but the transaction length is limited to 64 bytes for both write and read.

The typical transaction duration for one byte of data is given below.

- Interrupt Transaction via DMA: 23  $\mu$ s.
- Interrupt Transaction via CPU: 22  $\mu$ s.
- Polling Transaction via DMA: 9  $\mu$ s.
- Polling Transaction via CPU: 8  $\mu$ s.

Note that these data are tested with `CONFIG_SPI_MASTER_ISR_IN_IRAM` enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

**SPI Clock Frequency** The clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to `spi_clock_source_t` to know the supported clock sources.

By default driver sets `spi_device_handle_t::cfg::clock_source` to `SPI_CLK_SRC_DEFAULT`. This usually stands for the highest frequency among GPSPI clock sources. Its value is different among chips.

The actual clock frequency of a Device may not be exactly equal to the number you set, it is re-calculated by the driver to the nearest hardware-compatible number, and not larger than the clock frequency of the clock source. You can call `spi_device_get_actual_freq()` to know the actual frequency computed by the driver.

The theoretical maximum transfer speed of the Write or Read phase can be calculated according to the table below:

Line Width of Write/Read phase	Speed (Bps)
1-Line	<i>SPI Frequency / 8</i>
2-Line	<i>SPI Frequency / 4</i>
4-Line	<i>SPI Frequency / 2</i>
8-Line	<i>SPI Frequency</i>

The transfer speed calculation of other phases (Command, Address, Dummy) is similar.

**Cache Missing** The default config puts only the ISR into the IRAM. Other SPI-related functions, including the driver itself and the callback, might suffer from cache misses and need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache missing.

---

**Note:** SPI driver implementation is based on FreeRTOS APIs, to use `CONFIG_SPI_MASTER_IN_IRAM`, you should not enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`.

---

For an interrupt transaction, the overall cost is  $20+8n/F_{\text{spi}}[\text{MHz}]$  [ $\mu\text{s}$ ] for  $n$  bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/F_{\text{spi}})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval ( $\mu\text{s}$ )	Transaction Length (bytes)	Total Time ( $\mu\text{s}$ )	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of the transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations are handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache missing. For more details, see [IRAM-Safe Interrupt Handlers](#).

### Application Example

The code example for using the SPI master half duplex mode to read/write an AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi\\_master/hd\\_eeprom](#) directory of ESP-IDF examples.

The code example for using the SPI master full duplex mode to drive a SPI\_LCD (e.g. ST7789V or ILI9341) can be found in the [peripherals/spi\\_master/lcd](#) directory of ESP-IDF examples.

## API Reference - SPI Common

### Header File

- This header file can be included with:

```
#include "hal/spi_types.h"
```

### Structures

struct `spi_line_mode_t`

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

#### Public Members

uint8\_t `cmd_lines`

The line width of command phase, e.g. 2-line-cmd-phase.

uint8\_t `addr_lines`

The line width of address phase, e.g. 1-line-addr-phase.

uint8\_t `data_lines`

The line width of data phase, e.g. 4-line-data-phase.

## Type Definitions

typedef *soc\_periph\_spi\_clk\_src\_t* **spi\_clock\_source\_t**

Type of SPI clock source.

## Enumerations

enum **spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

*Values:*

enumerator **SPI1\_HOST**

SPI1.

enumerator **SPI2\_HOST**

SPI2.

enumerator **SPI3\_HOST**

SPI3.

enumerator **SPI\_HOST\_MAX**

invalid host value

enum **spi\_event\_t**

SPI Events.

*Values:*

enumerator **SPI\_EV\_BUF\_TX**

The buffer has sent data to master.

enumerator **SPI\_EV\_BUF\_RX**

The buffer has received data from master.

enumerator **SPI\_EV\_SEND\_DMA\_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI\_EV\_RECV\_DMA\_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI\_EV\_CMD9**

Received CMD9 from master.

enumerator **SPI\_EV\_CMDA**

Received CMDA from master.

enumerator **SPI\_EV\_TRANS**

A transaction has done.

enum **spi\_command\_t**

SPI command.

*Values:*

enumerator **SPI\_CMD\_HD\_WRBUF**

enumerator **SPI\_CMD\_HD\_RDBUF**

enumerator **SPI\_CMD\_HD\_WRDMA**

enumerator **SPI\_CMD\_HD\_RDDMA**

enumerator **SPI\_CMD\_HD\_SEG\_END**

enumerator **SPI\_CMD\_HD\_EN\_QPI**

enumerator **SPI\_CMD\_HD\_WR\_END**

enumerator **SPI\_CMD\_HD\_INT0**

enumerator **SPI\_CMD\_HD\_INT1**

enumerator **SPI\_CMD\_HD\_INT2**

## Header File

PRIV_REQUIRES esp_driver_spi
```

## Functions

`esp_err_t spi_bus_initialize` (`spi_host_device_t` host\_id, const `spi_bus_config_t` \*bus\_config, `spi_dma_chan_t` dma\_chan)

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Parameters

- **host\_id** -- SPI peripheral that controls this bus
- **bus\_config** -- Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI\_DMA\_DISABLED limits the size of transactions.
  - Set to SPI\_DMA\_DISABLED if only the SPI flash uses this bus.
  - Set to SPI\_DMA\_CH\_AUTO to let the driver to allocate the DMA channel.

#### Returns

- ESP\_ERR\_INVALID\_ARG if configuration is invalid
- ESP\_ERR\_INVALID\_STATE if host already is in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* spi\_bus\_free(*spi\_host\_device\_t* host\_id)

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters** **host\_id** -- SPI peripheral to free

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if bus hasn't been initialized before, or not all devices on the bus are freed
- ESP\_OK on success

## Structures

struct **spi\_bus\_config\_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used. On ESP32, using GPIO matrix will bring about 25ns of input delay, which may cause incorrect read for >40MHz speeds.

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi\_bus\_config\_t* referring to these lines will be ignored and can thus safely be left uninitialized.

## Public Members

int **mosi\_io\_num**

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

int **data0\_io\_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso\_io\_num**

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

int **data1\_io\_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk\_io\_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp\_io\_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2\_io\_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd\_io\_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3\_io\_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4\_io\_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5\_io\_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6\_io\_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7\_io\_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max\_transfer\_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32\_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

*esp\_intr\_cpu\_affinity\_t* **isr\_cpu\_id**

Select cpu core to register SPI ISR.

**int intr\_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

**Macros****SPI\_MAX\_DMA\_LEN****SPI\_SWAP\_DATA\_TX** (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

**Parameters**

- **DATA** -- Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI\_SWAP\_DATA\_RX** (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

**Parameters**

- **DATA** -- Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON\_BUSFLAG\_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON\_BUSFLAG\_MASTER**

Initialize I/O in master mode.

**SPICOMMON\_BUSFLAG\_IOMUX\_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON\_BUSFLAG\_GPIO\_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_IO4\_IO7**

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON\_BUSFLAG\_OCTAL**

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```
enum spi_common_dma_t
```

SPI DMA channels.

*Values:*

```
enumerator SPI_DMA_DISABLED
```

Do not enable DMA for SPI.

```
enumerator SPI_DMA_CH_AUTO
```

Enable DMA, channel is automatically selected by driver.

**API Reference - SPI Master****Header File**

## Functions

*esp\_err\_t* **spi\_bus\_add\_device** (*spi\_host\_device\_t* host\_id, const *spi\_device\_interface\_config\_t* \*dev\_config, *spi\_device\_handle\_t* \*handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

There's no notable delay on chips other than ESP32.

---

**Note:** On ESP32, due to the delay of GPIO matrix, the maximum frequency SPI Master can correctly sample the slave's output is lower than the case using IOMUX. Typical maximum frequency communicating with an ideal slave without data output delay: 80MHz (IOMUX pins) and 26MHz (GPIO matrix pins). With the help of extra dummy cycles in half-duplex mode, the delay can be compensated by setting `input_delay_ns` in `dev_config` structure correctly.

---

### Parameters

- **host\_id** -- SPI peripheral to allocate device on
- **dev\_config** -- SPI interface protocol config for the device
- **handle** -- Pointer to variable to hold the device handle

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn't set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- `ESP_ERR_INVALID_STATE` if selected clock source is unavailable or spi bus not initialized
- `ESP_ERR_NOT_FOUND` if host doesn't have any free CS slots
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

**Parameters** **handle** -- Device handle to free

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if device already is freed
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not ac-

quired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size

- `ESP_ERR_TIMEOUT` if there was no room in the queue before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or reuse the buffers.

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_start** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Immediately start a polling transaction.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

---

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; currently only portMAX\_DELAY is supported.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid. This can happen if SPI\_TRANS\_CS\_KEEP\_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag SPI\_TRANS\_DMA\_BUFFER\_ALIGN\_MANUAL but tx or rx buffer not DMA-capable, or `addr&len` not align to cache line size
- ESP\_ERR\_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP\_ERR\_NO\_MEM if allocating DMA-capable temporary buffer failed
- ESP\_ERR\_INVALID\_STATE if previous transactions are not finished
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_polling\_end** (*spi\_device\_handle\_t* handle, TickType\_t ticks\_to\_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if the transaction cannot finish before `ticks_to_wait` expired
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_polling\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if the device cannot get control of the bus
- ESP\_ERR\_NO\_MEM if allocating DMA-capable temporary buffer failed
- ESP\_ERR\_INVALID\_STATE if previous transactions of same device are not finished
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_acquire\_bus** (*spi\_device\_handle\_t* device, TickType\_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

---

**Note:** The function will wait until all the existing transactions have been sent.

---

**Parameters**

- **device** -- The device to occupy the bus.

- **wait** -- Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX\_DELAY.

**Returns**

- ESP\_ERR\_INVALID\_ARG : `wait` is not set to portMAX\_DELAY.
- ESP\_OK : Success.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters** `dev` -- The device to release the bus.

*esp\_err\_t* **spi\_device\_get\_actual\_freq** (*spi\_device\_handle\_t* handle, int \*freq\_khz)

Calculate working frequency for specific device.

**Parameters**

- **handle** -- SPI device handle
- **freq\_khz** -- [out] output parameter to hold calculated frequency in kHz

**Returns**

- ESP\_ERR\_INVALID\_ARG : `handle` or `freq_khz` parameter is NULL
- ESP\_OK : Success

int **spi\_get\_actual\_clock** (int fapb, int hz, int duty\_cycle)

Calculate the working frequency that is most close to desired frequency.

**Parameters**

- **fapb** -- The frequency of apb clock, should be APB\_CLK\_FREQ.
- **hz** -- Desired working frequency
- **duty\_cycle** -- Duty cycle of the spi clock

**Returns** Actual working frequency that most fit.

void **spi\_get\_timing** (bool gpio\_is\_used, int input\_delay\_ns, int eff\_clk, int \*dummy\_o, int \*cycles\_remain\_o)

Calculate the timing settings of specified frequency and settings.

---

**Note:** If `**dummy_o*` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

---

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if iomux pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.
- **eff\_clk** -- Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy\_o** -- Address of dummy bits used output. Set to NULL if not needed.
- **cycles\_remain\_o** -- Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool gpio\_is\_used, int input\_delay\_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if native pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

*esp\_err\_t* **spi\_bus\_get\_max\_transaction\_len** (*spi\_host\_device\_t* host\_id, size\_t \*max\_bytes)

Get max length (in bytes) of one transaction.

**Parameters**

- **host\_id** -- SPI peripheral
- **max\_bytes** -- [out] Max length of one transaction, in bytes

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

**Structures**

struct **spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when SPI\_TRANS\_VARIABLE\_CMD is not used, otherwise ignored.

uint8\_t **address\_bits**

Default amount of bits in address phase (0-64), used when SPI\_TRANS\_VARIABLE\_ADDR is not used, otherwise ignored.

uint8\_t **dummy\_bits**

Amount of dummy bits to insert between address and data phase.

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

*spi\_clock\_source\_t* **clock\_source**

Select SPI clock source, SPI\_CLK\_SRC\_DEFAULT by default.

uint16\_t **duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16\_t **cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8\_t **cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int **clock\_speed\_hz**

SPI clock speed in Hz. Derived from `clock_source`.

**int input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

**int spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

**uint32\_t flags**

Bitwise OR of SPI\_DEVICE\_\* flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction\_cb\_t* pre\_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction\_cb\_t* post\_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members****uint32\_t flags**

Bitwise OR of SPI\_TRANS\_\* flags.

**uint16\_t cmd**

Command data, of which the length is set in the `command_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

**uint64\_t addr**

Address data, of which the length is set in the `address_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.**

Example: write 0x123400 and address\_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size\_t **length**

Total data length, in bits.

size\_t **rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void **\*user**

User-defined variable. Can be used to store eg transaction ID.

const void **\*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8\_t **tx\_data**[4]

If SPI\_TRANS\_USE\_TXDATA is set, data set here is sent directly from this variable.

void **\*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8\_t **rx\_data**[4]

If SPI\_TRANS\_USE\_RXDATA is set, data is received directly to this variable.

struct **spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI\_TRANS\_VARIABLE\_CMD\_ADR to use the bit length here.

## Public Members

struct *spi\_transaction\_t* **base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

uint8\_t **command\_bits**

The command length in this transaction, in bits.

uint8\_t **address\_bits**

The address length in this transaction, in bits.

uint8\_t **dummy\_bits**

The dummy length in this transaction, in bits.

## Macros

**SPI\_MASTER\_FREQ\_8M**

SPI common used frequency (in Hz)

---

**Note:** SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

---

**SPI\_MASTER\_FREQ\_9M**

8.89MHz

**SPI\_MASTER\_FREQ\_10M**

10MHz

**SPI\_MASTER\_FREQ\_11M**

11.43MHz

**SPI\_MASTER\_FREQ\_13M**

13.33MHz

**SPI\_MASTER\_FREQ\_16M**

16MHz

**SPI\_MASTER\_FREQ\_20M**

20MHz

**SPI\_MASTER\_FREQ\_26M**

26.67MHz

**SPI\_MASTER\_FREQ\_40M**

40MHz

**SPI\_MASTER\_FREQ\_80M**

80MHz

**SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK****SPI\_DEVICE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use `post_cb` to notify instead)

**SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into `rx_data` member of *spi\_transaction\_t* instead into memory at `rx_buffer`.

**SPI\_TRANS\_USE\_TXDATA**

Transmit `tx_data` member of *spi\_transaction\_t* instead of data at `tx_buffer`. Do not set `tx_buffer` when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by `SPI_MODE_DIO/SPI_MODE_QIO`.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the `command_bits` in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the `address_bits` in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the `dummy_bits` in *spi\_transaction\_ext\_t* rather than default value in *spi\_device\_interface\_config\_t*.

**SPI\_TRANS\_CS\_KEEP\_ACTIVE**

Keep CS active after data transfer.

**SPI\_TRANS\_MULTILINE\_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI\_TRANS\_MODE\_OCT**

Transmit/receive data in 8-bit mode.

**SPI\_TRANS\_MULTILINE\_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

**SPI\_TRANS\_DMA\_BUFFER\_ALIGN\_MANUAL**

By default driver will automatically re-alloc dma buffer if it doesn't meet hardware alignment or dma\_capable requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error ESP\_ERR\_INVALID\_ARG.

**Type Definitions**

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

**2.5.21 SPI Slave Driver**

SPI Slave driver is a program that controls ESP32-S2's General Purpose SPI (GP-SPI) peripheral(s) when it functions as a slave.

For more hardware information about the GP-SPI peripheral(s), see **ESP32-S2 Technical Reference Manual > SPI Controller** [\[PDF\]](#).

**Terminology**

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-S2 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <b>de-assertion</b> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <b>launches</b> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <b>latches in</b> the signal.

## Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 72 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

## SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see *Transaction Interval*.

---

## Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.

If transactions will be longer than 32 bytes, allow a DMA channel by setting the parameter `dma_chan` to the host device. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

## Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO\_MUX** Most of chip's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same compared to routing them via IO\_MUX.

The IO\_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0	10
SCLK	12
MISO	13
MOSI	11
QUADWP	14
QUADHD	9

## Speed and Timing Considerations

**Transaction Interval** The ESP32-S2 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All

transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 40 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

### Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.  
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

### Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

## API Reference

### Header File

- [components/esp\\_driver\\_spi/include/driver/spi\\_slave.h](#)
- This header file can be included with:

```
#include "driver/spi_slave.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

### Functions

`esp_err_t spi_slave_initialize` (`spi_host_device_t` host, const `spi_bus_config_t` \*bus\_config, const `spi_slave_interface_config_t` \*slave\_config, `spi_dma_chan_t` dma\_chan)

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

#### Parameters

- **host** -- SPI peripheral to use as a SPI slave interface
- **bus\_config** -- Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **slave\_config** -- Pointer to a *spi\_slave\_interface\_config\_t* struct specifying the details for the slave interface
- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI\_DMA\_DISABLED limits the size of transactions.
  - Set to SPI\_DMA\_DISABLED if only the SPI flash uses this bus.
  - Set to SPI\_DMA\_CH\_AUTO to let the driver to allocate the DMA channel.

#### Returns

- ESP\_ERR\_INVALID\_ARG if configuration is invalid
- ESP\_ERR\_INVALID\_STATE if host already is in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_free** (*spi\_host\_device\_t* host)

Free a SPI bus claimed as a SPI slave interface.

**Parameters** **host** -- SPI peripheral to free

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_INVALID\_STATE if not all devices on the bus are freed
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_queue\_trans** (*spi\_host\_device\_t* host, const *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via *spi\_slave\_initialize*.) This function may block if the queue is full (depending on the *ticks\_to\_wait* parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in *trans\_desc* to the SPI slave driver; the application is not to access this memory until *spi\_slave\_queue\_trans* is called to hand ownership back to the application.

---

**Note:** On esp32, if *trans* length not WORD aligned, the rx buffer last word memory will still be overwritten by DMA HW

---

#### Parameters

- **host** -- SPI peripheral that is acting as a slave
- **trans\_desc** -- Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use port-MAX\_DELAY to never time out.

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if set flag SPI\_SLAVE\_TRANS\_DMA\_BUFFER\_ALIGN\_AUTO but there is no free memory

- `ESP_ERR_INVALID_STATE` if sync data between Cache and memory failed
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_get\_trans\_result** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or reuse the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

#### Parameters

- **host** -- SPI peripheral to that is acting as a slave
- **trans\_desc** -- [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_SLAVE_NO_RETURN_RESULT` is set
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_transmit** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

#### Parameters

- **host** -- SPI peripheral to that is acting as a slave
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

### Structures

struct **spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

#### Public Members

int **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of `SPI_SLAVE_*` flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

**uint8\_t mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

***slave\_transaction\_cb\_t* post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***slave\_transaction\_cb\_t* post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

**struct spi\_slave\_transaction\_t**

This structure describes one SPI transaction

**Public Members****uint32\_t flags**

Bitwise OR of `SPI_SLAVE_TRANS_*` flags.

**size\_t length**

Total data length, in bits.

**size\_t trans\_len**

Transaction data length, in bits.

**const void \*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

**void \*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

## Macros

### **SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

### **SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

### **SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

### **SPI\_SLAVE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

### **SPI\_SLAVE\_TRANS\_DMA\_BUFFER\_ALIGN\_AUTO**

Automatically re-alloc dma buffer if user buffer doesn't meet hardware alignment or `dma_capable`, this process may loss some memory and performance.

## Type Definitions

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

## 2.5.22 SPI Slave Half Duplex

### Introduction

The Half Duplex (HD) Mode is a special mode provided by ESP SPI Slave peripheral. Under this mode, the hardware provides more services than the Full Duplex (FD) Mode (the mode for general-purpose SPI transactions, see [SPI Slave Driver](#)). These services reduce the CPU load and the response time of SPI Slave. However, it is important to note that the communication format is determined by the hardware and is always in a half-duplex configuration, allowing only one-way data transfer at any given time. Hence, the mode is named Half Duplex Mode due to this characteristic.

When conducting an SPI transaction, transactions can be classified into several types based on the **command** phase of the transaction. Each transaction may consist of the following phases: command, address, dummy, and data. The command phase is mandatory, while the other phases may be determined by the command field. During the command, address, and dummy phases, the bus is always controlled by the master (usually the host), while the direction of the data phase depends on the command. The data phase can be either an input phase, where the master writes data to the slave (e.g., the host sends data to the slave), or an output phase, where the master reads data from the slave (e.g., the host receives data from the slave).

**Protocol** About the details of how master should communicate with the SPI Slave, see [ESP SPI Slave HD \(Half Duplex\) Mode Protocol](#).

Through these different transactions, the slave provides these services to the master:

- A DMA channel for the master to write a great amount of data to the slave.
- A DMA channel for the master to read a great amount of data from the slave.
- Several general purpose registers, shared between the master and the slave.
- Several general purpose interrupts, for the master to interrupt the SW of the slave.

## Terminology

- Transaction
- Channel
- Sending
- Receiving
- Data Descriptor

## Driver Feature

- Transaction read/write by master in segments
- Queues for data to send and received

## Driver Usage

**Slave Initialization** Call `spi_slave_hd_init()` to initialize the SPI bus as well as the peripheral and the driver. The SPI Slave exclusively uses the SPI peripheral, pins of the bus before it is deinitialized, which means other devices are unable to use the above resources during initialization. Thus, to ensure SPI resources are correctly occupied and the connections work properly, most configurations of the slave should be done as soon as the slave is initialized.

The `spi_bus_config_t` specifies how the bus should be initialized, while `spi_slave_hd_slot_config_t` specifies how the SPI Slave driver should work.

**Deinitialization (Optional)** Call `spi_slave_hd_deinit()` to uninstall the driver. The resources, including the pins, SPI peripheral, internal memory used by the driver, and interrupt sources, are released by the `deinit()` function.

**Send/Receive Data by DMA Channels** To send data to the master through the sending DMA channel, the application should properly wrap the data in an `spi_slave_hd_data_t` descriptor structure before calling `spi_slave_hd_queue_trans()` with the data descriptor and the channel argument of `SPI_SLAVE_CHAN_TX`. The pointers to descriptors are stored in the queue, and the data is sent to the master in the same order they are enqueued using `spi_slave_hd_queue_trans()`, upon receiving the master's `Rd_DMA` command.

The application should check the result of data sending by calling `spi_slave_hd_get_trans_res()` with the channel set as `SPI_SLAVE_CHAN_TX`. This function blocks until the transaction with the command `Rd_DMA` from the master successfully completes (or timeout). The `out_trans` argument of the function outputs the pointer of the data descriptor which is just finished, providing information about the sending.

Receiving data from the master through the receiving DMA channel is quite similar. The application calls `spi_slave_hd_queue_trans()` with proper data descriptor and the channel argument of `SPI_SLAVE_CHAN_RX`. And the application calls the `spi_slave_hd_get_trans_res()` later to get the descriptor to the receiving buffer before it handles the data in the receiving buffer.

---

**Note:** This driver itself does not have an internal buffer for the data to send or just received. The application should provide data buffer for driver via data descriptors to send to the master, or to receive data from the master.

The application has to properly keep the data descriptor as well as the buffer it points, after the descriptor is successfully sent into the driver internal queue by `spi_slave_hd_queue_trans()`, and before returned by `spi_slave_hd_get_trans_res()`. During this period, the hardware as well as the driver may read or write to the buffer and the descriptor when required at any time.

---

Please note that, when using this driver for data transfer, the buffer does not have to be fully sent or filled before it is terminated. For example, in the segment transaction mode, the master has to send `CMD7` to terminate a `Wr_DMA`

transaction or send `CMD8` to terminate an `Rd_DMA` transaction (in segments), no matter whether the send (receive) buffer is used up (full) or not.

**Using Data Descriptor with Customized User Arguments** Sometimes you may have initiator (sending data descriptor) and closure (handling returned descriptors) functions in different places. When you get the returned data descriptor in the closure, you may need some extra information when handling the finished data descriptor. For example, you may want to know which round it is for the returned descriptor when you send the same piece of data several times.

Set the `arg` member in the data descriptor to a variable indicating the transaction by force casting, or point it to a structure that wraps all the information you may need when handling the sending/receiving data. Then you can get what you need in your closure.

---

### Using Callbacks

**Note:** These callbacks are called in the ISR, so the required operations need to be processed quickly and returned as soon as possible to ensure that the system is functioning properly. You may need to be very careful to write the code in the ISR.

Since the interrupt handling is executed concurrently with the application, long delays or blocking may cause the system to respond slower or lead to unpredictable behavior. Therefore, when writing callback functions, avoid using operations that may cause delays or blocking, e.g., waiting, sleeping, resource locking, etc.

---

The `spi_slave_hd_callback_config_t` member in the `spi_slave_hd_slot_config_t` configuration structure passed when initializing the SPI Slave HD driver, allows you to have callbacks for each event you may concern.

The corresponding interrupt for each callback that is not `NULL` is enabled, so that the callbacks can be called immediately when the events happen. You do not need to provide callbacks for the unconcerned events.

The `arg` member in the configuration structure can help you pass some context to the callback or indicate the specific SPI Slave instance when using the same callbacks for multiple SPI Slave peripherals. You can set the `arg` member to a variable that indicates the SPI Slave instance by performing a forced type casting or point it to a context structure. All the callbacks are called with this `arg` argument you set when the callbacks are initialized.

There are two other arguments: the `event` and the `awoken`.

- The `event` passes the information of the current event to the callback. The `spi_slave_hd_event_t` type contains the information of the event, for example, event type, the data descriptor just finished (The `data argument` is very useful in this case!).
- The `awoken` argument serves as an output parameter. It informs the ISR that tasks have been awakened after the callback function, and the ISR should call `portYIELD_FROM_ISR()` to schedule these tasks. Simply pass the `awoken` argument to all FreeRTOS APIs that may unblock tasks, and the value of `awoken` will be returned to the ISR.

**Writing/Reading Shared Registers** Call `spi_slave_hd_write_buffer()` to write the shared buffer, and `spi_slave_hd_read_buffer()` to read the shared buffer.

---

**Note:** On ESP32-S2, the shared registers are read/written in words by the application but read/written in bytes by the master. There is no guarantee four continuous bytes read from the master are from the same word written by the slave's application. It is also possible that if the slave reads a word while the master is writing bytes of the word, the slave may get one word with half of them just written by the master, and the other half has not been written into.

The master can confirm that the word is not in transition by reading the word twice and comparing the values.

For the slave, it is more difficult to ensure the word is not in transition because the process of master writing four bytes can be very long (32 SPI clocks). You can put some CRC in the last (largest address) byte of a word so that when the byte is written, the word is sure to be all written.

Due to the conflicts that may be among read/write from SW (worse if there are multi-cores) and master, it is suggested that a word is only used in one direction (only written by the master or only written by the slave).

**Receiving General Purpose Interrupts from the Master** When the master sends CMD8, CMD9 or CMDA, the slave corresponding is triggered. Currently the CMD8 is permanently used to indicate the termination of Rd\_DMA segments. To receive general-purpose interrupts, register callbacks for CMD9 and CMDA when the slave is initialized, see *Using Callbacks*.

### Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave\\_hd](#) directory of ESP-IDF examples.

## API Reference

### Header File

- `components/esp_driver_spi/include/driver/spi_slave_hd.h`
- This header file can be included with:

```
#include "driver/spi_slave_hd.h"
```

- This header file is a part of the API provided by the `esp_driver_spi` component. To declare that your component depends on `esp_driver_spi`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_spi
```

or

```
PRIV_REQUIRES esp_driver_spi
```

### Functions

`esp_err_t spi_slave_hd_init` (`spi_host_device_t` host\_id, const `spi_bus_config_t` \*bus\_config, const `spi_slave_hd_slot_config_t` \*config)

Initialize the SPI Slave HD driver.

#### Parameters

- **host\_id** -- The host to use
- **bus\_config** -- Bus configuration for the bus used
- **config** -- Configuration for the SPI Slave HD driver

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: invalid argument given
- ESP\_ERR\_INVALID\_STATE: function called in invalid state, may be some resources are already in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM: memory allocation failed
- or other return value from `esp_intr_alloc`

`esp_err_t spi_slave_hd_deinit` (`spi_host_device_t` host\_id)

Deinitialize the SPI Slave HD driver.

**Parameters** **host\_id** -- The host to deinitialize the driver

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: if the host\_id is not correct

*esp\_err\_t* **spi\_slave\_hd\_queue\_trans** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*trans, TickType\_t timeout)

Queue transactions (segment mode)

#### Parameters

- **host\_id** -- Host to queue the transaction
- **chan** -- SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **trans** -- Transaction descriptors
- **timeout** -- Timeout before the data is queued

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP\_ERR\_TIMEOUT: Cannot queue the data before timeout. Master is still processing previous transaction.
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under segment mode.

*esp\_err\_t* **spi\_slave\_hd\_get\_trans\_res** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*\*out\_trans, TickType\_t timeout)

Get the result of a data transaction (segment mode)

---

**Note:** This API should be called successfully the same times as the `spi_slave_hd_queue_trans`.

---

#### Parameters

- **host\_id** -- Host to queue the transaction
- **chan** -- Channel to get the result, SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **out\_trans** -- [out] Pointer to the transaction descriptor (*spi\_slave\_hd\_data\_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** -- Timeout before the result is got

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: Function is not valid
- ESP\_ERR\_TIMEOUT: There's no transaction done before timeout
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under segment mode.

void **spi\_slave\_hd\_read\_buffer** (*spi\_host\_device\_t* host\_id, int addr, uint8\_t \*out\_data, size\_t len)

Read the shared registers.

#### Parameters

- **host\_id** -- Host to read the shared registers
- **addr** -- Address of register to read, 0 to SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-1
- **out\_data** -- [out] Output buffer to store the read data
- **len** -- Length to read, not larger than SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-addr

void **spi\_slave\_hd\_write\_buffer** (*spi\_host\_device\_t* host\_id, int addr, uint8\_t \*data, size\_t len)

Write the shared registers.

#### Parameters

- **host\_id** -- Host to write the shared registers
- **addr** -- Address of register to write, 0 to SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-1
- **data** -- Buffer holding the data to write
- **len** -- Length to write, SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE-addr

*esp\_err\_t* **spi\_slave\_hd\_append\_trans** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*trans, TickType\_t timeout)

Load transactions (append mode)

---

**Note:** In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

---

#### Parameters

- **host\_id** -- Host to load transactions
- **chan** -- SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **trans** -- Transaction descriptor
- **timeout** -- Timeout before the transaction is loaded

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP\_ERR\_TIMEOUT: Master is still processing previous transaction. There is no available transaction for slave to load
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under append mode.

*esp\_err\_t* **spi\_slave\_hd\_get\_append\_trans\_res** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*\*out\_trans, TickType\_t timeout)

Get the result of a data transaction (append mode)

---

**Note:** This API should be called the same times as the `spi_slave_hd_append_trans`

---

#### Parameters

- **host\_id** -- Host to load the transaction
- **chan** -- SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **out\_trans** -- **[out]** Pointer to the transaction descriptor (*spi\_slave\_hd\_data\_t*) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** -- Timeout before the result is got

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: Function is not valid
- ESP\_ERR\_TIMEOUT: There's no transaction done before timeout
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under append mode.

### Structures

struct **spi\_slave\_hd\_data\_t**

Descriptor of data to send/receive.

### Public Members

`uint8_t *data`

Buffer to send, must be DMA capable.

`size_t len`

Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

`size_t trans_len`

For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

`uint32_t flags`

Bitwise OR of `SPI_SLAVE_HD_TRANS_*` flags.

`void *arg`

Extra argument indicating this data.

struct `spi_slave_hd_event_t`

Information of SPI Slave HD event.

### Public Members

`spi_event_t event`

Event type.

`spi_slave_hd_data_t *trans`

Corresponding transaction for `SPI_EV_SEND` and `SPI_EV_RECV` events.

struct `spi_slave_hd_callback_config_t`

Callback configuration structure for SPI Slave HD.

### Public Members

`slave_cb_t cb_buffer_tx`

Callback when master reads from shared buffer.

`slave_cb_t cb_buffer_rx`

Callback when master writes to shared buffer.

`slave_cb_t cb_send_dma_ready`

Callback when TX data buffer is loaded to the hardware (DMA)

`slave_cb_t cb_sent`

Callback when data are sent.

`slave_cb_t cb_recv_dma_ready`

Callback when RX data buffer is loaded to the hardware (DMA)

***slave\_cb\_t* cb\_recv**

Callback when data are received.

***slave\_cb\_t* cb\_cmd9**

Callback when CMD9 received.

***slave\_cb\_t* cb\_cmdA**

Callback when CMDA received.

void \***arg**

Argument indicating this SPI Slave HD peripheral instance.

struct **spi\_slave\_hd\_slot\_config\_t**

Configuration structure for the SPI Slave HD driver.

**Public Members**

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint32\_t **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of SPI\_SLAVE\_HD\_\* flags.

uint32\_t **command\_bits**

command field bits, multiples of 8 and at least 8.

uint32\_t **address\_bits**

address field bits, multiples of 8 and at least 8.

uint32\_t **dummy\_bits**

dummy field bits, multiples of 8 and at least 8.

uint32\_t **queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi\_slave\_hd\_queue\_trans but not yet finished using spi\_slave\_hd\_get\_trans\_result) at the same time.

*spi\_dma\_chan\_t* **dma\_chan**

DMA channel to used.

*spi\_slave\_hd\_callback\_config\_t* **cb\_config**

Callback configuration.

## Macros

### **SPI\_SLAVE\_HD\_TRANS\_DMA\_BUFFER\_ALIGN\_AUTO**

Automatically re-malloc dma buffer if user buffer doesn't meet hardware alignment or `dma_capable`, this process may lose some memory and performance.

### **SPI\_SLAVE\_HD\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

### **SPI\_SLAVE\_HD\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

### **SPI\_SLAVE\_HD\_BIT\_LSBFIRST**

Transmit and receive LSB first.

### **SPI\_SLAVE\_HD\_APPEND\_MODE**

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

## Type Definitions

```
typedef bool (*slave_cb_t)(void *arg, spi_slave_hd_event_t *event, BaseType_t *awoken)
```

Callback for SPI Slave HD.

## Enumerations

```
enum spi_slave_chan_t
```

Channel of SPI Slave HD to do data transaction.

*Values:*

```
enumerator SPI_SLAVE_CHAN_TX
```

The output channel (RDDMA)

```
enumerator SPI_SLAVE_CHAN_RX
```

The input channel (WRDMA)

## 2.5.23 Temperature Sensor

### Introduction

The ESP32-S2 has a built-in sensor used to measure the chip's internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta analog-to-digital converter (ADC) and a digital-to-analog converter (DAC) to compensate for the temperature measurement.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

Predefined Range (°C)	Error (°C)
50 ~ 125	< 3
20 ~ 100	< 2
-10 ~ 80	< 1
-30 ~ 50	< 2
-40 ~ 20	< 3

---

**Note:** The temperature sensor is designed primarily to measure the temperature changes inside the chip. The internal temperature of a chip is usually higher than the ambient temperature, and is affected by factors such as the microcontroller's clock frequency or I/O load, and the external thermal environment.

---

## Functional Overview

The description of the temperature sensor functionality is divided into the following sections:

- *Resource Allocation* - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when the temperature sensor finishes working.
- *Enable and Disable Temperature Sensor* - covers how to enable and disable the temperature sensor.
- *Get Temperature Value* - covers how to get the real-time temperature value.
- *Power Management* - covers how the temperature sensor is affected when changing power mode (e.g., Light-sleep mode).
- *Thread Safety* - covers how to make the driver to be thread-safe.

**Resource Allocation** The ESP32-S2 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. By using `temperature_sensor_handle_t`, the temperature sensor properties can be accessed and modified in different function calls to control and manage the temperature sensor. The variable would always be the parameter of the temperature APIs with the information of hardware and configurations, so you can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment. For example, if the testing environment is in a room, the range you evaluate might be 10 °C ~ 30 °C; if the testing in a lamp bulb, the range you evaluate might be 60 °C ~ 110 °C. Based on that, configuration structure `temperature_sensor_config_t` should be defined in advance:

- `range_min`: The minimum value of the testing range you have evaluated.
- `range_max`: The maximum value of the testing range you have evaluated.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. You do not need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

## Creating a Temperature Sensor Handle

- Step 1: Evaluate the testing range. In this example, the range is 20 °C ~ 50 °C.
- Step 2: Configure the range and obtain a handle.

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor_config = TEMPERATURE_SENSOR_CONFIG_
↳DEFAULT(20, 50);
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor_config, &temp_handle));
```

### Enable and Disable Temperature Sensor

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

**Get Temperature Value** After the temperature sensor is enabled by `temperature_sensor_enable()`, you can get the current temperature by calling `temperature_sensor_get_celsius()`.

```
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it is not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

**Power Management** As the temperature sensor does not use the APB clock, it will keep working no matter if the power management is enabled with `CONFIG_PM_ENABLE`.

**Thread Safety** In the temperature sensor driver, we do not add any protection to ensure the thread safety, because typically this driver is only supposed to be used in one task. If you have to use this driver in different tasks, please add extra locks to protect it.

### Unexpected Behaviors

1. The value you get from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver may print the boundary you gave cannot meet the range of internal temperature sensor. It is because the built-in temperature sensor has a testing limit. The error comes from the incorrect configuration of `temperature_sensor_config_t` as follow:
  - (1) Totally out of range, like 200 °C ~ 300 °C.
  - (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

### Application Example

- Temperature sensor reading example: [peripherals/temperature\\_sensor/temp\\_sensor](#).

### API Reference

#### Header File

- `components/esp_driver_tsens/include/driver/temperature_sensor.h`
- This header file can be included with:

```
#include "driver/temperature_sensor.h"
```

- This header file is a part of the API provided by the `esp_driver_tsens` component. To declare that your component depends on `esp_driver_tsens`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_tsens
```

or

```
PRIV_REQUIRES esp_driver_tsens
```

## Functions

*esp\_err\_t* **temperature\_sensor\_install** (const *temperature\_sensor\_config\_t* \*tsens\_config, *temperature\_sensor\_handle\_t* \*ret\_tsens)

Install temperature sensor driver.

### Parameters

- **tsens\_config** -- Pointer to config structure.
- **ret\_tsens** -- Return the pointer of temperature sensor handle.

### Returns

- ESP\_OK if succeed

*esp\_err\_t* **temperature\_sensor\_uninstall** (*temperature\_sensor\_handle\_t* tsens)

Uninstall the temperature sensor driver.

**Parameters** **tsens** -- The handle created by `temperature_sensor_install()`.

### Returns

- ESP\_OK if succeed.

*esp\_err\_t* **temperature\_sensor\_enable** (*temperature\_sensor\_handle\_t* tsens)

Enable the temperature sensor.

**Parameters** **tsens** -- The handle created by `temperature_sensor_install()`.

### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE if temperature sensor is enabled already.

*esp\_err\_t* **temperature\_sensor\_disable** (*temperature\_sensor\_handle\_t* tsens)

Disable temperature sensor.

**Parameters** **tsens** -- The handle created by `temperature_sensor_install()`.

### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE if temperature sensor is not enabled yet.

*esp\_err\_t* **temperature\_sensor\_get\_celsius** (*temperature\_sensor\_handle\_t* tsens, float \*out\_celsius)

Read temperature sensor data that is converted to degrees Celsius.

---

**Note:** Should not be called from interrupt.

---

### Parameters

- **tsens** -- The handle created by `temperature_sensor_install()`.
- **out\_celsius** -- The measure output value.

### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG invalid arguments
- ESP\_ERR\_INVALID\_STATE Temperature sensor is not enabled yet.
- ESP\_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

## Structures

struct **temperature\_sensor\_config\_t**

Configuration of measurement range for the temperature sensor.

---

**Note:** If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed doc api-reference/peripherals/Temperature sensor.

---

## Public Members

int **range\_min**

the minimum value of the temperature you want to test

int **range\_max**

the maximum value of the temperature you want to test

*temperature\_sensor\_clk\_src\_t* **clk\_src**

the clock source of the temperature sensor.

## Macros

**TEMPERATURE\_SENSOR\_CONFIG\_DEFAULT** (min, max)

*temperature\_sensor\_config\_t* default constructor

## Type Definitions

typedef struct temperature\_sensor\_obj\_t \***temperature\_sensor\_handle\_t**

Type of temperature sensor driver handle.

## Header File

- `components/hal/include/hal/temperature_sensor_types.h`
- This header file can be included with:

```
#include "hal/temperature_sensor_types.h"
```

## Type Definitions

typedef *soc\_periph\_temperature\_sensor\_clk\_src\_t* **temperature\_sensor\_clk\_src\_t**

temperature sensor clock source

## Enumerations

enum **temperature\_sensor\_etm\_event\_type\_t**

temperature sensor event types enum

*Values:*

enumerator **TEMPERATURE\_SENSOR\_EVENT\_OVER\_LIMIT**

Temperature sensor over limit event

enumerator **TEMPERATURE\_SENSOR\_EVENT\_MAX**

Maximum number of temperature sensor events

enum **temperature\_sensor\_etm\_task\_type\_t**

temperature sensor task types enum

*Values:*

enumerator **TEMPERATURE\_SENSOR\_TASK\_START**

Temperature sensor start task

enumerator **TEMPERATURE\_SENSOR\_TASK\_STOP**

Temperature sensor stop task

enumerator **TEMPERATURE\_SENSOR\_TASK\_MAX**

Maximum number of temperature sensor tasks

## 2.5.24 Touch Sensor

### Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When the surface is touched, the capacitance variation is used to evaluate if the touch was valid.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see **ESP32-S2 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF]**.

In-depth design details of touch sensors and firmware development guidelines for ESP32-S2 are available in [Touch Sensor Application Note](#).

### Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section [API Reference](#). Practical implementation of this API is covered in Section [Application Examples](#).

**Initialization** Before using a touch pad, you need to initialize the touch pad driver by calling the function `touch_pad_init()`. This function sets several `._DEFAULT` driver parameters listed in [API Reference](#) under **Macros**. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling `touch_pad_deinit()`.

**Configuration** Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`. The following 14 capacitive touch pads are supported for ESP32-S2.

Touch Pad	GPIO Pin
T0	Internal channel, not connect to a GPIO
T1	GPIO1
T2	GPIO2
T3	GPIO3
T4	GPIO4
T5	GPIO5
T6	GPIO6
T7	GPIO7
T8	GPIO8
T9	GPIO9
T10	GPIO10
T11	GPIO11
T12	GPIO12
T13	GPIO13
T14	GPIO14

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

**Touch State Measurements** The following function come in handy to read raw measurements from the sensor:

- `touch_pad_read_raw_data()`

It can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

For the demonstration of how to read the touch pad data, check the application example [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_read](#).

**Method of Measurements** The touch sensor records the period of time (i.e., the number of clock cycles) over a fixed charge/discharge cycles (specified by `touch_pad_set_charge_discharge_times()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor sleeps until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

---

**Note:** If the specified charge and discharge cycles for measurement is too small, the result may be inaccurate, but increasing charge and discharge cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

---

**Optimization of Measurements** A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged/discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_charge_discharge_times()`.

The following list summarizes available measurement parameters and corresponding 'set' functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Charge and discharge times of one measurement: `touch_pad_set_charge_discharge_times()`

Relationship between the voltage range (high/low reference voltages), speed (slope), and measurement time is shown in the figure below.

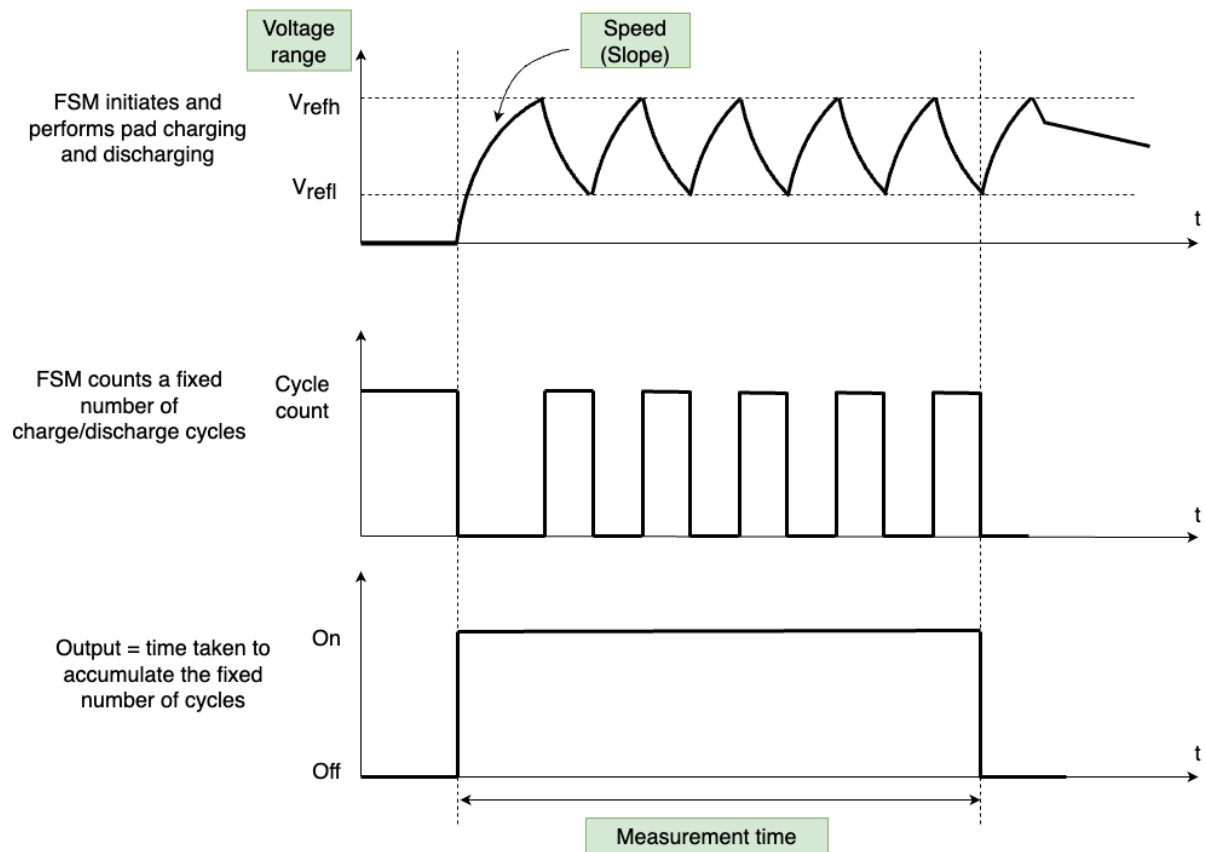

Fig. 21: Touch pad - relationship between measurement parameters

The last chart **Output** represents the touch sensor reading, i.e., the time taken to accumulate the fixed number of cycles.

All functions are provided in pairs to **set** a specific parameter and to **get** the current parameter's value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. The ESP32-S2's touch functionality provide two sets of APIs for doing this.

There is an internal touch channel that is not connected to any external GPIO. The measurements from this denoise pad can be used to filters out interference introduced on all channels, such as noise introduced by the power supply and external EMI.

The denoise parameters are set with the function `touch_pad_denoise_set_config()` and started by with `touch_pad_denoise_enable()`

There is also a configurable hardware implemented IIR-filter (infinite impulse response). This IIR-filter is configured with the function `touch_pad_filter_set_config()` and enabled by calling `touch_pad_filter_enable()`

**Touch Detection** Touch detection is implemented in ESP32's hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection/provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_interrupt](#).

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in *Touch State Measurements* to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

## Application Examples

- Touch sensor read example: [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_read](#).
- Touch sensor interrupt example: [peripherals/touch\\_sensor/touch\\_sensor\\_v2/touch\\_pad\\_interrupt](#).

## API Reference

### Header File

- `components/driver/touch_sensor/esp32s2/include/driver/touch_sensor.h`
- This header file can be included with:

```
#include "driver/touch_sensor.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

### Functions

*esp\_err\_t* **touch\_pad\_fsm\_start** (void)

Set touch sensor FSM start.

---

**Note:** Start FSM after the touch sensor FSM mode is set.

---

---

**Note:** Call this function will reset benchmark of all touch channels.

---

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_fsm\_stop** (void)

Stop touch sensor FSM.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_sw\_start** (void)

Trigger a touch sensor measurement, only support in SW mode of FSM.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_charge\_discharge\_times** (uint16\_t charge\_discharge\_times)

Set charge and discharge times of each measurement.

---

**Note:** This function will specify the charge and discharge times in each measurement period. The clock is sourced from SOC\_MOD\_CLK\_RTC\_FAST, and its default frequency is SOC\_CLK\_RC\_FAST\_FREQ\_APPROX. The touch sensor will record the total clock cycles of all the charge and discharge cycles as the final result (raw value).

---

---

**Note:** If the charge and discharge times is too small, it may lead to inaccurate results.

---

**Parameters** **charge\_discharge\_times** -- Charge and discharge times, range: 0 ~ 0xffff. No exact typical value can be recommended because the capacity is influenced by the hardware design and how finger touches, but suggest adjusting this value to make the measurement time around 1 ms.

**Returns**

- ESP\_OK Set charge and discharge times success

*esp\_err\_t* **touch\_pad\_get\_charge\_discharge\_times** (uint16\_t \*charge\_discharge\_times)

Get charge and discharge times of each measurement.

**Parameters** **charge\_discharge\_times** -- Charge and discharge times

**Returns**

- ESP\_OK Get charge\_discharge\_times success
- ESP\_ERR\_INVALID\_ARG The input parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_measurement\_interval** (uint16\_t interval\_cycle)

Set the interval between two measurements.

---

**Note:** The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC\_MOD\_CLK\_RTC\_SLOW, its default frequency is SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX.

---

**Parameters** `interval_cycle` -- The interval between two measurements `sleep_time = interval_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX`. The approximate frequency value of `RTC_SLOW_CLK` can be obtained using `rtc_clk_slow_freq_get_hz` function.

**Returns**

- `ESP_OK` Set interval cycle success

*esp\_err\_t* `touch_pad_get_measurement_interval` (`uint16_t *interval_cycle`)

Get the interval between two measurements.

**Parameters** `interval_cycle` -- The interval between two measurements

**Returns**

- `ESP_OK` Get interval cycle success
- `ESP_ERR_INVALID_ARG` The input parameter is NULL

*esp\_err\_t* `touch_pad_set_meas_time` (`uint16_t sleep_cycle`, `uint16_t meas_times`)

Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

---

**Note:** The touch sensor will measure time of a fixed number of charge/discharge cycles (specified as the second parameter). That means the time (raw value) will increase as the capacity of the touch pad is increasing. The time (raw value) here is the number of clock cycles which is sourced from `SOC_MOD_CLK_RTC_FAST` and at (`SOC_CLK_RC_FAST_FREQ_APPROX`) Hz as default

---

---

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed.

---

**Parameters**

- `sleep_cycle` -- The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX`. The approximate frequency value of `RTC_SLOW_CLK` can be obtained using `rtc_clk_slow_freq_get_hz` function.
- `meas_times` -- The times of charge and discharge in each measurement of touch channels. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1 ms.

**Returns**

- `ESP_OK` on success

*esp\_err\_t* `touch_pad_get_meas_time` (`uint16_t *sleep_cycle`, `uint16_t *meas_times`)

Get touch sensor times of charge and discharge and sleep time.

**Parameters**

- `sleep_cycle` -- Pointer to accept sleep cycle number
- `meas_times` -- Pointer to accept measurement times count.

**Returns**

- `ESP_OK` on success

*esp\_err\_t* `touch_pad_set_idle_channel_connect` (`touch_pad_conn_type_t type`)

Set the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ`(high resistance) setting increases the sensitivity of touch channels. The `CONN_GND`(grounding) setting increases the stability of touch channels.

**Parameters** `type` -- Select idle channel connect to high resistance state or ground.

**Returns**

- `ESP_OK` on success

*esp\_err\_t* **touch\_pad\_get\_idle\_channel\_connect** (*touch\_pad\_conn\_type\_t* \*type)

Get the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ`(high resistance) setting increases the sensitivity of touch channels. The `CONN_GND`(grounding) setting increases the stability of touch channels.

**Parameters** `type` -- Pointer to connection type.

**Returns**

- `ESP_OK` on success

*esp\_err\_t* **touch\_pad\_set\_thresh** (*touch\_pad\_t* touch\_num, *uint32\_t* threshold)

Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

---

**Note:** If set "`TOUCH_PAD_THRESHOLD_MAX`", the touch is never be triggered.

---

**Parameters**

- `touch_num` -- touch pad index
- `threshold` -- threshold of touch sensor. Should be less than the max change value of touch.

**Returns**

- `ESP_OK` on success

*esp\_err\_t* **touch\_pad\_get\_thresh** (*touch\_pad\_t* touch\_num, *uint32\_t* \*threshold)

Get touch sensor trigger threshold.

**Parameters**

- `touch_num` -- touch pad index
- `threshold` -- pointer to accept threshold

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if argument is wrong

*esp\_err\_t* **touch\_pad\_set\_channel\_mask** (*uint16\_t* enable\_mask)

Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will set the scan bits according to the given bitmask.

---

**Note:** If set this mask, the FSM timer should be stop firstly.

---

---

**Note:** The touch sensor that in scan map, should be deinit GPIO function firstly by `touch_pad_io_init`.

---

**Parameters** `enable_mask` -- bitmask of touch sensor scan group. e.g. `TOUCH_PAD_NUM14` -> `BIT(14)`

**Returns**

- `ESP_OK` on success

*esp\_err\_t* **touch\_pad\_get\_channel\_mask** (*uint16\_t* \*enable\_mask)

Get the touch sensor scan group bit mask.

**Parameters** `enable_mask` -- Pointer to bitmask of touch sensor scan group. e.g. `TOUCH_PAD_NUM14` -> `BIT(14)`

**Returns**

- `ESP_OK` on success

*esp\_err\_t* **touch\_pad\_clear\_channel\_mask** (uint16\_t enable\_mask)

Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

---

**Note:** If clear all mask, the FSM timer should be stop firstly.

---

**Parameters** **enable\_mask** -- bitmask of touch sensor scan group. e.g. TOUCH\_PAD\_NUM14  
-> BIT(14)

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_config** (*touch\_pad\_t* touch\_num)

Configure parameter for each touch channel.

---

**Note:** Touch num 0 is denoise channel, please use `touch_pad_denoise_enable` to set denoise function

---

**Parameters** **touch\_num** -- touch pad index

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG if argument wrong
- ESP\_FAIL if touch pad not initialized

*esp\_err\_t* **touch\_pad\_reset** (void)

Reset the FSM of touch module.

---

**Note:** Call this function after `touch_pad_fsm_stop`.

---

**Returns**

- ESP\_OK Success

*touch\_pad\_t* **touch\_pad\_get\_current\_meas\_channel** (void)

Get the current measure channel.

---

**Note:** Should be called when touch sensor measurement is in cyclic scan mode.

---

**Returns**

- touch channel number

uint32\_t **touch\_pad\_read\_intr\_status\_mask** (void)

Get the touch sensor interrupt status mask.

**Returns**

- touch interrupt bit

*esp\_err\_t* **touch\_pad\_intr\_enable** (*touch\_pad\_intr\_mask\_t* int\_mask)

Enable touch sensor interrupt by bitmask.

---

**Note:** This API can be called in ISR handler.

---

**Parameters** **int\_mask** -- Pad mask to enable interrupts

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_disable** (*touch\_pad\_intr\_mask\_t* int\_mask)

Disable touch sensor interrupt by bitmask.

---

**Note:** This API can be called in ISR handler.

---

**Parameters** *int\_mask* -- Pad mask to disable interrupts

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_intr\_clear** (*touch\_pad\_intr\_mask\_t* int\_mask)

Clear touch sensor interrupt by bitmask.

**Parameters** *int\_mask* -- Pad mask to clear interrupts

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_isr\_register** (*intr\_handler\_t* fn, void \*arg, *touch\_pad\_intr\_mask\_t* intr\_mask)

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** -- Pointer to ISR handler
- **arg** -- Parameter for ISR
- **intr\_mask** -- Enable touch sensor interrupt handler by bitmask.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Arguments error
- ESP\_ERR\_NO\_MEM No memory

*esp\_err\_t* **touch\_pad\_timeout\_set** (bool enable, uint32\_t threshold)

Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

---

**Note:** The threshold compared with touch readings.

---

**Note:** In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

---

**Parameters**

- **enable** -- true(default): Enable the timeout check; false: Disable the timeout check.
- **threshold** -- For all channels, the maximum value that will not be exceeded during normal operation.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_timeout\_resume** (void)

Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

---

**Note:** Call this API after finishes the exception handling by user.

---

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_read\_raw\_data** (*touch\_pad\_t* touch\_num, uint32\_t \*raw\_data)

get raw data of touch sensor.

---

**Note:** After the initialization is complete, the "raw\_data" is max value. You need to wait for a measurement cycle before you can read the correct touch value.

---

**Parameters**

- **touch\_num** -- touch pad index
- **raw\_data** -- pointer to accept touch sensor value

**Returns**

- ESP\_OK Success
- ESP\_FAIL Touch channel 0 haven't this parameter.

*esp\_err\_t* **touch\_pad\_read\_benchmark** (*touch\_pad\_t* touch\_num, uint32\_t \*benchmark)

get benchmark of touch sensor.

---

**Note:** After initialization, the benchmark value is the maximum during the first measurement period.

---

**Parameters**

- **touch\_num** -- touch pad index
- **benchmark** -- pointer to accept touch sensor benchmark value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Touch channel 0 haven't this parameter.

*esp\_err\_t* **touch\_pad\_filter\_read\_smooth** (*touch\_pad\_t* touch\_num, uint32\_t \*smooth)

Get smoothed data that obtained by filtering the raw data.

**Parameters**

- **touch\_num** -- touch pad index
- **smooth** -- pointer to smoothed data

*esp\_err\_t* **touch\_pad\_reset\_benchmark** (*touch\_pad\_t* touch\_num)

Force reset benchmark to raw data of touch sensor.

**Parameters** **touch\_num** -- touch pad index

- TOUCH\_PAD\_MAX Reset baseline of all channels

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_set\_config** (const *touch\_filter\_config\_t* \*filter\_info)

set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Parameters** **filter\_info** -- select filter type and threshold of detection algorithm**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_get\_config** (*touch\_filter\_config\_t* \*filter\_info)

get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Parameters** **filter\_info** -- select filter type and threshold of detection algorithm**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_enable** (void)

enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_filter\_disable** (void)

disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_set\_config** (const *touch\_pad\_denoise\_t* \*denoise)

set parameter of denoise pad (TOUCH\_PAD\_NUM0). T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

**Parameters** **denoise** -- parameter of denoise

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_get\_config** (*touch\_pad\_denoise\_t* \*denoise)

get parameter of denoise pad (TOUCH\_PAD\_NUM0).

**Parameters** **denoise** -- Pointer to parameter of denoise

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_enable** (void)

enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_disable** (void)

disable denoise function.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_denoise\_read\_data** (uint32\_t \*data)

Get denoise measure value (TOUCH\_PAD\_NUM0).

**Parameters** **data** -- Pointer to receive denoise value

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_set\_config** (const *touch\_pad\_waterproof\_t* \*waterproof)

set parameter of waterproof function.

The waterproof function includes a shielded channel (TOUCH\_PAD\_NUM14) **and** a **guard** channel. Guard pad **is** used to detect the large area of water covering the touch **panel**.

(continues on next page)

(continued from previous page)

Shield pad **is** used to shield the influence of water droplets covering the touch panel.  
It **is** generally designed **as** a grid **and is** placed around the touch buttons.

**Parameters** **waterproof** -- parameter of waterproof

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_get\_config** (*touch\_pad\_waterproof\_t* \*waterproof)

get parameter of waterproof function.

**Parameters** **waterproof** -- parameter of waterproof

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_enable** (void)

Enable parameter of waterproof function. Should be called after function touch\_pad\_waterproof\_set\_config.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_waterproof\_disable** (void)

Disable parameter of waterproof function.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_proximity\_enable** (*touch\_pad\_t* touch\_num, bool enabled)

Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

---

**Note:** Supports up to three touch channels configured as proximity sensors.

---

**Parameters**

- **touch\_num** -- touch pad index
- **enabled** -- true: enable the proximity function; false: disable the proximity function

**Returns**

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.
- ESP\_ERR\_NOT\_SUPPORTED: Don't support configured.

*esp\_err\_t* **touch\_pad\_proximity\_set\_count** (*touch\_pad\_t* touch\_num, uint32\_t count)

Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

---

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

---

**Parameters**

- **touch\_num** -- Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- **count** -- The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

**Returns**

- ESP\_OK: Configured correctly.
- ESP\_ERR\_INVALID\_ARG: Touch channel number error.

*esp\_err\_t* **touch\_pad\_proximity\_get\_count** (*touch\_pad\_t* touch\_num, uint32\_t \*count)

Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

---

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

---

**Parameters**

- **touch\_num** -- Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- **count** -- The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

**Returns**

- `ESP_OK`: Configured correctly.
- `ESP_ERR_INVALID_ARG`: Touch channel number error.

*esp\_err\_t* **touch\_pad\_proximity\_get\_data** (*touch\_pad\_t* touch\_num, uint32\_t \*measure\_out)

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

**Parameters**

- **touch\_num** -- touch pad index
- **measure\_out** -- If the accumulation process does not end, the `measure_out` is the process value.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Touch num is not proximity

*esp\_err\_t* **touch\_pad\_sleep\_channel\_get\_info** (*touch\_pad\_sleep\_channel\_t* \*slp\_config)

Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

---

**Note:** After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

---

**Parameters** **slp\_config** -- touch sleep pad config.

**Returns**

- `ESP_OK` Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_enable** (*touch\_pad\_t* pad\_num, bool enable)

Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

---

**Note:** ESP32S2 only support one sleep channel.

---

---

**Note:** After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

---

**Parameters**

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **enable** -- true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_enable\_proximity** (*touch\_pad\_t* pad\_num, bool enable)

Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

---

**Note:** ESP32S2 only support one sleep channel.

---

#### Parameters

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **enable** -- true: enable proximity for sleep channel; false: disable proximity for sleep channel;

#### Returns

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_set\_threshold** (*touch\_pad\_t* pad\_num, uint32\_t touch\_thres)

Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

---

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

---

#### Parameters

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **touch\_thres** -- touch sleep pad threshold

#### Returns

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_get\_threshold** (*touch\_pad\_t* pad\_num, uint32\_t \*touch\_thres)

Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

---

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

---

#### Parameters

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **touch\_thres** -- touch sleep pad threshold

#### Returns

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_benchmark** (*touch\_pad\_t* pad\_num, uint32\_t \*benchmark)

Read benchmark of touch sensor sleep channel.

#### Parameters

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **benchmark** -- pointer to accept touch sensor benchmark value

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_smooth** (*touch\_pad\_t* pad\_num, uint32\_t \*smooth\_data)

Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

**Parameters**

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **smooth\_data** -- pointer to accept touch sensor smoothed data

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_data** (*touch\_pad\_t* pad\_num, uint32\_t \*raw\_data)

Read raw data of touch sensor sleep channel.

**Parameters**

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **raw\_data** -- pointer to accept touch sensor raw data

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_reset\_benchmark** (void)

Reset benchmark of touch sensor sleep channel.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **touch\_pad\_sleep\_channel\_read\_proximity\_cnt** (*touch\_pad\_t* pad\_num, uint32\_t \*proximity\_cnt)

Read proximity count of touch sensor sleep channel.

**Parameters**

- **pad\_num** -- Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **proximity\_cnt** -- pointer to accept touch sensor proximity count value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_sleep\_channel\_set\_work\_time** (uint16\_t sleep\_cycle, uint16\_t meas\_times)

Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.

**Parameters**

- **sleep\_cycle** -- The touch sensor will sleep after each measurement. sleep\_cycle decide the interval between each measurement.  $t_{sleep} = sleep\_cycle / (RTC\_SLOW\_CLK \text{ frequency})$ . The approximate frequency value of RTC\_SLOW\_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.
- **meas\_times** -- The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

**Returns**

- ESP\_OK Success

**Header File**

- `components/driver/touch_sensor/include/driver/touch_sensor_common.h`
- This header file can be included with:

```
#include "driver/touch_sensor_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

*esp\_err\_t* **touch\_pad\_init** (void)

Initialize touch module.

---

**Note:** If default parameter don't match the usage scenario, it can be changed after this function.

---

### Returns

- `ESP_OK` Success
- `ESP_ERR_NO_MEM` Touch pad init error
- `ESP_ERR_NOT_SUPPORTED` Touch pad is providing current to external XTAL

*esp\_err\_t* **touch\_pad\_deinit** (void)

Un-install touch pad driver.

---

**Note:** After this function is called, other touch functions are prohibited from being called.

---

### Returns

- `ESP_OK` Success
- `ESP_FAIL` Touch pad driver not initialized

*esp\_err\_t* **touch\_pad\_io\_init** (*touch\_pad\_t* touch\_num)

Initialize touch pad GPIO.

**Parameters** `touch_num` -- touch pad index

### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if argument is wrong

*esp\_err\_t* **touch\_pad\_set\_voltage** (*touch\_high\_volt\_t* refh, *touch\_low\_volt\_t* refl, *touch\_volt\_atten\_t* atten)

Set touch sensor high voltage threshold of charge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

### Parameters

- **refh** -- the value of DREFH
- **refl** -- the value of DREFL
- **atten** -- the attenuation on DREFH

### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_voltage** (*touch\_high\_volt\_t* \*refh, *touch\_low\_volt\_t* \*refl, *touch\_volt\_atten\_t* \*atten)

Get touch sensor reference voltage,.

### Parameters

- **refh** -- pointer to accept DREFH value

- **refl** -- pointer to accept DREFL value
- **atten** -- pointer to accept the attenuation on DREFH

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_set\_cnt\_mode** (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* slope, *touch\_tie\_opt\_t* opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

---

**Note:** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

---

**Parameters**

- **touch\_num** -- touch pad index
- **slope** -- touch pad charge/discharge speed
- **opt** -- the initial voltage

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_cnt\_mode** (*touch\_pad\_t* touch\_num, *touch\_cnt\_slope\_t* \*slope, *touch\_tie\_opt\_t* \*opt)

Get touch sensor charge/discharge speed for each pad.

**Parameters**

- **touch\_num** -- touch pad index
- **slope** -- pointer to accept touch pad charge/discharge slope
- **opt** -- pointer to accept the initial voltage

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_isr\_deregister** (void (\*fn)(void\*), void \*arg)

Deregister the handler previously registered using touch\_pad\_isr\_handler\_register.

**Parameters**

- **fn** -- handler function to call (as passed to touch\_pad\_isr\_handler\_register)
- **arg** -- argument of the handler (as passed to touch\_pad\_isr\_handler\_register)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if a handler matching both fn and arg isn't registered

*esp\_err\_t* **touch\_pad\_get\_wakeup\_status** (*touch\_pad\_t* \*pad\_num)

Get the touch pad which caused wakeup from deep sleep.

**Parameters** **pad\_num** -- pointer to touch pad which caused wakeup

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG parameter is NULL

*esp\_err\_t* **touch\_pad\_set\_fsm\_mode** (*touch\_fsm\_mode\_t* mode)

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Parameters** **mode** -- FSM mode

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if argument is wrong

*esp\_err\_t* **touch\_pad\_get\_fsm\_mode** (*touch\_fsm\_mode\_t* \*mode)

Get touch sensor FSM mode.

**Parameters** mode -- pointer to accept FSM mode

**Returns**

- ESP\_OK on success

*esp\_err\_t* **touch\_pad\_clear\_status** (void)

To clear the touch sensor channel active status.

---

**Note:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

---

**Returns**

- ESP\_OK on success

uint32\_t **touch\_pad\_get\_status** (void)

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Returns**

- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

bool **touch\_pad\_meas\_is\_done** (void)

Check touch sensor measurement status.

**Returns**

- True measurement is under way
- False measurement done

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.,

1. TOUCH\_PAD\_NUM5\_GPIO\_NUM is the GPIO number of channel 5 (12);
2. TOUCH\_PAD\_GPIO4\_CHANNEL is the channel number of GPIO 4 (channel 0).

### Header File

- `components/soc/esp32s2/include/soc/touch_sensor_channel.h`
- This header file can be included with:

```
#include "soc/touch_sensor_channel.h"
```

- `components/hal/include/hal/touch_sensor_types.h`
- This header file can be included with:

```
#include "hal/touch_sensor_types.h"
```

## Structures

struct **touch\_pad\_denoise**

Touch sensor denoise configuration

### Public Members

*touch\_pad\_denoise\_grade\_t* **grade**

Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

*touch\_pad\_denoise\_cap\_t* **cap\_level**

Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use `touch_pad_denoise_read_data` to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.

struct **touch\_pad\_waterproof**

Touch sensor waterproof configuration

### Public Members

*touch\_pad\_t* **guard\_ring\_pad**

Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

*touch\_pad\_shield\_driver\_t* **shield\_driver**

Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel(Touch0).

struct **touch\_filter\_config**

Touch sensor filter configuration

### Public Members

*touch\_filter\_mode\_t* **mode**

Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

uint32\_t **debounce\_cnt**

Set debounce count, such as  $n$ . If the measured values continue to exceed the threshold for  $n+1$  times, the touch sensor state changes. Range: 0 ~ 7

uint32\_t **noise\_thr**

Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than (noise coefficient \* touch threshold). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;

uint32\_t **jitter\_step**

Set jitter filter step size. Range: 0 ~ 15

*touch\_smooth\_mode\_t* **smh\_lvl**

Level of filter applied on the original data against large noise interference.

struct **touch\_pad\_sleep\_channel\_t**

Touch sensor channel sleep configuration

### Public Members

*touch\_pad\_t* **touch\_num**

Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode. If clear the sleep channel, point this pad to TOUCH\_PAD\_NUM0

bool **en\_proximity**

enable proximity function for sleep pad

### Macros

**TOUCH\_PAD\_BIT\_MASK\_ALL**

**TOUCH\_PAD\_SLOPE\_DEFAULT**

**TOUCH\_PAD\_TIE\_OPT\_DEFAULT**

**TOUCH\_PAD\_BIT\_MASK\_MAX**

**TOUCH\_PAD\_HIGH\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_LOW\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_ATTEN\_VOLTAGE\_THRESHOLD**

**TOUCH\_PAD\_IDLE\_CH\_CONNECT\_DEFAULT**

**TOUCH\_PAD\_THRESHOLD\_MAX**

If set touch threshold max value, The touch sensor can't be in touched status

**TOUCH\_PAD\_SLEEP\_CYCLE\_DEFAULT**

Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

---

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed. The number of sleep cycle in each measure process of touch channels. The timer frequency is RTC\_SLOW\_CLK (can be 150k or 32k depending on the options). Range: 0 ~ 0xffff

---

**TOUCH\_PAD\_MEASURE\_CYCLE\_DEFAULT**

The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Recommended typical value: Modify this value to make the measurement time around 1ms. Range: 0 ~ 0xffff

**TOUCH\_PAD\_INTR\_MASK\_ALL**

All touch interrupt type enable.

**TOUCH\_PROXIMITY\_MEAS\_NUM\_MAX**

Touch sensor proximity detection configuration

**TOUCH\_DEBOUNCE\_CNT\_MAX****TOUCH\_NOISE\_THR\_MAX****TOUCH\_JITTER\_STEP\_MAX****Type Definitions**

typedef struct *touch\_pad\_denoise* touch\_pad\_denoise\_t

Touch sensor denoise configuration

typedef struct *touch\_pad\_waterproof* touch\_pad\_waterproof\_t

Touch sensor waterproof configuration

typedef struct *touch\_filter\_config* touch\_filter\_config\_t

Touch sensor filter configuration

**Enumerations**

enum touch\_pad\_t

Touch pad channel

*Values:*

enumerator TOUCH\_PAD\_NUM0

Touch pad channel 0 is GPIO4(ESP32)

enumerator TOUCH\_PAD\_NUM1

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM2**

Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM3**

Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM4**

Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM5**

Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM6**

Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM7**

Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM8**

Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM9**

Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM10**

Touch channel 10 is GPIO10(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM11**

Touch channel 11 is GPIO11(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM12**

Touch channel 12 is GPIO12(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM13**

Touch channel 13 is GPIO13(ESP32-S2)

enumerator **TOUCH\_PAD\_NUM14**

Touch channel 14 is GPIO14(ESP32-S2)

enumerator **TOUCH\_PAD\_MAX**

enum **touch\_high\_volt\_t**

Touch sensor high reference voltage

*Values:*

enumerator **TOUCH\_HVOLT\_KEEP**

Touch sensor high reference voltage, no change

enumerator **TOUCH\_HVOLT\_2V4**  
Touch sensor high reference voltage, 2.4V

enumerator **TOUCH\_HVOLT\_2V5**  
Touch sensor high reference voltage, 2.5V

enumerator **TOUCH\_HVOLT\_2V6**  
Touch sensor high reference voltage, 2.6V

enumerator **TOUCH\_HVOLT\_2V7**  
Touch sensor high reference voltage, 2.7V

enumerator **TOUCH\_HVOLT\_MAX**

enum **touch\_low\_volt\_t**  
Touch sensor low reference voltage

*Values:*

enumerator **TOUCH\_LVOLT\_KEEP**  
Touch sensor low reference voltage, no change

enumerator **TOUCH\_LVOLT\_0V5**  
Touch sensor low reference voltage, 0.5V

enumerator **TOUCH\_LVOLT\_0V6**  
Touch sensor low reference voltage, 0.6V

enumerator **TOUCH\_LVOLT\_0V7**  
Touch sensor low reference voltage, 0.7V

enumerator **TOUCH\_LVOLT\_0V8**  
Touch sensor low reference voltage, 0.8V

enumerator **TOUCH\_LVOLT\_MAX**

enum **touch\_volt\_atten\_t**  
Touch sensor high reference voltage attenuation

*Values:*

enumerator **TOUCH\_HVOLT\_ATTEN\_KEEP**  
Touch sensor high reference voltage attenuation, no change

enumerator **TOUCH\_HVOLT\_ATTEN\_1V5**  
Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_1V**  
Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V5**

Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_0V**

Touch sensor high reference voltage attenuation, 0V attenuation

enumerator **TOUCH\_HVOLT\_ATTEN\_MAX**

enum **touch\_cnt\_slope\_t**

Touch sensor charge/discharge speed

*Values:*

enumerator **TOUCH\_PAD\_SLOPE\_0**

Touch sensor charge / discharge speed, always zero

enumerator **TOUCH\_PAD\_SLOPE\_1**

Touch sensor charge / discharge speed, slowest

enumerator **TOUCH\_PAD\_SLOPE\_2**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_3**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_4**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_5**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_6**

Touch sensor charge / discharge speed

enumerator **TOUCH\_PAD\_SLOPE\_7**

Touch sensor charge / discharge speed, fast

enumerator **TOUCH\_PAD\_SLOPE\_MAX**

enum **touch\_tie\_opt\_t**

Touch sensor initial charge level

*Values:*

enumerator **TOUCH\_PAD\_TIE\_OPT\_LOW**

Initial level of charging voltage, low level

enumerator **TOUCH\_PAD\_TIE\_OPT\_HIGH**

Initial level of charging voltage, high level

enumerator **TOUCH\_PAD\_TIE\_OPT\_MAX**

enum **touch\_fsm\_mode\_t**

Touch sensor FSM mode

*Values:*

enumerator **TOUCH\_FSM\_MODE\_TIMER**

To start touch FSM by timer

enumerator **TOUCH\_FSM\_MODE\_SW**

To start touch FSM by software trigger

enumerator **TOUCH\_FSM\_MODE\_MAX**

enum **touch\_trigger\_mode\_t**

*Values:*

enumerator **TOUCH\_TRIGGER\_BELOW**

Touch interrupt will happen if counter value is less than threshold.

enumerator **TOUCH\_TRIGGER\_ABOVE**

Touch interrupt will happen if counter value is larger than threshold.

enumerator **TOUCH\_TRIGGER\_MAX**

enum **touch\_trigger\_src\_t**

*Values:*

enumerator **TOUCH\_TRIGGER\_SOURCE\_BOTH**

wakeup interrupt is generated if both SET1 and SET2 are "touched"

enumerator **TOUCH\_TRIGGER\_SOURCE\_SET1**

wakeup interrupt is generated if SET1 is "touched"

enumerator **TOUCH\_TRIGGER\_SOURCE\_MAX**

enum **touch\_pad\_intr\_mask\_t**

*Values:*

enumerator **TOUCH\_PAD\_INTR\_MASK\_DONE**

Measurement done for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_ACTIVE**

Active for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_INACTIVE**

Inactive for one of the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_SCAN\_DONE**

Measurement done for all the enabled channels.

enumerator **TOUCH\_PAD\_INTR\_MASK\_TIMEOUT**

Timeout for one of the enabled channels.

enum **touch\_pad\_denoise\_grade\_t**

*Values:*

enumerator **TOUCH\_PAD\_DENOISE\_BIT12**

Denoise range is 12bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT10**

Denoise range is 10bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT8**

Denoise range is 8bit

enumerator **TOUCH\_PAD\_DENOISE\_BIT4**

Denoise range is 4bit

enumerator **TOUCH\_PAD\_DENOISE\_MAX**

enum **touch\_pad\_denoise\_cap\_t**

*Values:*

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L0**

Denoise channel internal reference capacitance is 5pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L1**

Denoise channel internal reference capacitance is 6.4pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L2**

Denoise channel internal reference capacitance is 7.8pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L3**

Denoise channel internal reference capacitance is 9.2pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L4**

Denoise channel internal reference capacitance is 10.6pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L5**

Denoise channel internal reference capacitance is 12.0pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L6**

Denoise channel internal reference capacitance is 13.4pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_L7**

Denoise channel internal reference capacitance is 14.8pf

enumerator **TOUCH\_PAD\_DENOISE\_CAP\_MAX**

enum **touch\_pad\_shield\_driver\_t**

Touch sensor shield channel drive capability level

*Values:*

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L0**

The max equivalent capacitance in shield channel is 40pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L1**

The max equivalent capacitance in shield channel is 80pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L2**

The max equivalent capacitance in shield channel is 120pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L3**

The max equivalent capacitance in shield channel is 160pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L4**

The max equivalent capacitance in shield channel is 200pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L5**

The max equivalent capacitance in shield channel is 240pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L6**

The max equivalent capacitance in shield channel is 280pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_L7**

The max equivalent capacitance in shield channel is 320pf

enumerator **TOUCH\_PAD\_SHIELD\_DRV\_MAX**

enum **touch\_pad\_conn\_type\_t**

Touch channel idle state configuration

*Values:*

enumerator **TOUCH\_PAD\_CONN\_HIGHZ**

Idle status of touch channel is high resistance state

enumerator **TOUCH\_PAD\_CONN\_GND**

Idle status of touch channel is ground connection

enumerator **TOUCH\_PAD\_CONN\_MAX**

enum **touch\_filter\_mode\_t**

Touch channel IIR filter coefficient configuration.

---

**Note:** On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection `IIR_16`.

---

*Values:*

enumerator `TOUCH_PAD_FILTER_IIR_4`

The filter mode is first-order IIR filter. The coefficient is 4.

enumerator `TOUCH_PAD_FILTER_IIR_8`

The filter mode is first-order IIR filter. The coefficient is 8.

enumerator `TOUCH_PAD_FILTER_IIR_16`

The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

enumerator `TOUCH_PAD_FILTER_IIR_32`

The filter mode is first-order IIR filter. The coefficient is 32.

enumerator `TOUCH_PAD_FILTER_IIR_64`

The filter mode is first-order IIR filter. The coefficient is 64.

enumerator `TOUCH_PAD_FILTER_IIR_128`

The filter mode is first-order IIR filter. The coefficient is 128.

enumerator `TOUCH_PAD_FILTER_IIR_256`

The filter mode is first-order IIR filter. The coefficient is 256.

enumerator `TOUCH_PAD_FILTER_JITTER`

The filter mode is jitter filter

enumerator `TOUCH_PAD_FILTER_MAX`

enum `touch_smooth_mode_t`

Level of filter applied on the original data against large noise interference.

---

**Note:** On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection `IIR_2`.

---

*Values:*

enumerator `TOUCH_PAD_SMOOTH_OFF`

No filtering of raw data.

enumerator `TOUCH_PAD_SMOOTH_IIR_2`

Filter the raw data. The coefficient is 2 (Typical value).

enumerator `TOUCH_PAD_SMOOTH_IIR_4`

Filter the raw data. The coefficient is 4.

enumerator `TOUCH_PAD_SMOOTH_IIR_8`

Filter the raw data. The coefficient is 8.

enumerator `TOUCH_PAD_SMOOTH_MAX`

## 2.5.25 Touch Element

### Overview

The Touch Element Library is a highly abstracted element library designed on the basis of the touch sensor driver. The library provides a unified and user-friendly software interface to quickly build capacitive touch sensor applications. For more information about the touch sensor driver API, see *Touch Sensor*.

**Architecture** The Touch Element library configures touch sensor peripherals via the touch sensor driver. However, some necessary hardware parameters should be passed to `touch_element_install()` and will be configured automatically only after calling `touch_element_start()`. This sequential order is essential because configuring these parameters has a significant impact on the run-time system. Therefore, they must be configured after calling the start function to ensure the system functions properly.

These parameters include touch channel threshold, driver-level of waterproof shield sensor, etc. The Touch Element library sets the touch sensor interrupt and the `esp_timer` routine up, and the hardware information of the touch sensor (channel state, channel number) will be obtained in the touch sensor interrupt service routine. When the specified channel event occurs, the hardware information is passed to the `esp_timer` callback routine, which then dispatches the touch sensor channel information to the touch elements (such as button, slider, etc.). The library then runs a specified algorithm to update the touch element's state or calculate its position and dispatches the result accordingly.

So when using the Touch Element library, you are relieved from the implementation details of the touch sensor peripheral. The library handles most of the hardware information and passes the more meaningful messages to the event handler routine.

The workflow of the Touch Element library is illustrated in the picture below.

The features in relation to the Touch Element library in ESP32-S2 are given in the table below.

Features	ESP32S2
Touch Element waterproof	✓
Touch Element button	✓
Touch Element slider	✓
Touch Element matrix button	✓

**Peripheral** ESP32-S2 integrates one touch sensor peripheral with several physical channels.

- 14 physical capacitive touch channels
- Timer or software FSM trigger mode
- Up to 5 kinds of interrupt (Upper threshold and lower threshold interrupt, measure one channel finish and measure all channels finish interrupt, measurement timeout interrupt)
- Sleep mode wakeup source
- Hardware internal de-noise
- Hardware filter
- Hardware waterproof sensor
- Hardware proximity sensor

Fig. 22: Touch Element architecture

The channels are located as follows:

Channel	ESP32-S2
<b>Channel 0</b>	<b>GPIO 0 (reserved)</b>
<b>Channel 1</b>	<b>GPIO 1</b>
<b>Channel 2</b>	<b>GPIO 2</b>
<b>Channel 3</b>	<b>GPIO 3</b>
<b>Channel 4</b>	<b>GPIO 4</b>
<b>Channel 5</b>	<b>GPIO 5</b>
<b>Channel 6</b>	<b>GPIO 6</b>
<b>Channel 7</b>	<b>GPIO 7</b>
<b>Channel 8</b>	<b>GPIO 8</b>
<b>Channel 9</b>	<b>GPIO 9</b>
<b>Channel 10</b>	<b>GPIO 10</b>
<b>Channel 11</b>	<b>GPIO 11</b>
<b>Channel 12</b>	<b>GPIO 12</b>
<b>Channel 13</b>	<b>GPIO 13</b>
<b>Channel 14</b>	<b>GPIO 14</b>

The channels are located as follows:

Channel	ESP32-S2
<b>Channel 0</b>	<b>GPIO 0 (effective)</b>
<b>Channel 1</b>	<b>GPIO 1</b>
<b>Channel 2</b>	<b>GPIO 2</b>
<b>Channel 3</b>	<b>GPIO 3</b>
<b>Channel 4</b>	<b>GPIO 4</b>
<b>Channel 5</b>	<b>GPIO 5</b>
<b>Channel 6</b>	<b>GPIO 6</b>
<b>Channel 7</b>	<b>GPIO 7</b>
<b>Channel 8</b>	<b>GPIO 8</b>
<b>Channel 9</b>	<b>GPIO 9</b>

### Terminology

The terms used in relation to the Touch Element library are given below.

Term	Definition
<b>Touch sensor</b>	Touch sensor peripheral inside the chip
<b>Touch channel</b>	Touch sensor channels inside the touch sensor peripheral
<b>Touch pad</b>	Off-chip physical solder pad, generally inside the PCB
<b>De-noise channel</b>	Internal de-noise channel, which is always Channel 0 and is reserved
<b>Shield sensor</b>	One of the waterproof sensors for detecting droplets in small areas and compensating for the influence of water drops on measurements
<b>Guard sensor</b>	One of the waterproof sensors for detecting extensive wading and to temporarily disable the touch sensor
<b>Shield channel</b>	The channel that waterproof shield sensor connected to, which is always Channel 14
<b>Guard channel</b>	The channel that waterproof guard sensor connected to
<b>Shield pad</b>	Off-chip physical solder pad, generally is grids, and is connected to shield the sensor
<b>Guard pad</b>	Off-chip physical solder pad, usually a ring, and is connected to the guard sensor

**Touch Sensor Signal** Each touch sensor is able to provide the following types of signals:

- Raw: The Raw signal is the unfiltered signal from the touch sensor.
- Smooth: The Smooth signal is a filtered version of the Raw signal via an internal hardware filter.
- Benchmark: The Benchmark signal is also a filtered signal that filters out extremely low-frequency noise.

All of these signals can be obtained using touch sensor driver API.

**Touch Sensor Signal Threshold** The Touch Sensor Threshold value is a configurable threshold value used to determine when a touch sensor is touched or not. When the difference between the Smooth signal and the Benchmark signal becomes greater than the threshold value (i.e.,  $(\text{smooth} - \text{benchmark}) > \text{threshold}$ ), the touch channel's state will be changed and a touch interrupt will be triggered simultaneously.

**Sensitivity** Important performance parameter of the touch sensor, the larger it is, the better touch the sensor performs. It could be calculated by the format below:

$$\text{Sensitivity} = \frac{\text{Signal}_{\text{press}} - \text{Signal}_{\text{release}}}{\text{Signal}_{\text{release}}} = \frac{\text{Signal}_{\text{delta}}}{\text{Signal}_{\text{benchmark}}}$$

**Waterproof** Waterproof is the hardware feature of a touch sensor which has a guard sensor and shield sensor (always connect to Channel 14) that has the ability to resist a degree of influence of water drop and detect the water stream.

**Touch Button** The touch button consumes one channel of the touch sensor, and it looks like as the picture below:

**Touch Slider** The touch slider consumes several channels (at least three channels) of the touch sensor, the more channels consumed, the higher resolution and accuracy position it performs. The touch slider looks like as the picture below:

**Touch Matrix** The touch matrix button consumes several channels (at least  $2 + 2 = 4$  channels), and it gives a solution to use fewer channels and get more buttons. ESP32-S2 supports up to 49 buttons. The touch matrix button looks like as the picture below:

Fig. 23: Touch sensor application system components

Fig. 24: Touch sensor signals

Fig. 25: Touch sensor signal threshold

Fig. 26: Touch button

Fig. 27: Touch slider

Fig. 28: Touch matrix

## Touch Element Library Usage

Using this library should follow the initialization flow below:

1. To initialize the Touch Element library by calling `touch_element_install()`.
2. To initialize touch elements (button/slider etc) by calling `touch_xxxx_install()`.
3. To create a new element instance by calling `touch_xxxx_create()`.
4. To subscribe events by calling `touch_xxxx_subscribe_event()`.
5. To choose a dispatch method by calling `touch_xxxx_set_dispatch_method()` that tells the library how to notify you while the subscribed event occurs.
6. If dispatch by callback, call `touch_xxxx_set_callback()` to set the event handler function.
7. To start the Touch Element library by calling `touch_element_start()`.
8. If dispatch by callback, the callback will be called by the driver core when an event happens, no need to do anything; If dispatch by event task, create an event task and call `touch_element_message_receive()` to obtain messages in a loop.
9. (Optional) If you want to suspend the Touch Element run-time system or for some reason that could not obtain the touch element message, `touch_element_stop()` should be called to suspend the Touch Element system and then resume it by calling `touch_element_start()` again.

In code, the flow above may look like as follows:

```
static touch_xxx_handle_t element_handle; //Declare a touch element handle

//Define the subscribed event handler
void event_handler(touch_xxx_handle_t out_handle, touch_xxx_message_t out_message,
↳void *arg)
{
    //Event handler logic
}

void app_main()
{
    //Using the default initializer to config Touch Element library
    touch_elem_global_config_t global_config = TOUCH_ELEM_GLOBAL_DEFAULT_CONFIG();
    touch_element_install(&global_config);

    //Using the default initializer to config Touch elements
    touch_xxx_global_config_t elem_global_config = TOUCH_XXXX_GLOBAL_DEFAULT_
↳CONFIG();
    touch_xxx_install(&elem_global_config);

    //Create a new instance
    touch_xxx_config_t element_config = {
        ...
        ...
    };
    touch_xxx_create(&element_config, &element_handle);

    //Subscribe the specified events by using the event mask
    touch_xxx_subscribe_event(element_handle, TOUCH_ELEM_EVENT_ON_PRESS | TOUCH_
↳ELEM_EVENT_ON_RELEASE, NULL);

    //Choose CALLBACK as the dispatch method
    touch_xxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_CALLBACK);

    //Register the callback routine
    touch_xxx_set_callback(element_handle, event_handler);

    //Start Touch Element library processing
    touch_element_start();
}
```

## Initialization

1. To initialize the Touch Element library, you have to configure the touch sensor peripheral and Touch Element library by calling `touch_element_install()` with `touch_elem_global_config_t`, the default initializer is available in `TOUCH_ELEM_GLOBAL_DEFAULT_CONFIG()` and this default configuration is suitable for the most general application scene, and it is suggested not to change the default configuration before fully understanding Touch Sensor peripheral because some changes might bring several impacts to the system.
2. To initialize the specified element, all the elements will not work before its constructor `touch_xxxx_install()` is called so as to save memory, so you have to call the constructor of each used touch element respectively, to set up the specified element.

## Touch Element Instance Startup

1. To create a new touch element instance, call `touch_xxxx_create()`, select a channel, and provide its *Sensitivity* value for the new element instance.
2. To subscribe to events, call `touch_xxxx_subscribe_event()`. The Touch Element library offers several events, and the event mask is available in `components/touch_element/include/touch_element/touch_element.h`. You can use these event masks to subscribe to specific events individually or combine them to subscribe to multiple events.
3. To configure the dispatch method, use `touch_xxxx_set_dispatch_method()`. The Touch Element library provides two dispatch methods: `TOUCH_ELEM_DISP_EVENT` and `TOUCH_ELEM_DISP_CALLBACK`. These methods allow you to obtain the touch element message and handle it using different approaches.

**Events Processing** If `TOUCH_ELEM_DISP_EVENT` dispatch method is configured, you need to start up an event handler task to obtain the touch element message, all the elements' raw message could be obtained by calling `touch_element_message_receive()`, then extract the element-class-specific message by calling the corresponding message decoder with `touch_xxxx_get_message()` to get the touch element's extracted message; If `TOUCH_ELEM_DISP_CALLBACK` dispatch method is configured, you need to pass an event handler by calling `touch_xxxx_set_callback()` before the touch element starts working, all the element's extracted message will be passed to the event handler function.

**Warning:** Since the event handler function runs on the core of the element library, i.e., in the `esp_timer` callback routine, please avoid performing operations that may cause blocking or delays, such as calling `vTaskDelay()`.

In code, the events handle procedure may look like as follows:

```

/* ----- TOUCH_ELEM_DISP_EVENT -----
↳----- */
void element_handler_task(void *arg)
{
    touch_elem_message_t element_message;
    while(1) {
        if (touch_element_message_receive(&element_message, Timeout) == ESP_OK) {
            const touch_xxxx_message_t *extracted_message = touch_xxxx_get_
↳message(&element_message); //Decode message
            ... //Event handler logic
        }
    }
}
void app_main()
{
    ...

    touch_xxxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_EVENT); //Set_
↳TOUCH_ELEM_DISP_EVENT as the dispatch method
    xTaskCreate(&element_handler_task, "element_handler_task", 2048, NULL, 5, _
↳NULL); //Create a handler task

```

(continues on next page)

(continued from previous page)

```

    ...
}
/* -----
↳----- */

...
/* ----- TOUCH_ELEM_DISP_CALLBACK -----
↳----- */
void element_handler(touch_xxxx_handle_t out_handle, touch_xxxx_message_t out_
↳message, void *arg)
{
    //Event handler logic
}

void app_main()
{
    ...

    touch_xxxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_CALLBACK); //
↳Set TOUCH_ELEM_DISP_CALLBACK as the dispatch method
    touch_xxxx_set_callback(element_handle, element_handler); //Register an event_
↳handler function

    ...
}
/* -----
↳----- */

```

### Waterproof Usage

1. The waterproof shield sensor is always-on after Touch Element waterproof is initialized, however, the waterproof guard sensor is optional, hence if the you do not need the guard sensor, `TOUCH_WATERPROOF_GUARD_NOUSE` has to be passed to `touch_element_waterproof_install()` by the configuration struct.
2. To associate the touch element with the guard sensor, pass the touch element's handle to the Touch Element waterproof's masked list by calling `touch_element_waterproof_add()`. By associating a touch element with the Guard sensor, the touch element will be disabled when the guard sensor is triggered by a stream of water so as to protect the touch element.

The Touch Element Waterproof example is available in `peripherals/touch_sensor/touch_element/touch_element_waterproof` directory.

In code, the waterproof configuration may look as follows:

```

void app_main()
{
    ...

    touch_xxxx_install(); //Initialize instance (button, slider,
↳etc)
    touch_xxxx_create(&element_handle); //Create a new Touch element

    ...

    touch_element_waterproof_install(); //Initialize Touch Element_
↳waterproof
    touch_element_waterproof_add(element_handle); //Let an element associate_
↳with the guard sensor

```

(continues on next page)

```

...
}

```

**Wakeup from Light/Deep-sleep Mode** Only Touch Button can be configured as a wake-up source.

Light- or Deep-sleep modes are both supported to be wakened up by a touch sensor. For the Light-sleep mode, any installed touch button can wake it up. But only the sleep button can wake up from Deep-sleep mode, and the touch sensor will do a calibration immediately, the reference value will be calibrated to a wrong value if our finger does not remove timely. Though the wrong reference value recovers after the finger removes away and has no effect on the driver logic, if you do not want to see a wrong reference value while waking up from Deep-sleep mode, you can call `touch_element_sleep_enable_wakeup_calibration()` to disable the wakeup calibration.

The Touch Element Wakeup example is available in `system/light_sleep` directory.

```

void app_main()
{
    ...
    touch_element_install();
    touch_button_install(); //Initialize the touch button
    touch_button_create(&element_handle); //Create a new Touch element

    ...

    // ESP_ERROR_CHECK(touch_element_enable_light_sleep(&sleep_config));
    ESP_ERROR_CHECK(touch_element_enable_deep_sleep(button_handle[0], &sleep_
↪config));
    // ESP_ERROR_CHECK(touch_element_sleep_enable_wakeup_calibration(button_
↪handle[0], false)); // (optional) Disable wakeup calibration to prevent updating_
↪the benchmark to a wrong value

    touch_element_start();

    ...
}

```

## Application Example

All the Touch Element library examples could be found in the `peripherals/touch_sensor/touch_element` directory of ESP-IDF examples.

## API Reference - Touch Element Core

### Header File

- `components/touch_element/include/touch_element/touch_element.h`
- This header file can be included with:

```
#include "touch_element/touch_element.h"
```

- This header file is a part of the API provided by the `touch_element` component. To declare that your component depends on `touch_element`, add the following to your `CMakeLists.txt`:

```
REQUIRES touch_element
```

or

```
PRIV_REQUIRES touch_element
```

## Functions

*esp\_err\_t* **touch\_element\_install** (const *touch\_elem\_global\_config\_t* \*global\_config)

Touch element processing initialization.

---

**Note:** To reinitialize the touch element object, call `touch_element_uninstall()` first

---

**Parameters** `global_config` -- [in] Global initialization configuration structure

### Returns

- ESP\_OK: Successfully initialized
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Touch element is already initialized
- Others: Unknown touch driver layer or lower layer error

*esp\_err\_t* **touch\_element\_start** (void)

Touch element processing start.

This function starts the touch element processing system

---

**Note:** This function must only be called after all the touch element instances finished creating

---

### Returns

- ESP\_OK: Successfully started to process
- Others: Unknown touch driver layer or lower layer error

*esp\_err\_t* **touch\_element\_stop** (void)

Touch element processing stop.

This function stops the touch element processing system

---

**Note:** This function must be called before changing the system (hardware, software) parameters

---

### Returns

- ESP\_OK: Successfully stopped to process
- Others: Unknown touch driver layer or lower layer error

void **touch\_element\_uninstall** (void)

Release resources allocated using `touch_element_install`.

*esp\_err\_t* **touch\_element\_message\_receive** (*touch\_elem\_message\_t* \*element\_message, uint32\_t ticks\_to\_wait)

Get current event message of touch element instance.

This function will receive the touch element message (handle, event type, etc...) from `te_event_give()`. It will block until a touch element event or a timeout occurs.

### Parameters

- `element_message` -- [out] Touch element event message structure
- `ticks_to_wait` -- [in] Number of FreeRTOS ticks to block for waiting event

### Returns

- ESP\_OK: Successfully received touch element event
- ESP\_ERR\_INVALID\_STATE: Touch element library is not initialized
- ESP\_ERR\_INVALID\_ARG: `element_message` is null
- ESP\_ERR\_TIMEOUT: Timed out waiting for event

*esp\_err\_t* **touch\_element\_waterproof\_install** (const *touch\_elem\_waterproof\_config\_t* \*waterproof\_config)

Touch element waterproof initialization.

This function enables the hardware waterproof, then touch element system uses Shield-Sensor and Guard-Sensor to mitigate the influence of water-drop and water-stream.

---

**Note:** If the waterproof function is used, Shield-Sensor can not be disabled and it will use channel 14 as it's internal channel. Hence, the user can not use channel 14 for another propose. And the Guard-Sensor is not necessary since it is optional.

---

---

**Note:** Shield-Sensor: It always uses channel 14 as the shield channel, so user must connect the channel 14 and Shield-Layer in PCB since it will generate a synchronous signal automatically

---

---

**Note:** Guard-Sensor: This function is optional. If used, the user must connect the guard channel and Guard-Ring in PCB. Any channels user wants to protect should be added into Guard-Ring in PCB.

---

**Parameters** *waterproof\_config* -- [in] Waterproof configuration

**Returns**

- ESP\_OK: Successfully initialized
- ESP\_ERR\_INVALID\_STATE: Touch element library is not initialized
- ESP\_ERR\_INVALID\_ARG: waterproof\_config is null or invalid Guard-Sensor channel
- ESP\_ERR\_NO\_MEM: Insufficient memory

void **touch\_element\_waterproof\_uninstall** (void)

Release resources allocated using touch\_element\_waterproof\_install()

*esp\_err\_t* **touch\_element\_waterproof\_add** (*touch\_elem\_handle\_t* element\_handle)

Add a masked handle to protect while Guard-Sensor has been triggered.

This function will add an application handle (button, slider, etc...) as a masked handle. While Guard-Sensor has been triggered, waterproof function will start working and lock the application internal state. While the influence of water is reduced, the application will be unlock and reset into IDLE state.

---

**Note:** The waterproof protection logic must follow the real circuit in PCB, it means that all of the channels inside the input handle must be inside the Guard-Ring in real circuit.

---

**Parameters** *element\_handle* -- [in] Touch element instance handle

**Returns**

- ESP\_OK: Successfully added a masked handle
- ESP\_ERR\_INVALID\_STATE: Waterproof is not initialized
- ESP\_ERR\_INVALID\_ARG: element\_handle is null

*esp\_err\_t* **touch\_element\_waterproof\_remove** (*touch\_elem\_handle\_t* element\_handle)

Remove a masked handle to protect.

This function will remove an application handle from masked handle table.

**Parameters** *element\_handle* -- [in] Touch element instance handle

**Returns**

- ESP\_OK: Successfully removed a masked handle
- ESP\_ERR\_INVALID\_STATE: Waterproof is not initialized
- ESP\_ERR\_INVALID\_ARG: element\_handle is null

- `ESP_ERR_NOT_FOUND`: Failed to search `element_handle` from `waterproof_mask_handle` list

*esp\_err\_t* `touch_element_enable_light_sleep` (const *touch\_elem\_sleep\_config\_t* \*sleep\_config)

Touch element light sleep initialization.

---

**Note:** It should be called after touch button element installed. Any of installed touch element can wake up from the light sleep

---

**Parameters** `sleep_config` -- [in] Sleep configurations, set NULL to use default config

**Returns**

- `ESP_OK`: Successfully initialized touch sleep
- `ESP_ERR_INVALID_STATE`: Touch element is not installed or touch sleep has been installed
- `ESP_ERR_INVALID_ARG`: inputed argument is NULL
- `ESP_ERR_NO_MEM`: no memory for touch sleep struct
- `ESP_ERR_NOT_SUPPORTED`: inputed `wakeup_elem_handle` is not `touch_button_handle_t` type, currently only `touch_button_handle_t` supported

*esp\_err\_t* `touch_element_disable_light_sleep` (void)

Release the resources that allocated by `touch_element_enable_deep_sleep()`

This function will also disable the touch sensor to wake up the device

**Returns**

- `ESP_OK`: uninstall success
- `ESP_ERR_INVALID_STATE`: touch sleep has not been installed

*esp\_err\_t* `touch_element_enable_deep_sleep` (*touch\_elem\_handle\_t* wakeup\_elem\_handle, const *touch\_elem\_sleep\_config\_t* \*sleep\_config)

Touch element deep sleep initialization.

This function will enable the device wake-up from deep sleep or light sleep by touch sensor

---

**Note:** It should be called after touch button element installed. Only one touch button can be registered as the deep sleep wake-up button

---

**Parameters**

- `wakeup_elem_handle` -- [in] Touch element instance handle for waking up the device, only support button element
- `sleep_config` -- [in] Sleep configurations, set NULL to use default config

**Returns**

- `ESP_OK`: Successfully initialized touch sleep
- `ESP_ERR_INVALID_STATE`: Touch element is not installed or touch sleep has been installed
- `ESP_ERR_INVALID_ARG`: inputed argument is NULL
- `ESP_ERR_NO_MEM`: no memory for touch sleep struct
- `ESP_ERR_NOT_SUPPORTED`: inputed `wakeup_elem_handle` is not `touch_button_handle_t` type, currently only `touch_button_handle_t` supported

*esp\_err\_t* `touch_element_disable_deep_sleep` (void)

Release the resources that allocated by `touch_element_enable_deep_sleep()`

This function will also disable the touch sensor to wake up the device

**Returns**

- `ESP_OK`: uninstall success
- `ESP_ERR_INVALID_STATE`: touch sleep has not been installed

*esp\_err\_t* **touch\_element\_sleep\_enable\_wakeup\_calibration** (*touch\_elem\_handle\_t* element\_handle, bool en)

Touch element wake up calibrations.

This function will also disable the touch sensor to wake up the device

#### Returns

- ESP\_OK: uninstall success
- ESP\_ERR\_INVALID\_STATE: touch sleep has not been installed

### Structures

struct **touch\_elem\_sw\_config\_t**

Touch element software configuration.

#### Public Members

float **waterproof\_threshold\_divider**

Waterproof guard channel threshold divider.

uint8\_t **processing\_period**

Processing period(ms)

uint8\_t **intr\_message\_size**

Interrupt message queue size.

uint8\_t **event\_message\_size**

Event message queue size.

struct **touch\_elem\_hw\_config\_t**

Touch element hardware configuration.

#### Public Members

*touch\_high\_volt\_t* **upper\_voltage**

Touch sensor channel upper charge voltage.

*touch\_volt\_atten\_t* **voltage\_attenuation**

Touch sensor channel upper charge voltage attenuation (Diff voltage is upper - attenuation - lower)

*touch\_low\_volt\_t* **lower\_voltage**

Touch sensor channel lower charge voltage.

*touch\_pad\_conn\_type\_t* **suspend\_channel\_polarity**

Suspend channel polarity (High Impedance State or GND)

*touch\_pad\_denoise\_grade\_t* **denoise\_level**

Internal de-noise level.

*touch\_pad\_denoise\_cap\_t* **denoise\_equivalent\_cap**

Internal de-noise channel (Touch channel 0) equivalent capacitance.

*touch\_smooth\_mode\_t* **smooth\_filter\_mode**

Smooth value filter mode (This only apply to touch\_pad\_filter\_read\_smooth())

*touch\_filter\_mode\_t* **benchmark\_filter\_mode**

Benchmark filter mode.

uint16\_t **sample\_count**

The count of sample in each measurement of touch sensor.

uint16\_t **sleep\_cycle**

The cycle (RTC slow clock) of sleep.

uint8\_t **benchmark\_debounce\_count**

Benchmark debounce count.

uint8\_t **benchmark\_calibration\_threshold**

Benchmark calibration threshold.

uint8\_t **benchmark\_jitter\_step**

Benchmark jitter filter step (This only works at while benchmark filter mode is jitter filter)

struct **touch\_elem\_global\_config\_t**

Touch element global configuration passed to touch\_element\_install.

### Public Members

*touch\_elem\_hw\_config\_t* **hardware**

Hardware configuration.

*touch\_elem\_sw\_config\_t* **software**

Software configuration.

struct **touch\_elem\_waterproof\_config\_t**

Touch element waterproof configuration passed to touch\_element\_waterproof\_install.

### Public Members

*touch\_pad\_t* **guard\_channel**

Waterproof Guard-Sensor channel number (index)

float **guard\_sensitivity**

Waterproof Guard-Sensor sensitivity.

struct **touch\_elem\_sleep\_config\_t**

Touch element sleep configuration passed to `touch_element_enable_light_sleep` or `touch_element_enable_deep_sleep`.

### Public Members

uint16\_t **sample\_count**

scan times in every measurement, normally equal to the 'sample\_count' field in '*touch\_elem\_hw\_config\_t*'.

uint16\_t **sleep\_cycle**

sleep\_cycle decide the interval between two measurements,  $t_{\text{sleep}} = \text{sleep\_cycle} / (\text{RTC\_SLOW\_CLK frequency})$ , normally equal to the 'sleep\_cycle' field in '*touch\_elem\_hw\_config\_t*'.

struct **touch\_elem\_message\_t**

Touch element event message type from `touch_element_message_receive()`

### Public Members

*touch\_elem\_handle\_t* **handle**

Touch element handle.

*touch\_elem\_type\_t* **element\_type**

Touch element type.

void \***arg**

User input argument.

uint8\_t **child\_msg[8]**

Encoded message.

### Macros

**TOUCH\_ELEM\_GLOBAL\_DEFAULT\_CONFIG()**

**TOUCH\_ELEM\_EVENT\_NONE**

None event.

**TOUCH\_ELEM\_EVENT\_ON\_PRESS**

On Press event.

**TOUCH\_ELEM\_EVENT\_ON\_RELEASE**

On Release event.

**TOUCH\_ELEM\_EVENT\_ON\_LONGPRESS**

On LongPress event.

**TOUCH\_ELEM\_EVENT\_ON\_CALCULATION**

On Calculation event.

**TOUCH\_WATERPROOF\_GUARD\_NOUSE**

Waterproof no use guard sensor.

**Type Definitions**

```
typedef void *touch_elem_handle_t
```

Touch element handle type.

```
typedef uint32_t touch_elem_event_t
```

Touch element event type.

**Enumerations**

```
enum touch_elem_type_t
```

Touch element handle type.

*Values:*

```
enumerator TOUCH_ELEM_TYPE_BUTTON
```

Touch element button.

```
enumerator TOUCH_ELEM_TYPE_SLIDER
```

Touch element slider.

```
enumerator TOUCH_ELEM_TYPE_MATRIX
```

Touch element matrix button.

```
enum touch_elem_dispatch_t
```

Touch element event dispatch methods (event queue/callback)

*Values:*

```
enumerator TOUCH_ELEM_DISP_EVENT
```

Event queue dispatch.

```
enumerator TOUCH_ELEM_DISP_CALLBACK
```

Callback dispatch.

```
enumerator TOUCH_ELEM_DISP_MAX
```

**API Reference - Touch Button****Header File**

- [components/touch\\_element/include/touch\\_element/touch\\_button.h](#)
- This header file can be included with:

```
#include "touch_element/touch_button.h"
```

- This header file is a part of the API provided by the `touch_element` component. To declare that your component depends on `touch_element`, add the following to your `CMakeLists.txt`:

```
REQUIRES touch_element
```

or

PRIV_REQUIRES touch_element
-----------------------------

## Functions

*esp\_err\_t* **touch\_button\_install** (const *touch\_button\_global\_config\_t* \*global\_config)

Touch Button initialize.

This function initializes touch button global and acts on all touch button instances.

**Parameters** *global\_config* -- [in] Button object initialization configuration

### Returns

- ESP\_OK: Successfully initialized touch button
- ESP\_ERR\_INVALID\_STATE: Touch element library was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_init is NULL
- ESP\_ERR\_NO\_MEM: Insufficient memory

void **touch\_button\_uninstall** (void)

Release resources allocated using touch\_button\_install()

*esp\_err\_t* **touch\_button\_create** (const *touch\_button\_config\_t* \*button\_config, *touch\_button\_handle\_t* \*button\_handle)

Create a new touch button instance.

---

**Note:** The sensitivity has to be explored in experiments, Sensitivity = (Raw(touch) - Raw(release)) / Raw(release) \* 100%

---

### Parameters

- *button\_config* -- [in] Button configuration
- *button\_handle* -- [out] Button handle

### Returns

- ESP\_OK: Successfully create touch button
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_ARG: Invalid configuration struct or arguments is NULL

*esp\_err\_t* **touch\_button\_delete** (*touch\_button\_handle\_t* button\_handle)

Release resources allocated using touch\_button\_create()

**Parameters** *button\_handle* -- [in] Button handle

### Returns

- ESP\_OK: Successfully released resources
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_handle is null
- ESP\_ERR\_NOT\_FOUND: Input handle is not a button handle

*esp\_err\_t* **touch\_button\_subscribe\_event** (*touch\_button\_handle\_t* button\_handle, uint32\_t event\_mask, void \*arg)

Touch button subscribes event.

This function uses event mask to subscribe to touch button events, once one of the subscribed events occurs, the event message could be retrieved by calling touch\_element\_message\_receive() or input callback routine.

---

**Note:** Touch button only support three kind of event masks, they are TOUCH\_ELEM\_EVENT\_ON\_PRESS, TOUCH\_ELEM\_EVENT\_ON\_RELEASE, TOUCH\_ELEM\_EVENT\_ON\_LONGPRESS. You can use those event masks in any combination to achieve the desired effect.

---

### Parameters

- **button\_handle** -- [in] Button handle
- **event\_mask** -- [in] Button subscription event mask
- **arg** -- [in] User input argument

**Returns**

- ESP\_OK: Successfully subscribed touch button event
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_handle is null or event is not supported

*esp\_err\_t* **touch\_button\_set\_dispatch\_method** (*touch\_button\_handle\_t* button\_handle, *touch\_elem\_dispatch\_t* dispatch\_method)

Touch button set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

**Parameters**

- **button\_handle** -- [in] Button handle
- **dispatch\_method** -- [in] Dispatch method (By callback/event)

**Returns**

- ESP\_OK: Successfully set dispatch method
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_handle is null or dispatch\_method is invalid

*esp\_err\_t* **touch\_button\_set\_callback** (*touch\_button\_handle\_t* button\_handle, *touch\_button\_callback\_t* button\_callback)

Touch button set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

---

**Note:** Button message will be passed from the callback function and it will be destroyed when the callback function return.

---

**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling vTaskDelay().

**Parameters**

- **button\_handle** -- [in] Button handle
- **button\_callback** -- [in] User input callback

**Returns**

- ESP\_OK: Successfully set callback
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_handle or button\_callback is null

*esp\_err\_t* **touch\_button\_set\_longpress** (*touch\_button\_handle\_t* button\_handle, uint32\_t threshold\_time)

Touch button set long press trigger time.

This function sets the threshold time (ms) for a long press event. If a button is pressed and held for a period of time that exceeds the threshold time, a long press event is triggered.

**Parameters**

- **button\_handle** -- [in] Button handle
- **threshold\_time** -- [in] Threshold time (ms) of long press event occur

**Returns**

- ESP\_OK: Successfully set the threshold time of long press event
- ESP\_ERR\_INVALID\_STATE: Touch button driver was not initialized
- ESP\_ERR\_INVALID\_ARG: button\_handle is null or time (ms) is not lager than 0

```
const touch_button_message_t *touch_button_get_message (const touch_elem_message_t
                                                    *element_message)
```

Touch button get message.

This function decodes the element message from touch\_element\_message\_receive() and return a button message pointer.

**Parameters** `element_message` -- [in] element message

**Returns** Touch button message pointer

## Structures

```
struct touch_button_global_config_t
```

Button initialization configuration passed to touch\_button\_install.

### Public Members

float **threshold\_divider**

Button channel threshold divider.

uint32\_t **default\_lp\_time**

Button default LongPress event time (ms)

```
struct touch_button_config_t
```

Button configuration (for new instance) passed to touch\_button\_create()

### Public Members

*touch\_pad\_t* **channel\_num**

Button channel number (index)

float **channel\_sens**

Button channel sensitivity.

```
struct touch_button_message_t
```

Button message type.

### Public Members

*touch\_button\_event\_t* **event**

Button event.

## Macros

```
TOUCH_BUTTON_GLOBAL_DEFAULT_CONFIG ()
```

## Type Definitions

typedef *touch\_elem\_handle\_t* **touch\_button\_handle\_t**

Button handle.

typedef void (\***touch\_button\_callback\_t**)(*touch\_button\_handle\_t*, *touch\_button\_message\_t*\*, void\*)

Button callback type.

## Enumerations

enum **touch\_button\_event\_t**

Button event type.

*Values:*

enumerator **TOUCH\_BUTTON\_EVT\_ON\_PRESS**

Button Press event.

enumerator **TOUCH\_BUTTON\_EVT\_ON\_RELEASE**

Button Release event.

enumerator **TOUCH\_BUTTON\_EVT\_ON\_LONGPRESS**

Button LongPress event.

enumerator **TOUCH\_BUTTON\_EVT\_MAX**

## API Reference - Touch Slider

### Header File

- [components/touch\\_element/include/touch\\_element/touch\\_slider.h](#)
- This header file can be included with:

```
#include "touch_element/touch_slider.h"
```

- This header file is a part of the API provided by the `touch_element` component. To declare that your component depends on `touch_element`, add the following to your `CMakeLists.txt`:

```
REQUIRES touch_element
```

or

```
PRIV_REQUIRES touch_element
```

### Functions

*esp\_err\_t* **touch\_slider\_install** (const *touch\_slider\_global\_config\_t* \*global\_config)

Touch slider initialize.

This function initializes touch slider object and acts on all touch slider instances.

**Parameters** `global_config` -- [in] Touch slider global initialization configuration

**Returns**

- `ESP_OK`: Successfully initialized touch slider
- `ESP_ERR_INVALID_STATE`: Touch element library was not initialized
- `ESP_ERR_INVALID_ARG`: `slider_init` is NULL
- `ESP_ERR_NO_MEM`: Insufficient memory

void **touch\_slider\_uninstall** (void)

Release resources allocated using touch\_slider\_install()

*esp\_err\_t* **touch\_slider\_create** (const *touch\_slider\_config\_t* \*slider\_config, *touch\_slider\_handle\_t* \*slider\_handle)

Create a new touch slider instance.

---

**Note:** The index of Channel array and sensitivity array must be one-one correspondence

---

#### Parameters

- **slider\_config** -- **[in]** Slider configuration
- **slider\_handle** -- **[out]** Slider handle

#### Returns

- ESP\_OK: Successfully create touch slider
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: Invalid configuration struct or arguments is NULL
- ESP\_ERR\_NO\_MEM: Insufficient memory

*esp\_err\_t* **touch\_slider\_delete** (*touch\_slider\_handle\_t* slider\_handle)

Release resources allocated using touch\_slider\_create.

**Parameters** **slider\_handle** -- **[in]** Slider handle

#### Returns

- ESP\_OK: Successfully released resources
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle is null
- ESP\_ERR\_NOT\_FOUND: Input handle is not a slider handle

*esp\_err\_t* **touch\_slider\_subscribe\_event** (*touch\_slider\_handle\_t* slider\_handle, uint32\_t event\_mask, void \*arg)

Touch slider subscribes event.

This function uses event mask to subscribe to touch slider events, once one of the subscribed events occurs, the event message could be retrieved by calling touch\_element\_message\_receive() or input callback routine.

---

**Note:** Touch slider only support three kind of event masks, they are TOUCH\_ELEM\_EVENT\_ON\_PRESS, TOUCH\_ELEM\_EVENT\_ON\_RELEASE. You can use those event masks in any combination to achieve the desired effect.

---

#### Parameters

- **slider\_handle** -- **[in]** Slider handle
- **event\_mask** -- **[in]** Slider subscription event mask
- **arg** -- **[in]** User input argument

#### Returns

- ESP\_OK: Successfully subscribed touch slider event
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle is null or event is not supported

*esp\_err\_t* **touch\_slider\_set\_dispatch\_method** (*touch\_slider\_handle\_t* slider\_handle, *touch\_elem\_dispatch\_t* dispatch\_method)

Touch slider set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

#### Parameters

- **slider\_handle** -- **[in]** Slider handle
- **dispatch\_method** -- **[in]** Dispatch method (By callback/event)

**Returns**

- ESP\_OK: Successfully set dispatch method
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle is null or dispatch\_method is invalid

*esp\_err\_t* **touch\_slider\_set\_callback** (*touch\_slider\_handle\_t* slider\_handle, *touch\_slider\_callback\_t* slider\_callback)

Touch slider set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

---

**Note:** Slider message will be passed from the callback function and it will be destroyed when the callback function return.

---

**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling vTaskDelay().

**Parameters**

- **slider\_handle** -- [in] Slider handle
- **slider\_callback** -- [in] User input callback

**Returns**

- ESP\_OK: Successfully set callback
- ESP\_ERR\_INVALID\_STATE: Touch slider driver was not initialized
- ESP\_ERR\_INVALID\_ARG: slider\_handle or slider\_callback is null

const *touch\_slider\_message\_t* \***touch\_slider\_get\_message** (const *touch\_lem\_message\_t* \*element\_message)

Touch slider get message.

This function decodes the element message from touch\_element\_message\_receive() and return a slider message pointer.

**Parameters** **element\_message** -- [in] element message

**Returns** Touch slider message pointer

**Structures**

struct **touch\_slider\_global\_config\_t**

Slider initialization configuration passed to touch\_slider\_install.

**Public Members**

float **quantify\_lower\_threshold**

Slider signal quantification threshold.

float **threshold\_divider**

Slider channel threshold divider.

uint16\_t **filter\_reset\_time**

Slider position filter reset time (Unit is esp\_timer callback tick)

uint16\_t **benchmark\_update\_time**

Slider benchmark update time (Unit is esp\_timer callback tick)

uint8\_t **position\_filter\_size**

Moving window filter buffer size.

uint8\_t **position\_filter\_factor**

One-order IIR filter factor.

uint8\_t **calculate\_channel\_count**

The number of channels which will take part in calculation.

struct **touch\_slider\_config\_t**

Slider configuration (for new instance) passed to touch\_slider\_create()

### Public Members

const *touch\_pad\_t* \***channel\_array**

Slider channel array.

const float \***sensitivity\_array**

Slider channel sensitivity array.

uint8\_t **channel\_num**

The number of slider channels.

uint8\_t **position\_range**

The right region of touch slider position range, [0, position\_range (less than or equal to 255)].

struct **touch\_slider\_message\_t**

Slider message type.

### Public Members

*touch\_slider\_event\_t* **event**

Slider event.

*touch\_slider\_position\_t* **position**

Slider position.

### Macros

**TOUCH\_SLIDER\_GLOBAL\_DEFAULT\_CONFIG** ()

### Type Definitions

typedef uint32\_t **touch\_slider\_position\_t**

Slider position data type.

typedef *touch\_elem\_handle\_t* **touch\_slider\_handle\_t**

Slider instance handle.

typedef void (\***touch\_slider\_callback\_t**)(*touch\_slider\_handle\_t*, *touch\_slider\_message\_t*\*, void\*)

Slider callback type.

## Enumerations

enum **touch\_slider\_event\_t**

Slider event type.

*Values:*

enumerator **TOUCH\_SLIDER\_EVT\_ON\_PRESS**

Slider on Press event.

enumerator **TOUCH\_SLIDER\_EVT\_ON\_RELEASE**

Slider on Release event.

enumerator **TOUCH\_SLIDER\_EVT\_ON\_CALCULATION**

Slider on Calculation event.

enumerator **TOUCH\_SLIDER\_EVT\_MAX**

## API Reference - Touch Matrix

### Header File

- [components/touch\\_element/include/touch\\_element/touch\\_matrix.h](#)
- This header file can be included with:

```
#include "touch_element/touch_matrix.h"
```

- This header file is a part of the API provided by the `touch_element` component. To declare that your component depends on `touch_element`, add the following to your `CMakeLists.txt`:

```
REQUIRES touch_element
```

or

```
PRIV_REQUIRES touch_element
```

### Functions

*esp\_err\_t* **touch\_matrix\_install** (const *touch\_matrix\_global\_config\_t* \*global\_config)

Touch matrix button initialize.

This function initializes touch matrix button object and acts on all touch matrix button instances.

**Parameters** `global_config` -- [in] Touch matrix global initialization configuration

#### Returns

- `ESP_OK`: Successfully initialized touch matrix button
- `ESP_ERR_INVALID_STATE`: Touch element library was not initialized
- `ESP_ERR_INVALID_ARG`: `matrix_init` is NULL
- `ESP_ERR_NO_MEM`: Insufficient memory

void **touch\_matrix\_uninstall** (void)

Release resources allocated using touch\_matrix\_install()

*esp\_err\_t* **touch\_matrix\_create** (const *touch\_matrix\_config\_t* \*matrix\_config, *touch\_matrix\_handle\_t* \*matrix\_handle)

Create a new touch matrix button instance.

---

**Note:** Channel array and sensitivity array must be one-one correspondence in those array

---

---

**Note:** Touch matrix button does not support Multi-Touch now

---

#### Parameters

- **matrix\_config** -- [in] Matrix button configuration
- **matrix\_handle** -- [out] Matrix button handle

#### Returns

- ESP\_OK: Successfully create touch matrix button
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: Invalid configuration struct or arguments is NULL
- ESP\_ERR\_NO\_MEM: Insufficient memory

*esp\_err\_t* **touch\_matrix\_delete** (*touch\_matrix\_handle\_t* matrix\_handle)

Release resources allocated using touch\_matrix\_create()

**Parameters** **matrix\_handle** -- [in] Matrix handle

#### Returns

- ESP\_OK: Successfully released resources
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null
- ESP\_ERR\_NOT\_FOUND: Input handle is not a matrix handle

*esp\_err\_t* **touch\_matrix\_subscribe\_event** (*touch\_matrix\_handle\_t* matrix\_handle, uint32\_t event\_mask, void \*arg)

Touch matrix button subscribes event.

This function uses event mask to subscribe to touch matrix events, once one of the subscribed events occurs, the event message could be retrieved by calling touch\_element\_message\_receive() or input callback routine.

---

**Note:** Touch matrix button only support three kind of event masks, they are TOUCH\_ELEM\_EVENT\_ON\_PRESS, TOUCH\_ELEM\_EVENT\_ON\_RELEASE, TOUCH\_ELEM\_EVENT\_ON\_LONGPRESS. You can use those event masks in any combination to achieve the desired effect.

---

#### Parameters

- **matrix\_handle** -- [in] Matrix handle
- **event\_mask** -- [in] Matrix subscription event mask
- **arg** -- [in] User input argument

#### Returns

- ESP\_OK: Successfully subscribed touch matrix event
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null or event is not supported

*esp\_err\_t* **touch\_matrix\_set\_dispatch\_method** (*touch\_matrix\_handle\_t* matrix\_handle, *touch\_elem\_dispatch\_t* dispatch\_method)

Touch matrix button set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

#### Parameters

- **matrix\_handle** -- [in] Matrix button handle
- **dispatch\_method** -- [in] Dispatch method (By callback/event)

#### Returns

- ESP\_OK: Successfully set dispatch method
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null or dispatch\_method is invalid

*esp\_err\_t* **touch\_matrix\_set\_callback** (*touch\_matrix\_handle\_t* matrix\_handle, *touch\_matrix\_callback\_t* matrix\_callback)

Touch matrix button set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

---

**Note:** Matrix message will be passed from the callback function and it will be destroyed when the callback function return.

---

**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling vTaskDelay().

#### Parameters

- **matrix\_handle** -- [in] Matrix button handle
- **matrix\_callback** -- [in] User input callback

#### Returns

- ESP\_OK: Successfully set callback
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle or matrix\_callback is null

*esp\_err\_t* **touch\_matrix\_set\_longpress** (*touch\_matrix\_handle\_t* matrix\_handle, uint32\_t threshold\_time)

Touch matrix button set long press trigger time.

This function sets the threshold time (ms) for a long press event. If a matrix button is pressed and held for a period of time that exceeds the threshold time, a long press event is triggered.

#### Parameters

- **matrix\_handle** -- [in] Matrix button handle
- **threshold\_time** -- [in] Threshold time (ms) of long press event occur

#### Returns

- ESP\_OK: Successfully set the time of long press event
- ESP\_ERR\_INVALID\_STATE: Touch matrix driver was not initialized
- ESP\_ERR\_INVALID\_ARG: matrix\_handle is null or time (ms) is 0

const *touch\_matrix\_message\_t* \***touch\_matrix\_get\_message** (const *touch\_elem\_message\_t* \*element\_message)

Touch matrix get message.

This function decodes the element message from touch\_element\_message\_receive() and return a matrix message pointer.

**Parameters** *element\_message* -- [in] element message

**Returns** Touch matrix message pointer

## Structures

struct **touch\_matrix\_global\_config\_t**

Matrix button initialization configuration passed to `touch_matrix_install`.

### Public Members

float **threshold\_divider**

Matrix button channel threshold divider.

uint32\_t **default\_lp\_time**

Matrix button default LongPress event time (ms)

struct **touch\_matrix\_config\_t**

Matrix button configuration (for new instance) passed to `touch_matrix_create()`

### Public Members

const *touch\_pad\_t* \***x\_channel\_array**

Matrix button x-axis channels array.

const *touch\_pad\_t* \***y\_channel\_array**

Matrix button y-axis channels array.

const float \***x\_sensitivity\_array**

Matrix button x-axis channels sensitivity array.

const float \***y\_sensitivity\_array**

Matrix button y-axis channels sensitivity array.

uint8\_t **x\_channel\_num**

The number of channels in x-axis.

uint8\_t **y\_channel\_num**

The number of channels in y-axis.

struct **touch\_matrix\_position\_t**

Matrix button position data type.

### Public Members

uint8\_t **x\_axis**

Matrix button x axis position.

uint8\_t **y\_axis**

Matrix button y axis position.

uint8\_t **index**

Matrix button position index.

struct **touch\_matrix\_message\_t**

Matrix message type.

### Public Members

*touch\_matrix\_event\_t* **event**

Matrix event.

*touch\_matrix\_position\_t* **position**

Matrix position.

### Macros

**TOUCH\_MATRIX\_GLOBAL\_DEFAULT\_CONFIG** ()

### Type Definitions

typedef *touch\_lem\_handle\_t* **touch\_matrix\_handle\_t**

Matrix button instance handle.

typedef void (\***touch\_matrix\_callback\_t**)(*touch\_matrix\_handle\_t*, *touch\_matrix\_message\_t*\*, void\*)

Matrix button callback type.

### Enumerations

enum **touch\_matrix\_event\_t**

Matrix button event type.

*Values:*

enumerator **TOUCH\_MATRIX\_EVT\_ON\_PRESS**

Matrix button Press event.

enumerator **TOUCH\_MATRIX\_EVT\_ON\_RELEASE**

Matrix button Press event.

enumerator **TOUCH\_MATRIX\_EVT\_ON\_LONGPRESS**

Matrix button LongPress event.

enumerator **TOUCH\_MATRIX\_EVT\_MAX**

## 2.5.26 Two-Wire Automotive Interface (TWAI)

### Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S2 contains 1 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

### Sections

- *Two-Wire Automotive Interface (TWAI)*
  - *Overview*
  - *TWAI Protocol Summary*
  - *Signals Lines and Transceiver*
  - *API Naming Conventions*
  - *Driver Configuration*
  - *Driver Operation*
  - *Examples*
  - *API Reference*

### TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signaling:** Every node constantly monitors the bus. When any node detects an error, it signals the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This results in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as "fault confinement" where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node's **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

### Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g., using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX, RX, BUS-OFF, and CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-S2's GPIO pads.

Fig. 29: Signal lines of the TWAI controller

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0 V), and a recessive bit as a high logic level (3.3 V).

**BUS-OFF:** The BUS-OFF signal line is **optional** and is set to a low logic level (0 V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3 V) otherwise.

**CLKOUT:** The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock.

---

**Note:** An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

---

## API Naming Conventions

**Note:** The TWAI driver provides two sets of API. One is handle-free and is widely used in IDF versions earlier than v5.2, but it can only support one TWAI hardware controller. The other set is with handles, and the function name is usually suffixed with "v2", which can support any number of TWAI controllers. These two sets of API can be used at the same time, but it is recommended to use the "v2" version in your new projects.

## Driver Configuration

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode prevents the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller is still able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

Table 4: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

**Note:** The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI\_ALERT\_ABOVE\_ERR\_WARN is raised when the TEC or REC becomes larger then or equal to the error

warning limit. The `TWAI_ALERT_BELOW_ERR_WARN` is raised when both TEC and REC return back to values below **96**.

**Note:** When enabling alerts, the `TWAI_ALERT_AND_LOG` flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and `TWAI_ALERT_AND_LOG` if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

**Note:** The `TWAI_ALERT_ALL` and `TWAI_ALERT_NONE` macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a pre-scaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock. On the ESP32-S2, the `brp` can be **any even number from 2 to 32768**. Alternatively, you can decide the resolution of each quantum, by setting `twai_timing_config_t::quanta_resolution_hz` to a non-zero value. In this way, the driver can calculate the underlying `brp` value for you. It is useful when you set different clock sources but want the bitrate to keep the same.

Supported clock source for a TWAI controller is listed in the `twai_clock_source_t` and can be specified in `twai_timing_config_t::clk_src`.

Fig. 30: Bit timing configuration for 500kbit/s given `BRP = 8`, clock source frequency is 80MHz

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** causes 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

**Note:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS`
- `TWAI_TIMING_CONFIG_800KBITS`

- TWAI\_TIMING\_CONFIG\_500KBITS
- TWAI\_TIMING\_CONFIG\_250KBITS
- TWAI\_TIMING\_CONFIG\_125KBITS
- TWAI\_TIMING\_CONFIG\_100KBITS
- TWAI\_TIMING\_CONFIG\_50KBITS
- TWAI\_TIMING\_CONFIG\_25KBITS
- TWAI\_TIMING\_CONFIG\_20KBITS
- TWAI\_TIMING\_CONFIG\_16KBITS
- TWAI\_TIMING\_CONFIG\_12\_5KBITS
- TWAI\_TIMING\_CONFIG\_10KBITS
- TWAI\_TIMING\_CONFIG\_5KBITS
- TWAI\_TIMING\_CONFIG\_1KBITS

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **does not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within *twai\_filter\_config\_t* known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode uses the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 31: Bit layout of single filter mode (Right side MSBit)

**Dual Filter Mode** uses the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 32: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue** The TX queue can be disabled during configuration by setting the *tx\_queue\_len* member of *twai\_general\_config\_t* to 0. This allows applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM** The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR continues to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 33: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled > Stopped	<code>twai_driver_install()</code>
B	Stopped > Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped > Running	<code>twai_start()</code>
D	Running > Stopped	<code>twai_stop()</code>
E	Running > Bus-Off	Transmit Error Counter $\geq$ 256
F	Bus-Off > Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off > Recovering	<code>twai_initiate_recovery()</code>
H	Recovering > Stopped	128 occurrences of 11 consecutive recessive bits.

**Driver States Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller is unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore, the TWAI controller is able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller is unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver remains in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags** The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON_COMPLIANT	Message's Data length code is larger than 8. This will break compliance with CAN and TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

## Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
    }
}
```

(continues on next page)

```

    return;
}
...
}

```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Install Multiple TWAI Instances** The following code snippet demonstrates how to install multiple TWAI instances via the use of the `twai_driver_install_v2()` function.

```

#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    twai_handle_t twai_bus_0;
    twai_handle_t twai_bus_1;
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_0, GPIO_
↪NUM_1, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install driver for TWAI bus 0
    g_config.controller_id = 0;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_0) ==_
↪ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_0) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Install driver for TWAI bus 1
    g_config.controller_id = 1;
    g_config.tx_io = GPIO_NUM_2;
    g_config.rx_io = GPIO_NUM_3;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_1) ==_
↪ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
    //Start TWAI driver
    if (twai_start_v2(twai_bus_1) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }
}

```

(continues on next page)

(continued from previous page)

```

//Other Driver operations must use version 2 API as well
...
}

```

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```

#include "driver/twai.h"

...

// Configure message to transmit
twai_message_t message = {
    // Message type and format settings
    .extd = 1,           // Standard vs extended format
    .rtr = 0,           // Data vs RTR frame
    .ss = 0,            // Whether the message is single shot (i.e., does not
    ↪repeat on error)
    .self = 0,          // Whether the message is a self reception request
    ↪(loopback)
    .dlc_non_comp = 0, // DLC is less than 8
    // Message ID and payload
    .identifier = 0xAAAA,
    .data_length_code = 4,
    .data = {0, 1, 2, 3},
};

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}

```

(continues on next page)

(continued from previous page)

```
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

**Reconfiguring and Reading Alerts** The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```
#include "driver/twai.h"
...
//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```
#include "driver/twai.h"
...
//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs are accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
```

(continues on next page)

(continued from previous page)

```
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

**Application Examples Network Example:** The TWAI Network example demonstrates communication between two ESP32-S2s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai\\_network](#).

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai\\_alert\\_and\\_recovery](#).

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai\\_self\\_test](#).

## API Reference

### Header File

- [components/hal/include/hal/twai\\_types.h](#)
- This header file can be included with:

```
#include "hal/twai_types.h"
```

### Structures

struct **twai\_message\_t**

Structure to store a TWAI message.

---

**Note:** The flags member is deprecated

---

### Public Members

uint32\_t **extd**

Extended Frame Format (29bit ID)

uint32\_t **rtr**

Message is a Remote Frame

uint32\_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32\_t **self**

Transmit as a Self Reception Request. Unused for received.

**uint32\_t dlc\_non\_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

**uint32\_t reserved**

Reserved bits

**uint32\_t flags**

Deprecated: Alternate way to set bits using message flags

**uint32\_t identifier**

11 or 29 bit identifier

**uint8\_t data\_length\_code**

Data length code

**uint8\_t data[TWAI\_FRAME\_MAX\_DLC]**

Data bytes (not relevant in RTR frame)

**struct twai\_timing\_config\_t**

Structure for bit timing configuration of the TWAI driver.

---

**Note:** Macro initializers are available for this structure

---

**Public Members*****twai\_clock\_source\_t* clk\_src**

Clock source, set to 0 or TWAI\_CLK\_SRC\_DEFAULT if you want a default clock source

**uint32\_t quanta\_resolution\_hz**

The resolution of one timing quanta, in Hz. Note: the value of `brp` will be reflected by this field if it's non-zero, otherwise, `brp` needs to be set manually

**uint32\_t brp**

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported

**uint8\_t tseg\_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

**uint8\_t tseg\_2**

Timing segment 2 (Number of time quanta, 1 to 8)

**uint8\_t sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

**bool triple\_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai\_filter\_config\_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

---

**Note:** Macro initializers are available for this structure

---

### Public Members

uint32\_t **acceptance\_code**

32-bit acceptance code

uint32\_t **acceptance\_mask**

32-bit acceptance mask

bool **single\_filter**

Use Single Filter Mode (see documentation)

### Macros

**TWAI\_EXTD\_ID\_MASK**

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

**TWAI\_STD\_ID\_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI\_FRAME\_MAX\_DLC**

Max data bytes allowed in TWAI

**TWAI\_FRAME\_EXTD\_ID\_LEN\_BYTES**

EFF ID requires 4 bytes (29bit)

**TWAI\_FRAME\_STD\_ID\_LEN\_BYTES**

SFF ID requires 2 bytes (11bit)

**TWAI\_ERR\_PASS\_THRESH**

Error counter threshold for error passive

### Type Definitions

typedef *soc\_periph\_twai\_clk\_src\_t* **twai\_clock\_source\_t**

RMT group clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

## Enumerations

enum **twai\_mode\_t**

TWAI Controller operating modes.

*Values:*

enumerator **TWAI\_MODE\_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI\_MODE\_NO\_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI\_MODE\_LISTEN\_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

## Header File

- [components/driver/twai/include/driver/twai.h](#)
- This header file can be included with:

```
#include "driver/twai.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

## Functions

**esp\_err\_t twai\_driver\_install** (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

---

**Note:** Macro initializers are available for the configuration structures (see documentation)

---

---

**Note:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

---

### Parameters

- **g\_config** -- [in] General configuration structure
- **t\_config** -- [in] Timing configuration structure
- **f\_config** -- [in] Filter configuration structure

### Returns

- **ESP\_OK**: Successfully installed TWAI driver
- **ESP\_ERR\_INVALID\_ARG**: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution
- **ESP\_ERR\_NO\_MEM**: Insufficient memory
- **ESP\_ERR\_INVALID\_STATE**: Driver is already installed

*esp\_err\_t twai\_driver\_install\_v2* (const *twai\_general\_config\_t* \*g\_config, const *twai\_timing\_config\_t* \*t\_config, const *twai\_filter\_config\_t* \*f\_config, *twai\_handle\_t* \*ret\_twai)

Install TWAI driver and return a handle.

---

**Note:** This is an advanced version of `twai_driver_install` that can return a driver handle, so that it allows you to install multiple TWAI drivers. Don't forget to set the proper `controller_id` in the `twai_general_config_t`. Please refer to the documentation of `twai_driver_install` for more details.

---

#### Parameters

- **g\_config** -- [in] General configuration structure
- **t\_config** -- [in] Timing configuration structure
- **f\_config** -- [in] Filter configuration structure
- **ret\_twai** -- [out] Pointer to a new created TWAI handle

#### Returns

- ESP\_OK: Successfully installed TWAI driver
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution, invalid controller ID
- ESP\_ERR\_NO\_MEM: Insufficient memory
- ESP\_ERR\_INVALID\_STATE: Driver is already installed

*esp\_err\_t twai\_driver\_uninstall* (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

<p><b>Warning:</b> The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.</p>
--

#### Returns

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t twai\_driver\_uninstall\_v2* (*twai\_handle\_t* handle)

Uninstall the TWAI driver with a given handle.

---

**Note:** This is an advanced version of `twai_driver_uninstall` that can uninstall a TWAI driver with a given handle. Please refer to the documentation of `twai_driver_uninstall` for more details.

---

**Parameters** **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`

#### Returns

- ESP\_OK: Successfully uninstalled TWAI driver
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped/bus-off state, or is not installed

*esp\_err\_t twai\_start* (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Returns**

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

*esp\_err\_t twai\_start\_v2* (*twai\_handle\_t* handle)

Start the TWAI driver with a given handle.

---

**Note:** This is an advanced version of `twai_start` that can start a TWAI driver with a given handle. Please refer to the documentation of `twai_start` for more details.

---

**Parameters** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP\_OK: TWAI driver is now running
- ESP\_ERR\_INVALID\_STATE: Driver is not in stopped state, or is not installed

*esp\_err\_t twai\_stop* (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Returns**

- ESP\_OK: TWAI driver is now Stopped
- ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

*esp\_err\_t twai\_stop\_v2* (*twai\_handle\_t* handle)

Stop the TWAI driver with a given handle.

---

**Note:** This is an advanced version of `twai_stop` that can stop a TWAI driver with a given handle. Please refer to the documentation of `twai_stop` for more details.

---

**Parameters** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP\_OK: TWAI driver is now Stopped
- ESP\_ERR\_INVALID\_STATE: Driver is not in running state, or is not installed

*esp\_err\_t twai\_transmit* (const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

---

**Note:** This function does not guarantee that the transmission is successful. The TX\_SUCCESS/TX\_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

---

---

**Note:** The TX\_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

---

#### Parameters

- **message** -- [in] Message to transmit
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on the TX queue

#### Returns

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_transmit\_v2* (*twai\_handle\_t* handle, const *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Transmit a TWAI message via a given handle.

---

**Note:** This is an advanced version of `twai_transmit` that can transmit a TWAI message with a given handle. Please refer to the documentation of `twai_transmit` for more details.

---

#### Parameters

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- [in] Message to transmit
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on the TX queue

#### Returns

- ESP\_OK: Transmission successfully queued/initiated
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_TIMEOUT: Timed out waiting for space on TX queue
- ESP\_FAIL: TX queue is disabled and another message is currently transmitting
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in running state, or is not installed
- ESP\_ERR\_NOT\_SUPPORTED: Listen Only Mode does not support transmissions

*esp\_err\_t twai\_receive* (*twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

**Warning:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

#### Parameters

- **message** -- [out] Received message
- **ticks\_to\_wait** -- [in] Number of FreeRTOS ticks to block on RX queue

#### Returns

- ESP\_OK: Message successfully received from RX queue
- ESP\_ERR\_TIMEOUT: Timed out waiting for message
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_receive\_v2* (*twai\_handle\_t* handle, *twai\_message\_t* \*message, TickType\_t ticks\_to\_wait)

Receive a TWAI message via a given handle.

---

**Note:** This is an advanced version of `twai_receive` that can receive a TWAI message with a given handle. Please refer to the documentation of `twai_receive` for more details.

---

#### Parameters

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **message** -- **[out]** Received message
- **ticks\_to\_wait** -- **[in]** Number of FreeRTOS ticks to block on RX queue

#### Returns

- `ESP_OK`: Message successfully received from RX queue
- `ESP_ERR_TIMEOUT`: Timed out waiting for message
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts* (uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

---

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

---

#### Parameters

- **alerts** -- **[out]** Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** -- **[in]** Number of FreeRTOS ticks to block for alert

#### Returns

- `ESP_OK`: Alerts read
- `ESP_ERR_TIMEOUT`: Timed out waiting for alerts
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t twai\_read\_alerts\_v2* (*twai\_handle\_t* handle, uint32\_t \*alerts, TickType\_t ticks\_to\_wait)

Read TWAI driver alerts with a given handle.

---

**Note:** This is an advanced version of `twai_read_alerts` that can read TWAI driver alerts with a given handle. Please refer to the documentation of `twai_read_alerts` for more details.

---

#### Parameters

- **handle** -- **[in]** TWAI driver handle returned by `twai_driver_install_v2`
- **alerts** -- **[out]** Bit field of raised alerts (see documentation for alert flags)
- **ticks\_to\_wait** -- **[in]** Number of FreeRTOS ticks to block for alert

#### Returns

- `ESP_OK`: Alerts read
- `ESP_ERR_TIMEOUT`: Timed out waiting for alerts
- `ESP_ERR_INVALID_ARG`: Arguments are invalid
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t twai\_reconfigure\_alerts* (uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Parameters**

- **alerts\_enabled** -- [in] Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** -- [out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**

- ESP\_OK: Alerts reconfigured
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_reconfigure\_alerts\_v2* (*twai\_handle\_t* handle, uint32\_t alerts\_enabled, uint32\_t \*current\_alerts)

Reconfigure which alerts are enabled, with a given handle.

---

**Note:** This is an advanced version of `twai_reconfigure_alerts` that can reconfigure which alerts are enabled with a given handle. Please refer to the documentation of `twai_reconfigure_alerts` for more details.

---

**Parameters**

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **alerts\_enabled** -- [in] Bit field of alerts to enable (see documentation for alert flags)
- **current\_alerts** -- [out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**

- ESP\_OK: Alerts reconfigured
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t twai\_initiate\_recovery* (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

---

**Note:** The `BUS_RECOVERED` alert can be enabled to alert the application when the bus recovery process completes.

---

**Returns**

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t twai\_initiate\_recovery\_v2* (*twai\_handle\_t* handle)

Start the bus recovery process with a given handle.

---

**Note:** This is an advanced version of `twai_initiate_recovery` that can start the bus recovery process with a given handle. Please refer to the documentation of `twai_initiate_recovery` for more details.

---

**Parameters** **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP\_OK: Bus recovery started
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not in the bus-off state, or is not installed

*esp\_err\_t twai\_get\_status\_info* (*twai\_status\_info\_t* \*status\_info)

Get current status information of the TWAI driver.

**Parameters** `status_info` -- [out] Status information

**Returns**

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* `twai_get_status_info_v2` (*twai\_handle\_t* handle, *twai\_status\_info\_t* \*status\_info)

Get current status information of a given TWAI driver handle.

---

**Note:** This is an advanced version of `twai_get_status_info` that can get current status information of a given TWAI driver handle. Please refer to the documentation of `twai_get_status_info` for more details.

---

**Parameters**

- **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`
- **status\_info** -- [out] Status information

**Returns**

- ESP\_OK: Status information retrieved
- ESP\_ERR\_INVALID\_ARG: Arguments are invalid
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed

*esp\_err\_t* `twai_clear_transmit_queue` (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

---

**Note:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

---

**Returns**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t* `twai_clear_transmit_queue_v2` (*twai\_handle\_t* handle)

Clear the transmit queue of a given TWAI driver handle.

---

**Note:** This is an advanced version of `twai_clear_transmit_queue` that can clear the transmit queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_transmit_queue` for more details.

---

**Parameters** **handle** -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP\_OK: Transmit queue cleared
- ESP\_ERR\_INVALID\_STATE: TWAI driver is not installed or TX queue is disabled

*esp\_err\_t* `twai_clear_receive_queue` (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

---

**Note:** The receive queue is automatically cleared when `twai_start()` is called.

---

**Returns**

- ESP\_OK: Transmit queue cleared

- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

*esp\_err\_t* `twai_clear_receive_queue_v2` (*twai\_handle\_t* handle)

Clear the receive queue of a given TWAI driver handle.

---

**Note:** This is an advanced version of `twai_clear_receive_queue` that can clear the receive queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_receive_queue` for more details.

---

**Parameters** `handle` -- [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- `ESP_OK`: Transmit queue cleared
- `ESP_ERR_INVALID_STATE`: TWAI driver is not installed

## Structures

struct `twai_general_config_t`

Structure for general configuration of the TWAI driver.

---

**Note:** Macro initializers are available for this structure

---

## Public Members

int `controller_id`

TWAI controller ID, index from 0. If you want to install TWAI driver with a non-zero `controller_id`, please use `twai_driver_install_v2`

*twai\_mode\_t* `mode`

Mode of TWAI controller

gpio\_num\_t `tx_io`

Transmit GPIO number

gpio\_num\_t `rx_io`

Receive GPIO number

gpio\_num\_t `clkout_io`

CLKOUT GPIO number (optional, set to -1 if unused)

gpio\_num\_t `bus_off_io`

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32\_t `tx_queue_len`

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32\_t `rx_queue_len`

Number of messages RX queue can hold

uint32\_t **alerts\_enabled**

Bit field of alerts to enable (see documentation)

uint32\_t **clkout\_divider**

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int **intr\_flags**

Interrupt flags to set the priority of the driver's ISR. Note that to use the ESP\_INTR\_FLAG\_IRAM, the CONFIG\_TWAI\_ISR\_IN\_IRAM option should be enabled first.

struct **twai\_status\_info\_t**

Structure to store status information of TWAI driver.

### Public Members

*twai\_state\_t* **state**

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32\_t **msgs\_to\_tx**

Number of messages queued for transmission or awaiting transmission completion

uint32\_t **msgs\_to\_rx**

Number of messages in RX queue waiting to be read

uint32\_t **tx\_error\_counter**

Current value of Transmit Error Counter

uint32\_t **rx\_error\_counter**

Current value of Receive Error Counter

uint32\_t **tx\_failed\_count**

Number of messages that failed transmissions

uint32\_t **rx\_missed\_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32\_t **rx\_overshoot\_count**

Number of messages that were lost due to a RX FIFO overrun

uint32\_t **arb\_lost\_count**

Number of instances arbitration was lost

uint32\_t **bus\_error\_count**

Number of instances a bus error has occurred

### Macros

**TWAI\_IO\_UNUSED**

Marks GPIO as unused in TWAI configuration

## Type Definitions

typedef struct twai\_obj\_t **\*twai\_handle\_t**  
TWAI controller handle.

## Enumerations

enum **twai\_state\_t**

TWAI driver states.

*Values:*

enumerator **TWAI\_STATE\_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI\_STATE\_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI\_STATE\_BUS\_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI\_STATE\_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

## 2.5.27 Universal Asynchronous Receiver/Transmitter (UART)

### Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-S2 chip has 2 UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit, etc. All the regular UART controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

### Functional Overview

The overview describes how to establish communication between an ESP32-S2 and other UART devices using the functions and data types of the UART driver. A typical programming workflow is broken down into the sections provided below:

1. *Set Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Set Communication Pins* - Assigning pins for connection to a device
3. *Install Drivers* - Allocating ESP32-S2's resources for the UART driver
4. *Run UART Communication* - Sending/receiving data
5. *Use Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Set Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart\\_echo](#).

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 5: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Set Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the TX, RX, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro `UART_PIN_NO_CHANGE` should be specified for pins that will not be used.

```
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

**Install Drivers** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- UART port number

- Size of TX ring buffer
- Size of RX ring buffer
- Pointer to store the event queue handle
- Event queue size
- Flags to allocate an interrupt

The function allocates the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Run UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into TX FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into RX FIFO buffer
3. Read the data from RX FIFO buffer

Therefore, an application only writes and reads data from a specific buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM does the rest.

**Transmit Data** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function copies the data to the TX ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the TX FIFO buffer, an interrupt service routine (ISR) moves the data from the TX ring buffer to the TX FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the TX line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the TX FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function does not block until space is available. Instead, it writes all data which can immediately fit into the hardware TX FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the TX FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receive Data** Once the data is received by the UART and saved in the RX FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the RX FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the RX FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver handles the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Use Interrupts** There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-S2 Technical Reference Manual > UART Controller (UART) > UART Interrupts* and *UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The UART driver provides a convenient way to handle specific interrupts by wrapping them into corresponding events. Events defined in `uart_event_type_t` can be reported to a user application using the FreeRTOS queue functionality.

To receive the events that have happened, call `uart_driver_install()` and get the event queue handle returned from the function. Please see the above *code snippet* as an example.

The processed events include the following:

- **FIFO overflow** (`UART_FIFO_OVF`): The RX FIFO can trigger an interrupt when it receives more data than the FIFO can store.
  - (Optional) Configure the full threshold of the FIFO space by entering it in the structure `uart_intr_config_t` and call `uart_intr_config()` to set the configuration. This can help the data stored in the RX FIFO can be processed timely in the driver to avoid FIFO overflow.
  - Enable the interrupts using the functions `uart_enable_rx_intr()`.
  - Disable these interrupts using the corresponding functions `uart_disable_rx_intr()`.

```
const uart_port_t uart_num = UART_NUM_1;
// Configure a UART interrupt threshold and timeout
uart_intr_config_t uart_intr = {
    .intr_enable_mask = UART_INTR_RXFIFO_FULL | UART_INTR_RXFIFO_TOUT,
    .rxfifo_full_thresh = 100,
```

(continues on next page)

(continued from previous page)

```

        .rx_timeout_thresh = 10,
    };
    ESP_ERROR_CHECK(uart_intr_config(uart_num, &uart_intr));

    // Enable UART RX FIFO full threshold and timeout interrupts
    ESP_ERROR_CHECK(uart_enable_rx_intr(uart_num));

```

- **Pattern detection (*UART\_PATTERN\_DET*):** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly. It can be used, e.g., to detect a command string with a specific number of identical characters (the 'pattern') at the end. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

```

//Set UART pattern detect function
uart_enable_pattern_det_baud_intr(EX_UART_NUM, '+', PATTERN_CHR_NUM, 9, 0, 0);

```

- **Other events:** The UART driver can report other events such as data receiving (*UART\_DATA*), ring buffer full (*UART\_BUFFER\_FULL*), detecting NULL after the stop bit (*UART\_BREAK*), parity check error (*UART\_PARITY\_ERR*), and frame error (*UART\_FRAME\_ERR*).

The strings inside of brackets indicate corresponding event names. An example of how to handle various UART events can be found in [peripherals/uart/uart\\_events](#).

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Macros** The API also defines several macros. For example, *UART\_HW\_FIFO\_LEN* defines the length of hardware FIFO buffers; *UART\_BITRATE\_MAX* gives the maximum baud rate supported by the UART controllers, etc.

### Overview of RS485 Specific Communication Options

**Note:** The following section uses `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see **ESP32-S2 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]**. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-S2's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the *UART\_MODE\_RS485\_APP\_CTRL* mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the

user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-S2 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the TX FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32-S2's RS485 interface connection.

#### Note:

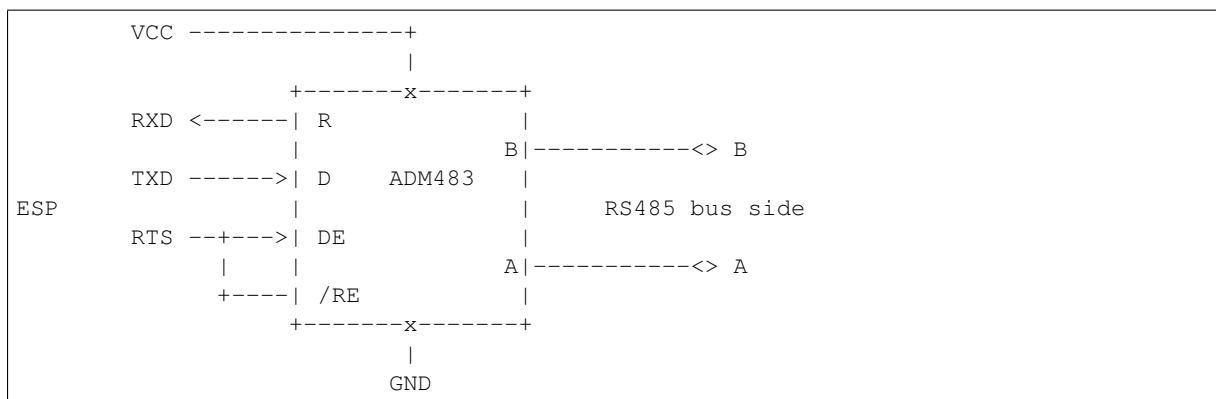

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

#### Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

#### Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

### Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

### Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32-S2 pins.
<a href="#">peripherals/uart/nmea0183_parser</a>	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

### API Reference

#### Header File

- [components/esp\\_driver\\_uart/include/driver/uart.h](#)
- This header file can be included with:

```
#include "driver/uart.h"
```

- This header file is a part of the API provided by the `esp_driver_uart` component. To declare that your component depends on `esp_driver_uart`, add the following to your `CMakeLists.txt`:

```
REQUIRES esp_driver_uart
```

or

```
PRIV_REQUIRES esp_driver_uart
```

## Functions

`esp_err_t uart_driver_install` (*uart\_port\_t* uart\_num, int rx\_buffer\_size, int tx\_buffer\_size, int queue\_size, *QueueHandle\_t* \*uart\_queue, int intr\_alloc\_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

---

**Note:** `Rx_buffer_size` should be greater than `UART_HW_FIFO_LEN(uart_num)`. `Tx_buffer_size` should be either zero or greater than `UART_HW_FIFO_LEN(uart_num)`.

---

### Parameters

- **uart\_num** -- UART port number, the max port number is (`UART_NUM_MAX` - 1).
- **rx\_buffer\_size** -- UART RX ring buffer size.
- **tx\_buffer\_size** -- UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue\_size** -- UART event queue size/depth.
- **uart\_queue** -- UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to `NULL`, driver will not use an event queue.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info. Do not set `ESP_INTR_FLAG_IRAM` here (the driver's ISR handler is not located in IRAM)

### Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

`esp_err_t uart_driver_delete` (*uart\_port\_t* uart\_num)

Uninstall UART driver.

**Parameters** **uart\_num** -- UART port number, the max port number is (`UART_NUM_MAX` - 1).

### Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

`bool uart_is_driver_installed` (*uart\_port\_t* uart\_num)

Checks whether the driver is installed or not.

**Parameters** **uart\_num** -- UART port number, the max port number is (`UART_NUM_MAX` - 1).

### Returns

- `true` driver is installed
- `false` driver is not installed

`esp_err_t uart_set_word_length` (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* data\_bit)

Set UART data bits.

### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- UART data bits

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* \*data\_bit)

Get the UART data bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- Pointer to accept value of UART data bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* stop\_bits)

Set UART stop bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- UART stop bits

**Returns**

- ESP\_OK Success
- ESP\_FAIL Fail

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* \*stop\_bits)

Get the UART stop bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- Pointer to accept value of UART stop bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*stop\_bit)

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* parity\_mode)

Set UART parity mode.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- the enum of uart parity configuration

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* \*parity\_mode)

Get the UART parity mode configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- Pointer to accept value of UART parity mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

*esp\_err\_t* **uart\_get\_sclk\_freq** (*uart\_sclk\_t* sclk, uint32\_t \*out\_freq\_hz)

Get the frequency of a clock source for the HP UART port.

**Parameters**

- **sclk** -- Clock source
- **out\_freq\_hz** -- [out] Output of frequency, in Hz

**Returns**

- `ESP_ERR_INVALID_ARG`: if the clock source is not supported
- otherwise `ESP_OK`

*esp\_err\_t* `uart_set_baudrate` (*uart\_port\_t* uart\_num, uint32\_t baudrate)

Set UART baud rate.

#### Parameters

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `baudrate` -- UART baud rate.

#### Returns

- `ESP_FAIL` Parameter error
- `ESP_OK` Success

*esp\_err\_t* `uart_get_baudrate` (*uart\_port\_t* uart\_num, uint32\_t \*baudrate)

Get the UART baud rate configuration.

#### Parameters

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `baudrate` -- Pointer to accept value of UART baud rate

#### Returns

- `ESP_FAIL` Parameter error
- `ESP_OK` Success, result will be put in (\*baudrate)

*esp\_err\_t* `uart_set_line_inverse` (*uart\_port\_t* uart\_num, uint32\_t inverse\_mask)

Set UART line inverse mode.

#### Parameters

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `inverse_mask` -- Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

#### Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

*esp\_err\_t* `uart_set_hw_flow_ctrl` (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* flow\_ctrl, uint8\_t rx\_thresh)

Set hardware flow control.

#### Parameters

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX - 1`).
- `flow_ctrl` -- Hardware flow control mode
- `rx_thresh` -- Threshold of Hardware RX flow control (0 ~ `UART_HW_FIFO_LEN(uart_num)`). Only when `UART_HW_FLOWCTRL_RTS` is set, will the `rx_thresh` value be set.

#### Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

*esp\_err\_t* `uart_set_sw_flow_ctrl` (*uart\_port\_t* uart\_num, bool enable, uint8\_t rx\_thresh\_xon, uint8\_t rx\_thresh\_xoff)

Set software flow control.

#### Parameters

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX - 1`)
- `enable` -- switch on or off
- `rx_thresh_xon` -- low water mark
- `rx_thresh_xoff` -- high water mark

#### Returns

- `ESP_OK` Success
- `ESP_FAIL` Parameter error

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* \*flow\_ctrl)

Get the UART hardware flow control configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Option for different flow control mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*flow\_ctrl)

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* uart\_num, uint32\_t clr\_mask)

Clear UART interrupt status.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **clr\_mask** -- Bit mask of the interrupt status to be cleared.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t enable\_mask)

Set UART interrupt enable.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable\_mask** -- Bit mask of the enable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t disable\_mask)

Clear UART interrupt enable bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **disable\_mask** -- Bit mask of the disable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* uart\_num)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* uart\_num)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* uart\_num)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* uart\_num, int enable, int thresh)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable** -- 1: enable; 0: disable
- **thresh** -- Threshold of TX interrupt, 0 ~ UART\_HW\_FIFO\_LEN(uart\_num)

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* uart\_num, int tx\_io\_num, int rx\_io\_num, int rts\_io\_num, int cts\_io\_num)

Assign signals of a UART peripheral to GPIO pins.

---

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

---

---

**Note:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

---

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **tx\_io\_num** -- UART TX pin GPIO number.
- **rx\_io\_num** -- UART RX pin GPIO number.
- **rts\_io\_num** -- UART RTS pin GPIO number.
- **cts\_io\_num** -- UART CTS pin GPIO number.

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* uart\_num, int level)

Manually set the UART RTS pin level.

---

**Note:** UART must be configured with hardware flow control disabled.

---

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: RTS output low (active); 0: RTS output high (block)

#### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* uart\_num, int level)

Manually set the UART DTR pin level.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

- **level** -- 1: DTR output low; 0: DTR output high

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_tx\_idle\_num** (*uart\_port\_t* uart\_num, uint16\_t idle\_num)

Set UART idle interval after tx FIFO is empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **idle\_num** -- idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_param\_config** (*uart\_port\_t* uart\_num, const *uart\_config\_t* \*uart\_config)

Set UART configuration parameters.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **uart\_config** -- UART parameter settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_intr\_config** (*uart\_port\_t* uart\_num, const *uart\_intr\_config\_t* \*intr\_conf)

Configure UART interrupts.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **intr\_conf** -- UART interrupt settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_wait\_tx\_done** (*uart\_port\_t* uart\_num, TickType\_t ticks\_to\_wait)

Wait until UART TX FIFO is empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **ticks\_to\_wait** -- Timeout, count in RTOS ticks

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

int **uart\_tx\_chars** (*uart\_port\_t* uart\_num, const char \*buffer, uint32\_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

---

**Note:** This function should only be used when UART TX buffer is not enabled.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buffer** -- data buffer address
- **len** -- data length to send

**Returns**

- (-1) Parameter error
- OTHERS ( $\geq 0$ ) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes** (*uart\_port\_t* uart\_num, const void \*src, size\_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size'  $> 0$ , this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

#### Returns

- (-1) Parameter error
- OTHERS ( $\geq 0$ ) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* uart\_num, const void \*src, size\_t size, int brk\_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size'  $> 0$ , this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send
- **brk\_len** -- break signal duration(unit: the time it takes to send one bit at current baudrate)

#### Returns

- (-1) Parameter error
- OTHERS ( $\geq 0$ ) The number of bytes pushed to the TX FIFO

int **uart\_read\_bytes** (*uart\_port\_t* uart\_num, void \*buf, uint32\_t length, TickType\_t ticks\_to\_wait)

UART read bytes from UART buffer.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buf** -- pointer to the buffer.
- **length** -- data length
- **ticks\_to\_wait** -- sTimeout, count in RTOS ticks

#### Returns

- (-1) Error
- OTHERS ( $\geq 0$ ) The number of bytes read from UART buffer

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* uart\_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

---

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

#### Returns

- ESP\_OK Success

- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* uart\_num)

Clear input buffer, discard all the data is in the ring-buffer.

---

**Note:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** `uart_num` -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_buffered\_data\_len** (*uart\_port\_t* uart\_num, *size\_t* \*size)

UART get RX ring buffer cached data length.

**Parameters**

- `uart_num` -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- `size` -- Pointer of *size\_t* to accept cached data length

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_tx\_buffer\_free\_size** (*uart\_port\_t* uart\_num, *size\_t* \*size)

UART get TX ring buffer free space size.

**Parameters**

- `uart_num` -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- `size` -- Pointer of *size\_t* to accept the free space size

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_disable\_pattern\_det\_intr** (*uart\_port\_t* uart\_num)

UART disable pattern detect function. Designed for applications like 'AT commands'. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters** `uart_num` -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_pattern\_det\_baud\_intr** (*uart\_port\_t* uart\_num, *char* pattern\_chr, *uint8\_t* chr\_num, *int* chr\_tout, *int* post\_idle, *int* pre\_idle)

UART enable pattern detect function. Designed for applications like 'AT commands'. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**

- `uart_num` -- UART port number.
- `pattern_chr` -- character of the pattern.
- `chr_num` -- number of the character, 8bit value.
- `chr_tout` -- timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as `at_cmd` char.
- `post_idle` -- idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last `at_cmd` char

- **pre\_idle** -- idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at\_cmd char.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

int **uart\_pattern\_pop\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int **uart\_pattern\_get\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

*esp\_err\_t* **uart\_pattern\_queue\_reset** (*uart\_port\_t* uart\_num, int queue\_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **queue\_length** -- Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**

- ESP\_ERR\_NO\_MEM No enough memory
- ESP\_ERR\_INVALID\_STATE Driver not installed
- ESP\_FAIL Parameter error

- ESP\_OK Success

*esp\_err\_t* **uart\_set\_mode** (*uart\_port\_t* uart\_num, *uart\_mode\_t* mode)

UART set communication mode.

---

**Note:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

---

#### Parameters

- **uart\_num** -- Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **mode** -- UART UART mode to set

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_rx\_full\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold value for RX fifo full.

---

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

---

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **threshold** -- Threshold value above which RX fifo full interrupt is generated

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_tx\_empty\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold values for TX fifo empty.

#### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1)
- **threshold** -- Threshold value below which TX fifo empty interrupt is generated

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* uart\_num, const uint8\_t tout\_thresh)

UART set threshold timeout for TOUT feature.

#### Parameters

- **uart\_num** -- Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **tout\_thresh** -- This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. `tout_thresh = 1`, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the `UART_RXFIFO_TOUT_INT` interrupt is triggered. If `tout_thresh == 0`, the TOUT feature is disabled.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* uart\_num, bool \*collision\_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision\_flag. \*collision\_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

#### Parameters

- **uart\_num** -- Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- **collision\_flag** -- Pointer to variable of type bool to return collision flag.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int wakeup\_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

---

**Note:** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as `function_1` to wake up UART0, GPIO9 should be configured as `function_5` to wake up UART1), UART2 does not support light sleep wakeup feature.

---

#### Parameters

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **wakeup\_threshold** -- number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

*esp\_err\_t* **uart\_get\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int \*out\_wakeup\_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

#### Parameters

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **out\_wakeup\_threshold** -- [out] output, set to the current value of wakeup threshold for the given UART.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `out_wakeup_threshold` is NULL

*esp\_err\_t* **uart\_wait\_tx\_idle\_polling** (*uart\_port\_t* uart\_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters** `uart_num` -- UART number*esp\_err\_t* `uart_set_loop_back` (*uart\_port\_t* `uart_num`, bool `loop_back_en`)

Configure TX signal loop back to RX module, just for the test usage.

•

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- `uart_num` -- UART number
- `loop_back_en` -- Set true to enable the loop back function, else set it false.

void `uart_set_always_rx_timeout` (*uart\_port\_t* `uart_num`, bool `always_rx_timeout_en`)

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- `uart_num` -- UART number
- `always_rx_timeout_en` -- Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**struct `uart_config_t`UART configuration parameters for `uart_param_config` function.**Public Members**int `baud_rate`

UART baud rate

*uart\_word\_length\_t* `data_bits`

UART byte size

*uart\_parity\_t* `parity`

UART parity mode

*uart\_stop\_bits\_t* `stop_bits`

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

uint32\_t **backup\_before\_sleep**

If set, the driver will backup/restore the HP UART registers before entering/after exiting sleep mode. By this approach, the system can power off HP UART's power domain. This can save power, but at the expense of more RAM being consumed

struct *uart\_config\_t*::[anonymous] **flags**

Configuration flags

struct **uart\_intr\_config\_t**

UART interrupt configuration parameters for `uart_intr_config` function.

### Public Members

uint32\_t **intr\_enable\_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8\_t **rx\_timeout\_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8\_t **txfifo\_empty\_intr\_thresh**

UART TX empty interrupt threshold.

uint8\_t **rxfifo\_full\_thresh**

UART RX full interrupt threshold.

struct **uart\_event\_t**

Event structure used in UART event queue.

### Public Members

*uart\_event\_type\_t* **type**

UART event type

size\_t **size**

UART data size for `UART_DATA` event

bool **timeout\_flag**

UART data read timeout flag for UART\_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

## Macros

**UART\_PIN\_NO\_CHANGE**

**UART\_FIFO\_LEN**

Length of the HP UART HW FIFO.

**UART\_HW\_FIFO\_LEN** (uart\_num)

Length of the UART HW FIFO.

**UART\_BITRATE\_MAX**

Maximum configurable bitrate.

## Type Definitions

typedef *intr\_handle\_t* **uart\_isr\_handle\_t**

## Enumerations

enum **uart\_event\_type\_t**

UART event types used in the ring buffer.

*Values:*

enumerator **UART\_DATA**

UART data event

enumerator **UART\_BREAK**

UART break event

enumerator **UART\_BUFFER\_FULL**

UART RX buffer full event

enumerator **UART\_FIFO\_OVF**

UART FIFO overflow event

enumerator **UART\_FRAME\_ERR**

UART RX frame error event

enumerator **UART\_PARITY\_ERR**

UART RX parity event

enumerator **UART\_DATA\_BREAK**

UART TX data and break event

enumerator **UART\_PATTERN\_DET**

UART pattern detected

enumerator **UART\_WAKEUP**

UART wakeup event

enumerator **UART\_EVENT\_MAX**

UART event max index

### Header File

- [components/hal/include/hal/uart\\_types.h](#)
- This header file can be included with:

```
#include "hal/uart_types.h"
```

### Structures

struct **uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

#### Public Members

uint8\_t **cmd\_char**

UART AT cmd char

uint8\_t **char\_num**

AT cmd char repeat number

uint32\_t **gap\_tout**

gap time(in baud-rate) between AT cmd char

uint32\_t **pre\_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32\_t **post\_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

#### Public Members

uint8\_t **xon\_char**

Xon flow control char

uint8\_t **xoff\_char**

Xoff flow control char

uint8\_t **xon\_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

uint8\_t **xoff\_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

### Type Definitions

typedef *soc\_periph\_uart\_clk\_src\_legacy\_t* **uart\_sclk\_t**

UART source clock.

### Enumerations

enum **uart\_port\_t**

UART port number, can be UART\_NUM\_0 ~ (UART\_NUM\_MAX -1).

*Values:*

enumerator **UART\_NUM\_0**

UART port 0

enumerator **UART\_NUM\_1**

UART port 1

enumerator **UART\_NUM\_MAX**

UART port max

enum **uart\_mode\_t**

UART mode selection.

*Values:*

enumerator **UART\_MODE\_UART**

mode: regular UART mode

enumerator **UART\_MODE\_RS485\_HALF\_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART\_MODE\_IRDA**

mode: IRDA UART mode

enumerator **UART\_MODE\_RS485\_COLLISION\_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART\_MODE\_RS485\_APP\_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart\_word\_length\_t**

UART word length constants.

*Values:*

enumerator **UART\_DATA\_5\_BITS**

word length: 5bits

enumerator **UART\_DATA\_6\_BITS**

word length: 6bits

enumerator **UART\_DATA\_7\_BITS**

word length: 7bits

enumerator **UART\_DATA\_8\_BITS**

word length: 8bits

enumerator **UART\_DATA\_BITS\_MAX**

enum **uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

enumerator **UART\_STOP\_BITS\_1**

stop bit: 1bit

enumerator **UART\_STOP\_BITS\_1\_5**

stop bit: 1.5bits

enumerator **UART\_STOP\_BITS\_2**

stop bit: 2bits

enumerator **UART\_STOP\_BITS\_MAX**

enum **uart\_parity\_t**

UART parity constants.

*Values:*

enumerator **UART\_PARITY\_DISABLE**

Disable UART parity

enumerator **UART\_PARITY\_EVEN**

Enable UART even parity

enumerator **UART\_PARITY\_ODD**

Enable UART odd parity

enum **uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

enumerator **UART\_HW\_FLOWCTRL\_DISABLE**

disable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_RTS**

enable RX hardware flow control (rts)

enumerator **UART\_HW\_FLOWCTRL\_CTS**

enable TX hardware flow control (cts)

enumerator **UART\_HW\_FLOWCTRL\_CTS\_RTS**

enable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_MAX**

enum **uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

enumerator **UART\_SIGNAL\_INV\_DISABLE**

Disable UART signal inverse

enumerator **UART\_SIGNAL\_IRDA\_TX\_INV**

inverse the UART irda\_tx signal

enumerator **UART\_SIGNAL\_IRDA\_RX\_INV**

inverse the UART irda\_rx signal

enumerator **UART\_SIGNAL\_RXD\_INV**

inverse the UART rxd signal

enumerator **UART\_SIGNAL\_CTS\_INV**

inverse the UART cts signal

enumerator **UART\_SIGNAL\_DSR\_INV**

inverse the UART dsr signal

enumerator **UART\_SIGNAL\_TXD\_INV**

inverse the UART txd signal

enumerator **UART\_SIGNAL\_RTS\_INV**

inverse the UART rts signal

enumerator **UART\_SIGNAL\_DTR\_INV**

inverse the UART dtr signal

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro returns the matching counterpart for you. See some examples below.

---

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is `UART_NUM_0`). It is similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

### Header File

- `components/soc/esp32s2/include/soc/uart_channel.h`
- This header file can be included with:

```
#include "soc/uart_channel.h"
```

## 2.5.28 USB Device Stack

### Overview

The ESP-IDF USB Device Stack (hereinafter referred to as the Device Stack) enables USB Device support on ESP32-S2. By using the Device Stack, ESP32-S2 can be programmed with any well defined USB device functions (e.g., keyboard, mouse, camera), a custom function (aka vendor-specific class), or a combination of those functions (aka a composite device).

The Device Stack is built around the TinyUSB stack, but extends TinyUSB with some minor features and modifications for better integration with ESP-IDF. The Device stack is distributed as a managed component via the [ESP-IDF Component Registry](#).

### Features

- Multiple supported device classes (CDC, HID, MIDI, MSC)
- Composite devices
- Vendor specific classes
- Maximum of 6 endpoints
  - 5 IN/OUT endpoints
  - 1 IN endpoints
- VBUS monitoring for self-powered devices

## Hardware Connection

The ESP32-S2 routes the USB D+ and D- signals to GPIOs 20 and 19 respectively. For USB device functionality, these GPIOs should be connected to the bus in some way (e.g., via a Micro-B port, USB-C port, or directly to standard-A plug).

**Note:** If you are using an ESP32-S2 development board with two USB ports, the port labeled "USB" will already be connected to the D+ and D- GPIOs.

**Note:** Self-powered devices must also connect VBUS through a voltage divider or comparator. For more details, please refer to [Self-Powered Device](#).

## Device Stack Structure

The basis of the Device Stack is TinyUSB, where the Device Stack implements the following features on top of TinyUSB:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Storage Media (SPI-Flash and SD-Card) for USB Device MSC Class.
- A task within the encapsulated device stack that handles TinyUSB servicing

**Component Dependency** The Device Stack is distributed via the [ESP-IDF Component Registry](#). Thus, to use it, please add the Device Stack component as dependency using the following command:

```
idf.py add-dependency esp_tinyusb
```

**Configuration Options** Multiple aspects of the Device Stack can be configured using menuconfig. These include:

- The verbosity of the TinyUSB's log
- Device Stack task related options
- Default device/string descriptor options
- Class specific options

**Descriptor Configuration** The `tinyusb_config_t` structure provides USB descriptor related fields that should be initialized.

The following descriptors should be initialized for both full-speed and high-speed devices:

- `device_descriptor`
- `string_descriptor`

Full-speed devices should initialize the following field to provide their configuration descriptor:

- `configuration_descriptor`

The Device Stack will instantiate a USB device based on the descriptors provided in the fields described above when `tinycusb_driver_install()` is called.

The Device Stack also provides default descriptors that can be installed by setting the corresponding field in `tinycusb_driver_install()` to `NULL`. Default descriptors include:

- **Default device descriptor:** Enabled by setting `device_descriptor` to `NULL`. Default device descriptor will use the values set by the corresponding menuconfig options (e.g., PID, VID, `bcdDevice` etc).
- **Default string descriptor:** Enabled by setting `string_descriptor` to `NULL`. Default string descriptors will use the value set by corresponding menuconfig options (e.g., manufacturer, product, and serial string descriptor options).
- **Default configuration descriptor.** Some classes that rarely require custom configuration (such as CDC and MSC) will provide default configuration descriptors. These can be enabled by setting associated configuration descriptor field to `NULL`:
  - `configuration_descriptor` full-speed descriptor for full-speed devices only
  - `fs_configuration_descriptor` full-speed descriptor for high-speed devices
  - `hs_configuration_descriptor` high-speed descriptor for high-speed devices

---

**Note:** Backward compatibility: when Device Stack supports high-speed, field `configuration_descriptor` could be used instead of `fs_configuration_descriptor` for full-speed configuration descriptor.

---

## Installation

To install the Device Stack, please call `tinycusb_driver_install()`. The Device Stack's configuration is specified in a `tinycusb_config_t` structure that is passed as an argument to `tinycusb_driver_install()`.

---

**Note:** The `tinycusb_config_t` structure can be zero-initialized (e.g., `const tinycusb_config_t tusb_cfg = { 0 };`) or partially (as shown below). For any member that is initialized to 0 or `NULL`, the stack uses its default configuration values for that member, see example below.

---

```
const tinycusb_config_t partial_init = {
    .device_descriptor = NULL, // Use the default device descriptor specified in
    ↪Menuconfig
    .string_descriptor = NULL, // Use the default string descriptors specified in
    ↪Menuconfig
    .external_phy = false, // Use internal USB PHY
    #if (TUD_OPT_HIGH_SPEED)
    .fs_configuration_descriptor = NULL, // Use the default full-speed
    ↪configuration descriptor according to settings in Menuconfig
    .hs_configuration_descriptor = NULL, // Use the default high-speed
    ↪configuration descriptor according to settings in Menuconfig
    .qualifier_descriptor = NULL, // Use the default qualifier descriptor, with
    ↪values from default device descriptor
    #else
    .configuration_descriptor = NULL, // Use the default configuration
    ↪descriptor according to settings in Menuconfig
    #endif // TUD_OPT_HIGH_SPEED
};
```

## Self-Powered Device

USB specification mandates self-powered devices to monitor voltage levels on USB's VBUS signal. As opposed to bus-powered devices, a self-powered device can be fully functional even without a USB connection. The self-powered device detects connection and disconnection events by monitoring the VBUS voltage level. VBUS is considered valid if it rises above 4.75 V and invalid if it falls below 4.35 V.

On the ESP32-S2, this will require using a GPIO to act as a voltage sensing pin to detect when VBUS goes above/below the prescribed thresholds. However, ESP32-S2 pins are 3.3 V tolerant. Thus, even if VBUS rises/falls above/below the thresholds mentioned above, it would still appear as a logic HIGH to the ESP32-S2. Thus, in order to detect the VBUS valid condition, users can do one of the following:

- Connect VBUS to a voltage comparator chip/circuit that detects the thresholds described above (i.e., 4.35 V and 4.75 V), and outputs a 3.3 V logic level to the ESP32-S2 indicating whether VBUS is valid or not.
- Use a resistor voltage divider that outputs  $(0.75 \times V_{dd})$  if VBUS is 4.4 V (see figure below).

**Note:** In either case, the voltage on the sensing pin must be logic low within 3 ms after the device is unplugged from the USB host.

Fig. 34: Simple voltage divider for VBUS monitoring

To use this feature, in `tinyusb_config_t`, you must set `self_powered` to `true` and `vbus_monitor_io` to GPIO number that is used for VBUS monitoring.

## USB Serial Device (CDC-ACM)

If the CDC option is enabled in Menuconfig, the USB Serial Device can be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t`, see example below.

```
const tinyusb_config_cdcacm_t acm_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
```

(continues on next page)

(continued from previous page)

```

.cdc_port = TINYUSB_CDC_ACM_0,
.rx_unread_buf_sz = 64,
.callback_rx = NULL,
.callback_rx_wanted_char = NULL,
.callback_line_state_changed = NULL,
.callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&acm_cfg);

```

To specify callbacks, you can either set the pointer to your `tusb_cdcacm_callback_t` function in the configuration structure or call `tinyusb_cdcacm_register_callback()` after initialization.

**USB Serial Console** The USB Serial Device allows the redirection of all standard input/output streams (stdin, stdout, stderr) to USB. Thus, calling standard library input/output functions such as `printf()` will result into the data being sent/received over USB instead of UART.

Users should call `esp_tusb_init_console()` to switch the standard input/output streams to USB, and `esp_tusb_deinit_console()` to switch them back to UART.

### USB Mass Storage Device (MSC)

If the MSC `CONFIG_TINYUSB_MSC_ENABLED` option is enabled in Menuconfig, the ESP Chip can be used as USB MSC Device. The storage media (SPI-Flash or SD-Card) can be initialized as shown below.

- SPI-Flash

```

static esp_err_t storage_init_spiflash(wl_handle_t *wl_handle)
{
    /**
     * esp_partition_t *data_partition = esp_partition_find_first(ESP_PARTITION_TYPE_
     * ↪DATA, ESP_PARTITION_SUBTYPE_DATA_FAT, NULL);
     * **/
    wl_mount(data_partition, wl_handle);
    /**
     */
}
storage_init_spiflash(&wl_handle);

const tinyusb_msc_spiflash_config_t config_spi = {
    .wl_handle = wl_handle
};
tinyusb_msc_storage_init_spiflash(&config_spi);

```

- SD-Card

```

static esp_err_t storage_init_sdmmc(sdmmc_card_t **card)
{
    /**
     *
     * sdmmc_host_t host = SDMMC_HOST_DEFAULT();
     * sdmmc_slot_config_t slot_config = SDMMC_SLOT_CONFIG_DEFAULT();
     * // For SD Card, set bus width to use
     *
     * slot_config.width = 4;
     * slot_config.clk = CONFIG_EXAMPLE_PIN_CLK;
     * slot_config.cmd = CONFIG_EXAMPLE_PIN_CMD;
     * slot_config.d0 = CONFIG_EXAMPLE_PIN_D0;
     * slot_config.d1 = CONFIG_EXAMPLE_PIN_D1;
     * slot_config.d2 = CONFIG_EXAMPLE_PIN_D2;
     * slot_config.d3 = CONFIG_EXAMPLE_PIN_D3;
     * slot_config.flags |= SDMMC_SLOT_FLAG_INTERNAL_PULLUP;
     *
     */
}

```

(continues on next page)

(continued from previous page)

```

sd_card = (sdmmc_card_t *)malloc(sizeof(sdmmc_card_t));
(*host.init)();
sdmmc_host_init_slot(host.slot, (const sdmmc_slot_config_t *) &slot_config);
sdmmc_card_init(&host, sd_card);
***
}
storage_init_sdmmc(&card);

const tinyusb_msc_sdmmc_config_t config_sdmmc = {
    .card = card
};
tinyusb_msc_storage_init_sdmmc(&config_sdmmc);

```

## Application Examples

The table below describes the code examples available in the directory [peripherals/usb/device](#):

Code Example	Description
<a href="#">peripherals/usb/device/tusb_console</a>	How to set up ESP32-S2 chip to get log output via Serial Device connection
<a href="#">peripherals/usb/device/tusb_serial_device</a>	How to set up ESP32-S2 chip to work as a USB Serial Device

  - *Maintainers Notes*

### Overview

The USB Host Library (hereinafter referred to as the Host Library) is the lowest layer of the USB Host stack that exposes a public facing API. In most cases, applications that require USB Host functionality do not need to interface with the Host Library directly. Instead, most applications use the API provided by a host class driver that is implemented on top of the Host Library.

However, you may want to use the Host Library directly for some of (but not limited to) the following reasons:

- Implementation of a custom host class driver
- Usage of lower level USB Host API

**Features & Limitations** The Host Library has the following features:

- Supports Full Speed (FS) and Low Speed (LS) Devices.
- Supports all four transfer types: Control, Bulk, Interrupt, and Isochronous.
- Allows multiple class drivers to run simultaneously, i.e., multiple clients of the Host Library.
- A single device can be used by multiple clients simultaneously, e.g., composite devices.
- The Host Library itself and the underlying Host Stack does not internally instantiate any OS tasks. The number of tasks is entirely controlled by how the Host Library interface is used. However, a general rule of thumb regarding the number of tasks is (the number of host class drivers running + 1).

Currently, the Host Library and the underlying Host Stack has the following limitations:

- Only supports a single device, but the Host Library's API is designed for multiple device support.
- Only supports Asynchronous transfers.
- Only supports using one configuration. Changing to other configurations after enumeration is not supported yet.
- Transfer timeouts are not supported yet.

### Architecture

Fig. 35: Diagram of the key entities involved in USB Host functionality

The diagram above shows the key entities that are involved when implementing USB Host functionality. These entities are:

- The **Host Library**

- **Clients** of the Host Library
- **Devices**
- Host Library **Daemon Task**

**Host Library** The Host Library is the lowest public-facing API layer of the ESP-IDF USB Host Stack. Any other ESP-IDF component (such as a class driver or a user component) that needs to communicate with a connected USB device can only do so using the Host Library API either directly or indirectly.

The Host Library's API is split into two sub-sets, namely the **Library API** and **Client API**.

- The Client API handles the communication between a client of the Host Library and one or more USB devices. The Client API should only be called by registered clients of the Host Library.
- The Library API handles all of the Host Library processing that is not specific to a single client, such as device enumeration. Usually, the library API is called by a Host Library Daemon Task.

**Clients** A client of the Host Library is a software component, such as a host class driver or user component, which utilizes the Host Library to establish communication with a USB device. Generally, each client has a one-to-one relation with a task. This implies that all Client API calls pertaining to a specific client must originate from the context of the same task.

By organizing the software components that use the Host Library's into clients, the Host Library can delegate the handling of all events specific to that client to the client's task. In other words, each client task is responsible for all the required processing and event handling associated with the USB communication that the client initiates.

**Daemon Task** Although the Host Library delegates the handling of client events to the clients themselves, there are still Library events –events that are not specific to any particular client –that need to be handled. Library event handling can include things such as:

- Handling USB device connection, enumeration, and disconnection
- Rerouting control transfers to/from clients
- Forwarding events to clients

Therefore, in addition to the client tasks, the Host Library also requires a task, which is usually the Host Library Daemon Task, to handle all of the library events.

**Devices** The Host Library shields clients from the details of device handling, encompassing details such as connection, memory allocation, and enumeration. The clients are provided only with a list of already connected and enumerated devices to choose from. By default during enumeration, each device is automatically configured to use the first configuration found, namely, the first configuration descriptor returned on a Get Configuration Descriptor request. For most standard devices, the first configuration will have a `bConfigurationValue` of 1. If option `CONFIG_USB_HOST_ENABLE_ENUM_FILTER_CALLBACK` is enabled, a different `bConfigurationValue` can be selected, see [Multiple configuration Support](#) for more details.

It is possible for two or more clients to simultaneously communicate with the same device as long as they are not communicating to the same interface. However, multiple clients can simultaneously communicate with the same device's default endpoint (i.e., EP0), which will result in their control transfers being serialized.

For a client to communicate with a device, the client must:

1. Open the device using the device's address. This lets the Host Library know that the client is using that device.
2. Claim the interface(s) that will be used for communication. This prevents other clients from claiming the same interface(s).
3. Send transfers to the endpoints of claimed interfaces. The client's task is responsible for handling its own processing and events related to USB device communication.

## Usage

The Host Library and the underlying Host Stack will not create any tasks. All tasks, namely the client tasks and the Daemon Task, need to be created by the class drivers or the user. Instead, the Host Library provides two event handler

functions that handle all of the required Host Library processing, thus these functions should be called repeatedly from the client tasks and the Daemon Task. Therefore, the implementation of client tasks and the Daemon Task will be largely centered around the invocation of these event handler functions.

### Host Library & Daemon Task

**Basic Usage** The Host Library API provides `usb_host_lib_handle_events()` to handle library events. This function should be called repeatedly, typically from the Daemon Task. Some notable features regarding `usb_host_lib_handle_events()` are:

- The function can block until a library event needs handling.
- Event flags are returned on each invocation. These event flags are useful for knowing when the Host Library can be uninstalled.

A bare-bones Daemon Task would resemble something like the following code snippet:

```
#include "usb/usb_host.h"

void daemon_task(void *arg)
{
    ...
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
        usb_host_lib_handle_events(portMAX_DELAY, &event_flags);
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
            ...
        }
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
            ...
        }
        ...
    }
    ...
}
```

**Note:** See the [peripherals/usb/host/usb\\_host\\_lib](#) example for full implementation of the Daemon Task.

Fig. 36: Graph of Typical USB Host Library Lifecycle

**Lifecycle** The graph above illustrates the typical lifecycle of the Host Library with multiple clients and devices. Specifically, the example involves:

- two registered clients (Client 1 and Client 2).
- two connected devices (Device 1 and Device 2), where Client 1 communicates with Device 1 and Client 2 communicates with Device 2.

With reference to the graph above, the typical lifecycle involves the following key stages.

1. **The Host Library is installed by calling `usb_host_install()`.**
  - Installation must be done before any other Host Library API is called.
  - Where `usb_host_install()` is called (e.g., from the Daemon Task or another task) depends on the synchronization logic between the Daemon Task, client tasks, and the rest of the system.
2. **Once the Host Library is installed, the clients can be registered by calling `usb_host_client_register()`.**
  - This is typically called from the client task, where the client task waits for a signal from the Daemon Task.
  - This can be called elsewhere if necessary as long as it is called after `usb_host_install()`.
3. **Device 1 connects and is then enumerated.**
  - Each registered client (in this case Client 1 and Client 2) is notified of the new device by way of the `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
  - Client 1 opens Device 1 and begins communication with it.
4. **Similarly Device 2 connects and is enumerated.**
  - Client 1 and 2 are notified of a new device via a `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
  - Client 2 opens Device 2 and begins communication with it.
5. **Device 1 suddenly disconnects.**
  - Client 1 is notified by way of `USB_HOST_CLIENT_EVENT_DEV_GONE` and begins its cleanup.
  - Client 2 is not notified as it has not opened Device 1.
6. **Client 1 completes its cleanup and deregisters by calling `usb_host_client_deregister()`.**
  - This is typically called from the client task before the task exits.
  - This can be called elsewhere if necessary as long as Client 1 has already completed its cleanup.
7. **Client 2 completes its communication with Device 2. Client 2 then closes Device 2 and deregisters itself.**
  - The Daemon Task is notified of the deregistration of all clients by way the `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` event flag as Client 2 is the last client to deregister.
  - Device 2 is still allocated (i.e., not freed), as it is still connected albeit not currently opened by any client.
8. **The Daemon Task decides to clean up as there are no more clients.**
  - The Daemon Task must free Device 2 first by calling `usb_host_device_free_all()`.
  - If `usb_host_device_free_all()` was able to free all devices, the function will return `ESP_OK` indicating that all devices have been freed.
  - If `usb_host_device_free_all()` was unable to free all devices for reasons like the device is still opened by a client, the function will return `ESP_ERR_NOT_FINISHED`.
  - The Daemon Task must wait for `usb_host_lib_handle_events()` to return the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag in order to know when all devices have been freed.
9. Once the Daemon Task has verified that all clients have deregistered and all devices have been freed, it can now uninstall the Host Library by calling `usb_host_uninstall()`.

## Clients & Class Driver

**Basic Usage** The Host Library API provides `usb_host_client_handle_events()` to handle a particular client's events. This function should be called repeatedly, typically from the client's task. Some notable features regarding `usb_host_client_handle_events()` are:

- The function can block until a client event needs handling.
- The function's primary purpose is to call the various event handling callbacks when a client event occurs.

The following callbacks are called from within `usb_host_client_handle_events()` thus allowing the client task to be notified of events.

- The client event callback of type `usb_host_client_event_cb_t` delivers client event messages to the client. Client event messages indicate events such as the addition or removal of a device.
- The USB transfer completion callback of type `usb_transfer_cb_t` indicates that a particular USB transfer previously submitted by the client has been completed.

**Note:** Given that the callbacks are called from within `usb_host_client_handle_events()`, users should avoid blocking from within the callbacks as this will result in `usb_host_client_handle_events()` being blocked as well, thus preventing other pending client events from being handled.

The following code snippet demonstrates a bare-bones host class driver and its client task. The code snippet contains:

- A simple client task function `client_task` that calls `usb_host_client_handle_events()` in a loop.
- Implementations of a client event callback and transfer completion callbacks.
- Implementation of a simple state machine for the class driver. The class driver simply opens a device, sends an OUT transfer to EP1, then closes the device.

```
#include <string.h>
#include "usb/usb_host.h"

#define CLASS_DRIVER_ACTION_OPEN_DEV    0x01
#define CLASS_DRIVER_ACTION_TRANSFER   0x02
#define CLASS_DRIVER_ACTION_CLOSE_DEV   0x03

struct class_driver_control {
    uint32_t actions;
    uint8_t dev_addr;
    usb_host_client_handle_t client_hdl;
    usb_device_handle_t dev_hdl;
};

static void client_event_cb(const usb_host_client_event_msg_t *event_msg, void_
↳*arg)
{
    // This function is called from within usb_host_client_handle_events(). Do not_
↳block and try to keep it short
    struct class_driver_control *class_driver_obj = (struct class_driver_control_
↳*)arg;
    switch (event_msg->event) {
        case USB_HOST_CLIENT_EVENT_NEW_DEV:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_OPEN_DEV;
            class_driver_obj->dev_addr = event_msg->new_dev.address; //Store the_
↳address of the new device
            break;
        case USB_HOST_CLIENT_EVENT_DEV_GONE:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
            break;
        default:
            break;
    }
}

static void transfer_cb(usb_transfer_t *transfer)
{
    // This function is called from within usb_host_client_handle_events(). Do not_
↳block and try to keep it short
    struct class_driver_control *class_driver_obj = (struct class_driver_control_
↳*)transfer->context;
    printf("Transfer status %d, actual number of bytes transferred %d\n", transfer-
↳>status, transfer->actual_num_bytes);
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
```

(continues on next page)

```

}

void client_task(void *arg)
{
    ... // Wait until Host Library is installed
    // Initialize class driver objects
    struct class_driver_control class_driver_obj = {0};
    // Register the client
    usb_host_client_config_t client_config = {
        .is_synchronous = false,
        .max_num_event_msg = 5,
        .async = {
            .client_event_callback = client_event_cb,
            .callback_arg = &class_driver_obj,
        }
    };
    usb_host_client_register(&client_config, &class_driver_obj.client_hdl);
    //Allocate a USB transfer
    usb_transfer_t *transfer;
    usb_host_transfer_alloc(1024, 0, &transfer);

    //Event handling loop
    bool exit = false;
    while (!exit) {
        // Call the client event handler function
        usb_host_client_handle_events(class_driver_obj.client_hdl, portMAX_DELAY);
        // Execute pending class driver actions
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_OPEN_DEV) {
            // Open the device and claim interface 1
            usb_host_device_open(class_driver_obj.client_hdl, class_driver_obj.dev_
↪addr, &class_driver_obj.dev_hdl);
            usb_host_interface_claim(class_driver_obj.client_hdl, class_driver_obj.
↪dev_hdl, 1, 0);
        }
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_TRANSFER) {
            // Send an OUT transfer to EP1
            memset(transfer->data_buffer, 0xAA, 1024);
            transfer->num_bytes = 1024;
            transfer->device_handle = class_driver_obj.dev_hdl;
            transfer->bEndpointAddress = 0x01;
            transfer->callback = transfer_cb;
            transfer->context = (void *)&class_driver_obj;
            usb_host_transfer_submit(transfer);
        }
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_CLOSE_DEV) {
            // Release the interface and close the device
            usb_host_interface_release(class_driver_obj.client_hdl, class_driver_
↪obj.dev_hdl, 1);
            usb_host_device_close(class_driver_obj.client_hdl, class_driver_obj.
↪dev_hdl);
            exit = true;
        }
        ... // Handle any other actions required by the class driver
    }

    // Cleanup class driver
    usb_host_transfer_free(transfer);
    usb_host_client_deregister(class_driver_obj.client_hdl);
    ... // Delete the client task. Signal the Daemon Task if necessary.
}

```

**Note:** An actual host class driver is likely to support many more features, thus will have a much more complex state machine. A host class driver is also likely to need to:

- Be able to open multiple devices
  - Parse an opened device's descriptors to identify if the device is of the target class
  - Communicate with multiple endpoints of an interface in a particular order
  - Claim multiple interfaces of a device
  - Handle various errors
- 

**Lifecycle** The typical life cycle of a client task and class driver will go through the following stages:

1. Wait for some signal regarding the Host Library being installed.
2. Register the client via `usb_host_client_register()` and allocate any other class driver resources, such as allocating transfers using `usb_host_transfer_alloc()`.
3. For each new device that the class driver needs to communicate with:
  - a. Check if the device is already connected via `usb_host_device_addr_list_fill()`.
  - b. If the device is not already connected, wait for a `USB_HOST_CLIENT_EVENT_NEW_DEV` event from the client event callback.
  - c. Open the device via `usb_host_device_open()`.
  - d. Parse the device and configuration descriptors via `usb_host_get_device_descriptor()` and `usb_host_get_active_config_descriptor()` respectively.
  - e. Claim the necessary interfaces of the device via `usb_host_interface_claim()`.
4. Submit transfers to the device via `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`.
5. Once an opened device is no longer needed by the class driver, or has disconnected, as indicated by a `USB_HOST_CLIENT_EVENT_DEV_GONE` event:
  - a. Stop any previously submitted transfers to the device's endpoints by calling `usb_host_endpoint_halt()` and `usb_host_endpoint_flush()` on those endpoints.
  - b. Release all previously claimed interfaces via `usb_host_interface_release()`.
  - c. Close the device via `usb_host_device_close()`.
6. Deregister the client via `usb_host_client_deregister()` and free any other class driver resources.
7. Delete the client task. Signal the Daemon Task if necessary.

## Examples

**Host Library Examples** The `peripherals/usb/host/usb_host_lib` demonstrates basic usage of the USB Host Library's API to implement a pseudo-class driver.

**Class Driver Examples** The USB Host Stack provides a number of examples that implement host class drivers using the Host Library's API.

## CDC-ACM

- A host class driver for the Communication Device Class (Abstract Control Model) is distributed as a managed component via the [ESP-IDF Component Registry](#).
- The `peripherals/usb/host/cdc/cdc_acm_host` example uses the CDC-ACM host driver component to communicate with CDC-ACM devices.
- The `peripherals/usb/host/cdc/cdc_acm_vcp` example shows how can you extend the CDC-ACM host driver to interface Virtual COM Port devices.
- The CDC-ACM driver is also used in [esp\\_modem examples](#), where it is used for communication with cellular modems.

## MSC

- A host class driver for the Mass Storage Class (Bulk-Only Transport) is deployed to [ESP-IDF Component Registry](#).
- The [peripherals/usb/host/msc](#) example demonstrates the usage of the MSC host driver to read and write to a USB flash drive.

## HID

- A host class driver for the HID (Human interface device) is distributed as a managed component via the [ESP-IDF Component Registry](#).
- The [peripherals/usb/host/hid](#) example demonstrates the possibility to receive reports from a USB HID device with several interfaces.

## UVC

- A host class driver for the USB Video Device Class is distributed as a managed component via the [ESP-IDF Component Registry](#).
- The [peripherals/usb/host/uvc](#) example demonstrates the usage of the UVC host driver to receive a video stream from a USB camera and optionally forward that stream over Wi-Fi.

## Host Stack Configuration

**Non-Compliant Device Support** To support USB devices that are non-compliant in various scenarios or exhibit specific behaviors, it is possible to configure the USB Host stack.

As a USB device may be hot-plugged, it is essential to have configurable delays between power switching and device attachment, and when the device's internal power has stabilized.

**Enumeration Configuration** During the process of enumerating connected USB devices, several delay values ensure the proper functioning of the device.

Fig. 37: USB Root Hub Power-on and Connection Events Timing

The figure above shows all the delay values associated with both turning on port power with a device connected and hot-plugging a device.

- After a port is reset or resumed, the USB system software is expected to provide a "recovery" interval of 10 ms before the device attached to the port is expected to respond to data transfers.

- After the reset/resume recovery interval, if a device receives a `SetAddress()` request, the device must be able to complete processing of the request and be able to successfully complete the Status stage of the request within 50 ms.
- After successful completion of the Status stage, the device is allowed a `SetAddress()` recovery interval of 2 ms.

---

**Note:** For more details regarding connection event timings, please refer to [USB 2.0 Specification](#) > Chapter 7.1.7.3 *Connect and Disconnect Signaling*.

---

Configurable parameters of the USB host stack can be configured with multiple options via Menuconfig.

- For debounce delay, refer to [CONFIG\\_USB\\_HOST\\_DEBOUNCE\\_DELAY\\_MS](#).
- For reset hold interval, refer to [CONFIG\\_USB\\_HOST\\_RESET\\_HOLD\\_MS](#).
- For reset recovery interval, refer to [CONFIG\\_USB\\_HOST\\_RESET\\_RECOVERY\\_MS](#).
- For `SetAddress()` recovery interval, refer to [CONFIG\\_USB\\_HOST\\_SET\\_ADDR\\_RECOVERY\\_MS](#).

**Multiple Configuration Support** To support USB devices that have more than one configuration, it is possible to specify the desired configuration number during a device's enumeration process.

**Enumeration Filter** The enumeration filter is a callback function of type `usb_host_enum_filter_cb_t` called at the beginning of the enumeration process once a device descriptor is read from a newly attached USB device. Consequently, the user is provided with the obtained device descriptor. Through this callback, the user can:

- Select the configuration of the USB device.
- Filter which USB devices should be enumerated.

To use the enumeration filter, users should enable the [CONFIG\\_USB\\_HOST\\_ENABLE\\_ENUM\\_FILTER\\_CALLBACK](#) option using menuconfig. Users can specify the callback by setting `usb_host_config_t::enum_filter_cb` which is then passed to the Host Library when calling `usb_host_install()`.

## API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only `#include "usb/usb_host.h"` and all USB Host Library headers will also be included.

- `usb/include/usb/usb_host.h` contains the functions and types of the USB Host Library.
- `usb/include/usb/usb_helpers.h` contains various helper functions that are related to the USB protocol such as descriptor parsing.
- `usb/include/usb/usb_types_stack.h` contains types that are used across multiple layers of the USB Host stack.
- `usb/include/usb/usb_types_ch9.h` contains types and macros related to Chapter 9 of the USB2.0 specification, i.e., descriptors and standard requests.

## Header File

- `components/usb/include/usb/usb_host.h`
- This header file can be included with:

```
#include "usb/usb_host.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

## Functions

*esp\_err\_t* **usb\_host\_install** (const *usb\_host\_config\_t* \*config)

Install the USB Host Library.

- This function should be called only once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

---

**Note:** If `skip_phy_setup` is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

---

**Parameters** `config` -- [in] USB Host Library configuration

### Returns

- `ESP_OK`: USB Host installed successfully
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_INVALID_STATE`: USB Host Library is not in correct state to be installed (eg. the library itself or one of its drivers is already installed)
- `ESP_ERR_NO_MEM`: Insufficient memory

*esp\_err\_t* **usb\_host\_uninstall** (void)

Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
- All clients must have been deregistered before calling this function
- All devices must have been freed by calling `usb_host_device_free_all()` and receiving the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag

---

**Note:** If `skip_phy_setup` was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

---

### Returns

- `ESP_OK`: USB Host uninstalled successfully
- `ESP_ERR_INVALID_STATE`: USB Host Library is not installed, or has unfinished actions

*esp\_err\_t* **usb\_host\_lib\_handle\_events** (TickType\_t timeout\_ticks, uint32\_t \*event\_flags\_ret)

Handle USB Host Library events.

- This function handles all of the USB Host Library's processing and should be called repeatedly in a loop
- Check `event_flags_ret` to see if any flags are set indicating particular USB Host Library events
- This function should never be called by multiple threads simultaneously

---

**Note:** This function can block

---

### Parameters

- `timeout_ticks` -- [in] Timeout in ticks to wait for an event to occur
- `event_flags_ret` -- [out] Event flags that indicate what USB Host Library event occurred.

### Returns

- `ESP_OK`: No events to be handled

- `ESP_ERR_INVALID_STATE`: USB Host Library is not installed
- `ESP_ERR_TIMEOUT`: Semaphore waiting for events has timed out

*esp\_err\_t* **usb\_host\_lib\_unblock** (void)

Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (`usb_host_lib_handle_events()`)

**Returns**

- `ESP_OK`: USB Host library unblocked successfully
- `ESP_ERR_INVALID_STATE`: USB Host Library is not installed

*esp\_err\_t* **usb\_host\_lib\_info** (*usb\_host\_lib\_info\_t* \*info\_ret)

Get current information about the USB Host Library.

**Parameters** `info_ret` -- [out] USB Host Library Information

**Returns**

- `ESP_OK`: USB Host Library info obtained successfully
- `ESP_ERR_INVALID_STATE`: USB Host Library is not installed
- `ESP_ERR_INVALID_ARG`: Invalid argument

*esp\_err\_t* **usb\_host\_lib\_set\_root\_port\_power** (bool enable)

Power the root port ON or OFF.

- Powering ON the root port will allow device connections to occur
- Powering OFF the root port will disconnect all devices downstream off the root port and prevent any further device connections.

---

**Note:** If '`usb_host_config_t.root_port_unpowered`' was set on USB Host Library installation, users must call this function to power ON the root port before any device connections can occur.

---

**Parameters** `enable` -- [in] True to power the root port ON, false to power OFF

**Returns**

- `ESP_OK`: Root port power enabled/disabled
- `ESP_ERR_INVALID_STATE`: Root port already powered or HUB driver not installed

*esp\_err\_t* **usb\_host\_client\_register** (const *usb\_host\_client\_config\_t* \*client\_config,  
*usb\_host\_client\_handle\_t* \*client\_hdl\_ret)

Register a client of the USB Host Library.

- This function registers a client of the USB Host Library
- Once a client is registered, its processing function `usb_host_client_handle_events()` should be called repeatedly

**Parameters**

- `client_config` -- [in] Client configuration
- `client_hdl_ret` -- [out] Client handle

**Returns**

- `ESP_OK`: USB Host Library client registered successfully
- `ESP_ERR_INVALID_STATE`: USB Host Library is not installed
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NO_MEM`: Insufficient memory

*esp\_err\_t* **usb\_host\_client\_deregister** (*usb\_host\_client\_handle\_t* client\_hdl)

Deregister a USB Host Library client.

- This function deregisters a client of the USB Host Library
- The client must have closed all previously opened devices before attempting to deregister

**Parameters** **client\_hdl** -- [in] Client handle

**Returns**

- ESP\_OK: USB Host Library client deregistered successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_client\_handle\_events** (*usb\_host\_client\_handle\_t* client\_hdl, TickType\_t timeout\_ticks)

USB Host Library client processing function.

- This function handles all of a client's processing and should be called repeatedly in a loop
- For a particular client, this function should never be called by multiple threads simultaneously

---

**Note:** This function can block

---

**Parameters**

- **client\_hdl** -- [in] Client handle
- **timeout\_ticks** -- [in] Timeout in ticks to wait for an event to occur

**Returns**

- ESP\_OK: No event to be handled
- ESP\_ERR\_INVALID\_STATE: USB Host Library is not installed
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_TIMEOUT: Semaphore waiting for events has timed out

*esp\_err\_t* **usb\_host\_client\_unblock** (*usb\_host\_client\_handle\_t* client\_hdl)

Unblock a client.

- This function simply unblocks a client if it is blocked on the `usb_host_client_handle_events()` function.
- This function is useful when need to unblock a client in order to deregister it.

**Parameters** **client\_hdl** -- [in] Client handle

**Returns**

- ESP\_OK: Client unblocked successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_device\_open** (*usb\_host\_client\_handle\_t* client\_hdl, uint8\_t dev\_addr, *usb\_device\_handle\_t* \*dev\_hdl\_ret)

Open a device.

- This function allows a client to open a device
- A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

**Parameters**

- **client\_hdl** -- [in] Client handle
- **dev\_addr** -- [in] Device's address
- **dev\_hdl\_ret** -- [out] Device's handle

**Returns**

- ESP\_OK: Device opened successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_device\_close** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl)

Close a device.

- This function allows a client to close a device
- A client must close a device after it has finished using the device (claimed interfaces must also be released)
- A client must close all devices it has opened before de-registering

---

**Note:** This function can block

---

**Parameters**

- **client\_hdl** -- [in] Client handle
- **dev\_hdl** -- [in] Device handle

**Returns**

- ESP\_OK: Device closed successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: Device address not found among opened devices
- ESP\_ERR\_INVALID\_STATE: The client never opened the device, or the client has not released all the interfaces from the device

*esp\_err\_t* **usb\_host\_device\_free\_all** (void)

Indicate that all devices can be freed when possible.

- This function marks all devices as waiting to be freed
- If a device is not opened by any clients, it will be freed immediately
- If a device is opened by at least one client, the device will be free when the last client closes that device.
- Wait for the USB\_HOST\_LIB\_EVENT\_FLAGS\_ALL\_FREE flag to be set by `usb_host_lib_handle_events()` in order to know when all devices have been freed
- This function is useful when cleaning up devices before uninstalling the USB Host Library

**Returns**

- ESP\_OK: All devices already freed (i.e., there were no devices)
- ESP\_ERR\_INVALID\_STATE: Client must be deregistered
- ESP\_ERR\_NOT\_FINISHED: There are one or more devices that still need to be freed, wait for USB\_HOST\_LIB\_EVENT\_FLAGS\_ALL\_FREE event

*esp\_err\_t* **usb\_host\_device\_addr\_list\_fill** (int list\_len, uint8\_t \*dev\_addr\_list, int \*num\_dev\_ret)

Fill a list of device address.

- This function fills an empty list with the address of connected devices
- The Device addresses can then used in `usb_host_device_open()`
- If there are more devices than the list\_len, this function will only fill up to list\_len number of devices.

**Parameters**

- **list\_len** -- [in] Length of the empty list
- **dev\_addr\_list** -- [inout] Empty list to be filled
- **num\_dev\_ret** -- [out] Number of devices

**Returns**

- ESP\_OK: Device list filled successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_device\_info** (*usb\_device\_handle\_t* dev\_hdl, *usb\_device\_info\_t* \*dev\_info)

Get device's information.

- This function gets some basic information of a device
- The device must be opened first before attempting to get its information

---

**Note:** This function can block

---

#### Parameters

- **dev\_hdl** -- [in] Device handle
- **dev\_info** -- [out] Device information

#### Returns

- ESP\_OK: Device information obtained successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_get\_device\_descriptor** (*usb\_device\_handle\_t* dev\_hdl, const *usb\_device\_desc\_t* \*\*device\_desc)

Get device's device descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device's descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

---

**Note:** No control transfer is sent. The device's descriptor is cached on enumeration

---

#### Parameters

- **dev\_hdl** -- [in] Device handle
- **device\_desc** -- [out] Device descriptor

#### Returns

- ESP\_OK: Device descriptor obtained successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_get\_active\_config\_descriptor** (*usb\_device\_handle\_t* dev\_hdl, const *usb\_config\_desc\_t* \*\*config\_desc)

Get device's active configuration descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device's active configuration descriptor is cached on enumeration
- This function simple returns a pointer to the cached descriptor

---

**Note:** This function can block

---

---

**Note:** No control transfer is sent. A device's active configuration descriptor is cached on enumeration

---

#### Parameters

- **dev\_hdl** -- [in] Device handle
- **config\_desc** -- [out] Configuration descriptor

#### Returns

- ESP\_OK: Active configuration descriptor obtained successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_get\_config\_desc** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl, uint8\_t bConfigurationValue, const *usb\_config\_desc\_t* \*\*config\_desc\_ret)

Get get device's configuration descriptor.

- The USB Host library only caches a device's active configuration descriptor.
- This function reads any configuration descriptor of a particular device (specified by bConfigurationValue).
- This function will read the specified configuration descriptor via control transfers, and allocate memory to store that descriptor.
- Users can call `usb_host_free_config_desc()` to free the descriptor's memory afterwards.

---

**Note:** This function can block

---

---

**Note:** A client must call `usb_host_device_open()` on the device first

---

---

**Note:** bConfigurationValue starts from index 1

---

#### Parameters

- **client\_hdl** -- [in] Client handle - `usb_host_client_handle_events()` should be called repeatedly in a separate task to handle client events
- **dev\_hdl** -- [in] Device handle
- **bConfigurationValue** -- [in] Index of device's configuration descriptor to be read
- **config\_desc\_ret** -- [out] Returned configuration descriptor

#### Returns

- ESP\_OK: Configuration descriptor obtained successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_SUPPORTED: Invalid bConfigurationValue value (the device does not have this configuration value)
- ESP\_ERR\_NO\_MEM: Insufficient memory

*esp\_err\_t* **usb\_host\_free\_config\_desc** (const *usb\_config\_desc\_t* \*config\_desc)

Free a configuration descriptor.

This function frees a configuration descriptor that was returned by `usb_host_get_config_desc()`

**Parameters** **config\_desc** -- [out] Configuration descriptor

#### Returns

- ESP\_OK: Configuration descriptor freed successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **usb\_host\_interface\_claim** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl, uint8\_t bInterfaceNumber, uint8\_t bAlternateSetting)

Function for a client to claim a device's interface.

- A client must claim a device's interface before attempting to communicate with any of its endpoints
- Once an interface is claimed by a client, it cannot be claimed by any other client.

---

**Note:** This function can block

---

**Parameters**

- **client\_hdl** -- [in] Client handle
- **dev\_hdl** -- [in] Device handle
- **bInterfaceNumber** -- [in] Interface number
- **bAlternateSetting** -- [in] Interface alternate setting number

**Returns**

- ESP\_OK: Interface claimed successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_INVALID\_STATE: USB Host is not a correct state to claim an interface
- ESP\_ERR\_NOT\_FOUND: Interface or EP not found
- ESP\_ERR\_NO\_MEM: Insufficient memory

*esp\_err\_t* **usb\_host\_interface\_release** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_device\_handle\_t* dev\_hdl, uint8\_t bInterfaceNumber)

Function for a client to release a previously claimed interface.

- A client should release a device's interface after it no longer needs to communicate with the interface
- A client must release all of its interfaces of a device it has claimed before being able to close the device

---

**Note:** This function can block

---

**Parameters**

- **client\_hdl** -- [in] Client handle
- **dev\_hdl** -- [in] Device handle
- **bInterfaceNumber** -- [in] Interface number

**Returns**

- ESP\_OK: Interface released successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_INVALID\_STATE: Client never opened the USB Device, or interface currently can not be freed
- ESP\_ERR\_NOT\_FOUND: Interface number not found in the list of interfaces

*esp\_err\_t* **usb\_host\_endpoint\_halt** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using `usb_host_endpoint_clear()` before it can communicate again

---

**Note:** This function can block

---

**Parameters**

- **dev\_hdl** -- [in] Device handle
- **bEndpointAddress** -- [in] Endpoint address

**Returns**

- ESP\_OK: Endpoint halted successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: Endpoint address not found
- ESP\_ERR\_INVALID\_STATE: Endpoint pipe is not in the correct state/condition to execute a command

*esp\_err\_t* **usb\_host\_endpoint\_flush** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- Flushing an endpoint will cause any queued up transfers to be canceled

---

**Note:** This function can block

---

#### Parameters

- **dev\_hdl** -- [in] Device handle
- **bEndpointAddress** -- [in] Endpoint address

#### Returns

- `ESP_OK`: Endpoint flushed successfully
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_FOUND`: Endpoint address not found
- `ESP_ERR_INVALID_STATE`: Endpoint pipe is not in the correct state/condition to execute a command

*esp\_err\_t* **usb\_host\_endpoint\_clear** (*usb\_device\_handle\_t* dev\_hdl, uint8\_t bEndpointAddress)

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

---

**Note:** This function can block

---

#### Parameters

- **dev\_hdl** -- [in] Device handle
- **bEndpointAddress** -- [in] Endpoint address

#### Returns

- `ESP_OK`: Endpoint cleared successfully
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_FOUND`: Endpoint address not found
- `ESP_ERR_INVALID_STATE`: Endpoint pipe is not in the correct state/condition to execute a command

*esp\_err\_t* **usb\_host\_transfer\_alloc** (size\_t data\_buffer\_size, int num\_isoc\_packets, *usb\_transfer\_t* \*\*transfer)

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

#### Parameters

- **data\_buffer\_size** -- [in] Size of the transfer's data buffer

- **num\_isoc\_packets** -- [in] Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- **transfer** -- [out] Transfer object

**Returns**

- ESP\_OK: Transfer object allocated successfully
- ESP\_ERR\_NO\_MEM: Insufficient memory

*esp\_err\_t* **usb\_host\_transfer\_free** (*usb\_transfer\_t* \*transfer)

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return ESP\_OK

**Parameters** **transfer** -- [in] Transfer object

**Returns**

- ESP\_OK: Transfer object freed successfully

*esp\_err\_t* **usb\_host\_transfer\_submit** (*usb\_transfer\_t* \*transfer)

Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

**Parameters** **transfer** -- [in] Initialized transfer object

**Returns**

- ESP\_OK: Transfer submitted successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FINISHED: Transfer already in-flight
- ESP\_ERR\_NOT\_FOUND: Endpoint address not found
- ESP\_ERR\_INVALID\_STATE: Endpoint pipe is not in a correct state to submit transfer

*esp\_err\_t* **usb\_host\_transfer\_submit\_control** (*usb\_host\_client\_handle\_t* client\_hdl, *usb\_transfer\_t* \*transfer)

Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer's data buffer should contain the control transfer setup packet
- On completion, the transfer's callback will be called from the client's `usb_host_client_handle_events()` function.

**Parameters**

- **client\_hdl** -- [in] Client handle
- **transfer** -- [in] Initialized transfer object

**Returns**

- ESP\_OK: Control transfer submitted successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FINISHED: Transfer already in-flight
- ESP\_ERR\_NOT\_FOUND: Endpoint address not found
- ESP\_ERR\_INVALID\_STATE: Endpoint pipe is not in a correct state to submit transfer

## Structures

struct **usb\_host\_client\_event\_msg\_t**

Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

---

**Note:** The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

---

## Public Members

*usb\_host\_client\_event\_t* **event**

Type of event

uint8\_t **address**

New device's address

struct *usb\_host\_client\_event\_msg\_t*::[anonymous]::[anonymous] **new\_dev**

New device info

*usb\_device\_handle\_t* **dev\_hdl**

The handle of the device that was gone

struct *usb\_host\_client\_event\_msg\_t*::[anonymous]::[anonymous] **dev\_gone**

Gone device info

struct **usb\_host\_lib\_info\_t**

Current information about the USB Host Library obtained via `usb_host_lib_info()`

## Public Members

int **num\_devices**

Current number of connected (and enumerated) devices

int **num\_clients**

Current number of registered clients

struct **usb\_host\_config\_t**

USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the `usb_host_install()` function

## Public Members

**bool skip\_phy\_setup**

If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling `usb_host_install()`. Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY

**bool root\_port\_unpowered**

If set, the USB Host Library will not power on the root port on installation. This allows users to power on the root port manually by calling `usb_host_lib_set_root_port_power()`.

**int intr\_flags**

Interrupt flags for the underlying ISR used by the USB Host stack

***usb\_host\_enum\_filter\_cb\_t* enum\_filter\_cb**

Enumeration filter callback. Enable `CONFIG_USB_HOST_ENABLE_ENUM_FILTER_CALLBACK` to use this feature. Set to `NULL` otherwise.

**struct usb\_host\_client\_config\_t**

USB Host Library Client configuration.

Configuration structure for a USB Host Library client. Provided in `usb_host_client_register()`

**Public Members****bool is\_synchronous**

Whether the client is asynchronous or synchronous or not. Set to false for now.

**int max\_num\_event\_msg**

Maximum number of event messages that can be stored (e.g., 3)

***usb\_host\_client\_event\_cb\_t* client\_event\_callback**

Client's event callback function

**void \*callback\_arg**

Event callback function argument

**struct *usb\_host\_client\_config\_t*::[anonymous]::[anonymous] async**

Async callback config

**Macros****USB\_HOST\_LIB\_EVENT\_FLAGS\_NO\_CLIENTS**

All clients have been deregistered from the USB Host Library

**USB\_HOST\_LIB\_EVENT\_FLAGS\_ALL\_FREE**

The USB Host Library has freed all devices

**Type Definitions**

```
typedef struct usb_host_client_handle_s *usb_host_client_handle_t
```

Handle to a USB Host Library asynchronous client.

An asynchronous client can be registered using `usb_host_client_register()`

---

**Note:** Asynchronous API

---

```
typedef void (*usb_host_client_event_cb_t)(const usb_host_client_event_msg_t *event_msg, void *arg)
```

Client event callback.

- Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
- The client event callback is run from the context of the clients `usb_host_client_handle_events()` function

### Enumerations

```
enum usb_host_client_event_t
```

The type event in a client event message.

Values:

```
enumerator USB_HOST_CLIENT_EVENT_NEW_DEV
```

A new device has been enumerated and added to the USB Host Library

```
enumerator USB_HOST_CLIENT_EVENT_DEV_GONE
```

A device opened by the client is now gone

### Header File

- [components/usb/include/usb/usb\\_helpers.h](#)
- This header file can be included with:

```
#include "usb/usb_helpers.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

### Functions

```
const usb_standard_desc_t *usb_parse_next_descriptor (const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, int *offset)
```

Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

#### Parameters

- **cur\_desc** -- [in] Current descriptor
- **wTotalLength** -- [in] Total length of the configuration descriptor

- **offset** -- **[inout]** Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

**Returns** `usb_standard_desc_t*` Next descriptor, NULL if end of configuration descriptor reached

```
const usb_standard_desc_t *usb_parse_next_descriptor_of_type (const usb_standard_desc_t
                                                         *cur_desc, uint16_t
                                                         wTotalLength, uint8_t
                                                         bDescriptorType, int *offset)
```

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the `bDescriptorType` value) within the configuration descriptor.

#### Parameters

- **cur\_desc** -- **[in]** Current descriptor
- **wTotalLength** -- **[in]** Total length of the configuration descriptor
- **bDescriptorType** -- **[in]** Type of the next descriptor to get
- **offset** -- **[inout]** Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

**Returns** `usb_standard_desc_t*` Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

```
int usb_parse_interface_number_of_alternate (const usb_config_desc_t *config_desc, uint8_t
                                           bInterfaceNumber)
```

Get the number of alternate settings for a `bInterfaceNumber`.

Given a particular configuration descriptor, for a particular `bInterfaceNumber`, get the number of alternate settings available for that interface (i.e., the max possible value of `bAlternateSetting` for that `bInterfaceNumber`).

#### Parameters

- **config\_desc** -- **[in]** Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** -- **[in]** Interface number

**Returns** `int` The number of alternate settings that the interface has, -1 if `bInterfaceNumber` not found

```
const usb_intf_desc_t *usb_parse_interface_descriptor (const usb_config_desc_t *config_desc,
                                                    uint8_t bInterfaceNumber, uint8_t
                                                    bAlternateSetting, int *offset)
```

Get a particular interface descriptor (using `bInterfaceNumber` and `bAlternateSetting`)

Given a full configuration descriptor, get a particular interface descriptor.

---

**Note:** To get the number of alternate settings for a particular `bInterfaceNumber`, call `usb_parse_interface_number_of_alternate()`

---

#### Parameters

- **config\_desc** -- **[in]** Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** -- **[in]** Interface number
- **bAlternateSetting** -- **[in]** Alternate setting number
- **offset** -- **[out]** Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

**Returns** `const usb_intf_desc_t*` Pointer to interface descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index (const usb_intf_desc_t *intf_desc,
                                                           int index, uint16_t wTotalLength,
                                                           int *offset)
```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the `bNumEndpoints` field of the interface descriptor.

---

**Note:** If `bNumEndpoints` is 0, it means the interface uses the default endpoint only

---

#### Parameters

- **intf\_desc** -- [in] Pointer to the start of an interface descriptor
- **index** -- [in] Endpoint index
- **wTotalLength** -- [in] Total length of the containing configuration descriptor
- **offset** -- [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

**Returns** `const usb_ep_desc_t*` Pointer to endpoint descriptor, NULL if not found.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address (const usb_config_desc_t
                                                           *config_desc, uint8_t
                                                           bInterfaceNumber, uint8_t
                                                           bAlternateSetting, uint8_t
                                                           bEndpointAddress, int
                                                           *offset)
```

Get an endpoint descriptor based on an endpoint's address.

Given a configuration descriptor, get an endpoint descriptor based on its `bEndpointAddress`, `bAlternateSetting`, and `bInterfaceNumber`.

#### Parameters

- **config\_desc** -- [in] Pointer to the start of a full configuration descriptor
- **bInterfaceNumber** -- [in] Interface number
- **bAlternateSetting** -- [in] Alternate setting number
- **bEndpointAddress** -- [in] Endpoint address
- **offset** -- [out] Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

**Returns** `const usb_ep_desc_t*` Pointer to endpoint descriptor, NULL if not found.

```
void usb_print_device_descriptor (const usb_device_desc_t *devc_desc)
```

Print device descriptor.

**Parameters** `devc_desc` -- [in] Device descriptor

```
void usb_print_config_descriptor (const usb_config_desc_t *cfg_desc, print_class_descriptor_cb
                                  class_specific_cb)
```

Print configuration descriptor.

- This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
- When a non-standard descriptor is encountered, this function will call the `class_specific_cb` if it is provided

#### Parameters

- **cfg\_desc** -- [in] Configuration descriptor
- **class\_specific\_cb** -- [in] Class specific descriptor callback. Can be NULL

```
void usb_print_string_descriptor (const usb_str_desc_t *str_desc)
```

Print a string descriptor.

This function will only print ASCII characters of the UTF-16 encoded string

**Parameters** `str_desc` -- [in] String descriptor

static inline int **usb\_round\_up\_to\_mps** (int num\_bytes, int mps)

Round up to an integer multiple of endpoint's MPS.

This is a convenience function to round up a size/length to an endpoint's MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

- If MPS  $\leq$  0, this function will return 0
- If num\_bytes  $\leq$  0, this function will return 0

#### Parameters

- **num\_bytes** -- [in] Number of bytes
- **mps** -- [in] MPS

**Returns** int Round up integer multiple of MPS

### Type Definitions

typedef void (\***print\_class\_descriptor\_cb**)(const *usb\_standard\_desc\_t*\*)

Print class specific descriptor callback.

Optional callback to be provided to `usb_print_config_descriptor()` function. The callback is called when when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

### Header File

- [components/usb/include/usb/usb\\_types\\_stack.h](#)
- This header file can be included with:

```
#include "usb/usb_types_stack.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

### Structures

struct **usb\_parent\_dev\_info\_t**

Parent device information.

#### Public Members

*usb\_device\_handle\_t* **dev\_hdl**

Device's parent handle

uint8\_t **port\_num**

Device's parent port number

struct **usb\_device\_info\_t**

Basic information of an enumerated device.

**Public Members**

*usb\_parent\_dev\_info\_t* **parent**

Device's parent information

*usb\_speed\_t* **speed**

Device's speed

uint8\_t **dev\_addr**

Device's address

uint8\_t **bMaxPacketSize0**

The maximum packet size of the device's default endpoint

uint8\_t **bConfigurationValue**

Device's current configuration number

const *usb\_str\_desc\_t* \***str\_desc\_manufacturer**

Pointer to Manufacturer string descriptor (can be NULL)

const *usb\_str\_desc\_t* \***str\_desc\_product**

Pointer to Product string descriptor (can be NULL)

const *usb\_str\_desc\_t* \***str\_desc\_serial\_num**

Pointer to Serial Number string descriptor (can be NULL)

struct **usb\_isoc\_packet\_desc\_t**

Isochronous packet descriptor.

If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint's specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

**Public Members**

int **num\_bytes**

Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS

int **actual\_num\_bytes**

Actual number of bytes transmitted/received in the packet

*usb\_transfer\_status\_t* **status**

Status of the packet

struct **usb\_transfer\_s**

USB transfer structure.

## Public Members

uint8\_t \*const **data\_buffer**

Pointer to data buffer

const size\_t **data\_buffer\_size**

Size of the data buffer in bytes

int **num\_bytes**

Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, num\_bytes should be an integer multiple of MPS.

int **actual\_num\_bytes**

Actual number of bytes transferred

uint32\_t **flags**

Transfer flags

*usb\_device\_handle\_t* **device\_handle**

Device handle

uint8\_t **bEndpointAddress**

Endpoint Address

*usb\_transfer\_status\_t* **status**

Status of the transfer

uint32\_t **timeout\_ms**

Timeout (in milliseconds) of the packet (currently not supported yet)

*usb\_transfer\_cb\_t* **callback**

Transfer callback

void \***context**

Context variable for transfer to associate transfer with something

const int **num\_isoc\_packets**

Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

*usb\_isoc\_packet\_desc\_t* **isoc\_packet\_desc[]**

Descriptors for each Isochronous packet

## Macros

**USB\_TRANSFER\_FLAG\_ZERO\_PACK**

Terminate Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device. However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the transfer if the following conditions are met:

- The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
- The transfer's length (i.e., `transfer.num_bytes`) is a multiple of the endpoint's MPS

Otherwise, this flag has no effect.

Users should check whether their target device's class requires a ZLP, as not all Bulk/Interrupt OUT endpoints require them. For example:

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

---

**Note:** See USB2.0 specification 5.7.3 and 5.8.3 for more details

---

---

**Note:** IN transfers normally terminate when the Host as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host (For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

---

## Type Definitions

```
typedef struct usb_device_handle_s *usb_device_handle_t
```

Handle of a USB Device connected to a USB Host.

```
typedef bool (*usb_host_enum_filter_cb_t)(const usb_device_desc_t *dev_desc, uint8_t  
*bConfigurationValue)
```

Enumeration filter callback.

This callback is called at the beginning of the enumeration process for a newly attached device. Through this callback, users are able to:

- filter which devices should be enumerated
- select the configuration number to use when enumerating the device

The device descriptor is passed to this callback to allow users to filter devices based on Vendor ID, Product ID, and class code.

**Attention** This callback must be non-blocking

**Attention** This callback must not submit any USB transfers

**Param dev\_desc [in]** Device descriptor of the device to enumerate

**Param bConfigurationValue [out]** Configuration number to use when enumerating the device  
(starts with 1)

**Return** bool

- true: USB device will be enumerated
- false: USB device will not be enumerated

```
typedef struct usb_transfer_s usb_transfer_t
```

USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- **Bulk:** This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint's MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- **Control:** This structure represents a single control transfer. This first 8 bytes of the data\_buffer must be filled with the setup packet (see *usb\_setup\_packet\_t*). The num\_bytes field should be the total size of the transfer (i.e., size of setup packet + wLength).
- **Interrupt:** Represents an interrupt transfer. If num\_bytes exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint's specified interval.
- **Isochronous:** Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each isoc\_packet\_desc. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB's overall status and the status of each packet descriptor will be updated, and the actual\_num\_bytes reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will be updated.

---

**Note:** For Bulk/Control/Interrupt IN transfers, the num\_bytes must be a integer multiple of the endpoint's MPS

---

---

**Note:** This structure should be allocated via usb\_host\_transfer\_alloc()

---

---

**Note:** Once the transfer has been submitted, users should not modify the structure until the transfer has completed

---

```
typedef void (*usb_transfer_cb_t)(usb_transfer_t *transfer)
```

USB transfer completion callback.

### Enumerations

```
enum usb_speed_t
```

USB Standard Speeds.

*Values:*

```
enumerator USB_SPEED_LOW
```

USB Low Speed (1.5 Mbit/s)

```
enumerator USB_SPEED_FULL
```

USB Full Speed (12 Mbit/s)

```
enumerator USB_SPEED_HIGH
```

USB High Speed (480 Mbit/s)

```
enum usb_transfer_type_t
```

The type of USB transfer.

---

**Note:** The enum values need to match the `bmAttributes` field of an EP descriptor

---

*Values:*

enumerator **USB\_TRANSFER\_TYPE\_CTRL**

enumerator **USB\_TRANSFER\_TYPE\_ISOCHRONOUS**

enumerator **USB\_TRANSFER\_TYPE\_BULK**

enumerator **USB\_TRANSFER\_TYPE\_INTR**

enum **usb\_transfer\_status\_t**

The status of a particular transfer.

*Values:*

enumerator **USB\_TRANSFER\_STATUS\_COMPLETED**

The transfer was successful (but may be short)

enumerator **USB\_TRANSFER\_STATUS\_ERROR**

The transfer failed because due to excessive errors (e.g. no response or CRC error)

enumerator **USB\_TRANSFER\_STATUS\_TIMED\_OUT**

The transfer failed due to a time out

enumerator **USB\_TRANSFER\_STATUS\_CANCELED**

The transfer was canceled

enumerator **USB\_TRANSFER\_STATUS\_STALL**

The transfer was stalled

enumerator **USB\_TRANSFER\_STATUS\_OVERFLOW**

The transfer as more data was sent than was requested

enumerator **USB\_TRANSFER\_STATUS\_SKIPPED**

ISOC packets only. The packet was skipped due to system latency or bus overload

enumerator **USB\_TRANSFER\_STATUS\_NO\_DEVICE**

The transfer failed because the target device is gone

### Header File

- [components/usb/include/usb/usb\\_types\\_ch9.h](#)
- This header file can be included with:

```
#include "usb/usb_types_ch9.h"
```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

## Unions

union **usb\_setup\_packet\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

### Public Members

uint8\_t **bmRequestType**

Characteristics of request

uint8\_t **bRequest**

Specific request

uint16\_t **wValue**

Word-sized field that varies according to request

uint16\_t **wIndex**

Word-sized field that varies according to request; typically used to pass an index or offset

uint16\_t **wLength**

Number of bytes to transfer if there is a data stage

struct *usb\_setup\_packet\_t*::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

uint8\_t **val**[USB\_SETUP\_PACKET\_SIZE]

Descriptor value

union **usb\_device\_status\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB device status.

See Figures 9-4 Information Returned by a GetStatus() Request to a Device of USB2.0 specification for more details

### Public Members

uint16\_t **self\_powered**

1 - Device is currently self-powered, 0 - bus powered

uint16\_t **remote\_wakeup**

1 - the ability of the device to signal remote wakeup is enabled, 0 - the ability of the device to signal remote wakeup is disabled.

uint16\_t **reserved**

reserved

struct *usb\_device\_status\_t*::[anonymous] **USB\_DESC\_ATTR**

Packed

uint16\_t **val**

Device status value

union **usb\_standard\_desc\_t**

*#include <usb\_types\_ch9.h>* USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

Descriptor Type

struct *usb\_standard\_desc\_t*::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

uint8\_t **val**[USB\_STANDARD\_DESC\_SIZE]

Descriptor value

union **usb\_device\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB device descriptor.

See Table 9-8 of USB2.0 specification for more details

### Public Members

uint8\_t **bLength**

Size of the descriptor in bytes

uint8\_t **bDescriptorType**

DEVICE Descriptor Type

uint16\_t **bcdUSB**

USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

uint8\_t **bDeviceClass**

Class code (assigned by the USB-IF)

`uint8_t bDeviceSubClass`

Subclass code (assigned by the USB-IF)

`uint8_t bDeviceProtocol`

Protocol code (assigned by the USB-IF)

`uint8_t bMaxPacketSize0`

Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

`uint16_t idVendor`

Vendor ID (assigned by the USB-IF)

`uint16_t idProduct`

Product ID (assigned by the manufacturer)

`uint16_t bcdDevice`

Device release number in binary-coded decimal

`uint8_t iManufacturer`

Index of string descriptor describing manufacturer

`uint8_t iProduct`

Index of string descriptor describing product

`uint8_t iSerialNumber`

Index of string descriptor describing the device's serial number

`uint8_t bNumConfigurations`

Number of possible configurations

struct `usb_device_desc_t`::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

`uint8_t val`[USB\_DEVICE\_DESC\_SIZE]

Descriptor value

union **usb\_config\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a short USB configuration descriptor.

See Table 9-10 of USB2.0 specification for more details

---

**Note:** The full USB configuration includes all the interface and endpoint descriptors of that configuration.

---

## Public Members

`uint8_t bLength`

Size of the descriptor in bytes

`uint8_t bDescriptorType`

CONFIGURATION Descriptor Type

`uint16_t wTotalLength`

Total length of data returned for this configuration

`uint8_t bNumInterfaces`

Number of interfaces supported by this configuration

`uint8_t bConfigurationValue`

Value to use as an argument to the `SetConfiguration()` request to select this configuration

`uint8_t iConfiguration`

Index of string descriptor describing this configuration

`uint8_t bmAttributes`

Configuration characteristics

`uint8_t bMaxPower`

Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational.

struct `usb_config_desc_t::[anonymous]` **USB\_DESC\_ATTR**

USB descriptor attributes

`uint8_t val[USB_CONFIG_DESC_SIZE]`

Descriptor value

union **usb\_iad\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB interface association descriptor.

### Public Members

`uint8_t bLength`

Size of the descriptor in bytes

`uint8_t bDescriptorType`

INTERFACE ASSOCIATION Descriptor Type

`uint8_t bFirstInterface`

Interface number of the first interface that is associated with this function

`uint8_t bInterfaceCount`

Number of contiguous interfaces that are associated with this function

`uint8_t bFunctionClass`

Class code (assigned by USB-IF)

**uint8\_t bFunctionSubClass**

Subclass code (assigned by USB-IF)

**uint8\_t bFunctionProtocol**

Protocol code (assigned by USB-IF)

**uint8\_t iFunction**

Index of string descriptor describing this function

struct *usb\_iad\_desc\_t*::[anonymous] **USB\_DESC\_ATTR**

USB descriptor attributes

**uint8\_t val**[USB\_IAD\_DESC\_SIZE]

Descriptor value

union **usb\_intf\_desc\_t**

*#include <usb\_types\_ch9.h>* Structure representing a USB interface descriptor.

See Table 9-12 of USB2.0 specification for more details

### Public Members

**uint8\_t bLength**

Size of the descriptor in bytes

**uint8\_t bDescriptorType**

INTERFACE Descriptor Type

**uint8\_t bInterfaceNumber**

Number of this interface.

**uint8\_t bAlternateSetting**

Value used to select this alternate setting for the interface identified in the prior field

**uint8\_t bNumEndpoints**

Number of endpoints used by this interface (excluding endpoint zero).

**uint8\_t bInterfaceClass**

Class code (assigned by the USB-IF)

**uint8\_t bInterfaceSubClass**

Subclass code (assigned by the USB-IF)

**uint8\_t bInterfaceProtocol**

Protocol code (assigned by the USB)

**uint8\_t iInterface**

Index of string descriptor describing this interface

```
struct usb_intf_desc_t::[anonymous] USB_DESC_ATTR
```

USB descriptor attributes

```
uint8_t val[USB_INTF_DESC_SIZE]
```

Descriptor value

```
union usb_ep_desc_t
```

*#include <usb\_types\_ch9.h>* Structure representing a USB endpoint descriptor.

See Table 9-13 of USB2.0 specification for more details

### Public Members

```
uint8_t bLength
```

Size of the descriptor in bytes

```
uint8_t bDescriptorType
```

ENDPOINT Descriptor Type

```
uint8_t bEndpointAddress
```

The address of the endpoint on the USB device described by this descriptor

```
uint8_t bmAttributes
```

This field describes the endpoint's attributes when it is configured using the `bConfigurationValue`.

```
uint16_t wMaxPacketSize
```

Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

```
uint8_t bInterval
```

Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

```
struct usb_ep_desc_t::[anonymous] USB_DESC_ATTR
```

USB descriptor attributes

```
uint8_t val[USB_EP_DESC_SIZE]
```

Descriptor value

```
union usb_str_desc_t
```

*#include <usb\_types\_ch9.h>* Structure representing a USB string descriptor.

### Public Members

```
uint8_t bLength
```

Size of the descriptor in bytes

`uint8_t bDescriptorType`  
STRING Descriptor Type

`uint16_t wData[]`  
UTF-16LE encoded

struct *usb\_str\_desc\_t*::[anonymous] **USB\_DESC\_ATTR**  
USB descriptor attributes

`uint8_t val[USB_STR_DESC_SIZE]`  
Descriptor value

### Macros

**USB\_DESC\_ATTR**

**USB\_B\_DESCRIPTOR\_TYPE\_DEVICE**

Descriptor types from USB2.0 specification table 9.5.

**USB\_B\_DESCRIPTOR\_TYPE\_CONFIGURATION**

**USB\_B\_DESCRIPTOR\_TYPE\_STRING**

**USB\_B\_DESCRIPTOR\_TYPE\_INTERFACE**

**USB\_B\_DESCRIPTOR\_TYPE\_ENDPOINT**

**USB\_B\_DESCRIPTOR\_TYPE\_DEVICE\_QUALIFIER**

**USB\_B\_DESCRIPTOR\_TYPE\_OTHER\_SPEED\_CONFIGURATION**

**USB\_B\_DESCRIPTOR\_TYPE\_INTERFACE\_POWER**

**USB\_B\_DESCRIPTOR\_TYPE\_OTG**

Descriptor types from USB 2.0 ECN.

**USB\_B\_DESCRIPTOR\_TYPE\_DEBUG**

**USB\_B\_DESCRIPTOR\_TYPE\_INTERFACE\_ASSOCIATION**

**USB\_B\_DESCRIPTOR\_TYPE\_SECURITY**

Descriptor types from Wireless USB spec.

**USB\_B\_DESCRIPTOR\_TYPE\_KEY**

**USB\_B\_DESCRIPTOR\_TYPE\_ENCRYPTION\_TYPE**

**USB\_B\_DESCRIPTOR\_TYPE\_BOS**

**USB\_B\_DESCRIPTOR\_TYPE\_DEVICE\_CAPABILITY**

**USB\_B\_DESCRIPTOR\_TYPE\_WIRELESS\_ENDPOINT\_COMP**

**USB\_B\_DESCRIPTOR\_TYPE\_WIRE\_ADAPTER**

**USB\_B\_DESCRIPTOR\_TYPE\_RPIPE**

**USB\_B\_DESCRIPTOR\_TYPE\_CS\_RADIO\_CONTROL**

**USB\_B\_DESCRIPTOR\_TYPE\_PIPE\_USAGE**

Descriptor types from UAS specification.

**USB\_SETUP\_PACKET\_SIZE**

Size of a USB control transfer setup packet in bytes.

**USB\_BM\_REQUEST\_TYPE\_DIR\_OUT**

Bit masks belonging to the bmRequestType field of a setup packet.

**USB\_BM\_REQUEST\_TYPE\_DIR\_IN**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_STANDARD**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_CLASS**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_VENDOR**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_RESERVED**

**USB\_BM\_REQUEST\_TYPE\_TYPE\_MASK**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_DEVICE**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_INTERFACE**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_ENDPOINT**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_OTHER**

**USB\_BM\_REQUEST\_TYPE\_RECIP\_MASK**

**USB\_B\_REQUEST\_GET\_STATUS**

Bit masks belonging to the bRequest field of a setup packet.

**USB\_B\_REQUEST\_CLEAR\_FEATURE**

**USB\_B\_REQUEST\_SET\_FEATURE**

**USB\_B\_REQUEST\_SET\_ADDRESS**

**USB\_B\_REQUEST\_GET\_DESCRIPTOR**

**USB\_B\_REQUEST\_SET\_DESCRIPTOR**

**USB\_B\_REQUEST\_GET\_CONFIGURATION**

**USB\_B\_REQUEST\_SET\_CONFIGURATION**

**USB\_B\_REQUEST\_GET\_INTERFACE**

**USB\_B\_REQUEST\_SET\_INTERFACE**

**USB\_B\_REQUEST\_SYNCH\_FRAME**

**USB\_W\_VALUE\_DT\_DEVICE**

Bit masks belonging to the wValue field of a setup packet.

**USB\_W\_VALUE\_DT\_CONFIG**

**USB\_W\_VALUE\_DT\_STRING**

**USB\_W\_VALUE\_DT\_INTERFACE**

**USB\_W\_VALUE\_DT\_ENDPOINT**

**USB\_W\_VALUE\_DT\_DEVICE\_QUALIFIER**

**USB\_W\_VALUE\_DT\_OTHER\_SPEED\_CONFIG**

**USB\_W\_VALUE\_DT\_INTERFACE\_POWER**

**USB\_SETUP\_PACKET\_INIT\_GET\_STATUS** (setup\_pkt\_ptr)

Initializer for a GET\_STATUS request.

Sets the address of a connected device

**USB\_SETUP\_PACKET\_INIT\_SET\_ADDR** (setup\_pkt\_ptr, addr)

Initializer for a SET\_ADDRESS request.

Sets the address of a connected device

**USB\_SETUP\_PACKET\_INIT\_GET\_DEVICE\_DESC** (setup\_pkt\_ptr)

Initializer for a request to get a device's device descriptor.

**USB\_SETUP\_PACKET\_INIT\_GET\_CONFIG** (setup\_pkt\_ptr)

Initializer for a request to get a device's current configuration number.

**USB\_SETUP\_PACKET\_INIT\_GET\_CONFIG\_DESC** (setup\_pkt\_ptr, desc\_index, desc\_len)

Initializer for a request to get one of the device's current configuration descriptor.

- desc\_index indicates the configuration's index number
- Number of bytes of the configuration descriptor to get

**USB\_SETUP\_PACKET\_INIT\_SET\_CONFIG** (setup\_pkt\_ptr, config\_num)

Initializer for a request to set a device's current configuration number.

**USB\_SETUP\_PACKET\_INIT\_SET\_INTERFACE** (setup\_pkt\_ptr, intf\_num, alt\_setting\_num)

Initializer for a request to set an interface's alternate setting.

**USB\_SETUP\_PACKET\_INIT\_GET\_STR\_DESC** (setup\_pkt\_ptr, string\_index, lang\_id, desc\_len)

Initializer for a request to get a string descriptor.

**USB\_STANDARD\_DESC\_SIZE**

Size of dummy USB standard descriptor.

**USB\_DEVICE\_DESC\_SIZE**

Size of a USB device descriptor in bytes.

**USB\_CLASS\_PER\_INTERFACE**

Possible base class values of the bDeviceClass field of a USB device descriptor.

**USB\_CLASS\_AUDIO**

**USB\_CLASS\_COMM**

**USB\_CLASS\_HID**

**USB\_CLASS\_PHYSICAL**

**USB\_CLASS\_STILL\_IMAGE**

**USB\_CLASS\_PRINTER**

**USB\_CLASS\_MASS\_STORAGE**

**USB\_CLASS\_HUB**

**USB\_CLASS\_CDC\_DATA**

**USB\_CLASS\_CSCID**

**USB\_CLASS\_CONTENT\_SEC**

**USB\_CLASS\_VIDEO**

**USB\_CLASS\_WIRELESS\_CONTROLLER**

**USB\_CLASS\_PERSONAL\_HEALTHCARE**

**USB\_CLASS\_AUDIO\_VIDEO**

**USB\_CLASS\_BILLBOARD**

**USB\_CLASS\_USB\_TYPE\_C\_BRIDGE**

**USB\_CLASS\_MISC**

**USB\_CLASS\_APP\_SPEC**

**USB\_CLASS\_VENDOR\_SPEC**

**USB\_SUBCLASS\_VENDOR\_SPEC**

Vendor specific subclass code.

**USB\_CONFIG\_DESC\_SIZE**

Size of a short USB configuration descriptor in bytes.

---

**Note:** The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

---

**USB\_BM\_ATTRIBUTES\_ONE**

Bit masks belonging to the bmAttributes field of a configuration descriptor.

Must be set

**USB\_BM\_ATTRIBUTES\_SELFPOWER**

Self powered

**USB\_BM\_ATTRIBUTES\_WAKEUP**

Can wake-up

**USB\_BM\_ATTRIBUTES\_BATTERY**

Battery powered

**USB\_IAD\_DESC\_SIZE**

Size of a USB interface association descriptor in bytes.

**USB\_INTF\_DESC\_SIZE**

Size of a USB interface descriptor in bytes.

**USB\_EP\_DESC\_SIZE**

Size of a USB endpoint descriptor in bytes.

**USB\_B\_ENDPOINT\_ADDRESS\_EP\_NUM\_MASK**

Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

**USB\_B\_ENDPOINT\_ADDRESS\_EP\_DIR\_MASK**

**USB\_W\_MAX\_PACKET\_SIZE\_MPS\_MASK**

Bit masks belonging to the wMaxPacketSize field of endpoint descriptor.

**USB\_W\_MAX\_PACKET\_SIZE\_MULT\_MASK**

**USB\_BM\_ATTRIBUTES\_XFERTYPE\_MASK**

Bit masks belonging to the bmAttributes field of an endpoint descriptor.

**USB\_BM\_ATTRIBUTES\_XFER\_CONTROL**

**USB\_BM\_ATTRIBUTES\_XFER\_ISOC**

**USB\_BM\_ATTRIBUTES\_XFER\_BULK**

**USB\_BM\_ATTRIBUTES\_XFER\_INT**

**USB\_BM\_ATTRIBUTES\_SYNC\_TYPE\_MASK**

**USB\_BM\_ATTRIBUTES\_SYNC\_NONE**

**USB\_BM\_ATTRIBUTES\_SYNC\_ASYNC**

**USB\_BM\_ATTRIBUTES\_SYNC\_ADAPTIVE**

**USB\_BM\_ATTRIBUTES\_SYNC\_SYNC**

**USB\_BM\_ATTRIBUTES\_USAGETYPE\_MASK**

**USB\_BM\_ATTRIBUTES\_USAGE\_DATA**

**USB\_BM\_ATTRIBUTES\_USAGE\_FEEDBACK**

**USB\_BM\_ATTRIBUTES\_USAGE\_IMPLICIT\_FB**

**USB\_EP\_DESC\_GET\_XFERTYPE** (desc\_ptr)

Macro helpers to get information about an endpoint from its descriptor.

**USB\_EP\_DESC\_GET\_EP\_NUM** (desc\_ptr)

**USB\_EP\_DESC\_GET\_EP\_DIR** (desc\_ptr)

**USB\_EP\_DESC\_GET\_MPS** (desc\_ptr)

**USB\_EP\_DESC\_GET\_MULT** (desc\_ptr)

**USB\_EP\_DESC\_GET\_SYNCTYPE** (desc\_ptr)

**USB\_EP\_DESC\_GET\_USAGETYPE** (desc\_ptr)

**USB\_STR\_DESC\_SIZE**

Size of a short USB string descriptor in bytes.

## Enumerations

enum **usb\_device\_state\_t**

USB2.0 device states.

See Table 9-1 of USB2.0 specification for more details

---

**Note:** The `USB_DEVICE_STATE_NOT_ATTACHED` is not part of the USB2.0 specification, but is a catch all state for devices that need to be cleaned up after a sudden disconnection or port error.

---

*Values:*

enumerator **USB\_DEVICE\_STATE\_NOT\_ATTACHED**

The device was previously configured or suspended, but is no longer attached (either suddenly disconnected or a port error)

enumerator **USB\_DEVICE\_STATE\_ATTACHED**

Device is attached to the USB, but is not powered.

enumerator **USB\_DEVICE\_STATE\_POWERED**

Device is attached to the USB and powered, but has not been reset.

enumerator **USB\_DEVICE\_STATE\_DEFAULT**

Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. Device responds at the default address.

enumerator **USB\_DEVICE\_STATE\_ADDRESS**

Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

enumerator **USB\_DEVICE\_STATE\_CONFIGURED**

Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.

enumerator **USB\_DEVICE\_STATE\_SUSPENDED**

Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device's function.

## Maintainers Notes

---

**Note:** For more details regarding the internal implementation details of the USB Host stack, please refer to [USB Host Maintainers Notes \(Introduction\)](#).

---

### USB Host Maintainers Notes (Introduction)

This document contains information regarding the implementation details of the USB Host stack. This document is intended for the maintainers and third-party contributors of the USB Host stack. Users of the USB Host stack should refer to *USB Host* instead.

**Warning:** The implementation details of the USB Host stack is categorized as private API. Thus, all layers (other than the USB Host Library) do not adhere to *ESP-IDF's versioning scheme* (i.e., breaking changes are permitted).

This document is split into the following sections:

### USB Host Maintainers Notes (Design Guidelines)

**Design Considerations** The design of the Host Stack takes into account the following design considerations:

#### Limited Hardware Resources:

The embedded nature of Host Stack means limited hardware resources (such as memory and processing power) when compared to larger host systems.

#### USB2.0 Chapter 10:

Chapter 10 of the USB 2.0 specification specifies certain requirements of USB Host systems, in particular the required layers of the USB Host's system software.

#### Diverse Use Case Complexities:

The embedded nature of the Host Stack also means a wide range of use cases with differing complexities. Some USB Host applications aim to only support a single vendor specific device, whereas other applications require support for a wide range of devices of different classes.

**Requirements** Given the design considerations above, the Host Stack was designed with the following set of requirements:

#### **DMA Support Requirement: The Host Stack must support DMA.**

The Host Stack must support DMA in order to reduce CPU's workload. DMA support allows the automatic copying of USB transfer data to/from the Host Controller without CPU intervention. This is especially critical given the embedded nature of the CPU (i.e., lower CPU frequencies) and large maximum data payloads of USB transfers (e.g., 1023 bytes for isochronous transfers).

#### **Minimize Memory Copies Requirement: The Host Stack should minimize the amount of memory copies when passing data between layers.**

Various data and objects (e.g., USB transfers) need to be passed between multiple layers of the Host Stack. The Host Stack should minimize the amount of memory copies that occur between layers by allocating the data's/object's memory once, and simply passing a pointer to that data/object between the layers. Therefore, the Host Stack requires some standardized data types shared across multiple layers (see USB2.0 Section 10.3.4).

#### **Event Driven Requirement: The Host Stack must allow for event driven operation (i.e., the Host Stack's API must not be polling).**

The Host Stack needs to support some CPU intensive use application scenarios such as video streaming (i.e., UVC class). Therefore, the Host Stack should minimize CPU usage by allowing for completely event driven operation, thus reserving the majority of CPU time for the application itself (i.e., video encoding/decoding in this case).

The Host Stack needs to communicate events across the layers using interrupts, callbacks, and FreeRTOS synchronization primitives (e.g., queues and semaphores).

**No Task Creation Requirement:** All layers of the Host Stack below (and including) the Host Library layer must not create any tasks.

Task stacks are generally one of the most memory intensive parts of an ESP-IDF applications. Given the wide range of applications scenarios, the number of tasks created (and their stack sizes) can vary greatly. For example...

- applications that require low latency or high throughput (such as isochronous transfers) may choose to create a dedicated task to handle those transfers in order to minimize latency.
- applications that do not have strict latency requirements (such as bulk transfers) may choose to handle those transfers from a shared task in order to save some memory.

Therefore, all layers of the Host Stack below (and including) the Host Library layer **must not** create any tasks. Instead, these layers should expose handlers functions to be called from tasks created by the upper layers. Task creation will be delegated to the class driver or application layer.

**Operable at Different Layers** Given the wide range of use case complexities, the Host Stack must be operable at different layers, allowing users to use the Host Stack at a lower layer (e.g., the HCD or HAL) or at a higher layer (e.g., a class driver).

Being operable at different layers allows the users to decide on the appropriate trade-off between convenience, control, and optimization for their application when using the Host Stack. For example...

- Host Stack applications that support a dedicated custom device may want to use a lower level of abstraction for better optimization, control, and simpler API.
- Host Stack applications that need to support a wide range of device classes requires the full Host Stack so that device enumeration is automatically handled.

**Coding Conventions** The Host Stack follows the following set of coding rules/guidelines for better code readability and maintainability:

**Symbols Use Layer Name As Prefix** For each layer of the Host Stack, the symbols exposed by that layer (i.e., functions, types, macros) must be prefixed with that layer's name. For example, the symbols exposed by the HCD layer will be prefixed `hcd_.../HCD_...`

However, internal symbols (e.g., static functions) **should not** be prefixed with their layer's name. This makes it easier to differentiate between internal and external symbols when modifying that layer's source code.

**Critical Section Functions Prefixed With `_`** In each layer of the Host Stack, there are various static functions that must be called inside a critical section. The names of these functions are prefixed with `_` (e.g., `_func_called_from_crit()`) to make it easier for maintainers to differentiate which functions should be called from critical sections. For example...

```
some_func(); // Called outside critical section
taskENTER_CRITICAL(&some_lock);
_some_func_crit(); // Called inside critical section. _ prefix makes it easier to
↳differentiate
taskEXIT_CRITICAL(&some_lock);
```

**Grouping Structure Members by Locking Mechanism** Some layers of the Host Stack utilize multiple locking schemes (e.g., critical sections and task mutexes) to ensure thread safety, where each locking scheme offers a different level of protection. However, member variables of the same object can be protected by different locking scheme. Therefore, to clearly demarcate the different locking schemes and their associated variables, structure members are grouped by locking scheme as nested structures.

Table 6: Locking Scheme

Locking Scheme	Nested Structure	Description
Critical Sections	dynamic	Shared data accessed from both a task context and ISR context are protected by a critical section.
Task Mutexes	mutex_protected	Shared data accessed from only a task context are protected by a FreeRTOS Mutex
Single Thread	single_thread	Data that is only ever accessed by the same task do not require the use of any locks.
Constant	constant	Constant data is set once during the object's instantiation and never changed again. Thus, any task or ISR can freely the constant data without the use of locks, so long as the variable is never written to.

Grouping structure members by locking scheme makes the code more maintainable as it makes clear which locking scheme is required when accessing a particular member variable, as demonstrated in the code snippet below:

```
typedef struct some_obj some_obj_t;

some_obj_t obj;

// Accessing dynamic members requires critical section
taskENTER_CRITICAL(&some_lock);
obj.dynamic.varA = 1;
taskEXIT_CRITICAL(&some_lock);

// Accessing mutex protected members requires taking the mutex
xSemaphoreTake(&some_mux, portMAX_DELAY);
obj.mutex_protected.varB = 1;
xSemaphoreGive(&some_mux);

// Accessing single thread members does not require locking so long as this is the
↳only task to access it
obj.single_thread.varC = 1;

// Accessing constant members requires no locking. But only read access is allowed
int local_var = obj.constant.varD;
```

**USB Host Maintainers Notes (Architecture)** The Host Stack is roughly split into multiple layers of abstraction, with each layer representing different USB concepts and a different level of USB Host operation. For example, a higher layer may present an abstraction of devices and application data transfers, whereas a lower layer may present an abstraction of endpoints and USB transfers.

**Layer Descriptions** The layers of the Host Stack are described in the following table. The layers are ordered from lowest layer (i.e, furthest away from the user) to highest layer (i.e., closest to the user).

Table 7: Host Stack Layers

Layer	Files	Description
Host Controller (DWC_OTG)	N/A	This layer represents the USB Controller Hardware of the ESP32-S2. The API presented by this layer is the register interface of the controller.
LL	usbh_ll.h	The LL (Low Level) layer abstracts the basic register access of the USB controller according to ESP-IDF's <i>Hardware Abstraction API Guidelines</i> . In other words, this layer provides APIs to access the controller's registers and format/parse the controller's DMA descriptors.
HAL	usbh_hal.h, usbh_hal.c	The HAL (Hardware Abstraction Layer) abstracts the operating steps of the USB controller into functions according to ESP-IDF's <i>Hardware Abstraction API Guidelines</i> . This layer also abstracts the controller's host port and host channels, and provides APIs to operate the them.
HCD	hcd.h, hcd.c	The HCD (Host Controller Driver) acts as hardware agnostic API for all USB controllers (i.e., an API that can theoretically be used with any USB controller implementation). This layer also abstracts the root port (i.e., root hub) and USB pipes.
USBH and Hub Driver	usbh.h, usbh.c	The USBH (USB Host Driver) layer is equivalent to the USBH layer described in chapter 10 of the USB2.0 specification. The USBH presents an abstraction of USB devices, internally manages a list of connected devices (i.e., device pool), and also arbitrates device sharing between clients (i.e., tracks which endpoints are in use and also presents a shared endpoint 0).
Hub Driver	hub.h, hub.c	The Hub Driver layer acts as a special client of the USBH that is responsible for handling device attachment/detachment, and notifying the USBH of such events. For device attachment, the Hub Driver also handles the enumeration process as well.
USB Host Library	usb_host.h, usb_host.c	The USB Host Library layer is the lowest public API layer of the Host Stack and presents the concept of USB Host Clients. The abstraction of clients allows for multiple class drivers to coexist simultaneously (where each class roughly maps to a single client) and also acts as a mechanism for division of labor (where each client is responsible for its own processing and event handling).
Host Class Drivers	See the <a href="#">ESP-USB repository</a> or the USB Host examples in ESP-IDF (via <a href="#">peripherals/usb/host</a> ).	The Host Class Drivers implement the host side of a particular device class (e.g., CDC, MSC, HID). The exposed API is specific to each class driver.

**Layer Dependencies** The Host Stack roughly follows a top to bottom hierarchy with inter-layer dependencies. Given layers A (highest), B, and C (lowest), the Host Stack has the following inter-layer dependency rules:

- a particular layer can use the API of any layer directly below (Layer A using layer B is allowed)
- a particular layer can use the API of any layer indirectly below (Layer A using layer C is allowed) i.e., skipping layers.
- a particular layer must not use the API of any layer above (Layer C using layer A/B is forbidden)

**Note:** Layer skipping is permitted in order to circumvent the need to repeat the same abstraction across multiple layers. For example, the abstraction of pipes are presented at the HCD layer but are used by multiple layers above.

**USB Host Maintainers Notes (DWC\_OTG Controller)** The ESP32-S2 uses a DesignWare USB 2.0 On-the-Go Controller (henceforth referred to as DWC\_OTG in this document) as its underlying hardware controller, where the DWC\_OTG operates in Host Mode with Scatter/Gather DMA enabled.

**Note:** This section only summarizes the operation of the DWC\_OTG operation in Host Mode at a high level. For full details of the DWC\_OTG, refer to the DWC\_OTG Databook and Programming Guide.

**Host Mode Operating Model** A simplified version of the operating model of the DWC\_OTG in Host Mode is illustrated in the diagram below. The diagram contains some of the key concepts and terms regarding DWC\_OTG Host Mode.

**Note:** Refer to Databook section 2.1.4 (Host Architecture) for more details

**Host Port** The Host Port represents the single USB port provided by the DWC\_OTG (in USB terms, this can be thought a single USB port of the root hub of the bus). The Host Port can only connect to a single device, though more devices can be connected via hub devices.

The Host Port is responsible for:

- detecting direct device connections/disconnections
- detecting the speed of the directly connected device
- issuing various bus signals (such as suspend, resume, reset)

**Host Channels** In Host Mode, the DWC\_OTG uses channels to communicate with device endpoints, where one channel maps to a particular endpoint (in USB terms, channels are the hardware representation of pipes). For example, a channel will map to EP 1 OUT. Each channel has its own set of CSRs (Control and Status Registers) so that they can independently configured and controlled independently. A channel's CSRs are used to...

- specify the details of the channel's target endpoint (e.g., device address, EP number, transfer type, direction)
- start a transfer on the channel (e.g., by setting up DMA descriptors)

When using Scatter/Gather DMA, transfers on Host Channels are completely event driven. Users simply fill out the appropriate DMA descriptors, fill in the channel's CSRs, then enable the channel. The channel will then generate an interrupt when the transfer completes.

**Data FIFOs** In Host Mode, the DWC\_OTG uses multiple FIFOs as a staging area for the data payloads of USB transfers. When using DMA, the DMA engine will copy data between the TX/RX FIFOs and ESP32-S2's internal memory:

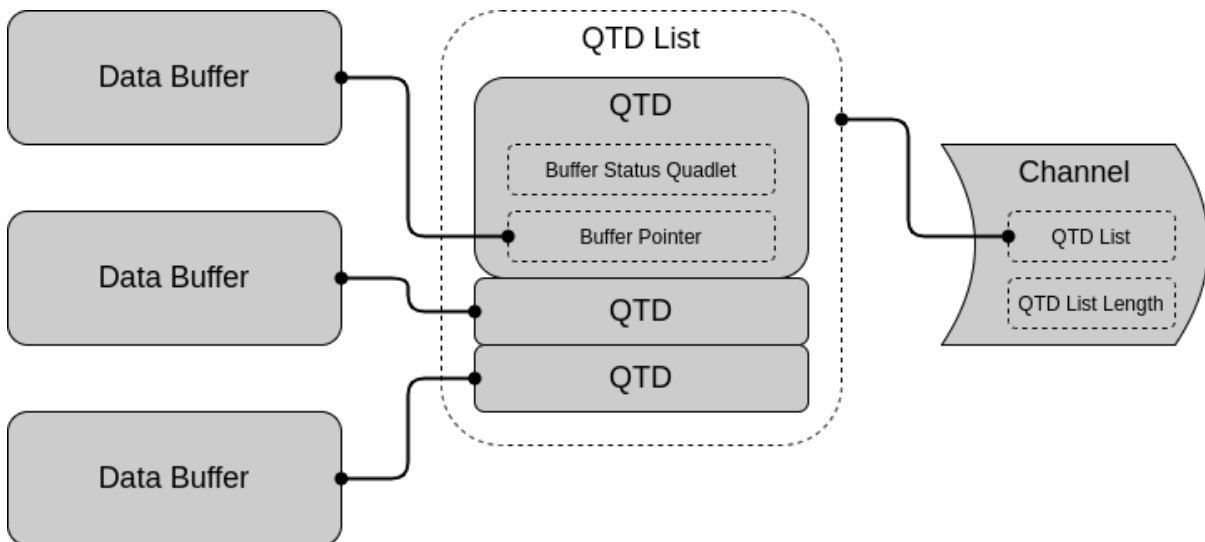

- For an OUT transfer, the transfer's data payload is copied from main memory to one of the TX FIFOs by DMA. The MAC Layer will then transmit that data payload in accordance to USB packet formatting.
- For an IN transfer, the MAC Layer will parse the received USB packet and store the received data payload in the RX FIFO. The data is then copied to main memory by DMA.

The destination FIFO depends on the direction and transfer type of the channel:

- All IN channel data goes to the RX FIFO
- All non-periodic (i.e., Control and Bulk) OUT channel data goes to the Non-periodic TX (NPTX) FIFO
- All periodic (i.e., Interrupt and Isochronous) OUT channel data goes to the Periodic TX (PTX) FIFO

**Note:** The separation of non-periodic and periodic OUT channels to the NPTX and PTX FIFOs is due to the periodic nature of Interrupt and Isochronous endpoints (specified by the `bInterval` value of the endpoint). The `DWC_OTG` automatically schedules these periodic transfers, thus a separate PTX FIFO allows these periodic transfers to be staged separately.

**DMA Engine** The DMA engine is responsible for copying data between the FIFOs and main memory. In Host Mode Scatter/Gather DMA, a particular channel can carry out multiple transfers automatically without software intervention. The following diagram illustrates the `DWC_OTG` Host Mode Scatter/Gather DMA Memory Structures.

- Each USB transfer is described by a Queue Transfer Descriptor (QTD). Each QTD consists of:
  - A 32-bit Buffer Status Quadlet specifying details of the transfer, and also reports the status of the transfer on completion. The Buffer Status Quadlet has bits to specify whether the QTD should generate an interrupt and/or halt the channel on completion.
  - A 32-bit pointer to the data buffer containing the data payload for OUT transfers, or an empty buffer used to store the data payload for IN transfers.
- The data payload of each QTD can be larger than the MPS (Maximum Packet Size) of its target endpoint. The `DWC_OTG` hardware automatically handles splitting of the transfer into multiple transactions.
- Multiple QTDs can be placed into a single QTD List. A channel will then execute each QTD in the list automatically, and optionally loop back around if configured to do so.
- Before a channel starts data transfer, it is configured with a QTD list (and QTD list length). Once the channel is enabled, USB transfers are executed automatically by the hardware.
- A channel can generate interrupts (configurable) on completion of a particular QTD, or an entire QTD list.

**Note:** Refer to Programming Guide section 6.2.1 (Descriptor Memory Structures) for more details

**Hardware Configuration** The DWC\_OTG IP is configurable. The notable Host related configurations of the ESP32-S2's DWC\_OTG are listed below:

Table 8: ESP32-S2's DWC\_OTG Configuration

Description	Configuration
Host and Device Mode support with OTG	OTG_MODE = 0
Full Speed (FS) and Low Speed (LS) support	OTG_FSPHY_INTERFACE = 1, OTG_HSPHY_INTERFACE = 0
Internal DMA controller with Scatter/Gather DMA	OTG_ARCHITECTURE = 2, OTG_EN_DESC_DMA = 1
8 Host Mode channels	OTG_NUM_HOST_CHAN = 8
All transfer types supported, including ISOC and INTR OUT transfers	OTG_EN_PERIO_HOST = 1
Dynamically sized Data FIFO of 1024 bytes (256 lines)	OTG_DFIFO_DYNAMIC = 1, OTG_DFIFO_DEPTH = 256

**Scatter/Gather DMA Transfer** The basic operating procedure for Host channels transfers consists of the following steps:

1. Prepare data buffers, QTDs, and QTD list. In particular, which QTDs should halt the channel (and generate an interrupt) on completion.
2. Set channel/endpoint characteristics via CSRs (such as EP address, transfer type, EP MPS etc).
3. Set channel's QTD list related CSRs (such as QTD list pointer and QTD list length) and channel interrupt CSRs
4. Enable the channel. Transfers are now handled automatically by hardware using DMA.
5. The Channel generates an interrupt on a channel event (e.g., QTD completion or channel error).
6. Parse the channel interrupt to determine what event occurred.
7. Parse the QTDs to determine the result of each individual transfer.

However, there are some minor differences in channel operation and QTD list usage depending on the transfer type.

**Bulk** Bulk transfers are a simplest. Each QTD represents a bulk transfer of a particular direction, where the DWC\_OTG automatically splits a particular QTD into multiple MPS sized transactions. Thus it is possible to fill a QTD list with multiple bulk transfers, and have the entire list executed automatically (i.e., only interrupt on completion of the last QTD).

**Control** Control transfers are more complicated as they are bi-directional (i.e., each control transfer stage can have a different direction). Thus, a separate QTD is required for each stage, and each QTD must halt the channel on completion. Halting the channel after each QTD allows changing the channel's direction to be changed by reconfiguring the channel's CSRs. Thus a typical control transfer consists of 3 QTDs (one for each stage).

**Interrupt** In accordance with the USB2.0 specification, interrupt transfers executes transactions at the endpoints specified service period (i.e., `bInterval`). A particular interrupt endpoint may not execute more than one interrupt transaction within a service period. The service period is specified in number of microframes/frames, thus a particular interrupt endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For interrupt channels, the service period of a particular channel (i.e., `bInterval`) is specified via the Host Frame List (see section 6.5 of programming guide for more details).

**Note:** HS USB allows an interrupt endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.7.3 (Interrupt Transfer Packet Size Constraints) for more details.

Thus, interrupt transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- If a QTD payload is larger than the endpoint's MPS, the channel will automatically split the transfer into multiple MPS sized transactions (similar to bulk transfers). However, each transaction **is executed at endpoint's specified service period** (i.e., one transaction per `bInterval`) until the transfer completes.
- For Interrupt IN transfers, if a short packet is received (i.e., transaction's data payload is < MPS), this indicates that the endpoint has no more data to send. In this case:
  - the channel generates an extra channel interrupt even if the transfer's QTD did not set the IOC (interrupt on complete) bit.
  - however, the channel is not halted even if this extra channel interrupt is generated.
  - software must then use this extra interrupt to manually halt the interrupt channel (thus canceling any remaining QTDs in the QTD list).

---

**Note:** Due to the interrupt transfer peculiarities, it may be easier for software allocate a QTD for each transaction instead of an entire transfer.

---

**Isochronous** In accordance with the USB2.0 specification, isochronous transfers executes transactions at the endpoints specified service period (i.e., `bInterval`) in order to achieve a constant rate of data transfer. A particular isochronous endpoint may not execute more than one isochronous transaction within a service period. The service period is specified in number of microframes/frames, thus a particular isochronous endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For isochronous channels, the service period of a particular channel (i.e., `bInterval`) is specified via the Host Frame List (see section 6.5 of programming guide for more details).

However, unlike interrupt transactions, isochronous transactions are not retried on failure (or NAK), due to the need to maintain the constant data rate.

---

**Note:** HS USB allows an isochronous endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.6.3 (Isochronous Transfer Packet Size Constraints) for more details.

---

Thus, isochronous transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- A QTD must be allocated for each microframe/frame. However, non-service service period QTDs should be left blank (i.e., only ever Nth QTD should be filled if the channel's service period is every Nth microframe/frame).
- **Each filled QTD must represent a single transaction instead of a transfer.**
- Because isochronous transactions are not retried on failure, the status each completed QTD must be checked.

**Supplemental Notes** Some of the DWC\_OTG's behaviors are not mentioned in the Databook or Programming Guide. This section describes some of those behaviors that are relevant to the Host stack's implementation.

**Port Errors Do Not Trigger a Channel Interrupt** If a port error occurs (such as a sudden disconnection or port over-current) while there are one or more active channels...

- The active channels remains active (i.e., `HCCHAR.ChEna` remains set) and no channel interrupts are generated.
- Channels could in theory be disabled by setting `HCCHAR.ChDis`, but this does not work for Isochronous channels as the channel disabled interrupt is never generated.

Therefore, on port errors, a controller soft reset should be used to ensure all channels are disabled.

### Port Reset Interrupts

- When the DWC\_OTG issues a reset signal on its port, and during the reset signal the device disconnects, the disconnection interrupt (i.e., `HPRT.PrtConnDet`) is not generated until the reset is deasserted.

- When resetting an already enabled port (i.e., `HPRT.Pr tEna`) such as a second reset during enumeration or a run-time reset, a Port Enable/Disable Change interrupt (i.e., `HPRT.Pr tEnChng`) is generated both on the assertion and deassertion of the reset signal.

## USB Host Driver (USBH)

**Introduction** The USB Host Driver (henceforth referred to as USBH) provides a USB Host software interface which abstracts USB devices. The USBH interface provides APIs to...

- manage the device pool (i.e., adding and removing devices)
- address and configure a device (i.e., setting device and configuration descriptors)
- submit transfers to a particular endpoint of a device

## Requirements

**USB Specification Requirements** Chapter 10 of the USB 2.0 specification outlines some requirements of the USBH (referred to as USBH in the specification). The design of the USBH takes into consideration these requirements from the specification.

- Default pipe of a device is owned by the USBH
- All other pipes are owned and managed by clients of the USBH
- USBH interface must provide the following services
  - Configuration and command mechanism
  - Transfer services via both command and pipe mechanisms
  - Event notification
  - Status reporting and error recovery

**Host Stack Requirements** In addition to the USB 2.0 specification requirements, the USBH also takes into consideration the requirements set for the overall Host Stack (see *USB Host Maintainers Notes (Design Guidelines)*):

- USBH must not instantiate any tasks/threads
- USBH must be event driven, providing event callbacks and an event processing function

## Implementation & Usage

**Events & Processing** The USBH is completely event driven and all event handling is done via the `usbh_process()` function. The `usbh_config_t.proc_req_cb` callback provided on USBH installation will be called when processing is required. Typically, `usbh_process()` will be called from a dedicated thread/task.

The USBH exposes the following event callbacks:

- `usbh_event_cb_t` used to indicate various events regarding a particular device and control transfers to EPO. This callback is called from the context of `usbh_process()`
- `usbh_ep_cb_t` used to indicate events for all other endpoints. This callback is not called from the `usbh_process()` context (currently called from an HCD interrupt context).

**Device Pool** The USBH keeps track of all currently connected devices by internally maintaining a device pool (simply a linked list) where each device is represented by a device object.

The USB 2.0 specification "assumes a specialized client of the USBH, called a hub driver, that acts as a clearinghouse for the addition and removal of devices from a particular hub". As a result, the USBH is completely reliant on an external client(s) (typically a Hub Driver) to inform the USBH of device addition and removal. The USBH provides the following APIs for device addition and removal:

- `usbh_devs_add()` which will allocate a new device object and add it to the device pool. The newly added device will be unenumerated, meaning the device object will...
  - be assigned to address 0
  - have no device and configuration descriptor
- `usbh_devs_remove()` which will indicate to the USBH that a device has been removed (such as due to a disconnection or a port error).
  - If the device is not currently opened (i.e., used by one or more clients), the USBH will free the underlying device object immediately.
  - If the device is currently opened, a `USBH_EVENT_DEV_GONE` event will be propagated and the device will be flagged for removal. The last client to close the device will free the device object.
  - When a device object is freed, a `USBH_EVENT_DEV_FREE` event will be propagated. This event is used to indicate that the device's upstream port can be recycled.

**Device Enumeration** Newly added devices will need to be enumerated. The USBH provides various `usbh_dev_set_...()` functions to enumerate the device, such as assigning the device's address and setting device/configuration/string descriptors. Given that USBH devices can be shared by multiple clients, attempting to enumerate a device while another client has opened the device can cause issues.

Thus, before calling any `usbh_dev_set_...()` enumeration function, a device must be locked for enumeration by calling `usbh_dev_enum_lock()`. This prevents the device from being opened by any other client but the enumerating client.

After enumeration is complete, the enumerating client can call `usbh_devs_trigger_new_dev_event()` to propagate a `USBH_EVENT_NEW_DEV` event.

**Device Usage** Clients that want to use a device must open the device by calling `usbh_devs_open()` and providing the device's address. The device's address can either be obtained from a `USBH_EVENT_NEW_DEV` event or by calling `usbh_devs_addr_list_fill()`.

Opening a device will do the following:

- Return a `usb_device_handle_t` device handle which can be used to refer to the device in various USBH functions
- Increment the device's internal `open_count` which indicates how many clients have opened the device. As long as `open_count > 0`, the underlying device object will not be freed, thus guaranteeing that the device handle refers to a valid device object.

Once a client no longer needs to use a device, the client should call `usbh_devs_close()` thus invalidating the device handle.

---

**Note:** Most device related APIs accept `usb_device_handle_t` as an argument, which means that the calling client must have previously opened the device to obtain the device handle beforehand. This design choice is intentional in order to enforce an "open before use" pattern.

However, a limited set of APIs (e.g., `usbh_devs_remove()`) refer to devices using a Unique Identifier (`uid`) which is assigned on device addition (see `usbh_devs_add()`). The use of `uid` in these functions allows their callers to refer to a device **without needing to open it** due to the lack of a `usb_device_handle_t`.

As a result, it is possible that a caller of a `uid` function may refer to a device that has already been freed. Thus, callers should account for a fact that these functions may return `ESP_ERR_NOT_FOUND`.

---

**Endpoints & Transfers** USBH supports transfer to default (i.e., EP0) and non-default endpoints.

For non-default endpoints:

- A client must first allocate the endpoint by calling `usbh_ep_alloc()` which assigns a `usbh_ep_cb_t` callback and returns a `usbh_ep_handle_t` endpoint handle so that the endpoint can be referred to.
- A client can then enqueue a `urb_t` transfer to the endpoint by calling `usbh_ep_enqueue_urb()`.
- The `usbh_ep_cb_t` callback is called to indicate transfer completion

- The client must then dequeue the transfer using `usbh_ep_dequeue_urb()`

Default endpoints are owned and managed by the USBH, thus API for control transfers are different:

- EP0 is always allocated for each device, thus clients do not need to allocate EP0 or provide an endpoint callback.
- Clients should call `usbh_dev_submit_ctrl_urb()` to submit a control transfer to a device's EP0.
- A `USBH_EVENT_CTRL_XFER` event will be propagated when the transfer is complete
- Control transfers do not need to be dequeued

## USB Host Enumeration Driver (Enum)

**Introduction** The USB Host Enumeration Driver (henceforth referred to as Enum Driver) provides a software interface which abstracts away the USB device enumeration process. The Enum Driver provides a simple API to start, proceed, complete and cancel the enumeration of a particular device. Internally, the Enum Driver will handle all stages of the enumeration process such as requesting various descriptors and setting the device's configuration.

### Requirements

**USB Specification Requirements** Chapter 9.1.2 of the USB 2.0 specification outlines some actions, when a USB device is attached to a powered port.

The design of the Enum Driver takes into consideration following actions:

- **The hub performs the required reset processing for the port.** `enum_config_t.enum_event_cb` call with `ENUM_EVENT_RESET_REQUIRED` event used for Hub Driver notification.
- **The host assigns a unique address to the USB device.** The Enum Driver keeps the device address value and assigns a unique address to the USB device, moving the device to the Address state.
- **The host reads the device descriptor to determine what actual maximum data payload size this USB device's default pipe can use.** The Enum Driver reads the device descriptor to determine what actual maximum data payload size this USB device's default pipe can use.
- **The host reads the configuration information from the device by reading each configuration zero to n-1, where n is the number of configurations.** This requirement simplified to reading only one configuration information from the device by reading configuration with default number, which could be selected by `enum_config_t.enum_filter_cb` call.
- **The host assigns a configuration value to the device.** The Enum Driver assigns a configuration value to the device.

---

**Note:** Typically, most USB devices only contain a single configuration. Thus, the Enum Driver defaults to selecting the configuration with `bConfigurationValue = 1`.

If users would like to select a different configuration, the Enum Driver provides an enumeration filter callback feature (enabled via `CONFIG_USB_HOST_ENABLE_ENUM_FILTER_CALLBACK`). This callback is called during the enumeration process and allows users to decide what devices to enumerate, and which `bConfigurationValue` to use.

---

**Note:** For more detailed information about Bus enumeration, please refer to [USB 2.0 Specification](#) > Chapter 9.1.2 **Bus Enumeration**.

---

**Host Stack Requirements** In addition to the USB 2.0 specification requirements, the Enum Driver also takes into consideration the requirements set for the overall Host Stack (see *USB Host Maintainers Notes (Design Guidelines)*):

- Enum Driver must not instantiate any tasks/threads
- Enum Driver must be event driven, providing event callbacks and an event processing function
- Enum Driver must use only API from underlying layer (USBH)

## Implementation & Usage

**Host Stack Interaction** The Enum Driver takes place between USB Host layer and USBH layer with a possibility to select configuration with `enum_config_t.enum_event_cb` callback provided on Enum Driver installation.

**Events & Processing** The Enum Driver is completely event driven and all event handling is done via the `enum_process()` function. The `enum_config_t.proc_req_cb` callback provided on Enum Driver installation will be called when processing is required. Typically, `enum_process()` will be called from a shared USB Host stack thread/task.

The Enum Driver exposes the following event callbacks:

- `enum_event_cb_t` used to indicate various events regarding an enumeration process. This callback is called from the context of `enum_process()`

The Enum Driver exposes the following events:

- `ENUM_EVENT_STARTED` Enumeration process has been started
- `ENUM_EVENT_RESET_REQUIRED` Enumeration process requires device reset
- `ENUM_EVENT_COMPLETED` Enumeration process has been completed
- `ENUM_EVENT_CANCELED` Enumeration process has been canceled (due to internal error or via `enum_cancel()` function call)

**Device Enumeration** The USB device enumeration process implemented in the Enum Driver is mostly based same process in the [Windows USB stack](#). The Enum Driver's enumeration process involves the following steps:

1. First device descriptor request (to obtain the MPS of EP0)
2. Second device reset (to workaround some non-compliant devices)
3. Set device address
4. Second device descriptor request (to obtain and store the full device descriptor)
5. Configuration descriptor request (to obtain the full configuration descriptor of selected configuration)
6. Language ID Table request (checks to see if en-US is supported)
7. Manufacturer string descriptor request
8. Product string descriptor request
9. Serial number string descriptor request
10. Set configuration request (sets the device to target configuration number)

---

**Note:** String descriptors are optional. If a device does not support string descriptors, these stages could be omitted.

---

**Enumeration Stages** The Enum Driver splits the enumeration process into multiple stages which are executed linearly. Depending on the connected device, some stages (such as fetching the string descriptors) can be skipped. When a stage completes, a call to the `enum_config_t.proc_req_cb` callback must be made to trigger a subsequent call of `enum_process()`. The subsequent call of `enum_process()` will then select and execute the next stage of enumeration. Stage completion can trigger the `enum_config_t.proc_req_cb` callback in one of the following ways:

- Inside the control transfer completion callback (for stages that send a control transfer)
- Direct call to `enum_config_t.proc_req_cb` (for stages that don't need to wait for any event)
- Inside `enum_proceed()` (for stages that require some action to be carried out outside the Enum Driver)

Any control transfer made during enumeration is split into two stages, where the first stage executes the transfer and the second stage (suffixed with `_CHECK`) will check the results of the transfers.

When requesting a variable length descriptors (e.g., configuration or string descriptors), the request is split into two control transfers. The first control transfer is fixed in length which only reads the header of the descriptor. The `bLength` field of the descriptor's header indicates the full length of the entire descriptor and is used to set the size of the second transfer which fetches the entire descriptor. As a result, any request for a variable length descriptor is split into four stages:

- Get short **ANY** descriptor (prefixed with `GET_SHORT_...`)
- Check short **ANY** descriptor (prefixed with `CHECK_SHORT_...`)
- Get full **ANY** descriptor (prefixed with `GET_FULLL_...`)
- Check full **ANY** descriptor (prefixed with `CHECK_FULLL_...`)

---

**Note:** Retrieving the Device Descriptor is an exception here because the second reset is taken place after retrieving short Device Descriptor.

---

**Cancel Enumeration** In some cases (such as a device disconnection), an ongoing enumeration process may need to be cancelled. An ongoing enumeration can be cancelled (regardless of its current stage) by calling `enum_cancel()` which will change the enumeration process's current stage to `ENUM_STAGE_CANCEL`.

On the next call to `enum_process`, the Enum Driver will execute the `ENUM_STAGE_CANCEL` which does the following:

- releases the device's enumeration lock.
- frees all resources related to the current device.
- propagates the `ENUM_EVENT_CANCELED` event.

## USB Host External Hub Driver (Ext Hub)

**Introduction** The External Hub Driver (henceforth referred to as Ext Hub Driver)

### Requirements

**USB Specification Requirements** Chapter 11 of the USB 2.0 specification outlines some aspects, when a USB Hub device is attached to a powered port.

The design of the Ext Driver takes into consideration the following:

- **Connectivity behavior**
- **Power management**
- **Device connect/disconnect detection**
- **Bus fault detection and recovery**
- **High-, full-, and low-speed device support**

---

**Note:** For more detailed information, please refer to [USB 2.0 Specification](#) > Chapter 11.1 **Overview**.

---

**Host Stack Requirements** In addition to the USB 2.0 specification requirements, the Ext Hub Driver also takes into consideration the requirements set for the overall Host Stack (see *USB Host Maintainers Notes (Design Guidelines)*):

- Ext Hub Driver must not instantiate any tasks/threads
- Ext Hub Driver must be event driven, providing event callbacks and an event processing function
- Ext Hub Driver must use only API from underlying layer (USBH)

### Implementation & Usage

**Host Stack Interaction** The Ext Hub Driver takes place between USB Host layer and USBH layer, next to the Hub Driver. The Hub Driver and the Ext Hub Driver were split into two Drivers to achieve the goal of logic distinguishing between root Hub and external Hub.

**Device handling** The Ext Hub Driver can be installed via `ext_hub_install()` call and uninstalled via `ext_hub_uninstall()` call. After installation the Ext Hub provides the following APIs for external Hub addition and removal:

- `ext_hub_new_dev()` which will verify the device class (*HUB\_CLASSCODE (09H)*) and, if the device has the Hub class, the Ext Hub Driver:
  - allocates a new device object
  - adds it to the external device pool
  - starts the process of Hub configuration (retrieving Hub Descriptor, Device status and Hub status)
- `ext_hub_dev_gone()` which will verify the device in the Ext Hub Driver list and start the process of external Hub device removing.

**Events & Processing** The Ext Hub Driver is completely event driven and all event handling is done via the `ext_hub_process()` function. The `ext_hub_config_t.proc_req_cb` callback provided on the Ext Hub Driver installation will be called when processing is required. Typically, `ext_hub_process()` will be called from the Hub Driver `hub_process()` processing function.

The Ext Hub Driver does not expose any event callback.

Todo:

- USB Host Maintainers Notes (HAL & LL)
- USB Host Maintainers Notes (HCD)
- USB Host Maintainers Notes (Hub)
- USB Host Maintainers Notes (USB Host Library)

**Introduction** The ESP-IDF USB Host Stack allows the ESP32-S2 to operate as a USB Host. Operating as a USB Host allows the ESP32-S2 to communicate with a wide range of USB devices. However, most USB Host Stack implementations do not run on embedded hardware (i.e., runs on PCs and smartphones), thus have comparatively more resources (i.e., memory and CPU speed).

The implementation of the ESP-IDF USB Host Stack (henceforth referred to as the Host Stack) takes into account the embedded nature of the ESP32-S2 which is reflected in various aspects of the Host Stack's design.

**Features & Limitations** The Host Stack currently supports the following notable features:

- Supports FS (Full Speed) and LS (Low Speed) devices
- Supports all transfer types (Control, Bulk, Isochronous, and Interrupt)
- Automatically enumerates connected devices
- Allows multiple class drivers (i.e., Clients of the USB Host Library) to run simultaneously and share the same device (i.e., composite devices)

The Host Stack currently has the following notable limitations:

- No Hub support (currently only supports a single device)

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

## 2.6 Project Configuration

### 2.6.1 Introduction

The `esp-idf-kconfig` package that ESP-IDF uses is based on `kconfiglib`, which is a Python extension to the `Kconfig` system. `Kconfig` provides a compile-time project configuration mechanism and offers configuration options of several types (e.g., integers, strings, and Booleans). `Kconfig` files specify dependencies between options, default values of options, the way options are grouped together, etc.

For the full list of available features, please see [Kconfig](#) and [kconfiglib extensions](#).

## 2.6.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved in the `sdkconfig` file under the project root directory. Based on `sdkconfig`, application build targets will generate the `sdkconfig.h` file under the build directory, and will make the `sdkconfig` options available to the project build system and source files.

## 2.6.3 Using `sdkconfig.defaults`

In some cases, for example, when the `sdkconfig` file is under revision control, it may be inconvenient for the build system to change the `sdkconfig` file. The build system offers a solution to prevent it from happening, which is to create the `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It contains all the options which matter to the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configuration, or it can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted or added to the ignore list of the revision control system (e.g., the `.gitignore` file for `git`). Project build targets will automatically create the `sdkconfig` file, populate it with the settings from the `sdkconfig.defaults` file, and configure the rest of the settings to their default values. Note that during the build process, settings from `sdkconfig.defaults` will not override those already in `sdkconfig`. For more information, see [Custom Sdkconfig Defaults](#).

## 2.6.4 Kconfig Format Rules

Format rules for Kconfig files are as follows:

- Option names in any menus should have consistent prefixes. The prefix currently should have at least 3 characters.
- The unit of indentation should be 4 spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 spaces, `config menu` by 4 spaces, `help in config` by 8 spaces, and the text under `help` by 12 spaces.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is 50 characters.
- The maximum length of lines is 120 characters.

---

**Note:** The `help` section of each config in the menu is treated as `reStructuredText` to generate the reference documentation for each option.

---

### Format Checker

`kconfcheck` tool in [esp-idf-kconfig](#) package is provided for checking Kconfig files against the above format rules. The checker checks all Kconfig and `Kconfig.projbuild` files given as arguments, and generates a new file with suffix `.new` with some suggestions about how to fix issues (if there are any). Please note that the checker cannot correct all format issues and the responsibility of the developer is to final check and make corrections in order to pass the tests. For example, indentations will be corrected if there is not any misleading formatting, but it cannot come up with a common prefix for options inside a menu.

The `esp-idf-kconfig` package is available in ESP-IDF environments, where the checker tool can be invoked by running command `python -m kconfcheck <path_to_kconfig_file>`.

For more information, please refer to [esp-idf-kconfig package documentation](#).

## 2.6.5 Backward Compatibility of Kconfig Options

The standard **Kconfig** tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases, then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `kconfiggen` is used by the tool chain to pre-process `sdkconfig` files before anything else. For example, `menuconfig` would read them, so the settings for old options is kept and not ignored.
2. `kconfiggen` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new **Kconfig** option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target-specific rename file `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g., `sdkconfig.rename.esp32s2`.
3. `kconfiggen` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.make`, and `auto.conf`) by adding a list of compatibility statements, i.e., the values of old options are set for new options after modification. If users still use old options in their code, this will prevent it from breaking.
4. *Deprecated options and their replacements* are automatically generated by `kconfiggen`.

## 2.6.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from **Kconfig** files. Note that due to dependencies between options, some options listed here may not be visible by default in `menuconfig`.

By convention, all option names are upper-case letters with underscores. When **Kconfig** generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a **Kconfig** file and selected in `menuconfig`, then the `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In the following sections, option names are also prefixed with `CONFIG_`, same as in the source code.

### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

### `CONFIG_APP_BUILD_TYPE`

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when `APP_BUILD_TYPE_RAM` is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A `gdbinit` file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main th
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the `load_ram` in `esptool.py` to load the generated `.bin` file into ram and execute.

**Example:** `esptool.py --chip {chip} -p {port} -b {baud} --no-stub load_ram {app.bin}`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_RAM` is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (`CONFIG_APP_BUILD_TYPE_APP_2NDBOOT`)
- Build app runs entirely in RAM (EXPERIMENTAL) (`CONFIG_APP_BUILD_TYPE_RAM`)

### CONFIG\_APP\_BUILD\_TYPE\_PURE\_RAM\_APP

Build app without SPI\_FLASH/PSRAM support (saves ram)

*Found in:* [Build type](#)

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the `spi_flash` component will also be unavailable, such as `app_update`, etc. When this option is enabled, about 26KB of RAM space can be saved.

### CONFIG\_APP\_REPRODUCIBLE\_BUILD

Enable reproducible build

*Found in:* [Build type](#)

If enabled, all date, time, and path information would be eliminated. A `.gdbinit` file would be create automatically. (or will be append if you have one already)

**Default value:**

- No (disabled)

### CONFIG\_APP\_NO\_BLOBS

No Binary Blobs

*Found in:* [Build type](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**

- No (disabled)

### Bootloader config

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- *Bootloader manager*
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
- *Serial Flash Configurations*
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_VDDSDIO_BOOST`

**Bootloader manager** Contains:

- `CONFIG_BOOTLOADER_PROJECT_VER`
- `CONFIG_BOOTLOADER_COMPILE_TIME_DATE`

### `CONFIG_BOOTLOADER_COMPILE_TIME_DATE`

Use time/date stamp for bootloader

*Found in: [Bootloader config](#) > [Bootloader manager](#)*

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

### `CONFIG_BOOTLOADER_PROJECT_VER`

Project version

*Found in: [Bootloader config](#) > [Bootloader manager](#)*

Project version. It is placed in "version" field of the `esp_bootloader_desc` structure. The type of this field is "uint32\_t".

**Range:**

- from 0 to 4294967295

**Default value:**

- 1

### `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`

Bootloader optimization Level

*Found in: [Bootloader config](#)*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default "Size" setting will add the -Os flag to CFLAGS.
- The "Debug" setting will add the -Og flag to CFLAGS.

- The "Performance" setting will add the -O2 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_SIZE)
- Debug (-Og) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for performance (-O2) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (Deprecated, will be removed in IDF v6.0) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_BOOTLOADER\_LOG\_LEVEL

Bootloader log verbosity

*Found in: [Bootloader config](#)*

Specify how much output to see in bootloader logs.

Available options:

- No output (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

**Serial Flash Configurations** Contains:

- [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#)
- [CONFIG\\_BOOTLOADER\\_CACHE\\_32BIT\\_ADDR\\_QUAD\\_FLASH](#)
- [CONFIG\\_BOOTLOADER\\_FLASH\\_XMC\\_SUPPORT](#)

## CONFIG\_BOOTLOADER\_FLASH\_DC\_AWARE

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

## CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_CACHE\_32BIT\_ADDR\_QUAD\_FLASH

Enable cache access to 32-bit-address (over 16MB) range of SPI Flash (READ DOCS FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

Enabling this option allows the CPU to access 32-bit-address flash beyond 16M range. 1. This option only valid for 4-line flash. Octal flash doesn't need this. 2. This option is experimental, which means it can't use on all flash chips stable, for more information, please contact Espressif Business support.

### CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_8V)
- 1.9V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_9V)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Range:**

- from 0 to 44 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

**Default value:**

- 4 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LEVEL

Factory reset GPIO level

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (`CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LOW`)
- Reset on GPIO high (`CONFIG_BOOTLOADER_FACTORY_RESET_PIN_HIGH`)

### **CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

### **CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy\_init, ...") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

**Default value:**

- "nvs" if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### **CONFIG\_BOOTLOADER\_APP\_TEST**

GPIO triggers boot from test app partition

*Found in: [Bootloader config](#)*

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

### **CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST**

Number of the GPIO input to boot TEST partition

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)

**Default value:**

- 18 if [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)

### **CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LEVEL**

App test GPIO level

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)*

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low (`CONFIG_BOOTLOADER_APP_TEST_PIN_LOW`)
- Enter test app on GPIO high (`CONFIG_BOOTLOADER_APP_TEST_PIN_HIGH`)

### **CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: [Bootloader config](#)*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET` || `CONFIG_BOOTLOADER_APP_TEST`

### **CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE**

Enable protection for unmapped memory regions

*Found in: [Bootloader config](#)*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

### **CONFIG\_BOOTLOADER\_WDT\_ENABLE**

Use RTC watchdog in start code

*Found in: [Bootloader config](#)*

Tracks the execution time of startup code. If the execution time is exceeded, the `RTC_WDT` will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. **NOTE:** Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for `slow_clk` - and ends calling `app_main`. Re-set timeout is needed due to WDT uses a `SLOW_CLK` clock source. After changing a frequency `slow_clk` a time of WDT needs to re-set for new frequency. `slow_clk` depends on `RTC_CLK_SRC` (`INTERNAL_RC` or `EXTERNAL_CRYSTAL`).

**Default value:**

- Yes (enabled)

### **CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE**

Allows RTC watchdog disable in user code

*Found in: [Bootloader config](#) > `CONFIG_BOOTLOADER_WDT_ENABLE`*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the `rtc_wdt` in the app's own code. If this option is not set (default), then `rtc_wdt` will be disabled by ESP-IDF before calling the `app_main()` function.

Use function `wdt_hal_feed()` for resetting counter of `RTC_WDT`. For esp32/s2 you can also use `rtc_wdt_feed()`.

Use function `wdt_hal_disable()` for disabling `RTC_WDT`. For esp32/s2 you can also use `rtc_wdt_disable()`.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_WDT\_TIME\_MS

Timeout for RTC watchdog (ms)

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC\_WDT will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

### CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE

Enable app rollback support

Found in: *Bootloader config*

After updating the app, the bootloader runs a new app with the "ESP\_OTA\_IMG\_PENDING\_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK

Enable app anti-rollback support

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**

- No (disabled) if *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*

### CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION

eFuse secure version of app

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE* > *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see *BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD* option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota\_0 + ota\_1 (without factory).

**Default value:**

- 0 if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

### CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD

Size of the efuse secure version field

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**

- from 1 to 16 if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

**Default value:**

- 16 if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE

Emulate operations with efuse secure version(only test)

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: *emul\_efuse, data, efuse, , 0x2000*.

This option enables: EFUSE\_VIRTUAL and EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP

Skip image validation when exiting deep sleep

*Found in:* [Bootloader config](#)

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if "allow insecure options" is enabled, however it's strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if [CONFIG\\_SECURE\\_BOOT](#) && [CONFIG\\_SECURE\\_BOOT\\_INSECURE](#)

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* [Bootloader config](#)

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it's not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it's not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in:* [Bootloader config](#)

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting "Skip image validation from power on reset" instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC**

Reserve RTC FAST memory for custom purposes

*Found in:* [Bootloader config](#)

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through `PRO_CPU`.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_IN\_CRC**

Include custom memory in the CRC calculation

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

This option allows the customer to use the legacy bootloader behavior when the RTC FAST memory CRC calculation takes place. When this option is enabled, the allocated user custom data will be taken into account in the CRC calculation. This means that any change to the custom data would need a CRC update to prevent the bootloader from marking this data as corrupted. If this option is disabled, the custom data will not be taken into account when calculating the RTC FAST memory CRC. The user custom data can be changed freely, without the need to update the CRC. **THIS OPTION MUST BE THE SAME FOR BOTH THE BOOTLOADER AND THE APPLICATION BUILDS.**

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE**

Size in bytes for custom purposes

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (`rtc_retain_mem_t`) is reserved and has access from the bootloader and an application.

**Default value:**

- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

**Security features**

Contains:

- `CONFIG_SECURE_BOOT_INSECURE`
- `CONFIG_SECURE_SIGNED_APPS_SCHEME`
- `CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP`
- `CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE`
- `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`
- `CONFIG_SECURE_FLASH_ENC_ENABLED`
- `CONFIG_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_ENCRYPT_ONLY_IMAGE_LEN_IN_APP_PART`
- `CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT`
- `CONFIG_SECURE_BOOTLOADER_KEY_ENCODING`
- *Potentially insecure options*
- `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
- `CONFIG_SECURE_BOOT_VERIFICATION_KEY`
- `CONFIG_SECURE_BOOTLOADER_MODE`
- `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`
- `CONFIG_SECURE_UART_ROM_DL_MODE`
- `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

**CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT**

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

**CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME**

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
  - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
  - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
  - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_SCHEME)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (CONFIG\_SECURE\_SIGNED\_APPS\_RSA\_SCHEME)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (CONFIG\_SECURE\_SIGNED\_APPS\_ECDSA\_V2\_SCHEME)  
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

### CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_192\_BITS)
- Using ECC curve NISTP256 (Recommended) (CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_256\_BITS)

### CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME`

### CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

**CONFIG\_SECURE\_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: [Security features](#)*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**

- No (disabled)

**CONFIG\_SECURE\_BOOT\_VERSION**

Select secure boot version

*Found in: [Security features](#) > [CONFIG\\_SECURE\\_BOOT](#)*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (`CONFIG_SECURE_BOOT_V1_ENABLED`)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (`CONFIG_SECURE_BOOT_V2_ENABLED`)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

**CONFIG\_SECURE\_BOOTLOADER\_MODE**

Secure bootloader mode

*Found in: [Security features](#)*

Available options:

- One-time flash (`CONFIG_SECURE_BOOTLOADER_ONE_TIME_FLASH`)  
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.  
Enabling this option means that the bootloader cannot be changed after the first time it is booted.

- **Reflashable (CONFIG\_SECURE\_BOOTLOADER\_REFLASHABLE)**  
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.  
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.  
This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

### **CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

### **CONFIG\_SECURE\_BOOT\_SIGNING\_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

#### **Default value:**

- "secure\_boot\_signing\_key.pem" if *CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES*

### **CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

### **CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling

secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

### **CONFIG\_SECURE\_BOOT\_FLASH\_BOOTLOADER\_DEFAULT**

Flash bootloader along with other artifacts when using the default flash command

*Found in: Security features*

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be separately flashed using the command `idf.py bootloader flash`, whereas, the application and partition table can be flashed using the command `idf.py flash` itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command `idf.py flash`.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_V2_ENABLED` && `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

### **CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

### **CONFIG\_SECURE\_BOOT\_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG\_SECURE\_FLASH\_ENC\_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**

- No (disabled)

**CONFIG\_SECURE\_FLASH\_ENCRYPTION\_KEYSIZE**

Size of generated XTS-AES key

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES128_DERIVED`)
- AES-128 (256-bit key) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES128`)
- AES-256 (512-bit key) (`CONFIG_SECURE_FLASH_ENCRYPTION_AES256`)

**CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE**

Enable usage mode

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When `EFUSE_VIRTUAL` is enabled, `SECURE_FLASH_ENCRYPTION_MODE_RELEASE` is not available. For CI tests we use `IDF_CI_BUILD` to bypass it ("export `IDF_CI_BUILD=1`"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (`CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`)
- Release (`CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE`)

**Potentially insecure options** Contains:

- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`
- `CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE`

### **CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG**

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

### **CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS**

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the `WR_DIS_RD_DIS` efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the `EFUSE_RD_DIS` efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the `BLK2` efuse (for ESP32) and `BLOCK4-BLOCK10` (i.e. `BLOCK_KEY0-BLOCK_KEY5`)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If "UART ROM download mode (Permanently disabled (recommended))" or "UART ROM download mode (Permanently switch to Secure mode (recommended))" is set, then it is `__NOT__` possible to read/write efuses using `espefuse.py` utility. However, efuse can be read/written from the application

### **CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS**

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

Note that if you plan to enable secure boot during the first boot up, the bootloader will intentionally revoke the unused digest slots while enabling secure boot, even if the above config is enabled because keeping the unused key slots un-revoked would a security hazard. In case for any development workflow if you need to avoid this revocation, you should enable secure boot externally (host based mechanism) rather than enabling it during the boot up, so that the bootloader would not need to enable secure boot and thus you could avoid its revocation strategy.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

### **CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### **CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash

encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

## CONFIG\_SECURE\_FLASH\_SKIP\_WRITE\_PROTECTION\_CACHE

Skip write-protection of DIS\_CACHE (DIS\_ICACHE, DIS\_DCACHE)

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS\_CACHE(for ESP32) or DIS\_ICACHE/DIS\_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these `SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`, `SECURE_BOOT_ALLOW_JTAG` or `SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE` options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: `MAC`, `MAC_CRC`, `DISABLE_APP_CPU`, `DISABLE_BT`, `DIS_CACHE`, `VOL_LEVEL_HP_INV`.

ESP32-C3: `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-C6: `SWAP_UART_SDIO_EN`, `DIS_ICACHE`, `DIS_USB_JTAG`, `DIS_DOWNLOAD_ICACHE`, `DIS_USB_SERIAL_JTAG`, `DIS_FORCE_DOWNLOAD`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-H2: `DIS_ICACHE`, `DIS_USB_JTAG`, `POWERGLITCH_EN`, `DIS_FORCE_DOWNLOAD`, `SPI_DOWNLOAD_MSPI_DIS`, `DIS_TWAI`, `JTAG_SEL_ENABLE`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S2: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB`, `DIS_TWAI`, `DIS_BOOT_REMAP`, `SOFT_DIS_JTAG`, `HARD_DIS_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`.

ESP32-S3: `DIS_ICACHE`, `DIS_DCACHE`, `DIS_DOWNLOAD_ICACHE`, `DIS_DOWNLOAD_DCACHE`, `DIS_FORCE_DOWNLOAD`, `DIS_USB_OTG`, `DIS_TWAI`, `DIS_APP_CPU`, `DIS_PAD_JTAG`, `DIS_DOWNLOAD_MANUAL_ENCRYPT`, `DIS_USB_JTAG`, `DIS_USB_SERIAL_JTAG`, `STRAP_JTAG_SEL`, `USB_PHY_SEL`.

## CONFIG\_SECURE\_FLASH\_ENCRYPT\_ONLY\_IMAGE\_LEN\_IN\_APP\_PART

Encrypt only the app image that is present in the partition of type app

*Found in: [Security features](#)*

If set (default), optimise encryption time for the partition of type APP, by only encrypting the app image that is present in the partition, instead of the whole partition. The image length used for encryption is derived from the image metadata, which includes the size of the app image, checksum, hash and also the signature sector when secure boot is enabled.

If not set, the whole partition of type APP would be encrypted, which increases the encryption time but might be useful if there is any custom data appended to the firmware image.

## CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

### Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

## CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

*Found in: Security features*

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (`CONFIG_SECURE_DISABLE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools.  
Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.  
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.  
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`CONFIG_SECURE_ENABLE_SECURE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.  
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).  
Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.  
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential "attack surface" for an attacker to try and bypass them with a successful physical attack.  
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`  
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (`CONFIG_SECURE_INSECURE_ALLOW_DL_MODE`)  
This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

## Application manager

Contains:

- [CONFIG\\_APP\\_EXCLUDE\\_PROJECT\\_NAME\\_VAR](#)
- [CONFIG\\_APP\\_EXCLUDE\\_PROJECT\\_VER\\_VAR](#)
- [CONFIG\\_APP\\_PROJECT\\_VER\\_FROM\\_CONFIG](#)
- [CONFIG\\_APP\\_RETRIEVE\\_LEN\\_ELF\\_SHA](#)
- [CONFIG\\_APP\\_COMPILE\\_TIME\\_DATE](#)

### CONFIG\_APP\_COMPILE\_TIME\_DATE

Use time/date stamp for app

*Found in:* [Application manager](#)

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

### CONFIG\_APP\_EXCLUDE\_PROJECT\_VER\_VAR

Exclude PROJECT\_VER from firmware image

*Found in:* [Application manager](#)

The PROJECT\_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_NAME\_VAR

Exclude PROJECT\_NAME from firmware image

*Found in:* [Application manager](#)

The PROJECT\_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG

Get the project version from Kconfig

*Found in:* [Application manager](#)

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

### CONFIG\_APP\_PROJECT\_VER

Project version

*Found in:* [Application manager](#) > [CONFIG\\_APP\\_PROJECT\\_VER\\_FROM\\_CONFIG](#)

Project version

**Default value:**

- 1 if `CONFIG_APP_PROJECT_VER_FROM_CONFIG`

**CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is `APP_RETRIEVE_LEN_ELF_SHA` plus the null terminator. Changing this value will change the size of this buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 9

**Boot ROM Behavior**

Contains:

- `CONFIG_BOOT_ROM_LOG_SCHEME`

**CONFIG\_BOOT\_ROM\_LOG\_SCHEME**

Permanently change Boot ROM output

*Found in: Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (`CONFIG_BOOT_ROM_LOG_ALWAYS_ON`)  
Always print ROM logs, this is the default behavior.
- Permanently disable logging (`CONFIG_BOOT_ROM_LOG_ALWAYS_OFF`)  
Don't print ROM logs.
- Log on GPIO High (`CONFIG_BOOT_ROM_LOG_ON_GPIO_HIGH`)  
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (`CONFIG_BOOT_ROM_LOG_ON_GPIO_LOW`)  
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

**Serial flasher config**

Contains:

- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`

### CONFIG\_ESPTOOLPY\_NO\_STUB

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

### CONFIG\_ESPTOOLPY\_FLASHMODE

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (CONFIG\_ESPTOOLPY\_FLASHMODE\_QIO)
- QOUT (CONFIG\_ESPTOOLPY\_FLASHMODE\_QOUT)
- DIO (CONFIG\_ESPTOOLPY\_FLASHMODE\_DIO)
- DOUT (CONFIG\_ESPTOOLPY\_FLASHMODE\_DOUT)
- OPI (CONFIG\_ESPTOOLPY\_FLASHMODE\_OPI)

### CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE

Flash Sampling Mode

*Found in: Serial flasher config*

Available options:

- STR Mode (CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_STR)
- DTR Mode (CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_DTR)

### CONFIG\_ESPTOOLPY\_FLASHFREQ

Flash SPI speed

*Found in: Serial flasher config*

Available options:

- 120 MHz (READ DOCS FIRST) (CONFIG\_ESPTOOLPY\_FLASHFREQ\_120M)
  - Optional feature for QSPI Flash. Read docs and enable *CONFIG\_SPI\_FLASH\_HPM\_ENA* first!
  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.
    - Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
- 80 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_80M)
- 64 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_64M)
- 60 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_60M)
- 48 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_48M)
- 40 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_40M)
- 32 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_32M)

- 30 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_30M)
- 26 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_26M)
- 24 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_24M)
- 20 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_20M)
- 16 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_16M)
- 15 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_15M)

### CONFIG\_ESPTOOLPY\_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

Available options:

- 1 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_1MB)
- 2 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_2MB)
- 4 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_4MB)
- 8 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_8MB)
- 16 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_16MB)
- 32 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_32MB)
- 64 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_64MB)
- 128 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_128MB)

### CONFIG\_ESPTOOLPY\_HEADER\_FLASHSIZE\_UPDATE

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

### CONFIG\_ESPTOOLPY\_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG\_ESPTOOLPY\_BEFORE\_RESET)
- No reset (CONFIG\_ESPTOOLPY\_BEFORE\_NORESET)

### CONFIG\_ESPTOOLPY\_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG\_ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (CONFIG\_ESPTOOLPY\_AFTER\_NORESET)

## Partition Table

Contains:

- [CONFIG\\_PARTITION\\_TABLE\\_CUSTOM\\_FILENAME](#)
- [CONFIG\\_PARTITION\\_TABLE\\_MD5](#)
- [CONFIG\\_PARTITION\\_TABLE\\_OFFSET](#)
- [CONFIG\\_PARTITION\\_TABLE\\_TYPE](#)

## CONFIG\_PARTITION\_TABLE\_TYPE

Partition Table

*Found in:* [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. These are mostly intended for example and development use, it's expected that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP)  
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE)  
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (CONFIG\_PARTITION\_TABLE\_TWO\_OTA)  
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota.csv
- Custom partition table CSV (CONFIG\_PARTITION\_TABLE\_CUSTOM)  
Specify the path to the partition table CSV to use for your project.  
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)

This is a variation of the default "Single factory app, no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_encr_nvs.csv`

- Single factory app (large), no OTA, encrypted NVS (`CONFIG_PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS`)

This is a variation of the "Single factory app (large), no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large_encr_nvs.csv`

- Factory app, two OTA definitions, encrypted NVS (`CONFIG_PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS`)

This is a variation of the "Factory app, two OTA definitions" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota_encr_nvs.csv`

### **CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME**

Custom partition CSV file

*Found in:* [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory by default. However, if the absolute path for the CSV file is provided, then the absolute path is configured.

**Default value:**

- "partitions.csv"

### **CONFIG\_PARTITION\_TABLE\_OFFSET**

Offset of partition table

*Found in:* [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same `PARTITION_TABLE_OFFSET` value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- "0x8000"

### **CONFIG\_PARTITION\_TABLE\_MD5**

Generate an MD5 checksum for the partition table

*Found in:* [Partition Table](#)

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled)

## Compiler options

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_RT_LIB`
- `CONFIG_COMPILER_NO_MERGE_CONSTANTS`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC12_WARNINGS`
- `CONFIG_COMPILER_DISABLE_GCC13_WARNINGS`
- `CONFIG_COMPILER_DUMP_RTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_ORPHAN_SECTIONS`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

### CONFIG\_COMPILER\_OPTIMIZATION

Optimization Level

*Found in: [Compiler options](#)*

This option sets compiler optimization level (gcc -O argument) for the app.

- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Size" setting will add the -Os flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

The "Size" setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The "Performance" setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

"None" with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the `BOOT-LOADER_COMPILER_OPTIMIZATION` setting.

Available options:

- Debug (-Og) (`CONFIG_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for size (-Os) (`CONFIG_COMPILER_OPTIMIZATION_SIZE`)
- Optimize for performance (-O2) (`CONFIG_COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (`CONFIG_COMPILER_OPTIMIZATION_NONE`)

### CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in: [Compiler options](#)*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.

- Set to "silent" to save code size (failed assertions will abort()) but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) `-DNDEBUG` is added to `CPPFLAGS` in this case.

Available options:

- Enabled (`CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE`)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (`CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_SILENT`)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets `-DNDEBUG`) (`CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE`)  
If assertions are disabled, `-DNDEBUG` is added to `CPPFLAGS`.

## **CONFIG\_COMPILER\_FLOAT\_LIB\_FROM**

Compiler float lib source

*Found in: [Compiler options](#)*

In the soft-fp part of `libgcc`, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

`RVfplib` is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. `RVfplib` is "fast", but it has a few exceptions from IEEE 754 compliance.

Available options:

- `libgcc` (`CONFIG_COMPILER_FLOAT_LIB_FROM_GCCLIB`)
- `librvfp` (`CONFIG_COMPILER_FLOAT_LIB_FROM_RVFPLIB`)

## **CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT**

Disable messages in `ESP_RETURN_ON_*` and `ESP_EXIT_ON_*` macros

*Found in: [Compiler options](#)*

If enabled, the error messages will be discarded in following check macros: -  
`ESP_RETURN_ON_ERROR` - `ESP_EXIT_ON_ERROR` - `ESP_RETURN_ON_FALSE` -  
`ESP_EXIT_ON_FALSE`

**Default value:**

- No (disabled)

## **CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS**

Replace ESP-IDF and project paths in binaries

*Found in: [Compiler options](#)*

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string "IDF", and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-macro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-macro-prefix-map` or `-file-prefix-map` arguments.

**Default value:**

- Yes (enabled)

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS

Enable C++ exceptions

*Found in: [Compiler options](#)*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#)

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE

Emergency Pool Size

*Found in: [Compiler options](#) > [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)

### CONFIG\_COMPILER\_CXX\_RTTI

Enable C++ run-time type info (RTTI)

*Found in: [Compiler options](#)*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_STACK\_CHECK\_MODE

Stack smashing protection mode

*Found in: [Compiler options](#)*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected -- those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NONE)
- Normal (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NORM)
- Strong (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_STRONG)
- Overall (CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_ALL)

### CONFIG\_COMPILER\_NO\_MERGE\_CONSTANTS

Disable merging const sections

*Found in: [Compiler options](#)*

Disable merging identical constants (string/floating-point) across compilation units. This helps in better size analysis of the application binary as the rodata section distribution is more uniform across libraries. On downside, it may increase the binary size and hence should be used during development phase only.

### CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable -Wwrite-strings warning flag

*Found in: [Compiler options](#)*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DISABLE\_GCC12\_WARNINGS

Disable new warnings introduced in GCC 12

*Found in: [Compiler options](#)*

Enable this option if use GCC 12 or newer, and want to disable warnings which don't appear with GCC 11.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DISABLE\_GCC13\_WARNINGS

Disable new warnings introduced in GCC 13

*Found in: [Compiler options](#)*

Enable this option if use GCC 13 or newer, and want to disable warnings which don't appear with GCC 12.

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

*Found in: [Compiler options](#)*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

## CONFIG\_COMPILER\_RT\_LIB

Compiler runtime library

*Found in: [Compiler options](#)*

Select runtime library to be used by compiler. - GCC toolchain supports libgcc only. - Clang allows to choose between libgcc or libclang\_rt. - For host builds ("linux" target), uses the default library.

Available options:

- libgcc (CONFIG\_COMPILER\_RT\_LIB\_GCCLIB)
- libclang\_rt (CONFIG\_COMPILER\_RT\_LIB\_CLANGRT)
- Host (CONFIG\_COMPILER\_RT\_LIB\_HOST)

## CONFIG\_COMPILER\_ORPHAN\_SECTIONS

Orphan sections handling

*Found in: [Compiler options](#)*

If the linker finds orphan sections, it attempts to place orphan sections after sections of the same attribute such as code vs data, loadable vs non-loadable, etc. That means that orphan sections could be placed between sections defined in IDF linker scripts. This could lead to corruption of the binary image. Configure the linker action here.

Available options:

- Place with warning (CONFIG\_COMPILER\_ORPHAN\_SECTIONS\_WARNING)  
Places orphan sections with a warning message.
- Place silently (CONFIG\_COMPILER\_ORPHAN\_SECTIONS\_PLACE)  
Places orphan sections without a warning/error message.

- [CONFIG\\_APPTRACE\\_UART\\_TX\\_BUFF\\_SIZE](#)

**CONFIG\_APPTRACE\_DESTINATION1**

Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (CONFIG\_APPTRACE\_DEST\_JTAG)
- None (CONFIG\_APPTRACE\_DEST\_NONE)

**CONFIG\_APPTRACE\_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (CONFIG\_APPTRACE\_DEST\_UART0)
- UART1 (CONFIG\_APPTRACE\_DEST\_UART1)
- UART2 (CONFIG\_APPTRACE\_DEST\_UART2)
- USB\_CDC (CONFIG\_APPTRACE\_DEST\_USB\_CDC)
- None (CONFIG\_APPTRACE\_DEST\_UART\_NONE)

**CONFIG\_APPTRACE\_UART\_TX\_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

### CONFIG\_APPTRACE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: [Component config](#) > [Application Level Tracing](#)*

This GPIO is used for UART RX pin.

### CONFIG\_APPTRACE\_UART\_BAUDRATE

UART baud rate

*Found in: [Component config](#) > [Application Level Tracing](#)*

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

### CONFIG\_APPTRACE\_UART\_RX\_BUFF\_SIZE

UART RX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

### CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE

UART TX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

### CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE

UART TX message size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Maximum size of the single message to transfer.

### CONFIG\_APPTRACE\_UART\_TASK\_PPIO

UART Task Priority

*Found in: [Component config](#) > [Application Level Tracing](#)*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX\_PRIORITIES-1).

**Range:**

- from 1 to 32

**Default value:**

- 1

**CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG\_APPTRACE\_BUF\_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- *CONFIG\_APPTRACE\_SV\_CPU*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_MAX\_TASKS*
- *CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_TS\_SOURCE*
- *CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO*

**CONFIG\_APPTRACE\_SV\_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

### CONFIG\_APPTRACE\_SV\_DEST

SystemView destination

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

SystemView will transfer data through defined interface.

Available options:

- Data destination JTAG (CONFIG\_APPTRACE\_SV\_DEST\_JTAG)  
Send SEGGER SystemView events through JTAG interface.
- Data destination UART (CONFIG\_APPTRACE\_SV\_DEST\_UART)  
Send SEGGER SystemView events through UART interface.

### CONFIG\_APPTRACE\_SV\_CPU

CPU to trace

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Define the CPU to trace by SystemView.

Available options:

- CPU0 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_0)  
Send SEGGER SystemView events for Pro CPU.
- CPU1 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_1)  
Send SEGGER SystemView events for App CPU.

### CONFIG\_APPTRACE\_SV\_TS\_SOURCE

Timer to use as timestamp source

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_CCOUNT)
- General Purpose Timer (Timer Group) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_GPTIMER)
- esp\_timer high resolution timer (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

### CONFIG\_APPTRACE\_SV\_MAX\_TASKS

Maximum supported tasks

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures maximum supported tasks in sysview debug

### **CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO**

Trace buffer wait timeout

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

### **CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE**

Trace Buffer Overflow Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Trace Buffer Overflow" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE**

ISR Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR Exit" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "ISR to Scheduler" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Task Start Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Task Stop Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables "Task Start Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Stop Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Create" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Terminate" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE**

System Idle Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "System Idle" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE**

Timer Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Timer Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE**

Timer Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Timer Exit" event.

### **CONFIG\_APPTRACE\_GCOV\_ENABLE**

GCOV to Host Enable

*Found in: [Component config](#) > [Application Level Tracing](#)*

Enables support for GCOV data transfer to host.

### **CONFIG\_APPTRACE\_GCOV\_DUMP\_TASK\_STACK\_SIZE**

Gcov dump task stack size

*Found in: [Component config](#) > [Application Level Tracing](#) > [CONFIG\\_APPTRACE\\_GCOV\\_ENABLE](#)*

Configures stack size of Gcov dump task

**Default value:**

- 2048 if [CONFIG\\_APPTRACE\\_GCOV\\_ENABLE](#)

**Bluetooth** Contains:

- [Bluedroid Options](#)
- [CONFIG\\_BT\\_ENABLED](#)
- [Common Options](#)
- [Controller Options](#)
- [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)
- [NimBLE Options](#)
- [CONFIG\\_BT\\_RELEASE\\_IRAM](#)

## CONFIG\_BT\_ENABLED

Bluetooth

*Found in:* [Component config](#) > [Bluetooth](#)

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

## CONFIG\_BT\_HOST

Host

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#)

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode** ([CONFIG\\_BT\\_BLUEDROID\\_ENABLED](#))  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only** ([CONFIG\\_BT\\_NIMBLE\\_ENABLED](#))  
This option is recommended for BLE only usecases to save on memory
- **Disabled** ([CONFIG\\_BT\\_CONTROLLER\\_ONLY](#))  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

## CONFIG\_BT\_CONTROLLER

Controller

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#)

This helps to choose Bluetooth controller stack

Available options:

- **Enabled** ([CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#))  
This option is recommended for Bluetooth controller usecases
- **Disabled** ([CONFIG\\_BT\\_CONTROLLER\\_DISABLED](#))  
This option is recommended for Bluetooth Host only usecases

**Bluedroid Options** Contains:

- [CONFIG\\_BT\\_ABORT\\_WHEN\\_ALLOCATION\\_FAILS](#)
- [CONFIG\\_BT\\_BLE\\_HOST\\_QUEUE\\_CONG\\_CHECK](#)
- [CONFIG\\_BT\\_BLUEDROID\\_MEM\\_DEBUG](#)
- [CONFIG\\_BT\\_BTU\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_BT\\_BTC\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_BT\\_BLE\\_ENABLED](#)

- *BT\_DEBUG\_LOG\_LEVEL*
- *CONFIG\_BT\_ACL\_CONNECTIONS*
- *CONFIG\_BT\_SMP\_MAX\_BONDS*
- *CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST*
- *CONFIG\_BT\_CLASSIC\_ENABLED*
- *CONFIG\_BT\_HID\_ENABLED*
- *CONFIG\_BT\_STACK\_NO\_LOG*
- *CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL*
- *CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER*
- *CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH*
- *CONFIG\_BT\_BLUEDROID\_ESP\_COEX\_VSC*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH*
- *CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN*
- *CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN*
- *CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE*
- *CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT*
- *CONFIG\_BT\_BLE\_RPA\_TIMEOUT*
- *CONFIG\_BT\_BLE\_RPA\_SUPPORTED*
- *CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY*
- *CONFIG\_BT\_HFP\_WBS\_ENABLE*

### **CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**Default value:**

- 3072 if *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### **CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (*CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_0*)
- Core 1 (APP CPU) (*CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_1*)

### **CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**

- 4352 if *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG

Bluetooth memory debug

Found in: *Component config > Bluetooth > Bluetooth Options*

Bluetooth memory debug

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLUEDROID\_ESP\_COEX\_VSC

Enable Espressif Vendor-specific HCI commands for coexist status configuration

Found in: *Component config > Bluetooth > Bluetooth Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_CLASSIC\_ENABLED

Classic Bluetooth

Found in: *Component config > Bluetooth > Bluetooth Options*

For now this option needs "SMP\_ENABLE" to be set to yes

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BT_CLASSIC_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED) && CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_ENC\_KEY\_SIZE\_CTRL\_ENABLED

configure encryption key size

Found in: *Component config > Bluetooth > Bluetooth Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This chooses the support status of configuring encryption key size

Available options:

- Supported by standard HCI command (`CONFIG_BT_ENC_KEY_SIZE_CTRL_STD`)
- Supported by Vendor-specific HCI command (`CONFIG_BT_ENC_KEY_SIZE_CTRL_VSC`)
- Not supported (`CONFIG_BT_ENC_KEY_SIZE_CTRL_NONE`)

### CONFIG\_BT\_CLASSIC\_BQB\_ENABLED

Host Qualification support for Classic Bluetooth

Found in: *Component config > Bluetooth > Bluetooth Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_A2DP\_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

Advanced Audio Distribution Profile

**Default value:**

- No (disabled) if *CONFIG\_BT\_CLASSIC\_ENABLED* && *CONFIG\_BT\_BLUEBIRD\_ENABLED*

**CONFIG\_BT\_SPP\_ENABLED**

SPP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables the Serial Port Profile

**Default value:**

- No (disabled) if *CONFIG\_BT\_CLASSIC\_ENABLED* && *CONFIG\_BT\_BLUEBIRD\_ENABLED*

**CONFIG\_BT\_L2CAP\_ENABLED**

BT L2CAP

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**

- No (disabled) if *CONFIG\_BT\_CLASSIC\_ENABLED* && *CONFIG\_BT\_BLUEBIRD\_ENABLED*

**CONFIG\_BT\_HFP\_ENABLE**

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED*

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

**Default value:**

- No (disabled) if *CONFIG\_BT\_CLASSIC\_ENABLED* && *CONFIG\_BT\_BLUEBIRD\_ENABLED*

Contains:

- *CONFIG\_BT\_HFP\_AG\_ENABLE*
- *CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH*
- *CONFIG\_BT\_HFP\_CLIENT\_ENABLE*

**CONFIG\_BT\_HFP\_CLIENT\_ENABLE**

Hands Free Unit

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE***Default value:**

- Yes (enabled) if *CONFIG\_BT\_HFP\_ENABLE* && *CONFIG\_BT\_BLUEBIRD\_ENABLED*

### CONFIG\_BT\_HFP\_AG\_ENABLE

Audio Gateway

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_HFP\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_CLASSIC\_ENABLED > CONFIG\_BT\_HFP\_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API "esp\_bredr\_sco\_datapath\_set" in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

Available options:

- PCM (*CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH\_PCM*)
- HCI (*CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH\_HCI*)

### CONFIG\_BT\_HFP\_WBS\_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH\_HCI* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_HID\_ENABLED

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**

- No (disabled) if *CONFIG\_BT\_CLASSIC\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

Contains:

- *CONFIG\_BT\_HID\_DEVICE\_ENABLED*
- *CONFIG\_BT\_HID\_HOST\_ENABLED*

### CONFIG\_BT\_HID\_HOST\_ENABLED

Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Host

**Default value:**

- No (disabled) if *CONFIG\_BT\_HID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_HID\_DEVICE\_ENABLED

Classic BT HID Device

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Device

### CONFIG\_BT\_BLE\_ENABLED

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Blueroid Options*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEROID_ENABLED` && `CONFIG_BT_BLUEROID_ENABLED`

### CONFIG\_BT\_GATTS\_ENABLE

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEROID_ENABLED`

### CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This enables "Peripheral Preferred Connection Parameters" characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEROID_ENABLED`

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEROID_ENABLED`

### CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 8 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE**

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)  
Let Bluedroid handle the service change indication internally

### **CONFIG\_BT\_GATTS\_ROBUST\_CACHING\_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option enables the GATT robust caching feature on the server. if turned on, the Client Supported Features characteristic, Database Hash characteristic, and Server Supported Features characteristic will be included in the GAP SERVICE.

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_GATTS\_DEVICE\_NAME\_WRITABLE**

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### **CONFIG\_BT\_GATTS\_APPEARANCE\_WRITABLE**

Allow to write appearance by GATT clients

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write appearance

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### **CONFIG\_BT\_GATTC\_ENABLE**

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### **CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR**

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 40 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### **CONFIG\_BT\_GATTC\_NOTIF\_REG\_MAX**

Max gattc notify(indication) register number

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC notify(indication) register number

**Range:**

- from 1 to 64 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 5 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH**

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 255 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 3 if `CONFIG_BT_GATTC_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_SMP\_ENABLE**

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_SMP\_ID\_RESET\_ENABLE**

Reset device identity when all bonding records are deleted

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

There are tracking risks associated with using a fixed or static IRK. If enabled this option, Bluedroid will assign a new randomly-generated IRK when all pairing and bonding records are deleted. This would decrease the ability of a previously paired peer to be used to determine whether a device with which it previously shared an IRK is within range.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_STACK\_NO\_LOG

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

#### Default value:

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### BT DEBUG LOG LEVEL Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

### CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

Available options:

- NONE (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_NONE`)
- ERROR (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_ERROR`)
- WARNING (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_WARNING`)
- API (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_API`)
- EVENT (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_EVENT`)
- DEBUG (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_DEBUG`)
- VERBOSE (`CONFIG_BT_LOG_HCI_TRACE_LEVEL_VERBOSE`)

### CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL**

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL**

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL**

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

Available options:

- NONE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

Available options:

- NONE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)

- DEBUG (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL

AVRC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL

MCA layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for MCA layer

Available options:

- NONE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL

HID layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HID layer

Available options:

- NONE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL

APPL layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for APPL layer

Available options:

- NONE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL

GATT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GATT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL

SMP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL**

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL**

OSI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for OSI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL**

BLUFI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BLUFI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_ACL\_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 4 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluebird Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_SMP\_MAX BONDS

BT/BLE maximum bond device count

*Found in: Component config > Bluetooth > Bluebird Options*

The number of security records for peer devices.

### CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluebird Options*

Originally, when doing BLE active scan, Bluebird will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluebird will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEBIRD_ENABLED` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, `ESP_GATTC_OPEN_EVT` or `ESP_GATTS_OPEN_EVT` is triggered.

**Range:**

- from 1 to 60 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

### CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if `CONFIG_BT_BLUEBIRD_ENABLED` && `CONFIG_BT_BLUEBIRD_ENABLED`

**Default value:**

- 32 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**

- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_TIMEOUT

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

**Range:**

- from 1 to 3600 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

Enabling this option activates BLE 5.0 features. This option is universally supported in chips that support BLE, except for ESP32.

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_50_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_BLE_SUPPORTED) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH**

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH**

Enable create sync enhancements(reporting disable and duplicate filtering enable support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the create sync enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `((CONFIG_BT_CONTROLLER_ENABLED && SOC_ESP_NIMBLE_CONTROLLER) || CONFIG_BT_CONTROLLER_DISABLED)` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_ABORT\_WHEN\_ALLOCATION\_FAILS**

Abort when memory allocation fails in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables abort when memory allocation fails

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**NimBLE Options** Contains:

- `CONFIG_BT_NIMBLE_HOST_ALLOW_CONNECT_WITH_SCAN`
- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- *BLE Services*
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
